
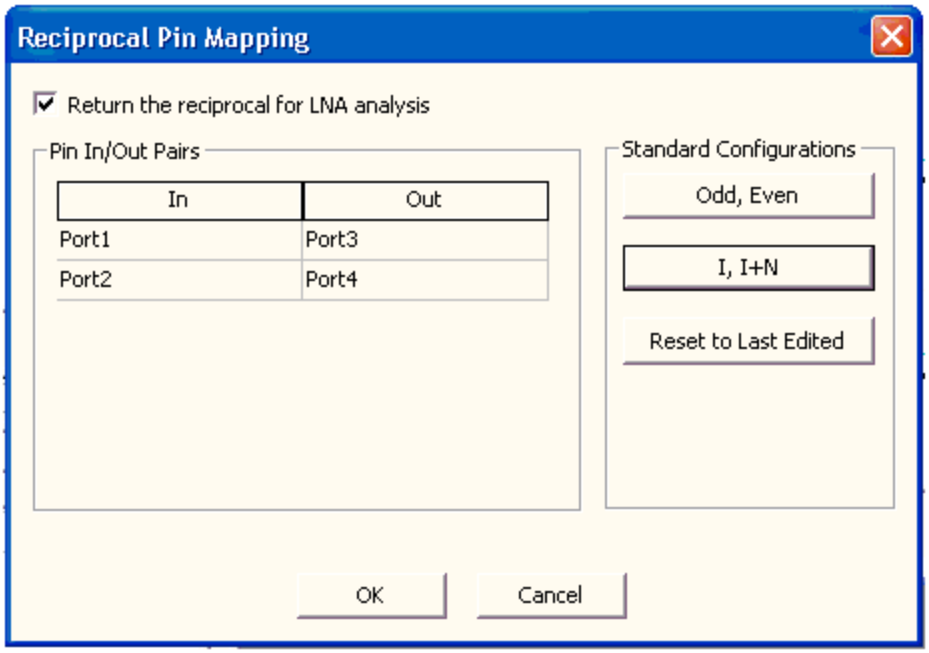
- To enable the reciprocal operation, click the box **Return the reciprocal for LNA analysis**.
- Click **Standard Configurations** to select the pin mapping configuration used by your subcircuit. The illustration above shows the **Odd, Even** configuration with four ports; the odd-numbered ports 1 and 3 are the inputs and the even-numbered ports 2 and 4 are the corresponding outputs.
- The following figure shows the **I, I+N** configuration; now the inputs are ports 1 and 2, while the corresponding outputs are ports 3 and 4.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Click **Reset to Last Edited** to restore the configuration that was initially read on the schematic.
- Click **OK** to return to the schematic editor. The **Value** field of the **LNA Reciprocal** property now reads **LNA Reciprocal ON**.

Copying an Existing Subcircuit within a Design

To copy an existing subcircuit within a design:

1. Open the design that contains the subcircuit you want to copy.
2. Do either of the following:
   - From the **Project Manager** window, right-click the icon for the subcircuit and select **Copy**.
   - In the design, select the subcircuit symbol, then click **Copy** on the **Draw** menu.
3. Do either of the following:
   - From the **Edit** menu, select **Copy**.
   - From the keyboard, press **Ctrl** +**V**.

Within the schematic window, the cursor is associated with an *N*-port symbol for subcircuit placement. To place the subcircuit, click at the appropriate location.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Tip:**
>
> You can rotate the symbol for a subcircuit before placing it by repeatedly pressing **R** on your keyboard. Each press rotates the component 90º counterclockwise.

If Multiple Placement is activated for components in the **Schematic Options** window, place additional instances of the subcircuit by clicking at additional locations. To stop placing subcircuits during multiple placement, do either of the following:

- Press **Enter**, the **Spacebar**, **Backspace**, or**Esc** on your keyboard.
- Right-click and select **Place and Finish**, **Finish**, **Cancel**, or **Back**.

> **Note:**
>
> To ensure electrical connectivity among schematic elements, the pins of placed subcircuit symbols snap to a 100-mil (2.54-millimeter) grid. This snapping cannot be deactivated, and the spacing of the connectivity grid cannot be adjusted.

Moving Between Designs in a Schematic Hierarchy

You can move between a project's different designs and design instances by double-clicking their icons in the project tree. Specific menu commands are also available for moving up and down one level.

To move down one level:

1. In the schematic from which you want to move, select the symbol for the design to which you want to move.
2. From the **Schematic** menu, select **Push Down**.

To move up one level:

1. In the schematic from which you want to move, select the symbol for the design to which you want to move.
2. From the **Schematic** menu, select **Pop Up**.

Accessing Include Files on the Schematic Editor

A schematic design can reference an include file. For example, frequency-dependent model data is commonly written into a separate file rather than entered into a Property Window.

Accessing Library File Blocks on the Schematic Editor

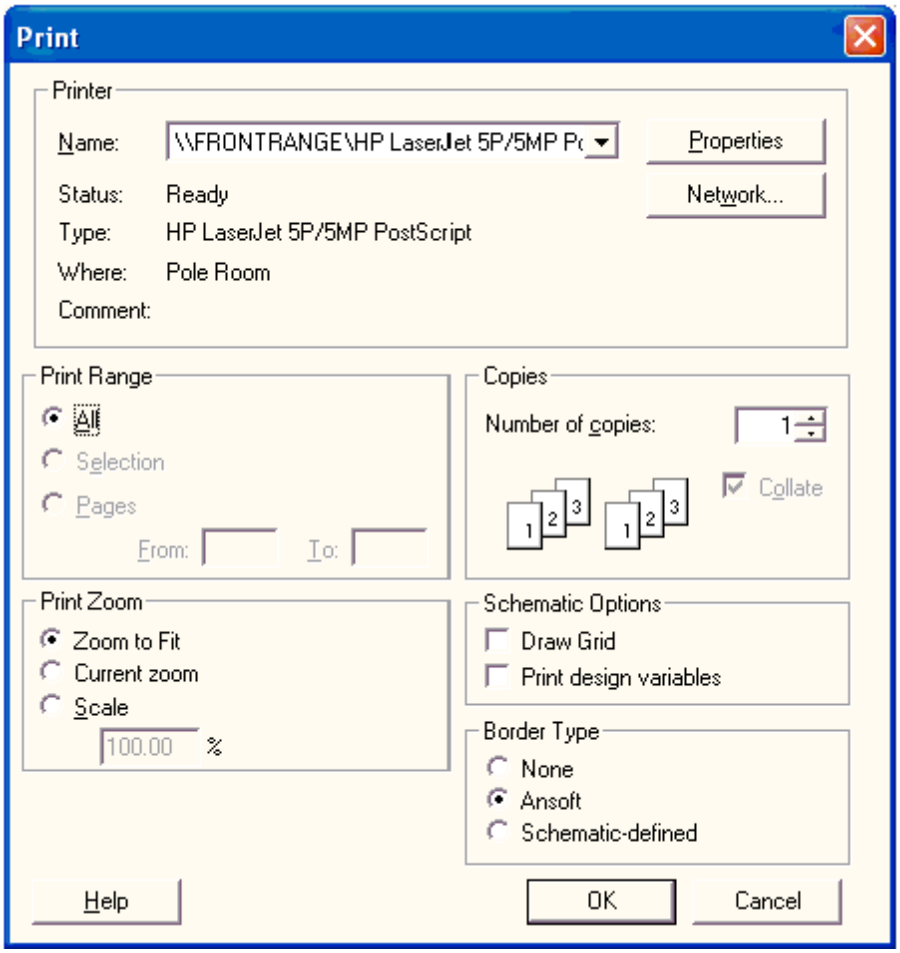
A schematic design can reference a library file block.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Printing a Schematic

To print the schematic that is in the active window:

1. Right-click in the schematic window and select **Print** on the menu (or select **Print** on the **File** menu) to open the **Print** window:



2. Use the controls to specify how you wish the print to appear.

- In the **Schematic Options** group box, specify whether or not to draw the grid and print the design variables.
- In the **Border type** group box, select the type of border to print around the schematic.

  Selecting the **Ansys** border type places a single line box around the schematic and adds the current date and page number to the print.

  Selecting the **Schematic-defined** border type prints the border as defined through the Schematic->Page Borders menu option at the size specified. Typically, select this option

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

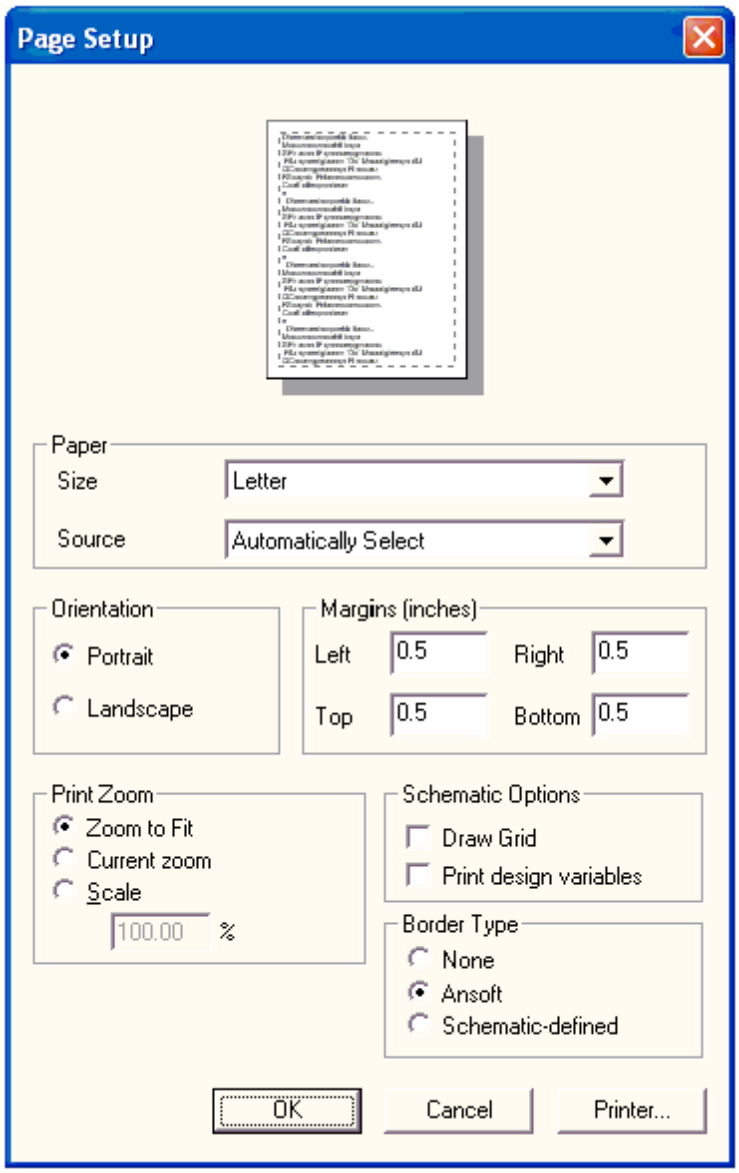
when printing out at a specific scale (e.g., 100%) to ensure that the border is visible. Use **File>Print Preview** to preview the effect of your choices.

- Make any appropriate selections in the **Print Range**, **Copies**, and **Print Zoom** group boxes.

3. Click **OK** to print the schematic, or click **Cancel** to cancel the operation.

To set up the page layout before printing:

1. Select **Page Setup** on the **File** drop-down menu to open the **Page Setup** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Use the **Paper**, **Orientation**, **Margins**, and **Print Zoom** controls to specify how you wish the print to appear. In the **Schematic Options** group box, specify whether or not to draw the grid and print the design variables.
- In the **Border type** group box, select the type of border to print around the schematic.

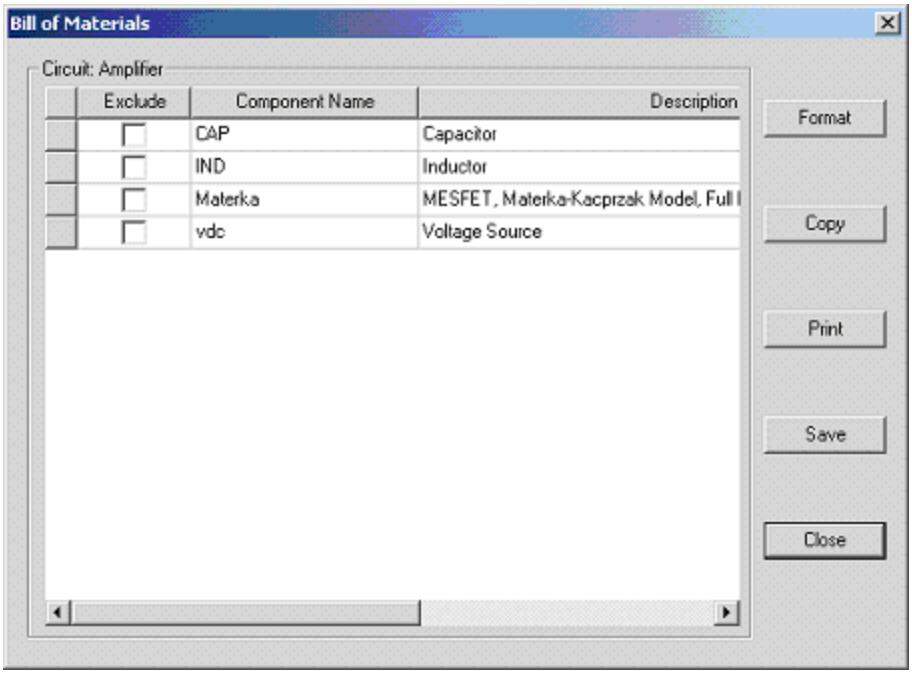
  — Selecting the **Ansys** border type places a single line box around the schematic and adds the current date and page number to the print.

  — Selecting the **Schematic-defined** border type prints the border as defined through the Schematic->Page Borders menu option at the size specified. Typically, select this option when printing out at a specific scale (e.g., 100%) to ensure that the border is visible. Use **File>Print Preview** to preview the effect of your choices.

3. Click **OK** to close the **Page Setup** window with your settings.
4. Select **Print Preview** on the **File** menu to see a preview of the print.

Bill of Materials

The Bill of Materials feature allows you to generate a configurable list of parts that are used in a schematic design. The list can be modified, viewed, printed, or exported to a file. To generate a Bill of Materials, with the design loaded into the schematic editor, select **Bill of Materials** on the **Product** menu.



The **Bill of Materials** window displays the list of components used in a design. The following controls are available:

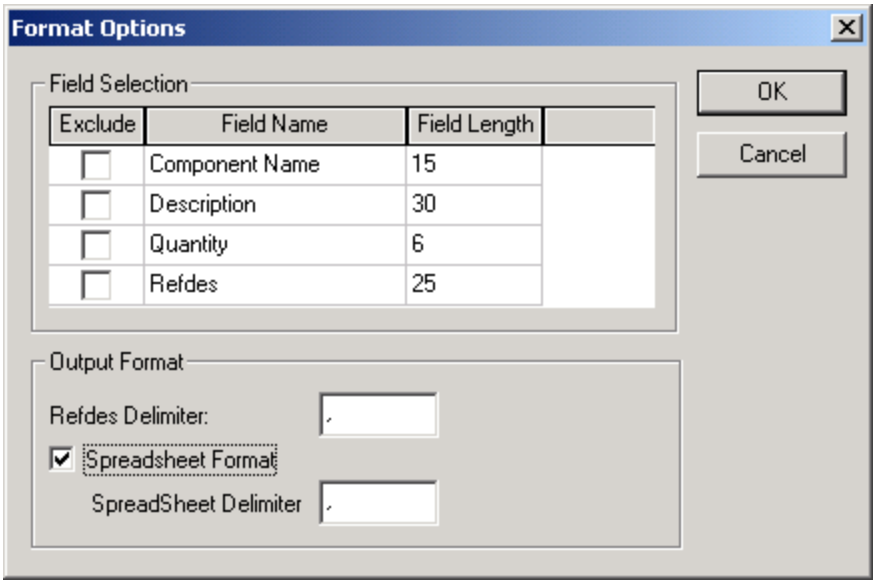
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Format** allows you to format the display. In particular, the **Format** window allows you to **Display Titles**, specify a **Spreadsheet Format**, and selectively **Exclude** fields to be displayed.
- **Copy** copies the list to the Windows clipboard.
- **Print** opens the standard Windows print window.
- **Save** saves the list to a file. You choose to save the bill of materials in text format (using either a **.bom** filename extension or a **.txt** extension), or in spreadsheet format (using a **.csv** filename extension).
- **Exclude**, when selected, removes a component on the list.
- To modify a value in the display, click directly on the value.

The default fields displayed in the Bill of Materials include:

- Component Name
- Description
- Quantity
- Refdes (Reference Designator)

To change the default fields that are displayed, click **Format** to open the **Format Options** window.



- **Exclude**, when selected, removes a field to be displayed.
- **Display Titles**, when selected, specifies that titles and headers can be included in the display.
- **Refdes Delimiter** specifies the delimiter that is used for the reference designator.
- **Spreadsheet Format**, when selected, displays the list in a spreadsheet format.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **SpreadSheet Delimiter**, when Spreadsheet Format is selected, specifies the delimiter that is used for the spreadsheet display.
- To modify a value in the display, click directly on the value.

Adding ALTER Blocks

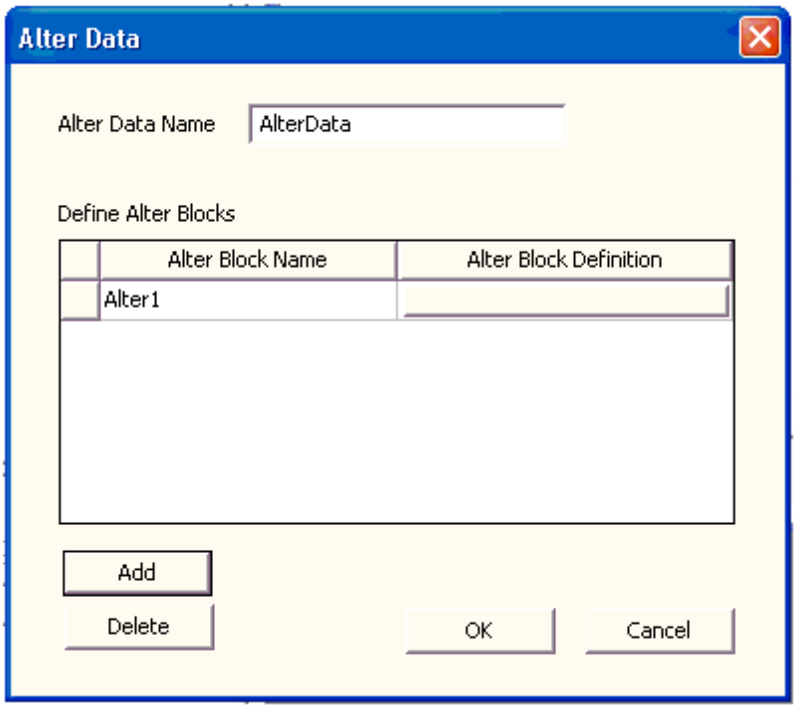
An ALTER statement directs Nexxim to resimulate a design using changed values for parameters. See ALTER Statements for details on the netlist representation of ALTER statements.

In a schematic, define one or more sets of ALTER blocks. ALTER data sets are added to the **Project Manager** window. Later, select one of the ALTER data sets on the **Project Manager** window to apply within a solution setup.

Defining a Set of ALTER Blocks in a Schematic

To create a set of ALTER blocks, right-click the icon for the Nexxim design in the **Project Manager** window and select **Add Alter Block**. (Alternatively, right-click the Analysis icon in the **Project Manager** window and select **Add Alter Block**).

The **Alter Data** window opens:



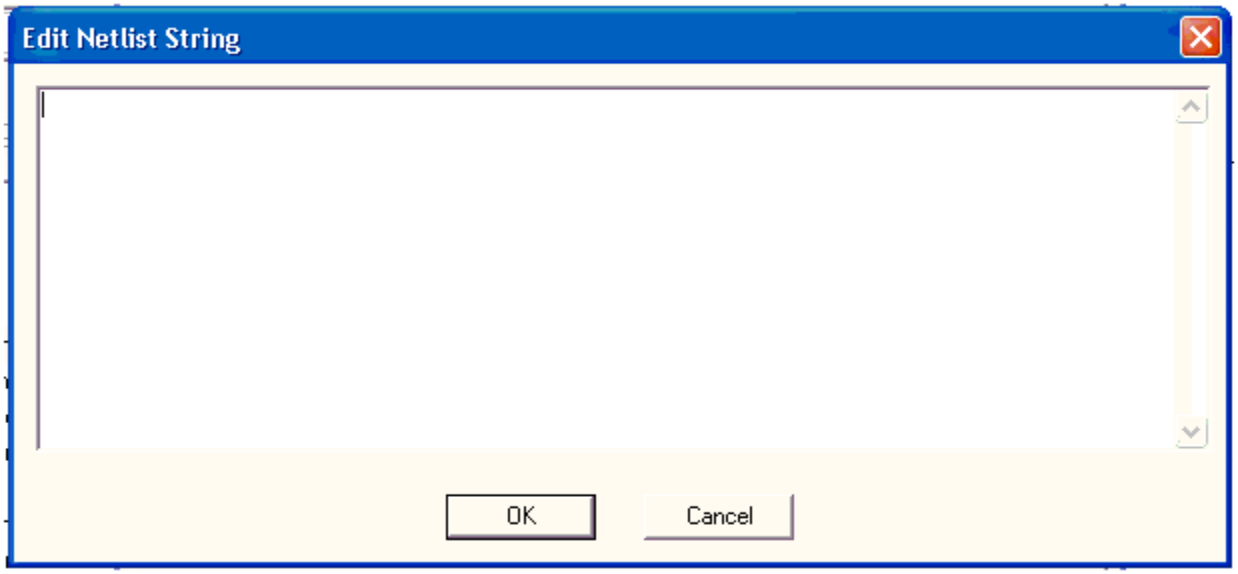
Click the **Alter Data Name** field to rename the ALTER dataset. The **Alter Data Name** is the name that appears for this ALTER dataset in the **Project Manager** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Initially, no ALTER blocks are defined. Click **Add** to start a new ALTER block (**Alter1** in the picture above).

- Click the name of the ALTER block to rename it if appropriate. The name of the ALTER block in the **Alter Data** window is the one that is written out to the netlist before simulation.

- Click in the **Definition Value** field to open the **Edit Netlist String** window:



- If the cursor does not appear immediately, click in the window to activate it.
- Type the text of the ALTER block one line at a time.

> **Note:** Start a new line by typing **Ctrl**+**Enter** at the end of the current line. Pressing **Enter** (without holding down **Ctrl**) ends the edit and closes the window..

When you are finished entering the ALTER block lines, click **OK** to return to the **Alter Data** window, or click **Cancel** to end the edit without defining anything.

- Use **Add** on the **Alter Data** window to add as many ALTER blocks to the set as appropriate. All the ALTER blocks in the set is written to the netlist when the set is selected for an analysis.
- Use **Delete** on the **Alter Data** window to delete ALTER block definitions that should not be used as part of the set being defined. Click the ALTER block to select it for deletion.
- When you have defined all the blocks in the set, click **OK** on the **Alter Data** window. The set of Alter blocks appears as an icon with the **Alter Data Name** entry under the Analysis icon in the **Project Manager** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** nbThe names for the ALTER data sets in the **Project Manager** window are used for selection in the solution setup. They are independent of the names used for the individual ALTER blocks assigned in the **Alter Data** window. You can rename an Alter set by right-clicking on its icon in the **Project Manager** window and selecting **Rename** on the menu. Renaming the set does not change the names of any of the ALTER blocks defined for the set.

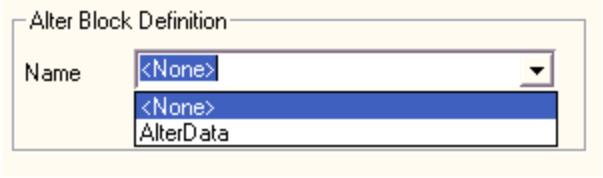
- To cancel the ALTER block entry process without creating any blocks, click **Cancel** on the **Alter Data** window.

Editing Alter Data Definitions

To review or edit the names or definitions in any ALTER dataset, double-click the icon for that set in the **Project Manager** window to open the **Alter Data** window.

Selecting an ALTER Data Set for Simulation

When one or more sets of ALTER blocks have been defined, the **Solution Setup** window for any analysis type has a field for selecting an Alter set to use as part of the simulation:



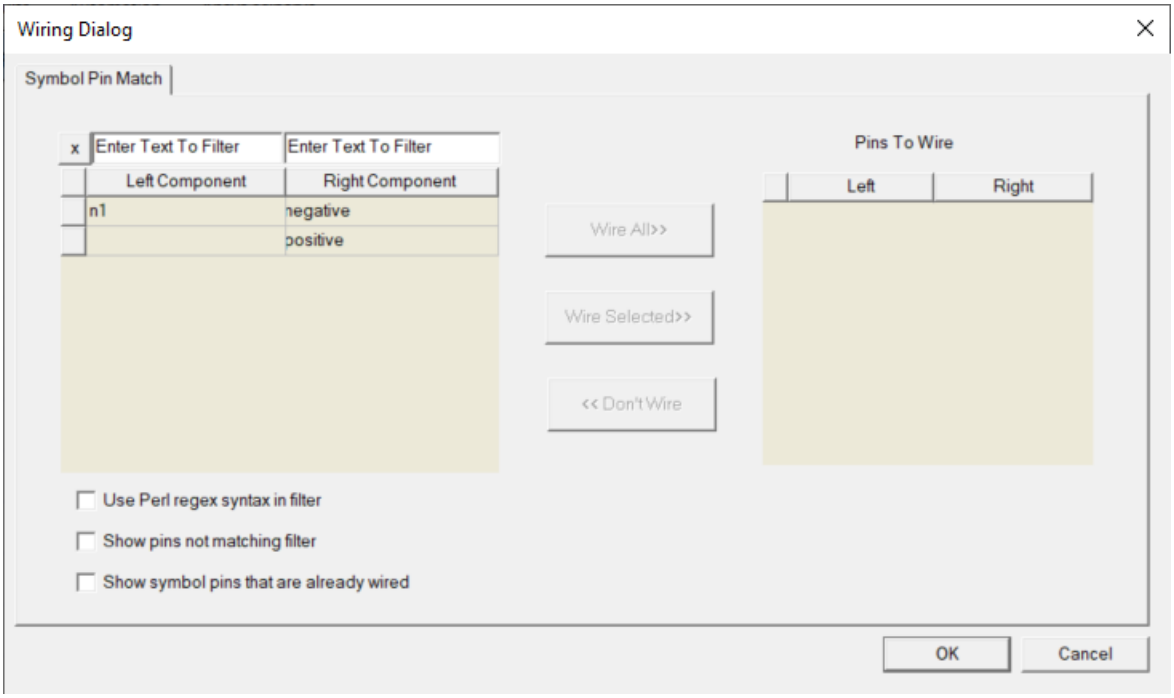
The sets listed are those available in the Project tree. When you complete the solution setup with an Alter set selected, all the ALTER blocks defined for that set are inserted at the end of the netlist that is generated internally for the schematic design with the solution setup. The blocks are inserted in the order they are defined in the set. To view the netlist, right-click the solution setup icon under the Analysis icon in the **Project Manager** window and select **Browse Netlist**.

When you run the analysis, Nexxim executes the statements in the ALTER blocks as described in the topic ALTER Statements. After simulation, create reports based on the settings in the ALTER statements.

Wiring window

In the **Schematic Editor**, hold Ctrl and select two component instances, then right-click and select **Wire**. This opens the **Wiring Dialog** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The pins of the selected component on the left are shown in the Left Component column. The pins of the selected component on the right are shown in the Right Component column. Pins are listed in alphanumeric order.

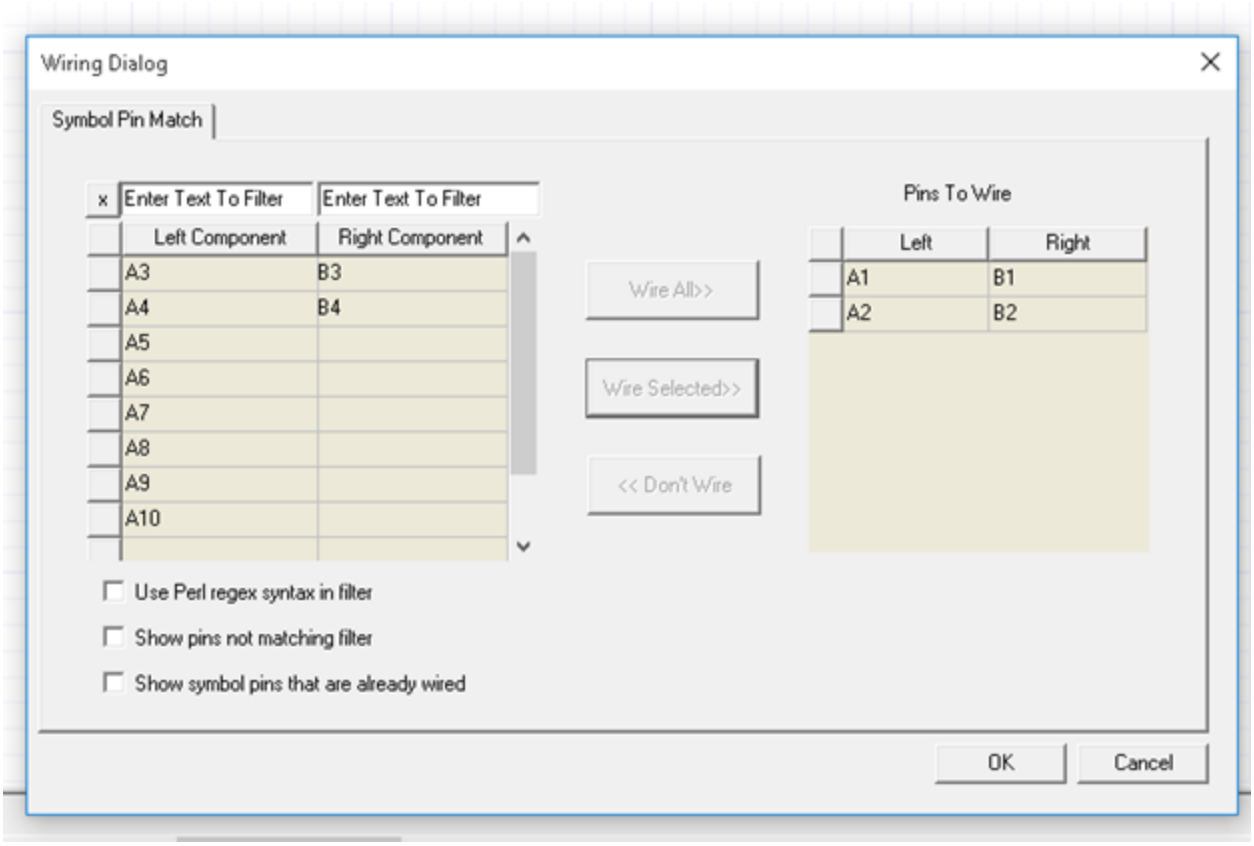
- As the user types into the text-box Filter for a column ("Enter Text To Filter"), the values in that column are filtered accordingly. A wild card ("*") matches zero or more characters.
- You can also filter the results by entering one of the following into the text-box Filter: <Odd>, <Even>, <Top Half>, <Bottom Half>.
- Click to select pins in both columns. Selected pins can be discontinuous. Multiple pins can be selected by holding down **Shift** or **Ctrl**.
- **Show symbol pins that are already wired** shows all ports on both components. But choosing to wire ports that are already wired may have a detrimental effect on the previous wiring.
- **Show pins not matching filter** shows all ports that do not match the filter entered.
- **Use Perl regex syntax in filter** shows all ports that match the entered Perl regular expression.
- **Wire Selected>>** puts the selected pairs of a pin in the **Pins To Wire** grid. If the number of pins in the left and right component are the same, click **Wire All>>** to move all pairs of pins to the **Pins To Wire** grid.
- You can select any pair of pins in the **Pins To Wire** grid. But if you decide not to wire a selected pair, click **Don’t Wire** to return the pins to their component lists.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click **OK** to confirm your selections or click **Edit>Undo Wiring** to undo the wiring operation and restore both symbols to their original states.

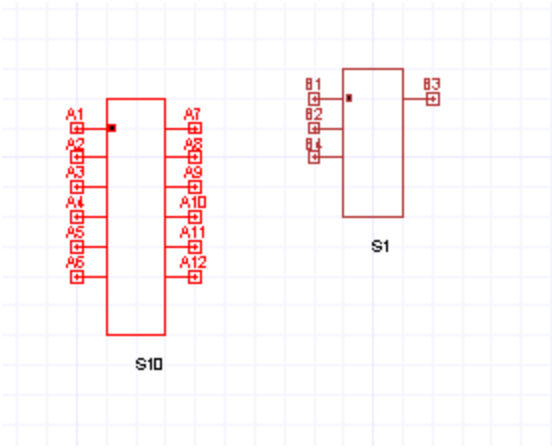
When you click **OK**, the two symbols is moved together and are positioned two squares apart (as long as one of them is not pre-wired to other components). For each pair selected, the pin on the left component is moved to the right side of the symbol, if it was not there before. Likewise, the pin on the right component is moved to the left side of the symbol, if necessary. Two pins is aligned horizontally and a wire connection is created between them. See the following example:

Wiring selection:

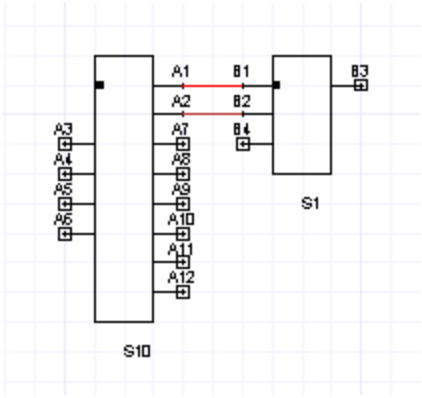


Before:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



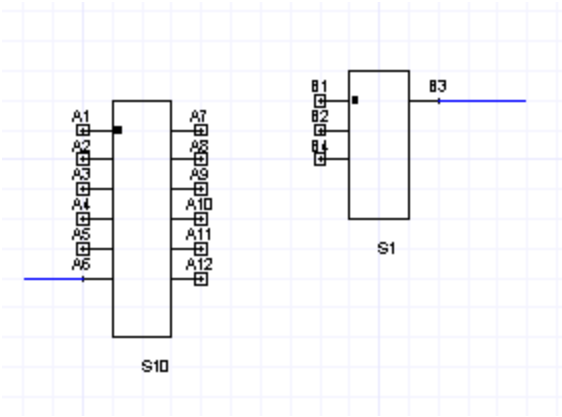
After:



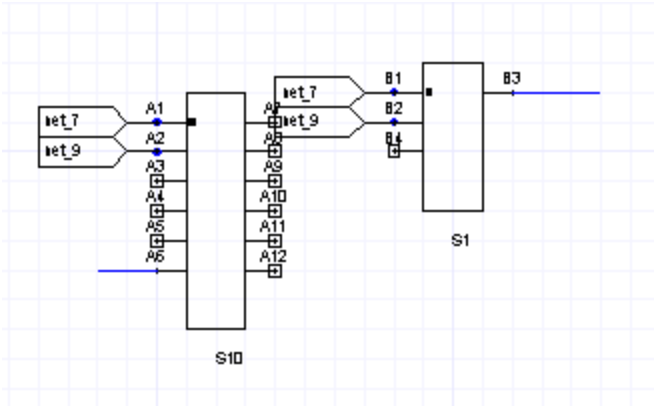
In the case where both component instances are pre-wired, one page-port is created for each pair of pins, each pin is connected to the page port, and the symbols and pins does not be moved. See the following example:

Before:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



After:



Plot I-V Curves of Active Components

A current-voltage characteristic, or I-V curve, is the relationship between an electric current and its corresponding voltage. The electric current can be a circuit, device, or material. An I-V curve is typically represented as a chart or graph , then a plot of the current-voltage relationship can be traced. This is referred to as the I-V characteristic of the element. When the I-V characteristic of the element is in the load subcircuit, it is plotted via standard labeling. A resistor satisfies Ohm's law, so the I-V characteristic of the element passes through the origin and possesses slope.

DC-IV plots are supported for the following devices:

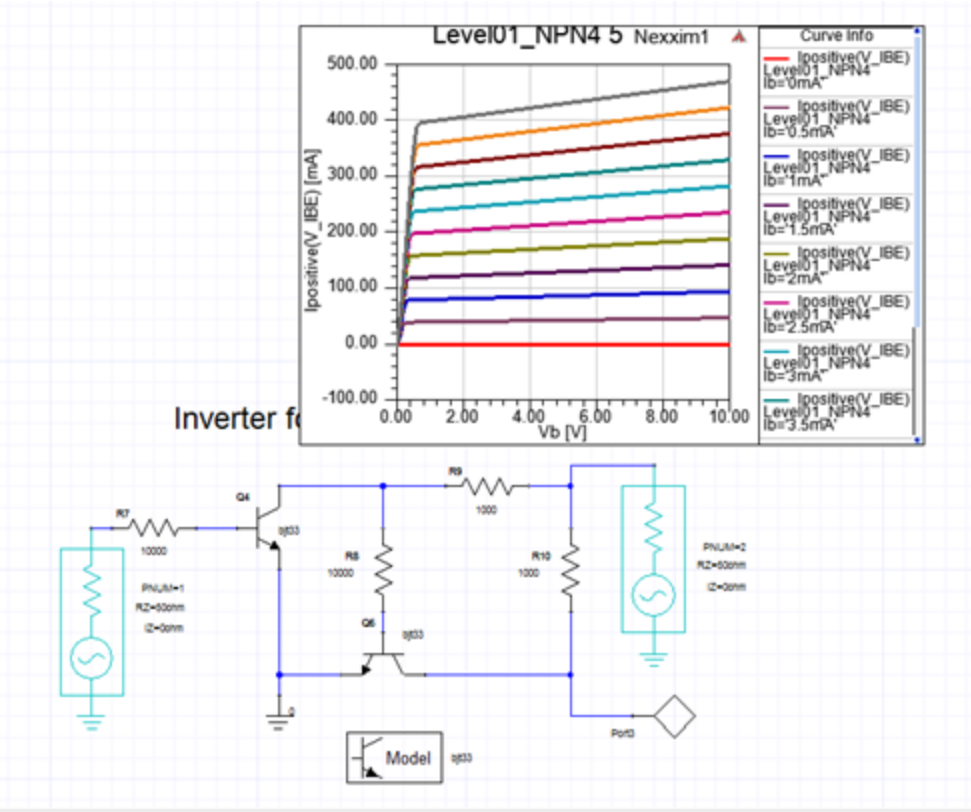
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. BJT NPN
2. BJT PNP
3. BJT NPN 4 Pin with substrate
4. BJT PNP 4 Pin with substrate
5. BJT NPN 4 Pin with heat
6. BJT PNP 4 Pin with heat
7. BJT NPN 5 Pin
8. BJT PNP 5 Pin
9. Diode
10. MOSFET NMOS
11. MOSFET PMOS
12. MOSFET NMOS 4 Pin
13. MOSFET PMOS 4 Pin
14. MOSFET NMOS 5 Pin
15. MOSFET PMOS 5 Pin
16. MESFET NJF
17. MESFET PJF
18. MESFET NJF 4 Pin
19. MESFET PJF 4 Pin
20. JFET NJF
21. JFET PJF
22. GaAsFET NJF
23. GaAsFET PJF

To generate a plot that displays I-V curves:

1. Open a project that contains one of the devices listed above; for example, BJT_inverter.aedt.
2. In the **Schematic Editor**, right-click the BJT device and select **Display IV Curves**. A schematic plot that shows I-V curves is generated and displayed.

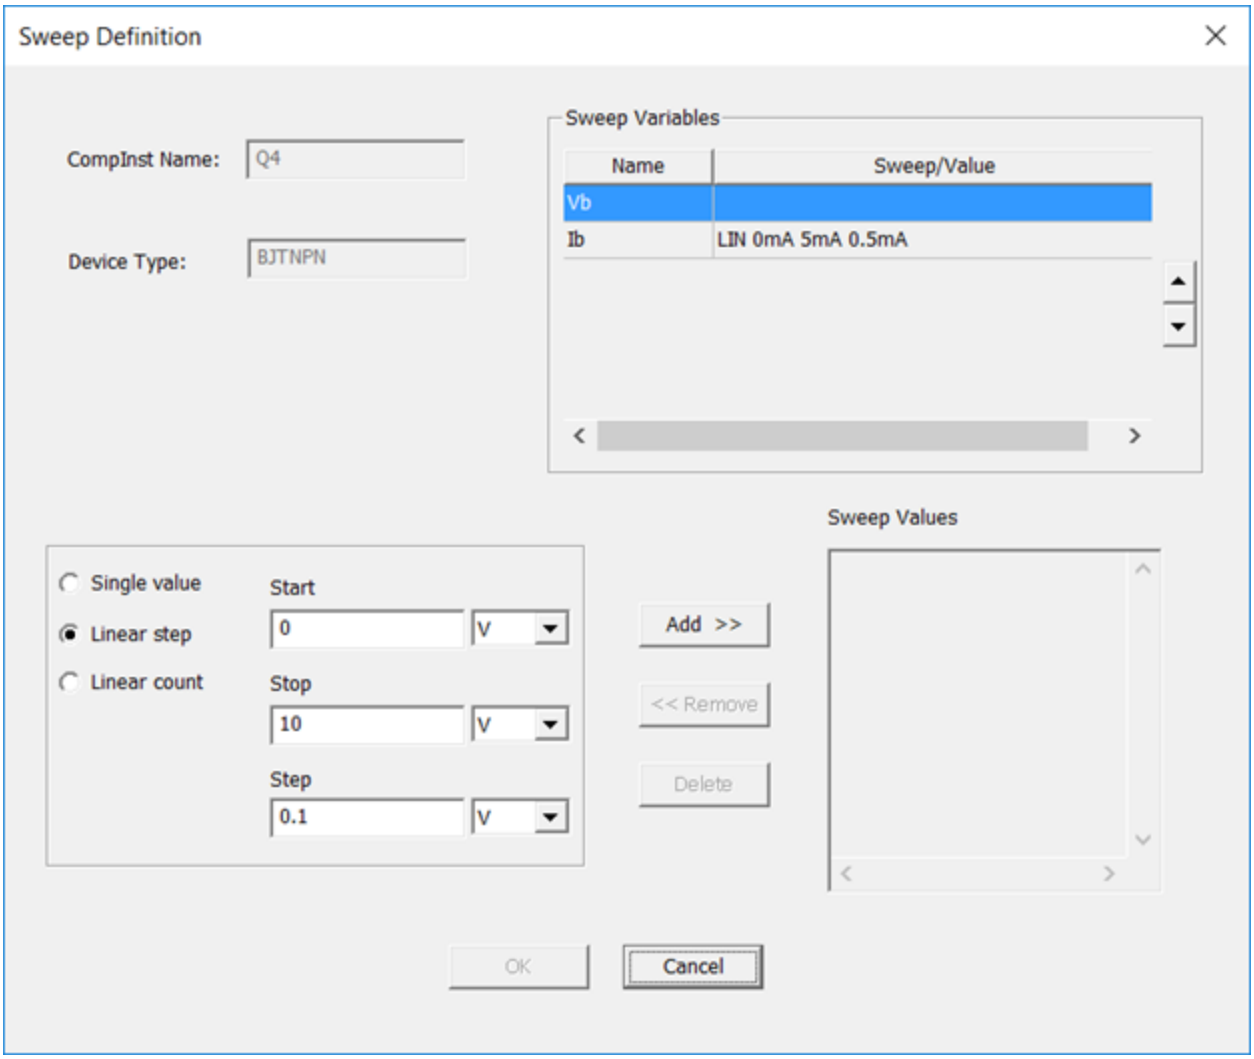
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



A corresponding I-V solution for the device is created beneath **Analysis** in the **Project Manager** window.

3. To modify curves, select the I-V solution in the **Project Manager** window to open the **Sweep Definition** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Sweep Values** pane displays the values of the variable selected in the **Sweep Variables** pane.

— **To add a sweep value**: Select Start, Stop, and Step values at lower-left, then click **Add >>**.
— **To edit a sweep value**: Select a sweep on the Sweep Values list, then click **<< Remove**.
Then modify the Start, Stop, and Step values, then click **Add**.
— **To delete a sweep value**: Select a sweep on the Sweep Values list, then click **Delete**.
This deletes the I-V solution and the corresponding plot.

After making modifications, when you click **OK** the I-V curves are automatically updated.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Transmission Line Designer

The Transmission Line Designer (TRL) is an analysis/synthesis tool for single and coupled transmission lines. The TRL provides:

- window-based data entry
- Analysis results
- Log output for sweep data

The analysis algorithms are shared by the circuit simulator, and synthesis algorithms make use of closed-form equations whenever possible for computation efficiency.

TRL Overview

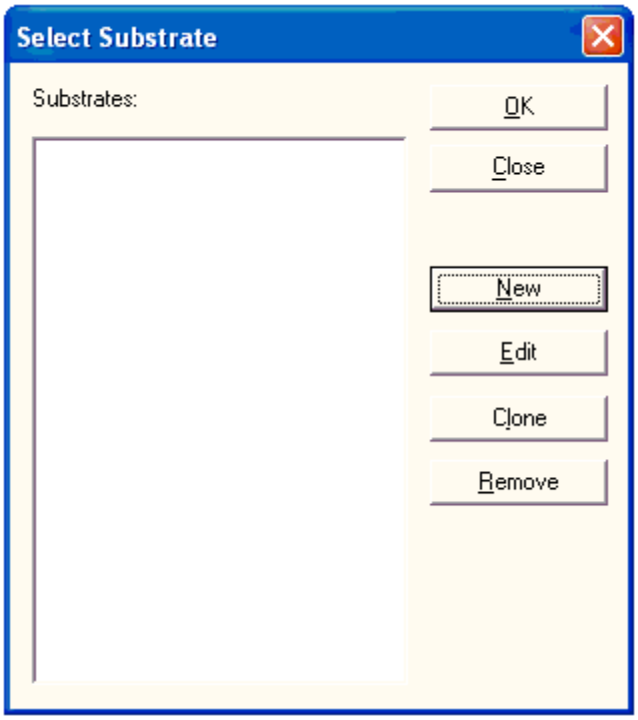
The **TRL** is used to analyze and synthesize single and coupled transmission lines realized in various layered media. In addition, it allows the results for many of these transmission lines to be exported directly to your schematic.

An **Auto Calculate** function allows you to specify whether calculations should be rerun automatically whenever any of the medium values are changed, or only run when you specifically request that synthesis or analysis be run. This feature is implemented for all dimensions and electrical properties of the transmission line, as well as for frequency.

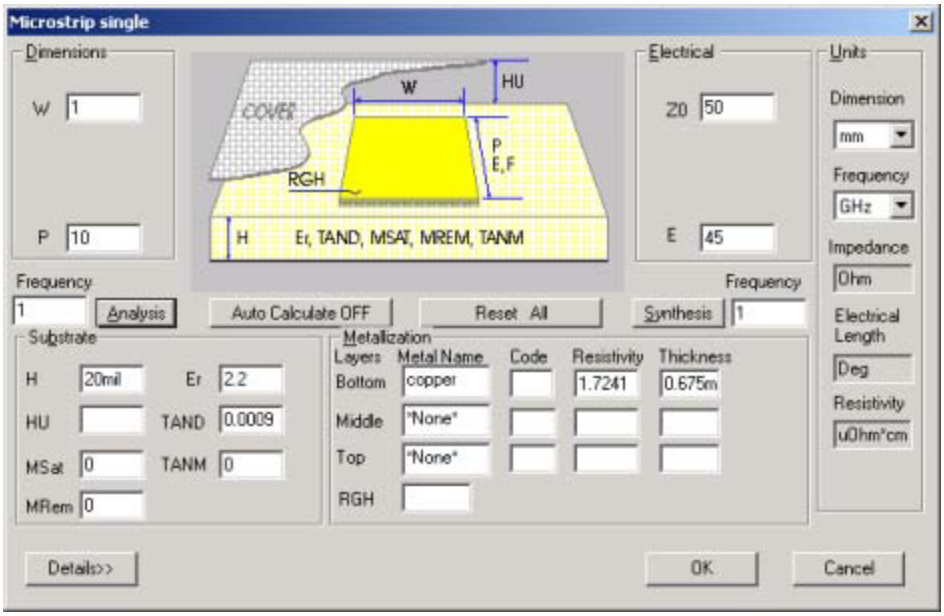
Starting Transmission Line Synthesis

The Transmission Line Designer is run from within a Circuit (Schematic) design, so you must first insert a design before starting the **TRL**. You can insert a design by clicking **Insert Circuit Design** on the **Project** menu. The **Transmission Line Designer** can be started by choosing the appropriate transmission line type under the cascading **TRL** item on the **Circuit** menu. A **Select Substrate** window first appears where choose an existing substrate definition or create a new one.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



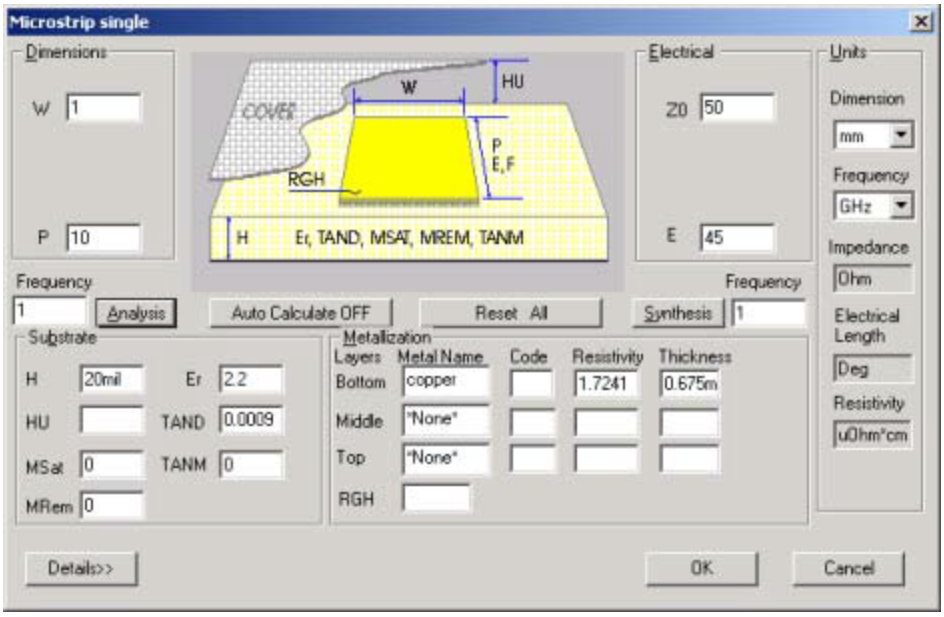
Once a substrate definition is chosen a Transmission Line window similar to the following appears to prompt you through a Transmission Line synthesis session.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Typical TRL window

Choose the appropriate transmission line type and select the substrate to open the main **TRL** window.



The **TRL** window features a menu bar which provides control, medium, and configuration selection. A rendition of the selected transmission line configuration and relevant dimensions is displayed at the center of the window. Dimensions of the line are arranged on the left, electrical parameters on the right. Two identical input boxes are provided for frequency selection; a number entered in one input box instantly appears in the second. Depending upon which box you change and the status of the **Auto Calculate** button, synthesis /analysis may run automatically.

The following window features are available:

- Click **Reset** underneath the picture to reset all data.
- Click **Auto Calculate** underneath the picture to toggle between ON and OFF, which functions as described:

Auto CalculateON – The program automatically runs the calculations each time you update dimensions, electrical parameters or frequency:

- If you change electrical parameters or the number in the **Frequency** group box located next to **Synthesis** , the program performs synthesis of the transmission line.
- If you change dimensions or the number in the **Frequency** group box located next to **Analysis**, the program performs analysis of the transmission line.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Auto CalculateOFF – You must click **Synthesis** or **Analysis** s to run the appropriate calculations after changing values.

- Common data and selections are in the lower right side of the window. The substrate group box has two sub sections for required and optional data.
- The **Units** group box has drop down window boxes for selection of the units for dimensions and frequency and displays the units for Impedance, Electrical length and Resistivity.
- An area is provided for defining metalization parameters. See Conductor Composition for details.
- Sweep results are shown in an output window at bottom, which displays messages on the simulation session. Data that appears in the output window is also stored into the session log file, the name of which is indicated at the beginning of the session.

Exporting Transmission Lines

Once you have designed a transmission line you may click **OK** to export the transmission line to the Ansys HFSS schematic and layout editors, or click **Cancel** to return to HFSS without exporting the transmission line.

Sweep Entries

Line width(s), gap spacing, and frequency may be analyzed over a list of values. This is accomplished by entering three values for the respective parameter: a start value, a stop value, and a step value. These parameters are swept during analysis on the start value to the stop value using the step increments. The following entry example defines a frequency sweep:

1GHZ, 5GHZ, 500MHZ

Or, with GHz selected as a global frequency unit:

1, 5, .5

The results of a sweep analysis are displayed in the output window and are saved in a log file. Physical to electrical length transformation is unavailable during sweep analysis.

Mandatory Entries

Certain data is required for **TRL** simulation. window fields are highlighted if required entries are omitted. The tables given for each medium type indicates which parameters are required.

Some physical dimensions have default values, and these values are described in the Designing Transmission Lines section and are displayed in the **TRL** window output window during analysis.

TRL Capabilities

The complete analysis and synthesis capabilities of **TRL** are summarized in the following topics.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TRL Analysis and Synthesis

The analysis and synthesis capabilities of the **TRL** are summarized in the following tables. The following keywords are used in the various drop-down menus of the **TRL** window to represent the function and medium types that are available.

ANA	analysis
SYN	synthesis
BCL	broadside-coupled lines
OCL	offset-coupled lines
CPL	edge-coupled lines
TRL	single transmission line
ACPL	asymmetric coupled lines

	Single Line	**Coupled Lines**	
Medium	**Capability**	**Keyword**	**Capability**
Microstrip	ANA/SYN	CPL ACPL Lange Coupler Design	ANA/SYN ANA ANA/SYN
Stripline	ANA/SYN	CPL BCL OCL	ANA/SYN ANA/SYN ANA/SYN
Offset Stripline	ANA/SYN		
Suspended substrate	ANA/SYN	CPL	ANA/SYN
Coplanar waveguide	ANA/SYN		
Grounded coplanar waveguide	ANA/SYN		
Coaxial	ANA/SYN		

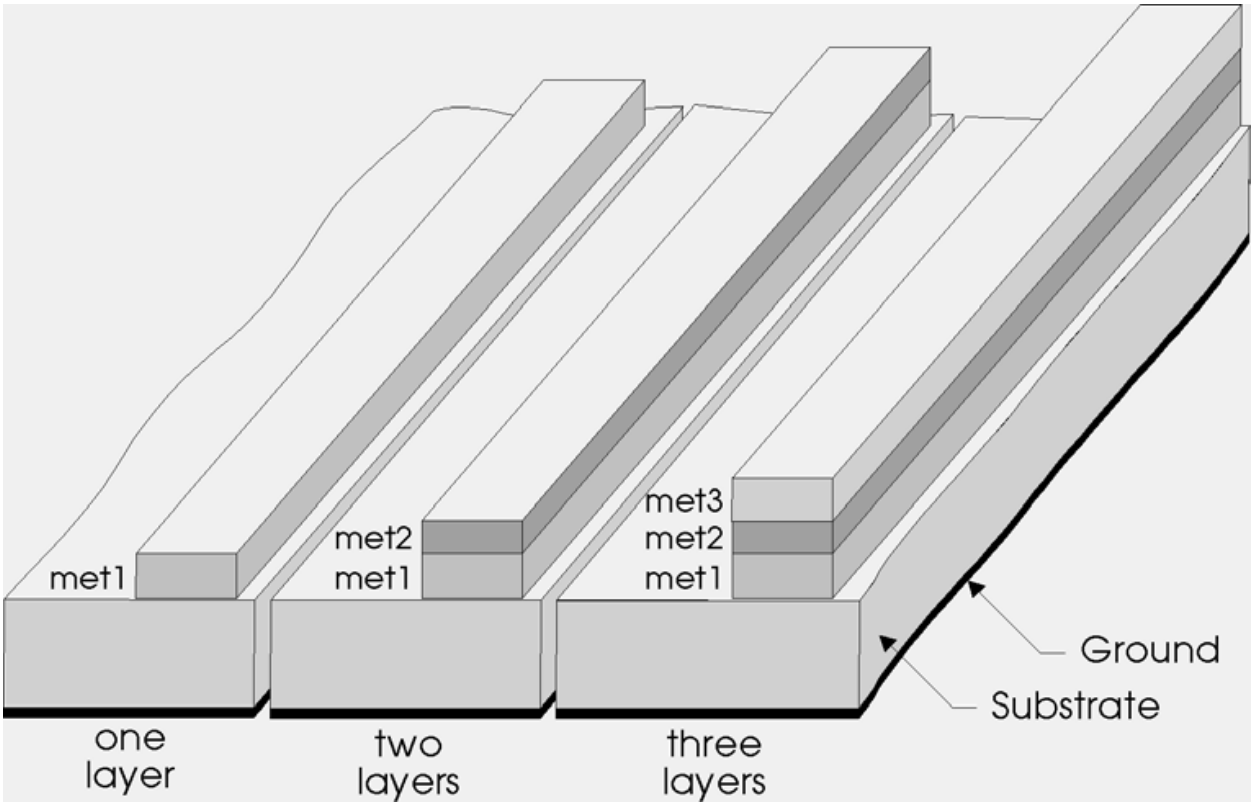
TRL Data log

Both the output window and the log file contain all the relevant data that was used to select and dimension the structure as well as the associated results. The log file is for one session and captures the entries and the result of the calculations for all the opened documents. The log file contains sweep results that are produced when one or more parameters are swept during analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TRL Conductor Composition

Conductor metallizations are selected on the Metalization group in the Main **TRL** window. A blank or selection of **none** corresponds to an ideal conductor with zero thickness. One to three metalization overlay layers can be specified by selecting the metal types and thickness.



METAL CODES AND RESISTIVITIES TABLE

Material	Metal Code	Resistivity (μΩ * cm)	Material	Metal Code	Resistivity (μΩ * cm)
aluminum	AL	2.65	rhodium	RH	4.51
chromium	CR	18 **	rolled copper	RC	1.673 ***
copper	CU	1.673	silver	AG	1.59
gold	AU	2.44 *	superconductor	SC	0
indium	IN	15.52	tantalum	TA	15.52
iridium	IR	5.30	tantalum nitride	TN	2.50
iron	FE	9.66	tin	SN	11.55
magnesium	MG	4.45	titanium	TI	55.0
molybdenum	MO	5.69	tungsten	W	5.6

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

nickel	NI	8.707	zinc	ZN	5.68
palladium	PD	10.69	zirconium	ZR	4.10
platinum	PT	10.62			

* Resistivity correction is applied when the metalization thickness is less than 0.03 μm.

** Resistivity correction is applied when the thickness is less than 0.1 μm.

*** Thickness of rolled copper is given in ounces of copper (1 oz = 0.00135 in).

> **Note:**
>
> If metalization material is specified but the conductor thickness is not, the conductor loss is zero.

Metalization surface roughness, **RGH**, can be specified for additional conductor loss calculations due to a nonideal metal surface. **RGH** is specified as the **RMS** variation from an ideal flat surface (in units of dimensions). **RGH** appears in each medium's **Metalization** control group as appropriate.

TRL Calculation Between Physical Length and Electrical Length

For each medium, TRL can compute physical length (**P)** from electrical length (**E)** for the transmission line if the **Frequency** is given. The reverse calculation is also possible. To compute **P**, enter the value for **E** and **Frequency** and click **Synthesize**. The **TRL** uses the effective dielectric constant to compute the transmission line length from **E** at **Frequency**. With a coupled line, the average of the effective dielectric constants for the even and odd mode is used. Similarly, to compute **E**, enter values for **P** and **Frequency** and click **Analysis**.

Designing Transmission Lines

The following transmission lines are available.

TRL Microstrip Transmission Line

TRL Edge-Coupled Symmetric Microstrip Transmission Lines

TRL Edge-Coupled Asymmetric Microstrip Transmission Lines

TRL Lange Coupler

TRL Stripline Transmission Line

TRL Edge-Coupled Stripline Transmission Lines

TRL Broadside-Coupled Stripline Transmission Lines

TRL Offset Stripline Transmission Line

TRL Suspended Stripline Transmission Line

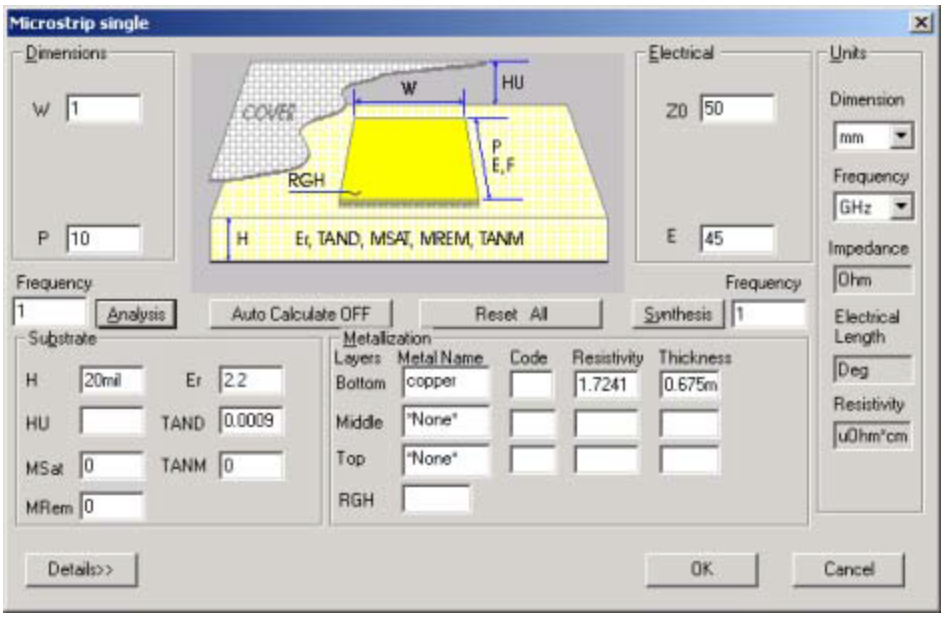
TRL Edge-Coupled Suspended Stripline Transmission Lines

TRL Coplanar Waveguide

TRL Grounded Coplanar Waveguide

TRL Coaxial Cable

TRL Microstrip Transmission Line



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width
P	0	m	Physical length of transmission line
Z0	Req (Elec)	ohm	Transmission line impedance
E	0	deg	Electrical length of transmission line
Frequency	0	Hz	Analysis frequency
ER	Req		Relative dielectric constant
H	Req	m	Substrate thickness
HU	40*H	m	Cover height above substrate (default value has negligible effect)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness
MSAT	0	Gauss	Saturation magnetization (4πMs)
MREM	0	Gauss	Remnant magnetization (4πMr)
TANM	0		Magnetic loss tangent

Synthesis and Analysis

- For synthesis of microstrip transmission lines, the parameters **Z0**, **H**, and **ER** must be entered prior to clicking **Synthesis**. The width, **W**, is computed.
- For analysis, the parameters **W**, **H**, and **ER** must be entered prior to clicking **Analysis**. The impedance, **Z0**, is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **H**, **ER**, and **TAND**. The substrate is assumed lossless unless **TAND** is specified and greater than zero.

Magnetic Substrates

- A magnetic substrate is defined when the **MSAT** and **MREM** parameters are given. The demagnetized substrate case occurs when **MSAT** > 0 and **MREM** = 0 (default). The partially magnetized substrate (including the fully magnetized, saturated, or latched substrate case) occurs when **MSAT** and **MREM** > 0, but **MREM** ≤**MSAT**.
- The direction of magnetic bias is assumed to be in the direction of wave propagation; that is, perpendicular to the transverse field.
- The magnetic loss tangent, **TANM**, can be specified to account for losses in the magnetic substrate. It is similar to the dielectric loss tangent, **TAND**, and its loss is added to find the total loss of the substrate.
- The minimum frequency of analysis must be greater than the gyromagnetic frequency:
- $f > 2.8\ (\text{MHz/Gauss}) \times \text{MSAT (Gauss)}$
- where the constant of 2.8 MHz/Gauss comes from the gyromagnetic ratio ($\gamma/2\pi$).
- References 23-25 document propagation on magnetic substrates. In particular, the formulations by Pucel and Massé have been utilized in the program.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

line's propagation characteristics. Up to three conductors of different metal and different thickness can be specified.

- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for the microstrip transmission line are:

Frequency
Width, **W**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

To maintain accuracy, the following limitations should be followed:

$0.01 \leq W/H \leq 100$

$1 \leq \varepsilon r \leq 128$

$$F(GHz) \cdot H(mm) \leq 39$$

Example

To select the microstrip transmission line medium, select **TRL** on the **Product** menu, select **Microstrip**, and click **Single**. Select the units mm and GHz. Enter the following parameters for synthesis and analysis of the transmission line:

Line impedance, **Z0**: 50 ohms

Substrate thickness, **H**: 0.635 mm

Dielectric constant, **ER**: 9.8

Metal: CU 0.01 mm

Loss tangent, **TAND**: 0.0001

Click **Synthesis** to determine the width of the line:

Width: 0.605 mm

The output that scrolls in the lower window includes the effective dielectric constant, **Keff**, which is this case is computed as 6.4762.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Next, click **Analysis** to sweep the frequency from 0 to 30 GHz in steps of 2 GHz. Enter the sweep by typing **0,30,2** in the **Frequency** group box. The results of the swept-frequency analysis are as follows:

Single Line in Microstrip

Metals: 1.67 0.0100mm

H = 0.635mm ER = 9.80 TAND = 0.00010 T/H = 0.0157

30.0	0.605	0.953	57.34	7.750	0.0007	0.0061	0.0068

Using this sweep analysis, determine how the impedance and **Keff** change with frequency, and the change in dielectric loss (**D Loss**), conductor loss (**C Loss**) and the total loss (**T Loss**) vary with frequency. At 0 GHz, the results reproduce the synthesized impedance of 50 ohms, and this impedance then rises at higher frequencies.

To convert from electrical length to physical length, enter the electrical length and the frequency:

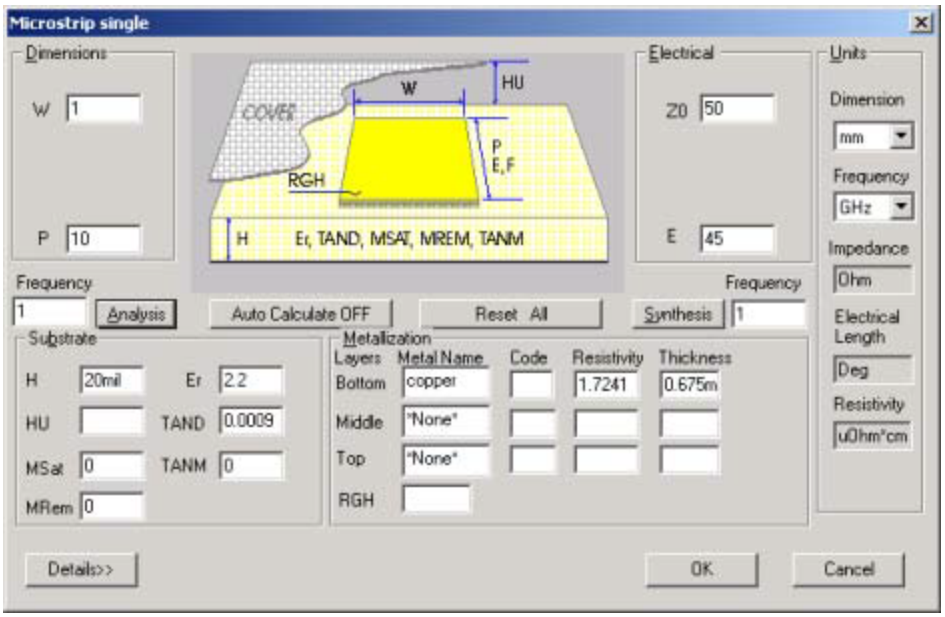
E: 45 degrees
Frequency: 10 GHz

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click **Synthesis**. Since the frequency is now set to 10 GHz, a new width is calculated to maintain an impedance of 50 ohms. The equivalent physical length is also computed:

W: 0.617 mm
P: 1.432 mm

Edge-Coupled Symmetric Microstrip Transmission Lines



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width
S	Req (Phys)	m	Spacing between conductors
P	0	m	Physical length of transmission line
Z0	Req (Elec Opt 1)	ohm	Impedance of the coupled lines
K	Req (Elec Opt 1)	dB	Coupling coefficient (positive)
Zo	Req (Elec Opt 2)	ohm	Odd-mode impedance of the coupled lines
Ze	Req (Elec Opt 2)	ohm	Even-mode impedance of the coupled lines
E	0	deg	Electrical length of the coupled lines
Frequency	0	Hz	Analysis frequency
ER	Required		Relative dielectric constant

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

H	Required	m	Substrate thickness
HU	40*H	m	Cover height above substrate (default value has negligible effect)
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Synthesis and Analysis

Two options exist for the synthesis of coupled microstrip transmission lines:

— Specify impedance, **Z0**, and coupling coefficient, **K**.

— Specify even-mode impedance, **Ze,** and odd-mode impedance, **Zo**.

- The substrate parameters **H**, and **ER** must be entered prior to clicking **Synthesis**. The width of the microstrip lines, **W**, and the spacing between them, **S**, is computed. Also, the alternate electrical option set is computed. For example, entering **Z0** and **K** computes **Ze** and **Zo**.
- For analysis, the parameters **W**, **S**, **H**, and **ER** must be entered prior to clicking **Analysis**. The electrical properties, **Z0**, **K**, **Zo**, and **Ze** is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and the frequency, **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **H**, **ER**, and **TAND**. The substrate is assumed lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the propagation characteristics. Up to three conductors of different metals and thicknesses can be specified.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for the coupled microstrip transmission lines are:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Frequency
Width, **W**
Spacing, **S**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the **Sweep Entries** topic for further information.

Limitations

To maintain accuracy, the following limitations should be followed:

$0.01 \leq W/H \leq 100$

$1 \leq \varepsilon r \leq 128$

$$F(GHz) \cdot H(mm) \leq 39$$

Example

To select the coupled microstrip medium, select **TRL** on the **Product** menu, select **Microstrip**, and click **CPL**. Set the units to **mm** and **GHz**. Enter the following parameters for synthesizing a 6-dB coupler at 10 GHz:

Impedance, **Z0**: 50 ohms

Coupling, **K**: 6 dB

Frequency: 10 GHz

Substrate thickness, **H**: 0.635 mm

Dielectric constant, **ER**: 9.8

Metal: Cu 0.01 mm

Click Synthesis to determine the coupler parameters:

Width, **W**: 0.369 mm

Spacing, **S**: 0.055 mm

Odd-mode impedance, **Zo**: 28.82 ohms

Odd-mode **Keff**: 5.46

Even-mode impedance, **Ze**: 86.74 ohms

Even-mode **Keff**: 7.08

To specify a 1/4 wavelength line, enter:

Electrical length, **E**: 90

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click Synthesis again to determine the physical length:

Physical length, **P**: 2.99 mm
Notice that the average **Keff** for the even and odd modes is used in the calculation.

To perform a sweep analysis of the conductor spacing, type in:

Spacing, **S**: 0.03, 0.06, 0.01 mm

by typing **(0.03 0.06 0.01**); the space bar inserts a comma and indicate that a sweep is appropriate. Click **Analysis** to get the following results:

Coupled Lines in Microstrip

H = 0.635mm ER = 9.80 TAND = 0.00000 T/H = 0.0157

						Loss (dB/mm)

HU	40***H**	m	Cover height above substrate (default value has negligible effect)
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Analysis

- For analysis, the parameters **W1**, **W2**, **S**, **H**, and **ER** must be entered prior to clicking **Analysis**. The electrical properties, **Zc1**, **Zc2**, **Zp1**, **Zp2** is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**. The average effective dielectric constant computed at **Frequency** is used for the calculation.

Dielectric Substrates

A dielectric substrate is defined by the parameters **H**, **ER**, and **TAND**. The substrate is assumed lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the propagation characteristics. Up to three conductors of different metal and different thickness can be selected.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for the asymmetric coupled microstrip transmission lines are:

Frequency
Spacing, **S**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

To maintain accuracy, the following limitations should be followed:

$0.01 \leq W/H \leq 100$

$1 \leq \varepsilon r \leq 128$

$0.1 < S/H < 10.0$

Example

To select the asymmetric coupled microstrip medium, select **TRL** on the **Product** menu, select **Microstrip**, and click **ACPL**. Set the units to **mm** and **GHz**. Enter the following parameters to analyze an ACPL (synthesis is not implemented for ACPL):

Spacing, **S**: 0.1 mm

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Width of line 1, **W1**: 0.2 mm

Width of line 2, **W2**: 0.3 mm

Substrate height, **H**: 0.635 mm

Dielectric constant, **ER**: 9.8

Frequency: 10 GHz

Click **Analysis** to determine the coupled line parameters:

c-mode impedance of line 1, Zc1: 115.97 ohms

c-mode impedance of line 2, Zc2: 93.12 ohms

π-mode impedance of line 1, Zp1: 44.17 ohms

π-mode impedance of line 2, Zp2: 35.47 ohms

c-mode effective ER, Effc: 6.768

π-mode effective ER, Effp: 5.531

Synthesis and Analysis

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Synthesis of a Lange coupler proceeds by first selecting the number of strips for the appropriate structure. Two options exist for synthesis:

— Specify impedance, **Z0**, and the coupling coefficient, **K**.

— Specify the even-mode impedance, **Ze**, and the odd-mode impedance, **Zo**.

- The substrate parameters **H**, and **ER** must be entered prior to clicking **Synthesis**. The width of the strips, **Width**, and the spacing between them, **Spacing**, is computed. Also, the alternate electrical option set is computed. For example, entering **Z0** and **K** computes **Ze** and **Zo**.
- For analysis, the parameters **Width**, **Spacing**, **H**, **ER** and either **PhysicalLength** or **Frequency** must be entered prior to clicking **Analysis**. The electrical properties, **Z0**, **K**, **Zo**, and **Ze** is computed.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering a value for **E** and the frequency, **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency** and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **H**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

The default conductor used for analysis is gold whose resistivity is 2.44 mohm-cm. The thickness of the metal can be specified using the **Thick** parameter in the substrate group. The calculation uses the thickness for loss and impedance calculations.

Frequency Sweep Options

A frequency sweep can be performed to determine the response of the coupler over frequency. Type *Start Stop Step* (e.g., **4 6 5**) and click **Analysis**.

Example

To select the Lange coupler, select **TRL** on the **Product** menu, select **Microstrip**, and click **Lange Coupler**. Set the units to **mil** and **GHz**. Enter the following parameters for synthesizing a 4 strip, 3-dB coupler at 10 GHz:

Number of Strips, **N**:	4
Impedance, Z0:	50 ohms
Coupling, K:	3 dB
Center Frequency:	10 GHz
Substrate thickness, H:	25 mil
Dielectric constant, ER:	10

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Metal Thickness, Thick: 0.2 mil

Click **Synthesis** to determine the coupled line parameters:

Width, **W**	1.6545 mil
Spacing, S	2.0000 mil
Odd-mode impedance, Zo:	20.68 ohms
Even-mode impedance, Ze:	120.91 ohms

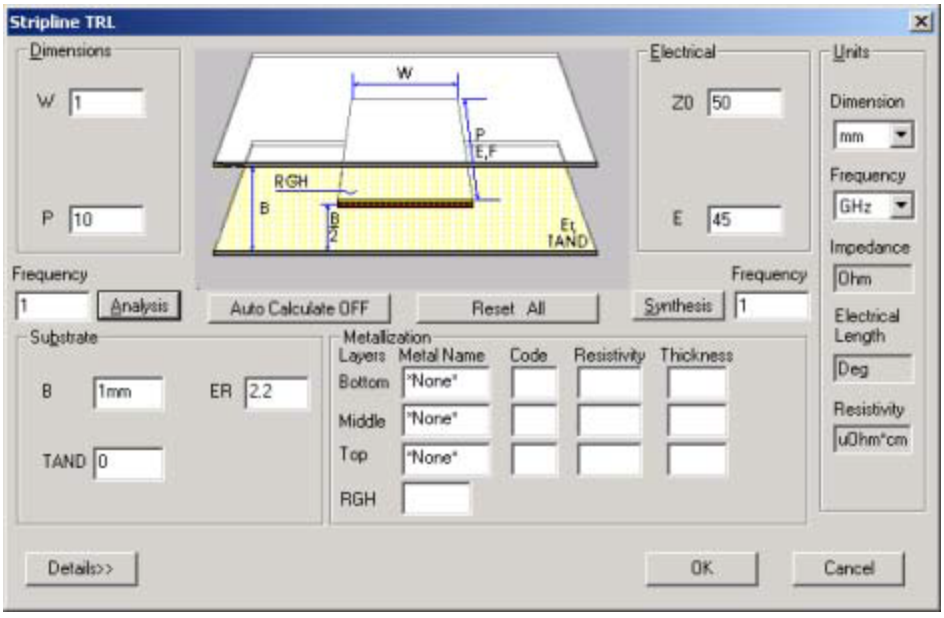
Electrical Length [Eeff=(Effo+Effe)/2] = 35.78 deg

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TRL Stripline Transmission Line



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width
P	0	m	Physical length of transmission line
Z0	Req (Elec)	ohm	Transmission line impedance
E	0	deg	Electrical length of transmission line
Frequency	0	Hz	Analysis frequency
ER	Req		Relative dielectric constant
B	Req	m	Substrate thickness
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Synthesis and Analysis

- For synthesis of stripline transmission lines, the parameters **Z0**, **B**, and **ER** must be entered prior to clicking **Synthesis**. The width, **W**, is computed.
- For analysis, the parameters **W**, **B**, and **ER** must be entered prior to clicking **Analysis**. The impedance, **Z0**, is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **B**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the line's propagation characteristics. Up to three conductors of different metals and thicknesses can be specified.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for the stripline transmission line are:

Frequency
Width, W

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

Error less than 0.5% for **W/B** < 10.

Example

To select the stripline medium, pull down the **Structure** menu, select **Stripline**, and click **Single**. Set the units to **mm** and **GHz**. Enter the following parameters to synthesize a stripline:

Impedance, **Z0**: 50 ohms

Dielectric constant, **ER**: 2.2

Substrate thickness, **B**: 1.27 mm

Click **Synthesis** to determine the width, W, of the transmission line:

Width, **W**: 1.05 mm

Since stripline is a TEM structure and does not vary with frequency, perform a sweep analysis on the width of the strip instead. Type **0.5, 3.0, 0.5** into the **W** group box to sweep the line's width from 0.5 mm to 3.0 mm in steps of 0.5 mm. Be sure to supply information on the line's metalization and losses:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Metal: Cu 0.01 mm

TAND: 0.001

Clicking Analysis yields the following:

Single Stripline

B = 1.270mm ER = 2.20 TAND = 0.00100 T/B = 0.0079

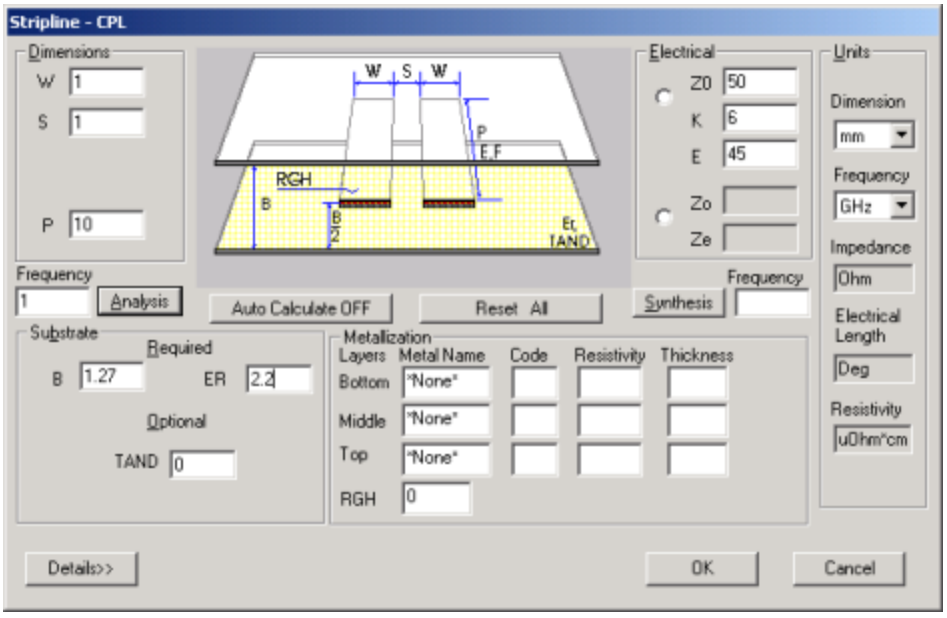
TRL Edge-Coupled Stripline Transmission Lines



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width
S	Req (Phys)	m	Spacing between conductors
P	0	m	Physical length of transmission line
Z0	Req (Elec,Opt 1)	ohm	Impedance of the coupled lines
K	Req (Elec,Opt 1)	dB	Coupling coefficient (positive)
Zo	Req (Elec,Opt 2)	ohm	Odd-mode impedance of the coupled lines
Ze	Req (Elec,Opt 2)	ohm	Even-mode impedance of the coupled lines
E	0	deg	Electrical length of the coupled lines
Frequency	0	Hz	Analysis frequency
ER	Required		Relative dielectric constant
B	Required	m	Substrate thickness
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Synthesis and Analysis

Two options exist for synthesis of edge-coupled stripline transmission lines:

— Specify impedance, **Z0**, and the coupling coefficient, **K**.

— Specify the even-mode impedance, **Ze**, and the odd-mode impedance, **Zo**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The substrate parameters **B**, and **ER** must be entered prior to clicking **Synthesis**. The width of the striplines, **W**, and the spacing between them, **S**, is computed. Also, the alternate electrical option set is computed. For example, entering **Z0** and **K** computes **Ze** and **Zo**.
- For analysis, the parameters **W**, **S**, **B**, and **ER** must be entered prior to clicking **Analysis**. The electrical properties, **Z0**, **K**, **Zo**, and **Ze** is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency,** and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **B**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the propagation characteristics. Up to three conductors of different metals and thicknesses can be specified.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for edge-coupled stripline are:

Frequency
Width, **W**
Spacing, **S**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See *Sweep Entries* topic for further information.

Limitations

To maintain accuracy, the following limitation should be followed:

T /**B** < 0.1, where **T** is the metal thickness

Example

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To select the edge-coupled stripline medium, select **TRL** on the **Product** menu, select **Stripline**, and click **CPL**. Set the units to **mm** and **GHz**. Enter the following parameters to synthesize a 6-dB coupler at 10 GHz:

Impedance, **Z0**: 50 ohms

Coupling, **K**: 6 dB

Frequency: 10 GHz

Substrate thickness, **B**: 1.27 mm

Dielectric constant, **ER**: 2.2

Metal: Cu 0.01 mm

Click **Synthesis** to determine the coupled line's parameters:

Width, **W**: 0.625 mm

Spacing, **S**: 0.019 mm

Odd-mode impedance, **Zo**: 28.82 ohms

Even-mode impedance, **Ze**: 86.74 ohms

To specify a 1/4 wavelength line, enter:

Electrical length, **E**: 90

Click Synthesis again to determine the physical length:

Physical length, **P**: 5.05 mm

A sweep analysis can be performed on **W**, **S**, or **Frequency**. To perform a sweep analysis on **W**, type **0.3,0.7,0.05** in the **W** field to specify a sweep from 0.3 mm to 0.7 mm in steps of 0.05 mm. Clicking **Analysis** then yields the following results:

Coplanar Coupled Strip Lines

B = 1.270mm ER = 2.20 TAND = 0.00000 T/B = 0.0079

Freq S/B W/B ZE ZO Cond + Diel Loss (dB/mm)

ghz Ohms Ohms Even Mode Odd Mode

B	Required	m	Substrate thickness
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Synthesis and Analysis

Two options exist for synthesis of broadside-coupled stripline transmission lines:

— Specify impedance, **Z0**, and the coupling coefficient, **K**.

— Specify even-mode impedance, **Ze**, and odd-mode impedance, **Zo**.

- The substrate parameters **B**, and **ER** must be entered prior to clicking **Synthesis**. The width of the striplines, **W**, and the spacing between them, **S**, is computed. Also, the alternate electrical option set is computed. For example, entering **Z0** and **K** computes **Ze** and **Zo**.
- For analysis, the parameters **W**, **S**, **B**, and **ER** must be entered prior to clicking **Analysis**. The electrical properties, **Z0**, **K**, **Zo**, and **Ze** is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **B**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the structure's propagation characteristics. Up to three conductors of different metals and thicknesses can be specified.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for the broadside-coupled striplines are:

Frequency
Width, **W**
Spacing, **S**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the topic on *Sweep Entries* for further information.

Limitations

To maintain accuracy, the following limitations should be followed:

$$\frac{W}{B} \geq 0.35$$

and

$$\frac{\frac{W}{B}}{1-\frac{S}{B}} \geq 0.35$$

Example

To select the broadside-coupled stripline medium, select **TRL** on the **Product** menu, select **Stripline**, and click **BCL**. Set the units to **mm** and **GHz** and enter the following parameters to synthesize a 6-dB coupler at 10 GHz:

Impedance, **Z0**: 50 ohms

Coupling, **K**: 6 dB

Frequency: 10 GHz

Substrate thickness, **B**: 1.27 mm

Dielectric constant, **ER**: 2.2

Metal: Cu 0.01 mm

Click **Synthesis** to determine the coupler's parameters:

Width, **W**: 0.764 mm

Spacing, **S**: 0.294 mm

Odd-mode impedance, **Zo**: 28.82 ohms

Even-mode impedance, **Ze**: 86.74 ohms

To specify a 1/4 wavelength line, enter:

Electrical length, **E**: 90

Click Synthesis again to determine the line's physical length:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Physical length, **P**: 5.05 mm

A sweep analysis can be performed on **W**, **S**, or **Frequency**. To perform a sweep analysis on **W**, type **0.5,1.0,0.05** in the **W** field to specify a sweep from 0.5 mm to 1.0 mm in steps of 0.05 mm. Clicking **Analysis** then yields the following results:

Broadside Coupled Strip Lines

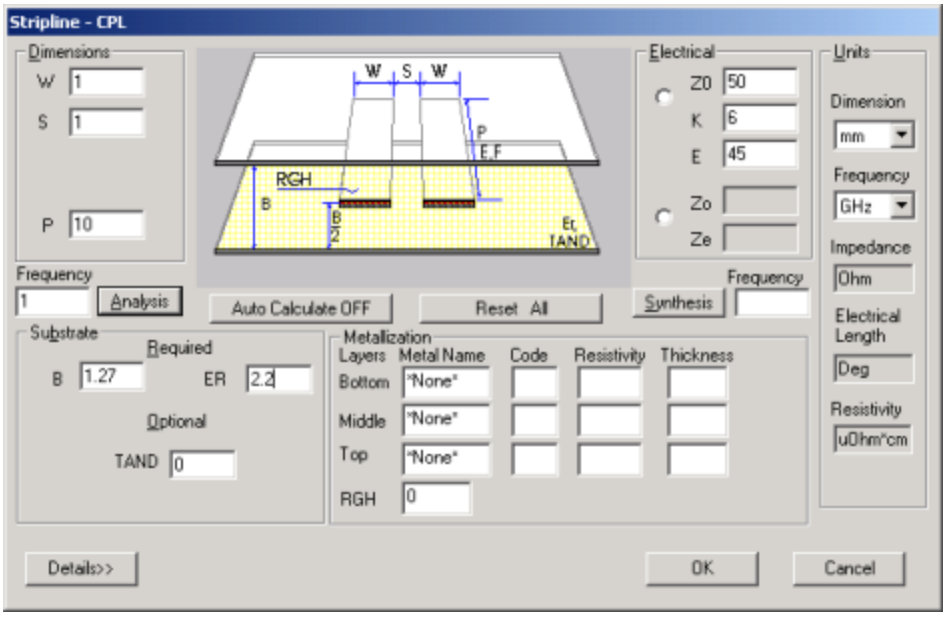
10.0 0.234 0.787 74.3 23.3 0.0010 0.0037

The variation of impedance and loss with conductor width is readily apparent.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TRL Suspended Stripline Transmission Line



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width
P	0	m	Physical length of transmission line
Z0	Req (Elec)	ohm	Transmission line impedance
E	0	deg	Electrical length of transmission line
Frequency	100 MHz	Hz	Analysis frequency
ER	Req		Relative dielectric constant
H	Req	m	Substrate thickness
HL	Req	m	Distance between bottom of substrate and ground
HU	Req	m	Cover height above substrate
A	inf.	m	Width between sidewalls
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Synthesis and Analysis

- To synthesize suspended substrate transmission lines, the parameters **Z0**, **H**, **HU**, **HL**, **A** and **ER** must be entered prior to clicking **Synthesis**. The width, **W**, is computed.
- For analysis, the parameters **W**, **H**, **HL**, **HU** and **ER** must be entered prior to clicking **Analysis**. The **A** parameter is assumed to be infinity. The impedance, **Z0**, is computed. The frequency is used if entered; otherwise, 100 MHz is used in the calculation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **H**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the structure's propagation characteristics. Up to three conductors of different metals and thicknesses can be specified.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for the suspended substrate transmission line are:

Frequency
Width, **W**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

Full-wave analysis is used; there are no limitations for practical dimensions.

Example

To select the suspended substrate medium, select **TRL** on the **Product** menu, select **Stripline**, and click **Single**. Set the units to **mm** and **GHz**. Enter the following parameters for synthesizing a 50-ohm transmission line:

Impedance, **Z0**: 50 ohms

Frequency: 10 GHz

Substrate thickness, **H**: 0.635mm

Lower height, **HL**: 1.0 mm

Upper height, **HU**: 1.0 mm

Sidewall width, **A**: 10.0 mm

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Dielectric constant, **ER**: 9.8

Dielectric loss, **TAND**: 0.001

Metal: Cu 0.01 mm

Click **Synthesis** to determine the line's parameters:

Width, **W**: 1.79 mm

Keff: 2.25

Note that the impedance has changed slightly to 49.6 ohms. This is due to the synthesis being approximate for this medium

To specify a 1/4 wavelength line, enter:

Electrical length, **E**: 90

Click Synthesis again to determine the corresponding physical length:

Physical length, **P**: 5.0 mm

The dispersion of the medium can be observed by sweeping frequency. Sweep from 0 to 30 GHz in steps of 2 GHz by typing **0.1,30,2** in the **Frequency** field.

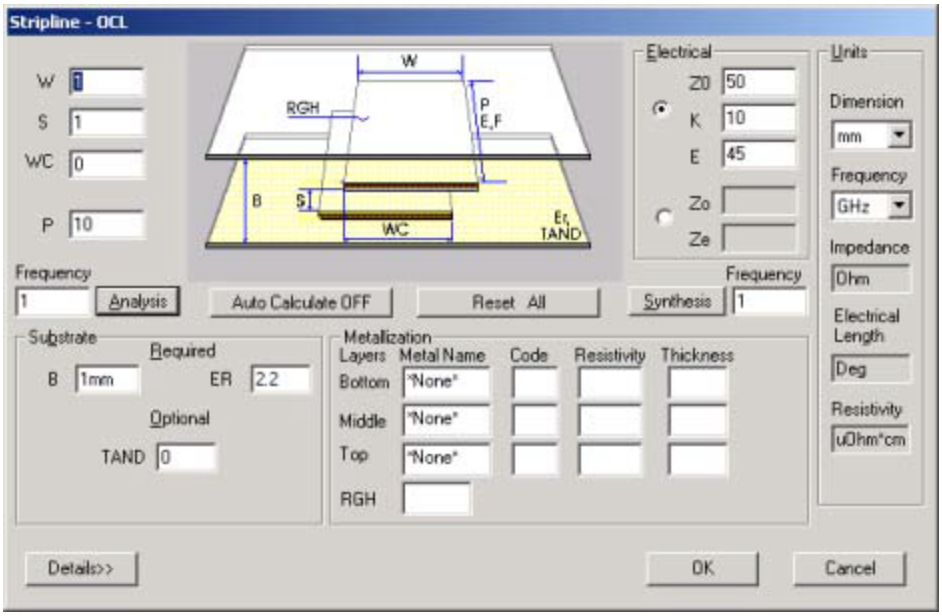
TRL Offset-Coupled Stripline Transmission Lines



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width
S	Req (Phys)	m	Spacing between conductors
WC	0	m	Conductor offset
P	0	m	Physical length of transmission line
Z0	Req (Elec, Opt 1)	ohm	Impedance of the coupled lines
K	Req (Elec, Opt 1)	dB	Coupling coefficient (positive)
Zo	Req (Elec, Opt 2)	ohm	Odd-mode impedance of the coupled lines
Ze	Req (Elec, Opt 2)	ohm	Even-mode impedance of the coupled lines
E	0	deg	Electrical length of the coupled lines
Frequency	0	Hz	Analysis frequency
ER	Required		Relative dielectric constant

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B	Required	m	Substrate thickness
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Synthesis and Analysis

Two options exist for synthesis of offset-coupled stripline transmission lines:

— Specify impedance, **Z0**, and the coupling coefficient, **K**.

— Specify even-mode impedance, **Ze**, and odd-mode impedance, **Zo**.

- The conductor spacing, **S**, and substrate parameters **B**, and **ER** must be entered prior to clicking **Synthesis**. The width of the striplines, **W**, and the offset between the lines, **WC**, is computed. Also, the alternate electrical option set is computed. For example, entering **Z0** and **K** computes **Ze** and **Zo**.
- For analysis, the parameters **W**, **S**, **B**, and **ER** must be entered prior to clicking **Analysis**. **WC** can also be entered, but defaults to 0. The electrical properties, **Z0**, **K**, **Zo**, and **Ze** is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency** and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **B**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the structure's propagation characteristics. Up to three conductors of different metals and thickness can be specified.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for coupled offset stripline are:

Frequency
Width, **W**
Spacing, **S**
Offset, **WC**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

The approximate limitations on strip dimensions are:

(1) **Tight coupling case** (when the two strips overlap, **WC** > 0):

$$\frac{W}{B-S} \geq 0.35$$

and

$$\frac{WC}{S} \geq 0.7$$

(2) **Loose coupling case** (when the two strips do not overlap, **WC** < 0):

$$\frac{W}{B-S} \geq 0.35$$

and

$$\frac{2(W-WC)}{B+S} \geq 0.85$$

Analyzing very loose coupling (e.g., coupling < 36 dB) requires a large number of iterations and the results may not be accurate. Synthesis, however, is accurate.

Example

To select the offset-coupled stripline medium, select **TRL** on the **Product** menu, select **Stripline**, and click **OCL**. Set the units to **mm** and **GHz**. Enter the following parameters to synthesize a 6-dB coupler at 10 GHz:

Impedance, **Z0**: 50 ohms

Coupling, **K**: 6 dB

Frequency: 10 GHz

Substrate thickness, **B**: 1.27 mm

Dielectric constant, **ER**: 2.2

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Metal: Cu 0.01 mm

Spacing, **S**: 0.2 mm

Click **Synthesis** to determine the coupler's parameters:

Width, **W**: 0.728 mm

Offset, **WC**: 0.324 mm

Odd-mode impedance, **Zo**: 28.82 ohms

Even-mode impedance, **Ze**: 86.74 ohms

To specify a 1/4 wavelength line, enter:

Electrical length, **E**: 90

Click Synthesis again to determine the corresponding physical length:

Physical length, **P**: 5.05 mm

A sweep analysis can be performed on **W**, **S**, **WC**, or **Frequency**. To perform a sweep analysis on **W**, type **1,1.5,0.05** in the **W** field to specify a sweep from 1.0 mm to 1.5 mm in steps of 0.05 mm. Clicking **Analysis** then yields following results:

Offset Parallel Coupled Strip Lines

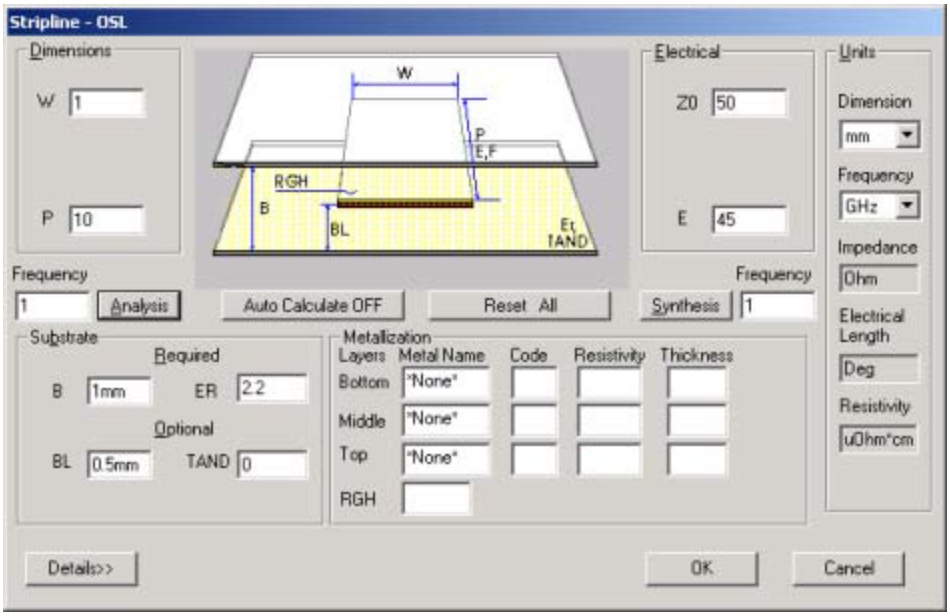
TRL Offset Stripline Transmission Line



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width
P	0	m	Physical length of transmission line
Z0	Req (Elec)	ohm	Transmission line impedance
E	0	deg	Electrical length of transmission line
Frequency	0	Hz	Analysis frequency
ER	Req		Relative dielectric constant
B	Req	m	Substrate thickness
BL	Req	m	Offset spacing
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Synthesis and Analysis

- To synthesize offset stripline transmission lines, the parameters **Z0**, **B**, **BL,** and **ER** must be entered prior to clicking **Synthesis**. The width, **W**, is computed.
- For analysis, the parameters **W**, **B**, **BL**, and **ER** must be entered prior to clicking **Analysis**. The impedance, **Z0**, is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **B**, **BL**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the structure's propagation characteristics. Up to three conductors of different metals and thicknesses can be selected.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for the offset stripline transmission line are:

Frequency
Width, **W**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

Error less than 0.5% for **W** /**B** < 10.

Example

To select the stripline medium, select **TRL** on the **Product** menu, select **Stripline**, and click **OSL**. Set the units to **mm** and **GHz**. Enter the following parameters to synthesize an offset stripline:

Impedance, **Z0**: 50 ohms

Dielectric constant, **ER**: 2.2

Substrate thickness, **B**: 2 mm

Offset Spacing, **BL**: 0.5mm

Click **Synthesis** to determine the width, W, of the transmission line:

Width, **W**: 1.1982 mm

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Since offset stripline is a **TEM** structure and does not vary with frequency, perform a sweep analysis on the width of the strip instead. Type **(0.5, 3.0, 0.5)** into the **W** field to sweep the width from 0.5 mm to 3.0 mm in steps of 0.5 mm. Be sure to supply metal and loss information:

Metal: Cu 0.01 mm

TAND: 0.001

Click Analysis. The following warning message appears:

W/(B-T-BL) >0.7

Clicking Yes yields the following results:

Offset Stripline

B = 2.000mm BL = 0.500mm ER = 2.20 TAND =0.00100 T/B =0.0050

Freq Width W/B Z0 D Loss C Loss T Loss

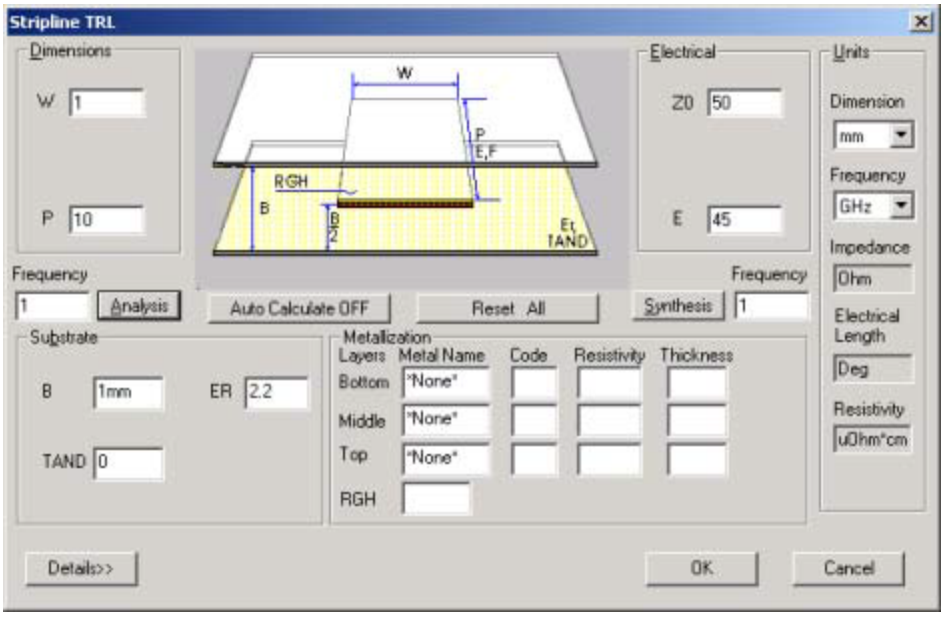
10.0 3.000 1.500 25.50 0.0014 0.0016 0.0030

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Notice that the impedances are the same for DC or 10 GHz, but the conductor loss calculations differ significantly due to the skin effect.

TRL Edge-Coupled Suspended Stripline Transmission Lines



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width
S	Req (Phys)	m	Spacing between conductors
P	0	m	Physical length of transmission line
Z0	Req (Elec, Opt 1)	ohm	Impedance of the coupled lines
K	Req (Elec, Opt 1)	dB	Coupling coefficient (positive)
Zo	Req (Elec, Opt 2)	ohm	Odd-mode impedance of the coupled lines
Ze	Req (Elec, Opt 2)	ohm	Even-mode impedance of the coupled lines
E	0	deg	Electrical length of the coupled lines
Frequency	100 MHz	Hz	Analysis frequency
ER	Required		Relative dielectric constant
H	Req	m	Substrate thickness
HL	Req	m	Distance between bottom of substrate and ground
HU	Req	m	Cover height above substrate
A	inf.	m	Width between sidewalls
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Synthesis and Analysis

Two options exist for synthesis of edge-coupled suspended substrate transmission lines:

— Specify impedance, **Z0**, and the coupling coefficient, **K**.

— Specify the even-mode impedance, **Ze**, and the odd-mode impedance, **Zo**.

- The substrate parameters **H**, **HU**, **HL**, **A**, and **ER** must be entered prior to clicking **Synthesis**. The width of the strips, **W**, and the spacing between them, **S**, is computed. Also, the alternate electrical option set is computed. For example, entering **Z0** and **K** computes **Ze** and **Zo**.
- For analysis, the parameters **W**, **HU**, **HL**, and **ER** must be entered prior to clicking **Analysis**. The electrical properties, **Z0**, **K**, **Zo**, and **Ze** is computed. The frequency is used if entered; otherwise, 100 MHz is used in the calculation.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency** and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **H**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- The selection of the conductor is performed in the Metalization group. The conductor isn't specified, in this case the conductor loss is zero and no thickness corrections are made to the propagation characteristics. Up to three conductors of different metal and different thickness can be selected.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for edge-coupled suspended substrate lines are:

Frequency
Width, **W**
Spacing, **S**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Full-wave analysis is used; there are no limitations for practical dimensions.

Example

To select the edge-coupled suspended substrate medium, select **TRL** on the **Product** menu, select **Stripline**, and click **CPL**. Set the units to **mm** and **GHz**. Enter the following parameters to synthesize a 6-dB coupler at 10 GHz:

Impedance, **Z0**: 50 ohms

Coupling, **K**: 6 dB

Frequency: 10 GHz

Substrate thickness, **H**: 0.635 mm

Lower height, **HL**: 1.0 mm

Upper height, **HU**: 1.0 mm

Sidewall width, **A**: 10.0 mm

Dielectric constant, **ER**: 9.8

TAND 0.001

Metal: Cu 0.01 mm

Click **Synthesis** to determine the coupler's parameters:

Width, **W**: 1.122 mm

Spacing, **S**: 0.112 mm

Odd-mode impedance, **Zo**: 28.8 ohms

Even-mode impedance, **Ze**: 86.7 ohms

Odd-mode Keff, **KO**: 4.54

Even-mode Keff, **KE** 2.11

To specify a 1/4 wavelength line, enter:

Electrical length, **E**: 90

Click Synthesis again to determine the corresponding physical length:

Physical length, **P**: 4.12 mm

A sweep analysis can be performed on **W**, **S**, or **Frequency**. To perform a sweep analysis on **W**, type **0.8,1.2,0.05** in the **W** field to specify a sweep from 0.8 mm to 1.2 mm in steps of 0.05 mm. Clicking **Analysis** then yields the following results:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

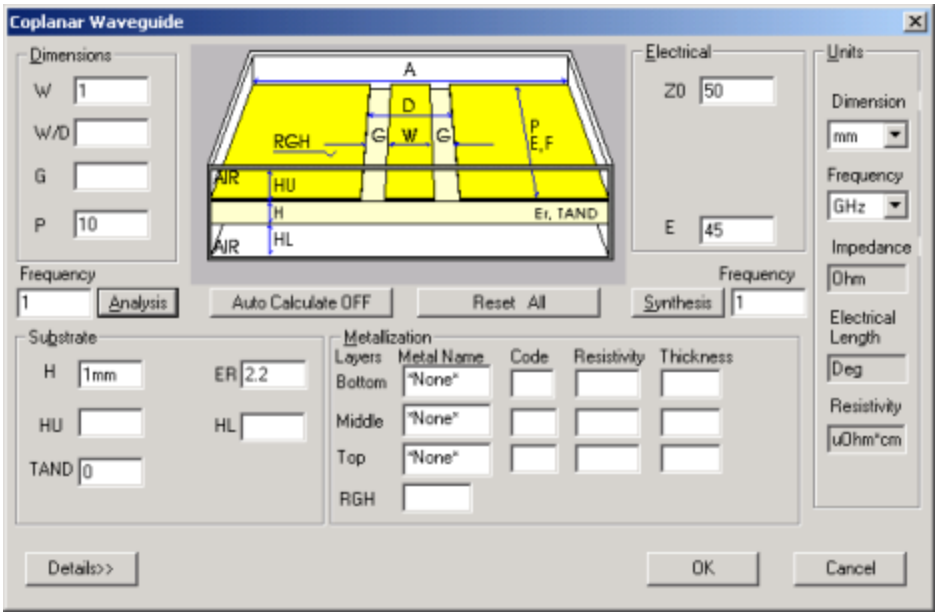
TRL Coplanar Waveguide Transmission Lines



Keyword	Default	Unit	Description
W	Req (Phys)	m	Conductor width

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

W/D			**W** /(**W** +2**G**)
G	Req (Phys)	m	Gap width
P	0	m	Physical length of transmission line
Z0	Req (Elec)	ohm	Characteristic impedance
E	0	deg	Electrical length of transmission line
Frequency	Req	Hz	Frequency
ER	Req		Relative dielectric constant
H	Req	m	Substrate thickness
HL	inf.	m	Distance between bottom of substrate and ground
HU	inf.	m	Cover height above substrate
A	inf.	m	Width between sidewalls
TAND	0		Dielectric loss tangent
RGH	0	m	Rms surface roughness

Synthesis and Analysis

- To synthesize coplanar waveguide, the parameters (**Z0**, **G**, **H**, and **ER)** or **(Z0, W, H** and **ER)** must be entered prior to clicking **Synthesis**. The width, **W**, and **W/D** is computed if **G** is entered and **W** is left empty, while **G** is computed if **W** is entered and **G** is left empty.
- For analysis, the parameters (**W, G**) or (**W/D, G**), **H**, **Frequency** and **ER** must be entered prior to clicking **Analysis**. The impedance, **Z0**, is computed.
- For now, the parameter **A** is not taken into consideration, and thus has no effect on the results. A specific formula is used to take into account the effect of dispersion on the line's effective dielectric constant and characteristic impedance.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**.

Dielectric Substrates

A dielectric substrate is defined by the parameters **H**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If a conductor is not specified, the conductor loss is zero and no thickness corrections are made to the line's propagation characteristics. Up to three conductors of different metal types and thicknesses can be specified. See the *Metalization* topic for further information.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for a coplanar waveguide analysis are:

Frequency
Normalized width ratio, **W/D**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

To maintain accuracy, the following limitations should be followed:,

$$\frac{H}{\lambda_g} < 0.05$$

where λ_g is the guide wavelength

Example

To select the coplanar waveguide medium, select **TRL** on the **Product** menu and select **Coplanar Waveguide**. Set the units to **mm** and **GHz**. Enter the following parameters for synthesizing a 50-ohm line:

Impedance, **Z0**: 50 ohms

Frequency: 10 GHz

Gap, **G**: 0.5 mm

Substrate thickness, **H**: 0.635 mm

Lower height, **HL**: 5.0 mm

Upper height, **HU**: 5.0 mm

Dielectric constant, **ER**: 9.8

Dielectric loss, **TAND**: 0.001

Metal: Cu 0.01 mm

Click **Synthesis** to determine the line's parameters:

Width, **W**: 1.62241 mm

Keff: 4.012

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To specify a 1/4 wavelength line, enter:

Electrical length, **E**: 90

Click Synthesis again to determine the corresponding physical length:

Physical length, **P**: 3.74157 mm

The loss of the medium can be observed by sweeping frequency. Sweep from 10 to 50 GHz in steps of 5 GHz by typing **10,50,5** in the **Frequency** field. Click **Analysis**. The results of the frequency sweep are as follows:

Conventional Coplanar Waveguide Analysis

G = 0.500mm H/G = 1.3 ER = 9.80 TAND = 0.00100 T/G = 0.0200

Synthesis and Analysis

- To synthesize grounded coplanar waveguide, the parameters (**Z0**, **G**, **H**, and **ER)** or **(Z0, W, H** and **ER)** must be entered prior to clicking **Synthesis**. The width, **W**, and **W/D** is computed if **G** is entered and **W** is left empty, while **G** is computed if **W** is entered and **G** is

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

left empty.

- For analysis, the parameters (**W, G**) or (**W/D, G**), **H**, **Frequency** and **ER** must be entered prior to clicking **Analysis**. The impedance, **Z0**, is computed.
- For now, the frequency is not taken into consideration, and thus it has no effect on the results other than the electrical length.
- Conversion from electrical length, **E**, to physical length, **P**, can be performed by entering values for **E** and **Frequency**. Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency**, and click **Analysis** to compute **E**.

Dielectric Substrate

A dielectric substrate is defined by the parameters **H**, **ER**, and **TAND**. The substrate is assumed to be lossless unless **TAND** is specified to be greater than zero.

Conductor Metalization

- Conductor specification is performed in the **Metalization** control group. If the conductor is not specified, the conductor loss is zero and no thickness corrections are made to the line's propagation characteristics. Up to three conductors of different metals and thicknesses can be specified. See the *Metalization* topic for further information.
- Metalization rms surface roughness, **RGH**, can be specified for additional conductor losses due to imperfect metal surfaces. **RGH** is specified in terms of rms variation from an ideal flat surface.

Sweep Options

Parameters that can be swept for the grounded coplanar waveguide are:

Frequency
Normalized width ratio, **W/D**

The order shown is the order used to generate output data when multiple parameters swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

To maintain accuracy, the following limitations should be followed:,

$$\frac{H}{\lambda_g} < 0.01$$

where λ_g is the guide wavelength

Example

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To select the grounded coplanar waveguide medium, select **TRL** on the **Product** menu and select **Grounded Coplanar Waveguide**. Set the units to **mm** and **GHz**. Use the following parameters for synthesizing a 50-ohm line:

Impedance, **Z0**: 50 ohms

Frequency: 10 GHz

Gap, **G**: 0.5 mm

Substrate thickness, **H**: 0.635 mm

Upper height, **HU**: 5.0 mm

Dielectric constant, **ER**: 9.8

Dielectric loss, **TAND**: 0.001

Metal: Cu 0.01 mm

Click **Synthesis** to determine the line's parameters:

Width, **W**: 0.522178 mm

Keff: 5.871

To specify a 1/4 wavelength line, enter:

Electrical length, **E**: 90

Click Synthesis again to determine the corresponding physical length:

Physical length, **P**: 3.09306 mm

The loss of the medium can be observed by sweeping frequency. Sweep from 5 to 50 GHz in steps of 5 GHz by typing **5,50,5** in the **Frequency** field. Click **Analysis**. The results of the frequency sweep are as follows:

Grounded Coplanar Waveguide Analysis

E	0	deg	Electrical length of coaxial cable

Synthesis and Analysis

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To synthesize coaxial cable, the parameters **Z0, D0** and **ER** must be entered prior to clicking **Synthesis**. The inner diameter **D** is computed.
- For analysis, the parameters **D, D0,** and **ER** must be entered prior to clicking **Analysis**. The characteristic impedance, **Z0** is computed. The frequency is used if entered; otherwise, 0 Hz is used in the calculation.
- Conversion from electrical length **E,** to physical length **P,** can be performed by entering values for **E** and **Frequency.** Click **Synthesis** to compute **P**. Similarly, to convert from physical length to electrical length, enter values for **P** and **Frequency**, then click **Analysis** to compute **E.**

Dielectric

The line dielectric is defined by the parameters **ER** and **TAND**. The dielectric is assumed to be lossless unless **TAND** is specified and greater than zero.

Conductor Metalization

The conductor loss is specified by the resistivity, metalization rms surface roughness **RGH**, and the cable dimensions.

Sweep Options

Parameters that can be swept for coaxial cable are:

Frequency

Inner diameter, **D**

The order shown is the order used to generate output data when multiple parameters are swept simultaneously. See the *Sweep Entries* topic for further information.

Limitations

$\varepsilon r \geq 1$

DO > **D**

Example

To select coaxial cable, select **TRL** on the **Product** menu and select **CoaxialCable**. Select the units for mm and GHz. Enter the following parameters for synthesis and analysis of the coaxial cable:

Line impedance, **Z0**: 50 ohms

Diameter of outer conductor, **DO**: 5.0 mm

Dielectric constant, **ER**: 2.2

Frequency: 1 GHZ

Electric Length, **E**: 90 degrees

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Dielectric loss, **TAND**: 0.001

Metal: Au

Click the **Synthesis** button to determine the diameter of the cable's inner conductor:

Diameter of inner conductor, **D**: 1.453 mm

Physical length, **P**: 50.53 mm

Next, use analysis to sweep the diameter of the inner conductor from 1 to 2 mm. Enter the sweep by typing **1,2,0.1** in the **D** group box. Clicking **Analysis** then yields:

Electrical Length= 90.00 deg

Coaxial Cable Analysis

Do = 5.000mm ER = 2.20 TAND = 0.00100 rb = 2.4400 [micro-Ohm-cm]

Freq d Do/D Zo D Loss C Loss T Loss

ghz mm Ohms dB/mm dB/mm dB/mm

1.0000 1.0000 5.0000 65.1050 0.0001 0.0003 0.0004

1.0000 1.1000 4.5455 61.2495 0.0001 0.0002 0.0004

1.0000 1.2000 4.1667 57.7297 0.0001 0.0002 0.0004

1.0000 1.3000 3.8462 54.4918 0.0001 0.0002 0.0004

1.0000 1.4000 3.5714 51.4940 0.0001 0.0002 0.0004

1.0000 1.5000 3.3333 48.7031 0.0001 0.0002 0.0004

1.0000 1.6000 3.1250 46.0924 0.0001 0.0002 0.0004

1.0000 1.7000 2.9412 43.6400 0.0001 0.0002 0.0004

1.0000 1.8000 2.7778 41.3278 0.0001 0.0002 0.0004

1.0000 1.9000 2.6316 39.1407 0.0001 0.0003 0.0004

1.0000 2.0000 2.5000 37.0658 0.0001 0.0003 0.0004

You can also sweep the analysis frequency. You note that the impedance does not change with frequency since there is no dispersion for the coaxial cable model.

Q3D RLGC Component Toolkit

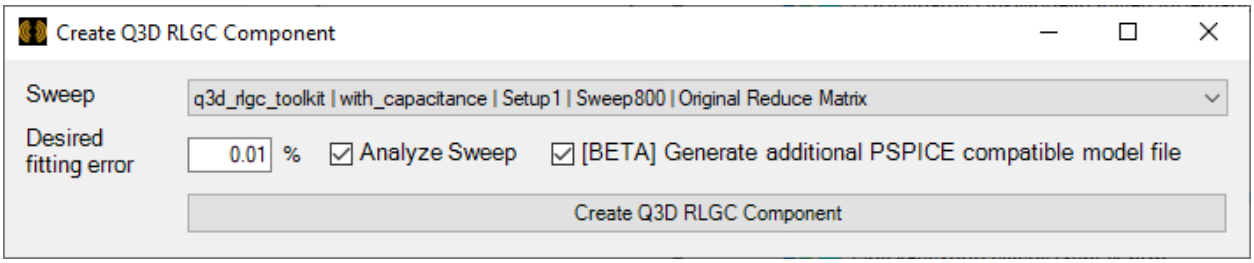
Nexxim supports dynamic links with Q3D through state-space fitting on the S-parameter, but it suffers accuracy issues for some areas of applications. The Q3D RLGC Component toolkit supports Nexxim Q3D links through state-space fitting on RLGC data to improve accuracy.

Creating a Component

Complete the following steps to create a component.

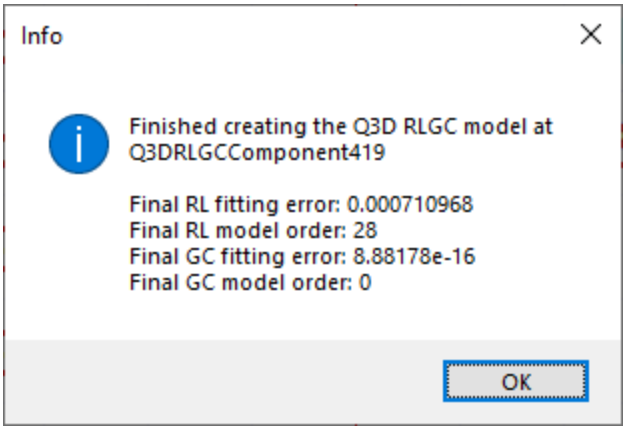
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

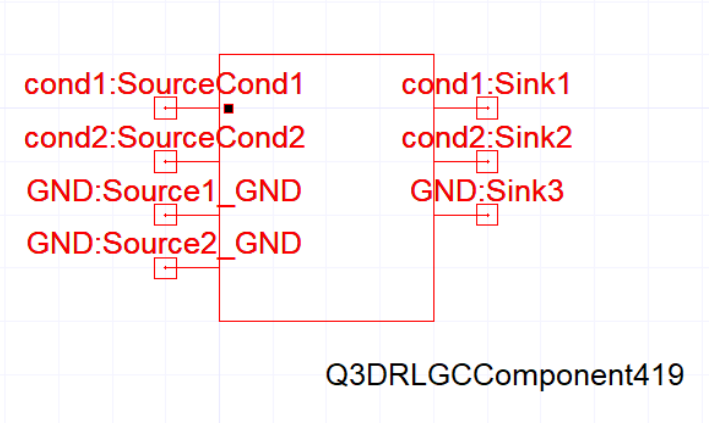
1. Open a project with a Q3D design.
2. Insert a circuit design.
3. You can access the toolkit by two ways:
    i. Select the Circuit design and browse to the Automation ribbon. Click on **Create Q3D RLGC Component**.
    ii. From the Circuit menu, select **Toolkit** > **Q3D RLGC Component** to open the **Create Q3D RLGC Component** window.



4. Choose a Q3D solution from the **Sweep** drop-down menu.
5. In the **Desired fitting error** field, enter an acceptable error for the RLGC data state space fitting.
6. Check the **Analyze Sweep** box, if appropriate.
7. Check the **[BETA] Generate additional PSPICE compatible model file** box, if appropriate. The PSPICE-compatible model is saved in the project directory. RLGC sub-circuit terminals are named after Q3D terminals.
8. Click **Create Q3D RLGC Component**. The toolkit invokes the state space fitting algorithm to fit the RLGC data and writes a Nexxim subcircuit netlist to generate a schematic component. When it is done, the **Info** window opens to report success or failure and the new Nexxim subcircuit component appears in the Schematic editor. Use the component to create circuits for Nexxim simulations.

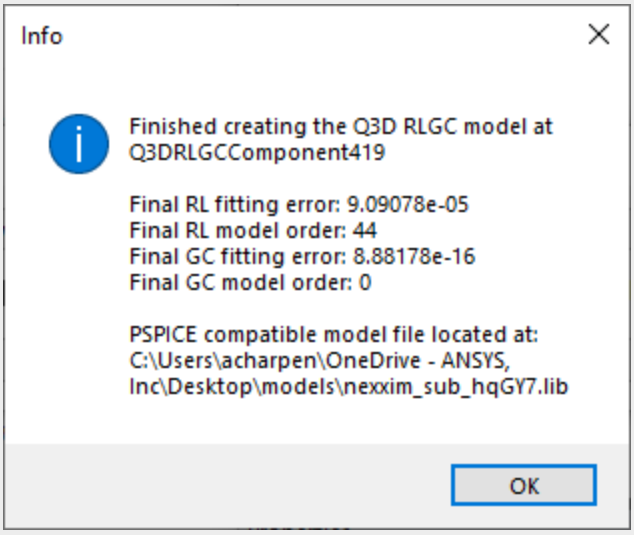
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: If the **[BETA] Generate additional PSPICE compatible model file** box is checked, the toolkit opens an explorer window to the directory where the PSPICE-compatible model is stored. The file path is also shown in the **Info** window.



9. Use this component to create circuits for Nexxim simulations.

The procedure is complete.

Automatic Causality Correction

Q3D may return non-causal RL data in certain circumstances. Non-causal data can cause a poor fit when generating a time domain circuit model. Automatic Causality Correction chooses the best fit to the Q3D data between the original S-Parameter data (S-data) and the causal-corrected S-data. A fitting error threshold of 5% on the original fit is used to trigger the correction routine. The threshold is adjustable when generating the model via command line from the *.rlgcdata* file. Refer to the **causality_thresh** entry in "Running State-Space Fitting on the Command Line" on page 26-90.

Passivity Enforcement (Beta Feature)

In simulations where non-passivity of an RLGC PSPICE circuit model export is suspected, the Passivity Enforcement feature can be activated from the command line. Refer to the **passive_rlfit** entry in "Running State-Space Fitting on the Command Line" on page 26-90.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Maxwell RL Component Toolkit

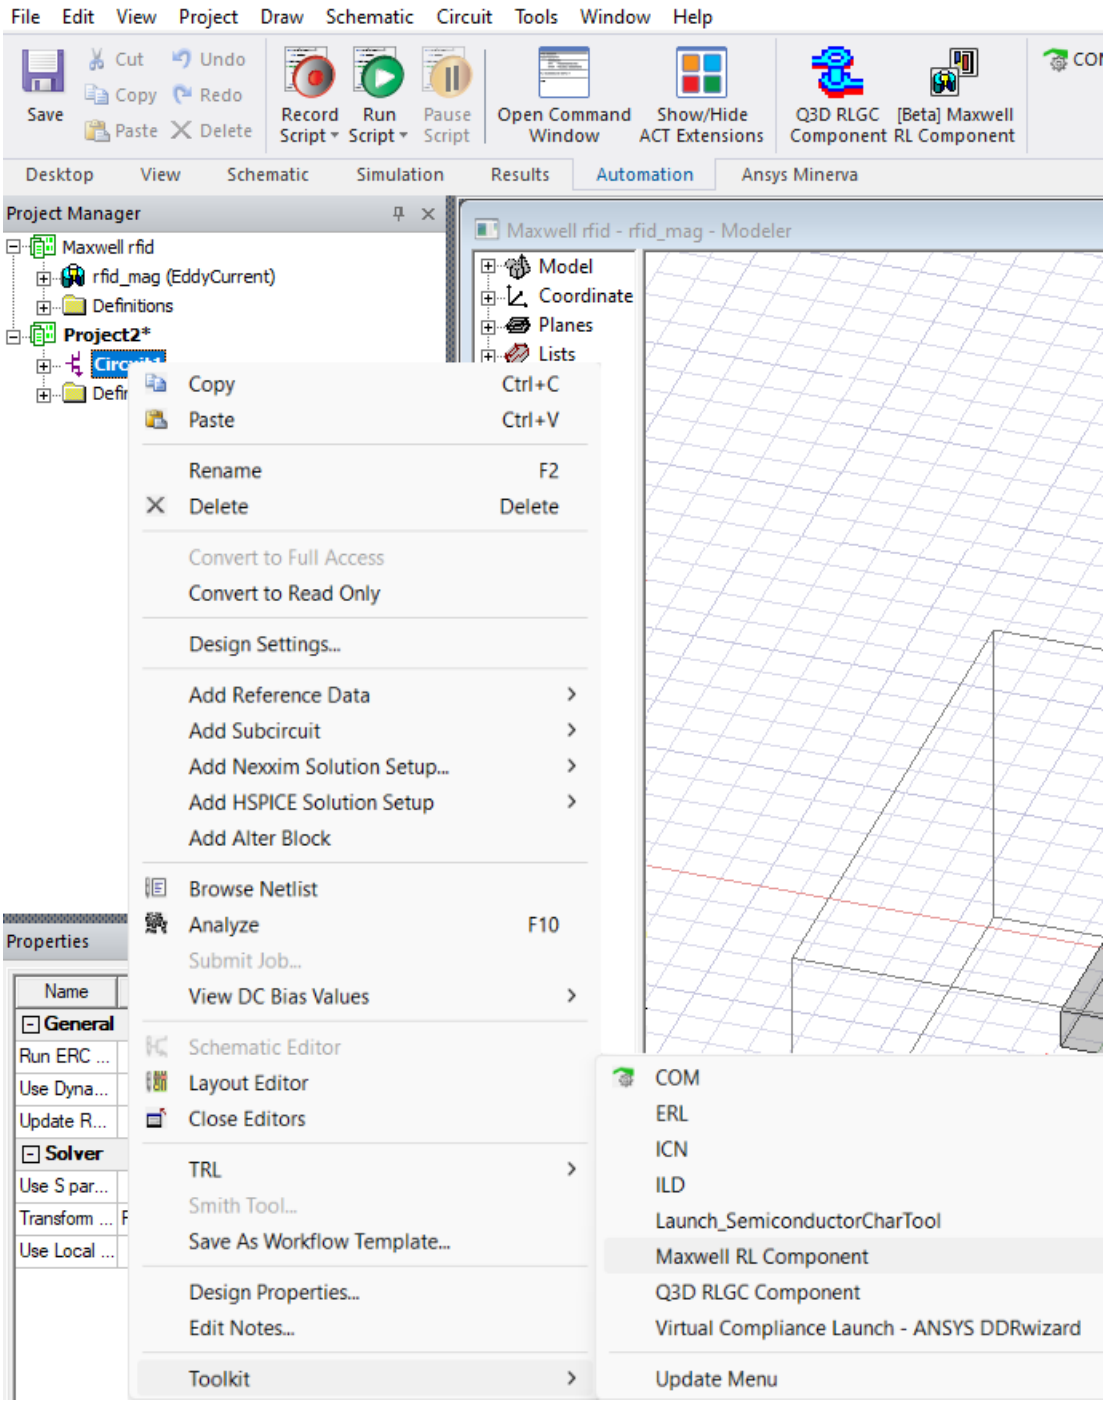
The Maxwell RL Component toolkit supports Circuit-Maxwell links through state-space fitting on RL data.

Creating a Component

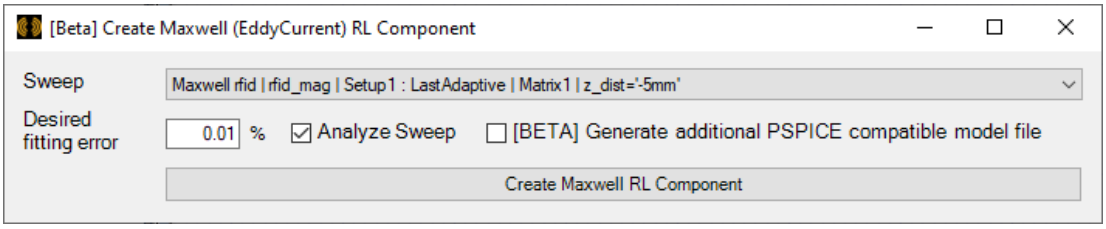
Complete the following steps to create a component.

1. Open a project with a Maxwell EddyCurrent design.
2. Insert a circuit design.
3. You can access the toolkit by two ways:
    i. Select the Circuit design and browse to the Automation ribbon. Click on **Maxwell RL Component**
    ii. From the Circuit menu, select **Toolkit** > **Maxwell RL Component** to open the **[Create Maxwell (EddyCurrent) RL Component** window.

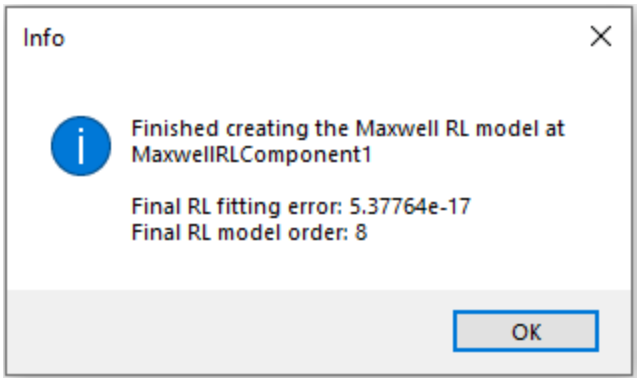
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



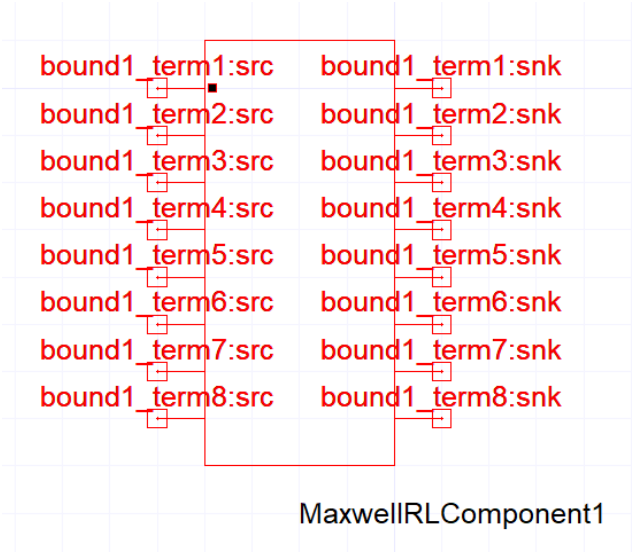
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



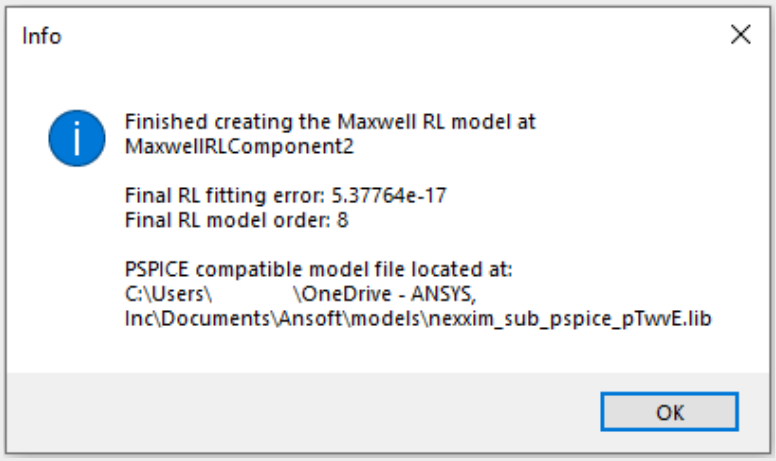
4. Choose a Maxwell solution from the **Sweep** drop-down menu.
5. In the **Desired fitting error** field, enter an acceptable error for the RL data state space fitting.
6. Check the **Analyze Sweep** box, if appropriate.
7. Check the **[BETA] Generate additional PSPICE compatible model file** box, if appropriate. The PSPICE-compatible model is saved in the project directory. RLGC sub-circuit terminals are named after Maxwell terminals.
8. Click **Create Maxwell RL Component**. The toolkit invokes the state space fitting algorithm to fit the RL data and writes a Nexxim subcircuit netlist. It then uses the Nexxim subcircuit netlist to generate a schematic component. When it is done, the **Info** window opens to report success or failure and the new Nexxim subcircuit component appears in the Schematic editor. Use the component to create circuits for Nexxim simulations.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note: If the **[BETA] Generate additional PSPICE compatible model file** box is checked, the toolkit opens an explorer window to the directory where the PSPICE-compatible model is stored. The file path is also shown in the **Info** window.



9. Use this component to create circuits for Nexxim simulations.

The procedure is complete.

11 - Circuit Netlist Operations

The Circuit Netlist Editor is an easy-to-use tool for viewing and editing netlists. The input conventions are the same as those of standard text editors, and the Netlist Editor also contains special functions that integrate it with the desktop environment.

Typically, a netlist is a coded textual representation that describes the connections, subcircuits, ports, and other components in a circuit. The netlist contains electrical information and optional references to substrate definitions. Netlist contributions from circuit components such as coupled lines and transmission lines can contain information about the physical layout of the component.

- The Circuit simulator supports both netlist-based designs and schematic-based designs. A netlist-based design consists of just a netlist definition, but with a schematic-based design, a netlist is created internally to represent the circuit.

Related Topics

Starting the Netlist Editor

Netlist Editor Operation

Starting the Netlist Editor

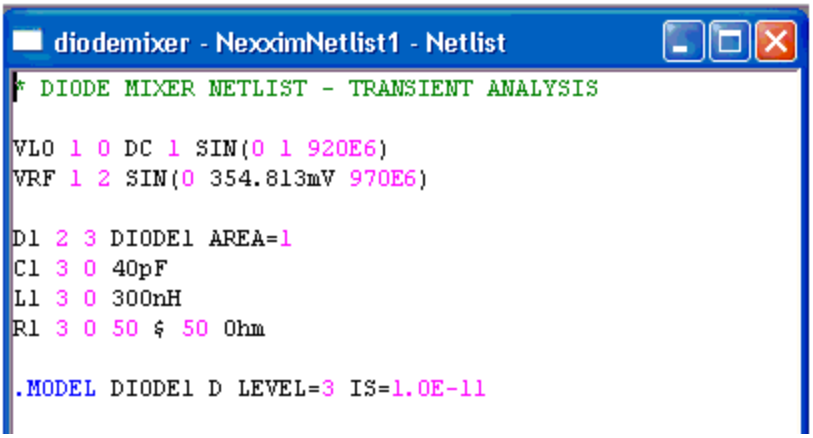
The Netlist Editor appears automatically when you create a new netlist design. You can also load a netlist-based design from an external file and edit it using the Netlist Editor. In schematic-based circuit designs, use the Netlist Editor to view the derived netlist without making any changes. See Netlist Format for further information.

Creating a New Netlist

The Netlist Editor is automatically started when you insert a new netlist design. To create and edit a new Circuit Netlist design:

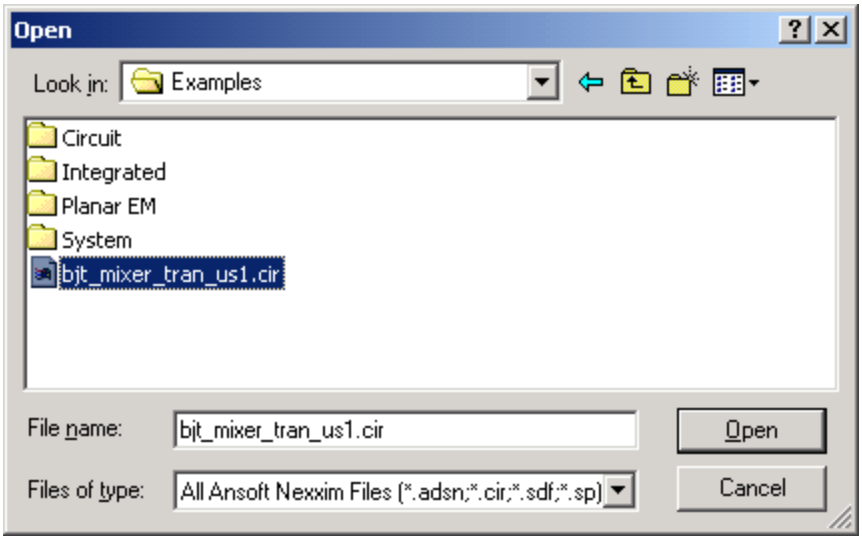
1. Click **File** > **New** to create a new Project.
2. Do one of the following:
   - From the **Project** menu, select **Insert Circuit Netlist**
   - From the **Project Manager** window, right-click the **Project** folder and select **Insert** > **Insert Circuit Netlist**
3. A new Netlist Editor window opens in the design area.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



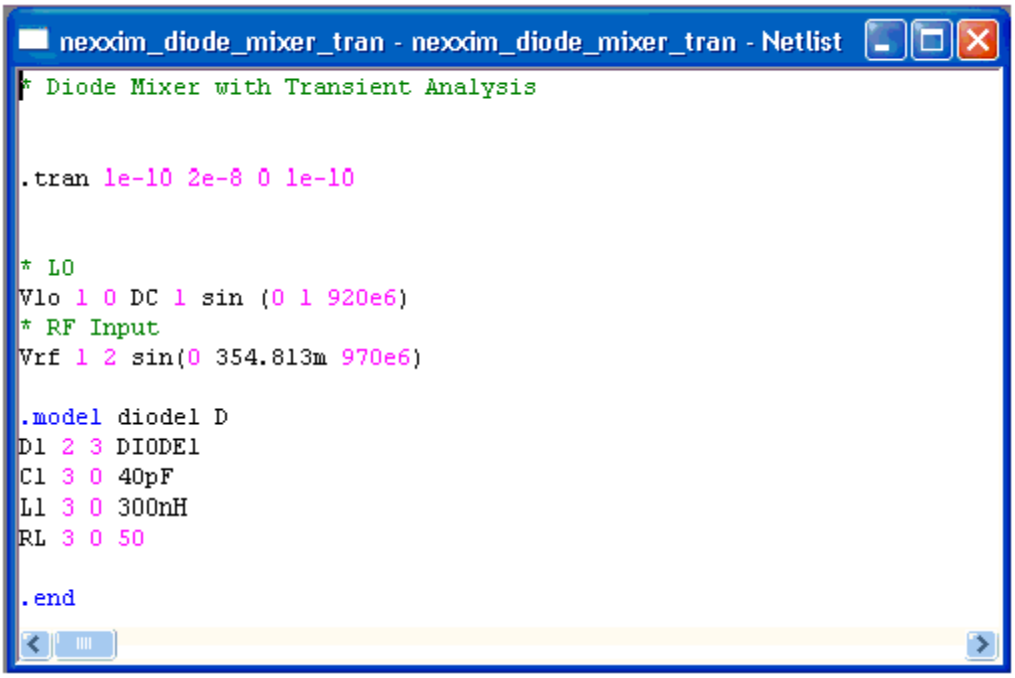
Loading a Netlist from a File

To load a design from an existing Circuit netlist file, Click the **File > Open** command. Select the "All Ansoft Nexxim Files" extension in the **Files of type** window of the explorer window.



The file opens in the Netlist Editor window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The Netlist Editor display is colored to provide easy identification of variables, values, comments, bookmarks, and other elements of the netlist.

Viewing Netlists in Schematic Designs

Circuit designs typically use the **Schematic Editor** to create circuits. In these designs, the schematic defines the circuit, and the netlist may be viewed for reference. Internally, the simulators generate a netlist on the schematic, and update it on the schematic right before performing any simulation.

You can view the netlist in any schematic design by selecting **Browse Netlist** on the **Product** menu. Or, in any simulator design, right-click the name of the design in the **Project** window, and select **Browse Netlist**.

> **Note:**
>
> The netlist in a schematic-based design is for reference only, and should not be modified in the Netlist Editor view. The Netlist Editor allows you to modify the netlist, and asks if you want to save the changes. However, any modifications you make is overwritten the next time the netlist is generated on the schematic.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Netlist Editor Operation

The Netlist Editor is a text editor that allows you to perform many common editor operations in order to enter, select, modify, and delete netlist text. The Netlist Editor provides additional commands that allow you to:

- Search text
- Add bookmarks
- Search and replace text
- Go to a numbered line in the netlist

Netlist Editor commands can be accessed on the toolbar, on the Edit menu, or by using keyboard shortcuts.

Netlist Editor Toolbar

When the Netlist Editor is the active window, the **Netlist Editor Toolbar** is displayed in the toolbar area.

The following table summarizes the Netlist Editor Toolbar commands.

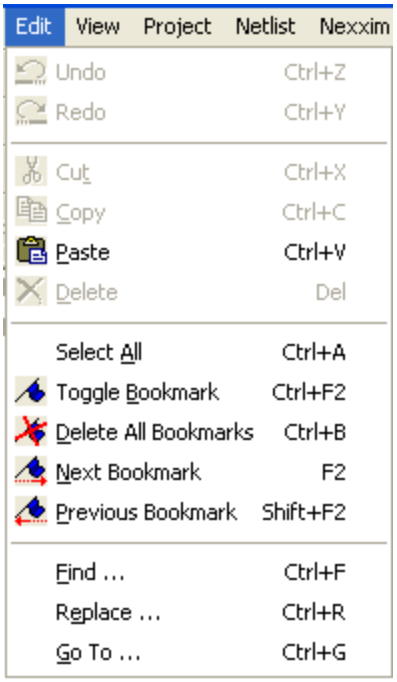
Command Function	Toolbar Commands and Description	
Toggle Bookmark		Inserts a bookmark at the active cursor position, or turns off an existing bookmark.
Delete All Bookmarks		Deletes all bookmarks in the text.
Next Bookmark		Moves the cursor to the next bookmark in the text.
Previous Bookmark		Moves the cursor to the previous bookmark in the text.
Find Window		Displays the text string you have entered to find. Click the drop-down menu to display previously searched for text strings.
Find Forward		Searches forward in the netlist for text entered in the Find Window.
Find Backward		Searches backward in the netlist for text entered in the Find Window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Command Function	Toolbar Commands and Description	
Find Forward, Case-sensitive		Searches forward in the netlist for text entered in the Find Window with case-sensitive control.
Find Backward, Case-sensitive		Searches backward in the netlist for text entered in the Find Window with case-sensitive control.

Netlist Edit Menu

When the Netlist Editor is the active window, the Edit menu on the menu includes Netlist Editor commands.



The menu also identifies keystroke shortcuts that may be used in place of the mouse-oriented command methods.

- The **Replace** and **Go To** commands are not available on the Netlist Editor Toolbar. These commands must be executed on the Edit menu or with a keystroke shortcut.

For more information, search the Help or use the Help Index to find information on any of the commands that appear on the **Netlist Edit Menu**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Using Bookmarks

A bookmark is a colored overlay that highlights a line in the netlist text that is significant to you. Once created, netlist editor bookmarks allow quick access to text sections.

Inserting a Bookmark

To insert a bookmark, position the cursor anywhere in the line to be marked, then do one of the following:

- Click the Toggle Bookmark command icon on the toolbar
- Select **Edit** > **Toggle Bookmark**
- Press **Ctrl** +**F2**

A colored overlay indicates that the line is bookmarked. The color used for bookmarks can be specified as a Netlist Editor option. See Netlist Editor Options for further information.

Deleting a Bookmark

To delete a single bookmark, position the cursor anywhere in the bookmarked line, then do one of the following:

- Click the Toggle Bookmark icon on the toolbar
- Select **Edit** > **Toggle Bookmark**
- Press **Ctrl**+**F2** to close the overlay.

Deleting All Bookmarks

To delete all bookmarks in the netlist, do one of the following:

- Click the Delete All Bookmarks icon .
- Select **Edit** > **Delete All Bookmarks**
- Press **Ctrl** +**B**

Moving Forward to the Next Bookmark

To move the cursor forward to the next bookmark, do one of the following:

- Click the Next Bookmark icon
- Select **Edit** > **Next Bookmark**
- Press **F2**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If no bookmarks have been inserted, the **NextBookmark** command does not move the cursor. If the cursor is on or past the last bookmark in the netlist, the **NextBookmark** command moves the cursor to the first bookmark in the netlist.

Moving Backward to the Previous Bookmark

To move the cursor backward to the previous bookmark, do one of the following:

- Click the Previous Bookmark icon .
- Select **Edit** > **Previous Bookmark**
- Press **Shift** +**F2**

If no bookmarks have been inserted, the **PreviousBookmark** command does not move the cursor. If the cursor is on or before the first bookmark in the netlist, the **PreviousBookmark** command moves the cursor to the last bookmark in the netlist.

Searching the Netlist

The Netlist Editor can locate an item of test in the netlist. You can specify the search parameters via the toolbar icons, on the Edit menu, or with a keystroke shortcut.

Searching on the Toolbar

To search for an item of text in the netlist, enter the search text in the **Find** window in the toolbar:

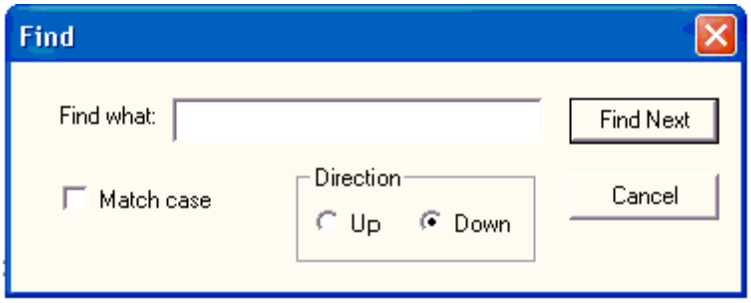
- To search forward using case-insensitive matching, click the **Find Forward** toolbar icon
- To search backward using case-insensitive matching, click the **Find Backward** toolbar icon
- To search forward using case-sensitive matching, click the **Find Forward**, **case-sensitive** toolbar icon
- To search backward using case-sensitive matching, click the **Find Backward**, **case-sensitive** toolbar icon

In all search cases, if the cursor is past the location of the search text, the search wraps on the beginning of the netlist. If any search fails to find the target text, the editor notifies you with a message.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Searching from the Edit Menu or by Keyboard Shortcut

Start a text search by selecting **Edit** > **Find** or by pressing **Ctrl**+**F** on your keyboard. Either of these operations opens the **Find** window:

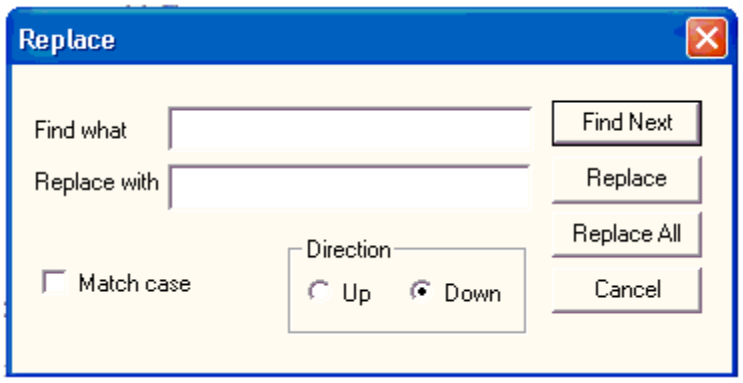


1. Enter the search text in the **Find what** field.
2. Select the **Direction** for the search. **Up** searches on the cursor toward the front of the netlist, wrapping on the front to the back if the text is not found. **Down** searches on the cursor toward the back of the netlist, wrapping from back to front is the text is not found.
3. Toggle **Match case** to enable case-sensitive text matching.
4. Click **Find Next** to start the search.

If any search fails to find the target text, the editor notifies you with a message.

Searching for and Replacing Text

To search for a text item and replace it with new text, select **Edit** > **Replace** or press **Ctrl** +**R**. Either of these operations opens the **Replace** window:



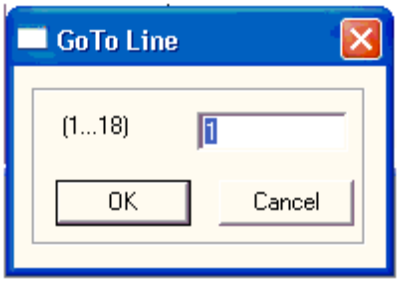
1. Enter the search text in the **Find what** field.
2. Enter the replacement text in the **Replace with** field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Select the **Direction** for the search. **Up** searches on the cursor toward the front of the netlist, wrapping on the front to the back if the text is not found. **Down** searches on the cursor toward the back of the netlist, wrapping from back to front is the text is not found.
4. Toggle **Match case** to enable case-sensitive text matching.
5. To find and replace text item-by-item, click **Find Next** to start the search. When the next instance of the search text is highlighted, click **Replace** to replace the search text with the replacement text, or click **Find Next** again to leave the instance unchanged. Repeat this step until all replacements have been made.
6. To replace all instances of the search text with the replacement text globally, click **Replace All**.
7. When all replacements have been made, click **Cancel** to close the **Replace** window.

Going to a Numbered Line

Errors and warnings on the netlist parser See line numbers in the netlist. Line numbers are not displayed in the Netlist Editor, but the cursor can be moved to a line by specifying its number. To move the cursor to a numbered line, select **Edit > Go to** or press **Ctrl** +**G**. Either operation opens the **Go To Line** window box.



The parenthesized display shows the range of available line numbers in the netlist that is currently being edited:

- Enter the number of the line and click **OK**.

The cursor moves to the beginning of that line.

Netlist Editor Options

To set option defaults that affect all designs, click **Tools>Options >General Options** to open the **Options** window, then select **Netlist & Script Editor** on the left group box.

The following controls are available:

- **Display Line Numbers**, when checked, displays line numbers in the Netlist and Script Editors.
- Click the **Bookmark** color-display group box to select a new color on the color palette.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The **Font Name** drop-down menu lists many available font styles from which to choose.
- **Size** allows you to vary the size of the selected **Font Name** style.
- An example of the **Font Name** style is shown in the display window.
- Click **OK** to save your changes and close the window, or click **Cancel** to close without saving changes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

12 - Circuit Time Domain Analyses

Nexxim provides a variety of analysis methods for simulating circuit designs in the time domain. Any of these analyses can include a sweep of circuit parameters.

DC Operating Point Analysis

DC analysis provides the DC operating point voltages and currents. In turn, the DC operating point provides the initial values for DC sweep analysis, harmonic balance, and transient analyses. It also provides the large signal bias operating point for small signal AC analysis, noise analysis, and linear network analysis.

See Nexxim DC Analysis.

Transient Analysis in Nexxim

Transient analysis computes the response of a circuit over time, using a system of differential/algebraic equations derived from information provided by the circuit topology and by the device models. Transient analysis can calculate its initial values by running a DC operating point simulation, or can be set to use initial values supplied in the netlist.

See Nexxim Transient Analysis.

Statistical Eye Diagram Analyses

Statistical eye analysis is commonly used to perform bit error rate (BER) simulations on high-speed communications channels. Statistical eye analysis uses statistical post-processing to calculate the performance of a serial channel given the channel parameters including jitter.

Nexxim Quick Eye analysis uses simplifying assumptions to calculate the BER from a transient analysis of single transitions. Nexxim VerifEye analysis uses a fully statistical approach to calculate the BER.

See VerifEye And Quick Eye Analyses.

AMI Analysis

The IBIS Algorithmic Modeling Interface (AMI) allows time-domain simulation of a linear channel using customer-supplied models for the transmitter and receiver. Reports include eye diagrams and bit-error-rate (BER) contours like those available for QuickEye.

For details on Nexxim AMI Analysis, see AMI Analysis.

HSPICE Transient Analysis

Ansys **Electronics Desktop** Circuit projects offer direct integration with HSPICE® analysis software. This integration does not require the Ansys RSM Service. HSPICE is a trademark of Synopsys, Inc.

See HSPICE in Circuit Designs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Nexxim DC Analysis

DC (direct current) analysis first initializes the circuit, then solves the circuit equations to derive the DC operating point. The DC operating point consists of the voltages at all nodes and currents through all branches and includes the DC bias voltage applied to semiconductor devices. DC operating point analysis also provides the initial values used as the starting point for DC sweep analysis, harmonic balance, and transient analysis, unless these are set by the user. It also provides the large-signal bias operating point for small-signal AC analysis, noise analysis, and linear network analysis. Successful and accurate calculation of the DC operating point is essential for these simulations.

> **Note:**
>
> In particular, the accuracy of the DC operating point solution strongly affects the accuracy of the small-signal analyses.

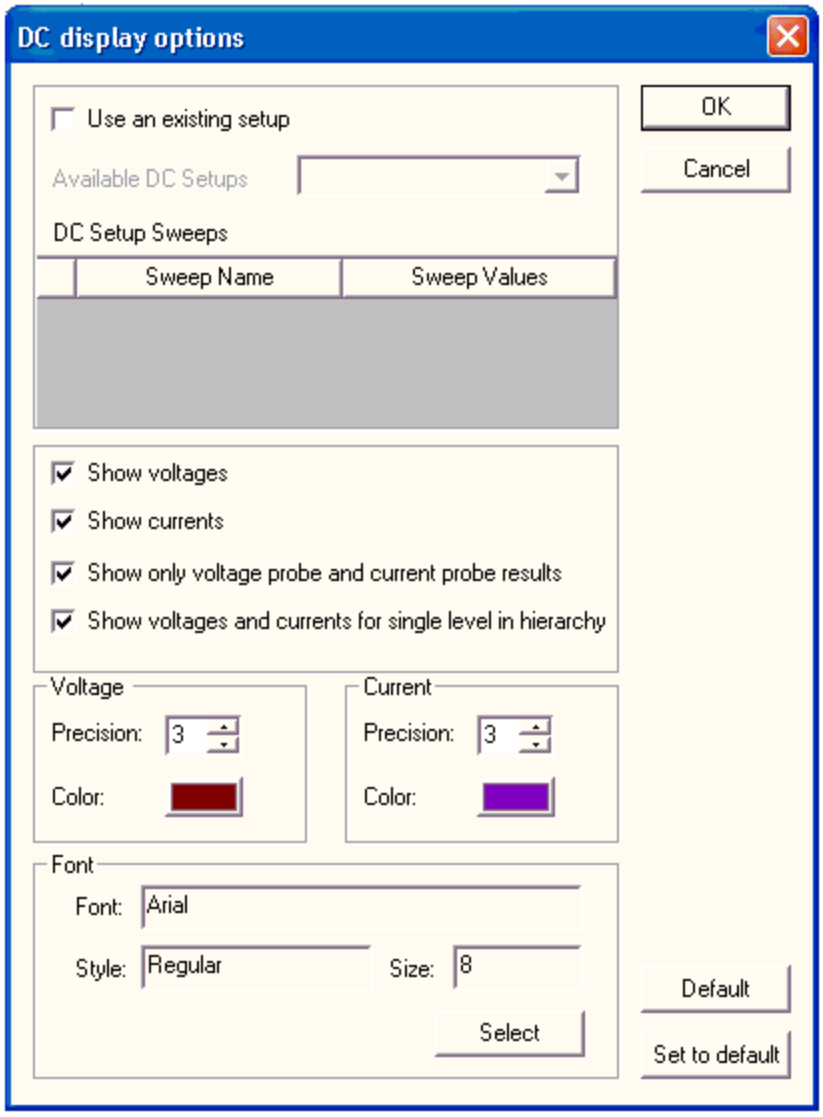
For details on DC sweep simulations, See the separate topic on Variable Sweep.

Viewing DC Bias Voltages and Currents in a Schematic

To run a DC bias analysis on a Circuit design on the **Schematic Editor**, right-click **Circuit** and select **View DC Bias Values** to open a window.

- Select **Show DC Bias** to run the analysis and display the results on the schematic. To remove the DC bias information on the schematic, toggle **Show DC Bias**.
- After the first DC bias analysis has been run, select **Update** to recalculate the bias values after making changes to the circuit.
- Select **Display Options** to open the DC display options window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Click **Use an existing setup** to use the setup information from a DC solution setup that you have already created. Select the setup on the **Available DC Setups** drop-down menu.
- Click the **DC Setup Sweeps** group box to select a sweep on the existing setup, and select one of the sweep values for the DC bias analysis. (To run the sweep through all the values, you must perform the DC analysis as described in Running DC Analysis on the **Schematic Editor**.)

By default, the DC bias display shows values only for voltage and current probes. However, if the circuit does not contain any probes, Nexxim advises you to adjust the options. Deselect **Show only voltage probe and current probe results** to enable DC analysis to display values for all nodes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click the **Show voltages** and **Show currents** options to display voltages only, currents only, or both voltages and currents.

By default, the DC bias information for only a single level of hierarchy is displayed. Toggle this option off to show the information for all levels of a hierarchical design.

- Click the **Voltage** and **Current** group boxes to control the precision (number of decimal points) and color used to open these values.
- Click the **Font** group box to control the font used for the display. Click **Select** to open the Font window. Use the sliders to select the appropriate **Font**, **Style**, and **Size**, then click **OK** to return to the **DC display options** window.

Click **Default** to restore the default option values in the window. Click **Set to default** to make the currently set options the defaults.

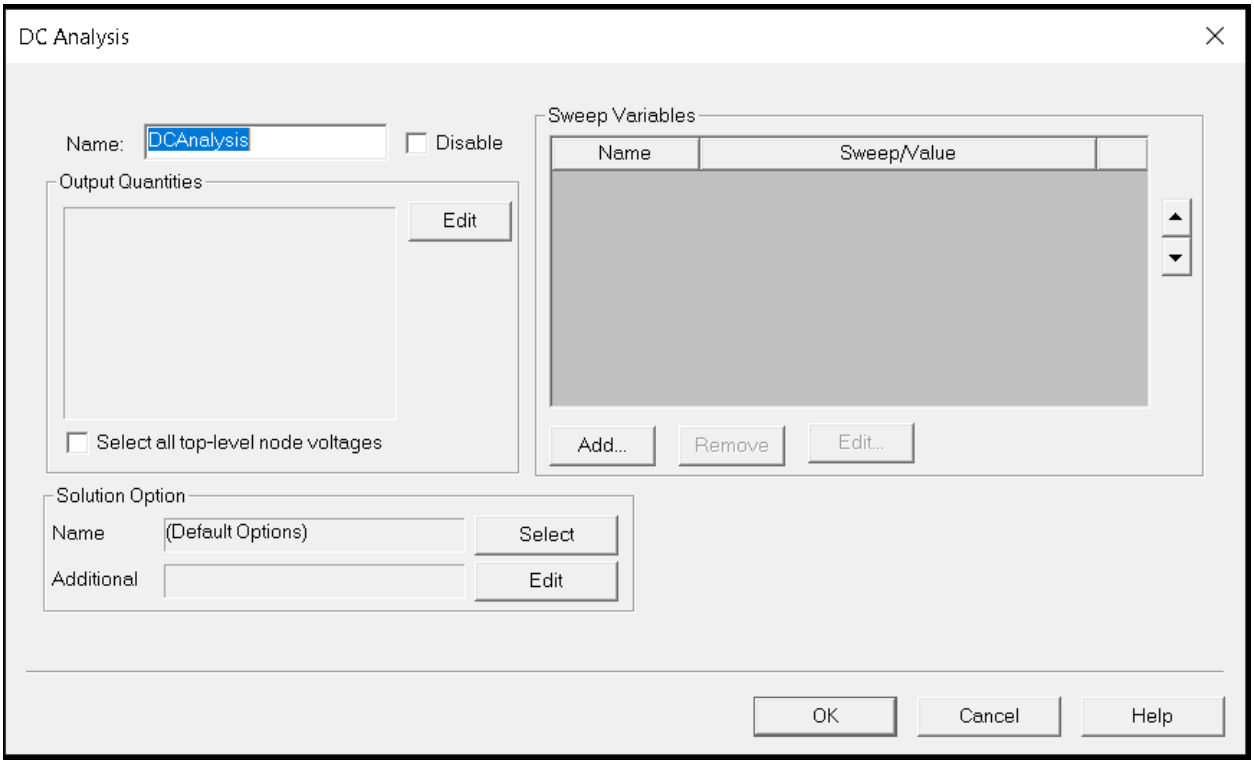
Click **OK** to enable the specified options, or click **Cancel** to close the window without changing any options.

Running DC Analysis on the Schematic Editor

From the **Schematic Editor**, perform the following steps to set up and run a DC analysis.

1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **DC Analysis** to open the **DC Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Type an **Analysis Name** (or accept the default name, for example “DCAnalysis”).
3. To add a sweep, locate the **Sweep Variable** area in the **DC Analysis**window.
   - From the **Sweep Variable** area, select **Add** to open the **Add/Edit Sweep** window.
   - In the **Variable** list, select Temp or the name of a variable (when a variable has been defined for the design), then select one of the following: **Single value, Linear step, Linear count, Decade count**, or **Octave count**.
   - Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
   - For details on sweeps, see Variable Sweep.
   - Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **DC Analysis** window.
4. Optionally, click **Edit Quantities** to open the **Output** window.
   - Click the check boxes on the **Output** window to add net voltages and branch currents to the data generated by the DC analysis.
   - Click **OK** to add the selected output values and return to the **DC Analysis** window.
5. The **Select all top level node voltages** checkbox is a short cut to automatically save node voltage output quantities for all schematic nets which aren't being saved otherwise.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Caution -For larger designs this could result in large solution data files and an increase in total simulation time.

6. Optionally, use the fields in the **Solution Options** group box to select or add DC analysis options and other Nexxim options to the design.

- Click **Select** on the **Name** field to open the **Select Solution Options** window.

If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a named option set that you have previously defined, click the name of the option set, then click **OK** to return to the **DC Analysis** window. The named option set appears in the **Name** field in the **Solution Options** group box.

To create a new option set, click **New** to open the **Solution Options** window. Click the **Name** field to name the new option set. Select the **DC Options** tab. Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window box. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the **DC Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.

- Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**.

Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Do not include the keyword .OPTIONS; the .OPTIONS keyword is automatically inserted at the beginning of the line in the netlist statement.

The line can contain multiple options settings. Use spaces to separate the options settings.

To modify or delete an option once it has been added, just edit or delete its entry in the list.

To clear all options, delete the entire line.

Click **OK** to return to the **DC Analysis** window.

The options in the **Additional** field are automatically added to the netlist when the solution containing them is performed.

- For more information, see DC Analysis Options.

7. Run the simulation:

- From the **Circuit** menu, select **Start Analysis**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- The **Message Manager** window signals success or failure.
- For details on creating and modifying reports, see Generating Reports and Post-processing.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DC Operating Point Statement in a Netlist

To perform a DC operating point analysis on a Nexxim circuit in the Netlist Editor, the netlist should contain a .DC statement. The syntax is:

.DC

or

.OP

By default, all node voltages and branch currents are output to the results file. For large circuits, significant simulation time can be saved by specifying a set of values to output, rather than the default of calculating variables for every node or current in the circuit.

In the **Schematic Editor**, Click the **Edit Output Quantities** feature in the **Solution Setup** window to specify particular outputs.

The netlist can use one or more .PRINT statements to specify the outputs from DC analysis. If you do not add a .PRINT statement, all node voltages and branch currents are output to the results file. The netlist syntax for printing DC analysis results is:

.PRINT DC*output1* [*output2*] ...

For more information see Controlling Nexxim Output.

DC Analysis Options

The DC analysis options are listed in the DC Analysis Options Reference. In the **Schematic Editor**, these option values can be changed by selecting **Solution Options** on the **Solution Setup** window, then selecting the **DC Options** tab.

In the netlist editor, set option values by specifying them on an .OPTIONS statement. The syntax for the .OPTIONS statement is:

.OPTIONS [**dc.**]*option1*=*value1* [[**dc.**]*option2*=*value2* ...]

Use the prefix **dc.** to associate an option with DC analysis only. Options with no prefix apply to all analyses that recognize the option. Options that are set in the **Solution Options** window under **DC Solution Setup** in the **Schematic Editor** automatically receive the **dc.** prefix in the generated netlist.

- See Analysis-Specific Options for a listing of options that are used by more than one Nexxim analysis.
- See DC Analysis Technical Notes for an explanation of the DC controls and options.
- See Convergence, Speed, and Accuracy for a discussion of the effect of changing these options.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Table 15: Nexxim DC Analysis Options

Option	Default Value	Description
abstol	1e-9	Absolute current tolerance (Amps). The DC simulator starts with this options at an initial value.
alpha	1e-13	Minimum conductance of the resistor placed in parallel with each branch (mho, equivalent to GMINDC)
autoconverge	1	1 = Enable automatic cyclic progression through convergence methods starting with **conv** setting, upon convergence failure. 0 = Turns off automatic cycling of methods.
beta	1e-12	Minimum conductance of the resistor placed between each node and ground (mho, equivalent to GSHUNT)
conv	1	1 = Beta and device continuation 2 = Device continuation 3 = Pseudotransient 4 = Modified beta/device continuation 5 = Alpha, beta, and device continuation
create_ic_file	0	1=Create initial conditions (.ic) file from DC operating point.
dcic	1	Flag to ignore initial conditions
gmax	1e2	Maximum conductance of the resistor placed in parallel with each branch (mho). Used for HSPICE compatibility in nodesets and initial conditions
limiting	1	1=allow limiting on Newton steps
limiting_ method	Standard Limiting	Standard Limiting = Damped Newton-Raphson. Modified Limiting = Newton-Raphson with enhanced limiting algorithm. Faster convergence rate for moderately nonlinear circuits.
limiting_step	0.3 for nonlinear circuits. Very large (unavailable) for linear circuits	Maximum absolute voltage update allowed per N-R iteration (Volts). The DC simulator starts with this options at an initial value.
max_ continuation_ iterations	500	Maximum number of continuation steps allowed per strategy
max_newton_ iterations	200	Maximum number of Newton-Raphson (N-R) iterations per continuation step. The DC simulator starts with this

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Option	Default Value	Description
		options at an initial value.
max_newton_ iterations_limit	None	Maximum post-lambda pseudo-transient continuation
max_pt_ continuation_ iterations (Used only when **conv=3** has been specified.)	5000	Maximum iterations of pseudotransient continuation
min_lambda_ step	1e-4	Minimum lambda step allowed in continuation
noisemodel	external	external = use external data if present, else use internal noise model internal = use internal noise model. External data is ignored none = no noise calculation Noisemodel applies to frequency domain analyses, not to time domain.
output_ic_file_ name	None	Name of the initial condition file
reltol	1e-3	Relative current and voltage tolerance. The DC simulator starts with this options at an initial value.
result_as_ initial_guess	1	Turned off, when set to 0, otherwise the use of the result from each step in a sweep as the initial guess for the next sweep step.
vntol	50e-6	Absolute voltage tolerance (Volts). The DC simulator starts with this options at an initial value.

Nexxim Monte Carlo Analysis

The Nexxim DC and transient analyses can be performed multiple times while using randomly generated values of one or more component parameters. The random-value method is referred to as Monte Carlo analysis. For DC, Monte Carlo analysis can be performed with or without specifying a parameter sweep. For details on the syntax used to specify sweeps, see Variable Sweep.

A Monte Carlo analysis requires three steps:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Define a netlist parameter using one of the Monte Carlo distributions.
2. Use the netlist parameter directly or indirectly as the value of an element parameter or model parameter.
3. Add the Monte Carlo analysis to the DC or TRAN solution setup in the netlist.

> **Note:**
>
> Monte Carlo analysis is supported only in netlists. There is no setup dialog in the schematic editor.

Monte Carlo Analysis Netlist Syntax

Monte Carlo Analysis Options

Monte Carlo Distributions

Running Monte Carlo Analyses

If you use the Netlist Editor to create a design, the netlist should contain the information for running the Monte Carlo analysis. No Solution Setup is required.

1. Specify the Monte Carlo analysis as part of simulation statement (.DC or .TRAN), using the syntax described in the section Monte Carlo Analysis Netlist Syntax.
2. Run the simulation:

- On the **Circuit** menu, click **Analyze with Nexxim**. If the circuit is set up correctly, the analysis begins immediately and a green progress bar appears.
- The **Message Window** signals success or failure.

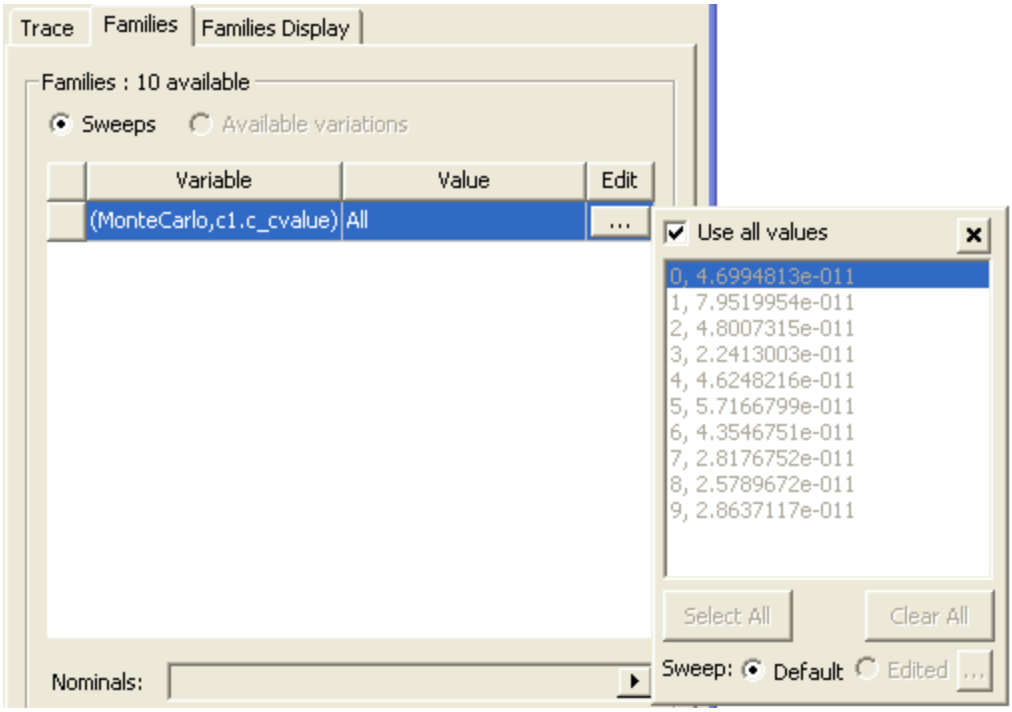
Viewing a Monte Carlo Analysis in a Report

After running a Monte Carlo Analysis, you can plot any calculated or derived quantity against the sequence of Monte Carlo parameter values.

1. Right-click the Results icon in the Project tree, and select **Create Standard Report >Rectangular Plot** from the menus.
2. The **Reports** dialog opens. The Solution, Domain, and Plotting Values fields have all been filled in with the correct data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Click on the **Families** tab. Select the **Monte Carlo** item to display the sweep values:



4. Select the **Use all values** box.
5. Click **New Report**. The report is displayed in the window.

Monte Carlo Analysis Netlist Syntax

The netlist syntax for Monte Carlo analysis has three parts:

- The netlist parameter definition.

  See Defining a Monte Carlo Netlist Parameter.

- The use of the netlist parameter as the value of a component or model parameter.

  See Setting a Component or Model to Use Monte Carlo Analysis.

- The addition of Monte Carlo analysis to the solution setup statement.

  See Monte Carlo Solution Setups.

Defining a Monte Carlo Netlist Parameter

The netlist uses the .PARAM statement to define a netlist parameter with a Monte Carlo distribution. Five distributions are supported:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Uniform distribution with absolute bounds
- Uniform distribution with relative bounds
- Gaussian distribution with absolute spread
- Gaussian distribution with relative spread
- Limit or min/max distribution

See Monte Carlo Distributions for explanations of these distributions.

Uniform Distribution with Absolute Bounds

To define a Monte Carlo netlist parameter with uniform distribution and absolute bounds, use the following syntax:

.PARAM *name*=**AUNIF(***nominal_value*,*absolute_bound* [,*multiplier*]**)**

Monte Carlo values will be generated from a uniform distribution in the range:

(*nominal_value-absolute_bound*) to (*nominal_value* + *absolute_bound*)

If a *multiplier* is specified, that many values will be generated, the value that has the highest absolute deviation from the nominal value will be used in the simulation, and the other values will be discarded. The default is to do one selection.

For example, to define a uniform distribution with a nominal value of zero and an absolute range of plus or minus five:

```
.PARAM D1=AUNIF(0, 5)
```

Uniform Distribution with Relative Bounds

To define a Monte Carlo netlist parameter with uniform distribution and relative bounds, use the following syntax:

.PARAM *name*=**UNIF(***nominal_value*,*relative_bound* [,*multiplier*]**)**

Monte Carlo values will be generated from a uniform distribution in the range:

-(*nominal_value*×*relative_bound*) to +(*nominal_value*×*relative_bound*)

If a *multiplier* is specified, that many values will be generated, the value that has the highest absolute deviation from the nominal value will be used in the simulation, and the other values will be discarded. The default is to do one selection.

For example, to define a uniform distribution with a nominal value of 10 and a relative range of plus or minus 5%:

```
.PARAM D1=UNIF(10, 0.05)
```

A relative distribution cannot have a nominal value of zero. To create an actual distribution with relative range and nominal value zero, you could use a secondary variable:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
.PARAM D1=UNIF(10, 0.05)
.PARAM ACTUAL_D1='D1 - 10'
```

Alternatively, you could use the expression to set the instance or model parameter:

```
R21 Vin 0 R='1000 + (D1 - 10)'
```

Gaussian Distribution with Absolute Spread

To define a Monte Carlo netlist parameter with Gaussian distribution and absolute spread, use the following syntax:

.PARAM *name*=**AGAUSS(***mean*,*abs_spread*, num_*sigma*[,*multiplier*]**)**

Monte Carlo values will be generated from a Gaussian distribution with standard deviation:

σ = *abs_spread/num_sigma*

If a *multiplier* is specified, that many values will be generated, the value that has the highest absolute deviation from the mean will be used in the simulation, and the other values will be discarded. The default is to do one selection.

For example, to define a Gaussian distribution with a mean of zero and a standard deviation of 1 (a “normal” distribution) using an absolute spread:

```
.PARAM D1=AGAUSS(0, 3, 3) // Normal distribution
```

Gaussian Distribution with Relative Spread

To define a Monte Carlo netlist parameter with Gaussian distribution and relative spread, use the following syntax:

.PARAM *name*=**GAUSS(***mean*,*rel_spread*, num_*sigma*[,*multiplier*]**)**

Monte Carlo values will be generated from a Gaussian distribution with standard deviation:

σ = (*mean* × *rel_spread*)*/num_sigma*

If a *multiplier* is specified, that many values will be generated, the value that has the highest absolute deviation from the mean will be used in the simulation, and the other values will be discarded. The default is to do one selection.

For example, to define a Gaussian distribution with a mean of 10 and a standard deviation of 50% of the mean, using a relative spread:

```
.PARAM D1=GAUSS(10, 0.5, 1)
```

A relative distribution cannot have a mean of zero. To create an actual distribution with relative range and zero mean, you could use a secondary variable:

```
.PARAM D1=GAUSS(10, 0.5, 1)
.PARAM ACTUAL_D1='D1 - 10'
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Alternatively, you could use the expression to set the instance or model parameter:

```
R21 Vin 0 R='1000 + (D1 - 10)'
```

Limit or Min/Max Distribution

To define a Monte Carlo netlist parameter with a limit or min/max distribution, use the following syntax:

.PARAM *name*=**LIMIT(***nominal_value*,*absolute_offset*]**)**

Either the minimum value (*nominal_value-absolute_offset*) or the maximum value (*nominal_value + absolute_offset*) will be selected, with equal probability.

For example, to create a sample set consisting of the two values 5 and 15, you could use:

```
.PARAM D1=LIMIT(10, 5)
```

Setting a Component or Model to Use Monte Carlo Analysis

When the netlist specifies the name of a Monte Carlo netlist parameter as the value of an instance or model parameter, Nexxim will generate a random variable for it, and will recalculate the random variable when the instance or model parameter is referenced.

For both the instance and the model usage, the reference to the Monte Carlo distribution can be individual or grouped.

Instance Parameter with Individual Reference

In an individual reference, the instance parameter references the Monte Carlo netlist parameter directly.

In the following example, the two resistors will be simulated using separate random distributions for their resistance values:

```
.PARAM indiv=AUNIF(0, 0.05)
...
Rtest1 Vin 0 R='0.1 + indiv'
Rtest2 Vin 0 R='0.1 + indiv'
```

Instance Parameter with Group Reference

In a group reference, the instance parameter references a netlist parameter that in turn references the Monte Carlo netlist parameter.

In the following example, both resistors will be simulated using the same set of random values for resistance.

```
.PARAM indiv=AUNIF(0, 0.05)
.PARAM group='10*indiv'
...
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
Rtest1 Vin 0 R='0.1 + group'
Rtest2 Vin 0 R='0.1 + group'
```

Model Parameter with Individual Reference

In an individual reference, the model parameter references the Monte Carlo netlist parameter directly.

In the following example, the two MOSFET instances will be simulated using the random distribution for model parameter TOX specified for the model.

```
.PARAM indiv_model=AGAUSS(0, 5, 3)
...
Mtest1 Vcc Vin 0 MonteModel
Mtest2 Vcc Vin 0 MonteModel
.MODEL MonteModel NMOS LEVEL=1 TOX='1.0e-7+indiv_model*1e-8'
```

Model Parameter with Group Reference

In a group reference, the model parameter references netlist parameter that in turn references the Monte Carlo netlist parameter.

In this example, all instances of either MonteModel1 or MonteModel2 will use the same values of model parameter TOX.

```
.PARAM indiv_model=AGAUSS(0, 5, 3)
.PARAM group_model='indiv_model*1e-8'
...
Mtest1 Vcc Vin 0 MonteModel1
Mtest2 Vcc Vin 0 MonteModel2
.MODEL MonteModel1 NMOS LEVEL=1 TOX='1.0e-7 + group_model'
.MODEL MonteModel2 NMOS LEVEL=1 TOX='1.0e-7 + group_model'
```

Combining Instance and Model Distributions

The netlist can specify one distribution on an instance parameter, and a different distribution on a model parameter. The two distributions must be referenced by different parameters. Nexxim then creates two distributions, one for the model and another for the element. For example, a MOSFET instance could use a Monte Carlo distribution for channel length variations (that might differ from instance to instance of MOSFETs on a wafer) and the model could use a different distribution for oxide thickness (that could differ from wafer to wafer).

Monte Carlo Solution Setups

To run a Monte Carlo Analysis with a simple DC analysis, use the following syntax:

.DC SWEEP MONTE=*mval* [**FIRSTRUN=***firstval*]

To run a Monte Carlo analysis with a DC sweep, use the following syntax:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

.DC *variable sweep_spec***SWEEP MONTE=***mval* [**FIRSTRUN=***firstval*]

To run a Monte Carlo analysis with Transient analysis, use the following syntax:

.TRAN*stepstoptime***MONTE=***mval* [**FIRSTRUN=***firstval*]

In the Monte Carlo setup, the value (*mval*) specified for the **MONTE** keyword sets the number of Monte Carlo trials to be run. The random value generator can be set to start at a definite seed value by setting the **SEED** option (See Monte Carlo Analysis Options).

Here are some examples. Suppose the Monte Carlo parameters have been set up with the following statements (from a previous example):

```
.PARAM indiv=AUNIF(0, 0.05)
...
Rtest1 Vin 0 R='0.1 + indiv'
Rtest2 Vin 0 R='0.5 + 10*indiv'
```

Now, to run a DC analysis using ten random resistance values for each resistor:

```
.DC SWEEP MONTE=10
```

To run a set of Monte Carlo analyses during each iteration of a DC sweep:

```
.DC Vin V LIN 0.1 0.5 5 SWEEP MONTE=10
```

The previous example would execute five iterations of the voltage sweep, with ten Monte Carlo variations in each iteration, for a total of 50 analyses.

To run a transient analysis with the same Monte Carlo parameters:

```
.TRAN 1e-3 10e-2 SWEEP MONTE=10
```

The **FIRSTRUN** parameter runs the Monte Carlo simulation starting with random value number *firstval*, and continuing through random value number (*mval* minus 1). Random values 1 through (*firstrun*-1) are discarded. The **FIRSTRUN** parameter can be used with the **SEED** option to partition a Monte Carlo analysis over separate runs. Any Monte Carlo analysis that starts with a given **SEED** setting runs through the same sequence of random values. So, for example, you could run ten trials with the following netlist:

```
.OPTION SEED=5
...
.TRAN 0.1 10 SWEEP MONTE=10
```

And later, modify the netlist as follows to do the next ten trials:

```
.OPTION SEED=5
...
.TRAN 0.1 10 SWEEP MONTE=21 FIRSTVAL=11
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **FIRSTVAL** entry causes Nexxim to run the Monte Carlo analysis, discarding the first ten random values, then execute transient simulations using Monte Carlo values 11 through 20.

If a solution setup does not specify a Monte Carlo distribution, the nominal or mean value will be used as the value of any Monte Carlo netlist parameter that is referenced by an instance or model parameter, when that solution is run.

You can specify a Monte Carlo distribution for one or more analyses, but use the nominal values of Monte Carlo netlist parameters for other analyses set up in the netlist. For example, using the netlist from the previous examples:

```
.PARAM indiv=AUNIF(0, 0.05)
...
Rtest1 Vin 0 R='0.1 + indiv'
Rtest2 Vin 0 R='0.5 + 10*indiv'
.DC
.TRAN 1e-3 10e-2 SWEEP MONTE=10
```

The DC analysis uses the nominal value (zero) for the Monte Carlo parameter indiv. The transient analysis sweeps the Monte Carlo parameter over the specified distribution.

Monte Carlo Analysis Options

Nexxim Monte Carlo analysis recognizes one option, the **SEED** option, set with the following syntax:

.OPTION SEED=*seed_value*

The *seed_value* is used by the random-value generator to initialize the sequence of pseudo-random values. All Monte Carlo analyses that use a given *seed_value* generate the same sequence of parameter values. The *seed_value* should be a positive integer.

In the absence of a **SEED** option setting, Nexxim Monte Carlo analysis calculates a seed internally.

Monte Carlo Distributions

Nexxim Monte Carlo analysis supports three distributions from which random values are selected—uniform, Gaussian, and limit (min/max).

Uniform Distribution

A uniform distribution generates values within a range centered on a nominal value. All values within the range have equal likelihood of selection.

The range for a uniform distribution can be specified using absolute bounds or relative bounds.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- With an **absolute bound**, the range is the nominal value plus or minus the absolute bound. For example, if the nominal value is zero and the absolute bound is 2.5, the range of values is -2.5 to +2.5.
- With a **relative bound**, the range is the nominal value plus or minus the relative bound times the nominal value. For example, if the nominal value is 10 and the relative bound is 0.1, the range of values is 9 to 11. Note that a relative range cannot have a nominal value of zero.

Selection from a uniform distribution can be set up to do multiple selections and simulate with the value that has the highest absolute deviation from the nominal value. For example, suppose the nominal value is zero and the range is from -2.5 to +2.5. With a multiplier of 5, the Monte Carlo analyzer might select the five values -1.1, 2.2, 0.7, -2.4, and -0.6. The most extreme value, -2.4, would be used in the simulation and the other selections would be discarded. The resulting output distribution is somewhat bimodal. If no multiplier is specified, the default is one selection.

Gaussian Distribution

A Gaussian distribution generates values from plus infinity to minus infinity ($-\infty$ to $+\infty$) centered on the mean or nominal value. A value within the distribution has a probability of selection determined by the standard deviation.

The standard deviation for a Gaussian distribution is specified using an absolute spread or a relative spread that represents a specified number of standard deviations.

- With an **absolute spread**, the standard deviation is the absolute spread divided by the number of standard deviations it represents. For example, if the absolute spread is 2 and it represents 3 standard deviations, the standard deviation is 2/3 or 0.6666.
- With a **relative spread**, the standard deviation is the relative spread times the mean, divided by the number of standard deviations represented by the product. For example, if the mean is 10, the relative spread is 0.2 and the product represents 3 standard deviations, the standard deviation is (10×0.2)/3 or 0.6666. Note that a relative spread cannot have a mean of zero.

Selection from a Gaussian distribution can be set up to do multiple selections and simulate with the value that has the highest absolute deviation from the nominal value. For example, suppose the mean value is zero, the standard deviation is 1.0, and the range is from the range is -1.5 to +1.5. With a multiplier of 5, the Monte Carlo analyzer might select the five values -0.1, 1.2, 0.7, -0.4, and 0.6. The most extreme value, 1.2, would be used in the simulation and the other selections would be discarded. The resulting output values would tend to be somewhat bimodal. If no multiplier is specified, the default is one selection.

Limit or Min/Max Distribution

A limit or min/max distribution generates two values offset an absolute distance from the nominal value. The two values have equal likelihood of selection. The two values are:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The nominal value plus the absolute offset.
- The nominal value minus the absolute offset.

Circuit Transient Analysis

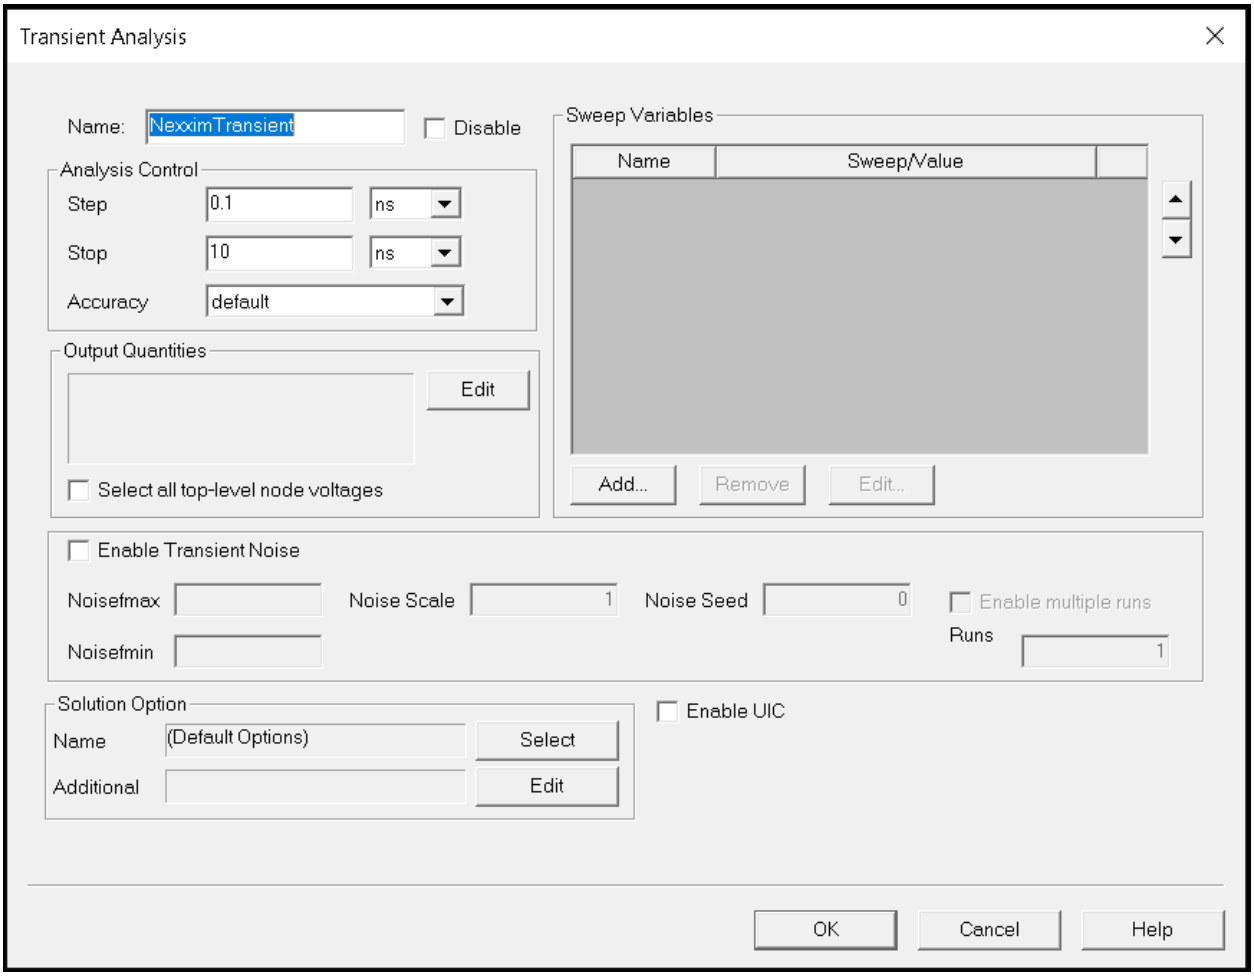
Transient analysis computes the time-domain response of a circuit by numerically integrating a system of differential/algebraic equations. The equations are derived on the circuit topology and from information provided by the circuit device models. Transient analysis breaks continuous time into discrete timesteps and uses numerical integration methods (such as the trapezoidal rule) and Newton-Raphson iterations to solve the circuit equations at each timestep.

Transient Analysis Setup from the Schematic Editor

From the **Schematic Editor**, perform the following steps to set up and run a Nexxim transient analysis:

1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **Transient Analysis** to open the **Transient Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Type an **Analysis Name** (or accept the default name, “NexximTransient”).
3. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
4. Under **Analysis Control**, specify the **Step** time, the **Stop** time, and the **Accuracy** level using the drop-down menu.
5. To add a sweep, locate the **Sweep Variable** area in the **Transient Analysis** window.

- From the **Sweep Variable** area, select **Add** to open the **Add/Edit Sweep** window.
- In the **Variable** list, select **Temp** or the name of a variable (when a variable has been defined for the design), then select one of the following: **Single value, Linear step, Linear count, Decade count**, or **Octave count**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
- For details on sweeps, see Variable Sweep.
- Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **Transient Analysis** window.

6. Optionally, click **Edit** in the **Output Quantities** group box to open the **Output** window.

- Click the check boxes on the **Output** window to add net voltages and branch currents to the data generated by the transient analysis.
- Click **OK** to add the selected output values and return to the **Transient Analysis** window.

7. The **Select all top level node voltages** checkbox is a short cut to automatically save node voltage output quantities for all schematic nets which aren't being saved otherwise.

   Caution -For larger designs this could result in large solution data files and an increase in total simulation time.

8. Optionally, click the **Enable Transient Noise** group box to activate the fields in the transient noise group box. Refer to the *Transient Noise* topic in the "Transient Analysis Netlist Syntax " on page 12-25 for details on these fields.
9. Optionally, use the fields in the **Solution Options** group box to select or add Transient or DC analysis options and other Nexxim options to the design.

- Click **Select** on the **Name** field to open the **Select Solution Options** window.
- Check the **Enable UIC** checkbox to enable UIC.

If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a named option set that you have previously defined, click the name of the option set, then click **OK** to return to the **Transient Analysis** window. The named option set appears in the **Name** field in the **Solution Options** group box.

To create a new option set, click **New** to open the **Solution Options** window. Click the **Name** field to name the new option set. Select the **DC Options** or **Transient Options** tab. Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the **Transient Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.

- Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**.

Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Do not include the keyword .OPTIONS; the .OPTIONS keyword is automatically inserted at the beginning of the line in the netlist statement.

The line can contain multiple options settings. Use spaces to separate the options settings.

To modify or delete an option once it has been added, just edit or delete its entry in the list.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To clear all options, delete the entire line.

Click **OK** to return to the **Transient Analysis** window.

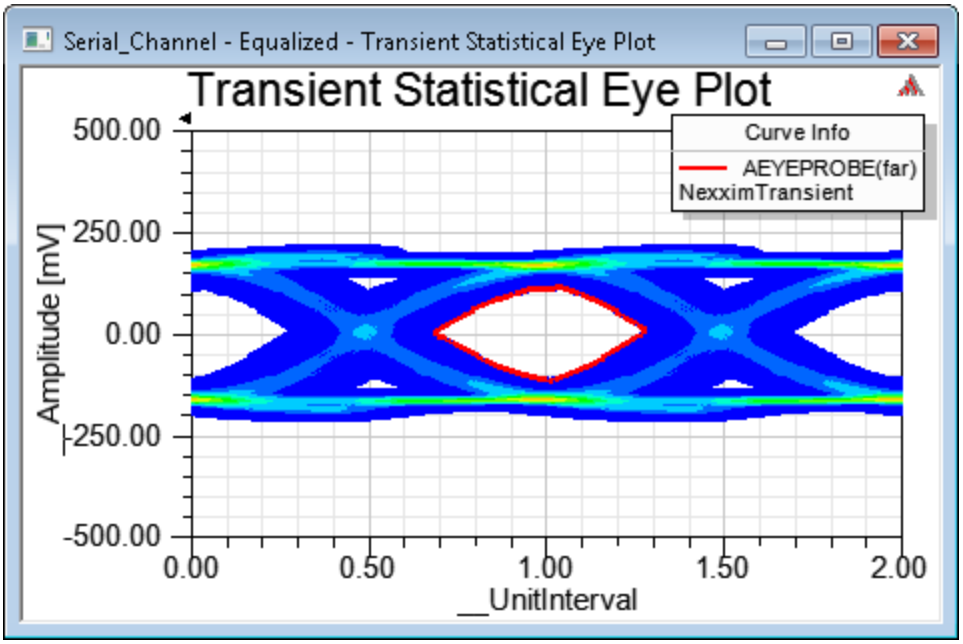
The options in the **Additional** field are automatically added to the netlist when the solution containing them is performed.

- For more information, see Transient Analysis Options.

10. Run the simulation:
    - From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
    - The **Message Manager** window signals success or failure.

Generating a Transient Sampled Eye Report

A sampled or statistical eye diagram samples the transient data to generate the eye. To generate a sampled or statistical eye report after transient analysis has run to completion, click the Results icon and select **Create Statistical Eye Report** > **Statistical Eye Plot**. Select your Transient analysis as the Solution, **UI** as the Domain, **Eye** as the Category, your Eye Probe as the Quantity, and **<none>** as the Function. Click **New Report** to generate the plot. Here is an example:



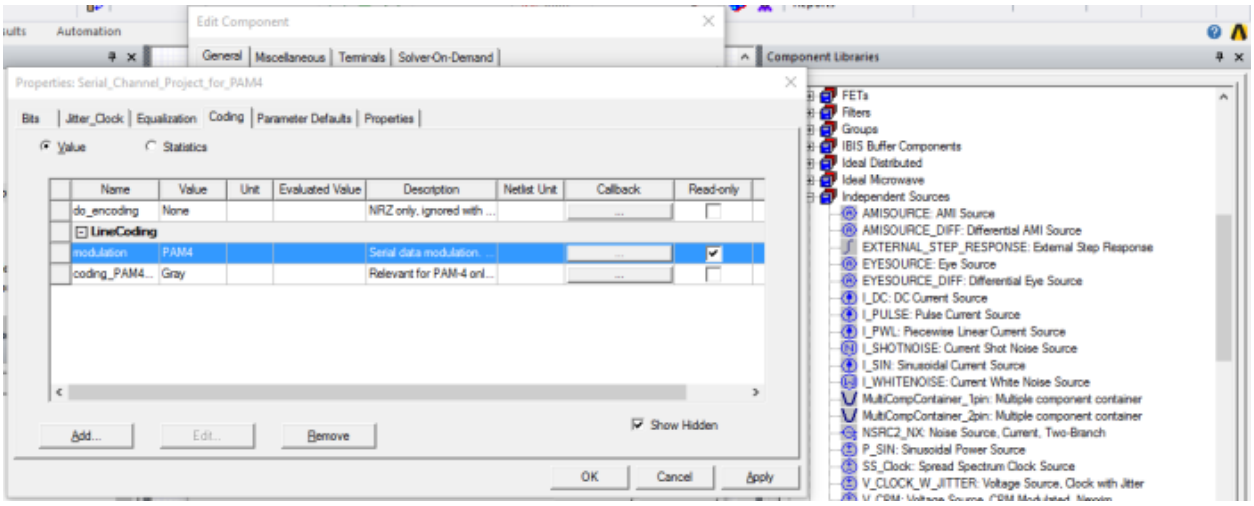
PAM-4 Transient Analysis

PAM-4 signaling is advantageous because it doubles the number of bits in serial data transmissions. PAM-4 allows you to double the bit rate in the channel without doubling the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

required bandwidth. This is accomplished by increasing the number of levels of pulse-amplitude modulation, but does so at the cost of noise susceptibility.

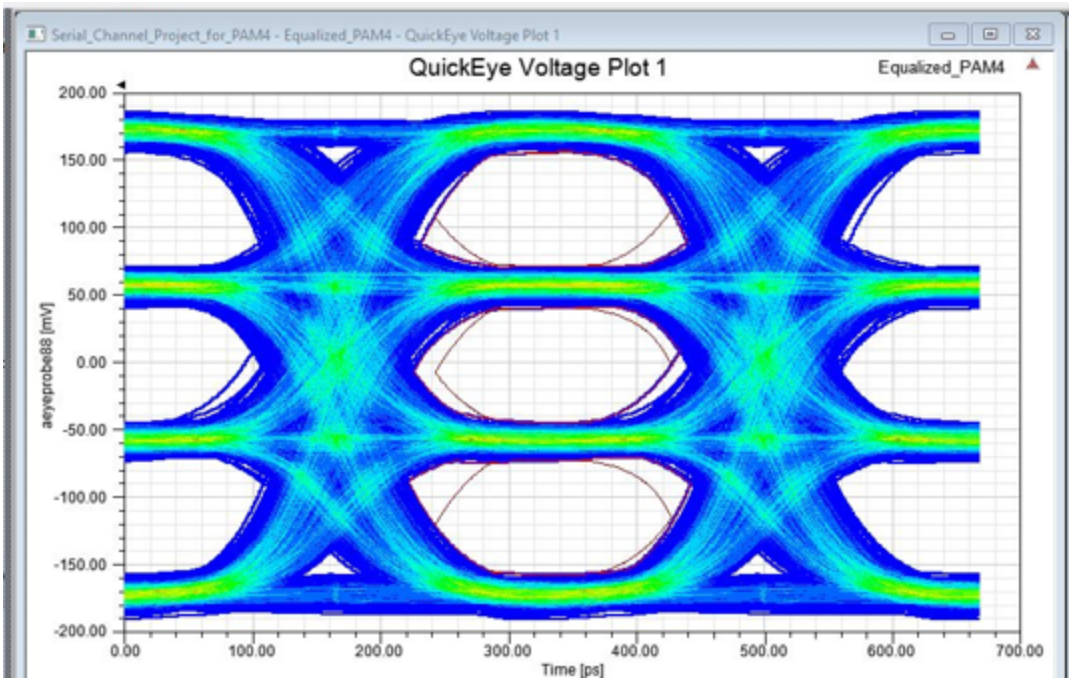
To set up a PAM-4 Transient Analysis, select and edit the Eye Source listed in the Components Window. Then, in the Coding tab of the **Properties** window, click the modulation Value and select **modulation PAM-4**.

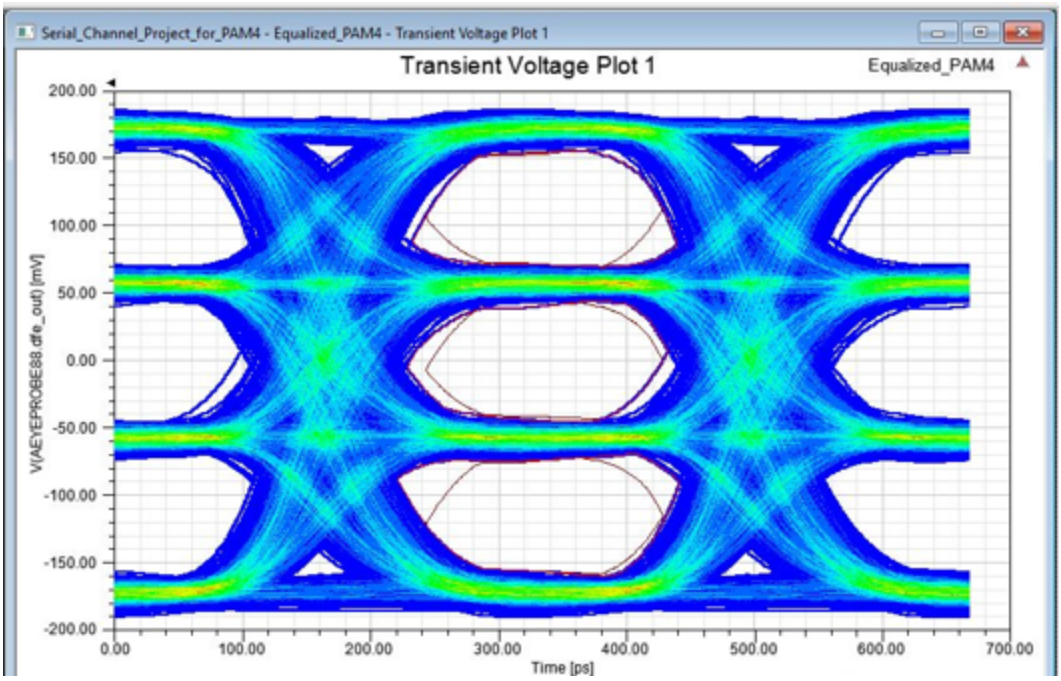


Voltage Plots of PAM-4 Results

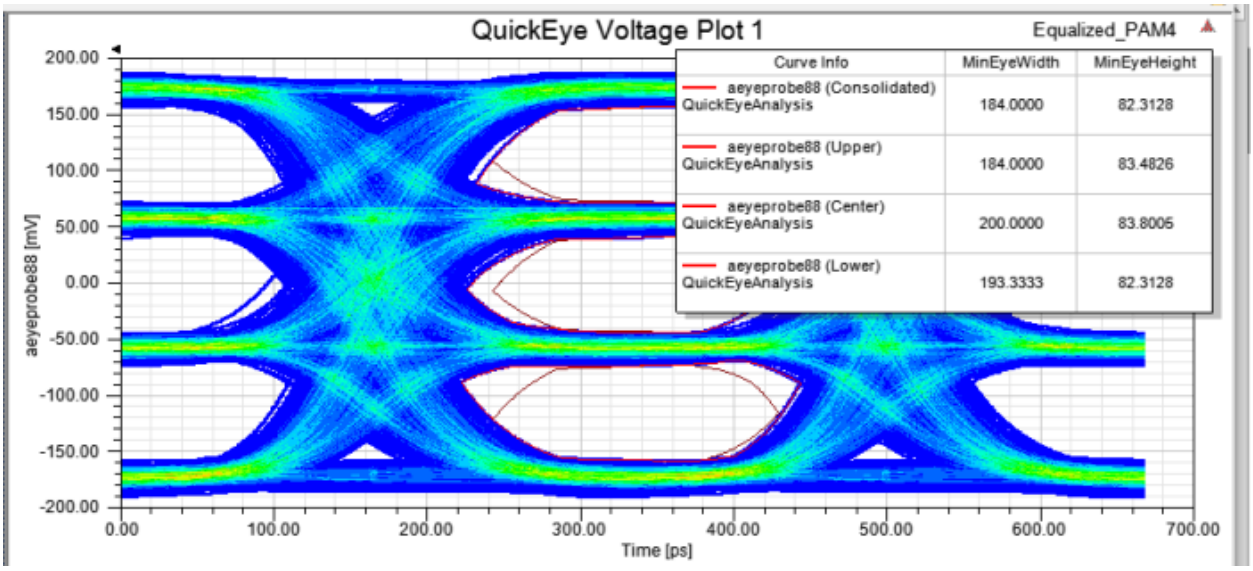
When you generate a Rectangular Eye Diagram from PAM-4 data, the waveform sub-view can be zoomed in to show the boundaries of the unit intervals (black lines) and the inner-eye contour overlay. Following are some examples of PAM-4 Plot Results.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For more information, see 2D and Circuit PAM-4 Eye Plot.

Running Transient Analysis on the Netlist Editor

If you use the Netlist Editor to create a design, the netlist contains the information for running the linear network analysis, as described later in this topic. No Solution Setup is required.

Run Circuit Transient Analysis

To run the transient analysis setup:

1. From the **Circuit** menu, select **Analyze with Nexxim**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
2. The **Message Manager** window signals success or failure.

For details on creating and modifying reports, see Generating Reports and Post-processing.

Transient Analysis Netlist Syntax

The transient analysis setup in a netlist has a basic form plus optional arguments for control of accuracy, access to file data, and calculation of noise.

TRAN Statement

To execute transient analysis simulation on a circuit, add a .TRAN statement to the netlist. The syntax for the basic .TRAN statement is:

```
.TRANstep stoptime
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

All transient analyses start at time 0. The *step* argument is a suggested initial step size and also influences the maximum step size that is used. The *stoptime* argument sets the end of the transient solution interval. For example, to execute a transient analysis on an interval from time zero to one microsecond with a suggested initial step size of one nanosecond:

```
.TRAN 1e-9 1e-6
```

Transient Analysis Accuracy Syntax

Two optional arguments on the transient analysis statement provide broad control over the trade-off between speed and accuracy:

```
.TRAN stepstoptime
+ ERRPRESET=relaxed|moderate|strict
 + RELREF=pointlocal|allocal|sigglobal|allglobal
```

The **ERRPRESET** argument overrides the settings for several options that control the trade-off between speed and accuracy.

Option	Errpreset Controls errpreset			
	None	**relaxed**	**moderate**	**strict**
reltol	x1	x10	x1	/10
trtol	7	7	7, 8, and 9	10
relref	alllocal	sigglobal	sigglobal	alllocal
method	trap	trap	trap	ndf2
update_jacobian_ period	3	3	3	1

Errpreset can be set to **relaxed**, **moderate**, **strict**, **pspice**, or **pspice2**:

- **Relaxed** lowers accuracy to speed simulation. Set the following values and they will not be overridden by errpreset.
    - **Local truncation error factor (trtol)** = **< 7**
- **Moderate** balances accuracy and speed. To avoid long simulation time caused by high accuracy settings, or low accurate results due to fast settings, the following values will be automatically set.
    - Reset **Error reference (relref)**= **sigglobal** if the customized value is **alllocal** or **pointlocal**
    - Reset **Integration method** = **trapezoidal** if the customized value is **ndf2**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

    - Reset **Local truncation error factor (trtol)**= **7** if the customized value is **< 7**
    - Reset **Local truncation error factor (trtol)**= **9** if the customized value is **> 9**
- **Strict** provides results of high accuracy but slows simulation. Set the following values and they will not be overridden by errpreset.
    - **Error reference (relref)**= **pointlocal**
    - **Local truncation error factor (trtol)** = **>10**
    - **Update Jacobian period** = **1**
- **Pspice** is only available if the circuit contains pspice components. Pspice will be overridden by **relaxed**, **moderate**, or **strict** settings if **Accuracy** is customized. The following values are automatically set to improve the chance of convergence:
    - Reset **Integration method** = **ndf2** if the customized value is **trapezoidal**
    - Reset **Update Jacobian period** = **1** if the customized value is **>1**
    - Reset **Maximum Newton-Raphson iterations** = **30** if the customized value is **<30**
- **Pspice2** must be enabled manually via the **Solution Option** group box, by entering **tran.errpreset=pspice2**. **Pspice2** takes precedence over all aforementioned errpreset settings and automatically sets the following value.
    - Set **Integration method** = **ndf2**
    - Increase **Max time step size** to **stop time**
    - Set **Update Jacobian period** = **3**
    - Set **Relative error tolerance for current (reltol)** = **0.0025**

The **Relref** argument controls how the norms are computed for the delta check, function check, and LTE checks. *Point-local* means the norm is local to the signal and the timestep. *Local* means the norm is local to the signal but considers the maximums over all time-steps. *Global* means the norm is global for the entire circuit over all time-steps. The settings for **relref** are:

- **pointlocal** = Point-local for delta, function, and LTE
- **alllocal** = Local for delta, function, and LTE
- **sigglobal** = Local for function, global for delta & LTE
- **allglobal** = Global for delta, function, and LTE

In circuits where nodes exhibit a wide range of voltages, the maximum voltage greatly affects tolerance evaluation. Large differences in node voltages can lead to reduced accuracy in tolerance calculations for lower-voltage nodes. To address this, two indicators are used to adjust tolerance settings automatically: **Voltage Ratio** and **Tolerance Jump**. They dynamically configure the **tran.relref** variable to *Point-local* to ensure precise tolerance evaluation when

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

both a high **Voltage Ratio** and a significant **Tolerance Jump** are detected. These adjustments are automatically applied when **strict** accuracy settings are selected.

Transient Analysis File Arguments

Optional arguments on the transient analysis statement enable Nexxim to read initial state information from an external data file, and write initial or final state information to an external data file.

```
.TRANstepstoptime
+ READ_STATE=file_reference
+ WRITE_FINAL_STATE=file_reference
+ WRITE_INITIAL_STATE=file_reference
```

- **READ_STATE** reads the initial values of node voltages on the specified file.
- **WRITE_FINAL_STATE** writes the final values of node voltages to the specified file.
- **WRITE_INITIAL_STATE** writes the initial values of node voltages to the specified file.

See File References for details on references to external files.

Transient Analysis Noise Syntax

To enable transient noise analysis, the .TRAN statement takes additional optional arguments.

```
.TRANstepstoptime
+ NOISEFMAX=val
+ NOISESCALE=val
+ NOISESEED=val
+ NOISEFMIN=val
```

Table 2: Transient Noise Arguments

Argument	Description	Unit	Default
NOISEFMAX	The highest frequency to analyze for pseudorandom noise. Must be non-zero to enable transient noise analysis. Maximum transient timestep is set to 1/NOISEFMAX.	Hz	0
NOISESCALE	Scale factor	None	1
NOISESEED	Random number seed. Using the same seed generates the same set of random values	None	None
NOISEFMIN	Lowest frequency to analyze for noise. Under NOISEFMIN, noise power density is constant. 1/NOISEFMIN must be less than the transient analysis stoptime. **Not used currently.**	Hz	NOISEFMAX
NOISESTART	Noise start time	Second	0

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Netlist Syntax for Sources and Probes

The complete netlist syntax for the Eye Source is provided in the Eye Source component topic.

The complete netlist syntax for the Eye Probe is provided in the Eye Probe component topic.

The complete netlist syntax for the Eye Scope is provided in the Eye Scope component topic.

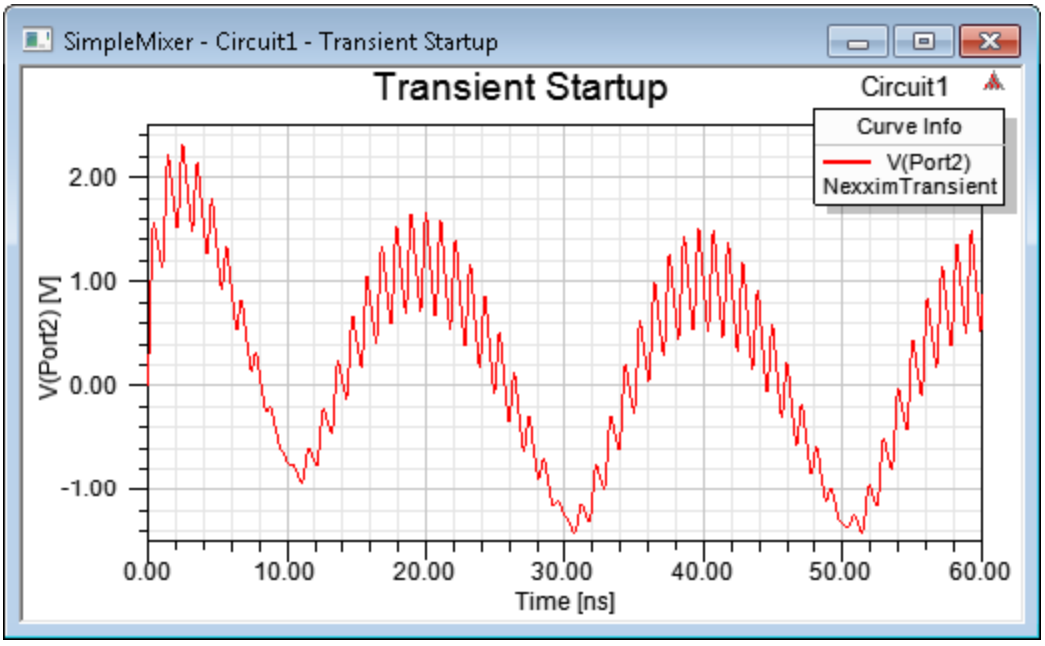
The complete netlist syntax for the MATLAB Probe is provided in the MATLAB Probe component topic.

Transient Analysis Outputs

The graphical plots and reports described in this topic help you to visualize the relationship between design parameters and transient analysis results.

1. To view the Transient results in the Time domain, click on the **Results** icon and select **Create Standard Report>Rectangular Plot**.
2. Selections in the report window are context-sensitive. Whatever Eye Probe/Scope settings are chosen determines the relevant output quantities from which you may select.

   Select Transient analysis as the Solution, **Time** as the Domain, **Voltage** as the Category, a port or net voltage as the Quantity, and **<none>** as the Function.
3. Click **New Report** to generate the plot.



For details on creating and modifying reports, see Generating Reports and Post-processing.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

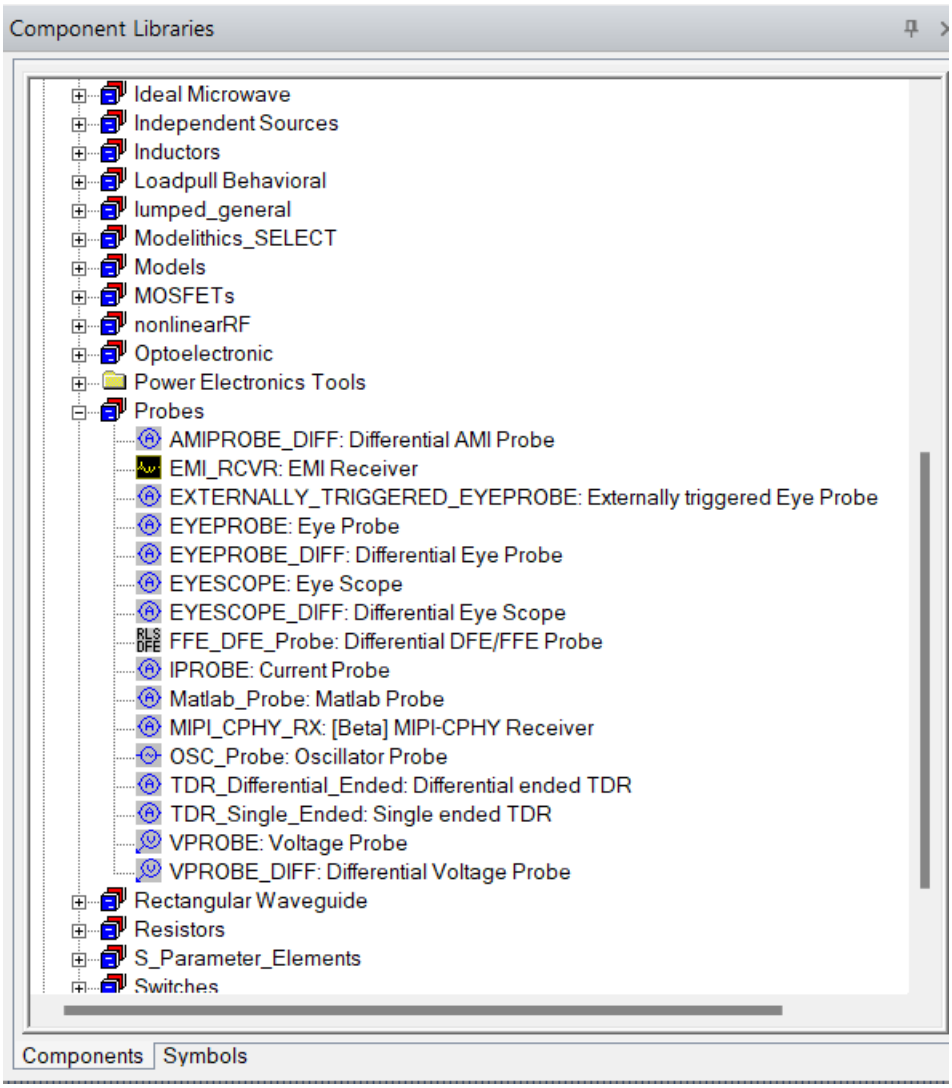
Outputs for Circuits with Eye Source and Eye Probe

The Eye Source and Eye Probe may be used with Transient analysis. In this way a single source and probe set can drive transient, QuickEye, and VerifEye analyses.

The Eye Source and Eye Probe setups for transient analysis are the same as for Quick Eye analysis. The outputs are also similar. See Display Quick Eye Analysis Outputs for statistical eye and bathtub plots for transient analysis.

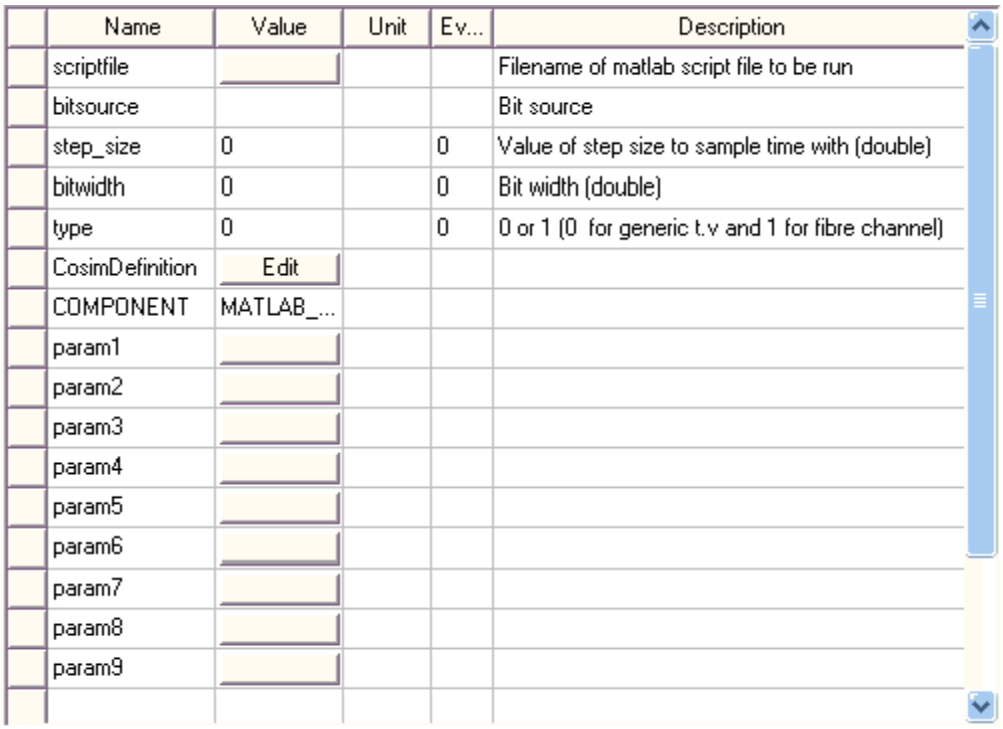
Adding a MATLAB Probe

A MATLAB probe allows the user to pass transient analysis data to a MATLAB script (MATLAB™ is a trademark of The Mathworks, Inc.). In a schematic, select the MATLAB Probe on the list of Probes:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To set up the MATLAB probe, right-click and select **Edit Properties**:



Name	Value	Unit	Ev...	Description
scriptfile				Filename of matlab script file to be run
bitsource				Bit source
step_size	0		0	Value of step size to sample time with (double)
bitwidth	0		0	Bit width (double)
type	0		0	0 or 1 (0 for generic t.v and 1 for fibre channel)
CosimDefinition	Edit			
COMPONENT	MATLAB_...			
param1				
param2				
param3				
param4				
param5				
param6				
param7				
param8				
param9				

- Set **scriptfile** to the name of the file containing the MATLAB script.
- Set **bitsource** to the netlist name of the source of the bit pattern for transient to use.
- Set **bitwidth** to the bit width or unit interval.
- Set **type** to 0 for generic time/voltage data format, 1 for FibreChannel data format.
- For FibreChannel data only, set **step_size** to a non-zero value (fixed step size to interpolate the transient data).
- Enter values for up to ten parameters. Each parameter can be a single numeric or string value, or a vector of numeric or string data.

Transient Parallel Bus Speedup

Highly non-linear circuits do not simulate well with QuickEye or VerifEye, so transient analysis must be used. To speed up transient solutions for large non-linear designs that require simulating millions of bits, Nexxim offers the Transient Parallel Bus Speedup (TPBS) option.

To enable the TPBS feature globally for all analyses, Click the **HPC and Analysis Options** window.

- From **Electronics Desktop**, select **Tools>Options>HPC and Analysis Options**.
- From the **HPC and Analysis Options** window, select the **Options** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Select **Circuit Design** on the **Design type** menu.
- Click **Enable HPC for transient parallel bus speedup**. Use the menu to select **True**.
- Click **OK** to close the **HPC and Analysis Options** window.

To enable TPBS for just a single transient analysis:

- Open the **Transient Analysis** setup window.
- In the **Solution Options** group box, click **Edit** on the **Additional** field.
- Enter tran.tpbs=1 num_threads=*val*, where *val* is the number of threads to be used.
- Click **OK** to close the Transient Analysis setup window.

Parallel bus speedup requires that multiple processors are available for the analysis—10 CPU cores minimum, 16 recommended. Parallel speedup also requires at least 20GB of free memory, 30GB recommended. Due to the overhead required, transient parallel speedup should be used only for bit-pattern problems requiring from a few hundred to millions of bits to determine. TPBS supports RGB, PRBS, Eye, and LFSR bit-pattern sources. A bare minimum of 25 bits per thread is required to switch to TPBS; the minimum increases as the size of the circuit increases.

Transient parallel speedup operates by dividing the simulation length into equal-length overlapping windows; simulation of windows is performed in parallel. After calculating the response within each window, the overlaps are removed using an iterative error-minimizing algorithm.

For the right kind of problem, parallel speedup can achieve a significant speedup of the transient simulation. Parallel speedup is less efficient for small examples and for large ones with relatively small simulation time. Networks with high time constants reduce TPBS efficiency; examples of such networks are transmission lines with large propagation delays and RC networks.

> **Note:** Enabling TPBS turns on passivity enforcement. Click the **Additional** options field in the **Transient Analysis** setup window to set **auto_enforce_passivity=0** if required to simulate.

Circuit Transient Analysis Options

The transient analysis options and their default values are listed in the Transient Analysis Options Reference. See also Transient Analysis Technical Notes for an explanation of the controls and options.

The values can be changed with a .OPTIONS statement. The syntax is:

.OPTIONS tran.*option1***=***value1* [**tran.***option2***=***value2* ...]

The **tran.** prefix causes the option to apply only to transient analysis. Without the prefix, an option in the netlist applies to all analyses that recognize it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

See Analysis-Specific Options for a listing of options that are used by more than one Nexxim analysis.

You can also specify options for DC analysis to control the DC calculation done to obtain the initial conditions for transient analysis. See DC Analysis Options.

You can also specify the statistical eye resolution for circuits with Eye Source and Eye Probe. See Resolutions of Eye Diagram for further information.

Some options (in particular, **abstol** and **reltol**) can affect both DC analysis and transient analysis. To specify different settings for the DC initialization and the subsequent transient analysis, use the prefix **dc.** for the DC settings and the prefix **tran.** for the transient analysis settings. In general, option settings with the prefix **dc.** affect only the DC initialization, and settings with the prefix **tran.** affect only the transient analysis. An option setting with no prefix affects both the DC and transient analyses. However, **dc.abstol** or **dc.reltol** is applied to transient analysis when **tran.abstol** or **tran.reltol** is not given explicitly.

Here is an example:

```
.option dc.conv=3 $ Applied to DC initialization only
.OPTION dc.abstol=4e-9 $ Applied to DC initialization only
.OPTION tran.abstol=1e-9 $ Applied to transient only
.OPTION reltol=2e-4 $ Applies to both DC and transient
.OPTION tran.UI-bins=400 tran.ampl-bins=400 $ for eye resolution
(rest of netlist)
.TRAN 1e-3 1
```

Transient Analysis Error Messages

When Nexxim transient analysis is unable to complete its analysis successfully, it displays an error message. This topic provides an analysis of some of the error messages.

Unable to satisfy convergence tolerances at t=*time*

Nexxim was unable to achieve the accuracy specified by the RELTOL, ABSTOL, and VNTOL options at time *time*. During transient analysis, a variant of Newton's method is used to attempt to solve the nonlinear algebraic problem generated at each time point. Convergence is achieved only when both a delta check and a residue check are satisfied. (The delta check and residue check are explained in the Nexxim DC Analysis topic; see Nexxim DC Analysis Convergence Criteria.) Convergence problems may indicate that some model parameters specified in the netlist are inconsistent or are not correctly interpreted.

- Verify the values of device parameters that are set by device instance statements or MODEL statements in the netlist.

Unable to satisfy local error tolerances on voltage at time *time*, node *nodename*

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Although Nexxim was able to achieve convergence at time *time*, the resulting solution did not satisfy the local error tolerance. This usually indicates that there is a discontinuity or instability in the solution that the transient analysis engine could not step over.

- The best remedy is to change the circuit so as to eliminate the problem behavior.
- A second possible remedy is to adjust the local error tolerance itself. The local error tolerance is looser than the convergence tolerances specified by RELTOL, ABSTOL and VNTOL by a factor of TRTOL. You can relax all transient tolerances by increasing TRTOL to 10 from its default of 7.

See Timestep Control for more information on TRTOL and the local error tolerance.

VerifEye and Quick Eye Analyses

The eye diagram is a convenient way to analyze the performance of a serial communications channel. In a traditional eye diagram, copies of the waveform generated by transient analysis are overlaid at a spacing of one unit interval (UI). The width of the eye is affected by timing variations such as jitter and by variations in setup and hold times. The maximum allowable shrinkage in eye width is called the *jitter budget*. The height of the eye is affected by voltage variations or noise. The maximum allowable closure in eye height is called the *noise margin*. The jitter budget and noise margin depend on the maximum allowable bit error rate (BER), the ratio of correctly received bits to the total number of bits sent. In high-speed channels, the required BER becomes very small, on the order of one error in 10^{12} bits. Generating a useful eye diagram requires transient simulation over multiple terabits.

In practice, however, designers are interested only in the *probability* that a waveform violates the eye window. For this purpose, faster statistical techniques can be used instead of the full transient simulation.

- Quick Eye analysis uses simplifying assumptions to calculate an eye diagram from a transient analysis of single transitions.
- VerifEye analysis uses a fully statistical approach to calculate the BER directly, similar to the public domain Stat Eye.

Quick Eye Analysis

Quick Eye analysis employs pattern-dependent convolution. QuickEye uses a brief transient simulation to calculate the channel's step responses to a single rising edge and a single falling edge. QuickEye combines the step responses with the data stream to approximate the output of the channel. The eye diagram is formed by overlaying UIs in the usual manner. With QuickEye, the effect of inter-symbol interference (ISI) on the bit error rate is easy to calculate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VerifEye Analysis

VerifEye analysis is a statistical eye-analysis algorithm. VerifEye also calculates the rising and falling edge responses. VerifEye calculates the probability density function (PDF) for the receiver voltage, taking into account the conditional probabilities for the various kinds of transitions. The BER at a given sample time is the proportion of the voltage PDF that results in an incorrect bit being read. A plot of the BERs over all sample times generates the familiar bathtub curve.VerifEye simulates transmit jitter by adding the jitter distribution to the PDFs for the edge responses. With edge responses, random jitter is truly random (timings of edges are independent) and duty cycle distortion (DCD) is easy to calculate. QuickEye simulates transmit jitter using Monte Carlo techniques.

Channel Equalization

Both QuickEye and VerifEye have the ability to simulate the effects of equalization on the channel. Both analyses can add feed-forward equalization (FFE) and decision-feedback equalization (DFE).

Peak Distortion Analysis

Peak distortion analysis (PDA) to find the worst case bit pattern is automatically performed for both VerifEye and QuickEye analyses. For Quick Eye analyses, the worst case bit pattern can be pushed to all eye sources, overriding any bit lists set in the eye sources. For both QuickEye and VerifEye analyses, the worst case bit pattern can be displayed in reports.

Running VerifEye Analysis on the Schematic Editor

To run VerifEye analysis, the design must include at least one Eye Source and a corresponding Eye Probe. Channel parameters including equalization are set up in the source and probe. Other parameters can be specified in the setup window.

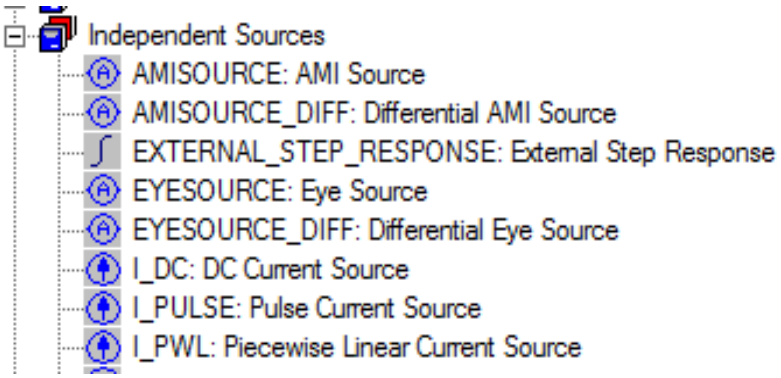
Add an Eye Source for VerifEye

To run VerifEye analysis, the design must include one Eye Source and a corresponding Eye Probe. Note that the Eye sources are internally grounded. All terminals should be connected to signal lines — not directly to ground.

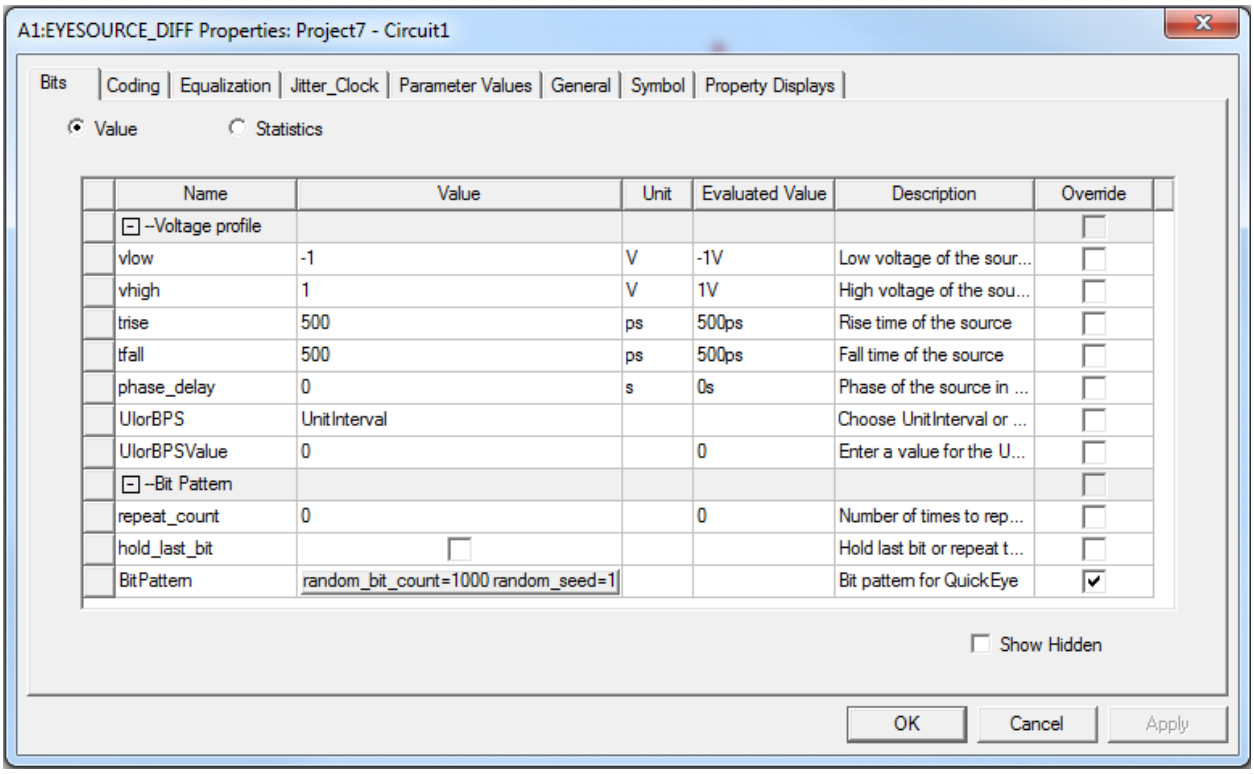
- For Quick Eye analysis, all Eye Source parameters apply except spread spectrum clocking.
- For VerifEye analysis, all parameters apply except the bit pattern generators and spread spectrum clocking.
- For Transient analysis, all parameters apply.

To add an Eye Source, select the source on the Independent Sources list on the Components tab:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Both single-ended and differential versions are available. Click the Eye Source to open the Properties list:



Bits Tab

The **Properties** window opens with the Bits tab displayed.

- The logic low, **vlow**. The default is 0 volt.
- The logic high, **vhigh**. The default is 1 volt.
- The rise time of input (**trise**). The default is 5.0e-10 seconds (500 picoseconds).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The fall time of input (**tfall**). The default is 5.0e-10 seconds (500 picoseconds).
- The **phase_delay** for this source. The default is 0 seconds.
- The data rate: Click the **UIorBPS** drop-down to select **UnitInterval** or **BitsPerSecond**. Then Click the **UIorBPS Value** field to enter the unit interval size or number of bits per second.

Coding Tab

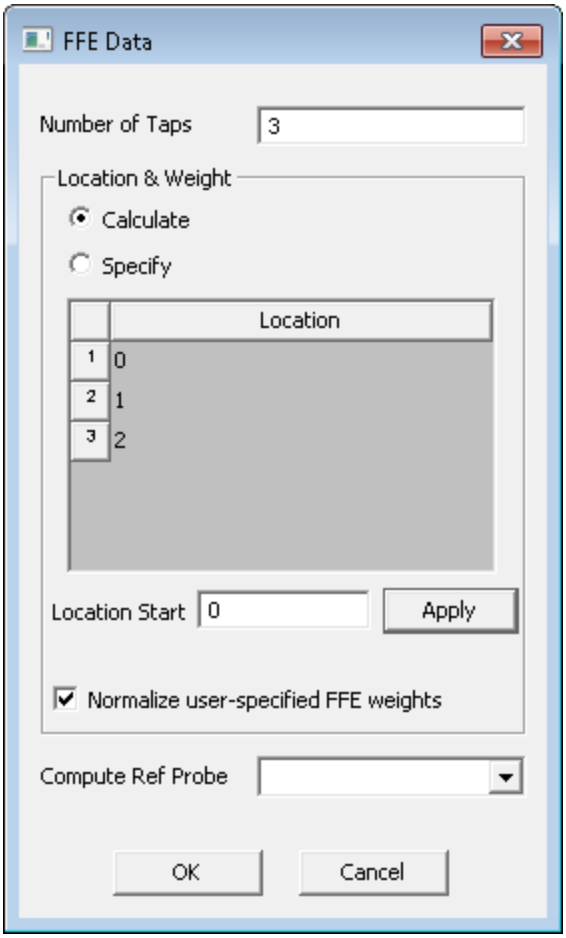
The Coding tab contains parameters to set up bit encoding and select NRZ or PAM4 modulation.

- The **do_encoding** parameter controls 8b10b, 64b66b, 128b130b, or 128b132b encoding of the transmitted bit stream. The default is no encoding (None). Select 8b10b encoding, 64b66b encoding, 128b130b encoding, or 128b132b encoding on the drop-down menu. Note: Option **do_encoding** is valid only when **modulation=NRZ**. **do_encoding** is ignored when **modulation=PAM4**
- The **modulation** to be used. The default **NRZ** uses two voltage levels (binary data), **PAM4** uses four voltage levels to represent two-bit symbols. See **coding**.
- In the window, the **coding** parameter is labeled **coding_PAM4_only** as a reminder that it is ignored for NRZ transmissions. The **coding** parameter defines how digital bits are sent as analog waveforms in PAM-4 transmissions. In PAM-4, two bits ("00"/"01"/ "10"/"11") are transmitted at a time; in Gray coding, "00" is transmitted as "vlow," "01" as "vlow + (vhigh-vlow)/3," "11" as (vhigh - (vhigh-vlow)/3), "10" as "vhigh". In Linear coding, these voltage levels (smallest to largest) are used to transmit bits "00," "01,"10," and "11," respectively. The **coding** parameter has no effect in NRZ transmissions. In NRZ, one bit ('0' or '1') is transmitted at a time; '0' is transmitted as "vlow," and 1 as "vhigh."

Equalization Tab

The Equalization tab allows you to set up Feed-Forward Equalization in the Eye Source. To apply Feed-Forward Equalization, click **FFE_data** and open the window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



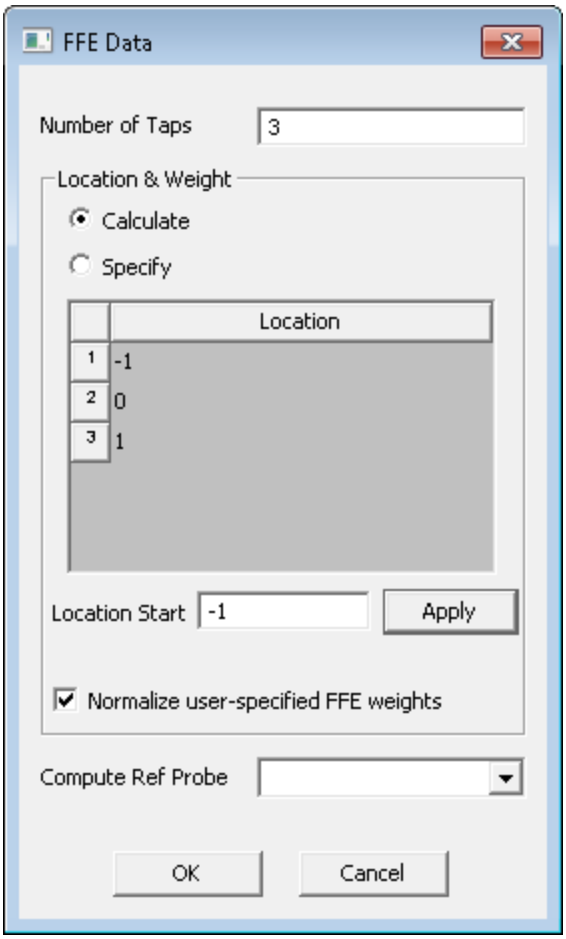
- To enable Feed-Forward Equalization, set the **Number of taps** in the **FFE** field to a positive, non-zero integer value. The default is zero taps (no FFE). When one or more taps have been specified, a list of tap numbers and cursor locations appears. In the example above, three taps have been specified. QuickEye applies the step response to transitions to generate the eye diagram. Each FFE tap has an associated weight that adjusts the applied step response in order to correct for the effect of the bit sampled at that location in the original step response.
- Tap numbers are always numbered from 1 to N, the number of taps you specify. The cursor locations are sample points in the step response over the number of unit intervals (UI) equal to the number of taps. Cursor 0 is the main cursor, whose weight affects the value of the current bit. By default, Tap 1 is at cursor location 0, the main cursor. Taps at positive locations are postcursors, bits that occur later in time than the main cursor bit. Taps at negative locations are precursors, bits that occur earlier in time than the main cursor bit. In the example above, Tap 1 is at main cursor 0. Taps 2 and 3 are postcursor bits.

  Note that the list of cursor locations must include the main cursor, location 0, and when

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

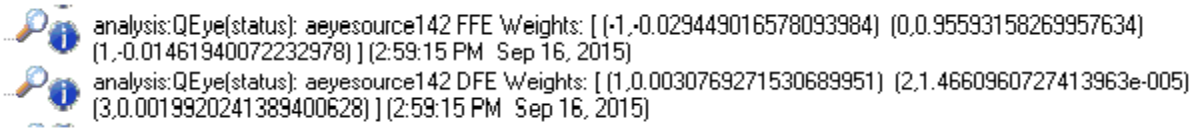
negative tap locations are specified, it may be necessary to add a delay (of at least one UI) to the transient analysis, if there is no inherent delay in the system.

- Use **Location Start** to set Tap 1 to 0 or to a positive or negative cursor location. Click **Apply** to apply the new starting location. The locations of the taps in the display change to reflect the selected starting location. In the following example, three taps of FFE are applied, with one precursor, the main cursor, and one postcursor.



- By default, Nexxim calculates the tap weights on the (unequalized) step response. The algorithm always places the largest tap weight at location 0. For weights calculated by Nexxim, normalization is always performed such that the sum of the absolute values of all the weights is equal to one. For VerifEye, the tap weights are applied to the step response before analyzing. The tap weights calculated by QuickEye are displayed in the **Message Manager** window after the Quick Eye analysis has completed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- To specify the tap weights directly, select **Specify** and enter the weights. For weights supplied by the user, normalization of the tap weights to 1 is enabled by checking the **Normalize FFE weights** check box. Normalization of user-supplied weights is enabled by default in the Eye Source **Properties** window. Uncheck the box to disable normalization of user-supplied weights.
- Make a selection on the Eye Probe drop-down menu to be the **Compute Ref Probe** for the FFE calculation. When FFE has been enabled, a **Compute ref probe** is required.
- The **Compute ref probe** field is automatically filled in with the name of the Eye Probe when the Source and Probe are paired on the GUI. For more information, see Pairing an Eye Source and an Eye Probe in the Schematic.
- Click **OK** to close the **FFE_data** window and return to the Properties window. For more information on FFE, see Feed-Forward Equalization.

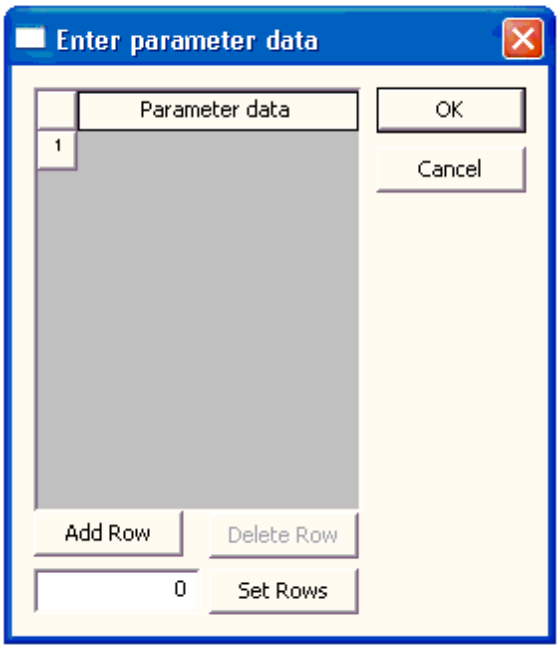
Jitter_Clock Tab

The Jitter_Clock tab contains parameters to set up DCD, transmit jitter, and Spread Spectrum clocking.

- Duty cycle distortion: Click the **DCDFractionorTime** dropdown menu to select **Fraction** (the default) or **Time**. For **Fraction**, the DCD value is a decimal fraction of the UI between 0.0 and 1.0. For **Time**, the DCD value is a time between 0.0 and UI in seconds. A time unit such as ps may be used to set the DCD time. The default for both Fraction and Time is 0.
- For more information, see Duty Cycle Distortion in the QE/VE Technical Notes.

For **txrj**, **txpj**, and **txuj**, clicking within the **Value** field allows you to specify one or more values, generating multiple jitter sources:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- For the random transmit jitter (**txrj**) the value is the standard deviation for the Gaussian distribution. The default is 0 seconds.
- For the Periodic random transmit jitter (**txpj**) the value is the amplitude. The default is 0 seconds.
- For the Uniform random transmit jitter (**txuj**) the value is the amplitude. The default is 0 seconds.
- For the User-defined transmit jitter (**txcj**) the value is the name of the file containing the time (seconds and probability density function (PDF) data. There is no default.
- For more information on transmit jitter parameters, see Transmit Jitter in the Technical Notes.

Parameter Values Tab

The Parameter Values tab contains parameters that are seldom changed.

- The **resistance** to be placed in series with the eye source. The default is 50 Ohm.
- The number of unit intervals to be used in computing the step response (**step_resp_num_ui**). The default is 100.
- Click **EYESOURCE** in the **Value** field of the **Info** property to open the help for the Eye Source component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

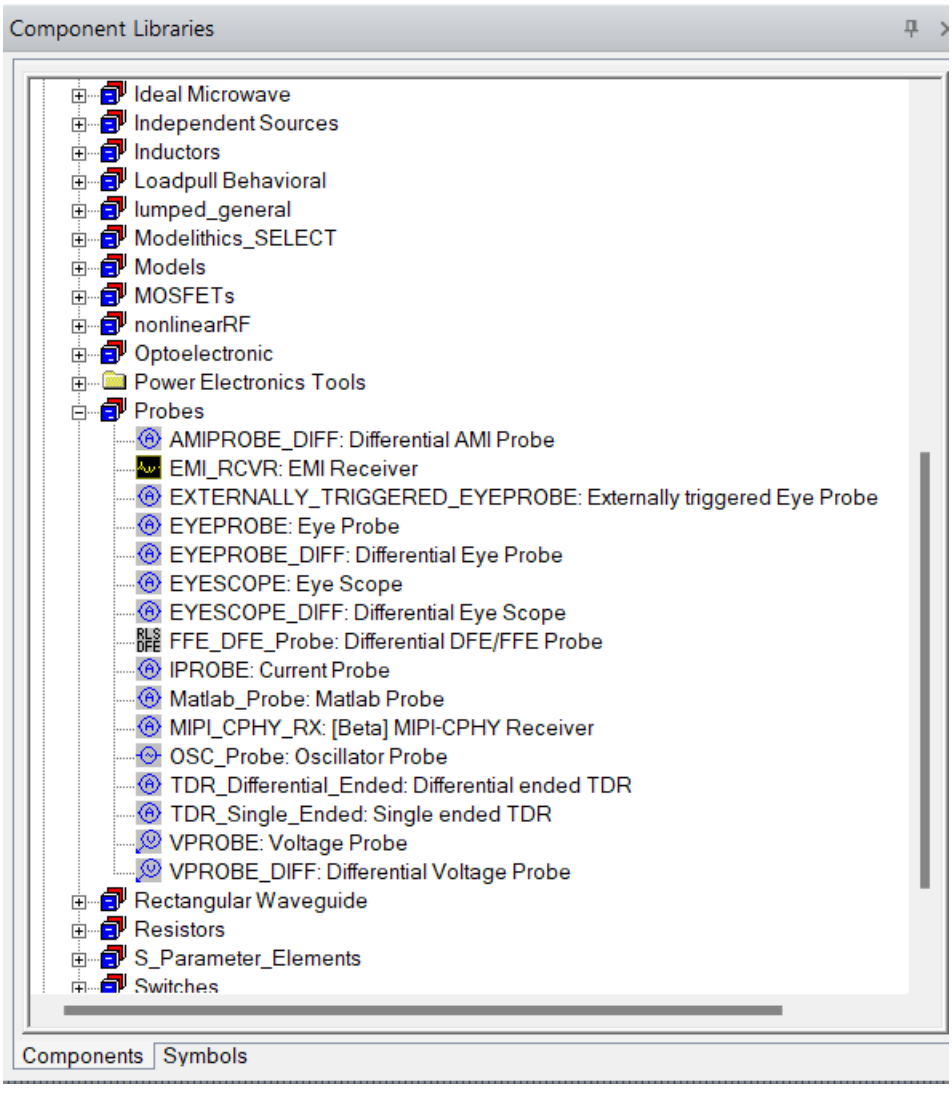
The other properties on the Parameter Values tab are primarily for use by the Component Library editors.

General, Symbol, and Property Display Tabs

The parameters on these tabs are primarily for use by the Component Library editors.

Add an Eye Probe for VerifEye

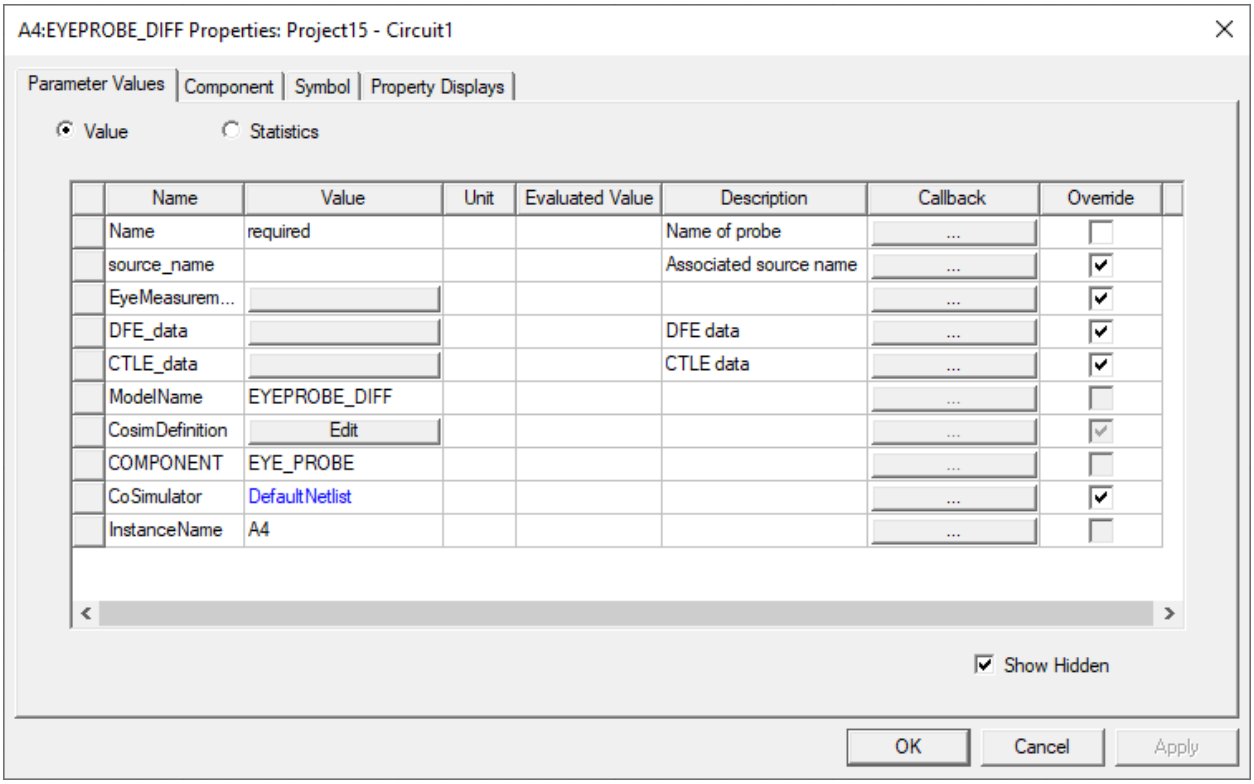
The Eye Probe may be selected on the Probes list on the Components tab:



Both single-ended and differential versions are available.

Click the Eye Probe to open its parameter list:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



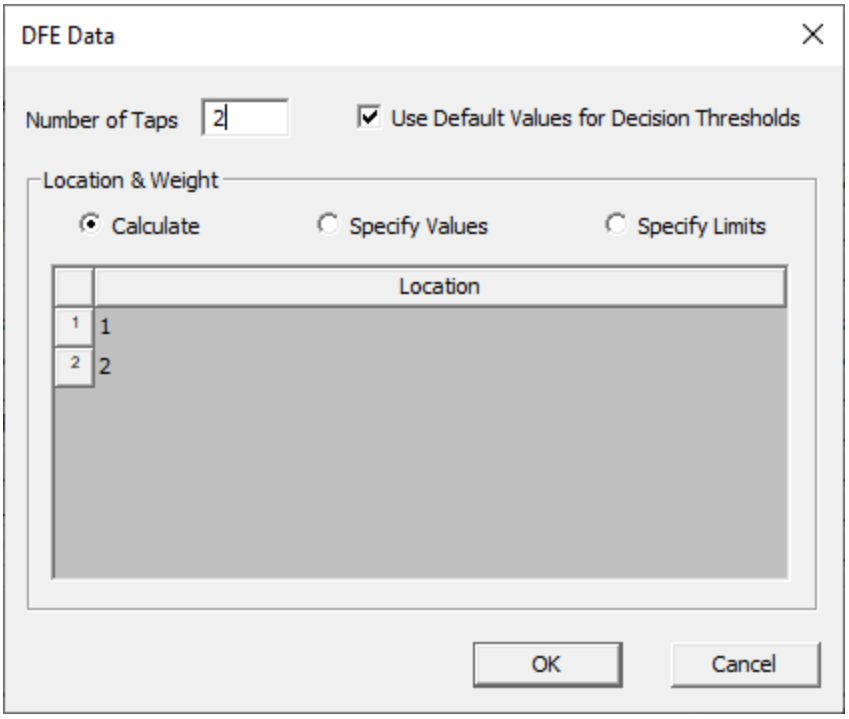
The Parameter Values tab is the default.

- Specify a name for the Eye Probe.
- Select the Eye Source for this probe on the **source_name** drop-down menu. A channel can have multiple sources, but only the source actually at the transmitter should be the reference source.

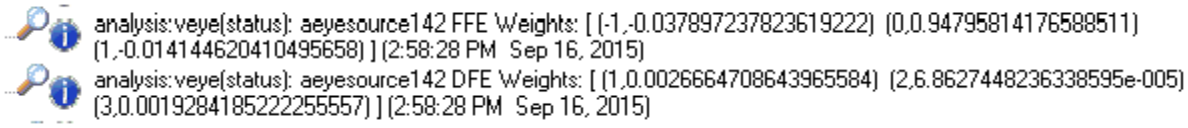
The **source_name** field is automatically filled in with the name of the Eye Source when the Source and Probe are paired on the GUI. See Pairing an Eye Source and an Eye Probe in the Schematic.

- To apply decision-feedback equalization to the received bits, click **DFE_data** to open the window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

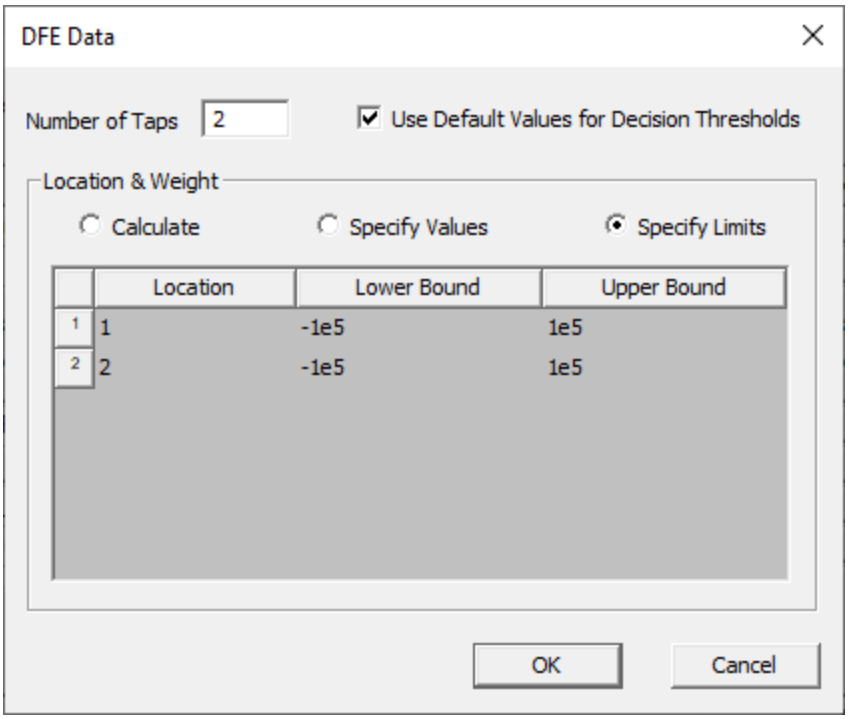


- To enable Decision-Feedback Equalization at the probe, set the **Number of taps** in the **DFE** field to a positive, non-zero value. The default is zero taps (no DFE). When one or more taps have been specified, the list of tap numbers and locations appears. The tap locations are those of previous bits. DFE corrects for inter-symbol interference (ISI) on the current bit due to previous bits.
- DFE applies its tap weights to the decision threshold for each bit to correct for inter-symbol interference (ISI) in the transition from previous bits to the current bit. A DFE with M taps is like a buffer of M bits. Tap 1 is applied to the earliest bit to arrive in the DFE buffer. Tap 2 is applied to the next later bit, et cetera.
- The value of each bit is decoded, and the difference between the actual voltage and the ideal voltage is calculated. Tap weights compensate for the difference. In VerifEye, the weights are applied to the step response.
- By default, the Circuit solver calculates the weights to apply to the DFE taps. The tap weights calculated by VerifEye are displayed in the **Message Manager** window after the VerifEye analysis has completed.



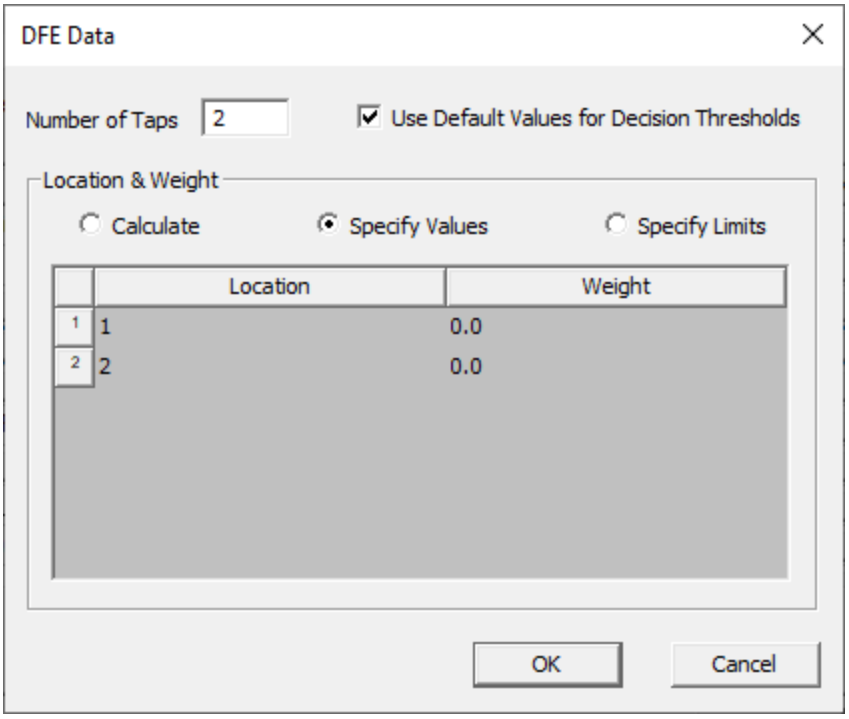
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To automatically calculate the tap weights, choose **Specify Limits** and set the limits. The tap weights are calculated in the bounds you specify. The default value for bounds are +/- 1e5 for taps. There are no requirements on the limits.



- To specify your own set of tap weights, select **Specify Values** and click the weights to specify them.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

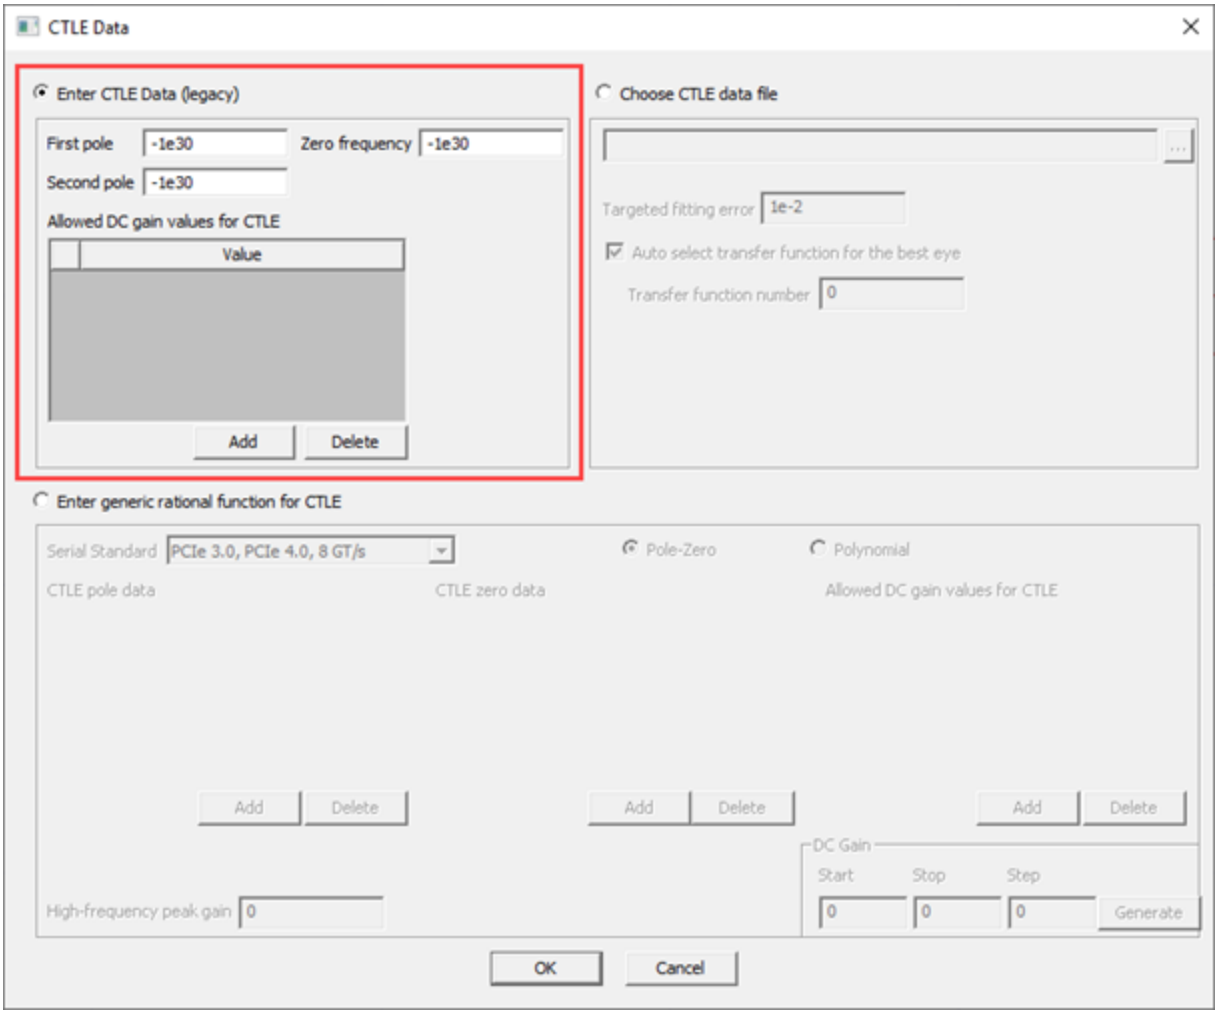


- To decode the received bits, mark **Use Default Values for Decision Thresholds** which causes Nexxim to calculate the thresholds.
- For more information on DFE, see Decision-Feedback Equalization.
- Click **OK** to close the **DFE_data** window and return to the Properties window.
- Click **CTLE_data** to open the **CTLE Data** window. (See Continuous Time Linear Equalization in the QE/VE Technical Notes for details).

Select **Enter CTLE Data (legacy)**, **Choose CTLE data file**, or **Enter generic rational function for CTLE**.

If you select **Enter CTLE Data**, only the CTLE data group box is activated:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



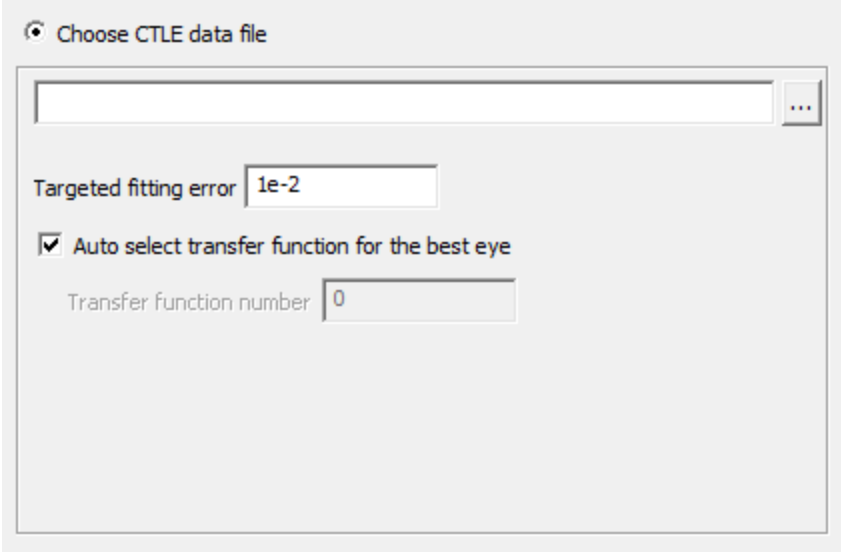
- Specify the first pole frequency in Hz (positive). The first pole frequency typically is the lower bound of the high passband.
- Optionally, specify a second pole frequency. The second pole frequency typically is the higher bound of the passband.
- Optionally, specify a zero frequency, typically where the response curve begins to rise.

> **Note:**
>
> 1. The default pole and zero frequency values of -1e30 are equivalent to "None."
> 2. If the zero frequency is specified, it must be greater than 0.0.
> 3. See Continuous Time Linear Equalization in the QE/VE Technical Notes for an illustration of the two-pole, one zero filter.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Optionally, click **Add Row** and **Delete Row** to specify one or more allowable values for the DC gain factor in dB for the CTLE calculation. Nexxim varies the gain to find the optimum equalization (maximum eye height). If no values are provided, the Circuit solver calculates the optimum CTLE gain (between -infinity dB to 0 dB).

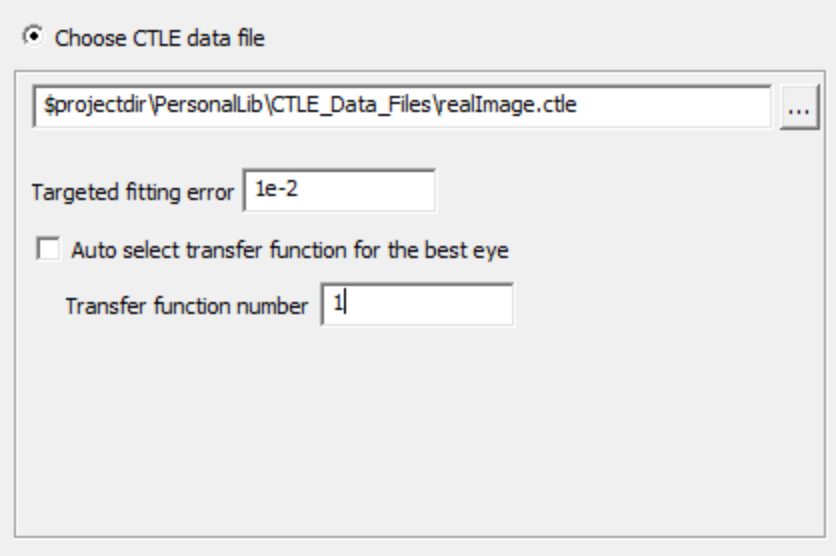
If you select **Choose CTLE Data File**, only the CTLE data file group box is activated. Here is that portion of the window:



- Use **Browse** to access the **File Open** window. Browse to the target directory and select the file with the CTLE transfer function data (**.ctle** extension). Nexxim fits a rational function to the data.
- Optionally, Click the **Targeted fitting error** field to specify a tolerance to apply to the CTLE rational function calculation using the transfer function data.
- By default, **Auto select transfer function for the best eye** is enabled. Nexxim tries all the transfer functions on the file, and uses the one that yields the maximum eye height. Optionally, uncheck the **Auto select** group box, then enter the number of a transfer function among the multiple transfer functions in the data file.

In the following figure, transfer function 1 is specified

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



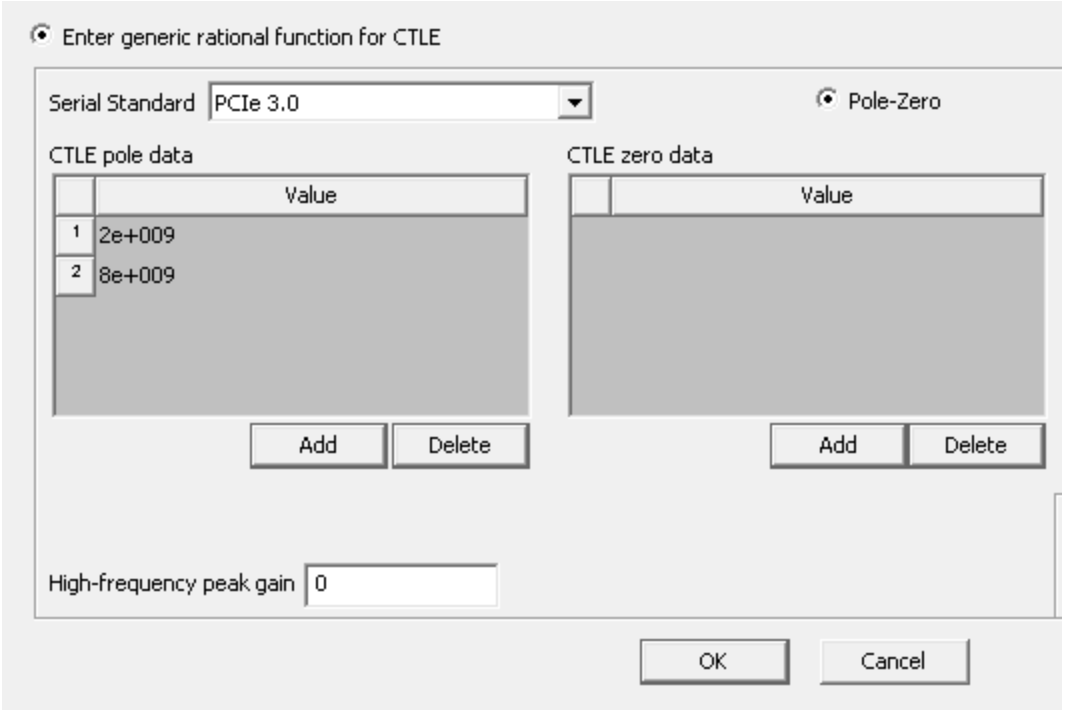
- Values for the transfer function number run from 0 (the **Auto select** default) to the number of transfer functions in the file. The first transfer function is number 1, the second is number 2, et cetera. If the number given for this parameter is less than 0 or greater than the number of transfer functions in the file, an error occurs.

When you select **Enter generic rational function for CTLE**, only that group box is activated.

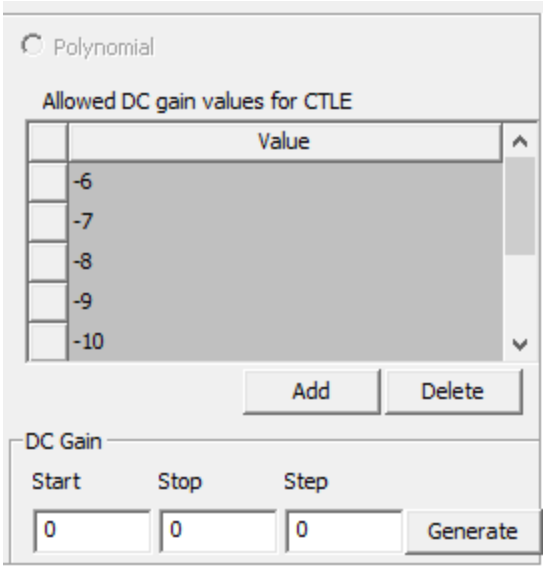
There are two formats for specifying a generic rational function, chosen by selecting **Pole-Zero** or **Polynomial**. By default, the **Pole-Zero** format is selected. With this format, the rational function is specified by a set of pole frequencies, a set of zero frequencies, the high-frequency peak gain, and a list of allowable DC gain values.

Here are the entry fields for the pole and zero frequencies and the High frequency peak gain:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

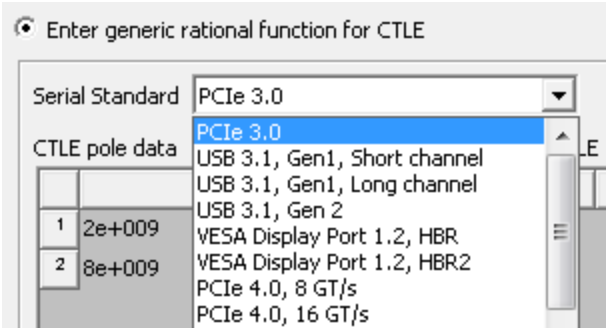


Here is the entry field for the DC gain values:



The **Serial Standard** field has a drop-down menu with a selection of preset standard CTLEs. The PCIe, USB, and VESA preset CTLEs use only the **Pole-Zero** format.

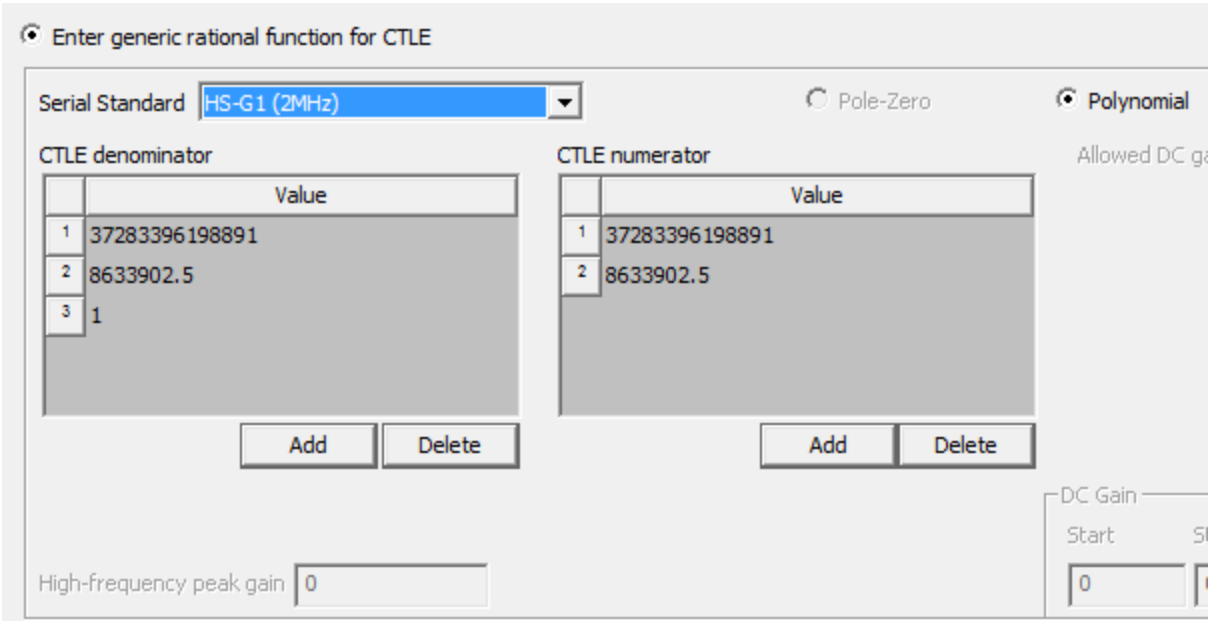
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



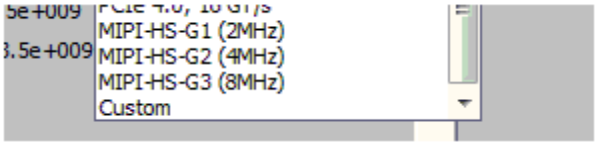
Note: This illustration may not include later additions to the preset standards.

Alternatively, select **Polynomial** format. In this format, the rational function is specified by giving the coefficients for the terms in the numerator and denominator of the polynomial fraction. The **High-frequency peak gain** and **Allowed DC gain** fields are inactivated in the **Polynomial** format.

Here are the entry fields for the **Polynomial** format coefficients:



The MIPI-HS-G1, MIPI-HS-G2, and MIPI-HS-G3 CTLE presets use only the **Polynomial** format.

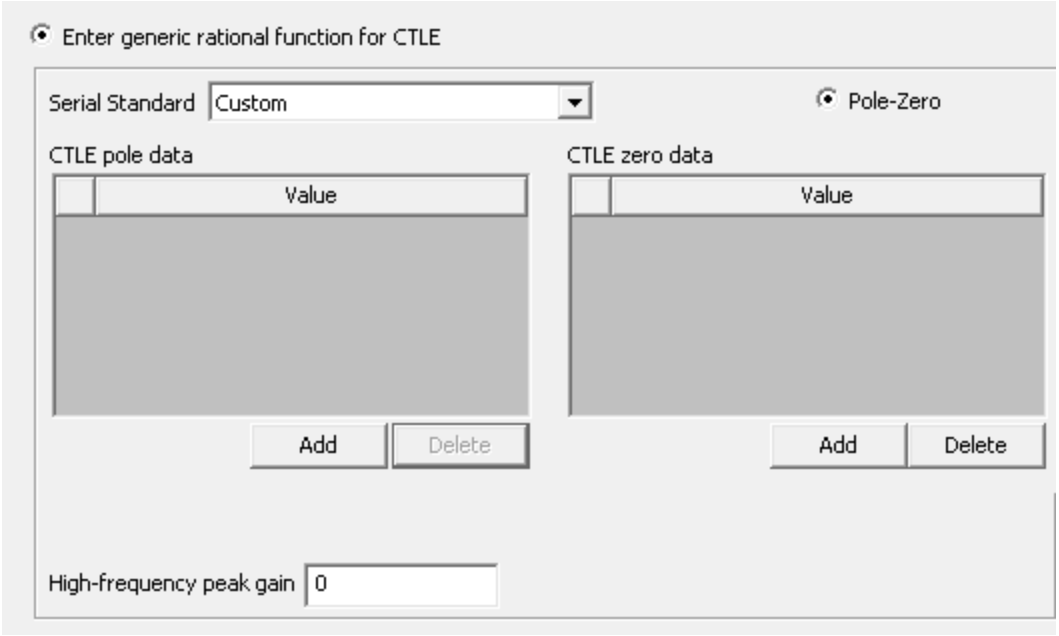


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** This illustration may not include later additions to the preset standards.

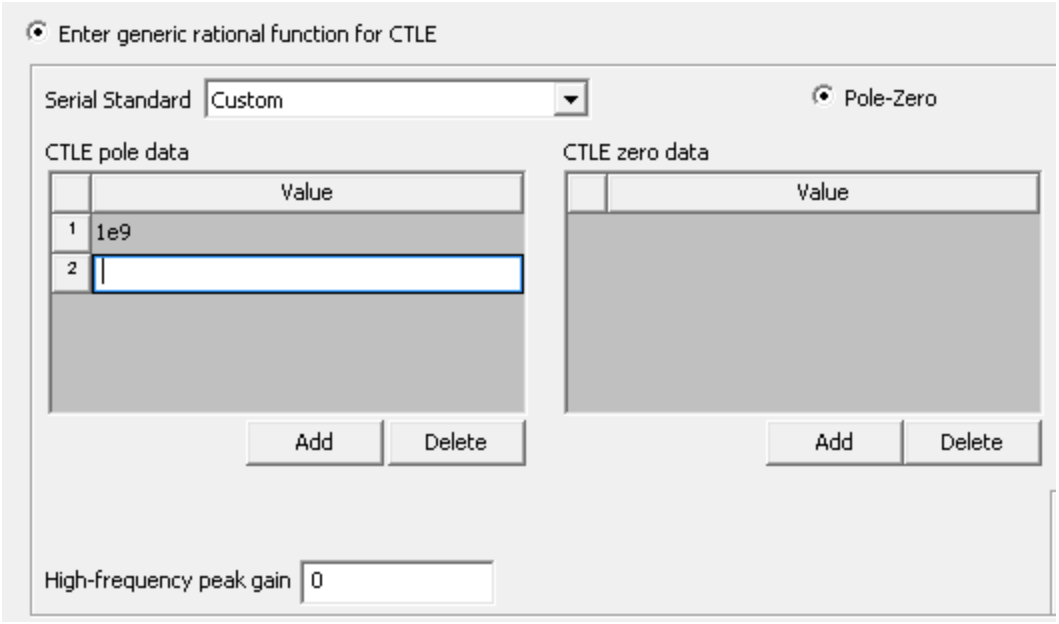
To create your own rational function, select **Custom** on the menu. The **Custom** entry allows you to specify a generic rational transfer function in either **Pole-Zero** format or **Polynomial** format.

Here are the **CTLE pole data**, **CTLE zero data**, and **High-frequency gain** entry fields for the **Custom** entry in **Pole-Zero** format:

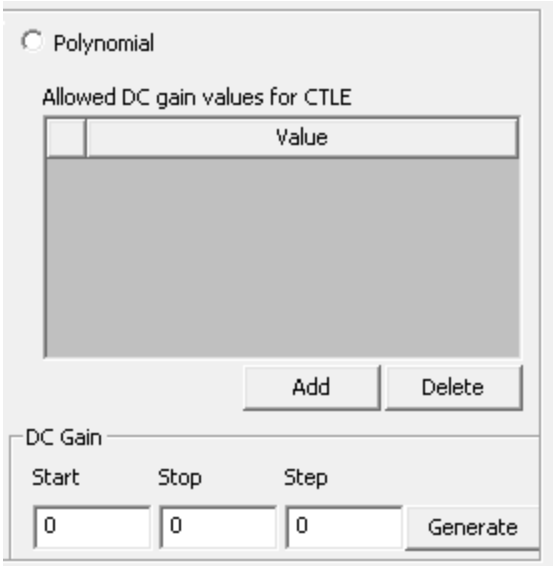


Click **Add** to add a row in the pole or zero data list. Click in the **Value** field to enter the pole or zero frequency in Hz. Click **Return** to generate a new row. Click **Delete** in either field to delete unwanted rows. Set the **High-frequency peak gain** to a appropriate value in dB.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



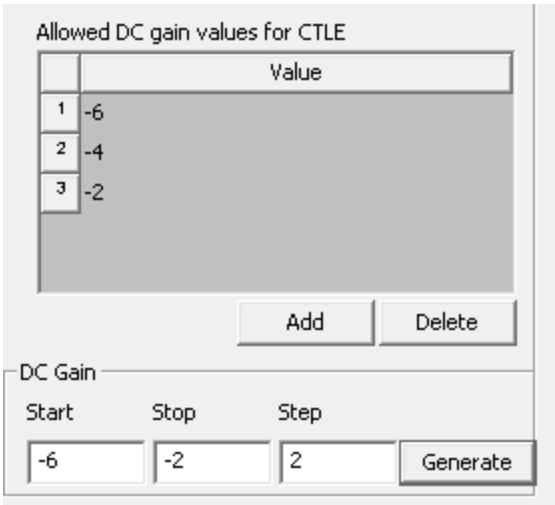
Use the **Allowed DC gain** group box to specify a range of DC gain values in dB.



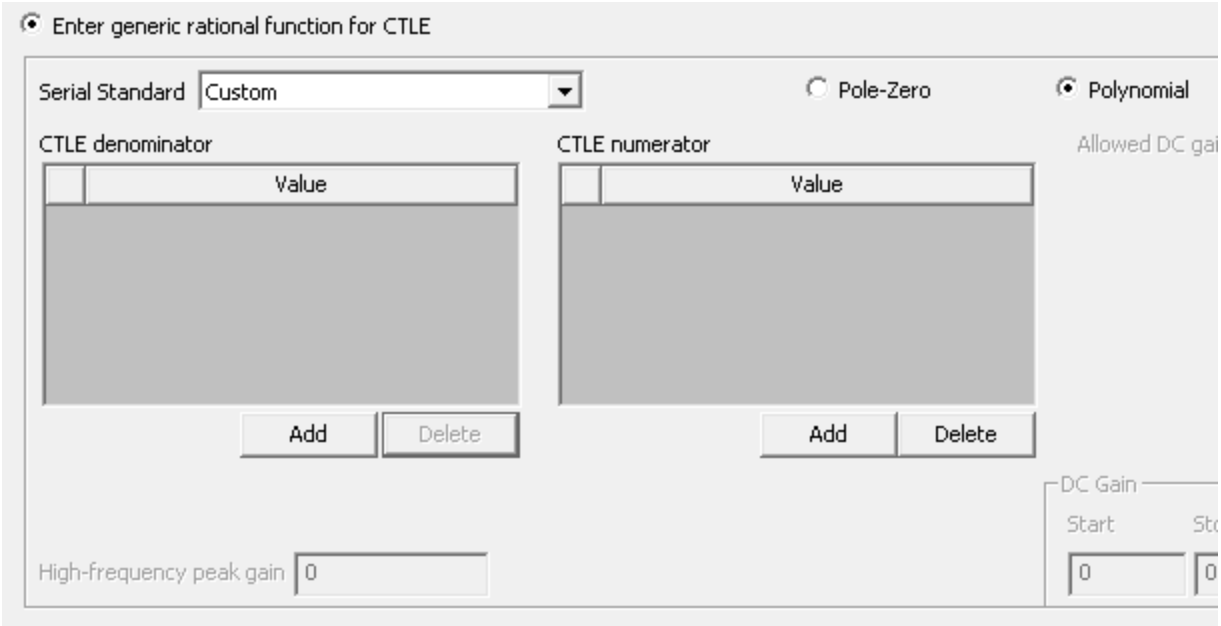
Click **Add** and **Delete** to specify one or more allowable values for the DC gain factor in dB for the CTLE calculation. Nexxim varies the gain to find the optimum equalization (maximum eye height). If no values are provided, the Circuit solver calculates the optimum CTLE gain (between -infinity dB to 0 dB).

To have Nexxim generate a sequence of DC values, enter the **Start**, **Stop**, and **Step** values in the **DC Gain** fields and click **Generate**. In this window, Start=-6, Stop=-2. and Step=2:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Alternatively, a **Custom** rational function CTLE can Click the **Polynomial** format.

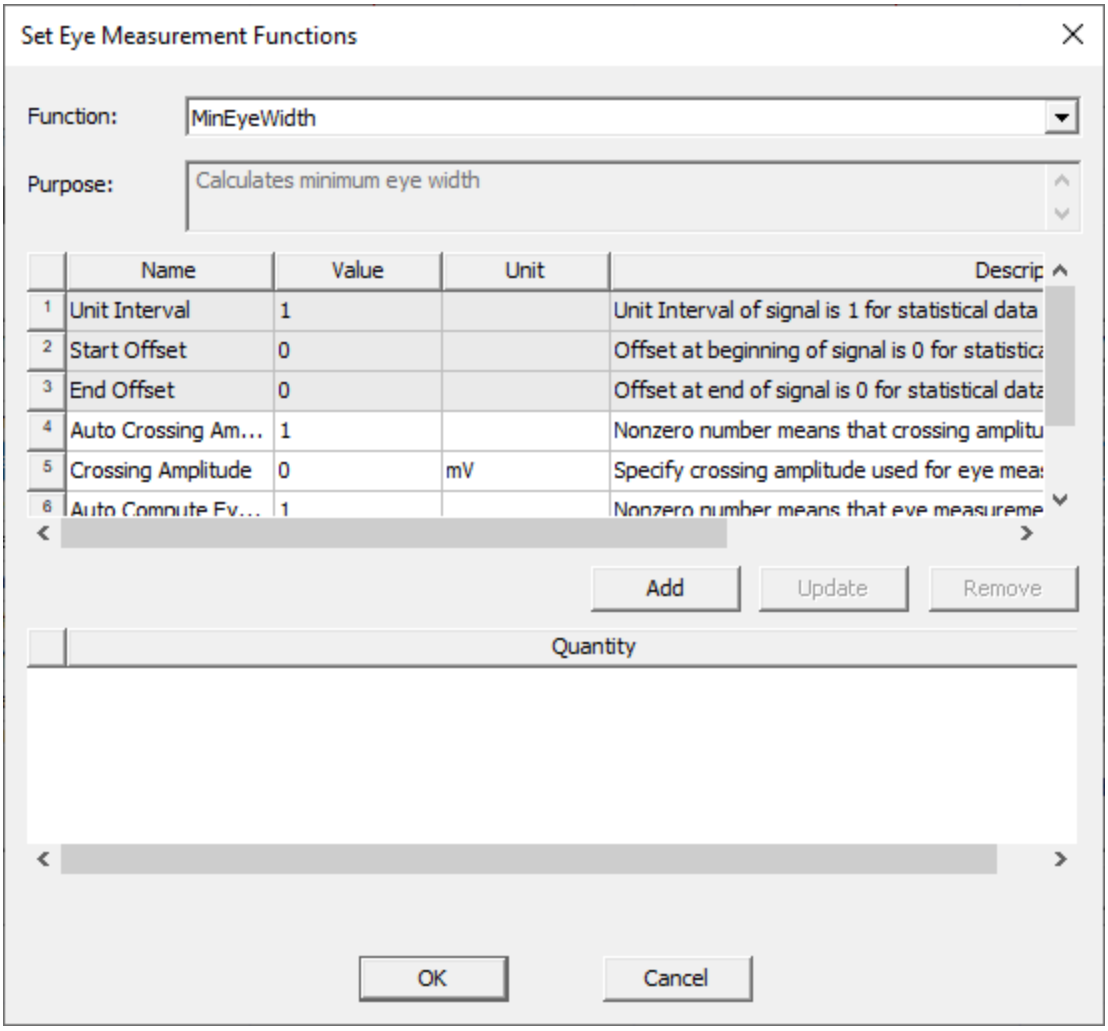


Click **Add** to add a row in the CTLE denominator or CTLE numerator list. Click in the **Value** field to enter the (unitless) coefficient. Click **Return** to generate a new row. Click **Delete** in either field to delete unwanted rows. Click **OK** to close the **CTLE Data** window.

For more information see Continuous Time Linear Equalization.

Click **EyeMeasurementFunctions** to open the **Set Eye Measurement Functions** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- In the **Function** field, select **MinEyeWidth** or **MinEyeHeight**.
- Set the **Unit Interval** parameter to the Unit Interval (UI) of the Eye diagram.
- Set the **Start Offset** parameter if an initial time offset is appropriate.
- Set the **End Offset** parameter if trailing time offset is appropriate.
- Leave **Auto Crossing Amplitude** set to 1 (or any non-zero number) to have the Circuit solver compute the crossing amplitude by averaging the histograms for the high and low voltages. The crossing amplitude sets the voltage at which the minimum eye width is calculated.
- When **Auto Crossing Amplitude** is 0, the Circuit solver uses the voltage set in the **Crossing Amplitude** parameter as the crossing voltage amplitude for the minimum eye width calculation.
- Leave **Auto Compute Eye Measurement Point** set to 1 (or any non-zero number) to have the Circuit solver compute the eye measurement point by averaging the times of the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

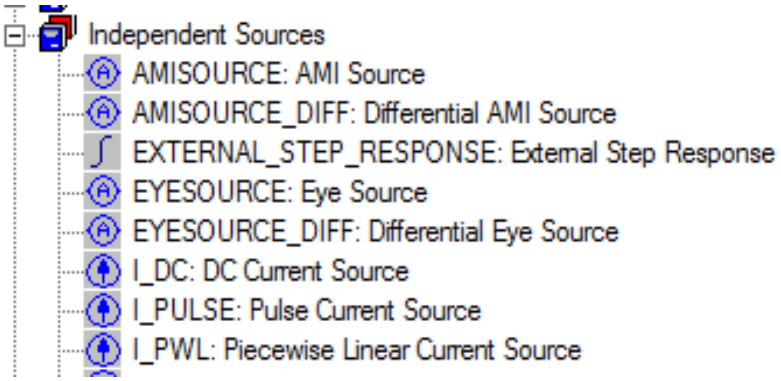
crossing points. The eye measurement point sets the time at which the minimum eye height is calculated.

- When **Auto Compute Eye Measurement Point** is 0, the Circuit solver uses the voltage set in the **Eye Measurement Point** parameter as the time for the minimum eye height calculation.
- Click **Add** to add the measurement to the analysis. Add any number of measurements. The window above has added a **MinEyeWidth** measurement using the default settings.
- Click **OK** to close the **Set Eye Measurement Functions** window.
- For more information, see Eye Measurements in the Reports topic.

Click **OK** to close the Properties window of the probe.

Add an External Step Response to a VerifEye Analysis

Instead of having the Circuit solver compute the step response, supply the step response via a data file, using the External Step Response component. First, place Eye Sources and Probes in the circuit. Select the External Step Response on the Independent Sources list on the Components tab:



The External Step Response component does not physically connect to the circuit.

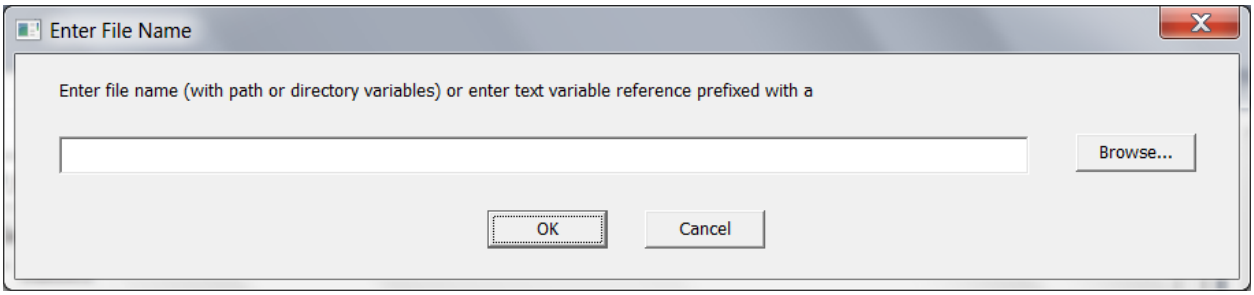
Click the component to open the Properties list:

source_name				Eye source name
probe_name				Eye probe name
step_response_file_rise				Rising step response fil...
step_response_file_fall				Falling step response fil...

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Select the source name and the probe name. The source and probe names appear automatically when they are present in the circuit. Each step response source applies to one source and one probe.

Specify the files that contain the rising and falling step responses by clicking the buttons in the **Value** field. The same window applies to both files.



If only one file is supplied, the rise and fall are treated as symmetrical.

> **Note:** If no step response file is specified (or found), the default is for analysis to fail. Setting the VE/QE analysis parameter **run_missing_step_response=1** runs transient analysis to generate the missing step response.

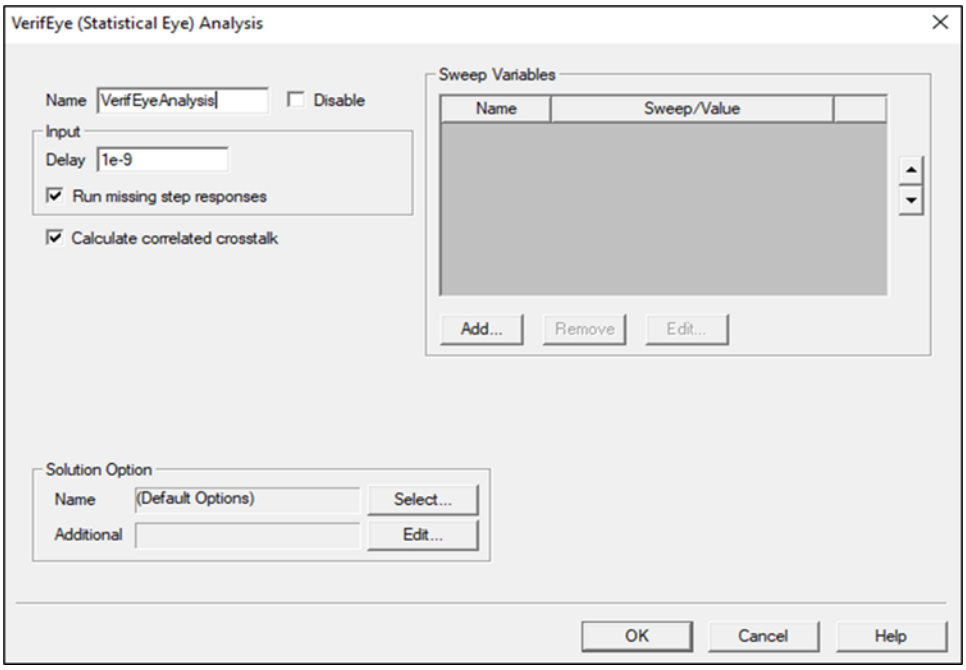
The step response data files have a two-column format: *time voltage*. Linear interpolation is used between time points.

Set Up the VerifEye Analysis

From the **Schematic Editor**, perform the following steps to set up and run a VerifEye analysis.

1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **VerifEye Analysis** to open the **VerifEye (Statistical Eye) Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Type an **Analysis Name** (or accept the default name, for example “VerifEyeAnalysis”).
3. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use.
4. From the **Input** group box:

- Specify the **Delay** to be applied before the step response is applied (default is 0 seconds)
- **Run missing step response** allows simulation to proceed when an External Step Response component is present in the design but no step response data file can be found.

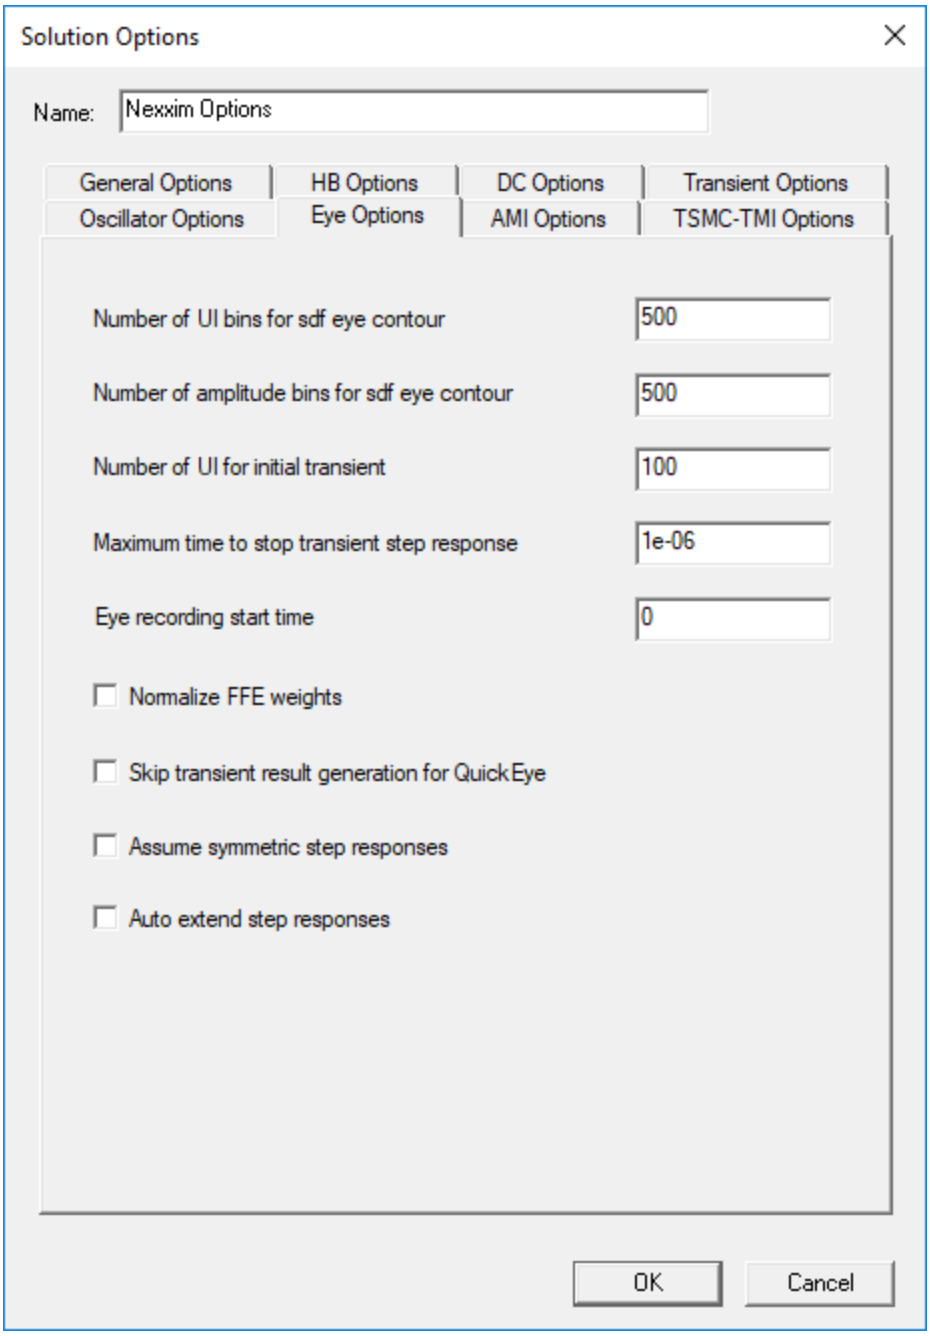
5. **Calculate correlated crosstalk** is checked (i.e., activated) by default. To compute uncorrelated crosstalk, uncheck the **Calculate correlated crosstalk** box.
6. To add a sweep, locate the **Sweep Variable** area in the **VerifEye Analysis** window.

- From the **Sweep Variable** area, select **Add** to open the **Add/Edit Sweep** window.
- In the **Variable** list, select **Temp** or the name of a variable (when a variable has been defined for the design), then select one of the following: Single value, Linear step, Linear count, Decade count, or Octave count.
- Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
- For details on sweeps, see Variable Sweep.
- Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **VerifEye Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Optionally, use the fields in the **Solution Options** group box to add **VerifEye/QuickEye** options.

- Click **Select** on the **Name** field to open the **Select Solution Options** window.
- To create a new option set, click **New** to open the **Solution Options** window.



- Click the **Name** field to name the new option set.
- Click the **Eye Options** group box fields and check boxes to set any appropriate options.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of UI bins sets the number of UI histogram bins to use for generating the 3D and contour data. The default is 500. Option: **eye.ui_bins**.

Number of amplitude bins sets the number of amplitude histogram bins to use for generating the 3D and contour data. The default is 500. Option: **eye.ampl_bins**.

Number of UI sets the number of unit intervals (UI) over which the initial transient step response should run after any channel or source delay. The default is 100. Option: **eye.num_initial_ui**.

Maximum time sets the maximum stop time for the transient step response calculation. The default is 1μs. Option: **eye.resp_tmax**.

NOTE: VerifEye uses the minimum of (**num_initial_ui** x UI) and (**resp_tmax**) to set the transient final time for the step response calculation.

Eye recording start time adds a delay in seconds to the start of sampling for the Statistical Eye diagrams. Default is 0 seconds. Option: **eye.eye_start_time**.

Normalize FFE weights sets the solver to normalize FFE tap weights (sum of absolute values of all tap weights equals 1). This option applies only to weights supplied by the user. The Circuit solver always normalizes the taps weights that it calculates. By default, the option to normalize user-supplied weights is not enabled in the **Solution Options** window. Option: **eye.normalize_ffe_weights**.

Skip transient result turns off QuickEye storage of the eye diagram and the transient-like result. By default, QuickEye stores the eye diagram and the transient-like result. Option: **eye.qe_only_cmf**.

Assume symmetric step responses sets QE/VE to use the rise time as the fall time. The default is to use different rise and fall times. Option: **eye.sym_step_resp**.

Auto extend step responses extends the step response beyond the simulation time. By default, the step response is extended only to the end of simulation time. Option: **eye.auto_extend_step_resp**.

- For more information, see VerifEye and Quick Eye Analysis Options.
- Click **OK** to return to the **VerifEye (Statistical Eye)Analysis** window.

Run the VerifEye Analysis and Display Results

1. From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- The **Message Manager** window signals success or failure.

For information on viewing the results of the VerifEye analysis, see "Display VerifEye Analysis Outputs " on page 12-64. For details on creating and modifying reports, see Generating Reports and Post-processing.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Running VerifEye Analysis on the Netlist Editor

If you use the Netlist Editor to create a design, the netlist contains the information for running the envelope analysis. No Solution Setup is required.

VerifEye Source Netlist Syntax

The netlist syntax for the VerifEye Source is:

```
AEYESOURCExxxxn1 [n2] COMPONENT=EYE_SOURCE
 + RESISTANCE=val
+ VLOW=valVHIGH=val TRISE=val TFALL=val
+ UI=valBPS=val
+ STEP_RESP_NUM_UI=val

 + CTLE_ZEROS=[val ... ]
 + CTLE_AC_GAIN=val
+ CTLE_ALLOWED_GAIN=[val ... ]
 + CTLE_NUMERATOR=[val ... ]
 + CTLE_DENOMINATOR=[val ... ]
```

n1 is the node connected to the single-ended source. *n2* is the second node on a differential probe. The entry **COMPONENT=EYE_PROBE** is required.

See *Eye Probe* in the Components help for details on these properties.

VerifEye External Step Response Netlist Syntax

The netlist syntax for the Eye External Step Response is:

```
Axxxx COMPONENT=EXTERNAL_STEP_RESPONSE
 + SOURCE_NAME='eye_source '
 + PROBE_NAME='eye_probe '
 + STEP_RESPONSE_FILE_RISE='file_reference '
 + STEP_RESPONSE_FILE_FALL='file_reference '
```

The entry **COMPONENT=EXTERNAL_STEP_RESPONSE** is required**.**

See External Files for details on references to external files.

See *Eye External Step Response* in the Components help for details on these properties.

VerifEye Analysis Netlist Format

VerifEye analysis is invoked on the netlist using the .EYE statement:

```
.EYE
LOW=val HIGH=valTRISE=val TFALL=val BPS=val|UI=val
STEP_RESP_NUM_UI=val
FFE_TAP=val FFE_LOCS=[val val...] FFE_WEIGHTS=[val val...]
NORMALIZE_FFE_WEIGHTS=val
DFE_TAP=val DFE_LOCS=[val val...] DFE_WEIGHTS=[val val...]
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(or DFE_WEIGHT_LBS=[*val val ...*] DFE_WEIGHT_UBS=[*val val ...*])
DECISION_THRESHOLD=*val* DECISION_HIGH=*val* DECISION_LOW=*val*
DELAY=*val* RUN_MISSING_STEP_RESPONSE=*val*

The VerifEye analysis statement can specify channel parameters and equalization settings. These values is applied to any Eye Sources and Probes that do not specify them. When a parameter is set on the source or probe and in the analysis statement, the source/probe setting is used.

VerifEye Analysis Statement Parameters

Parameter	Description	Unit	Default
LOW	Logic low voltage level	Volt	
HIGH	Logic high voltage level	Volt	
TRISE	Low-to-high rise time	Second	
TFALL	High-to-low fall time	Second	TRISE
BPS	Bit rate for the source	1/Second	None
UI	Duration of the unit interval. When both UI and BPS are given, UI is used.	Second	None
STEP_RESP_ NUM_UI	Number of unit intervals to allow step response to reach steady state	None	
FFE_TAP	Number of FFE taps	None	0
FFE_LOCS	Bit locations of FFE taps	None	None
FFE_WEIGHTS	FFE weights	None	None
NORMALIZE_ FFE_WEIGHTS	1=Normalize user-supplied FFE tap weights. (Sum of absolute values of all tap weights equals 1) 0=No normalization	None	0
DFE_TAP	Number of DFE taps	None	None
DFE_LOCS	Bit locations of DFE taps	None	None
DFE_WEIGHTS	DFE weights	None	None
DFE_WEIGHT_ LBS	DFE weight lower bounds	None	None
DFE_WEIGHT_ UBS	DFE weight upper bounds	None	None
DECISION_HIGH	Decision high value	Volt	
DECISION_LOW	Decision low value	Volt	None
DECISION_ THRESHOLD	Decision threshold	Volt	
DELAY	Delay offset for transition	Second	

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Parameter	Description	Unit	Default
RUN_MISSING_STEP_RESPONSE	0=analysis fails when no step response file is found for an External Step Response component 1=run transient for any missing step response data.	None	None

Run VerifEye Analysis

Run the simulation:

1. From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
2. The **Message Manager** window signals success or failure.

For details on viewing results of VerifEye analysis, see VerifEye Analysis Outputs.

For details on creating and modifying reports, see Generating Reports and Post-processing.

Display VerifEye Analysis Outputs

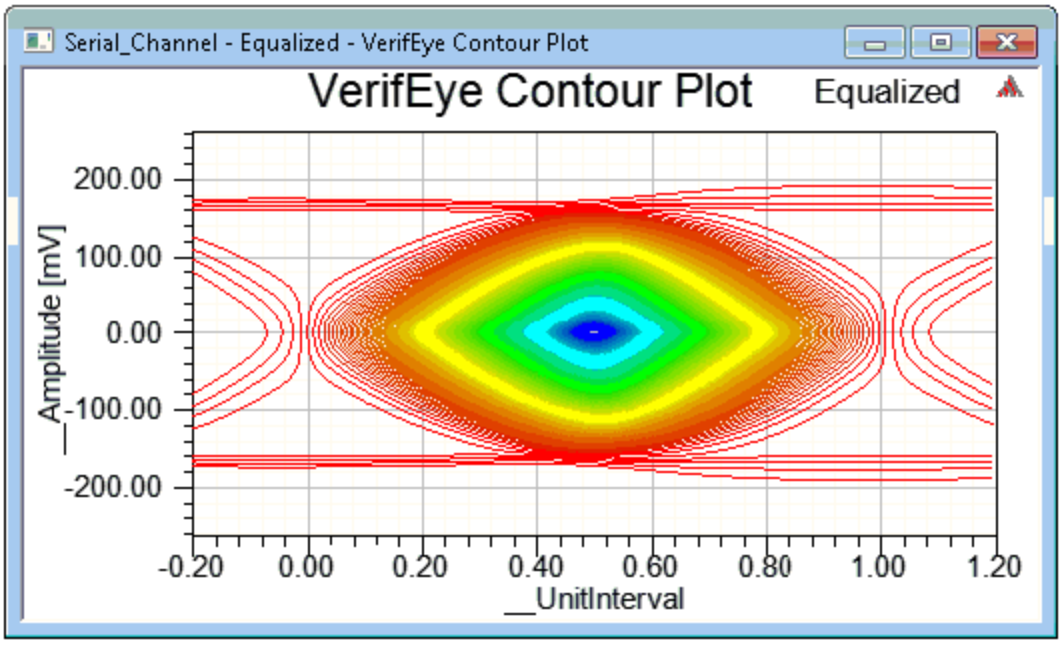
To open the results of a Quick Eye analysis, click the **Results** icon in the **Project Manager** window and select one of the **Create Report** options. There are many ways to plot the data; this topic gives examples of a Statistical (Sampled) Eye Diagram, a 2D Bathtub plot,standard and statistical Eye diagrams with PAM4 modulation, and a 2D Bathtub plot with PAM4 modulation.

For bathtub curve of QE, distinguish simulated/extrapolated regions using a partitioning horizontal line via the ‘SimulatedLimit’ option that is in available the ‘Quantity’ column. Such processing allows for the robust extrapolation of bathtub curves arising out of QE and AMI analyses.

2D Contour Plot

The contour plot of the bit error rate at times within the unit interval. To view the data as a contour plot of the bit error rate, select **Create Standard Report** > **Rectangular Contour Plot**. From the Report window, select **UI** as the Domain and **Eye** as the Category. Click **New Report**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

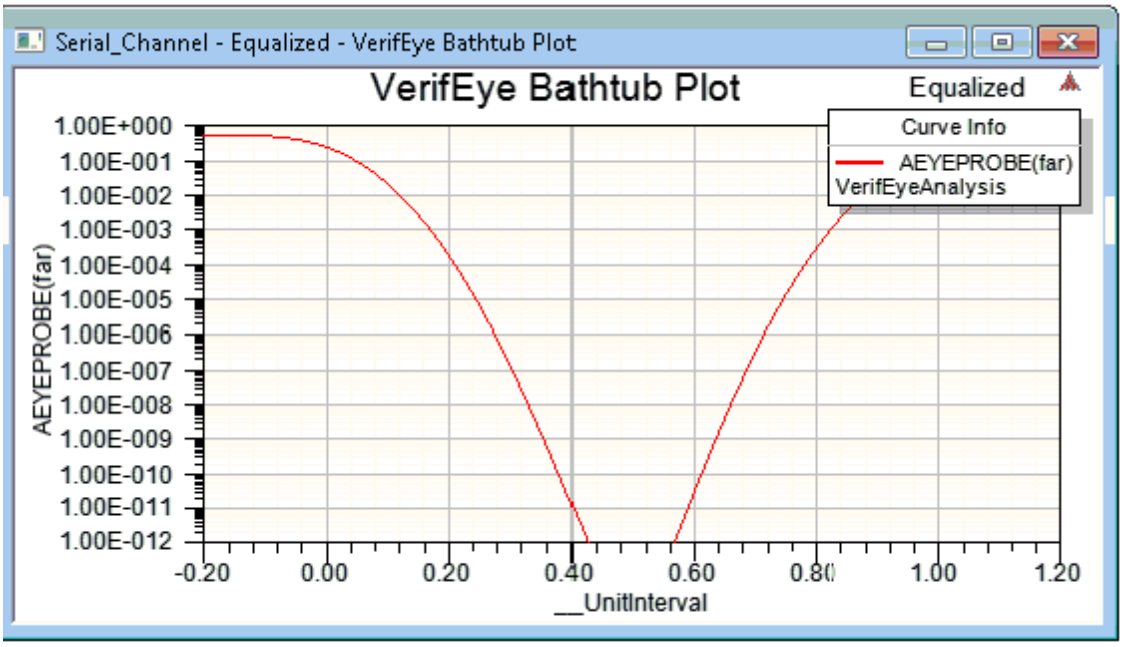


The contours for AEYEPROBE represent the bit error rates using logarithmic scaling. Amplitude represents the voltage transitions and UnitInterval is the location of the data relative to the unit interval.

2D Bathtub Plot

To view the VerifEye data as a 2D bathtub curve, select **Create Standard Report** > **Rectangular Plot**. From the Report window, select **UI** as the Domain and **Bathtub** as the Category. Click **New Report**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This graph shows the BER at various locations in the unit interval. The amplitude is set at the midpoint of its value range. The BER values are on the Y-axis using logarithmic scaling and a minimum of 1e-16 ~ e-21.

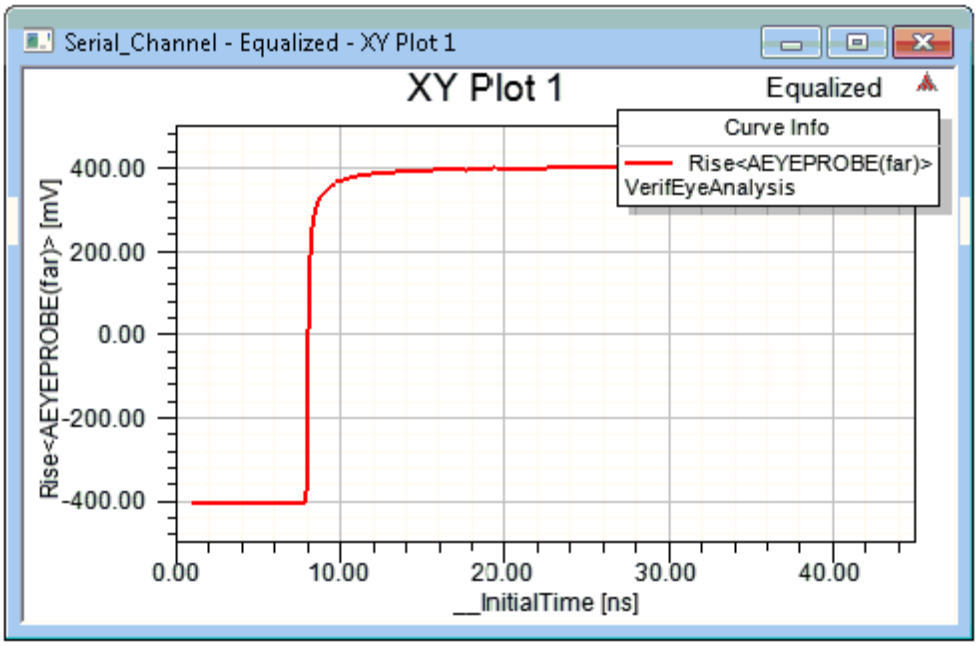
2D Step Response Plot

To open the initial step response of the channel as calculated by VerifEye:

- Under Reports, select **Create Standard Report** > **Rectangular Plot**.
- Click the **Domain** drop-down menu to select **Initial Response**. Click **New Report**. The

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

report shows the initial response of the channel in the time domain



VerifEye Data Table

To open the VerifEye data as a table, select **Create Standard Report** > **Data Table** on the Results menu. Select **Bathtub** as the Category, the name of the Eye probe as the Quantity, and <None> as the Function. Click **New Report**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	__UnitInterval	AEYEPROBE(far) VerifEyeAnalysis __Amplitude='-0.002450080284V'
1	-0.200000	0.499574
2	-0.190000	0.499275
3	-0.180000	0.498795
4	-0.170000	0.498041
5	-0.160000	0.496888
6	-0.150000	0.495165
7	-0.140000	0.492656
8	-0.130000	0.489096
9	-0.120000	0.484168

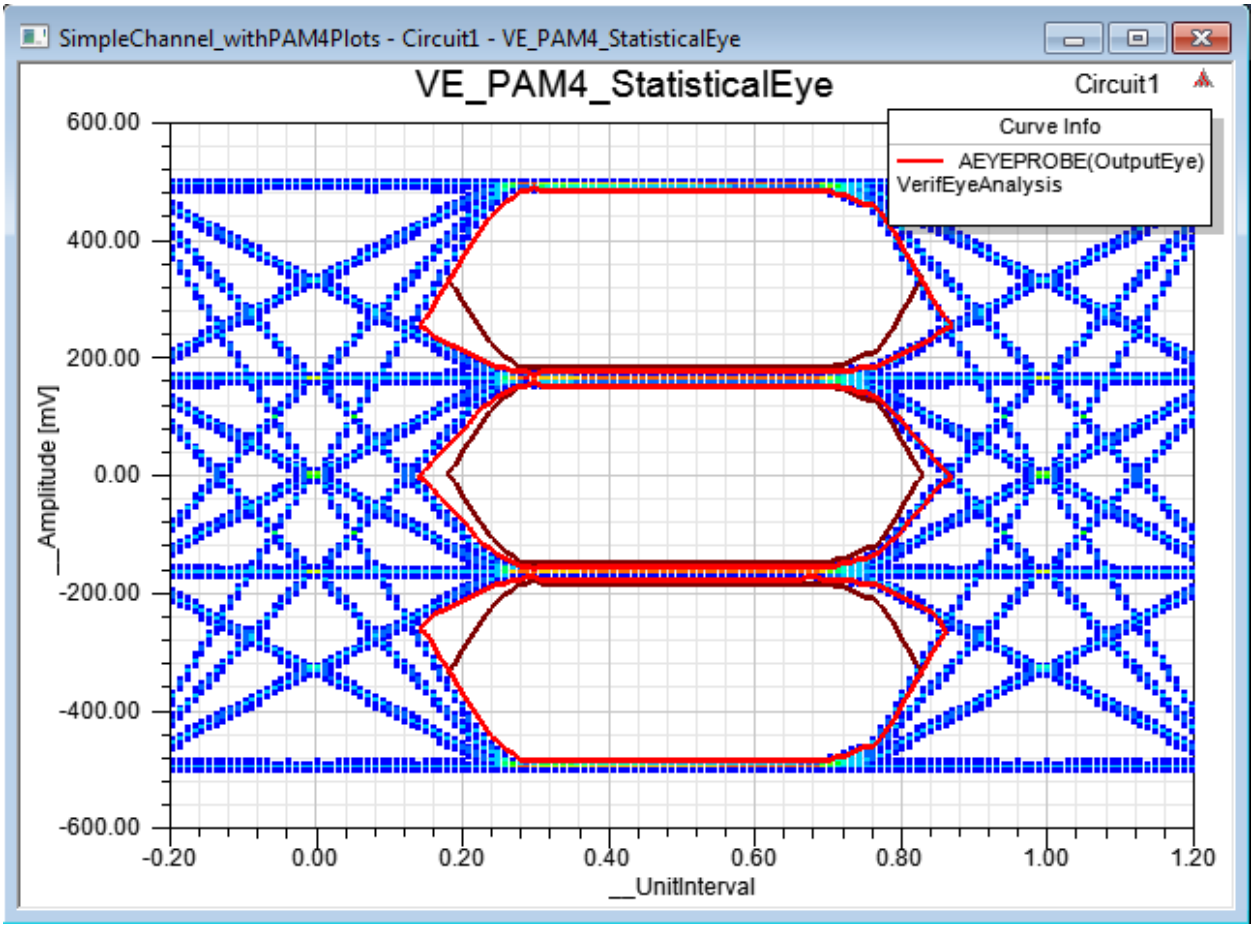
11	-0.100000	0.468776

2D PAM4 Statistical Eye Diagrams

To enable PAM4 modulation, set the **modulation** parameter in the Eye source to **PAM4**. Select **Gray** or **Linear** for the **coding** parameter as applicable. When analysis completes, select **Create Statistical Eye Diagram** > **Rectangular Plot**.

The plot shows four voltage levels, each one corresponding to a transition between two bits. This example uses the default Gray coding: the lowest level represents 00, the next higher level represents 01, the next higher level represents 11, and the highest level represents 10. The four voltage levels form three eyes in the diagram.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

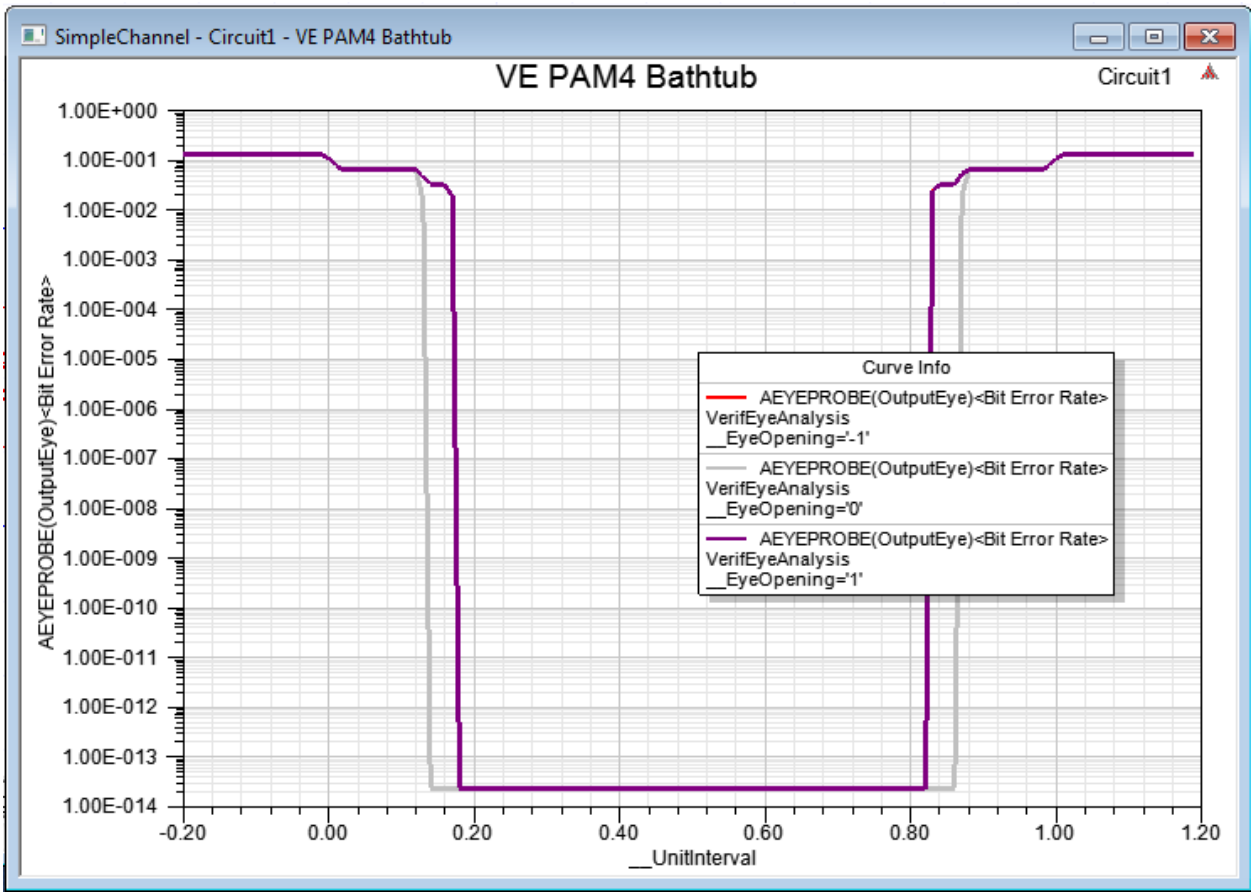


The red lines show the eye openings. The dark lines show the intersection of all three eye openings.

2D PAM4 Bathtub Plots

To enable PAM4 modulation, set the **modulation** parameter in the Eye source to **PAM4**. Select **Gray** or **Linear** for the **coding** parameter as applicable. When analysis completes, select **CreateStandard Report** > **Rectangular Plot**. From the Report setup, click the Families tab and edit the _EyeOpening family. The entries are -101 (combined error rate), -1 (upper eye error rate), 0 (middle eye error rate) and 1 (lower eye error rate). From the Report window, select **UI** as the Domain and **Bathtub** as the Category. Select the **<Bit Error Rate>** trace to see the bit error rate.

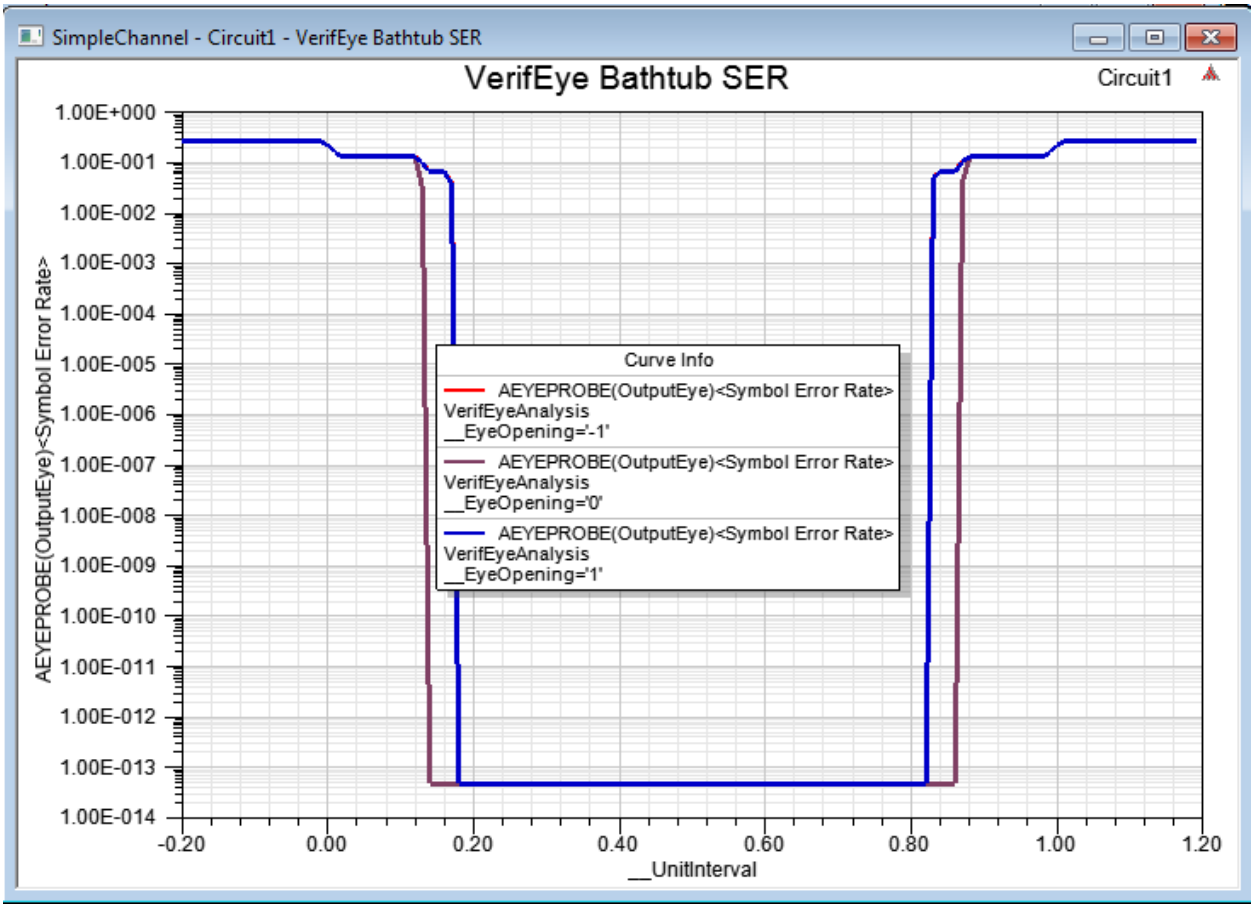
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The example plot shows the separate bit error rates for the three PAM4 eyes (-1, 0, and 1 selected).

The bathtub curve for a PAM4 simulation can show the symbol error rate instead of the bit error rate. With PAM4, a symbol is two bits. The report setup is the same, but now select the **<Symbol Error Rate>** trace.

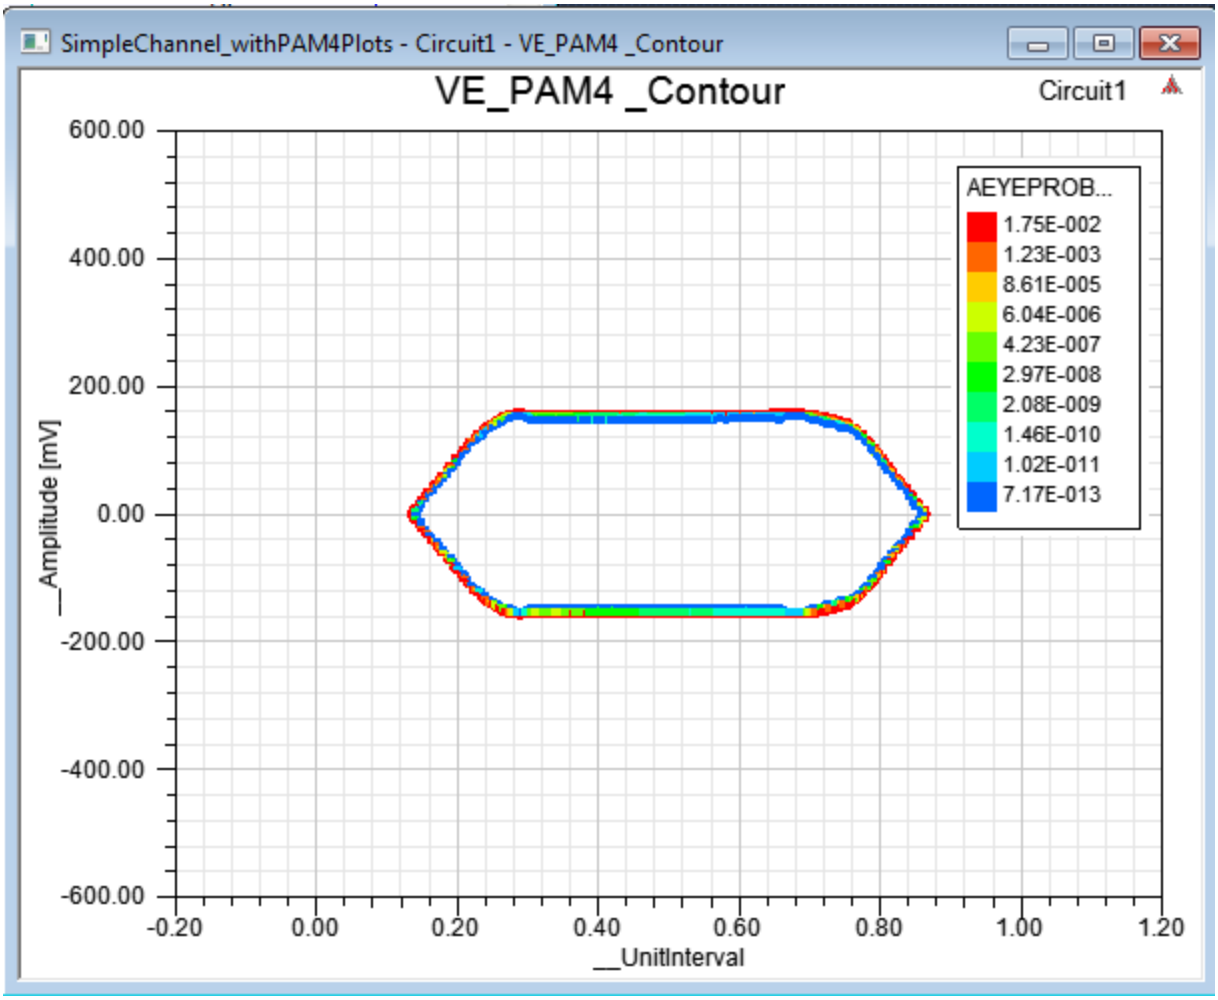
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2D PAM4 Contour Plots

To enable PAM4 modulation, set the **modulation** parameter in the Eye source to **PAM4**. Select **Gray** or **Linear** for the **coding** parameter as applicable. When analysis completes, select **CreateStandard Report** > **Rectangular Contour Plot**. From the Report setup, click the Families tab and edit the _EyeOpening family. The entries are -101 (combined error rate), -1 (upper eye error rate), 0 (middle eye error rate) and 1 (lower eye error rate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The example plot shows the separate bit error rates for the three PAM4 eyes (-1, 0, and 1 selected).

Running Quick Eye Analysis on the Schematic Editor

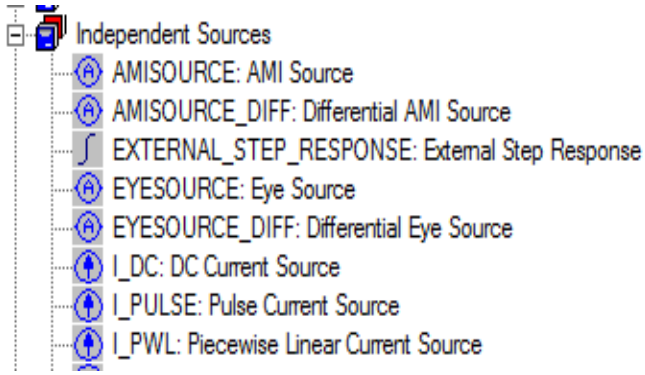
The eye diagram is a convenient way to analyze the performance of a serial communications channel. In a traditional eye diagram, copies of the waveform generated by transient analysis are overlaid at a spacing of one unit interval (UI). To run Quick Eye analysis, the design must include one or more Eye Sources and corresponding Eye Probes. Transmitter and receiver parameters including equalization are set up in the sources and probes. Other parameters can be specified in the setup window.

Add a QuickEye Source to a Schematic

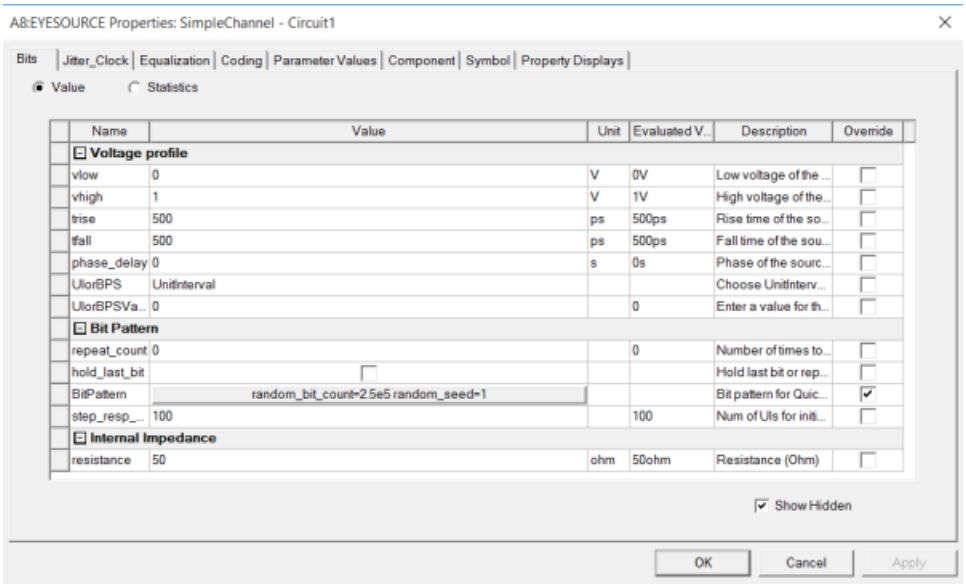
The eye diagram is a convenient way to analyze the performance of a serial communications channel. In a traditional eye diagram, copies of the waveform generated by transient analysis

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

are overlaid at a spacing of one unit interval (UI). The Eye Source may be used as the transmitter in QuickEye, VerifEye, and Transient analyses. The Eye Source may be selected on the Independent Sources list on the Components tab.



Both single-ended and differential versions are available. In a schematic, double-click the Eye Source, or right-click the Eye Source and select **Properties**, to open the Properties window.



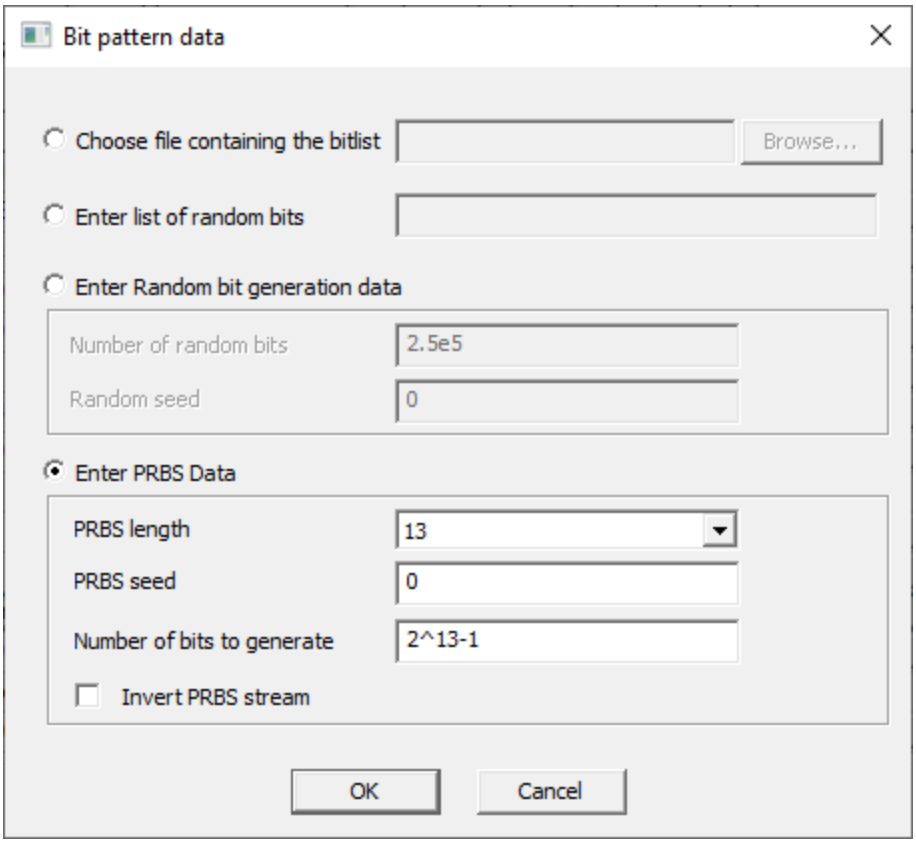
- For Quick Eye analysis, all Eye Source parameters apply except spread spectrum clocking.
- For VerifEye analysis, all parameters apply except the bit pattern generators and spread spectrum clocking.
- For Transient analysis, all parameters apply.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Bits Tab

The **Properties** window opens with the Bits tab displayed.

- The logic low, **vlow**. The default is 0 volt.
- The logic high, **vhigh**. The default is 1 volt.
- The rise time of input (**trise**). The default is 5.0e-10 seconds (500 picoseconds).
- The fall time of input (**tfall**). The default is 5.0e-10 seconds (500 picoseconds).
- The **phase_delay** for this source. The default is 0 seconds.
- The data rate: Click the **UIorBPS** drop-down to select **UnitInterval** or **BitsPerSecond**. Then Click the **UIorBPS Value** field to enter the unit interval size or number of bits per second.
- Click **Bit Pattern** to open the window.



- Select ONE of the methods for generating the QuickEye or Transient bit pattern.
- To link to a file with the bit values, click **Choose file**, then Click the **Browse** window to locate and select the data file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To specify a bit list, click **Enter list** and type in the list of 1s and 0s.
- To have the Eye source generate a random sequence of bits, click **Enter random**, then enter the **Number of random bits to be generated** and the **Random seed** value. To guarantee that multiple Eye sources always use different random seeds, set the **Random seed** to **-1** or **-2**. All Eye sources with setting **-1** get sequential random seeds starting with 1000, the same on every run. All Eye sources with setting **-2** get random seeds derived on the clock, changing from run to run.
- To generate a pseudo-random sequence of bit patterns of various lengths, click **Enter PRBS Data**. Select the length of the pattern, **PRBS_length**, (2 to 31 bits) on the drop-down menu. Enter a PRBS seed value, and specify the total number of bits to be generated. To invert the PRBS bit stream, check the check box at the lower-left of the PRBS Data group box.

Click **OK** to close the **Bit pattern** window and return to the Eye Source parameter list.

- To specify one or more repeats of the bits in the bit list, bit file, random sequence, or PRBS, set the **repeat_count** parameter on the Eye Source to the number of repeats. For more information, see Eye Source Bit Data in the Technical Notes.
- The **Hold Last Bit** check box is for sources with different bit sequences. The shorter bit list can be repeated or the last bit value can be held, until simulation ends. The default is to repeat (check box not checked).

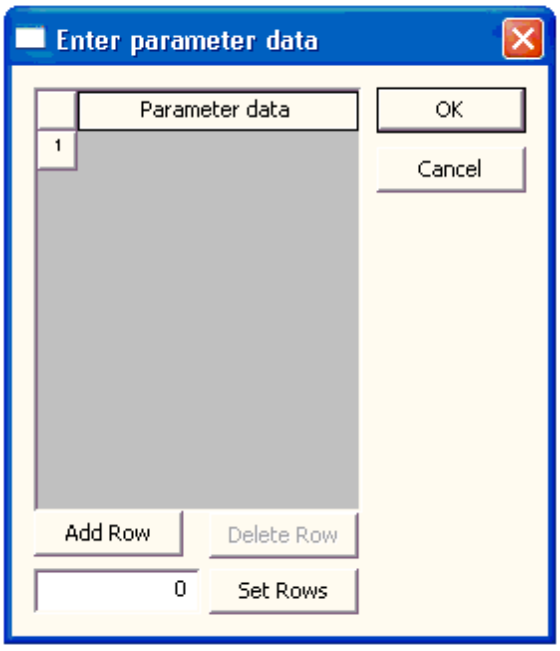
Jitter_Clock Tab

The Jitter_Clock tab contains parameters to set up DCD, transmit jitter, and Spread Spectrum clocking.

- Duty cycle distortion: Click the **DCDFractionorTime** dropdown menu to select **Fraction** (the default) or **Time**. For **Fraction**, the DCD value is a decimal fraction of the UI between 0.0 and 1.0. For **Time**, the DCD value is a time between 0.0 and UI in seconds. A time unit such as ps may be used to set the DCD time. The default for both Fraction and Time is 0.
- For more information, see *Duty Cycle Distortion* in the QE/VE Technical Notes.

For **txrj**, **txpj**, and **txuj**, clicking in the **Value** field allows you to specify one or more values that allow you to configure the generation of multiple jitter sources.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

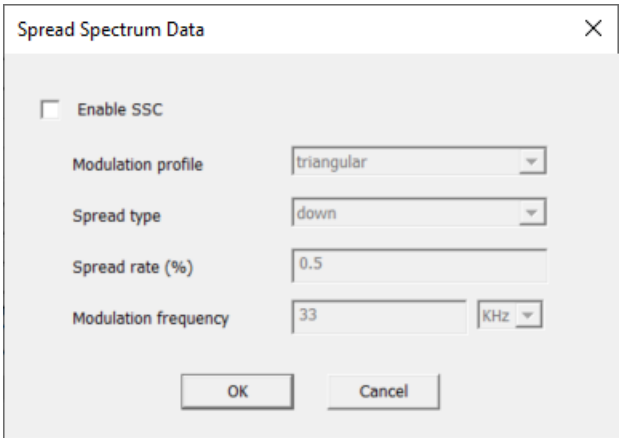


- For the random transmit jitter (**txrj**) the value is the standard deviation for the Gaussian distribution. The default is 0 seconds.
- For the Periodic random transmit jitter (**txpj**) the value is the amplitude. The default is 0 seconds.
- For the Uniform random transmit jitter (**txuj**) the value is the amplitude. The default is 0 seconds.
- For the User-defined transmit jitter (**txcj**) the value is the name of the file containing the time (seconds and probability density function (PDF) data. There is no default.
- For more information on transmit jitter parameters, see Transmit Jitter in the Technical Notes.

With Transient Analysis, configure the Eye Source to enable the application of Spread Spectrum Clocking. (Please note that QuickEye and VerifEye do not use Spread Spectrum clocking.)

- Click the **Value** field of the **SpreadSpectrum** property to open the Spread Spectrum Data window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Click the **Enable SSC** check box to activate the spread spectrum clock parameter fields.
- Select the **Modulation profile**: **triangular** (the default) or **sinusoidal**.
- Select the **Spread type**: **down** (the default), **center**, or **up**.
- Select the **Spread rate (%)**, a percentage of the main clock frequency (which is calculated on the UI or BPS value in the Eye Source Bits tab). The Spread rate must be non-zero to enable Spread Spectrum clocking. The default is 0.5%.
- Set the **Modulation frequency** to a non-zero value to enable Spread Spectrum clocking. The default is 33kHz.

Coding Tab

The Coding tab contains parameters to set up bit encoding and select NRZ or PAM4 modulation.

- The **do_encoding** parameter controls 8b10b, 64b66b, 128b130b, or 128b132b encoding of the transmitted bit stream. The default is no encoding (None). Select 8b10b encoding, 64b66b encoding, 128b130b encoding, or 128b132b encoding on the drop-down menu. Please note that the **do_encoding** option is valid only when **modulation=NRZ**. **do_encoding** is ignored when **modulation=PAM4**.
- The **modulation** to be used. The default **NRZ** uses two voltage levels (binary data), **PAM4** uses four voltage levels to represent two-bit symbols. See **Coding**.
- In the window, the **coding** parameter is labeled **coding_PAM4_only** as a reminder that it is ignored for NRZ transmissions. The **coding** parameter defines how digital bits are sent as analog waveforms in PAM-4 transmissions. In PAM-4, two bits ("00"/"01"/ "10"/"11") are transmitted at a time; in Gray coding, "00" is transmitted as "vlow," "01" as "vlow + (vhigh-vlow)/3," "11" as (vhigh - (vhigh-vlow)/3), "10" as "vhigh". In Linear coding, these voltage levels (smallest to largest) are used to transmit bits "00," "01,"10," and "11," respectively. The **coding** parameter has no effect in NRZ transmissions. In NRZ, one bit ('0' or '1') is transmitted at a time; '0' is transmitted as "vlow," and 1 as "vhigh."

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

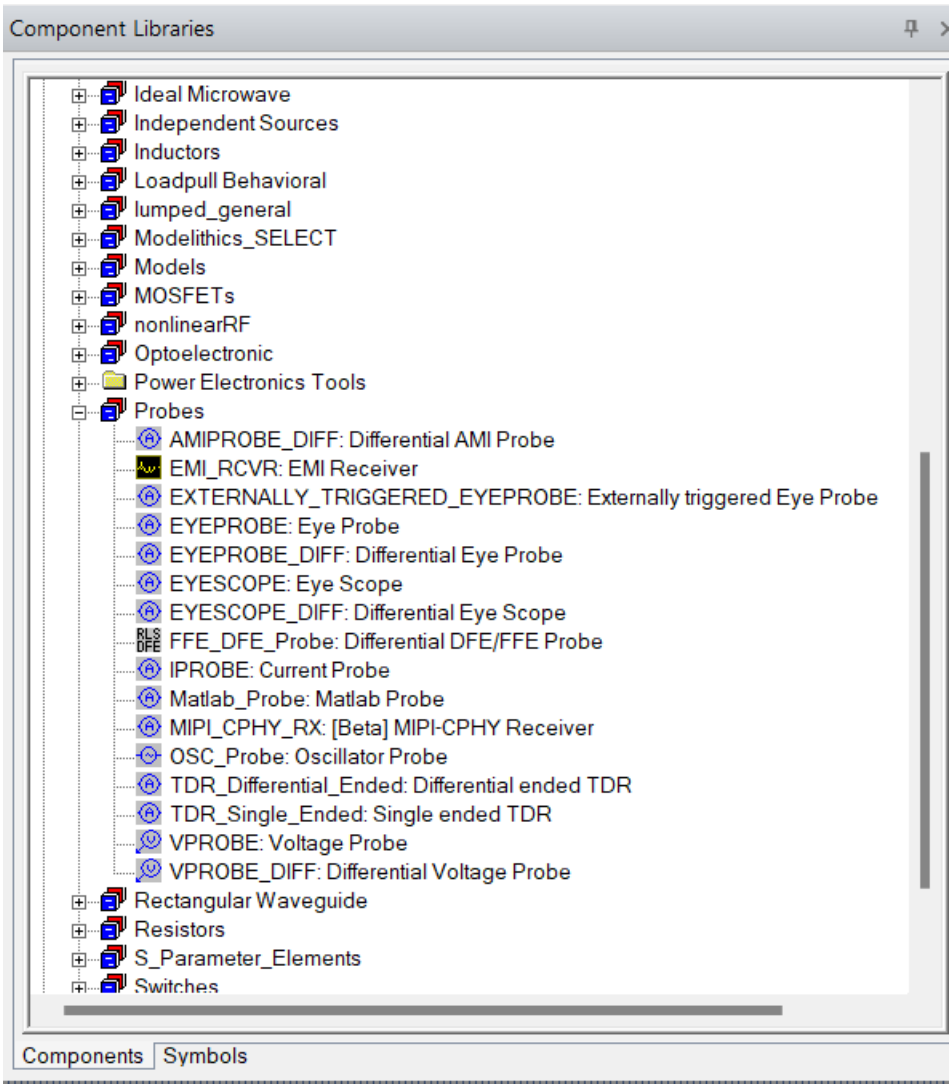
Equalization Tab

The Equalization tab allows you to set up Feed-Forward Equalization in the Eye Source. To apply Feed-Forward Equalization, click **FFE_data** which opens the **FFE Data** window.

Add an Eye Probe to a Schematic

An Eye Probe is required when the QuickEye, VerifEye, or Transient analysis uses an Eye Source as the transmit device. All QuickEye and some Transient analyses use one or more Eye Sources and Eye Probes. Each Eye Probe receives data from a specific Eye Source, allows for Decision-feedback and Continuous-time equalization at the receiver end, and preserves all the transient analysis data generated during the analysis.

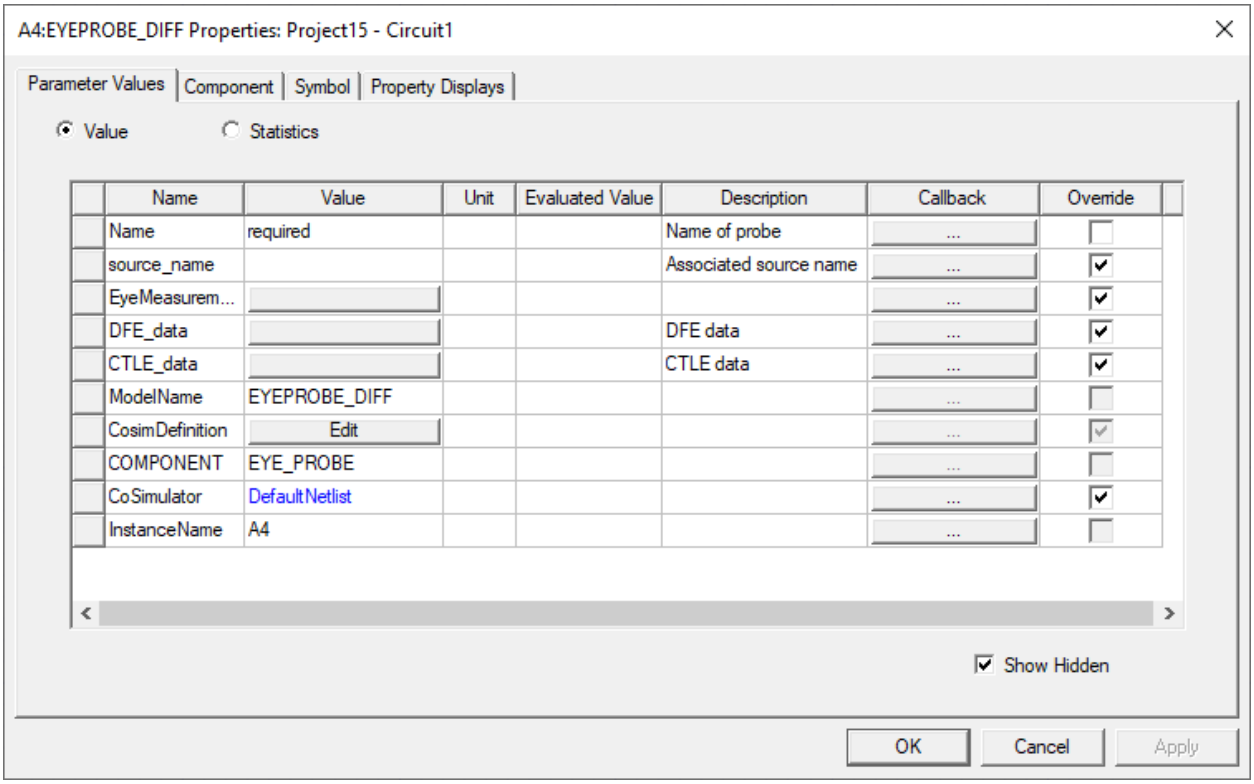
The Eye Probe may be selected on the Probes list on the Components tab:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Both single-ended and differential versions are available.

Click the Eye Probe to open its parameter list:



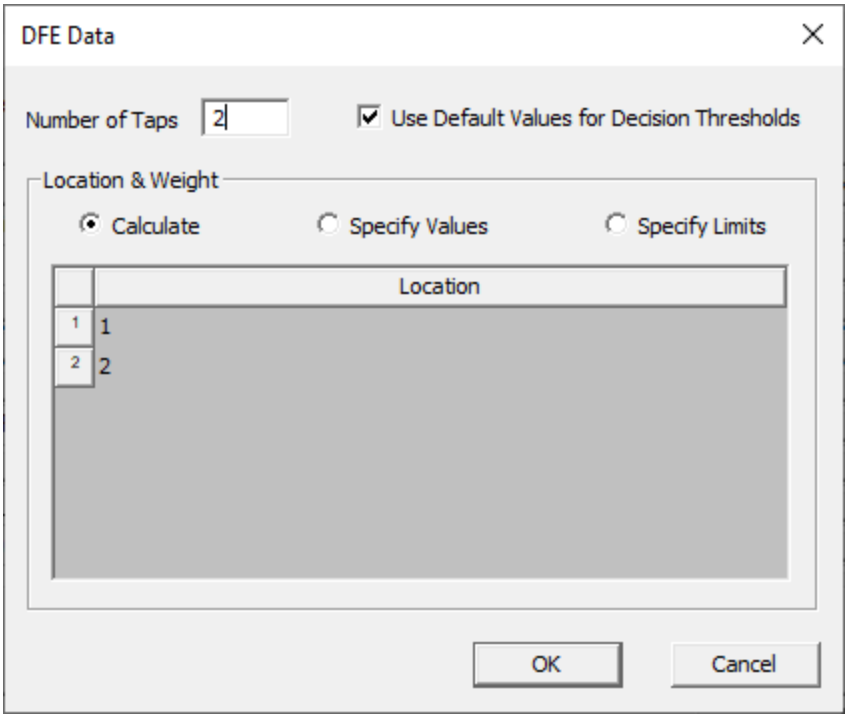
The **Parameter Values** tab is the default.

- Specify a name for the Eye Probe.
- Select the Eye Source for this probe on the **source_name** drop-down menu. A channel can have multiple sources, but only the source actually at the transmitter should be the reference source.

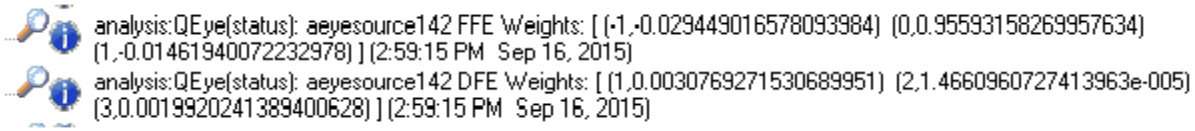
The **source_name** field is automatically filled in with the name of the Eye Source when the Source and Probe are paired on the GUI. See Pairing an Eye Source and an Eye Probe in the Schematic.

- To apply decision-feedback equalization to the received bits, click **DFE_data** to open the window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



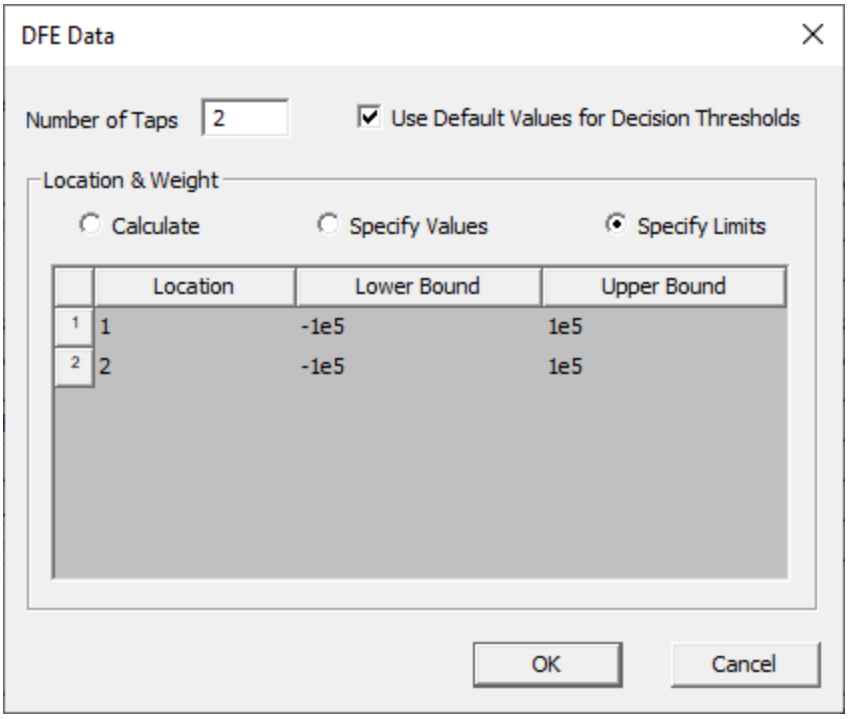
- To enable Decision-Feedback Equalization at the probe, set the **Number of taps** in the **DFE** field to a positive, non-zero value. The default is zero taps (no DFE). When one or more taps have been specified, a list of tap numbers and locations appears.
- DFE applies its tap weights to the decision threshold for each bit to correct for inter-symbol interference (ISI) in the transition from previous bits to the current bit. A DFE with M taps is like a buffer of M bits. Tap 1 is applied to the earliest bit to arrive in the DFE buffer. Tap 2 is applied to the next later bit, et cetera.
- The value of each bit is decoded, and the difference between the actual voltage and the ideal voltage is calculated. Tap weights compensate for the difference. In QuickEye, the weights are applied to the step response.
- By default, the Circuit solver calculates the weights to apply to the DFE taps. The tap weights calculated by QuickEye are displayed in the **Message Manager** window after the Quick Eye analysis has completed.



- To automatically calculate the tap weights, choose **Specify Limits** and set the limits. The tap weights are calculated in the bounds you specify. The default value for bounds are +/-

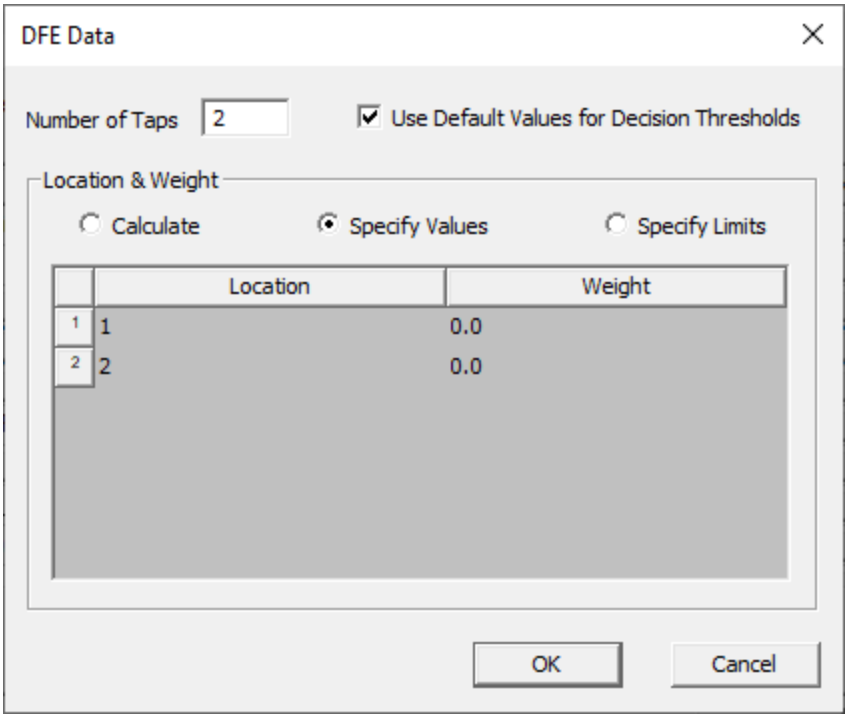
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1e5 for taps. There are no requirements on the limits.



- To specify your own set of tap weights, select **Specify Values** and click the weights to specify them.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



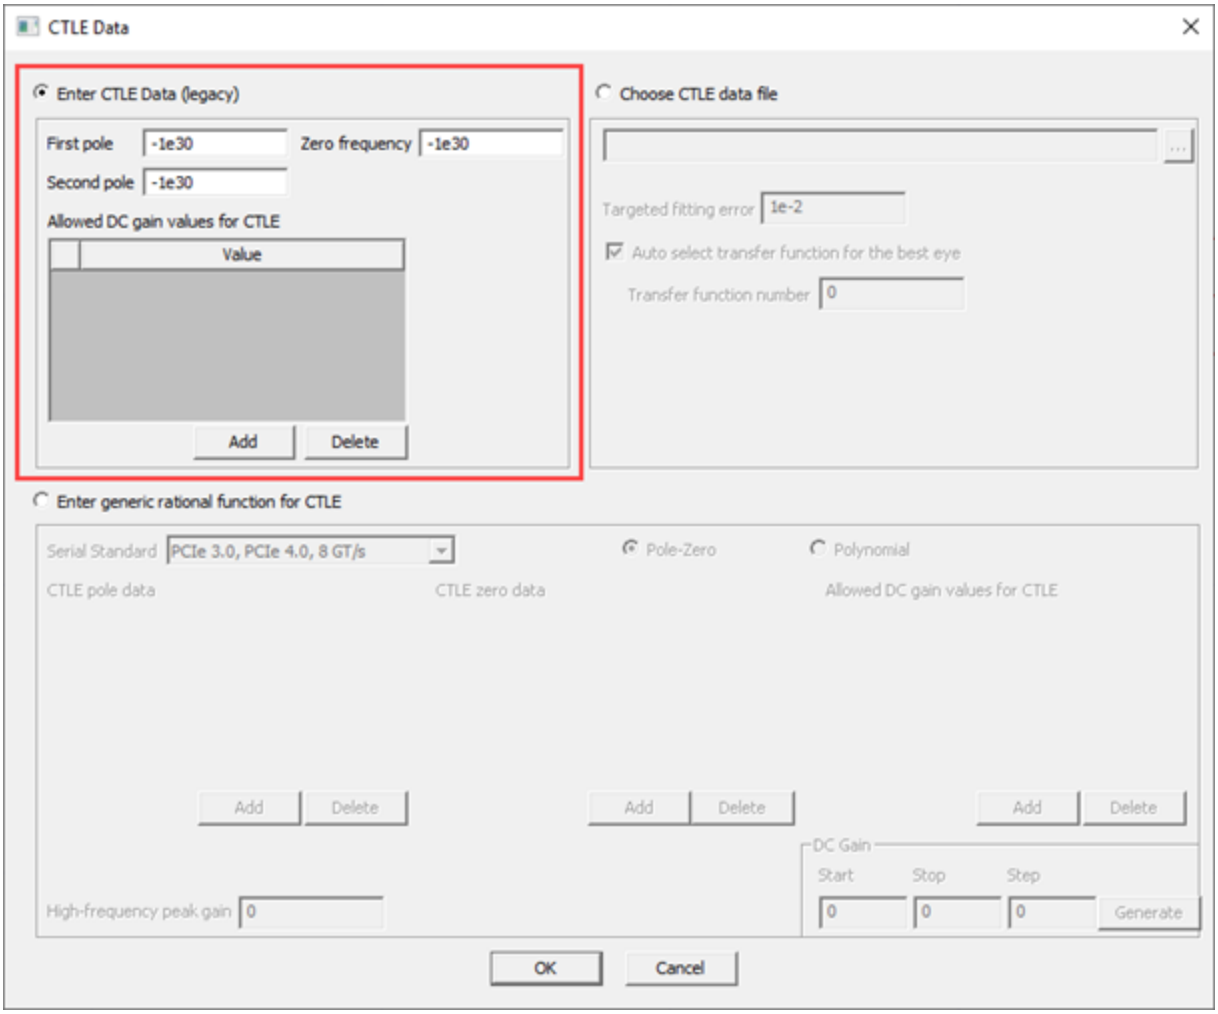
- To decode the received bits, mark **Use Default Values for Decision Thresholds**. For NRZ transmissions, you enter a single voltage threshold. For PAM4, you enter three voltage thresholds, one for each eye. The default is to have Nexxim calculate the thresholds.
- For more information on DFE, see Decision-Feedback Equalization.
- Click **OK** to close the **DFE_data** window and return to the Properties window.

Click **CTLE_data** to open the **CTLE Data** window. (See Continuous Time Linear Equalization in the QE/VE Technical Notes for details).

- Select **Enter CTLE Data (legacy)**, **Choose CTLE data file**, or **Enter generic rational function for CTLE**.

If you select **Enter CTLE Data**, only the CTLE data group box is activated:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



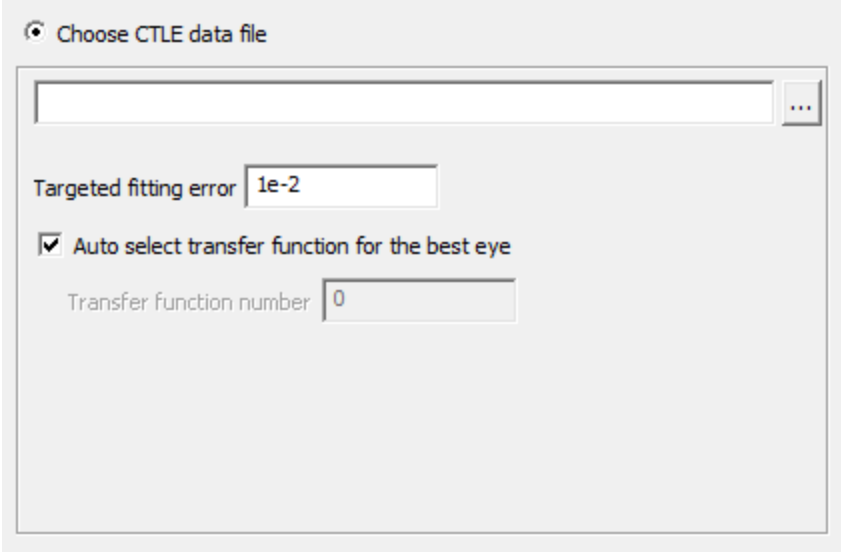
- Specify the first pole frequency in Hz (positive). The first pole frequency typically is the lower bound of the high passband.
- Optionally, specify a second pole frequency. The second pole frequency typically is the higher bound of the passband.
- Optionally, specify a zero frequency, typically where the response curve begins to rise.

> **Note:**
>
> 1. The default pole and zero frequency values of -1e30 are equivalent to "None."
> 2. If the zero frequency is specified, it must be greater than 0.0.
> 3. See Continuous Time Linear Equalization in the QE/VE Technical Notes for an illustration of the two-pole, one zero filter.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Optionally, click **Add Row** and **Delete Row** to specify one or more allowable values for the DC gain factor in dB for the CTLE calculation. Nexxim varies the gain to find the optimum equalization (maximum eye height). If no values are provided, the Circuit solver calculates the optimum CTLE gain (between -infinity dB to 0 dB).

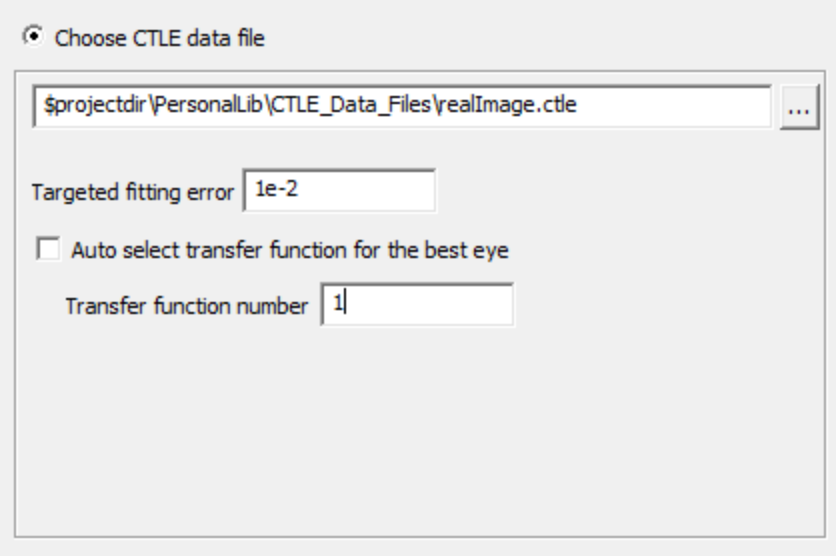
If you select **Choose CTLE Data File**, only the CTLE data file group box is activated. Here is that portion of the window:



- Use **Browse** to access the **File Open** window. Browse to the target directory and select the file with the CTLE transfer function data (**.ctle** extension). Nexxim fits a rational function to the data.
- Optionally, Click the **Targeted fitting error** field to specify a tolerance to apply to the CTLE rational function calculation using the transfer function data.
- By default, **Auto select transfer function for the best eye** is enabled. Nexxim tries all the transfer functions on the file, and uses the one that yields the maximum eye height. Optionally, uncheck the **Auto select** group box, then enter the number of a transfer function among the multiple transfer functions in the data file.

In the following figure, transfer function 1 is specified.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



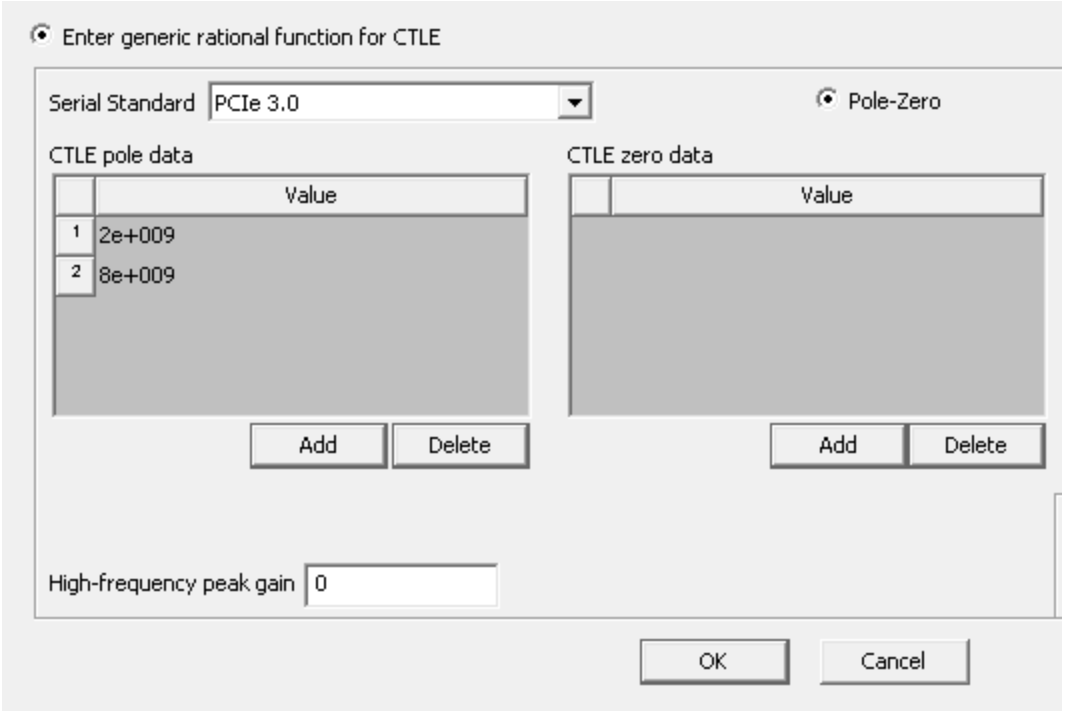
- Values for the transfer function number run from 0 (the **Auto select** default) to the number of transfer functions in the file. The first transfer function is number 1, the second is number 2, et cetera. If the number given for this parameter is less than 0 or greater than the number of transfer functions in the file, an error occurs.

When you select **Enter generic rational function for CTLE**, only that group box is activated.

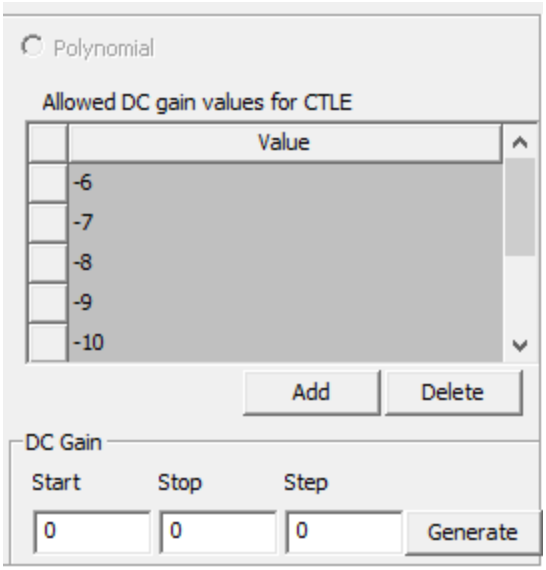
There are two formats for specifying a generic rational function, chosen by selecting **Pole-Zero** or **Polynomial**. By default, the **Pole-Zero** format is selected. With this format, the rational function is specified by a set of pole frequencies, a set of zero frequencies, the high-frequency peak gain, and a list of allowable DC gain values.

Here are the entry fields for the pole and zero frequencies and the High frequency peak gain:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

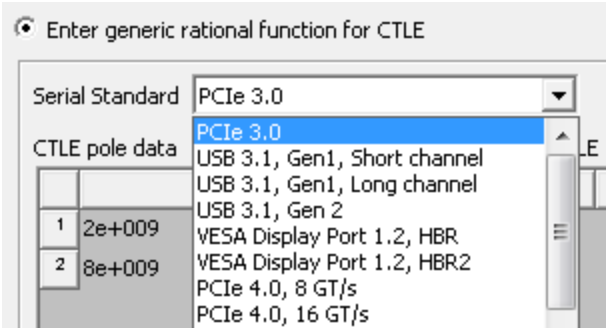


Here is the entry field for the DC gain values:



The **Serial Standard** field has a drop-down menu with a selection of preset standard CTLEs. The PCIe, USB, and VESA preset CTLEs use only the **Pole-Zero** format.

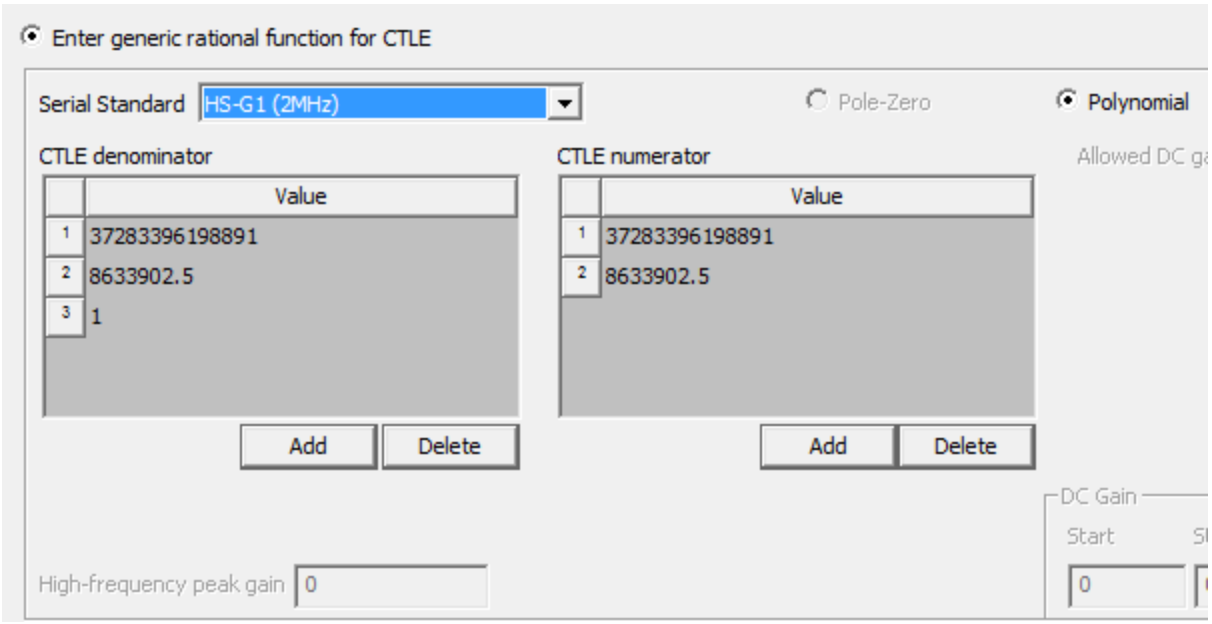
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



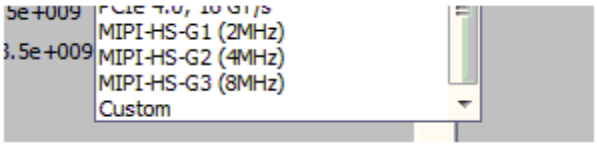
Note: This illustration may not include later additions to the preset standards.

Alternatively, select **Polynomial** format. In this format, the rational function is specified by giving the coefficients for the terms in the numerator and denominator of the polynomial fraction. The **High-frequency peak gain** and **Allowed DC gain** fields are inactivated in the **Polynomial** format.

Here are the entry fields for the **Polynomial** format coefficients:



The MIPI-HS-G1, MIPI-HS-G2, and MIPI-HS-G3 CTLE presets use only the **Polynomial** format.

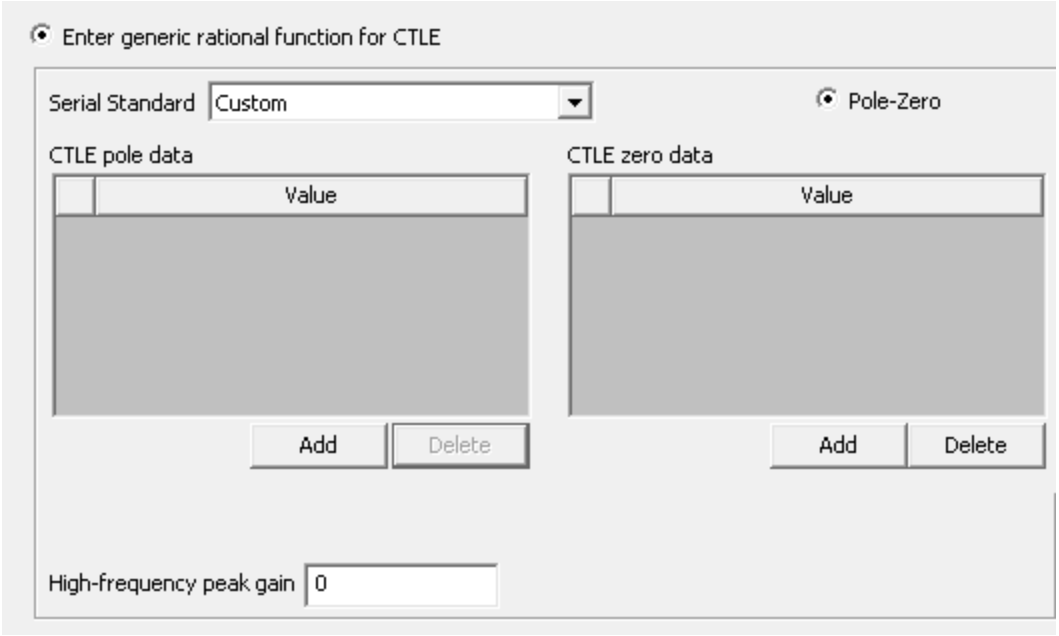


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: This illustration may not include later additions to the preset standards.

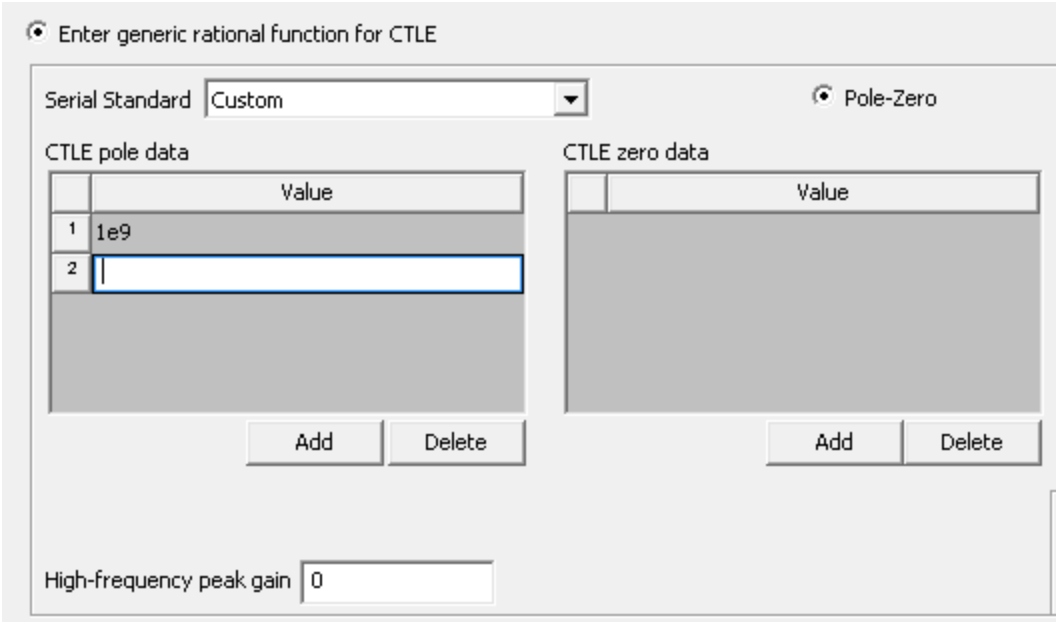
To create your own rational function, select **Custom** on the menu. The **Custom** entry allows you to specify a generic rational transfer function in either **Pole-Zero** format or **Polynomial** format.

Here are the **CTLE pole data**, **CTLE zero data**, and **High-frequency gain** entry fields for the **Custom** entry in **Pole-Zero** format:

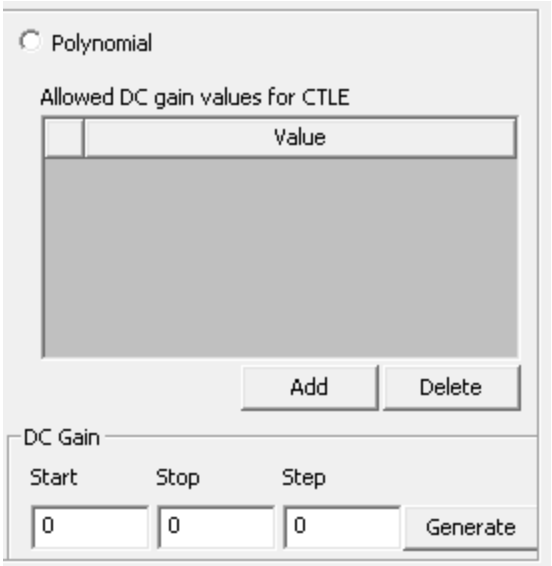


Click **Add** to add a row in the pole or zero data list. Click in the **Value** field to enter the pole or zero frequency in Hz. Click **Return** to generate a new row. Click **Delete** in either field to delete unwanted rows. Set the **High-frequency peak gain** to a appropriate value in dB.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



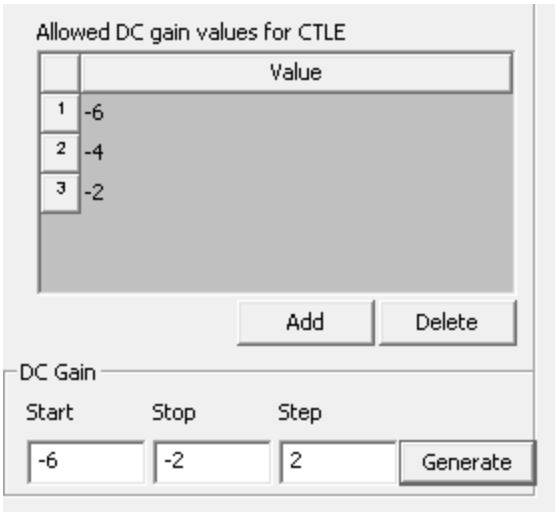
Use the **Allowed DC gain** group box to specify a range of DC gain values in dB.



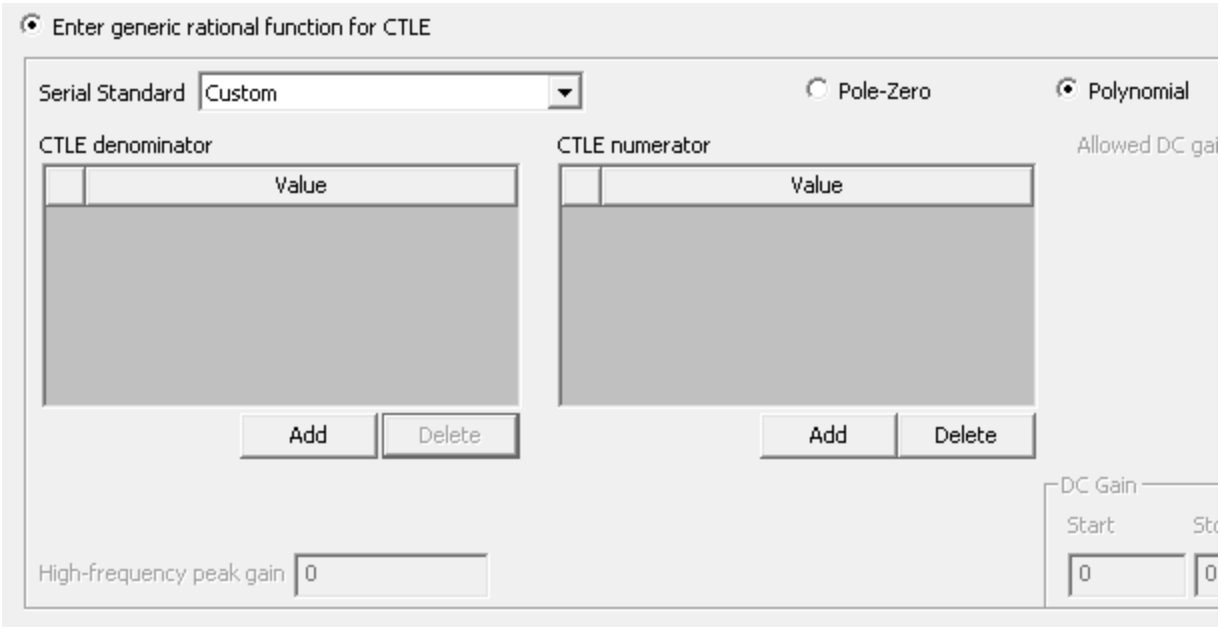
Click **Add** and **Delete** to specify one or more allowable values for the DC gain factor in dB for the CTLE calculation. Nexxim varies the gain to find the optimum equalization (maximum eye height). If no values are provided, the Circuit solver calculates the optimum CTLE gain (between -infinity dB to 0 dB).

To have Nexxim generate a sequence of DC values, enter the **Start**, **Stop**, and **Step** values in the **DC Gain** fields and click **Generate**. In this window, Start=-6, Stop=-2. and Step=2:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Alternatively, a **Custom** rational function CTLE can Click the **Polynomial** format.

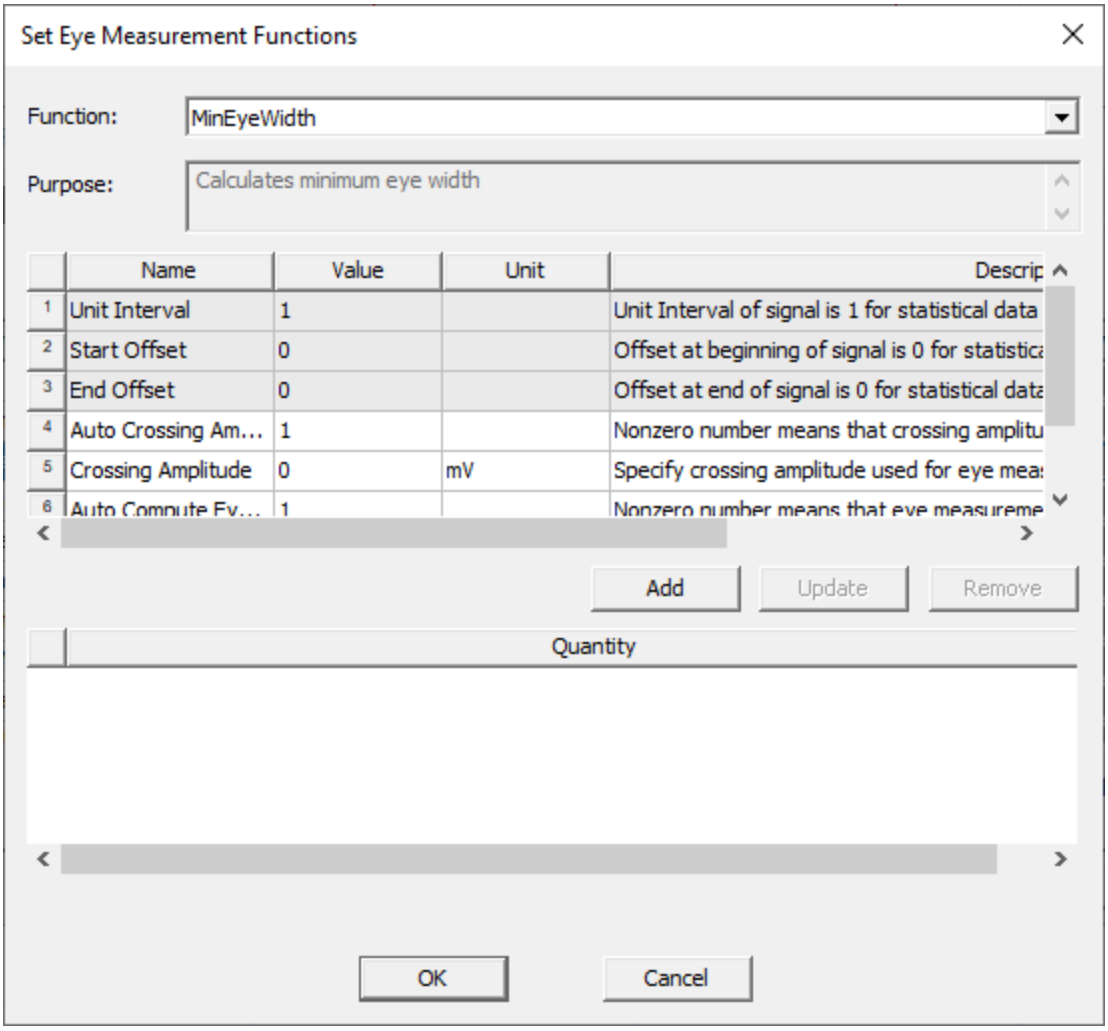


Click **Add** to add a row in the CTLE denominator or CTLE numerator list. Click in the **Value** field to enter the (unitless) coefficient. Click **Return** to generate a new row. Click **Delete** in either field to delete unwanted rows. Click **OK** to close the **CTLE Data** window.

For more information see Continuous Time Linear Equalization.

Click **EyeMeasurementFunctions** to open the **Set Eye Measurement Functions** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- In the **Function** field, select **MinEyeWidth** or **MinEyeHeight**.
- Set the **Unit Interval** parameter to the Unit Interval (UI) of the Eye diagram.
- Set the **Start Offset** parameter if an initial time offset is appropriate.
- Set the **End Offset** parameter if trailing time offset is appropriate.
- Leave **Auto Crossing Amplitude** set to 1 (or any non-zero number) to have the solver compute the crossing amplitude by averaging the histograms for the high and low voltages. The crossing amplitude sets the voltage at which the minimum eye width is calculated.
- When **Auto Crossing Amplitude** is 0, the solver uses the voltage set in the **Crossing Amplitude** parameter as the crossing voltage amplitude for the minimum eye width calculation.
- Leave **Auto Compute Eye Measurement Point** set to 1 (or any non-zero number) to have the solver compute the eye measurement point by averaging the times of the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

crossing points. The eye measurement point sets the time at which the minimum eye height is calculated.

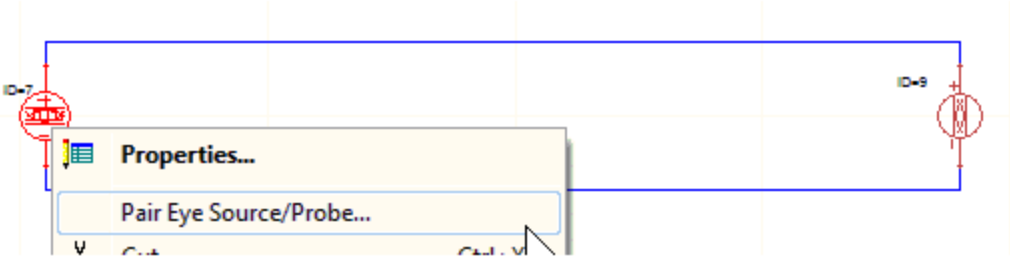
- When **Auto Compute Eye Measurement Point** is 0, the solver uses the voltage set in the **Eye Measurement Point** parameter as the time for the minimum eye height calculation.
- Click **Add** to add the measurement to the analysis. Add any number of measurements. The window above has added a **MinEyeWidth** measurement using the default settings.
- Click **OK** to close the **Set Eye Measurement Functions** window.
- For more information, see Eye Measurements in the Reports topic.

Click **OK** to close the Properties window of the probe.

Pairing an Eye Source and an Eye Probe in the Schematic Editor

A VerifEye or QuickEye circuit may contain multiple Eye Sources and Eye Probes. Each Eye Probe must be paired with a corresponding Eye Source. The Eye Probe **source_name** parameter has a drop-down that lists all the Eye Sources in the design.

Instead of using the drop-down menu, pair a selected source and probe directly in the schematic. Use **Ctrl**+click to select the Eye Source and Eye Probe that you want to pair up. With the cursor on either component, right-click and select **Pair Eye Source/Probe ...** on the menu.

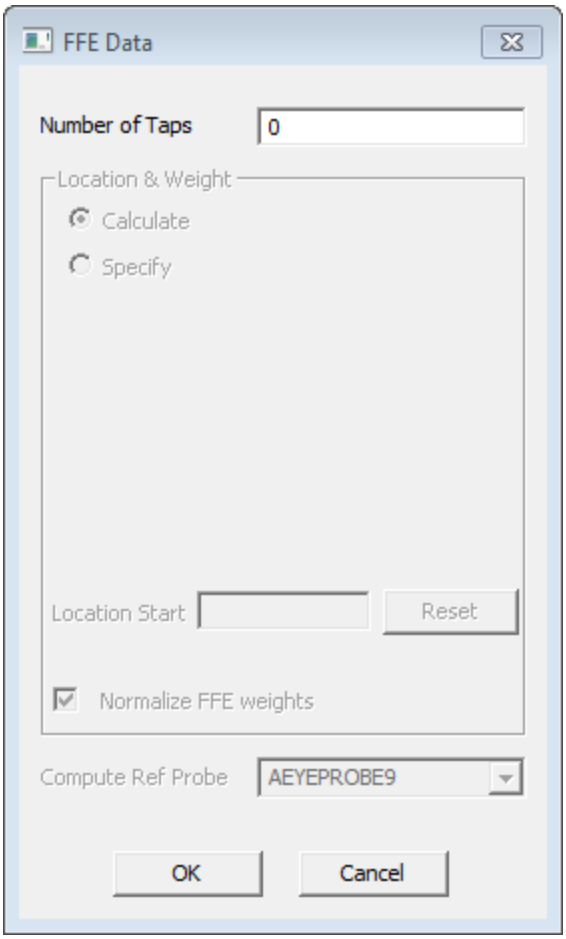


The **source_name** parameter in the selected Eye Probe is set to the name of the selected Eye Source.

	Name	Value	Unit	Evaluated Value	Description	
	Name	probe_for_source_7			Name of probe	
	source_name	AEYESOURCE7			Associated source name	
	DFE_data				DFE data	

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

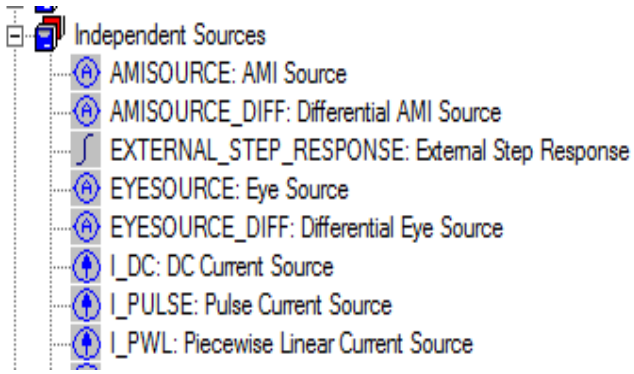
The **Compute ref probe** field in the FFE setup window for the selected Eye Source is set to the name of the selected Eye probe. The pairing is made whether or not FFE is enabled in the Eye Source.



Add an External Step Response to a QuickEye Analysis

Instead of having the solver compute the step response, supply the step response via a data file, using the External Step Response component. First, place Eye Sources and Probes in the circuit. Select the External Step Response on the Independent Sources list on the Components tab:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



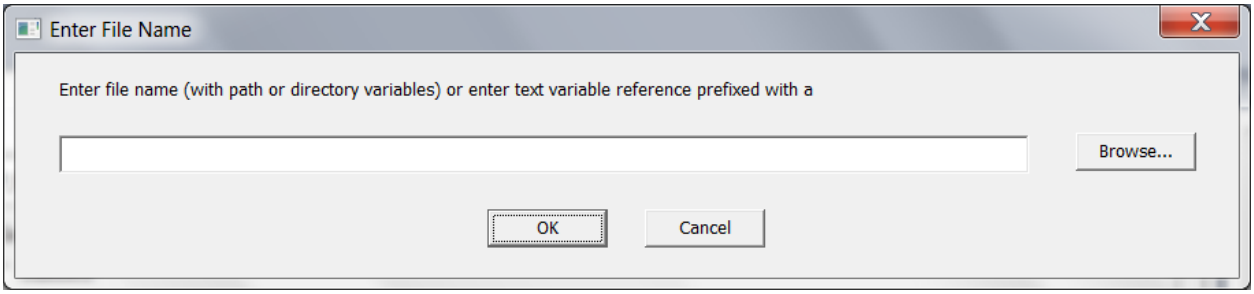
The External Step Response component does not physically connect to the circuit.

Click the component to open the Properties list:

source_name				Eye source name
probe_name				Eye probe name
step_response_file_rise				Rising step response fil...
step_response_file_fall				Falling step response fil...

Select the source name and the probe name. The source and probe names appear automatically when they are present in the circuit. Each step response source applies to one source and one probe.

Specify the files that contain the rising and falling step responses by clicking the buttons in the **Value** field. The same window applies to both files:



If only one file is supplied, the rise and fall are treated as symmetrical.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

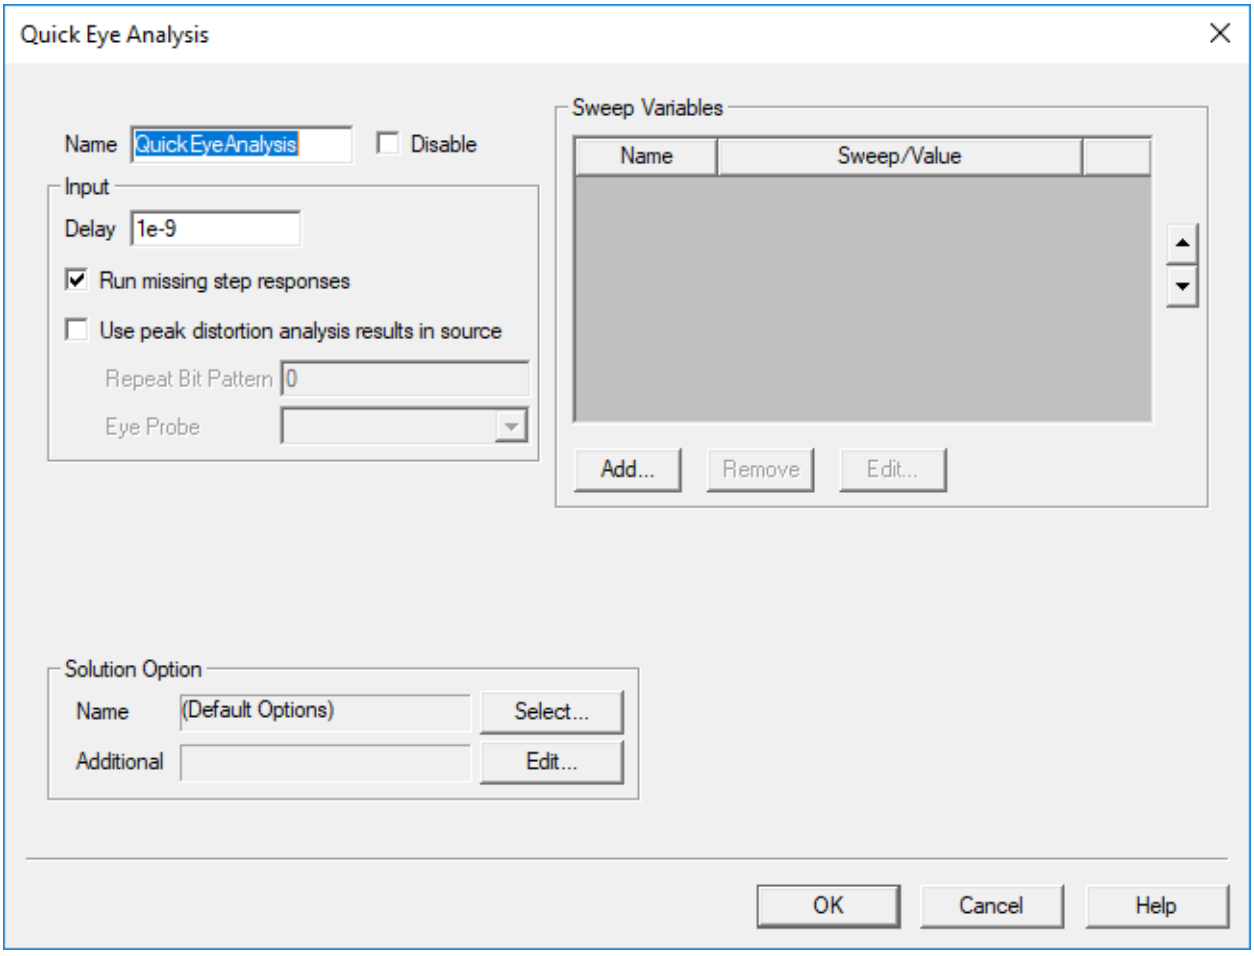
> **Note:** If no step response file is specified (or found), the default is for analysis to fail. Setting the VE/QE analysis parameter **run_missing_step_response=1** runs transient analysis to generate the missing step response.

The step response data files have a two-column format: *time voltage*. Linear interpolation is used between time points.

Set Up the Quick Eye Analysis

From the **Schematic Editor**, perform the following steps to set up and run a Quick Eye analysis and view the results.

1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **Quick Eye Analysis** to open the **Quick Eye Analysis** window.

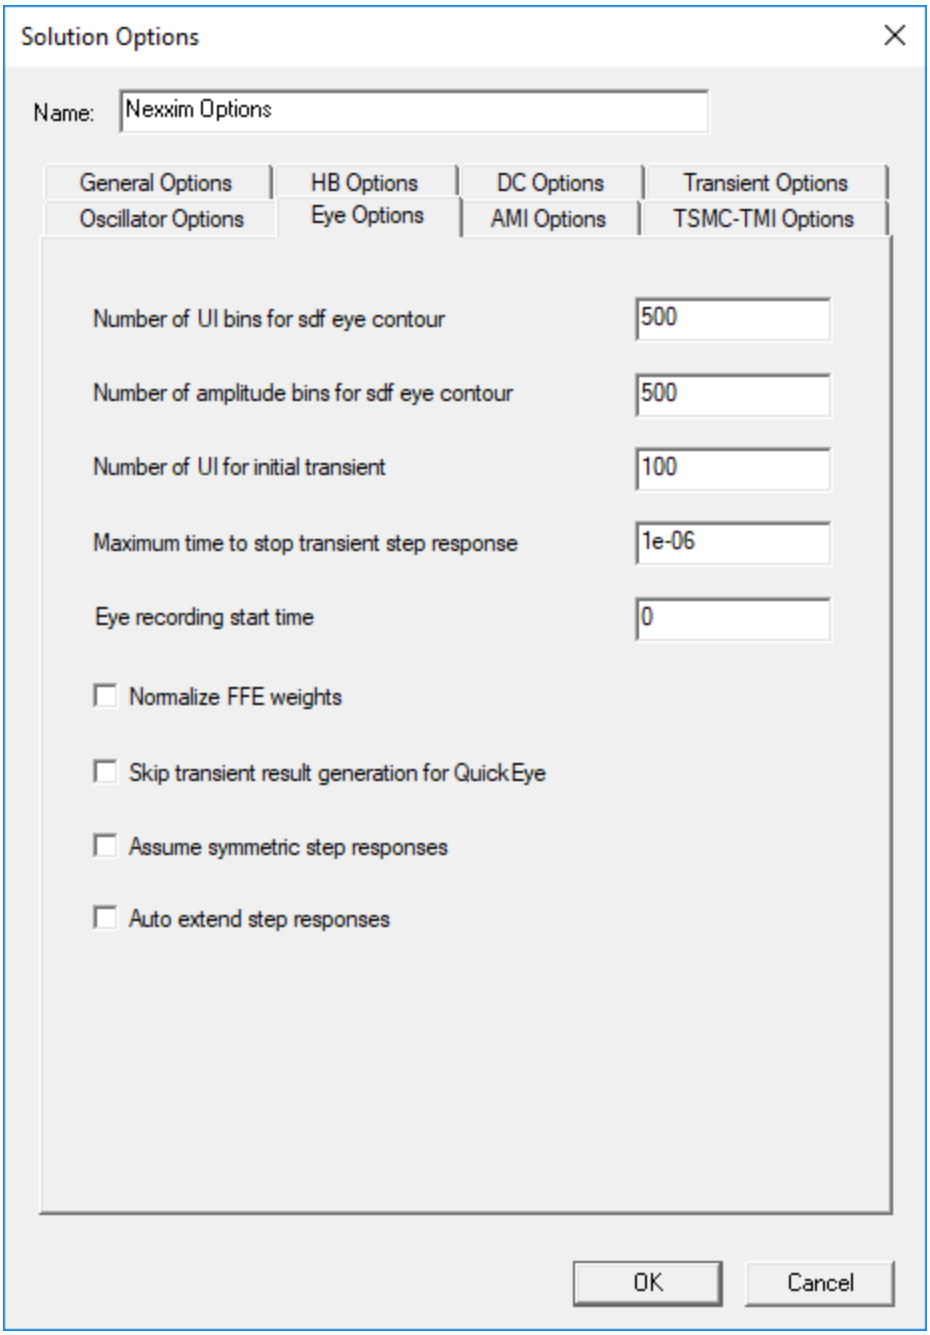


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Type an **Analysis Name** (or accept the default name, for example “QuickEyeAnalysis”).
3. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use.
4. Set the **Delay** parameter to control the delay in applying the step response.
5. **Run missing step response** allows simulation to proceed when an External Step Response component is present in the design but no step response data file can be found.

6. Click the **Use peak distortion analysis results in source** check box to enable the worst-case bit pattern to be output on the source. Set the **Repeat Bit Pattern** field to the appropriate number of repeats. When the **Use peak distortion** check box is checked, the worst-case bits from Peak Distortion Analysis is output from all Eye Sources. Any bit patterns set in the sources are ignored. See Peak Distortion Analysis for further information.
   - Specify the number of times to repeat the worst-case bit pattern.
   - Select the Eye Probe that is to be the target for all Eye Sources.
7. To add a sweep, locate the **Sweep Variable** area in the **Quick Eye Analysis** window.
   - In the **Sweep Variable** area, click **Add**, and the **Add/Edit Sweep** window opens.
   - In the **Variable** list, select **Temp** or the name of a variable (when a variable has been defined for the design), then select one of the following: **Single value, Linear step, Linear count, Decade count,** or **Octave count**.
   - Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
   - For details on sweeps, see Variable Sweep.
   - Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the**Quick Eye Analysis** window.
8. Optionally, click **Edit** to open the **Output Quantities** window.
   - Click the check boxes on the **OutputQuantities** window to add net voltages and branch currents to the data generated by the analysis.
   - Click **OK** to add the selected output values and return to the **QuickEyeAnalysis** window.
9. Optionally, use the fields in the **Solution Options** group box to add **VerifEye/QuickEye** options.
   - Click **Select** on the **Name** field to open the **Select Solution Options** window.
   - To create a new option set, click **New** to open the **Solution Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Click the **Name** field to name the new option set.
- Click the **Eye Options** group box fields and check boxes to set any appropriate options.

Number of UI bins sets the number of UI histogram bins to use for generating the 3D and contour data. The default is 500. Option: **eye.ui_bins**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of amplitude bins sets the number of amplitude histogram bins to use for generating the 3D and contour data. The default is 500. Option: **eye.ampl_bins**.

Number of UI sets the number of unit intervals (UI) over which the initial transient step response should run after any channel or source delay. The default is 100. Option: **eye.num_initial_ui**.

Maximum time sets the maximum stop time for the transient step response calculation. The default is 1μs. Option: **eye.resp_tmax**.

NOTE: QuickEye uses the minimum of (**num_initial_ui** x UI) and (**resp_tmax**) to set the transient final time for the step response calculation.

Normalize FFE weights sets the solver to normalize FFE weights (sum of absolute values of all weights equals one). This option applies only to weights supplied by the user. The Circuit solver always normalizes the taps weights that it calculates. The default for user-supplied weights is no normalization. Option: **eye.normalize_ffe_weights**.

Skip transient result turns off QuickEye storage of the eye diagram and the transient-like result. By default, QuickEye stores the eye diagram and the transient-like result. Option: **eye.qe_only_cmf**.

Assume symmetric step responses sets QE/VE to use the rise time as the fall time. The default is to use different rise and fall times. Option: **eye.sym_step_resp**.

Auto extend step responses extends the step response beyond the simulation time. By default, the step response is extended only to the end of simulation time. Option: **eye.auto_extend_step_resp**.

- For more information, see VerifEye and Quick Eye Analysis Options.
- Click **OK** to return to the **VerifEye (Statistical Eye)Analysis** window.

Run the Quick Eye Analysis and Display Results

1. Run the simulation:
- From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- If the analysis is not successful, check the **Message Manager** window for an explanation, and then take corrective action.
2. Display results:
- From the menu bar, click **Circuit**, then click **Results** >**Create Standard Report**. (Alternatively, select **Create Standard Report** on the **Results** icon in the **Project Manager** window.)

For more information, see QuickEye Analysis Outputs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For information on reporting the Peak Distortion Analysis (PDA) data, see Peak Distortion Analysis.

Running Quick Eye Analysis on the Netlist Editor

If you use the Netlist Editor to create a design, the netlist should contain the information for running the envelope analysis. No Solution Setup is required.

QuickEye Source Netlist Syntax

The netlist syntax for the QuickEye Source is:

```
AEYESOURCExxxxn1 [n2] COMPONENT=EYE_SOURCE
 + VLOW=valVHIGH=val TRISE=val TFALL=val
+ UI=valBPS=val
+ BITSPERSYMBOL=1|2 CODING=0|1
+ STEP_RESP_NUM_UI=val
+ DCD=valDCD_TIME=val
+ TXRJ=[val ...]TXPJ=[val ...]TXUJ=[val ...]
 + TXCJ='filename'
 + FFE_LOCS=[locations]
 + FFE_WEIGHTS=[weights]
 + NORMALIZE_FFE= val
+ FFE_COMPUTE_PROBE='probe_name'
+ RESISTANCE=val
+ BITLIST=#bitlist
+ BITFILE='file-reference'
 + RANDOM_BIT_COUNT=val REPEAT_COUNT=val RANDOM_SEED=val
+ PRBS_NO=val
+ PRBS_SEED=val
+ PRBS_INVERT=val
+ PRBS_BITLENGTH=val
+ DO_ENCODING=val
+ HOLD_LAST_BIT=val
+ DELAY=val
```

n1 is the node connected to the single-ended source. *n2* is the second node on a differential source. One of the entries **BITLIST**, **BITFILE**, **RANDOM_BIT_COUNT**, or **PRBS_NO** must be specified. The entry **COMPONENT=EYE_SOURCE** is required.

> **Note:**
>
> The Eye sources are internally grounded. All terminals should be connected to signal lines, not directly to ground.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

See *Eye Source* in the Components help for details on these properties.

QuickEye Probe Netlist Syntax

The netlist syntax for the QuickEye Probe is:

```
AEYEPROBExxxxn1 [n2] COMPONENT=EYE_PROBE
 + SOURCE_NAME='source_name'
 + DFE_TAPS=val
+ DFE_LOCS=[locations]
 + DFE_WEIGHTS=[weights]
+ DFE_WEIGHT_lbS=[lower bounds]
+ DFE_WEIGHT_ubS=[upper bounds]
+ DECISION_HIGH=val
+ DECISION_LOW=val
+ THRESHOLDS=[val (val...) ]
+ CTLE_FIRST_POLE=val
+ CTLE_SECOND_POLE=val
+ CTLE_ALLOWED_GAIN=[val ...]
 + CTLE_FILE="file_reference"
 + CTLE_RELTOL=val
 + TF_NUM=val
 + CTLE_POLES=[ val ... ]
 + CTLE_ZEROS=[ val ... ]
 + CTLE_AC_GAIN=val
 + CTLE_ALLOWED_GAIN=[ val ... ]
 + CTLE_NUMERATOR=[ val ... ]
 + CTLE_DENOMINATOR=[ val ... ]
```

n1 is the node connected to the single-ended source. *n2* is the second node on a differential source. The entry **COMPONENT=EYE_PROBE** is required.

See *Eye Probe* in the Components help for details on these properties.

QuickEye External Step Response Netlist Syntax

The netlist syntax for the Eye External Step Response is:

```
Axxxx COMPONENT=EXTERNAL_STEP_RESPONSE
 + SOURCE_NAME='eye_source '
 + PROBE_NAME='eye_probe '
 + STEP_RESPONSE_FILE_RISE='file_reference '
 + STEP_RESPONSE_FILE_FALL='file_reference '
```

The entry **COMPONENT=EXTERNAL_STEP_RESPONSE** is required**.**

See External Files for details on references to external files.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

See *Eye External Step Response* in the Components help for details on these properties.

Quick Eye Analysis Netlist Format

Quick Eye analysis is invoked on the netlist using the **.EYE** statement:

```
.EYE QUICK=1 DELAY=val
TRISE=val TFALL=val LOW=val HIGH=val
BPS=val|UI=val FFE_TAP=val FFE_WEIGHTS=[val val...]
NORMALIZE_FFE_WEIGHTS=val DFE_TAPS=val DFE_LOCS=[val val... ]
DFE_WEIGHTS=[val val...]
(or DFE_WEIGHT_LBS=[val val ...] DFE_WEIGHT_UBS=[val val ...])
DECISION_THRESHOLD=val DECISION_HIGH=val DECISION_LOW=val
PD_COUNT=val PROBE=eyeprobe
RUN_MISSING_STEP_RESPONSE=val
```

The entry **QUICK=1** enables the Quick Eye analysis.

> **Note:** If **DFE** is automatically calculated, then neither **DEF_WEIGHTS** nor **DFE_WEIGHT_LBS/DFE_WEIGHT_UBS** show. If **DFE** is calculated with limits, **DEF_WEIGHTS** does not appear. If **DFE** is specified, neither **DFE_WEIGHT_LBS** nor **DFE_WEIGHT_UBS** appear. See Add an Eye Probe to a Schematic for DFE options.

By default, the worst-case bit pattern is calculated by Peak Distortion Analysis (PDA). The worst-case bit pattern can be displayed in a report, and can also be sent to the Eye sources for simulation with QuickEye. The **PD_COUNT** parameter controls the sending of the worst-case bit pattern.

- When **PD_COUNT** is -1, the worst case bit pattern is not sent to the Eye sources. This is the default behavior.
- When **PD_COUNT** is 0 (zero), one iteration of the worst-case bit pattern is sent to all Eye sources in the design, overriding any bit patterns set in the Eye Sources.
- When **PD_COUNT** is greater than zero, the solver repeats the PDA pattern. For example, PD_COUNT=1 gets one repeat (two iterations of the pattern), PD_COUNT=2 gets two repeats (three iterations), et cetera.

The PROBE parameter controls the PDA calculation when PD_COUNT is 0 or greater than zero. When PD_COUNT is -1, PDA worst-case bit patterns are calculated for all pairs of Eye Sources and Eye Probes, but no bits are sent to the analysis. When PD_COUNT is zero or greater, the worst-case bit patterns are calculated from all sources to the Eye Probe given by the PROBE parameter, and those bit patterns are sent from the sources.

- The **DELAY** parameter sets a time delay during which the effects of transitions are ignored. After the delay, the step response is applied.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Setting **RUN_MISSING_STEP_RESPONSE=1** runs transient analysis to compute the step response when an External Step Response data file reference is missing or cannot be found. Without this option, missing step response data causes analysis to fail.

The other parameters are global versions of the Eye Source and Eye Probe parameters. The global version of a parameter is used only when the Eye Source or Eye Probe does not have that parameter set locally.

Run Quick Eye Analysis and Display Results

1. Run the simulation:
- From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- If the analysis is not successful, check the **Message Manager** window for an explanation, and then take corrective action.
2. Display results:
- From the menu bar, click **Circuit**, then click **Results** >**Create Standard Report**. (Alternatively, select **Create Standard Report** on the **Results** icon in the **Project Manager** window.)

For more information, see QuickEye Analysis Outputs.

For information on reporting the Peak Distortion Analysis (PDA) data, see Peak Distortion Analysis.

Display Quick Eye Analysis Outputs

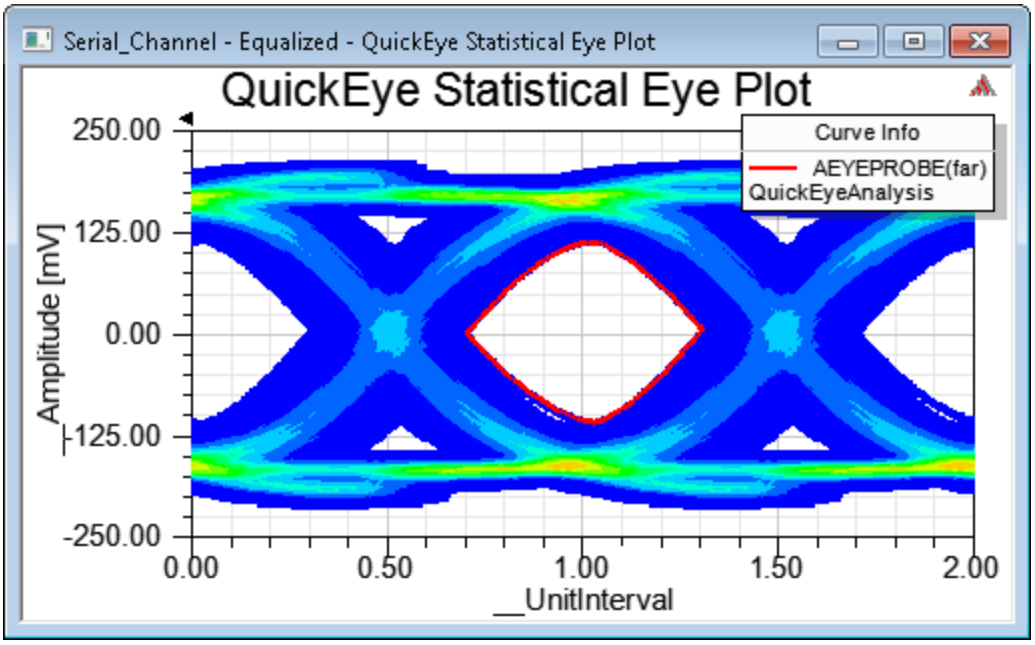
To open the results of a Quick Eye analysis, click on the Results icon in the **Project Manager** window and select one of the **Create Report** options. There are many ways to plot the data; this topic gives examples of a Statistical (Sampled) Eye Diagram, a 2D Bathtub plot, standard and statistical Eye diagrams with PAM4 modulation, and a 2D Bathtub plot with PAM4 modulation.

Sampled Eye Diagram

The sampled or statistical eye report generates the eye diagram but does not retain the transient data for further post-processing. The sampled eye diagram plot requires an Eye Scope be present at the appropriate measurement point.

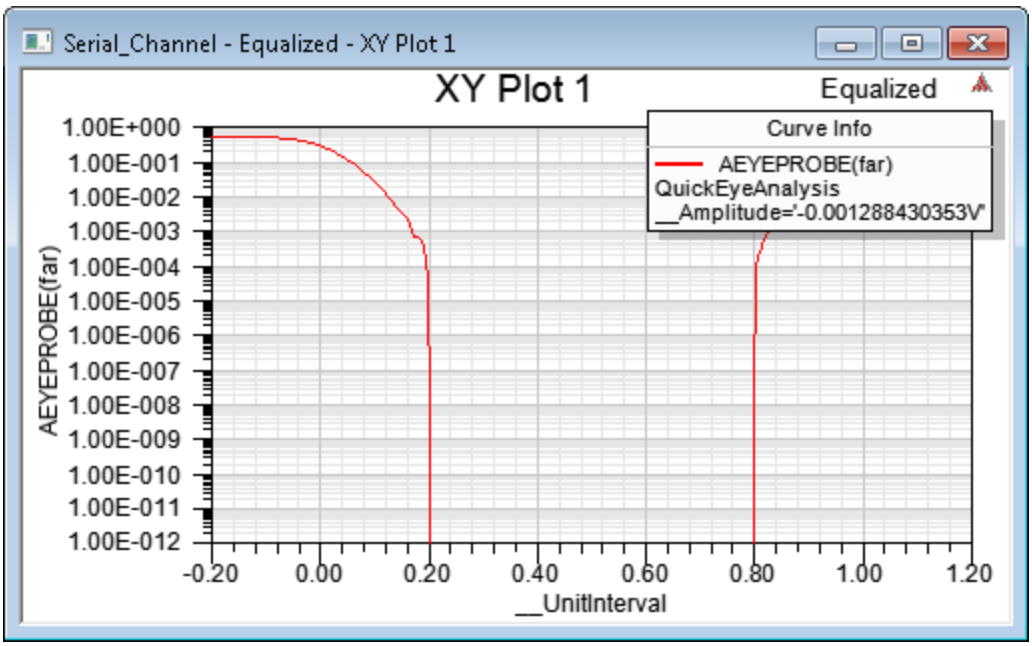
To generate a sampled eye diagram, select **Create Statistical Eye Report>Statistical Eye Plot**. Select your Quick Eye Analysis as the **Solution** ; **UI** as the Domain; **Eye** as the Category; the appropriate Eye Probe as the Quantity Type; and **<none>** as the Function.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2D Bathtub BER Plots

To view the data as a 2D bathtub curve, select **Create Standard Report>Rectangular Plot**. From the Report window, select **UI** as the Domain and **Bathtub** as the Category. Click **New Report**.

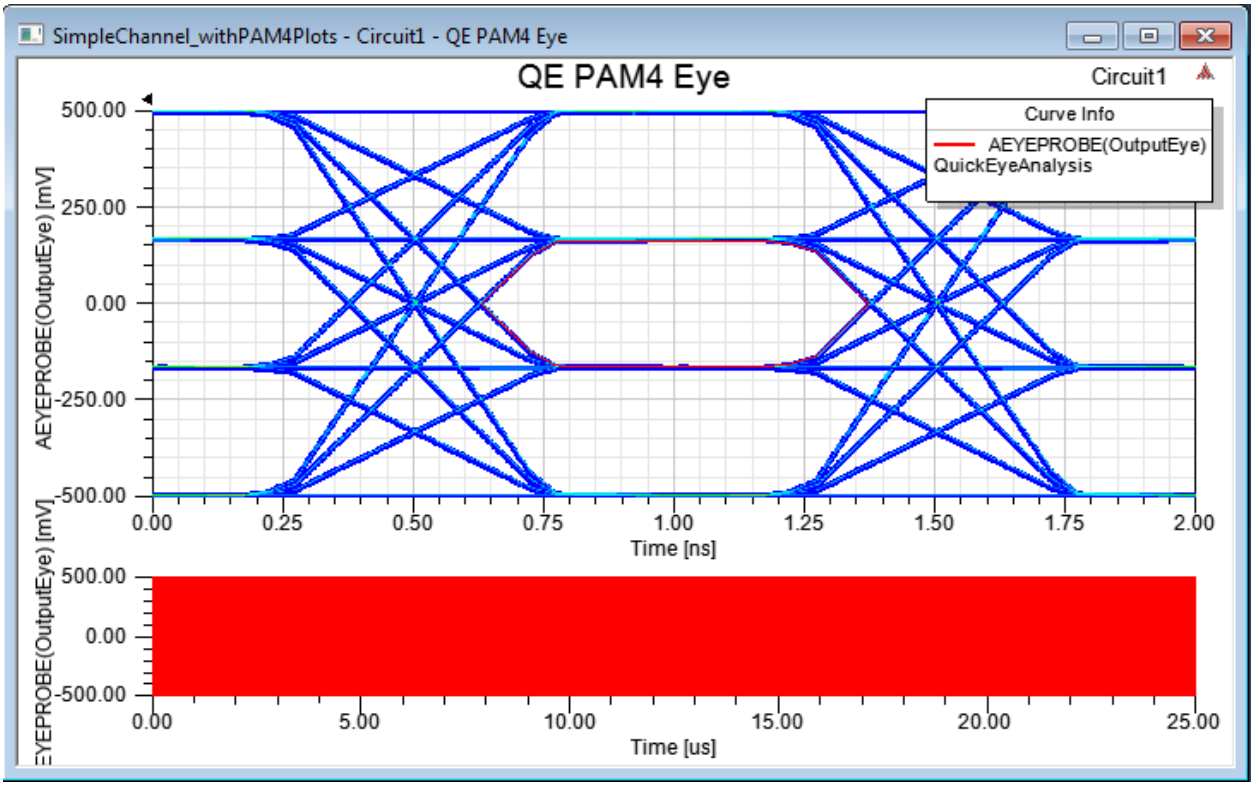


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This graph shows the BER at various locations in the unit interval. By default, the amplitude is set at the midpoint of its value range. The BER values are on the Y-axis using logarithmic scaling and a minimum of 1e-16.

2D PAM4 Eye Diagrams

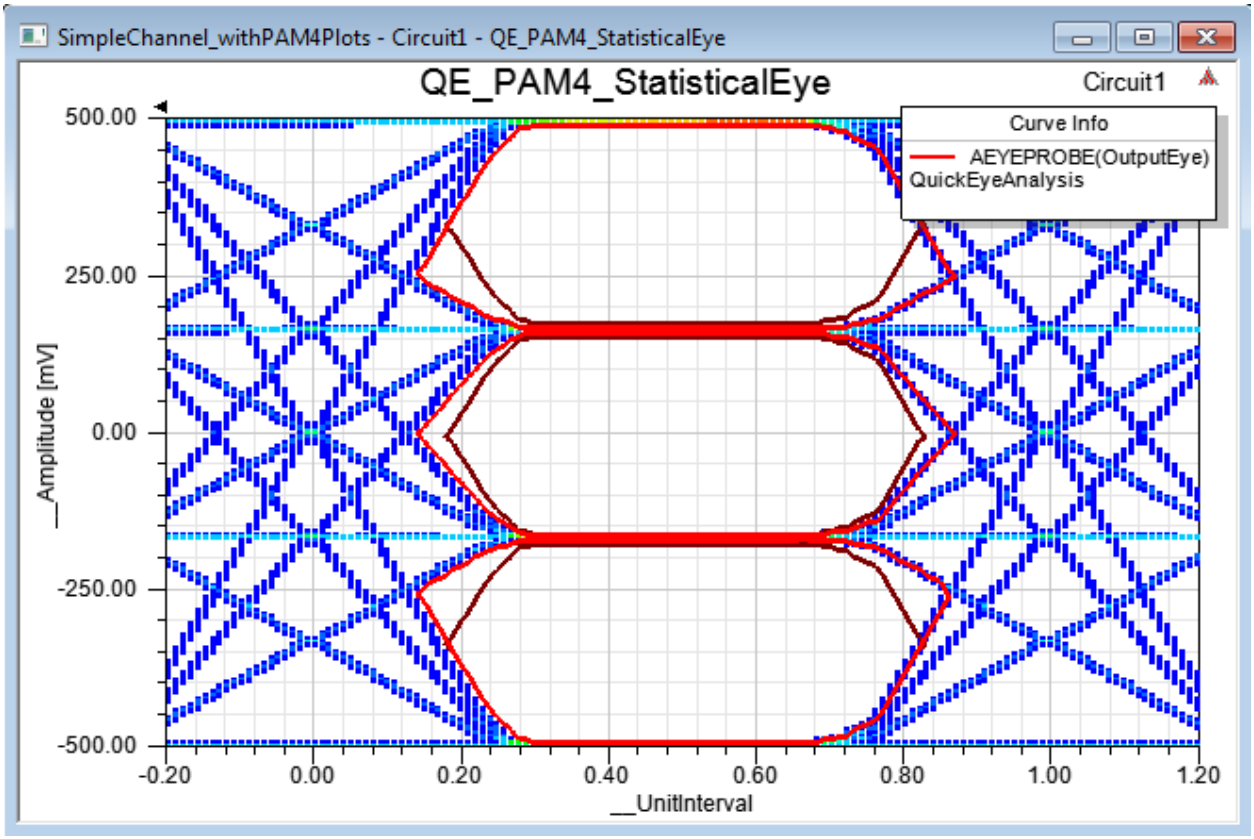
To enable PAM4 modulation, set the **modulation** parameter in the Eye source to **PAM4**. Select **Gray** or **Linear** for the **coding** parameter as applicable. When analysis completes, select **Create Eye Diagram > Rectangular Plot**.



The plot shows four voltage levels, each one corresponding to a transition between two bits. This example uses the default Gray coding: the lowest level represents 00, the next higher level represents 01, the next higher level represents 11, and the highest level represents 10. The four voltage levels form three eyes in the diagram.

Alternatively, select **Create Statistical Eye Diagram Report**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

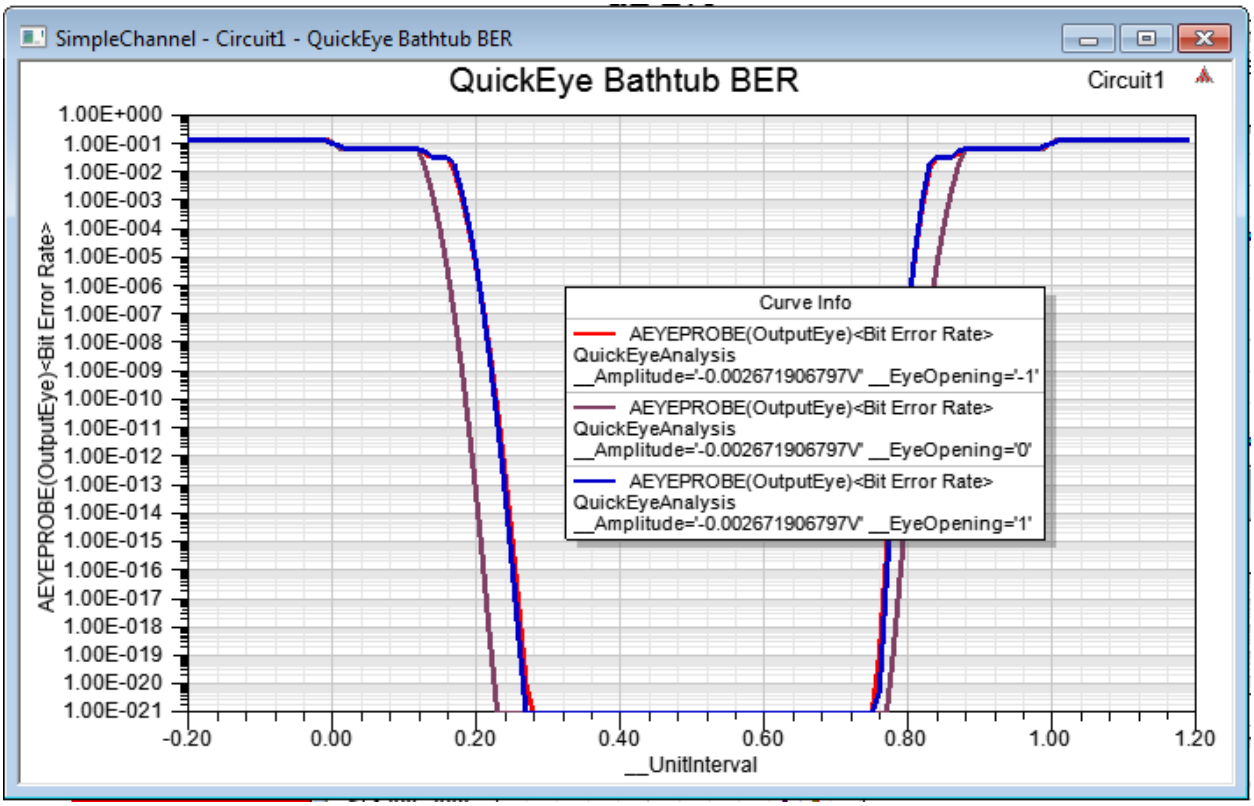


The red lines show the eye openings. The dark lines show the intersection of all three eye openings.

2D PAM4 Bathtub Plots

To enable PAM4 modulation, set the **modulation** parameter in the Eye source to **PAM4**. Select **Gray** or **Linear** for the **coding** parameter as applicable. When analysis completes, select **CreateStandard Report> Rectangular Plot**. From the Report setup, click the Families tab and edit the _EyeOpening family. The entries are -101 (combined error rate), -1 (upper eye error rate), 0 (middle eye error rate) and 1 (lower eye error rate). From the Report window, select **UI** as the Domain and **Bathtub** as the Category. Select the **<Bit Error Rate>** trace to see the bit error rate.

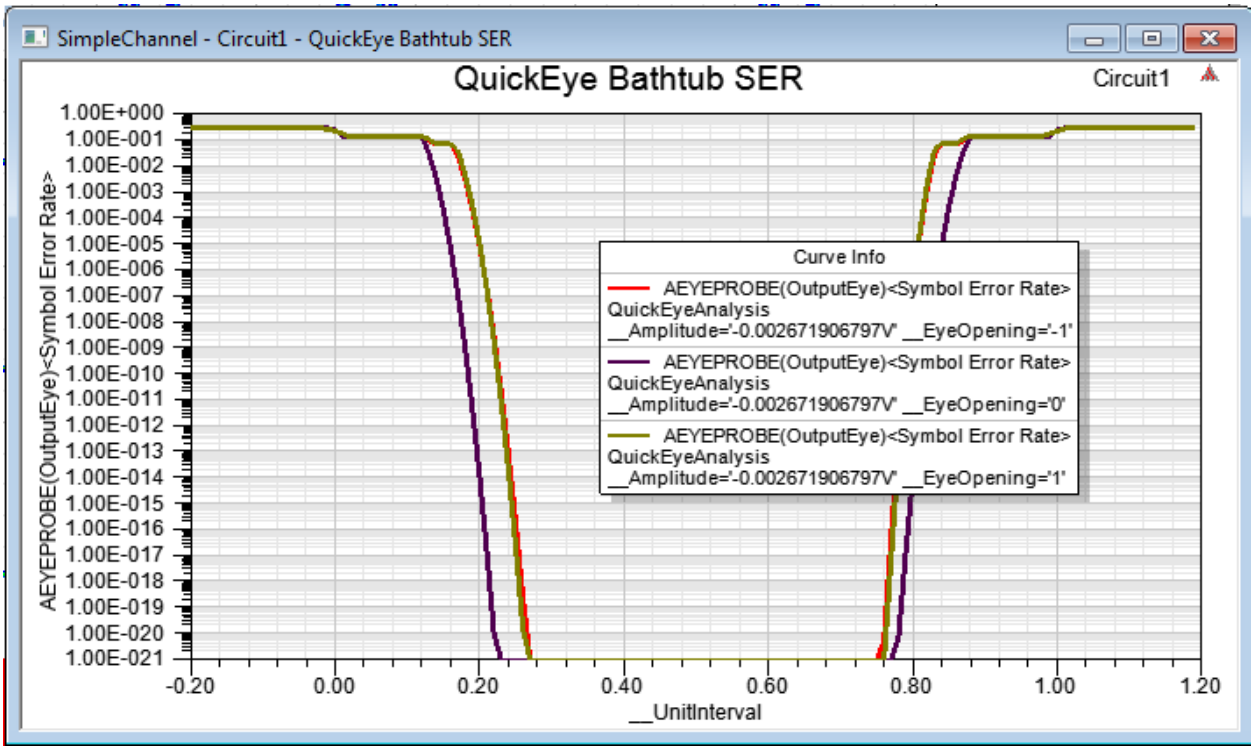
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The example plot shows the separate bit error rates for the three PAM4 eyes (-1, 0, and 1 selected).

Thebathtub curvebathtub curve for a PAM4 simulation can show the symbol error rate instead of the bit error rate. With PAM4, a symbol is two bits. The report setup is the same, but now select the **<Symbol Error Rate>** trace.

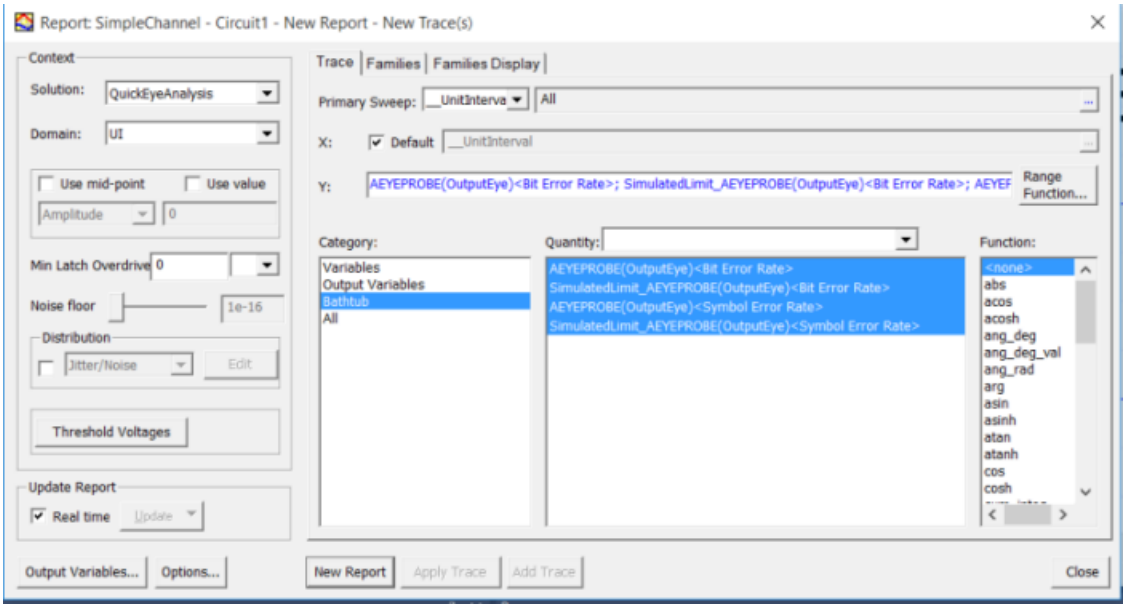
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

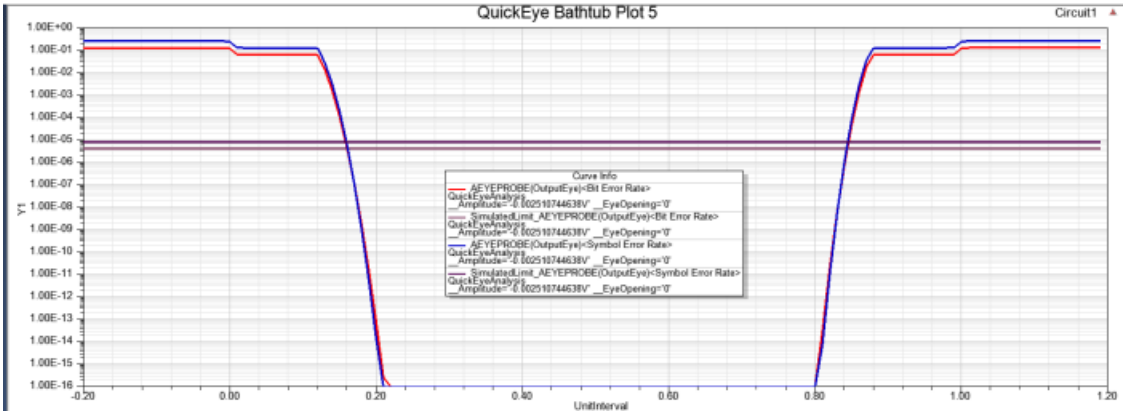


For bathtub curves of QE, distinguish simulated/extrapolated regions using a partitioning horizontal line via the ‘SimulatedLimit’ option that is in available the ‘Quantity’ column. Such processing allows for the robust extrapolation of bathtub curve arising out of QE and AMI analyses.

- BER/SER level of partitioning = 1/bit or symbol_length simulated
- symbol_length = bit_length for NRZ, or, 0.5*bit_length for PAM4

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





VerifEye and Quick Eye Analysis Options

The options apply to both VerifEye and Quick Eye analyses.

For more information see the VerifEye and Quick Eye Analysis Options Reference.

All QuickEye and VerifEye analysis options use the prefix **eye**.

See Analysis-Specific Options for details on setting or changing these options.

See Resolutions of Eye Diagrams for details on setting amplitude and UI bin resolutions.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Resolutions of Eye Diagrams

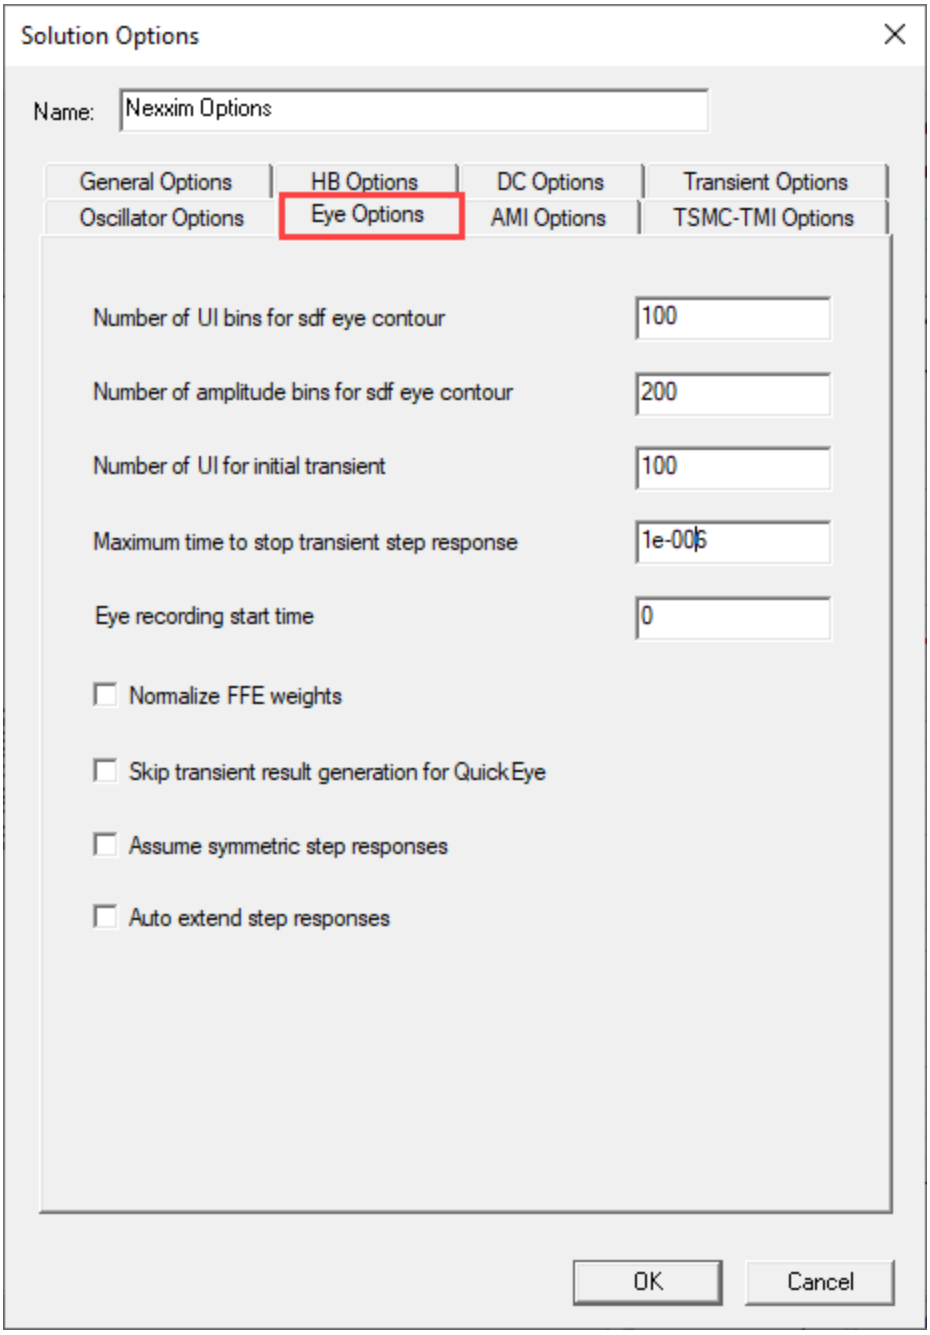
In a schematic, define sets of analysis-specific options with the **Add Solution Options** selection. You can then select one of your defined option sets when you create or edit a solution setup. Using this mechanism, use the same option set in multiple analysis setups, or use different option sets in the same solution setup by editing the setup.

There are multiple ways to create an option set:

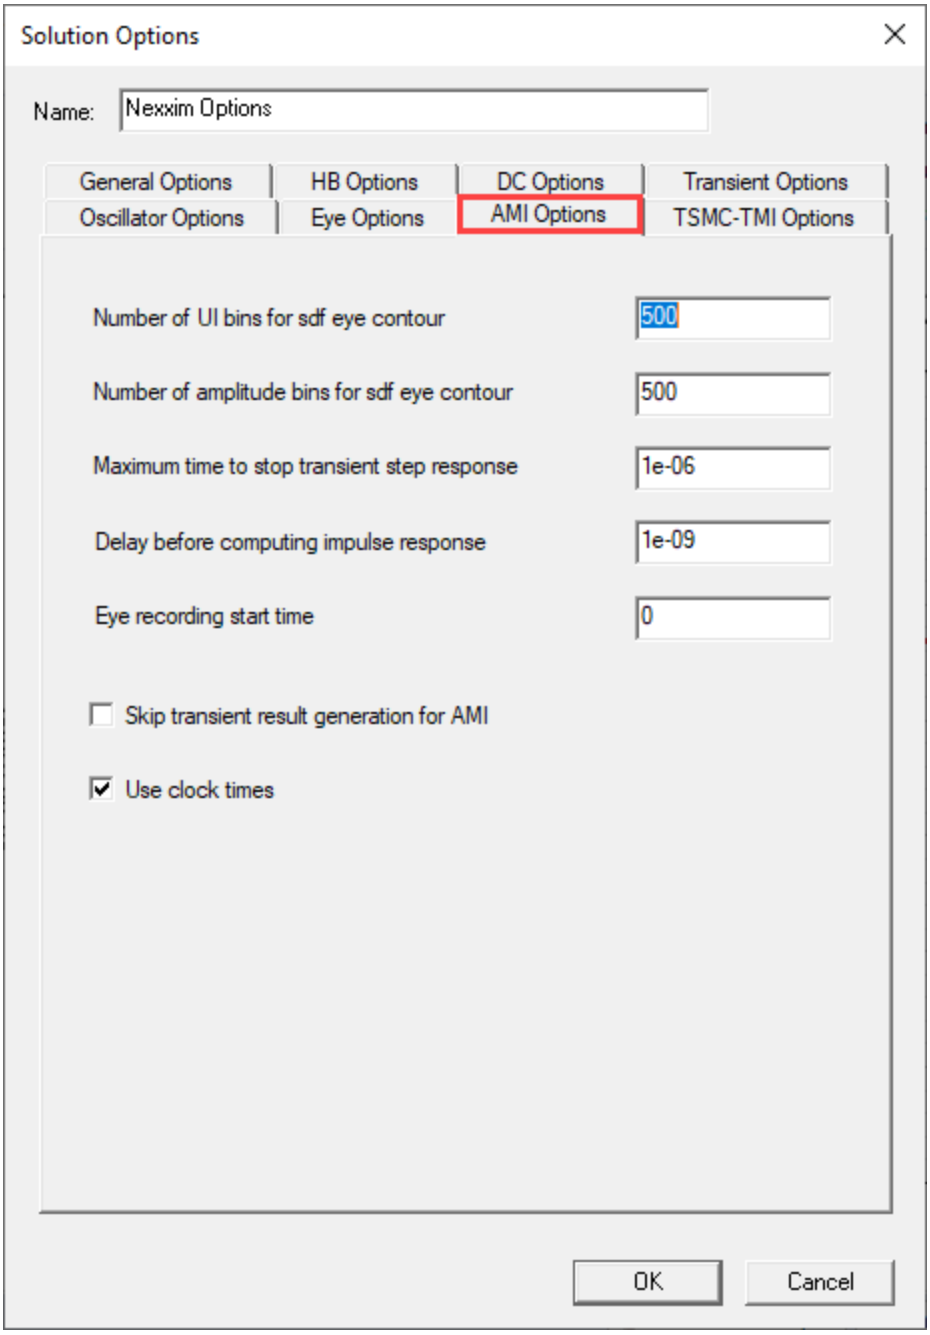
- From the **Circuit** menu, select **Add Solution Options ...**.
- From the **Project Manager** window, expand the **Project Tree**. Then right-click **Analysis** and select **Add Solution Options ...** to open the **Solution Setup** window.
- Click **Select** in the **Solution Options** group box in a **Solution Setup** window.

Any of these actions opens the **Solution Options** window. Click the **Eye Options**, **AMI Options**, and **Transient Options** tabs to view the following options.

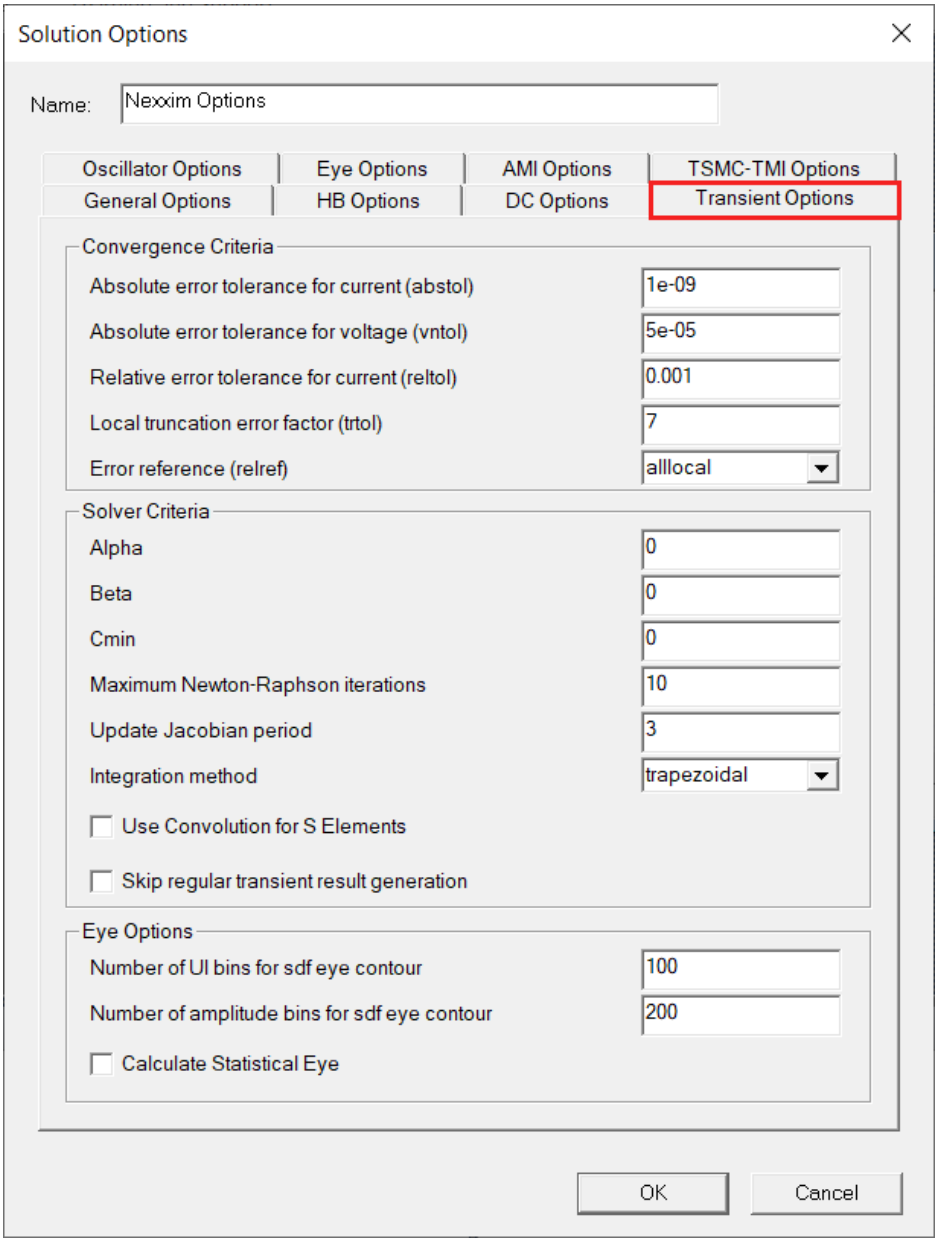
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

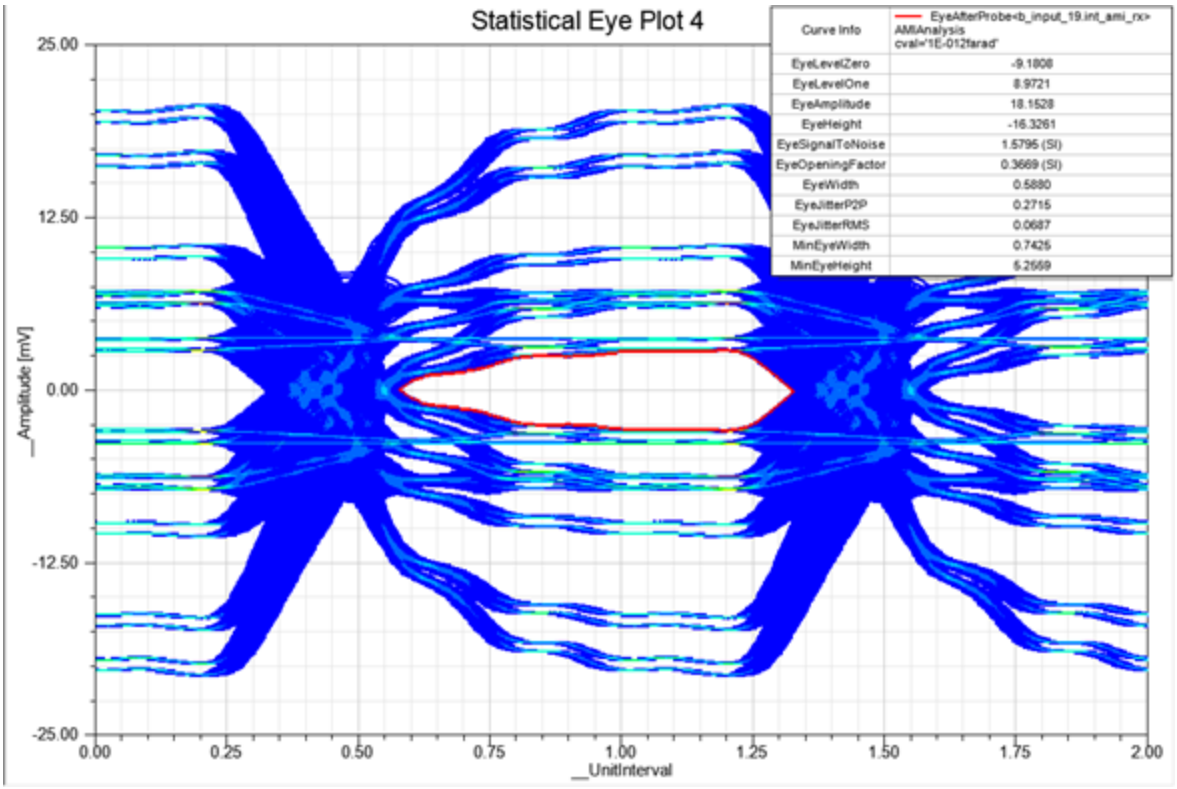


The **Solution Options** window controls the UI and amplitude resolutions of the generated sampled/statistical eye diagrams. And this amplitude resolution in turn controls the fineness of the eye diagram plot and measurements. The limits on these bin counts are set to 1500 which allows a finer resolution (at the possible expense of analysis time). Any eye diagram generated at a resolution higher than 1500 is sub-sampled to fit into a 1500 resolution which could potentially introduce visual and measurement artifacts.

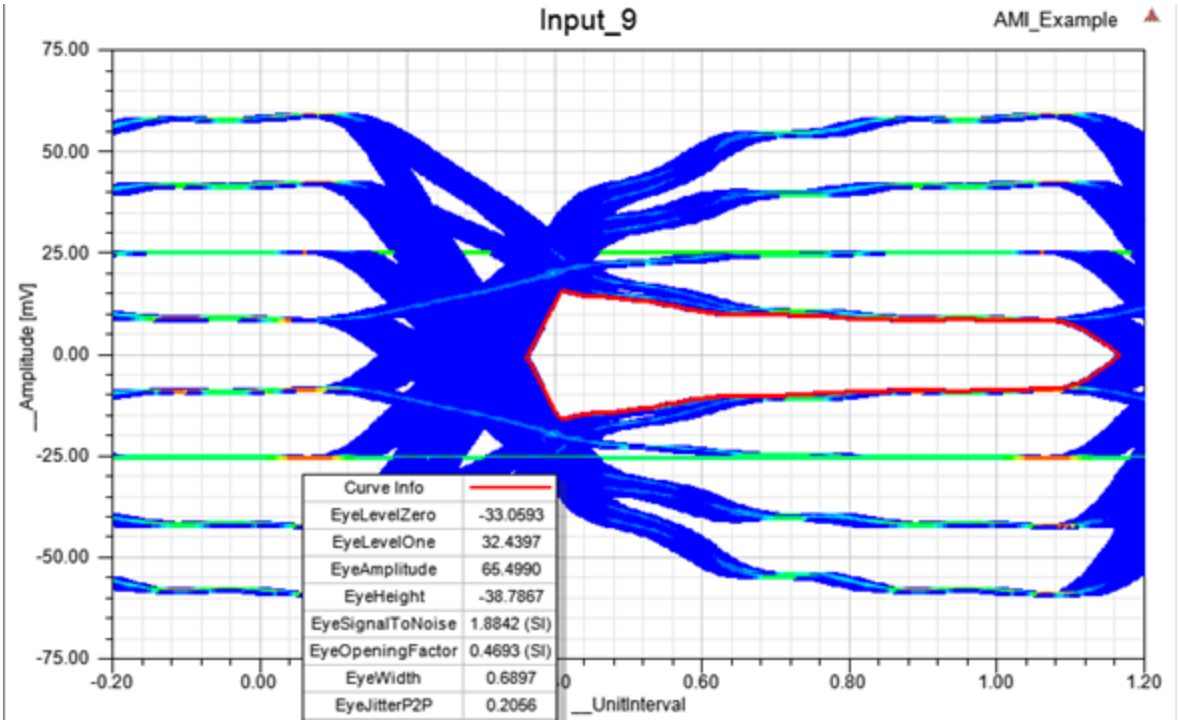
Additionally, when combining multiple traces into a statistical eye diagram with different amplitude or UI bin resolutions, the plot tries to **up-sample** as many traces as needed to ensure

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

that no trace needs to be sub-sampled. In such a case, the allowed max resolution of the composite eye is increased to 3000. For example, if the two traces (whose individual statistical eye diagrams plots are displayed in the following figures) are combined into one statistical plot.

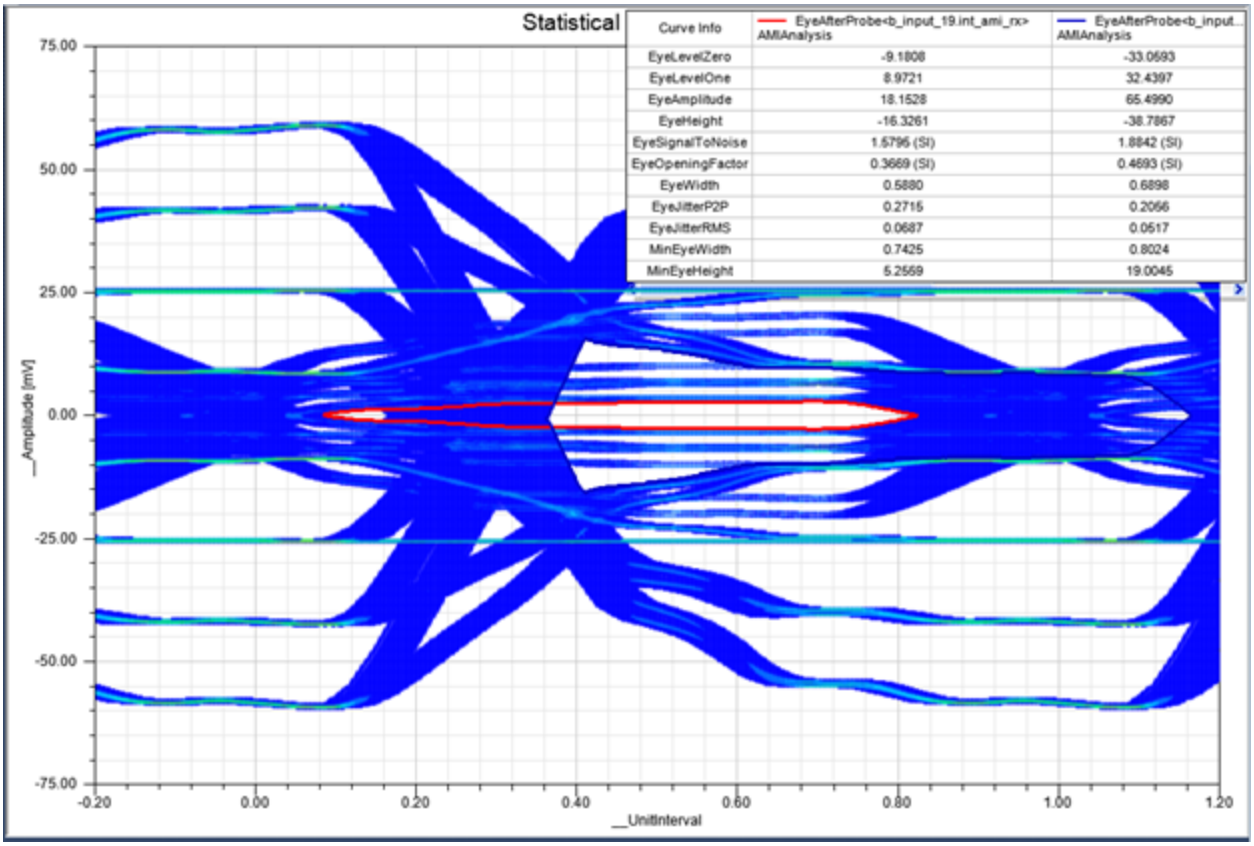


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Assume both are set to have Amplitude resolutions of 500. Until the specified UI or Amplitude resolution in the Options is maintained at less than 1500, the trace is displayed faithfully.
- "**Statistical Eye Plot 4** " has a range of 50mV and **Input_9** has an Amplitude range of 150mV. When these two are added to one plot, the composite eye diagram which superimposes both the eyes now has to fit the 50mV amplitude range of one trace into the combined 150mV Amplitude range: To avoid sub-sampling artifacts, this means that the 50mV range has to occupy at least 500 central bins in the composite eye. This means that the 150mV trace needs to be up/super-sampled to 1500 Amplitude bins (UI bins are upsampled also). In this case of mixed traces with different traces each having different Amplitude ranges, AnsysEDT super-samples the sampled eyes such that none of the constituent eyes are sub-sampled and this limit is increased on the individual eye limit of 1500 to 3000.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



These limits are in place to prevent uncontrolled memory usage and users are not expected to be concerned with them. However, if these limits need to be removed (accepting the consequences for memory swell), set the **ANSOFT_DISABLE_PMF_BIN_SIZE_LIMITS=1** environment variable.

For more information see Analysis-Specific Options.

Copying a VerifEye or Quick Eye Analysis

Once a VerifEye analysis has been set up in the schematic editor, save a copy of the setup as a Quick Eye analysis, so you can compare the results of the two types of analysis with the same setup.

1. Right-click the VerifEye analysis in the **Project Manager** window, and select **Copy as QuickEye** on the menu. The copy is made on the clipboard.
2. Select the project that is to contain the copy of the analysis. Right-click the **Analysis** icon in the Project window, and select **Paste** on the menu. The copy is pasted into the list of analyses, with the default name “QuickEyeAnalysis.” Rename the analysis as appropriate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Once a Quick Eye analysis has been set up in the schematic editor, save a copy of the setup as a VerifEye analysis, so you can compare the results of the two types of analysis with the same setup.

1. Right-click the Quick Eye analysis in the **Project Manager** window, and select **Copy as VerifEye** on the menu. The copy is made on the clipboard.
2. Select the project that is to contain the copy of the analysis. Right-click the **Analysis** icon in the Project window, and select **Paste** on the menu. The copy is pasted into the list of analyses, with the default name "VerifEyeAnalysis." Rename the analysis as appropriate.

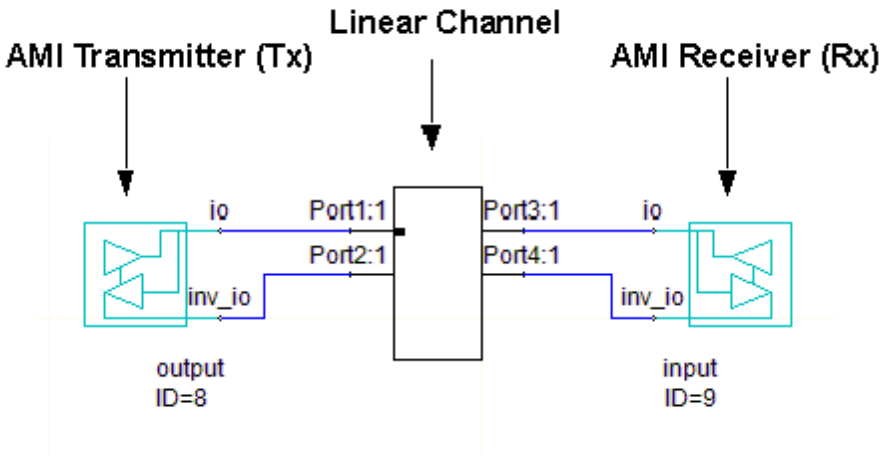
AMI Analysis

The IBIS Algorithmic Modeling Interface (AMI) allows time-domain simulation of a linear-channel Circuit design using customer-supplied models for the transmitter and receiver. Reports include plots of step responses from VerifEye, eye diagrams like those available for QuickEye, and bit-error-rate (BER) contours.

AMI Analysis with IBIS Buffer Models

The Algorithmic Modeling Interface (AMI) simulates user-specified transmitter/receiver models, furnished as IBIS models and C-interface compiled AMI libraries, over a linear channel. The AMI Specification is published in the IBIS Specification (See AMI Analysis References).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The first step is to either import a single AMI transmitter/receiver component or separate AMI transmitter and receiver components.

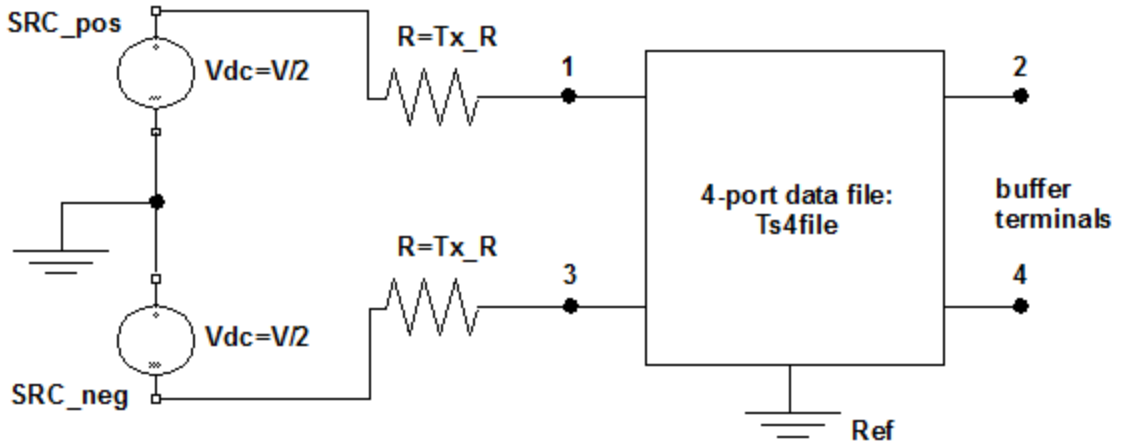
Continue to Importing AMI Components with IBIS Buffer Models.

The AMI Transmitter Model

The AMI transmitter consists of an Analog output model and three Algorithmic processing functions, Tx **AMI_Init**, Tx **AMI_GetWave**, and Tx **AMI_Close** that model equalization behavior and are provided in a .dll or .so. The IBIS specification allows the transmitter to omit the TX **AMI_GetWave** function.

The Analog output model can be specified using traditional IBIS methods (including linearized I/V tables and voltage ramps), or with 4-port frequency-dependent data from a Touchstone-format file containing the transmitter behavior.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



When the transmitter model uses 4-port data, the reserved parameters **Ts4file** (name of Touchstone file), **TX_V** (transmitter voltage swing), and **Tx_R** (series resistances) control the transmitter operation.

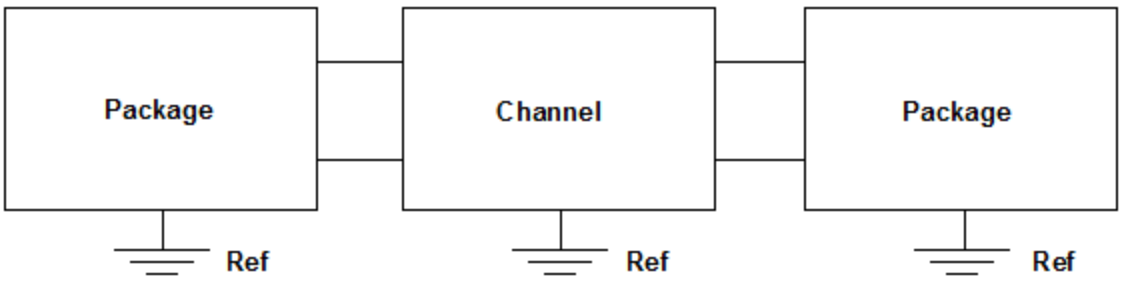
- The voltages of the voltage sources correspond to **V=Tx_V** for logic level 1 and **V=-Tx_V** for logic level 0.
- The series resistors have resistance **R=Tx_R**.

See "AMI Ts4 Analog Buffer Model Parameters " on page 12-150"AMI Ts4 Analog Buffer Model Parameters " on page 12-150 for details on these parameters.

The Channel Impulse Response

AMI Analysis assumes a linear channel. The channel is characterized by its impulse response function.

When 4-port Touchstone files are referenced for the AMI transmitter and receiver, the channel is assumed to include the package behavior in the impulse response:



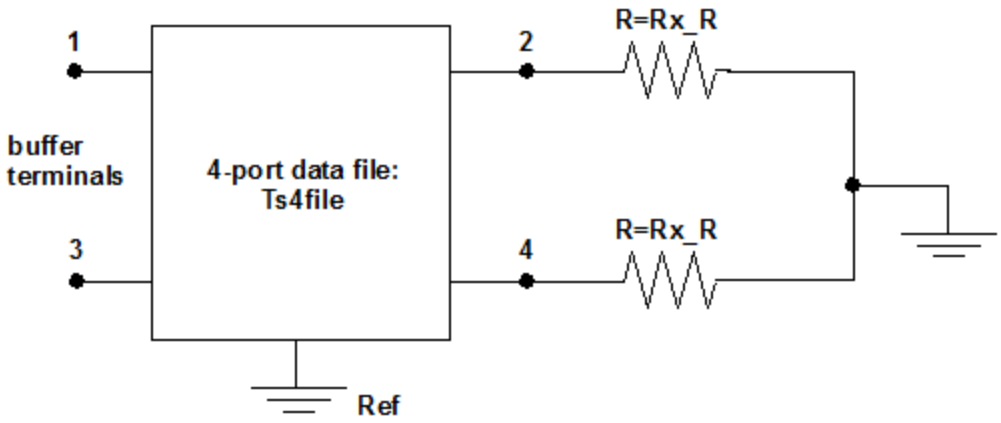
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The AMI Receiver Model

The AMI receiver consists of an Analog input model and three Algorithmic processing functions that model equalization behavior and are provided in a .dll or .so: Rx **AMI_Init**, Rx **AMI_GetWave**, and Rx **AMI_Close**. The IBIS specification allows the receiver to omit the Rx **AMI_GetWave** function, unless it is part of an AMI retimer link (See AMI Repeaters).

The RX **AMI_GetWave** function in the receiver model can generate clock times internally, and return the clock ticks as parameters to the solver for post-processing. For AMI channel simulation, the results of clock tick sampling can be observed in the Statistical Eye Plot for the EyeAfterProbe quantity. For an AMI Retimer link, the clock times are used to generate a new digital waveform (See AMI Repeaters).

The Analog Receiver model can be specified using traditional IBIS methods or with 4-port frequency-dependent data from a Touchstone-format file containing the receiver behavior.



When the receiver model uses 4-port data, the reserved parameters **Ts4file** (name of Touchstone file), and **Rx_R** (terminating resistances) control the Receiver analog section operation. The terminating resistors have resistance **R=Rx_R**. See "AMI Ts4 Analog Buffer Model Parameters " on page 12-150 for details on these parameters.

Importing AMI Components with IBIS Buffer Models

This section contains the following topics:

- Importing the AMI Transmitter
- Importing the AMI Receiver

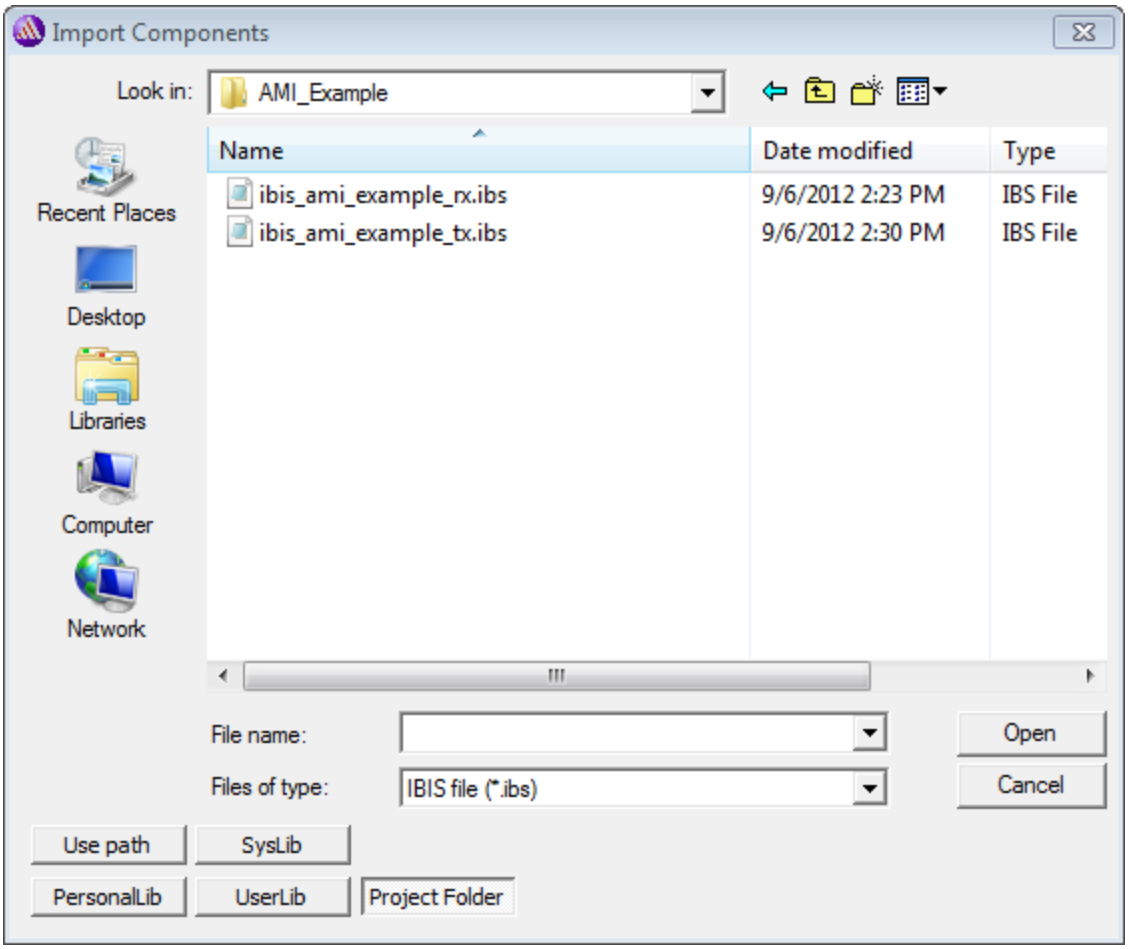
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Importing an AMI Transmitter/Receiver

Importing the AMI Transmitter

To import an IBIS AMI transmitter model from an IBIS library file (.ibs):

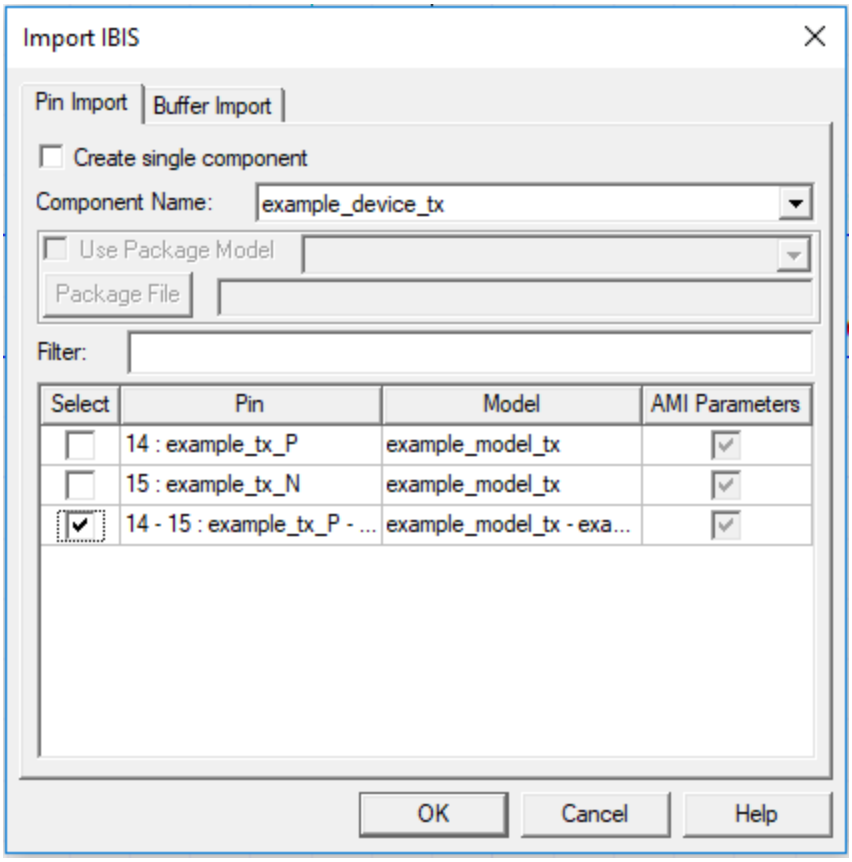
1. View the **Components Manager**. Open the **Symbols** group box. Click **Import Models**.
2. From the group box of icons, select the **IBIS** icon. This opens the **Import Components** window:



3. Specify the location of the IBIS file by clicking **Use Path**, **PersonalLib**, **UserLib**, or **SysLib**.
4. Locate and select the IBIS file that references the AMI transmitter.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Click **Open** to open the **Import IBIS** window.



6. The **Pin Import** tab displays the pins defined for the component in the IBIS file, the model or model selector associated with each pin, and whether the model is an AMI model. Single pins are listed first, then differential pin pairs. On this tab:

   a. To import the transmitter as a single component with multiple pins wherein each pin retains its own model and buffer type, check **Create single component**. See Import IBIS Single Component or Pin or Buffer Element for details.

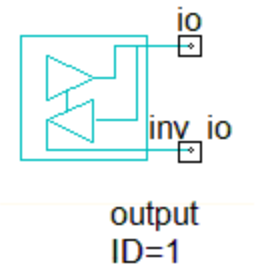
   b. The **Component Name** field lists all the IBIS components contained in the selected IBIS library. Scroll the list and select the name of the component to be imported.

   c. Click the check box to select the pin or differential pair of pins to import.

   > **Note:** If an attempt is made to import a single pin that is part of a differential pin pair, a warning appears in the Message Manager. The import can still proceed.

7. Click **OK** to import the transmitter model. An instance of the component is attached to the cursor so you can drag and drop it into the schematic.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

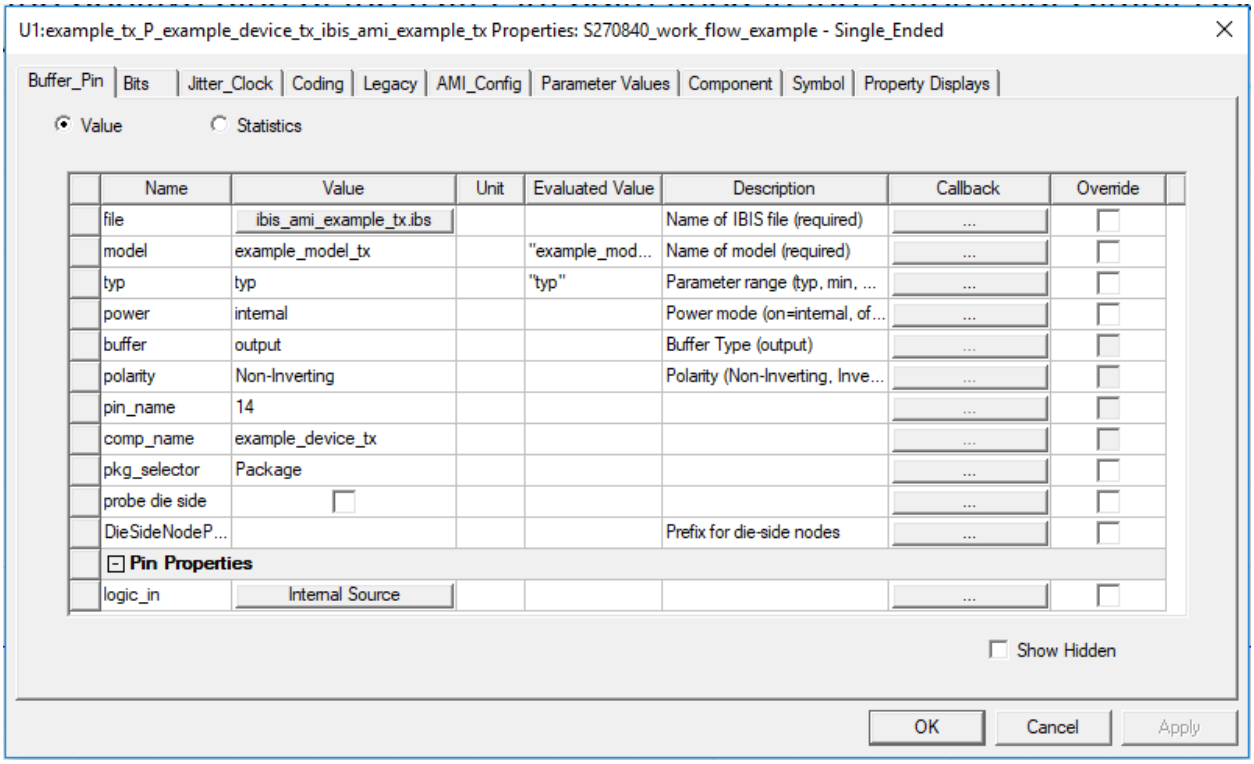


The next step is to edit the properties on the transmitter component.

Set AMI Transmitter Properties

To view or set the properties on the AMI transmitter:

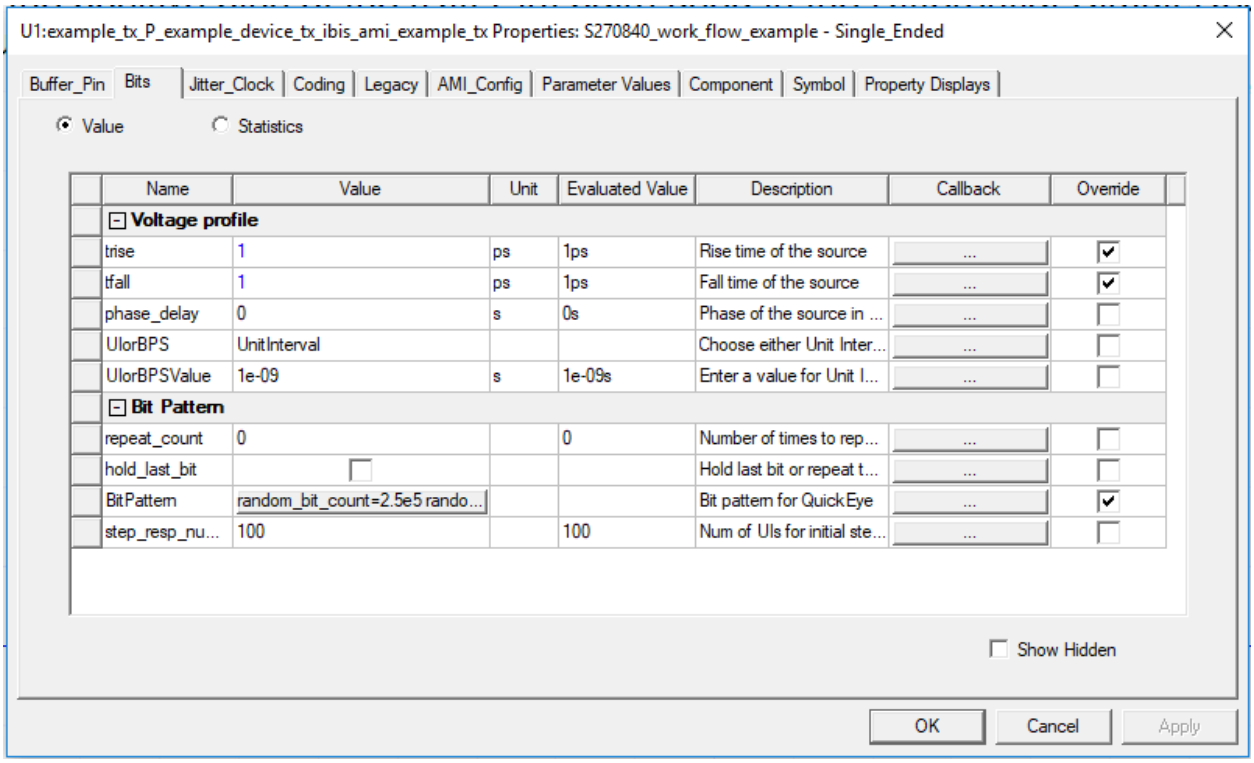
1. Select the component and click **Edit Properties** on the menu. Here are the basic buffer properties for an imported single-ended AMI transmitter example:



An AMI transmitter model is imported as an **output or I/O** buffer type with internal power source and other basic parameters set as shown. See IBIS Library Support for additional information.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

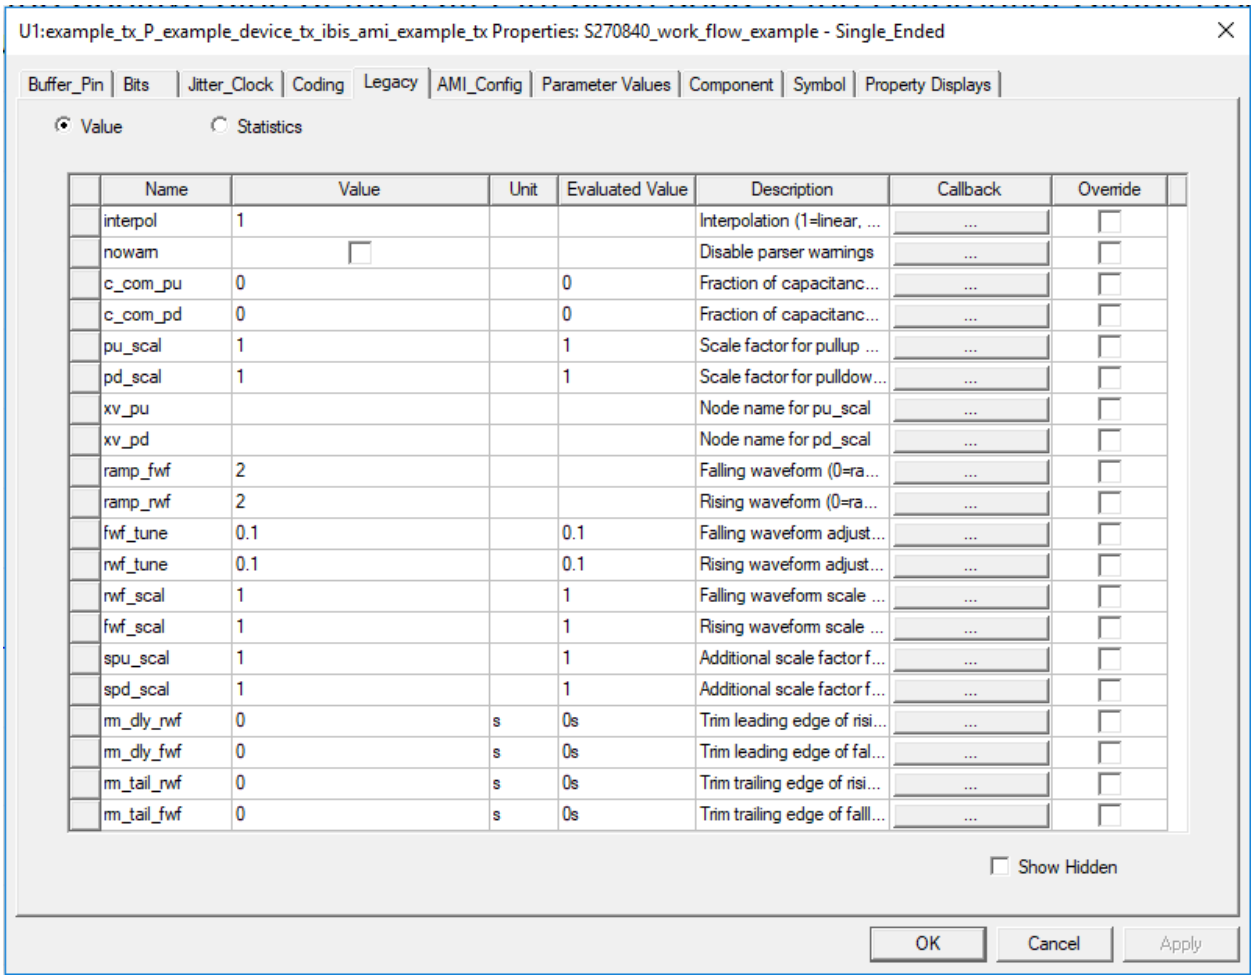
2. In the Pin properties for the AMI transmitter, the **logic_in** pin is set to **Internal Source**. With this setting, Nexxim displays the Eye Source parameters for the transmitter to use when generating the waveform on the **Bits**, **Jitter_Clock**, and **Coding** tabs.



See IBIS Library Support or Add a QuickEye Source to a Schematic for more information on the eye source properties.

3. The AMI transmitter properties also include the waveform properties on the **Legacy** tab. These are rarely used for AMI simulations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

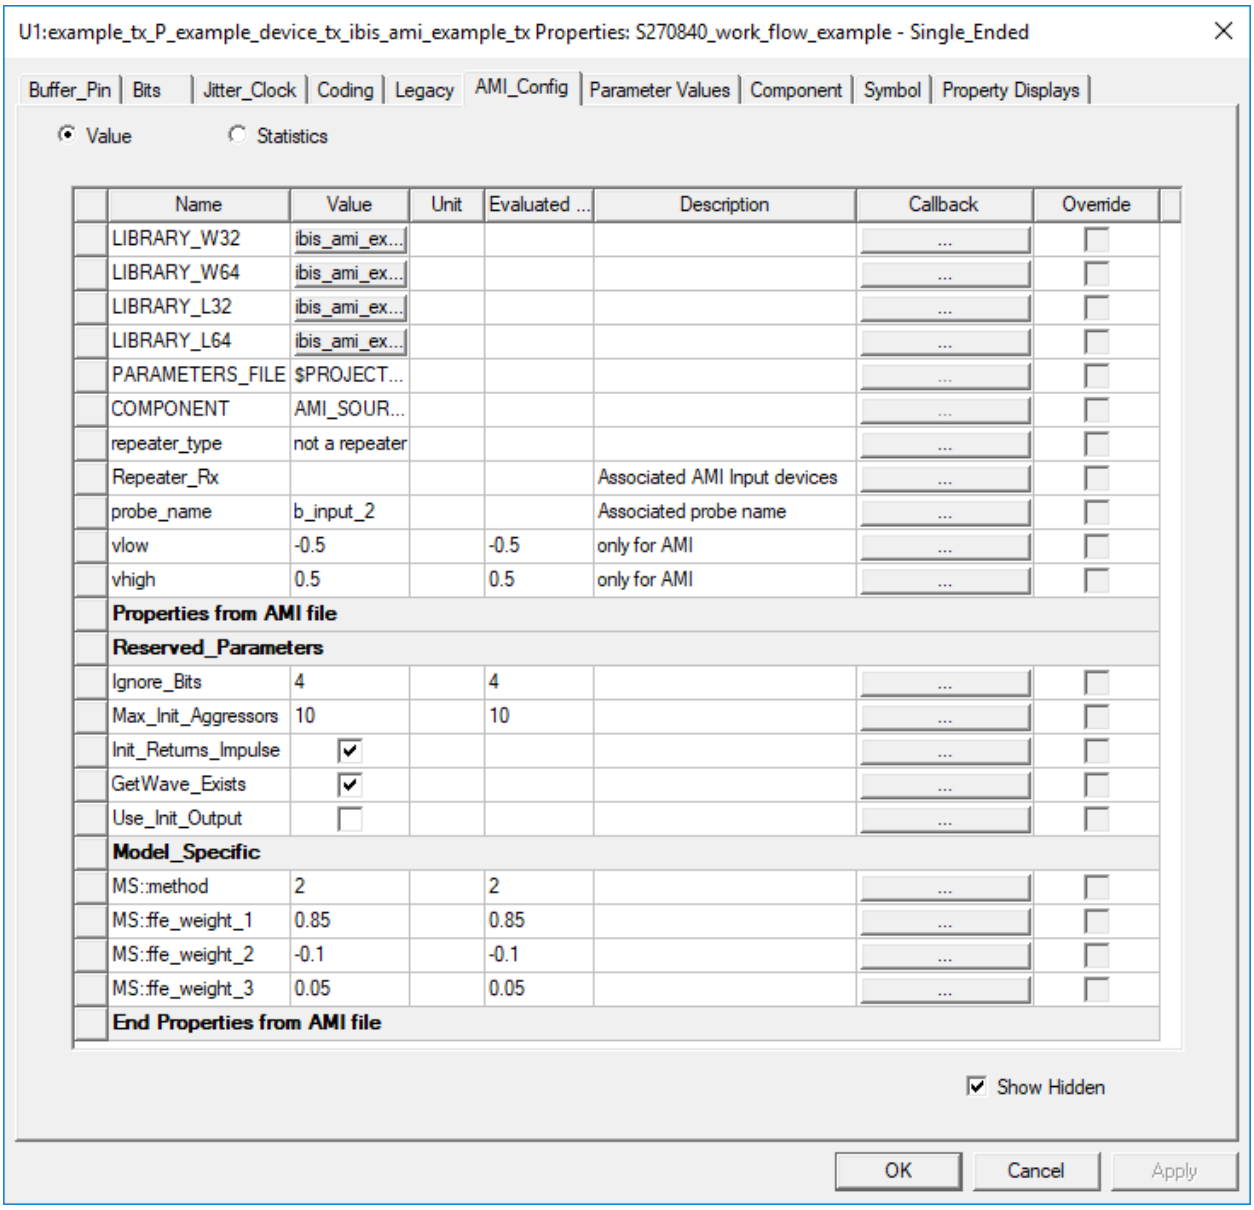


- See IBIS Library Support for more information on the waveform properties.

4. When the IBIS Pin Import selection references an Algorithmic Model (AMI), the properties include the AMI file references and any AMI parameters that are made user-visible in the AMI file. At import time, the AMI files are parsed and validated. Parameters from the AMI file are added to the component property list.

Here is a listing of the properties for an AMI Transmitter output model:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- The **LIBRARY** properties show the executable files on the .ibs library file.
- The **COMPONENT** property has been set to AMI_SOURCE automatically.
- See AMI Repeater Properties for details on the **repeater_type** and **Repeater_Rx** properties.
- The **vlow** and **vhigh** properties have been set to -0.5V and +0.5V, respectively, per the IBIS AMI specification.
- The Transmitter AMI properties list includes a property **probe_name** which lists the available AMI Receivers in the design. Then choose a receiver on the drop-down menu.

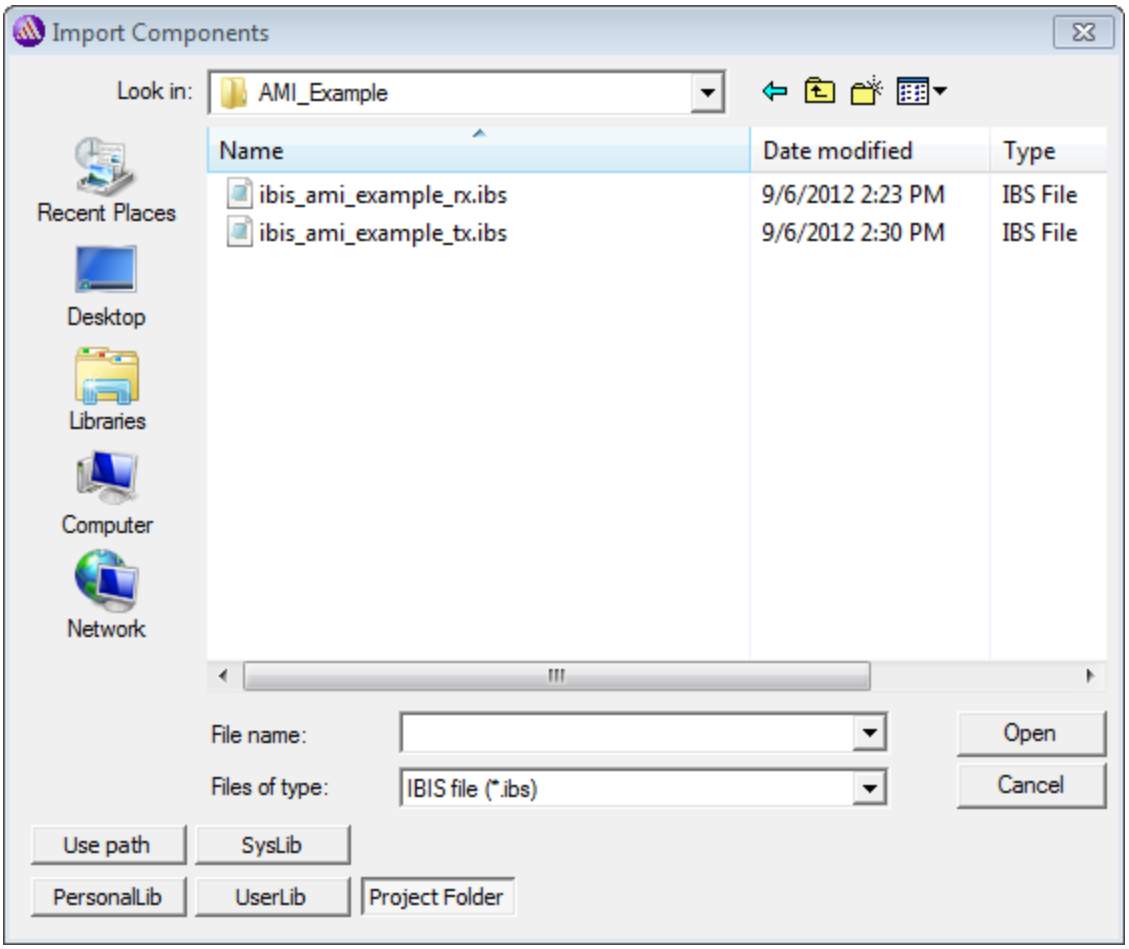
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The **probe_name** field is automatically filled in with the name of the AMI receiver when the AMI Source and AMI Probe are paired on the GUI. See Pairing an AMI Source and an AMI Probe in the Schematic.
- The **AMI_Config** tab includes listings of the parameters on the AMI parameters file. The reserved and model specific AMI parameters are broken out in separate groups

Importing the AMI Receiver

To import an IBIS AMI receiver model from an IBIS library file (.ibs):

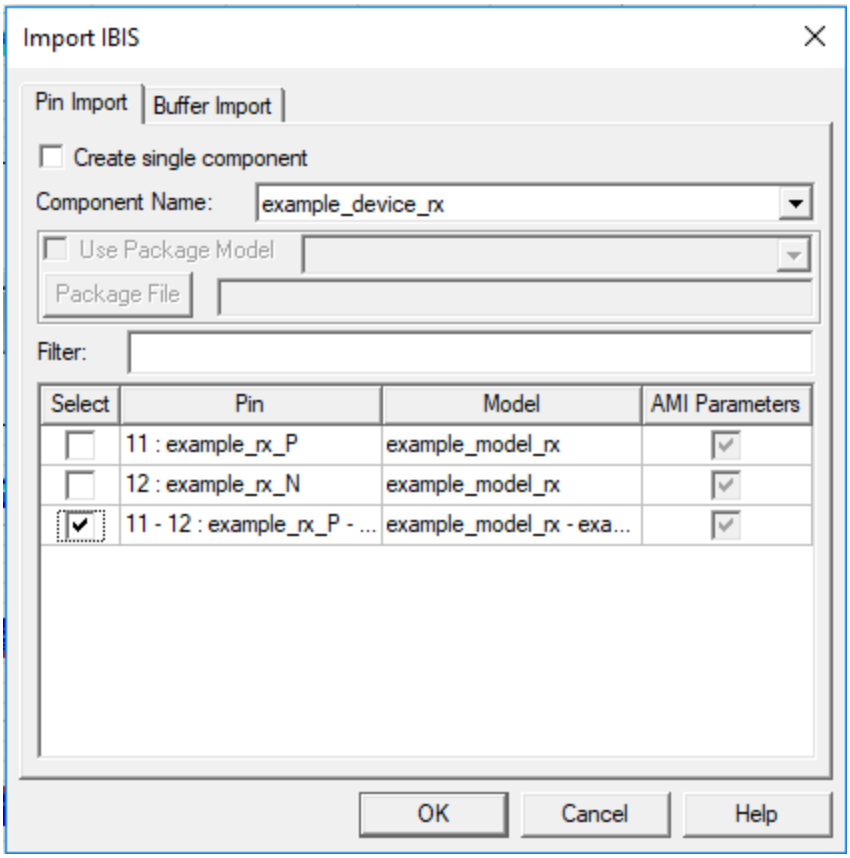
1. Click **Import Models** on the **Symbols** tab of the **Component Libraries** group box. Select the **IBIS** icon. This opens the **Import Components** window:



2. Locate and select the IBIS file that references the AMI receiver.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Click **Open** to open the **Import IBIS** window.

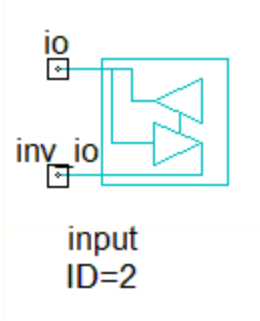


4. The **Pin Import** tab displays the pins defined for the component in the IBIS file, the model or model selector associated with each pin, and whether the model is an AMI model. Single pins are listed first, then differential pin pairs. On this tab:
   a. To import the receiver as a single component with multiple pins wherein each pin retains its own model and buffer type, check **Create single component**. See Import IBIS Single Component or Pin or Buffer Element for details.
   b. The **Component Name** field lists all the IBIS components contained in the selected IBIS library. Scroll the list and select the name of the component to be imported.
   c. Click the **Select** check boxes to designate the differential pair of pins to import.

   > **Note:** If an attempt is made to import a single pin that is part of a differential pin pair, a warning appears in the Message Manager. The import can still proceed.

5. Click **OK** to import the transmitter model. An instance of the receiver is attached to the cursor. Drag and drop it into the schematic.

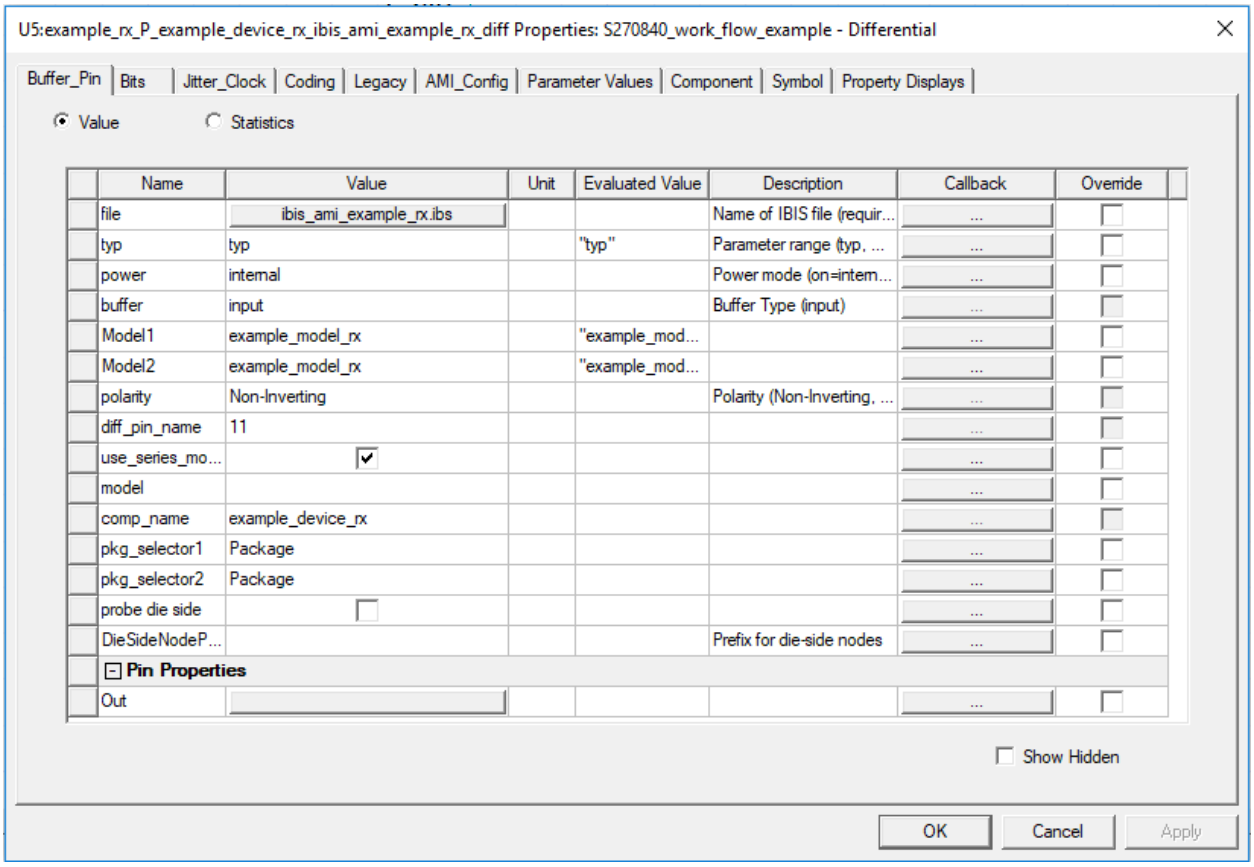
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The next step is to edit the properties on the receiver component.

Setting AMI Receiver Properties

To view or set the properties on the AMI receiver, select the component and click **Edit Properties** on the menu. Here are the basic buffer properties for an imported differential pair AMI receiver example:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

An AMI receiver model is imported as an **input or I/O** buffer type with internal power source and other basic parameters set as shown. See IBIS Library Support for additional information.

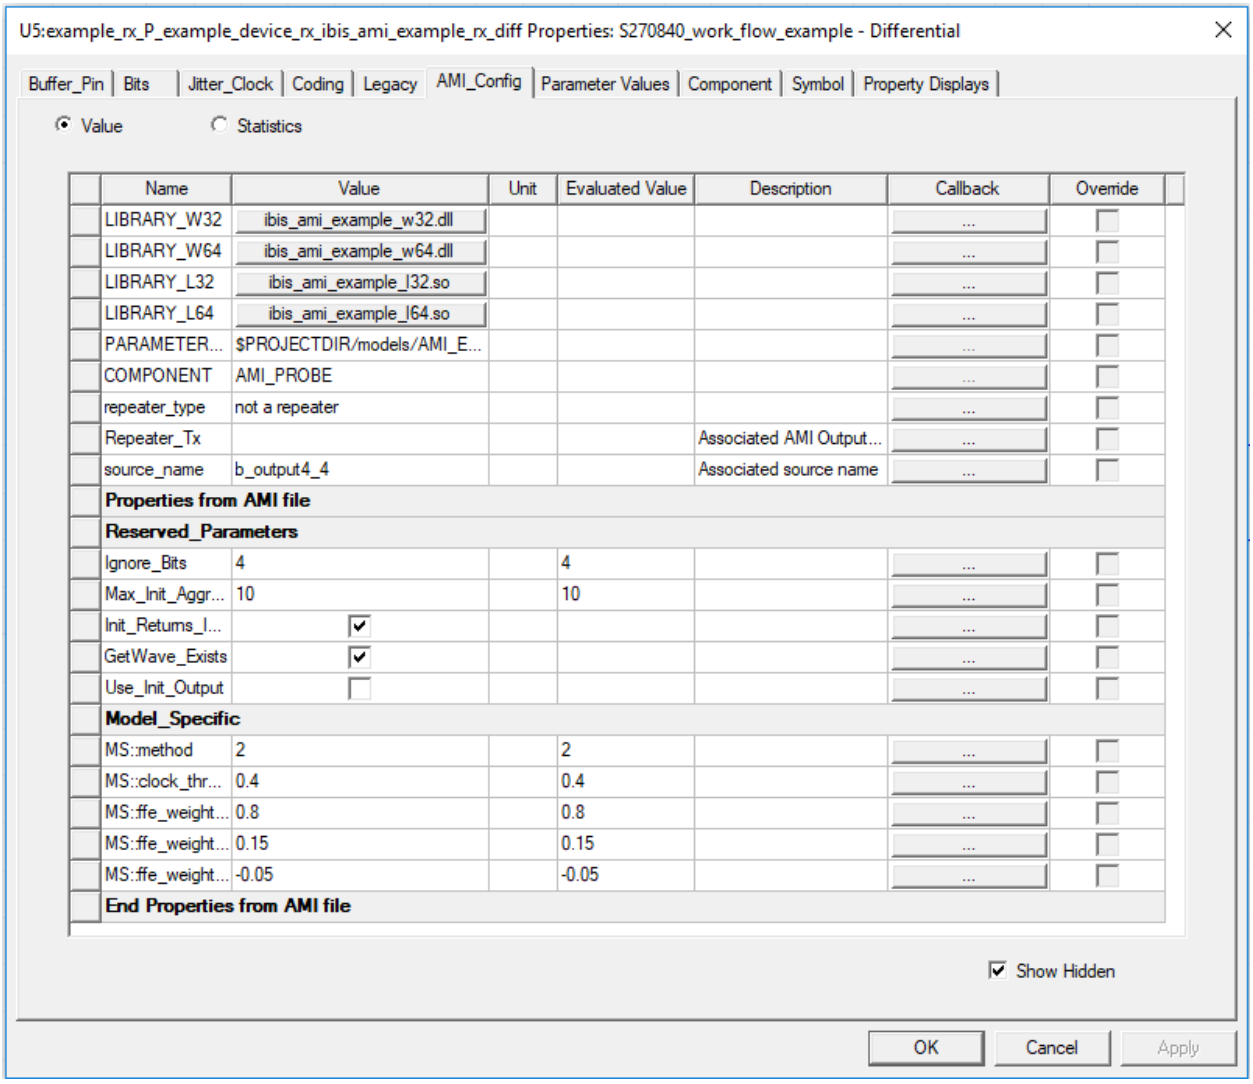
- The **Out** property under the Pin Properties row, is set using a net name, selected from a drop-down menu populated automatically on the completed circuit.The **Out** pin is not relevant to AMI analysis. See for IBIS Library Support for additional information.
- The **diff_pin_name** property shows the **Pin Import** selection.
- See for IBIS Library Support for additional information on the **use_series_model**, **package_selector**, and **probe die side** properties.

This is the AMI Parameters Tab information:

- The **LIBRARY** properties show the executable files on the [Model] in the .ibs file.
- The **COMPONENT** property has been set to AMI_PROBE automatically.
- See AMI Repeater Properties for details on the **repeater_type** and **Repeater_Tx** properties.
- The AMI Receiver properties list includes a property **source_name** which lists the available AMI Transmitters in the design. Then choose a transmitter on the drop-down menu.
- The **source_name** field is automatically filled in with the name of the AMI Transmitter when the AMI Transmitter and AMI Receiver are paired on the GUI. See Pairing an AMI Source and an AMI Probe in the Schematic.

Finally, the AMI_Config tab includes listings of the parameters on the AMI parameters file. The reserved and model specific AMI parameters are broken out in separate groups.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



If your system includes AMI Repeaters or Retimers, the steps for setting them up are in AMI Repeater Properties.

You complete the circuit by adding a channel and wiring the connections. If the circuit is complete, you are ready to run the AMI Analysis.

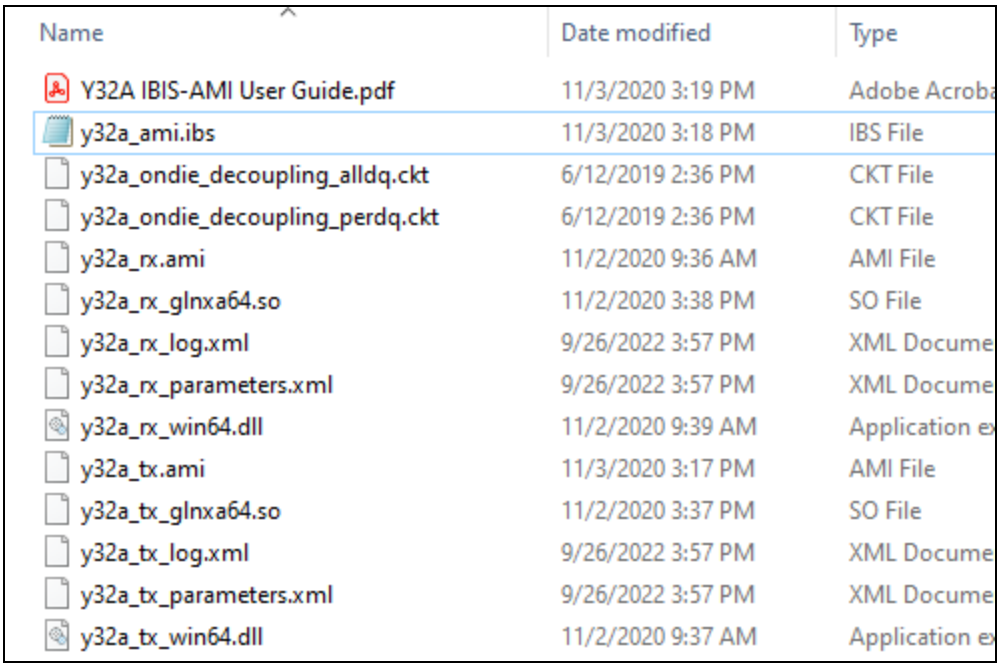
Importing a Bi-directional AMI Transmitter/Receiver

Complete the following steps to import an IBIS bi-directional AMI transmitter/receiver model from an IBIS library file (*.ibs*).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Import an *.ibs* file by doing one of the following:

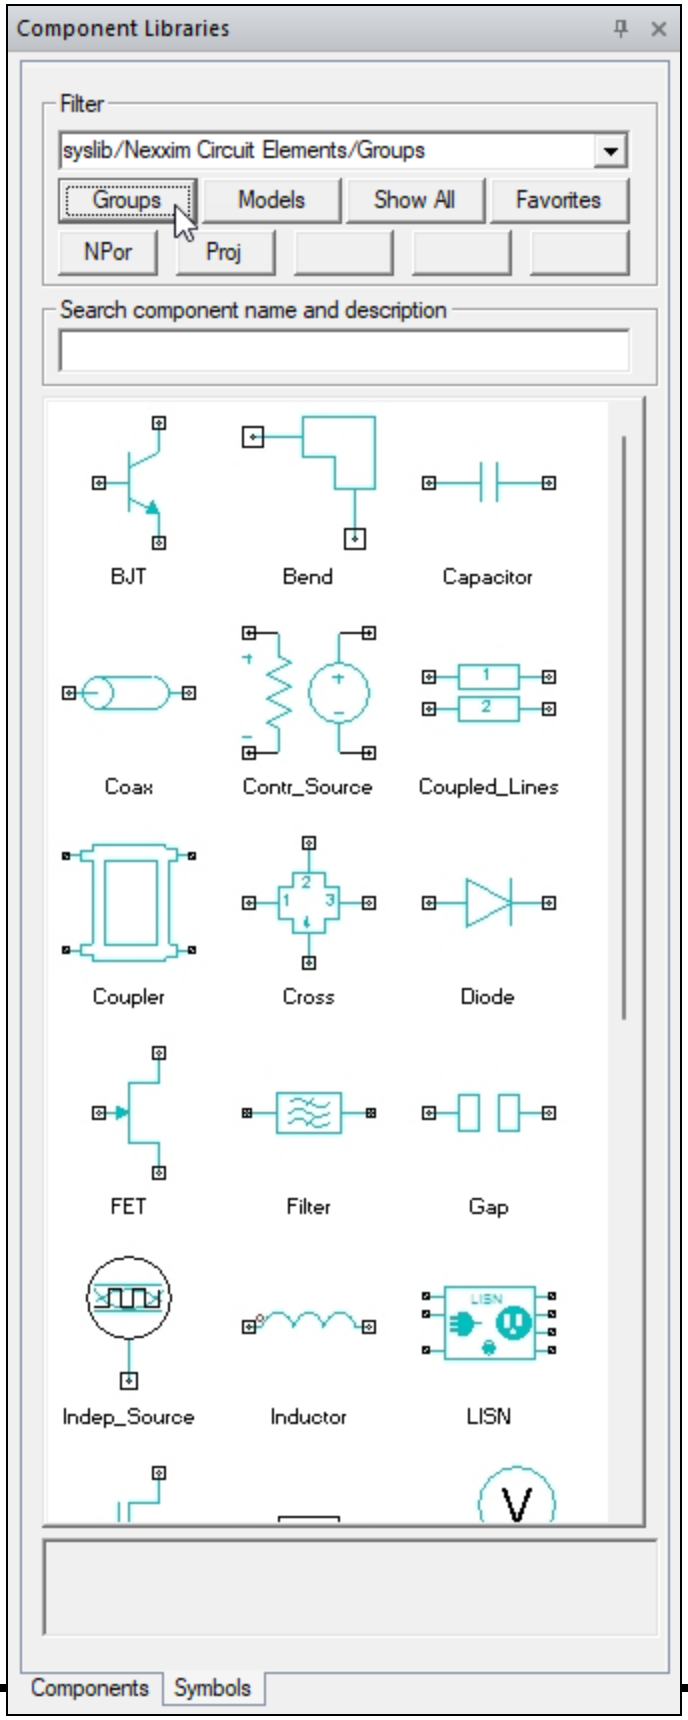
   - Navigate to the appropriate *.ibs* file from an explorer window. Then **drag+drop** the file into the **Electronic Desktop Schematic Editor** to open the **Import IBIS** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Navigate to the **Component Libraries** window > **Symbols** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



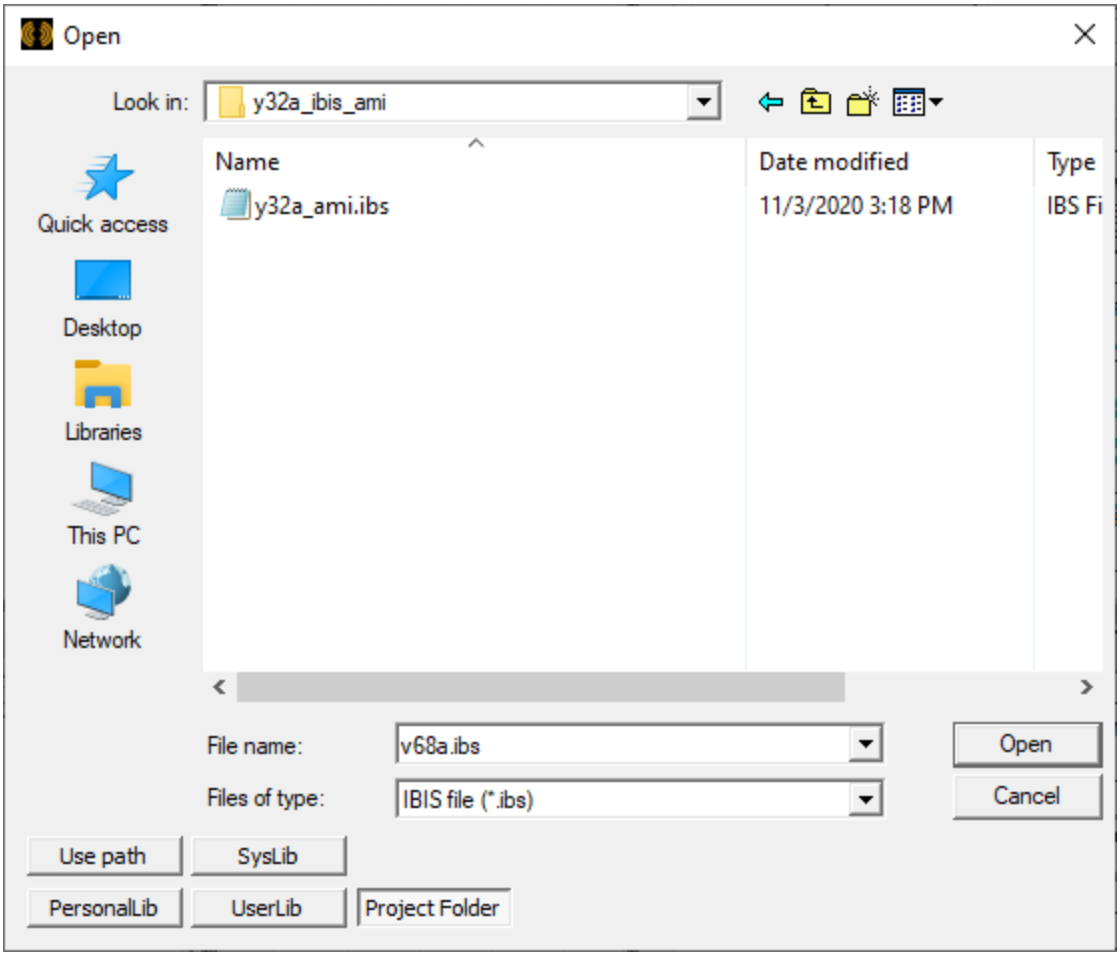
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

From the **Filter** group box, click **Models**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

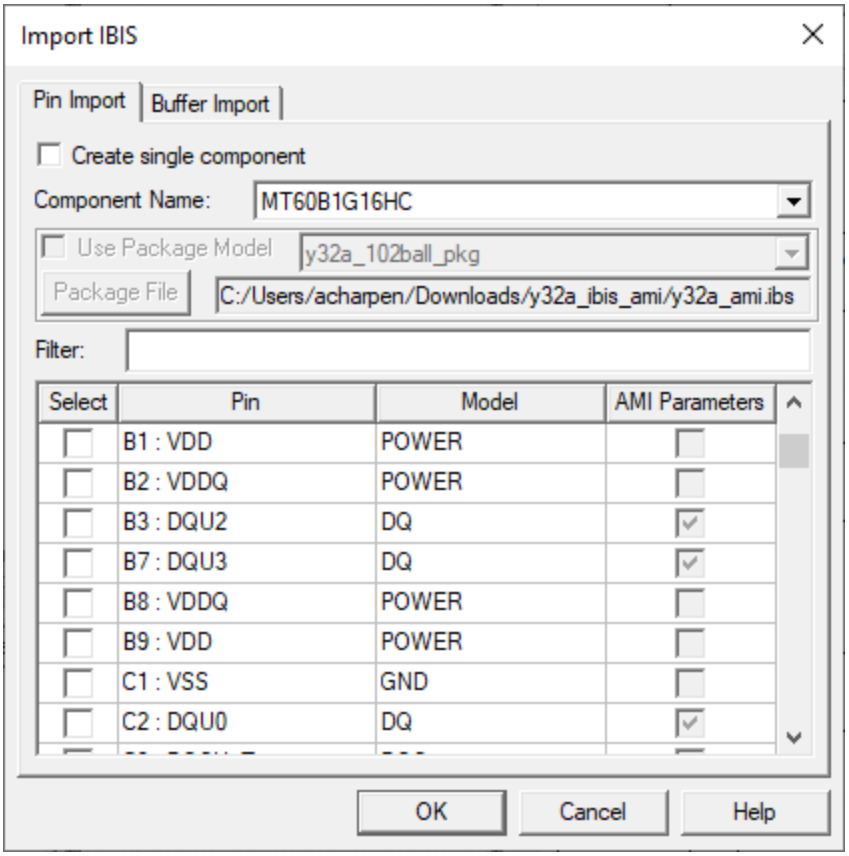
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click **IBIS** to open an explorer window. Then navigate to the appropriate *.ibs* file. Select the file and click **Open** to open the file in the **Import IBIS** window.



2. The **Import IBIS** > **Pin Import** tab displays the component's pins identified in the IBIS file, the model or model selector associated with each pin, and whether the model is an AMI model. Single pins are listed first, then differential pin pairs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



From the **Pin Import** tab, do the following:

a. To import the *.ibs* file as a single component with multiple pins wherein each pin retains its own model and buffer type, check **Create single component**.See Import IBIS Single Component or Pin or Buffer Element for details.

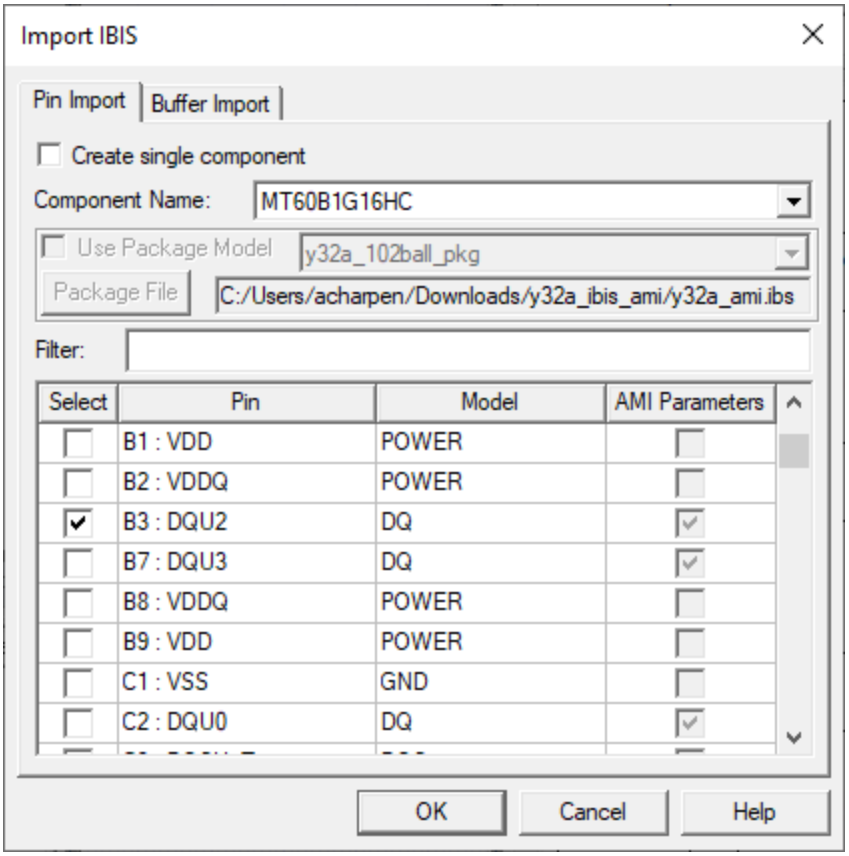
b. The **Component Name** drop-down menu lists all the IBIS components contained in the *.ibs* file (i.e., the IBIS library). Select the appropriate component.

c. Check boxes in the **Select** column to choose which pins to import (i.e., check the box adjacent to the component(s) with the appropriate AMI parameters).

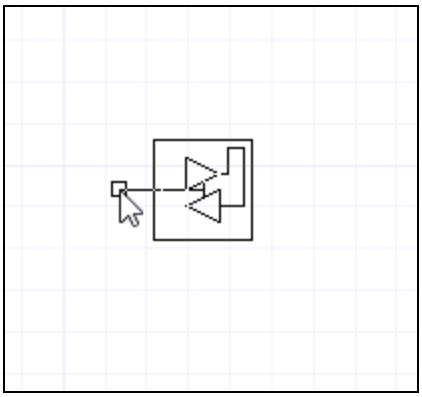
> **Note:** If an attempt is made to import a single pin that is part of a differential pin pair, a warning appears in the **Message Manager**. The import can still proceed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

d. Click **OK** to close the **Import IBIS** window.

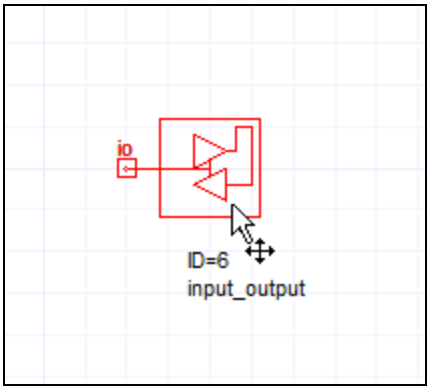


3. An instance of the component is now pinned to the cursor.

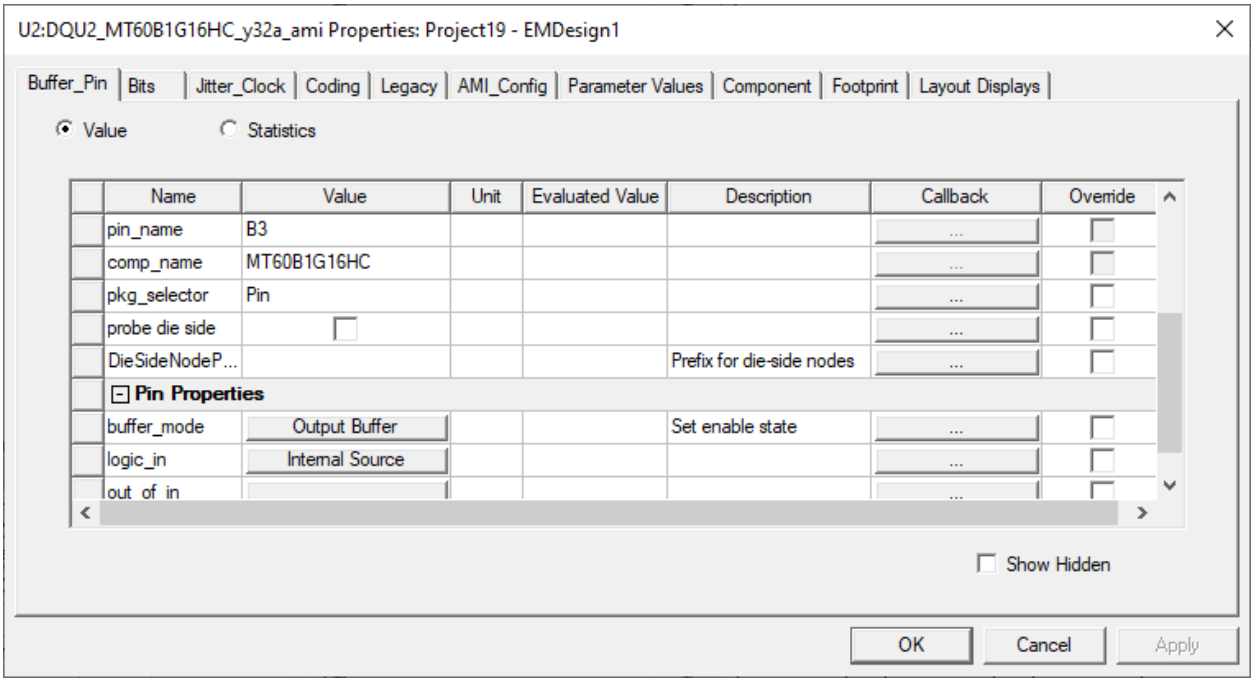


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. **Drag+click** an appropriate place in the **Schematic Editor** to drop the component.

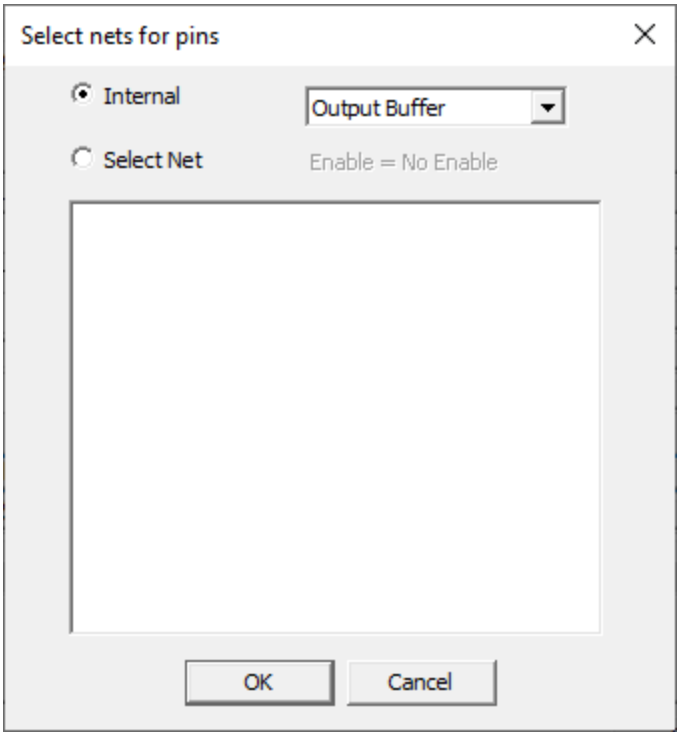


5. Double-click the component to open the **Properties** window. Then scroll to the **buffer_mode** row.



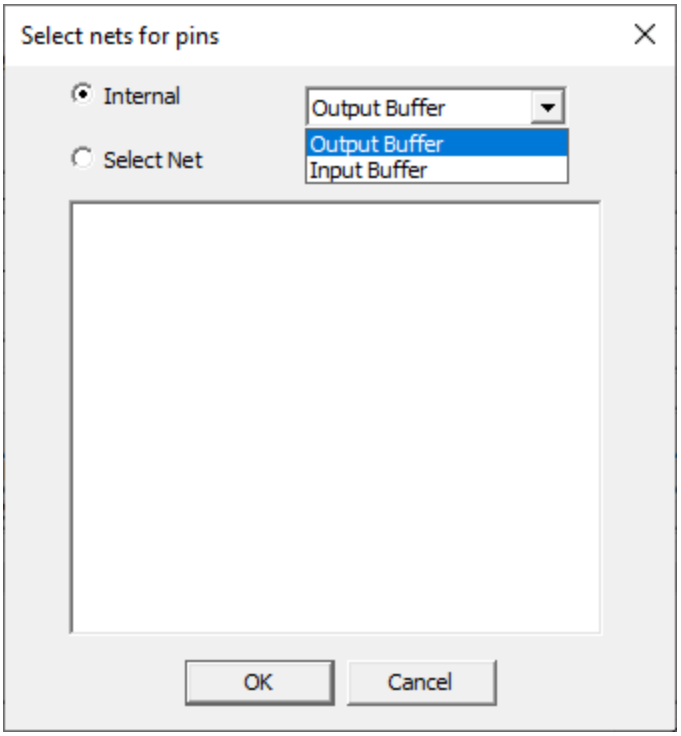
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Click the button in the **buffer_mode Value** field to open the **Select nets for pins** window.

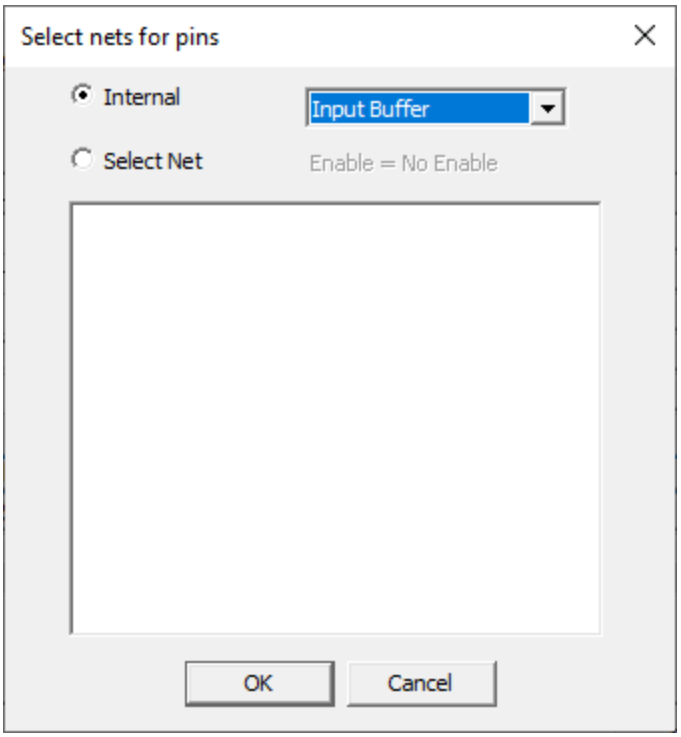


7. Select the appropriate buffer from the **Internal** drop-down menu (e.g., **Output Buffer** or **Input Buffer**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



8. Click **OK** to close the **Select nets for pins** window.



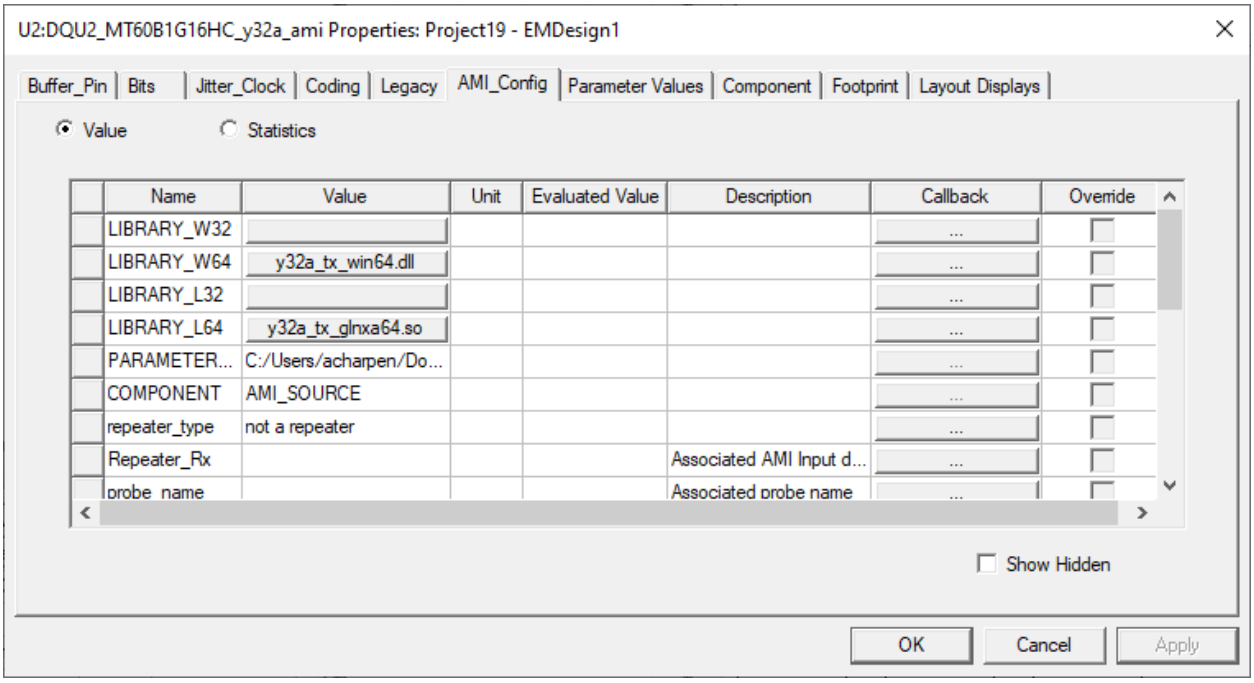
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9. Navigate to the **AMI_Config** tab. The appropriate library files will have immediately populated the **LIBRARY Value** fields after making a selection in **Steps 7-8**.

   The following example shows the fields populated with receiver files (e.g., **y32a_rx_win64.dll** and **y32a_rx_glnxa64.so**) after **Input Buffer** is chosen.

   The following example shows the fields populated with the appropriate transmitter files (e.g., **y32a_tx_win64.dll** and **y32a_tx_glnxa64.so**) after **Output Buffer** is chosen.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

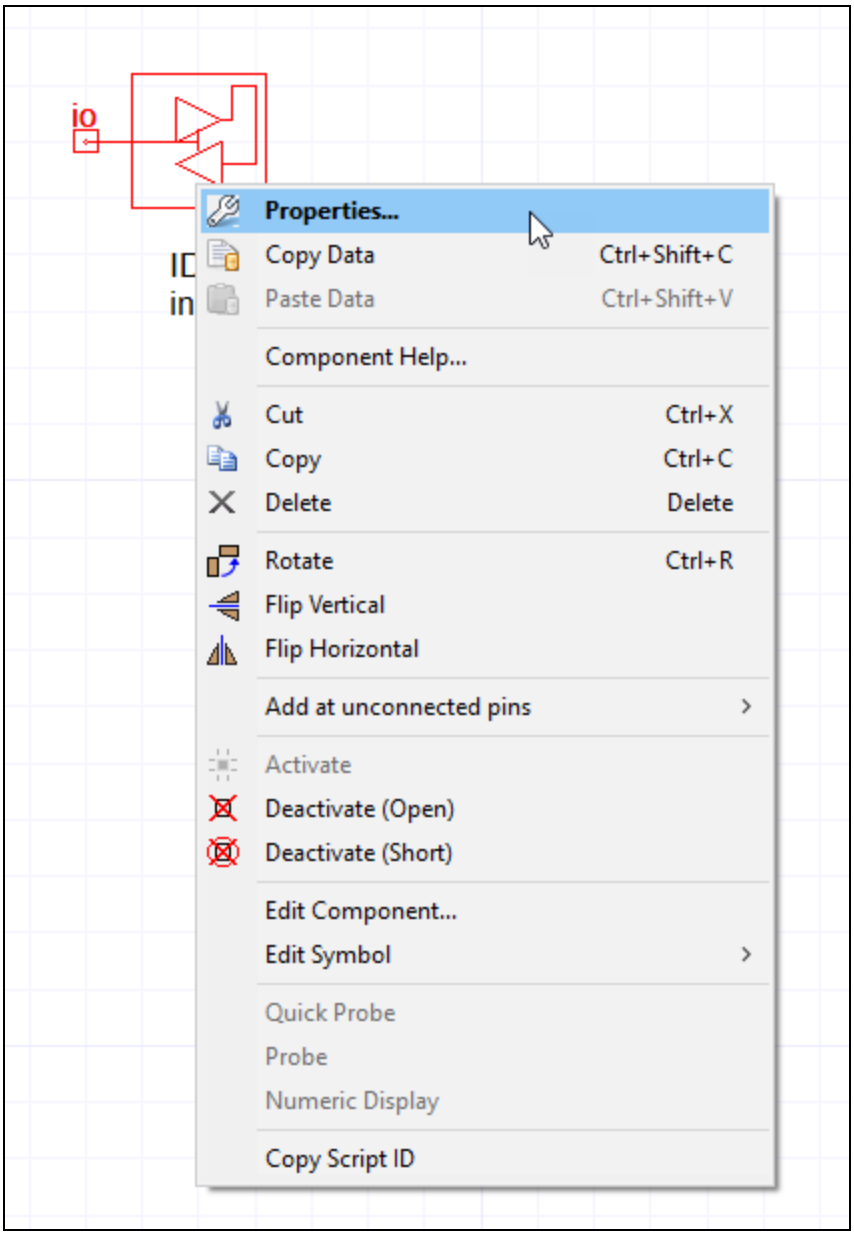


10. Complete the circuit by adding a channel and wiring the connections. Refer to the following subsection for more information about the **Properties** window. When the circuit is complete, continue to Set Up and Run AMI Analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Setting AMI Transmitter/Receiver Properties

Right-click the component and select **Properties...** to open the **Properties** window.



Note: For bidirectional Tx/Rx AMI models, changing the model from the **Properties** dialog requires clicking **OK** and then reopening the **Properties** dialog to populate all of the model's property fields.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

An AMI transmitter/receiver model is imported as an **I/O** buffer type with an internal power source and basic parameters. Refer to IBIS Library Support for more information about the parameters.

The **Buffer_Pin** tab has parameters that are not exclusive to AMI models, such as the following examples

- The **out_of_in** property under the **Pin Properties** row, is set using a net name, selected from a drop-down menu populated automatically. Refer for IBIS Library Support for additional information.
- The **file** property shows the **Pin Import** selection (i.e., **y32a_ami.ibs**).
- See IBIS Library Support for more information on the **model**, **pkg_selector**, and **probe die side** properties.

The **AMI_Config** contains AMI-specific parameters, such as the following examples:

- The **LIBRARY** properties show the executable files extracted from the *.ibs* file.
- The **COMPONENT** property has been set to **AMI_SOURCE** automatically.
- Refer to AMI Repeater Properties for information about the **repeater_type** and **Repeater_Tx** parameters.
- The *.ibs* file may include other parameters that populate underneath the **Properties from AMI file** row. The parameters may even distribute into subrows (e.g., **Reserved_ Parameters**).

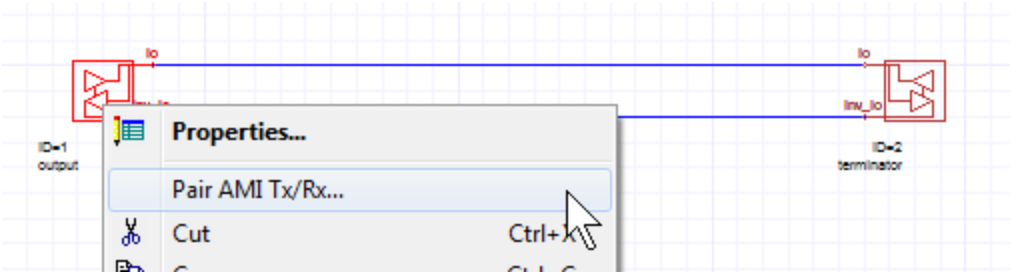
If the design includes AMI Repeaters or Retimers, refer to AMI Repeater Properties.

Pairing an AMI Transmitter and an AMI Receiver in the Schematic

An AMI circuit may contain multiple AMI Transmitters and AMI Receivers. Each AMI Transmitter must be paired with a corresponding AMI Receiver, and vice versa. The **probe_name** parameter in the AMI Transmitter has a drop-down menu that lists all the AMI Receivers in the design. The AMI Receiver **source_name** parameter has a drop-down that lists all the AMI Transmitters in the design.

Instead of using the drop-down menus, pair a selected Transmitter and Receiver directly in the schematic. Use **Ctrl**+click to select the AMI Transmitter and AMI Receiver that you want to pair up. With the cursor on either component, right-click and select **Pair AMI Tx/Rx ...** on the menu.

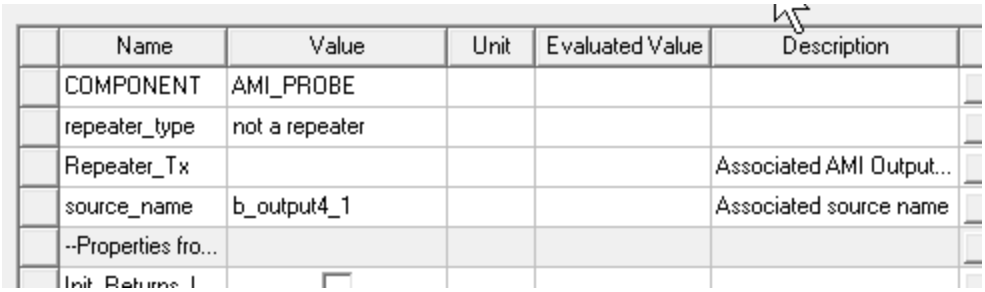
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **probe_name** parameter in the selected AMI Transmitter is set to the name of the selected AMI Receiver.

COMPONENT	AMI_SOURCE			
repeater_type	not a repeater			
Repeater_Rx				Associated AMI Input d...
probe_name	b_terminator_2			Associated probe name

The **source_name** parameter in the selected AMI Receiver is set to the name of the selected AMI Transmitter.



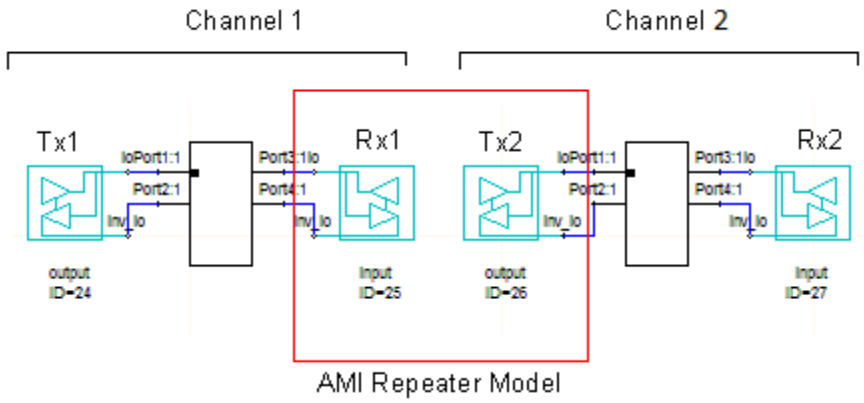
Name	Value	Unit	Evaluated Value	Description
COMPONENT	AMI_PROBE			
repeater_type	not a repeater			
Repeater_Tx				Associated AMI Output...
source_name	b_output4_1			Associated source name
--Properties fro...				

AMI Repeater Properties

A repeater is a device added to a channel to compensate for channel loss. The AMI model of a repeater links two AMI channels together. The AMI Repeater model simulates a repeater connection between the Receiver on the upstream channel and the transmitter on the downstream channel. See AMI Repeaters in the AMI Analysis Technical Notes for details.

Here is an example:

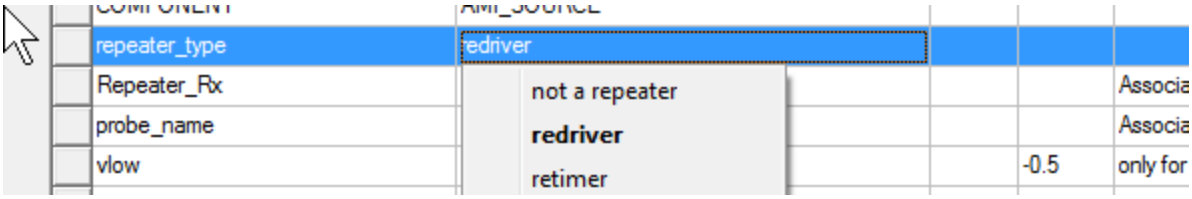
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



In this example, upstream channel 1 consists of transmitter Tx1 and receiver Rx1, while downstream channel 2 consists of transmitter Tx2 and receiver Rx2. Each of these transmitters and receivers is imported as a standalone component. Each component has its own fully defined differential pin pair and model in an IBIS file. The AMI Repeater model consists of a two “halves,” the receiver half (Rx1) and the transmitter half (Tx2). AMI Repeater properties in the components connect the output of Rx1 to the input of Tx2.

Here is the procedure for setting up the AMI Repeater, assuming the two channels are already defined.

1. Select the transmitter Tx2 from the downstream channel or the receiver Rx1 on the upstream channel. This example starts with the transmitter. Edit the Properties. Scroll down to the **repeater_type** property. Here are the AMI Repeater properties for the Tx2 component in the example above.



2. The default for **repeater_type** is **not a repeater**. To create an AMI repeater model, set the **repeater_type** property on Tx2 to **redriver** or **retimer**.

> **Note:**
>
> When the **repeater_type** property is set to **redriver** or **retimer**, the Internal Source properties for the AMI transmitter component are not displayed in the Properties window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. The **Repeater_Rx** field is populated with a list of available AMI receivers (probes). Select the probe corresponding to receiver Rx1 on the upstream channel.
4. Verify that the Tx2 **probe_name** property points to receiver Rx2 at the output of the downstream channel.
5. Click **OK** to close the Properties window.

The GUI automatically sets the AMI Repeater properties on the upstream receiver Rx1 to match those on downstream transmitter Tx2. You can verify the property settings in the receiver. You can also set the **Rx_Receiver_Sensitivity** parameter if it is present.

6. Select the receiver Rx1 on the upstream channel. Edit the Properties. Scroll down to the **repeater_type** property. Here are the properties for the Rx1 component in the example above.

	COMPONENT	AMI_PROBE			
	repeater_type	redriver			
	Repeater_Tx	b_output4_26			Associated AMI Output devices
	source_name	b_output4_24			Associated source name

7. Verify that the **repeater_type** property has been set to the **repeater_type** in the Repeater Tx2, **redriver** in this example.
8. Verify that the **Repeater_Tx** property in Rx1 has been set to the netlist name of the Tx2 component.
9. If the AMI file for the receiver contains an **Rx_Receiver_Sensitivity** property, that property is displayed among the **Properties on the AMI File**. Click the **Value** field to change the sensitivity. The **Rx_Receiver_Sensitivity** parameter sets the voltage thresholds (plus and minus) for sampling the equalized signal.

> **Note:**
>
> If you start with the upstream receiver Rx1, set the **repeater_type** property to **redriver** or **retimer**, then select the downstream **Repeater_Tx** from the list. The corresponding properties in that transmitter is automatically set. You can verify the settings.

10. Click **OK** to close the Properties window.
11. See AMI Repeaters in the AMI Technical Notes for details.

This completes the IBIS import process. If the circuit is complete, you are ready to run the AMI Analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMI Reserved Parameters

This topic discusses some of the AMI Reserved parameters. The definitions of Reserved parameters are given in the IBIS Specification (See AMI Analysis References).

AMI DLL_ID Parameter

The `DLL_ID` parameter was created so the EDA tool can provide the AMI executable (.dll or .so) with a string value that is guaranteed to be unique. The AMI executable can then use this value, for example, as part of filenames it uses when it creates any temporary or permanent output files.

At import time, if the AMI Reserved parameter DLL_ID is found, the parameter is displayed in the **AMI_Config** tab of the Parameters dialog, and whatever value was read from the AMI file is displayed as the initial value. Often the AMI file specifies a value of “placeholder”, as the actual value is to be provided by the EDA tool at simulation time.

In **Electronics Desktop**, the user may modify the value of DLL_ID in the **AMI_Config** tab. The value specified will be used as the prefix of the final value generated by Circuit and passed to the AMI executable. This may make it easier for the user to correlate any output files with the AMI device that created them. The final value of DLL_ID passed to the AMI executable has the following form:

```
<prefix provided by user>_<device_name>_<process ID of Circuit
Solver>
```

This name is guaranteed to be unique to the instance of the AMI model.

For example, if the user specifies `my_name` as the value of the DLL_ID parameter in the **AMI_Config** tab, and the name of the AMI device is `b_output4_1`, and the process ID of the instance of the Circuit solver is 784, then the value of DLL_ID passed to the AMI executable would be:

```
my_name_b_output4_1_784
```

By defining the value of DLL_ID (“my_name” in this example), the user can control the way any output files created by instances of the AMI model are grouped alphabetically in a file browser.

AMI DLL_Path Parameter

The **DLL_Path** parameter is provided so the EDA tool can tell the AMI executable (.dll or .so) the path to the directory where the executable resides. The AMI executable can then locate any needed support files relative to its own directory.

At import time, if the Reserved parameter "DLL_Path" is found, the parameter is displayed in the Parameters window, and whatever value was read on the AMI file is replaced with a period (.).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The value shown in the display is the one that is passed to the AMI executable; you should not change the value in the window.

The **Electronics Desktop** uses the ami_child_process when it has to launch an AMI .dll. The ami_child_process process always starts by changing its working directory to the directory containing the .dll. Therefore, the value set in the **DLL_Path** parameter is always "." to represent the current working directory of the AMI executable.

AMI Ts4 Analog Buffer Model Parameters

Instead of using the legacy IBIS constructs for modeling analog portions of the AMI transmitter and receiver, 4-port Touchstone files may be specified for the AMI transmitter's analog output network and for the AMI receiver's analog input network.

The reserved parameters in this topic control the operation when a Touchstone file is used. For reference diagrams, see "The AMI Transmitter Model " on page 26-324and "The AMI Receiver Model " on page 26-326.

Ts4file

The **Ts4file** parameter specifies the name of the 4-port Touchstone-format file for either the transmitter or receiver. The file may contain a path; if no path is specified, the file is assumed to be in the same directory as the .ami file. There is no default.

Tx_V

The **Tx_V** parameter defines the voltage swing of the stimulus input to the transmitter circuit. The voltages of the voltage sources correspond to **V=Tx_V** for logic level 1 and **V=-Tx_V** for logic level 0.

Tx_R

The **Tx_R** parameter specifies the resistance of the series resistors in the transmitter circuit.

Rx_R

The **Rx_R** parameter specifies the resistance of the terminating resistors in the receiver circuit.

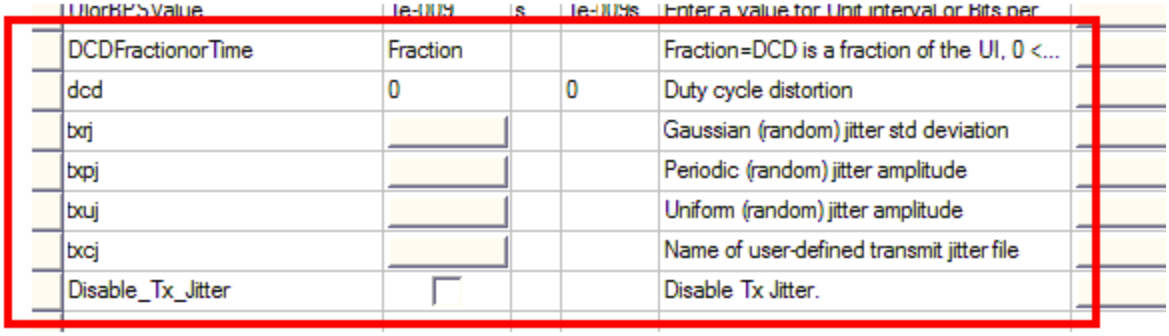
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMI Transmit Jitter Parameters

Nexxim analysis of the AMI transmitter provides two ways to specify transmit jitter: with the Nexxim jitter properties or with jitter parameters read on the AMI file.

Both methods are controlled by the **Disable_Tx_Jitter** parameter of the AMI transmitter. When **Disable_Tx_Jitter** is checked, both Nexxim and AMI transmit jitter calculations are deactivated. See the following example for the location of the **Disable_Tx_Jitter** control.

Nexxim Transmit Jitter Properties. Nexxim jitter properties are added to the AMI transmitter component properties. You can specify one or more transmit jitter distributions with the **txrj** (Gaussian), **txpj** (Periodic), and **txuj** (Uniform) properties, and duty-cycle distortion with the **dcd** (Duty Cycle Distortion) property. These properties are highlighted in the red box in the following example. The Nexxim transmit jitter and DCD properties are identical to the properties from QuickEye and VerifEye.



Note:

1. The Nexxim **txcj** (Custom or user-defined) jitter property is not supported for AMI analyses.
2. The AMI analysis uses one value for each Nexxim property, taking only the first value if a list of values is given.

- Duty cycle distortion: Click the **DCDFractionorTime** dropdown menu to select **Fraction** (the default) or **Time**. For **Fraction**, the DCD value is a decimal fraction of the UI between 0.0 and 1.0. For **Time**, the DCD value is a time between 0.0 and UI in seconds. A time unit such as **ps** (picosecond) may be used to set the DCD time. The default for both **Fraction** and **Time** is 0. See also Duty Cycle Distortion in the QE/VE Technical Notes.

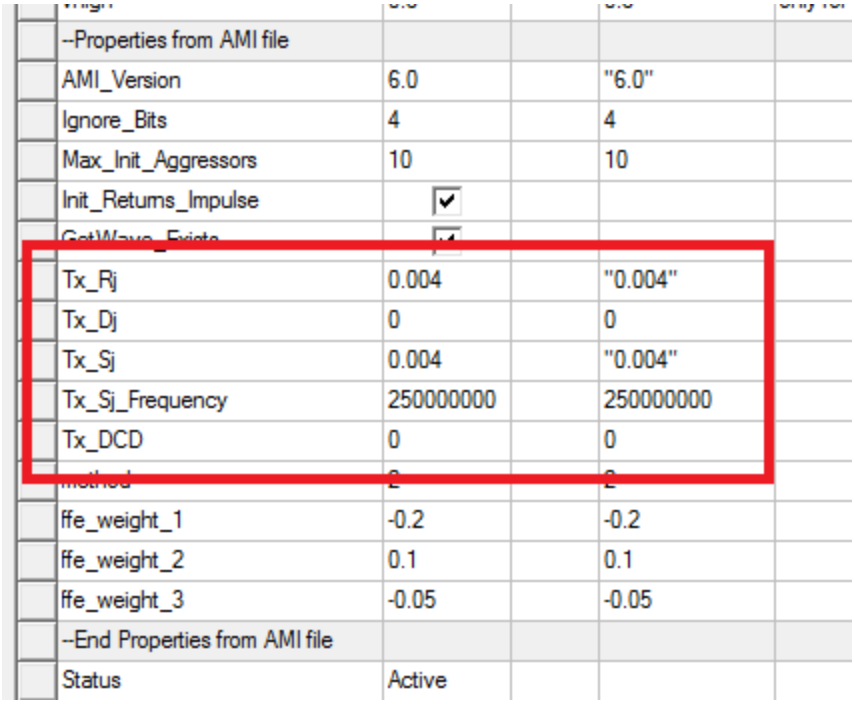
For **txrj**, **txpj**, or **txuj**, click the **Value** field and specify one value for the AMI analysis. All three types of jitter may be added, generating multiple jitter sources.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For random transmit jitter (**txrj**) the value is the standard deviation for the Gaussian distribution. The default is 0 seconds.
- For Periodic random transmit jitter (**txpj**) the value is the amplitude. Default: 0 seconds.
- For Uniform random transmit jitter (**txuj**) the value is the amplitude. Default is 0 seconds.

> **Note:** For more information on the QE/VE transmit jitter parameters, see Transmit Jitter in the Quick Eye and VerifEye Technical Notes.

Transmit Jitter Parameters in the AMI File. If the AMI file contains transmit jitter parameters, they are imported into the transmitter component and displayed with the AMI Properties (red box in the following example).



When the AMI model does not include transmit jitter parameters, use the appropriate Nexxim jitter properties to provide the equivalent jitter or duty cycle distortion for most AMI transmit jitter parameters. The AMI transmit jitter parameters **Tx_Rj** and **Tx_Sj** map directly to the **txrj** and **txpj** Nexxim properties, while the AMI **Tx_DCD** and **Tx_Dj** parameters map to the Nexxim **dcd** and **txuj** properties with minor adjustments to obtain the same result, as shown in the following table.

Jitter Type	Mapping to Nexxim Jitter Properties from AMI Parameters
Gaussian or Random	**txrj** (time) = **Tx_Rj** (time or fractional UI)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Jitter Type	Mapping to Nexxim Jitter Properties from AMI Parameters
Periodic or Sinusoidal	**txpj** (time) = **Tx_Sj** (time or fractional UI)
Duty Cycle Distortion	**dcd** (fractional UI) = 2 x **Tx_DCD** (time or fractional UI)
Uniform or Deterministic	**txuj** (time) = 2 x **TX_Dj** (time or fractional UI)

Note:

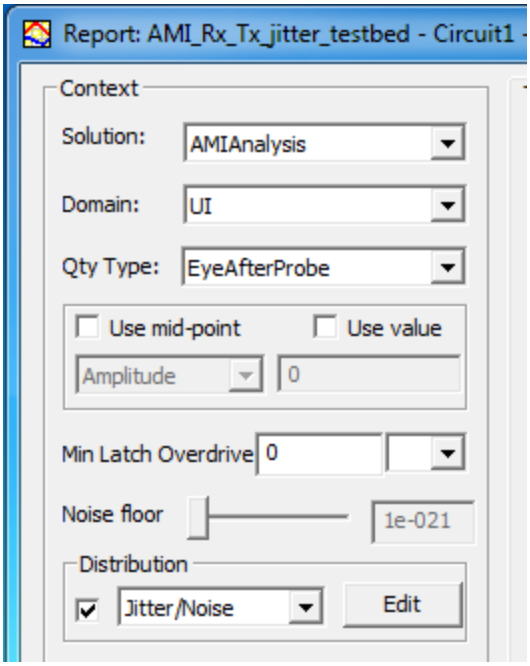
1. The mappings for duty cycle distortion and uniform jitter incorporate a factor of 2, because the AMI parameters specify half the peak-to-peak values, while the Nexxim properties specify the full values.
2. Nexxim can apply the AMI **Tx_Sj_Frequency** parameter only in AMI Time Domain simulation (AMI analysis). The AMI **Tx_Sj_Frequency** parameter is ignored for Nexxim AMI Statistical simulation (VerifEye analysis). The **Tx_Sj_Frequency** parameter does not map to any Nexxim transmit jitter parameter. Nexxim periodic jitter **txpj** relies only on the amplitude of the periodic noise source (**Tx_Sj**).
3. When a Nexxim jitter property has been set and the AMI file contains the corresponding AMI jitter parameter, the Nexxim property setting is applied, the AMI parameter is ignored, and a warning is displayed.

AMI Receive Jitter Parameters

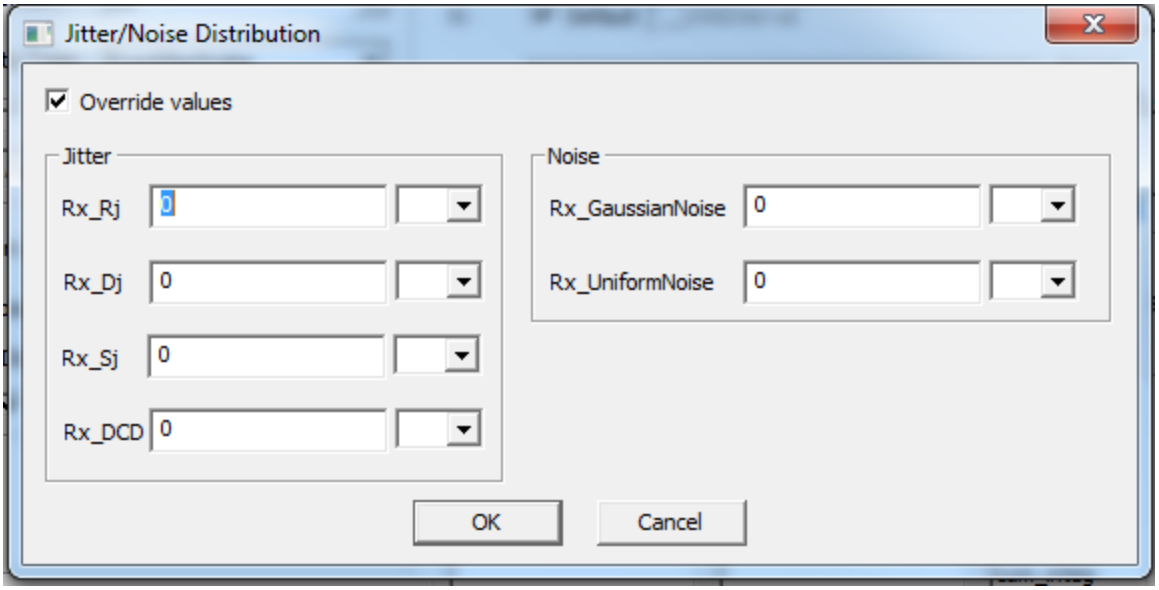
Receive jitter and noise are specified using the Receive Jitter/Noise **Distribution** group box on the Report setup window. For AMI analysis simulations (including statistical analysis using VerifEye with AMI), the values of the parameters may be provided by the simulation. Values may come on the .ami file at import time (and potentially be modified by the user in the **Properties** window for the Rx device), or may be returned by the AMI model after the call to AMI_Init(). In either case, the values provided by the simulation are used to initialize the Jitter/Noise window.

Receive Jitter/Noise Distributions. Receive jitter and noise can be added or modified in the Reports window. For AMI, the **Distribution** group box appears when you select EyeAfterProbe for the Bathtub plot:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Click **Edit** to open the Jitter/Noise Distribution window.



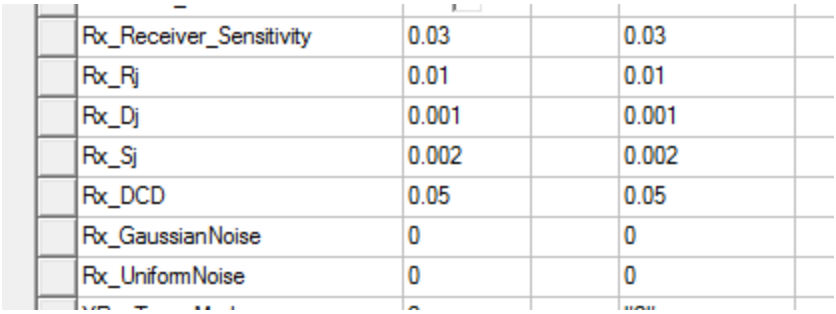
The parameter names and definitions are as defined in the IBIS specification.

- For random receive jitter (**Rx_Rj**) the value is the standard deviation of the Gaussian distribution in time units. The default is 0 seconds (overridden when the AMI file contains a value for **Rx_Rj**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For uniform receive jitter (**Rx_Dj**) the value is one-half the width of the jitter distribution in time units. Default is 0 seconds (overridden when the AMI file contains a value for **Rx_Dj**).
- For sinusoidal jitter (**Rx_Sj**) the value is the amplitude of the distribution in time units. Default is 0 seconds (overridden when the AMI file contains a value for **Rx_Sj**).
- For clock duty cycle distortion (**Rx_DCD**) the value is one-half the peak-to-peak variation of the distortion in time units. Default is 0 seconds (overridden when the AMI file contains a value for **Rx_DCD**).
- For random receiver noise, (**Rx_GaussianNoise**) the value is the standard deviation of the Gaussian distribution in voltage units. The default is 0 volts (overridden when the AMI file contains a value for **Rx_GaussianNoise**).
- For uniform receiver noise (**Rx_UniformNoise**) the value is one-half the width of the noise distribution in voltage units. Default is 0 volts (overridden when the AMI file contains a value for **Rx_UniformNoise**).

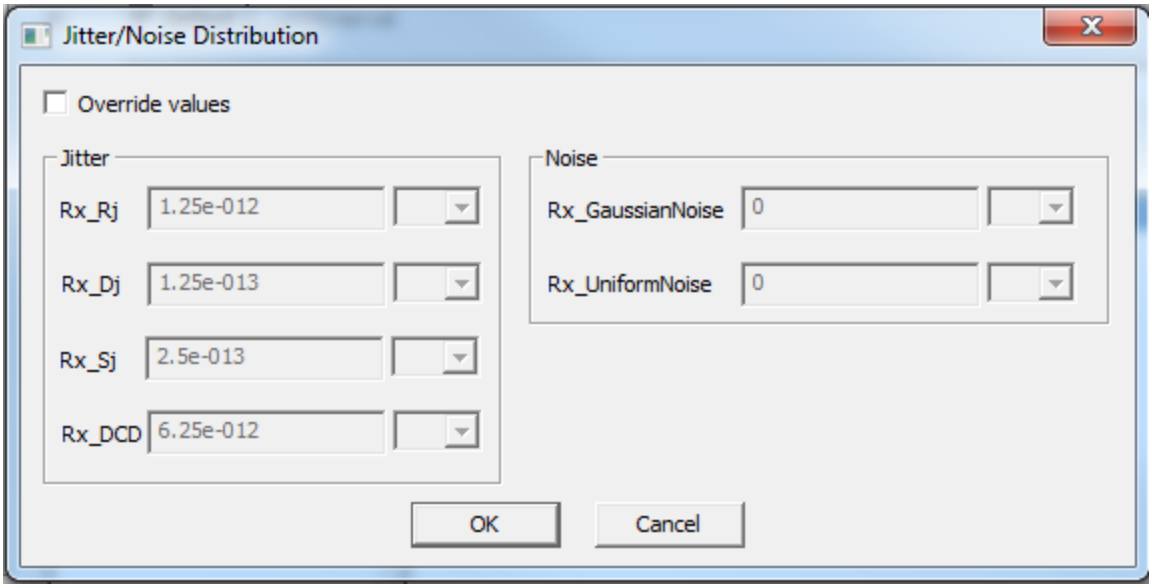
Receive Jitter Parameters in the AMI File. If the AMI file contains receive jitter parameters, they are imported into the receiver component and displayed with the AMI Properties. Note that the quantities in this Properties listing may be in terms of fractions of the UI (as in the following example), or in absolute times.



Rx_Receiver_Sensitivity	0.03		0.03
Rx_Rj	0.01		0.01
Rx_Dj	0.001		0.001
Rx_Sj	0.002		0.002
Rx_DCD	0.05		0.05
Rx_GaussianNoise	0		0
Rx_UniformNoise	0		0

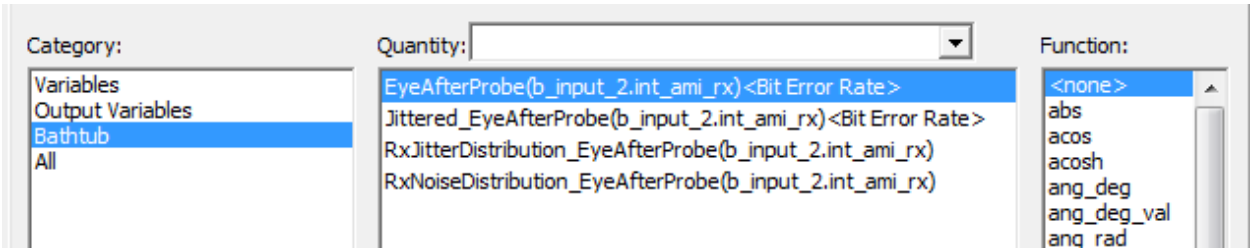
If there are receive jitter parameters in the AMI file, they is copied into the Receive Jitter window during simulation. When the AMI receive jitter parameters are copied into the Jitter/Noise Distribution window, they are converted to absolute times if necessary. The window in the following diagram illustrates the fractional UI values on the example above converted to absolute times in seconds.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



When you create a bathtub plot of the EyeAfterProbe quantity, any values provided by the AMI simulation are used to populate the Jitter/Noise window if the user chooses to add the Jitter/Noise distributions. Modify these values in the window. When the AMI model does not include receive jitter parameters, enter the jitter parameters manually.

When the Jitter/Noise distribution box is checked for a bathtub plot of the EyeAfterProbe, four traces are available for plotting:



The quantities are the bathtub without jitter applied, the bathtub with noise and jitter applied, and the distributions that represent the Jitter and Noise parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMI Modulation Parameters

Modulation

The **Modulation** parameter specifies the modulation scheme to be used for analysis using AMI_GetWave and for post-processing the simulation results. The choices are "NRZ" and "PAM4". When the **Modulation** parameter is not included in the .ami file, the default is "NRZ". If a list of both values is given in the AMI file, the transmitter component property display offers a drop-down menu to select the value.

When **Modulation** is "NRZ", Nexxim sets the input stimulus using -0.5V to represent a logic 0 and 0.5V to represent a logic 1.

When **Modulation** is "PAM4", Nexxim sets the input stimulus using voltage levels of -0.5V, -0.166V, 0.166V and 0.5V, which are mapped to PAM4 two-bit values or symbols (00, 01, 10 and 11) using the **PAM4_Mapping** parameter.

PAM4_Mapping

The **PAM4_Mapping** parameter declares a four-character string that maps the four voltage levels to the PAM4 symbols.

The **PAM4_Mapping** parameter is ignored when the **Modulation** parameter has value "NRZ".

The values of the characters in the **PAM4_Mapping** string are:

"0" = symbol 00

"1" = symbol 01

"2" = symbol 10

"3" = symbol 11.

The positions in the string (1st, 2nd, 3rd, 4th) correspond to signal voltage levels, beginning with the most negative voltage and becoming incrementally more positive.

The **PAM4_Mapping** parameter must contain four characters and each of the four characters "0", "1", "2" and "3" must occur once.

For example, a **PAM4_Mapping** value string of "0132" (the Grey code default) sets up the following mapping:

- The most negative voltage (-0.5v) represents binary 00
- The next higher voltage should be interpreted as binary 01
- The next higher voltage should be interpreted as binary 11

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

• The most positive voltage should be interpreted as binary 10

A **PAM4_Mapping** value string of "0123" sets up the following mapping:

• The most negative voltage should be interpreted as binary 00

• The next higher voltage should be interpreted as binary 01

• The next higher voltage should be interpreted as binary 10

• The most positive voltage should be interpreted as binary 11

If **Modulation** is set to "PAM4" and **PAM4_Mapping** is not present, the default mapping is the Gray code value "0132".

PAM4_UpperThreshold

PAM4_CenterThreshold

PAM4_LowerThreshold

Nexxim uses the three threshold voltages in conjunction with the **RX_Receiver_Sensitivity** parameter to identify the PAM4 voltage levels at the Receiver:

• A voltage lower than (**PAM4_LowerThreshold** – **Rx_Receiver_Sensitivity**) is the lowest voltage level (by default -0.5V).

• A voltage lower than (**PAM4_CenterThreshold** – **Rx_Receiver_Sensitivity**) but greater than (**PAM4_LowerThreshold** + **Rx_Receiver_Sensitivity**) is the second lowest voltage level (default -0.166V).

• A voltage lower than (**PAM4_UpperThreshold** – **Rx_Receiver_Sensitivity**) but greater than (**PAM4_CenterThreshold** + **Rx_Receiver_Sensitivity**) is the second highest voltage level (default +0.166V).

• A voltage greater than (**PAM4_UpperThreshold** + **Rx_Receiver_Sensivity**) is the highest voltage level (default +0.5V).

A voltage that is not in one of these ranges is treated as a symbol error.

If the **Modulation** parameter lists "PAM4" either as a Value or as a List selection, **PAM4_ UpperThreshold** and **PAM4_LowerThreshold** are required for Rx AMI parameter definition files.

If **PAM4 _CenterThreshold** is not declared, the value of **PAM4_CenterThreshold** defaults to 0.0 volts.

The **PAM4 Threshold** parameters are ignored when the **Modulation** parameter has value "NRZ".

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PAM4_UpperEyeOffset (Value Float)

PAM4_CenterEyeOffset (Value Float)

PAM4_LowerEyeOffset (Value Float)

These three parameters specify sampling clock offsets for Upper, Center and Lower PAM4 eyes.

During PAM4 analysis, receiver sampling data is referenced to a nominal eye centered between consecutive edge transition times. The PAM4 Upper, Center and Lower eyes may have a time shift with respect to the nominal eye. Each of the three Offset parameters defines a sampling offset on the nominal eye of one of the PAM4 eyes.

When the offset is a positive value, sampling occurs after the sample time for the nominal eye. When the offset is a negative value, sampling occurs before the sample time for the nominal eye.

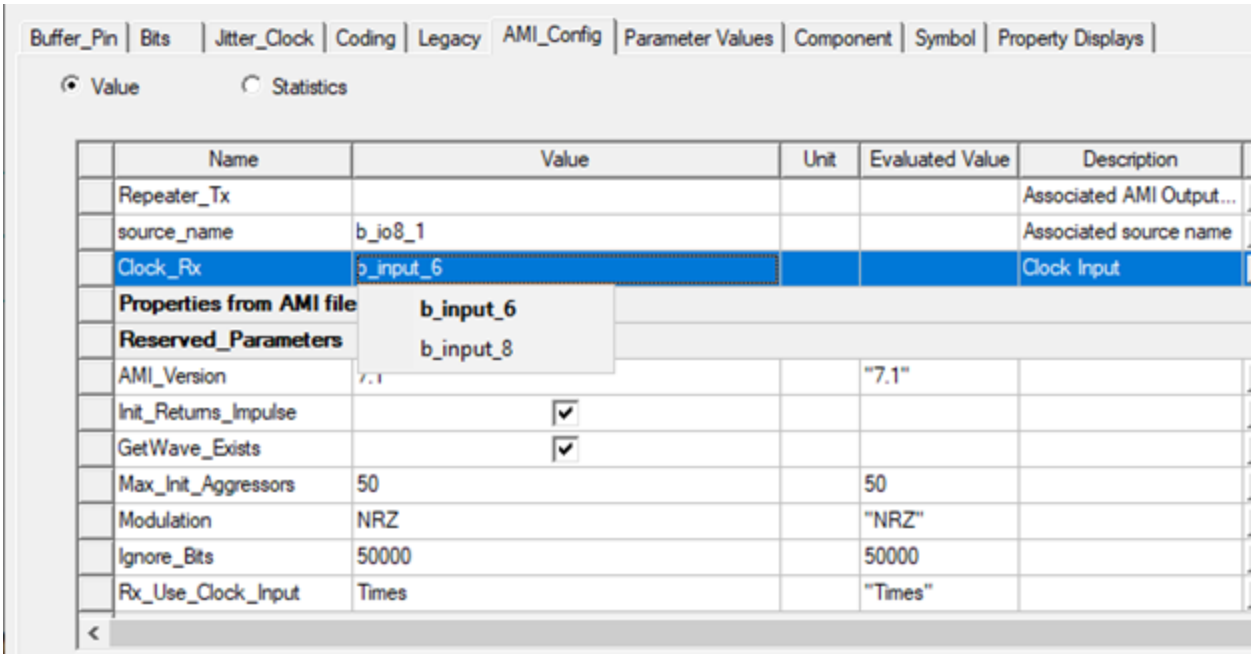
If the **Modulation** parameter is set to "PAM4" and any offset values are not present, the default value is 0.0 for each offset parameter not declared. The Offset parameters are ignored when the **Modulation** parameter is not present or is set to "NRZ".

AMI Rx_Use_Clock_Input Parameter

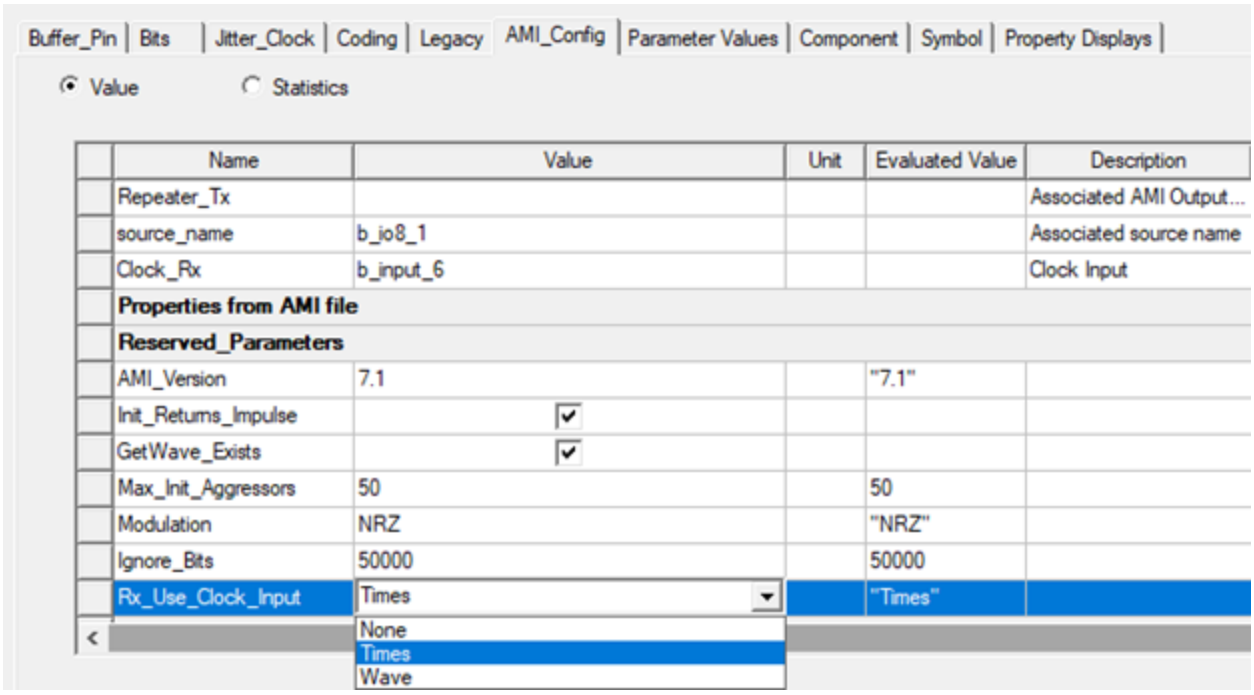
The **Rx_Use_Clock_Input** parameter was introduced in version 7.1 of the IBIS specification to support clock forwarded architectures such as DDR. If a data (DQ) Rx model requires a clock input from a clock (DQS) Rx model, then it specifies the **Rx_Use_Clock_Input** parameter.

At import time, if the AMI Reserved parameter **Rx_Use_Clock_Input** is found, the parameter is displayed in the **AMI_Config** tab of the Parameters dialog. In addition, a new property **Clock_Rx** is automatically added. It provides a drop-down box with a list of all the AMI Rxs in the Circuit Design. The drop-down box allows the user to choose the Rx model that will provide the clock to this data Rx model:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The allowed values of Rx_Use_Clock_Input are **None**, **Times**, or **Wave**. The model may specify one of these values, or it may specify that multiple settings are supported. If multiple values are supported, a drop-down box allows the user to specify which setting to use:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The value **None**, specifies that the AMI data model does not take any clock information as an input. This is traditional AMI behavior, and it is the same as if **Rx_Use_Clock_Input** does not exist in the model.
- The value **Times** specifies that the data Rx model expects the clock times output by the clock Rx model to be provided as an input.
- The value **Wave** specifies that the data Rx model expects the entire sampled waveform returned by the clock model to be provided as an input.

In the case of either **Times** or **Wave**, the Circuit solver ensures that the clock model is called prior to the calling the data model so that the outputs of the clock model are available to the data model. The Circuit solver passes the appropriate information to the data model according to the **Times** or **Wave** setting.

> **Note: Eye Diagrams and Clock Times for the Rx Data Model**
> Even though **Rx_Use_Clock_Input** allows a data Rx model to specify an external clock source, the Eye_After_Probe eye diagram for the data Rx model works as it does for any other AMI Rx. The IBIS specification states that (IBIS 7.2, pg. 230):
>
> *A receiver model that specifies the **Rx_Use_Clock_Input** parameter must return valid clock times.*
>
> Therefore, a data Rx model will always return a final set of clock times, which Circuit uses to create the **Eye_After_Probe** in the same way it would for a conventional AMI Rx that returned clock times.

Set Up and Run AMI Analysis

AMI analysis is equivalent to the Time Domain simulation described in the IBIS AMI specification. To run AMI analysis, the design must include one or more IBIS AMI transmitters (or AMI Sources) and corresponding IBIS AMI receivers (or AMI Probes). Transmitter and receiver parameters are set up in the sources and probes (See "Importing AMI Components with IBIS Buffer Models" on page 12-119).

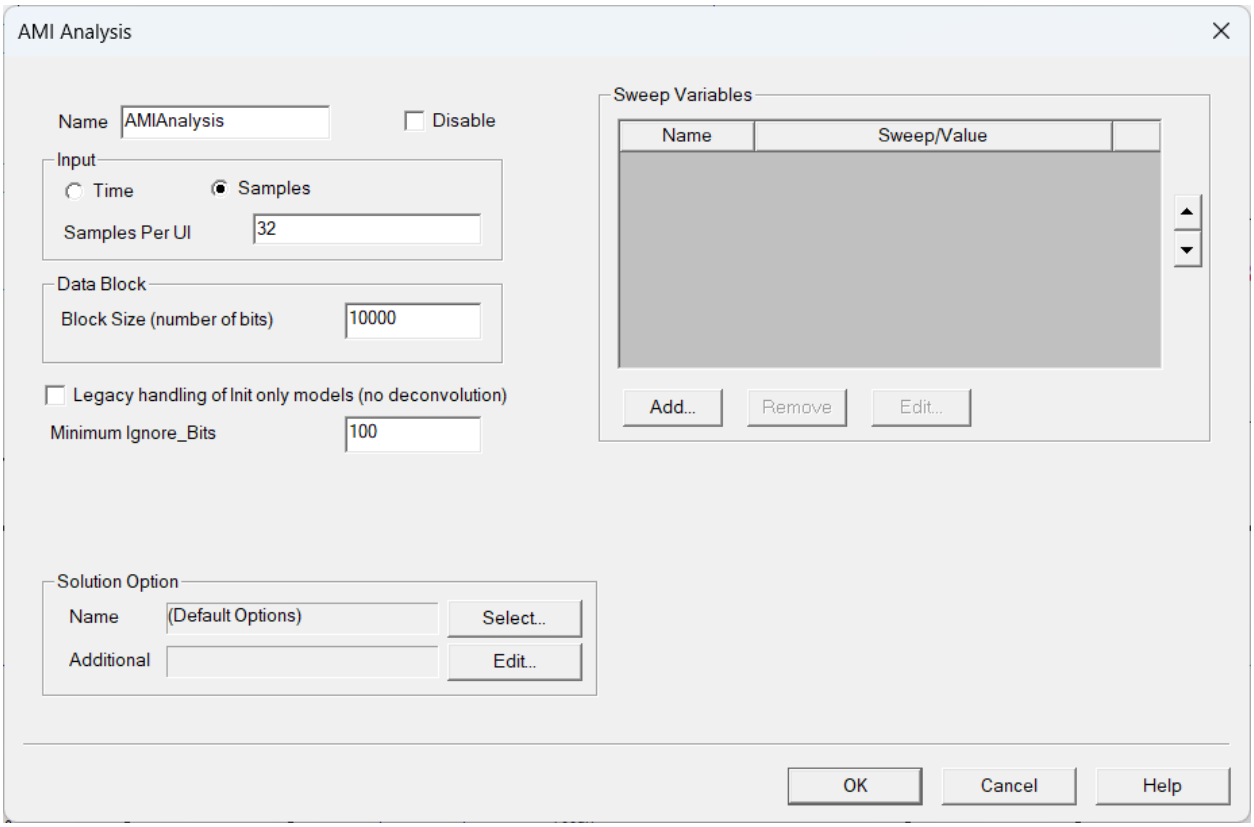
Other parameters and options can be specified in the AMI Analysis setup window, as described in the following topics.

Set Up the AMI Analysis

From the **Schematic Editor**, perform the following steps to set up, run, and view the results of an AMI analysis using the Circuit solver.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **AMI Analysis** to open the **AMI Analysis** window.



2. Type an **Analysis Name** (or accept the default name, “AMIAnalysis”).
3. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use.
4. AMI simulation uses a fixed timestep for sampling the impulse response and any processed waveforms. Click **Time** or **Samples** to define the interval at which the impulse response and waveforms are sampled.

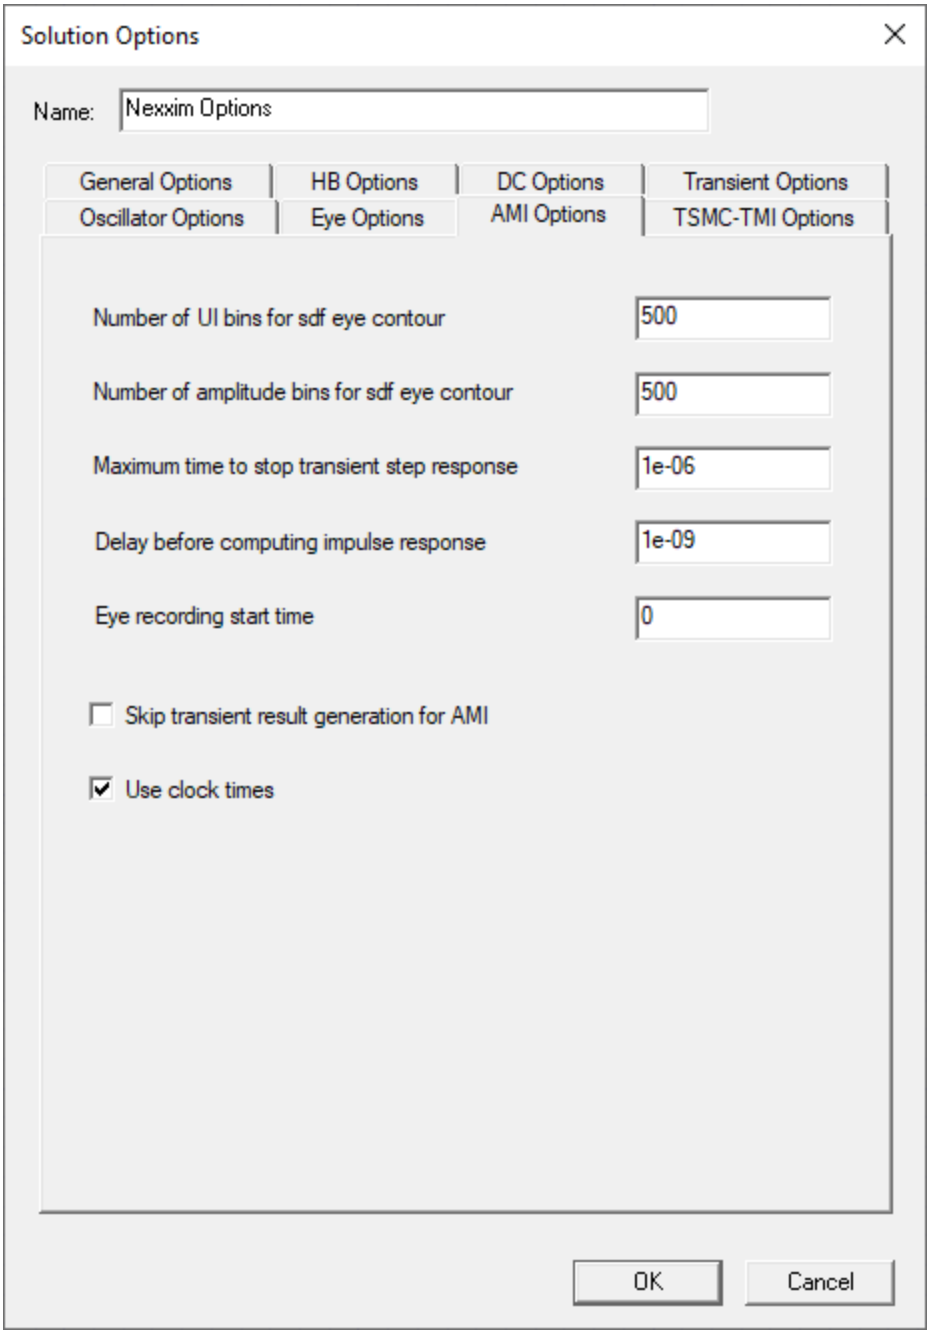
- **Samples** allows you to specify the number of samples per bit (UI). The default is 32 samples per bit. Most AMI models and simulations are set up using **Samples** per bit rather than the absolute **Time** step.
- **Time** allows you to set the timestep in seconds. The timestep must be greater than 0, and must be a fraction of the unit interval (UI). The default timestep is 5e-10 seconds.

5. **Minimum Ignore_Bits** defines a minimum value for the AMI Reserved parameter Ignore_Bits for all AMI devices. **Ignore_Bits** specifies the number of symbols that will be ignored before data accumulates in the eye diagram(s) associated with any AMI device. This global option is helpful for certain AMI models that return invalid data for the first few symbols but do not specify an Ignore_Bits value.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. The **Block Size** field sets the number of bits per AMI data block. Default is 10,000 bits per block.
7. Optionally, use the fields in the **Solution Options** group box to add AMI options.

- Click **Select** on the **Name** field to open the **Select Solution Options** window.
- Click **New** to create a new option set and open the **Solution Options** window.



- Click the **Name** field to name the new option set.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click the **AMI Options** tab fields and check boxes to set any appropriate options.
- Click **OK** to return to the **AMIAnalysis** window.

For more information, see AMI Analysis Options

Run the AMI Analysis

1. From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
2. The **Message Manager** window signals success or failure.

The next step is to view the outputs as reports; see AMI Analysis Outputs.

For additional details on creating and modifying reports, see Generating Reports and Post-processing.

AMI Analysis Options

Options that apply to AMI analyses are listed in the AMI Analysis Options Reference. All options use the prefix **ami** and all transient analysis options are valid with AMI Analysis.

AMI Analysis Outputs

To open the results of an AMI analysis, click the Results icon in the **Project Manager** window and select one of the following **Create Report** options.

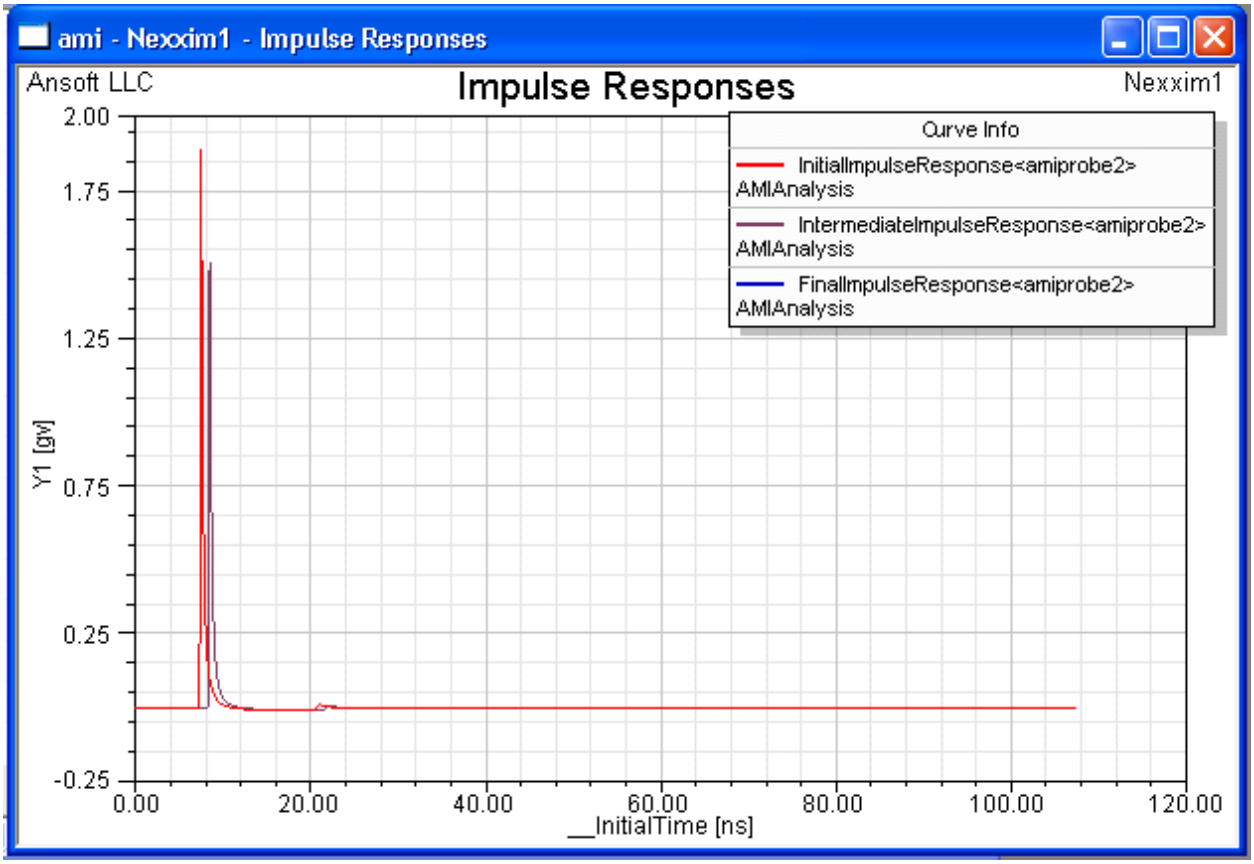
AMI Impulse Response versus Time

To plot the impulse responses in the time domain:

1. Select **Create Standard Report>Rectangular Plot**.
2. Select your AMI Analysis as the **Solution** ; **Initial Response** as the Domain; **Voltage** as the Category; **InitialImpulseResponse**, **IntermediateImpulseResponse**, or **FinalImpulseResponse** as the Quantity; and **<none>** as the Function.

The following chart shows all three impulse responses.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- The Initial Impulse Response is the one generated by the Circuit solver.
- The Intermediate Impulse Response reflects any modifications made by the AMI transmitter **AMI_Init** function at initialization.
- The Final Impulse Response reflects any further modifications made by the AMI receiver **AMI_Init** function at initialization.
- In the chart above, the Intermediate and Final responses are identical.

Note:

When the AMI transmitter model contains an **AMI_GetWave** function, the Intermediate Impulse Response in the graph is not the one that is applied unless the transmitter's **AMI_Init** and **AMI_GetWave** functions perform identical modifications.

When the AMI receiver model contains an **AMI_GetWave** function, the Final Impulse Response in the graph is not the one that is applied unless the receiver's **AMI_Init** and **AMI_GetWave** functions perform identical modifications.

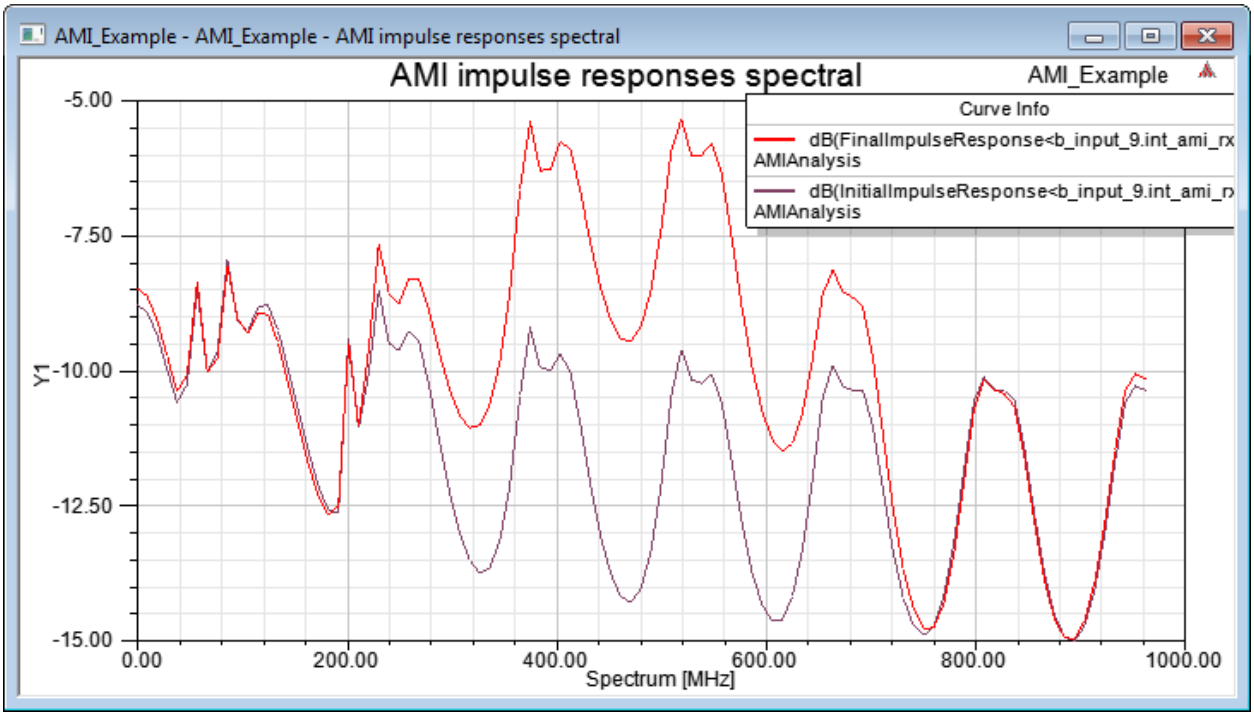
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AMI Impulse Response in Spectral Domain

To plot the impulse responses:

1. Select **Create Standard Report>Rectangular Plot**.
2. Select your AMI Analysis as the **Solution** ;
   Spectral as the Domain;
   Voltage as the Category;
   InitialImpulseResponse, **IntermediateImpulseResponse**, or **FinalImpulseResponse** as the Quantity;
   and **dB** as the Function.

The following shows the initial and final impulse responses.



- The Initial Impulse Response is the one generated by the Circuit solver.
- The Final Impulse Response reflects any modifications made by the AMI transmitter and receiver at initialization.

For more information, see Plotting Spectral Domain Data in the Reports topic. (Although that topic mentions only transient solutions, the Context controls also apply to AMI analyses.)

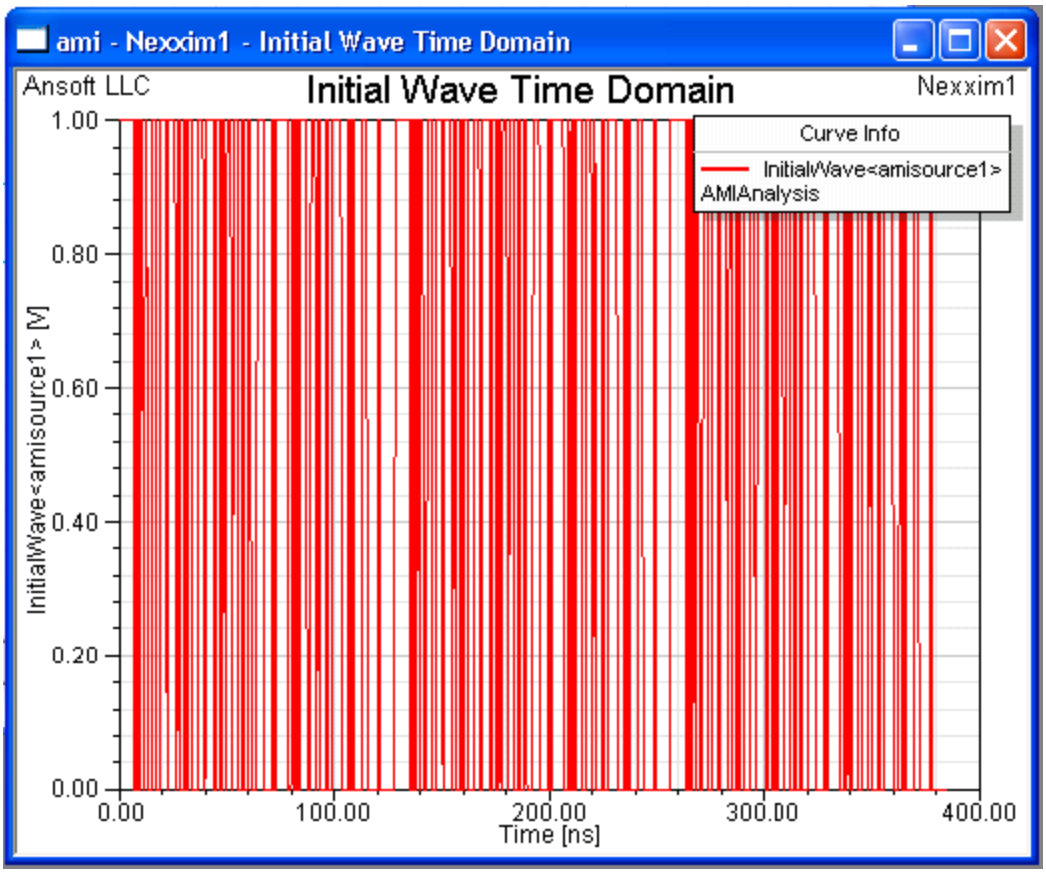
AMI Time Domain Waveforms

The report can show the Time Domain waveform at four points in the circuit:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

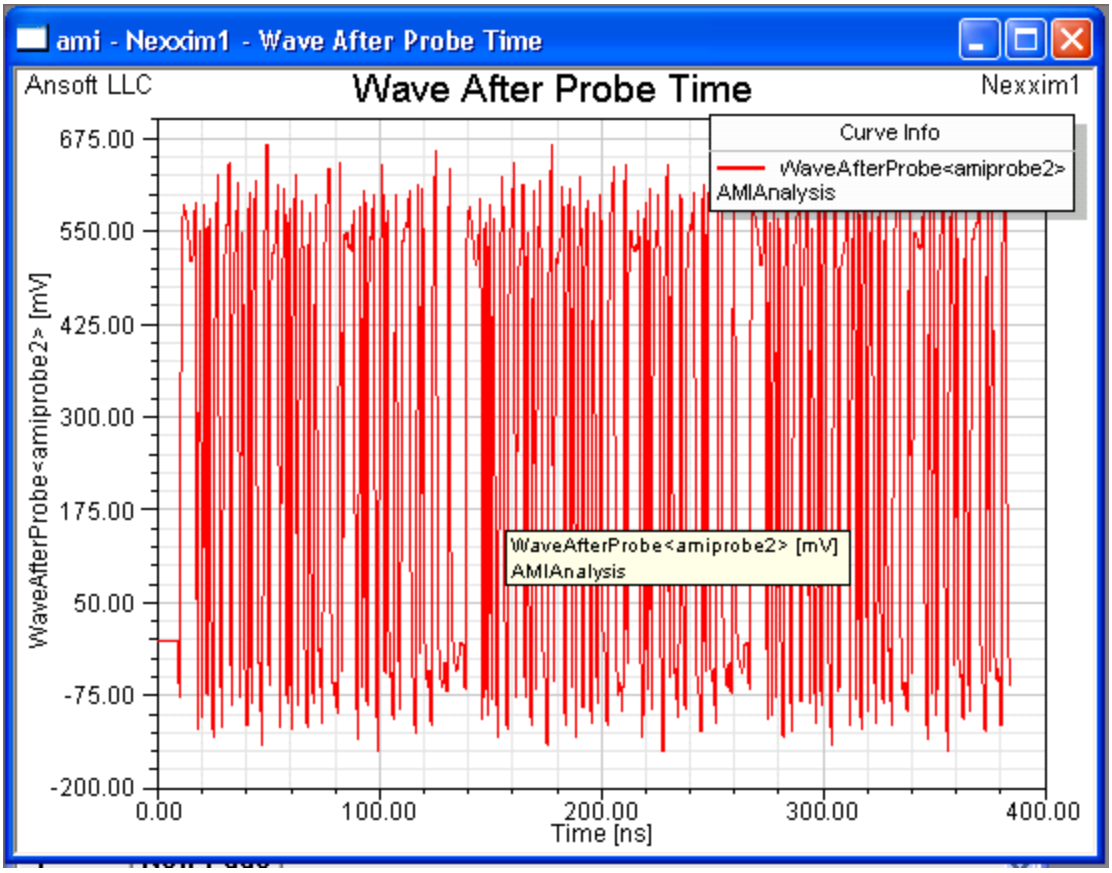
- The Initial Waveform shows the Piecewise Linear data input to the transmitter, including any jitter.
- The Waveform After Source shows the output from the transmitter.
- The Waveform After Channel shows the input to the receiver.
- The Waveform After Probe shows the output from the receiver.

To plot the waveforms, select **Create Standard Report>Rectangular Plot**. Select your AMI Analysis as the **Solution** ; **Time** as the Domain; **Voltage** as the Category; **InitialWaveform**, **WaveformAfterSource**, **WaveformAfterChannel**, or **WaveformAfterProbe** as the Quantity; and **<none>** as the Function. The following chart shows the Initial Waveform.



This second chart shows the Waveform After Probe in the Time Domain:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



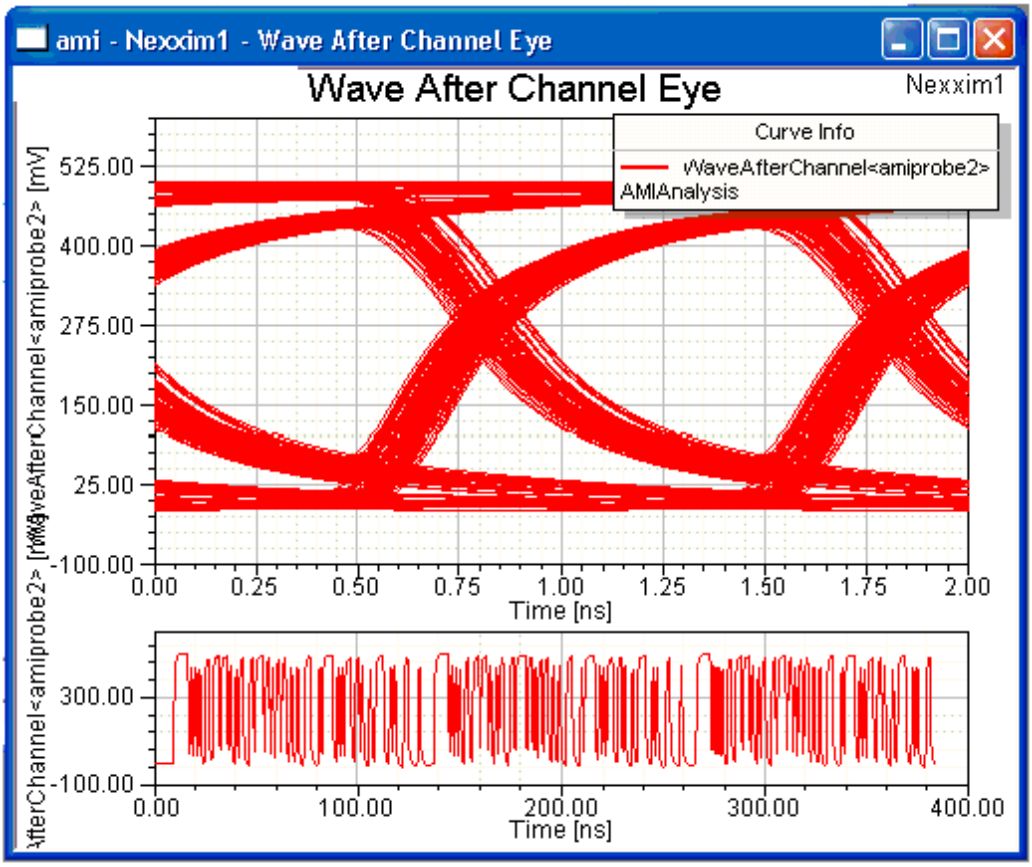
AMI Eye Diagram Waveforms

The report can show Eye diagrams of the waveform at four points in the circuit:

- The Initial Waveform shows the Piecewise Linear data input to the transmitter, including any jitter.
- The Waveform After Source shows the output from the transmitter.
- The Waveform After Channel shows the input to the receiver.
- The Waveform After Probe shows the output from the receiver.

To plot the waveforms, select **Create Eye Diagram Report>Rectangular Plot**. Select your AMI Analysis as the **Solution** ; **Time** as the Domain; **Voltage** as the Category; **InitialWaveform**, **EyeAfterSource**, **EyeAfterChannel**, or **EyeAfterProbe** as the Quantity; and **<none>** as the Function. The following chart shows the Waveform After Channel.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



AMI Bathtub Charts

The AMI bathtub report can illustrate curves of the Bit Error Rate (BER) at four points in the circuit:

- The Initial Waveform shows the Piecewise Linear data input to the transmitter, including any jitter.
- The Waveform After Source shows the output on the transmitter.
- The Waveform After Channel shows the input to the receiver.
- The Waveform After Probe shows the output on the receiver.

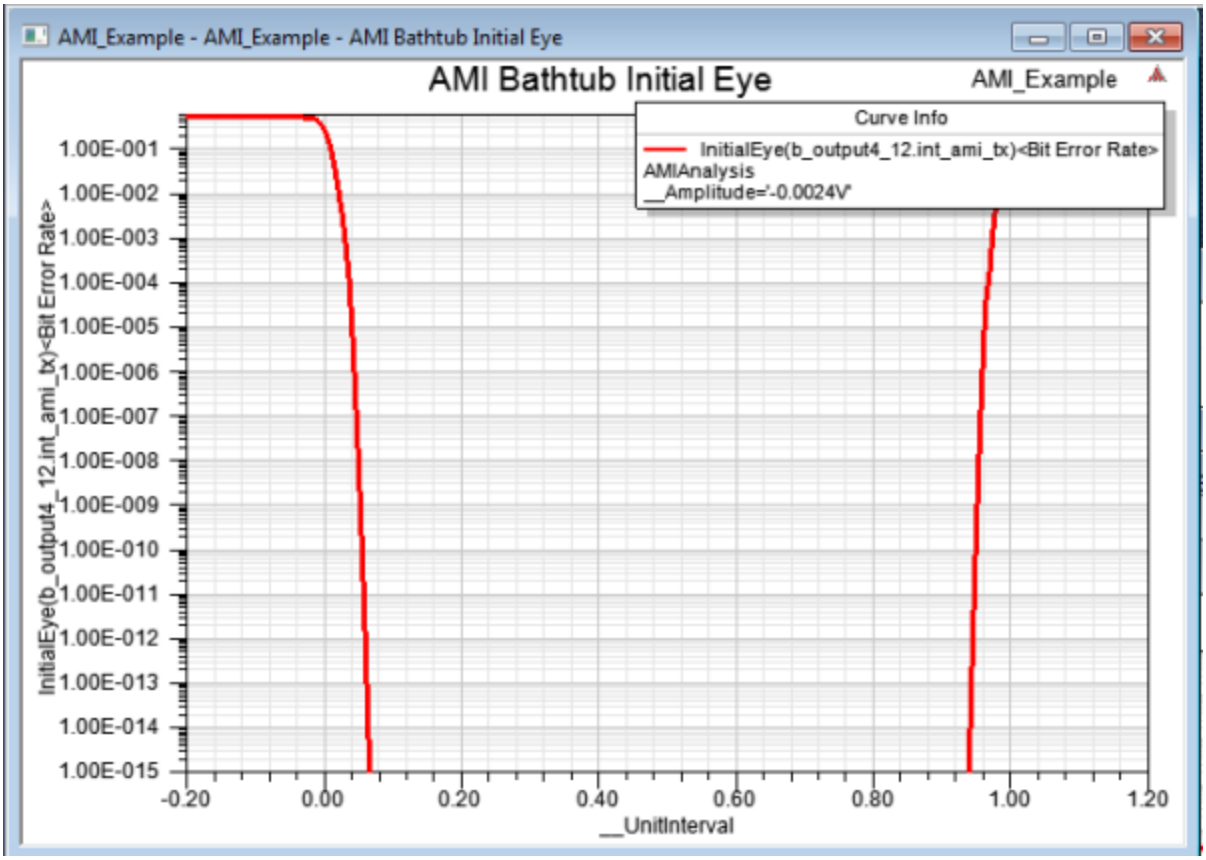
> **Note:** With AMI plots, when Bathtub curves can be plotted and txrj is present, a warning message is displayed if the number of bits is less than 2.5e5.

To plot the bathtub diagram:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

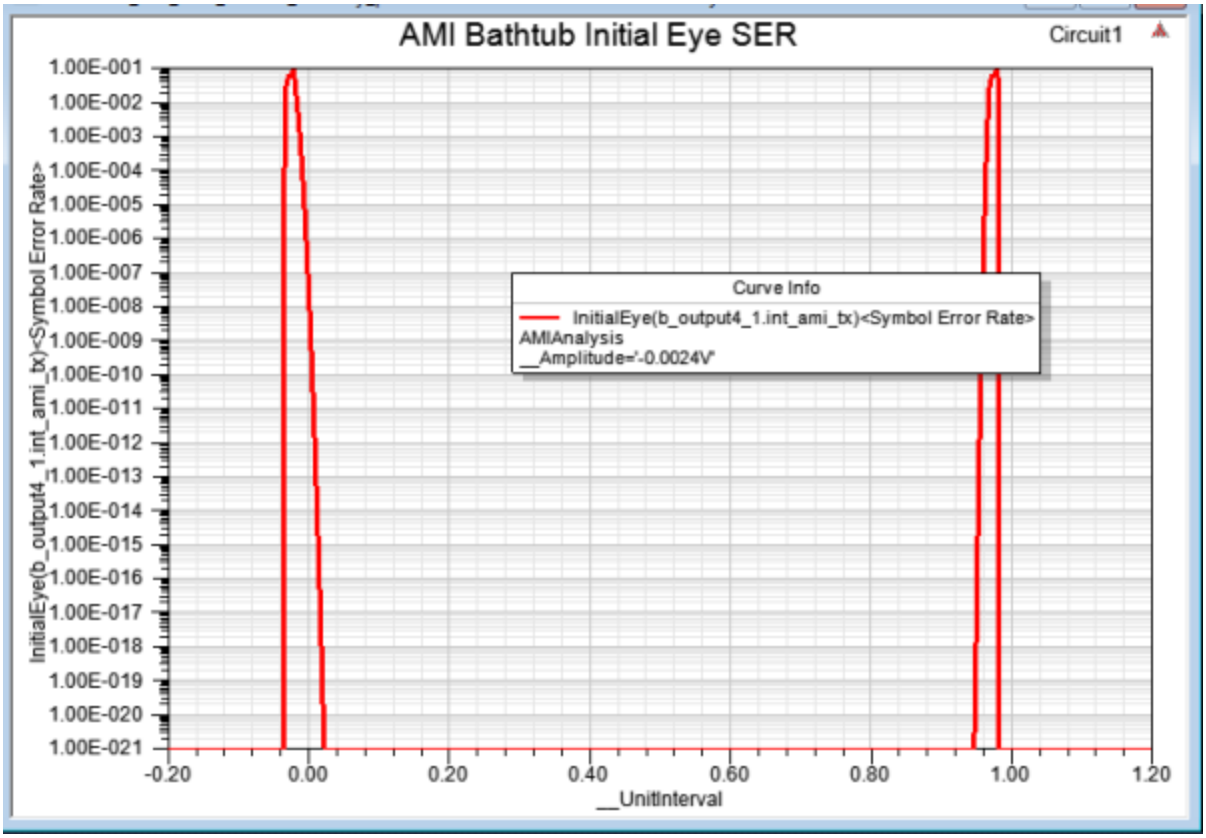
1. Select **Create Standard Report>Rectangular Plot**.
2. Select the following:
    - **Solution**: AMI Analysis
    - **Domain**: UI
    - **Quantity**: InitialEye, EyeAfterSource, EyeAfterChannel, or EyeAfterProbe
    - **Primary Sweep**: _UnitInterval
    - **Function**: <none>

The following chart shows the BER bathtub curve for the **Initial Eye** waveform. From the Y-Axis, the **Scaling** is set to **Log**, with **Max** 0.6 and **Min** 1e-15.



3. With **modulation=PAM4**, plot the symbol error rate. PAM4 symbols are two bits. Click the same Report setup, but select the **<Symbol Error Rate>** trace.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For bathtub curves of AMI, distinguish simulated and extrapolated regions with a partitioning horizontal line using the ‘SimulatedLimit’ option that is in the ‘Quantity’ column. For more information, please see Display Quick Eye Analysis Outputs.

AMI Sampled Eye Diagrams

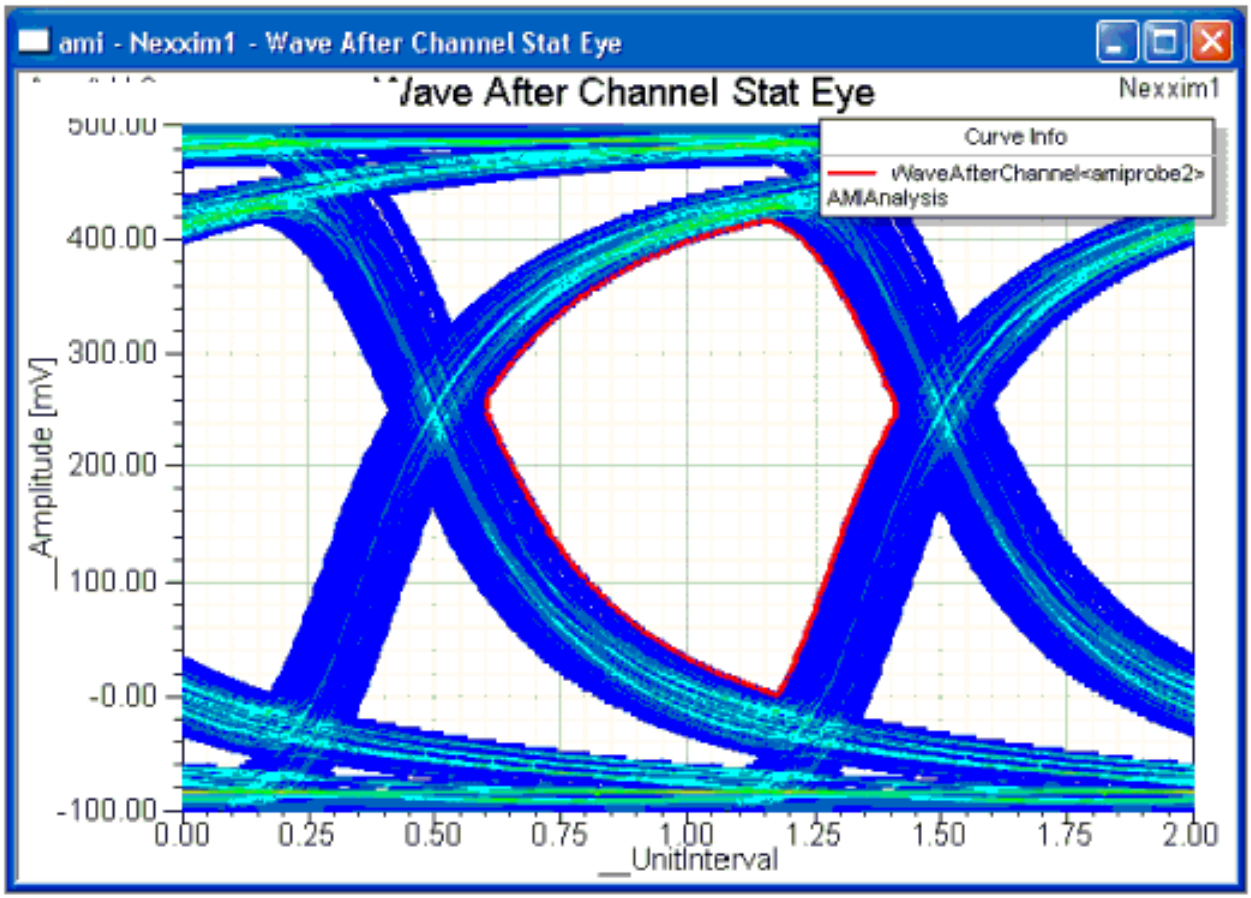
The sampled or statistical eye report generates the eye diagram but does not retain the transient data for further post-processing. The Circuit solver can generate sampled eye diagrams of the waveform at four points in the circuit:

- The Initial Waveform shows the Piecewise Linear data input to the transmitter, including any jitter.
- The Waveform After Source shows the output from the transmitter.
- The Waveform After Channel shows the input to the receiver.
- The Waveform After Probe shows the output from the receiver.

To generate a sampled eye diagram, select **Create Statistical Eye Report>Statistical Eye Plot**. Select your AMI Analysis as the **Solution** ; **UI** as the Domain; **Eye** as the Category; **InitialWaveform**, **WaveformAfterSource**, **WaveformAfterChannel**, or **WaveformAfterProbe**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

as the Quantity Type; and **<none>** as the Function. The following chart shows the Wave After Channel.

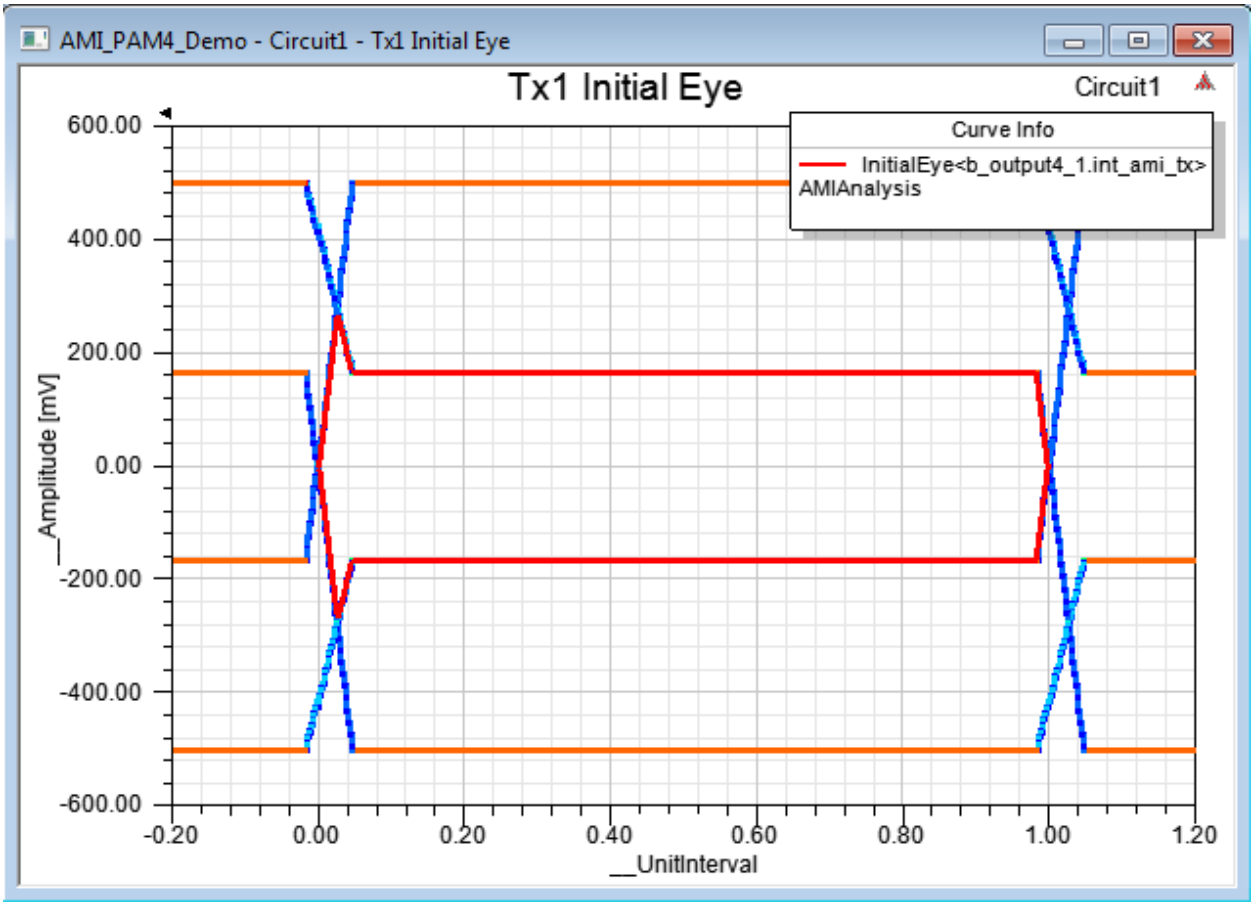


The receiver model can generate clock times internally, and provide the clock ticks to the simulator for post-processing. The clock times are among the parameters returned on the AMI Receiver's GetWave call. The results of clock tick sampling can be observed only in the Statistical Eye Plot for the "EyeAfterProbe" quantity. By default, the solver uses the clock ticks on the receiver when sampling the statistical eye diagram based on the clock times values produced by the AMI receiver model (option **ami.use_clock_times=1**). If the clock ticks are not present or are deactivated (option **ami.use_clock_times=0**), the eye diagram is sampled at even UI intervals. For more information, see the AMI Analysis Options.

AMI PAM4 Eye Diagrams

PAM4 is a Pulse Amplitude Modulated (PAM) signal with four amplitude levels. An AMI eye report accurately displays the output from such a PAM-4 modulated transmission. A PAM-4 transmission is enabled with PAM-4 reserved parameters. For more information, see "AMI Reserved Parameters" on page 12-149.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This plot shows the multiple eye diagram generated with Gray coding (00, 01, 11, 10 from lowest-to-highest), using a repeating 0, 1, 2, 3 symbol pattern (00011011).

Analyzing AMI Models with VerifEye

Instead of using the **AMI_GetWave()** data to create a time-domain waveform, use VerifEye to generate the impulse response on the channel parameters and apply the modifications in the **AMI_Init()** functions from both transmitter and receiver. Analysis with VerifEye is equivalent to the Statistical Simulation described in the IBIS AMI specification.

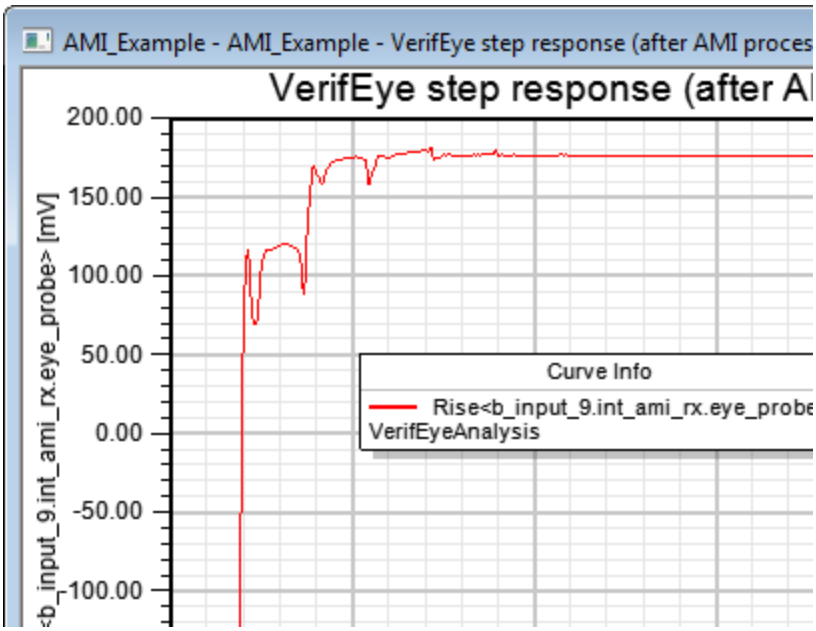
When used with AMI, VerifEye uses only the **AMI_Init()** functions. The **AMI_GetWave()** function is ignored. VerifEye is more accurate than standard AMI analysis, but computes only the linear part of the model's behavior. VerifEye analysis assumes that incoming 0 and 1 bits are independent and occur with equal probability 0.5.

The VerifEye setup and run is the same as for standard VerifEye analysis. See VerifEye and Quick Eye Analyses for further information.

Three kinds of VerifEye reports are available: step response, contour plot, and bathtub curve.

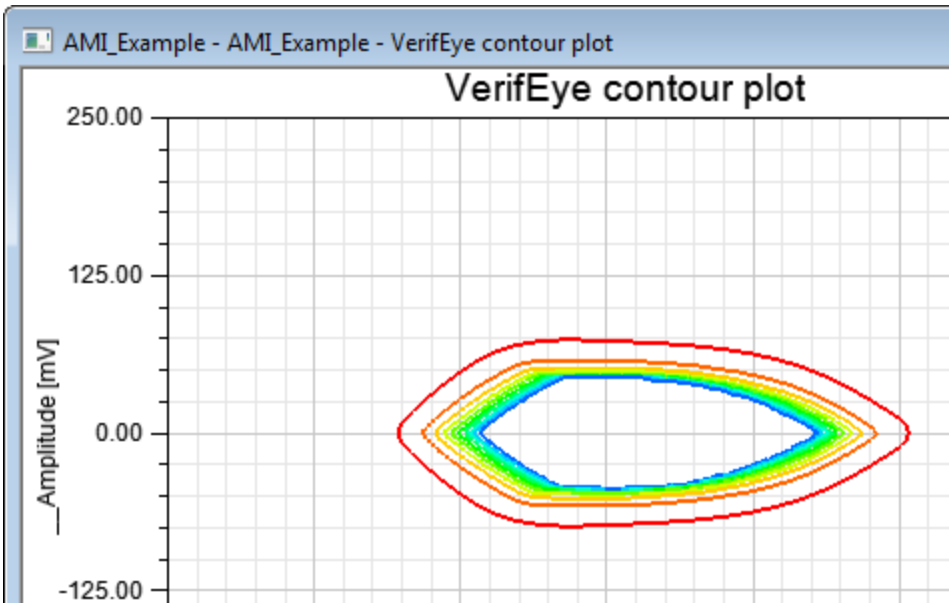
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Here is an example of a step response report:



View the initial and final impulse responses in AMI analysis . With VerifEye see only the final step response (after the **AMI_Init()** functions have been applied).

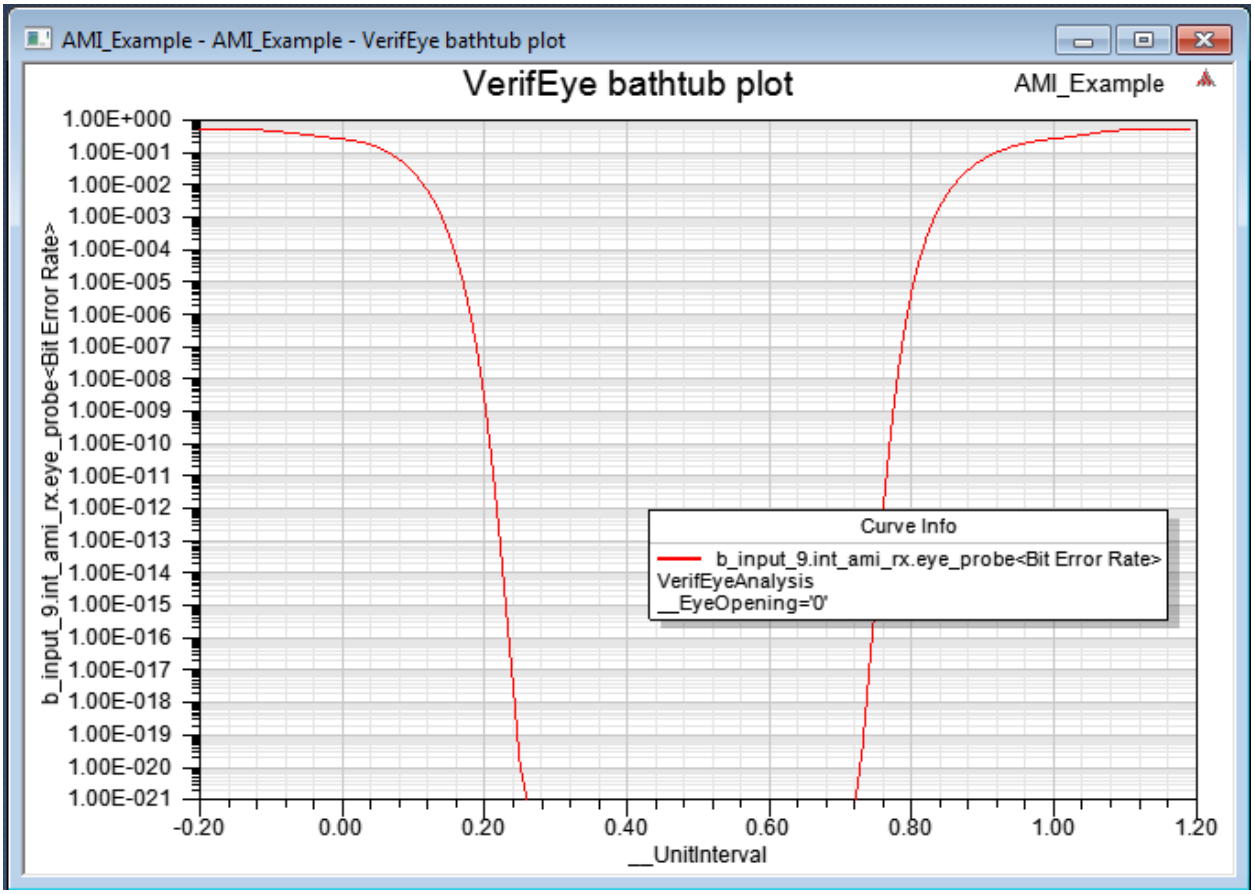
Here is an example of a contour plot:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The VerifEye contour plot is always centered around 0.5 of the UI, while the AMI transient eye takes into account the actual phase shift of the signal.

Here is an example of a bathtub plot using the <Bit Error Rate> trace.:



The bathtub curve for a PAM4 simulation can show the symbol error rate instead of the bit error rate. With PAM4, a symbol is two bits. The report setup is the same, but now select the **<Symbol Error Rate>** trace.

Prototyping with MATLAB Files

Instead of C++ modules, Circuit AMI analysis can simulate from library files containing MATLAB functions for the transmitter and receiver. The parameter files are the same for both C++ and MATLAB implementations.

The MATLAB files for the transmitter and receiver have the standard **.m** extension. Each file should contain the MATLAB code for the **Init()**, **GetWave()**, and **Close()** functions described in the AMI Analysis Technical Notes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Other than the **library** file, the setups for the source, receiver and analysis are the same for both MATLAB and C++ implementations.

AMI Analysis Technical Notes

The IBIS Algorithmic Modeling Interface simulates user-specified transmitter and receiver models, furnished as C-interface compiled libraries, over a linear channel. The AMI Specification is published in the IBIS Specification (See AMI Analysis References).

HSPICE in Circuit Designs

Ansys HFSS Circuit projects offer direct integration with HSPICE® analysis software. This integration does not require the Ansys RSM Service. HSPICE is a trademark of Synopsys, Inc.

Supported HSPICE Integration

Ansys Desktop products offer a direct integration with HSPICE simulation software, and this integration does not require Ansys RSM Service. The following list summarizes the nature of the HSPICE integration that is supported by Ansys HFSS Desktop.

- Only transient simulations are supported
- You can simulate netlists and schematic-based designs
- Solver on Demand co-simulation is available for simulation using Ansys field solvers (HFSS, SIwave, HFSS 3D Layout, etc.)
- Remote simulation is not fully supported. Direct or indirect include files might not be accessible on the remote machine, or their location might be relative to the original computer, in which case remote simulation fails.
- You can plot results directly from HSPICE output data files
- Custom HSPICE command line options can be added
- Many advanced methods are supported, including .alter
- HSPICE encrypted libraries can be included and simulated
- Many schematic Circuit library components can be used:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

— You can override a standard Circuit netlist with a custom product netlist. However, no distributed components are supported.

> **Note:**
>
> To run HSPICE on Linux, set the AD_HSPICE_INSTALLDIR environment variable to the full path of the HSPICE executable. For example, on a 64-bit Linux system where the HSPICE executable is hspice64, set AD_HSPICE_INSTALLDIR to /opt/hspice-2009.03-SP1/hspice/linux/hspice64.

Running an HSPICE Transient Analysis

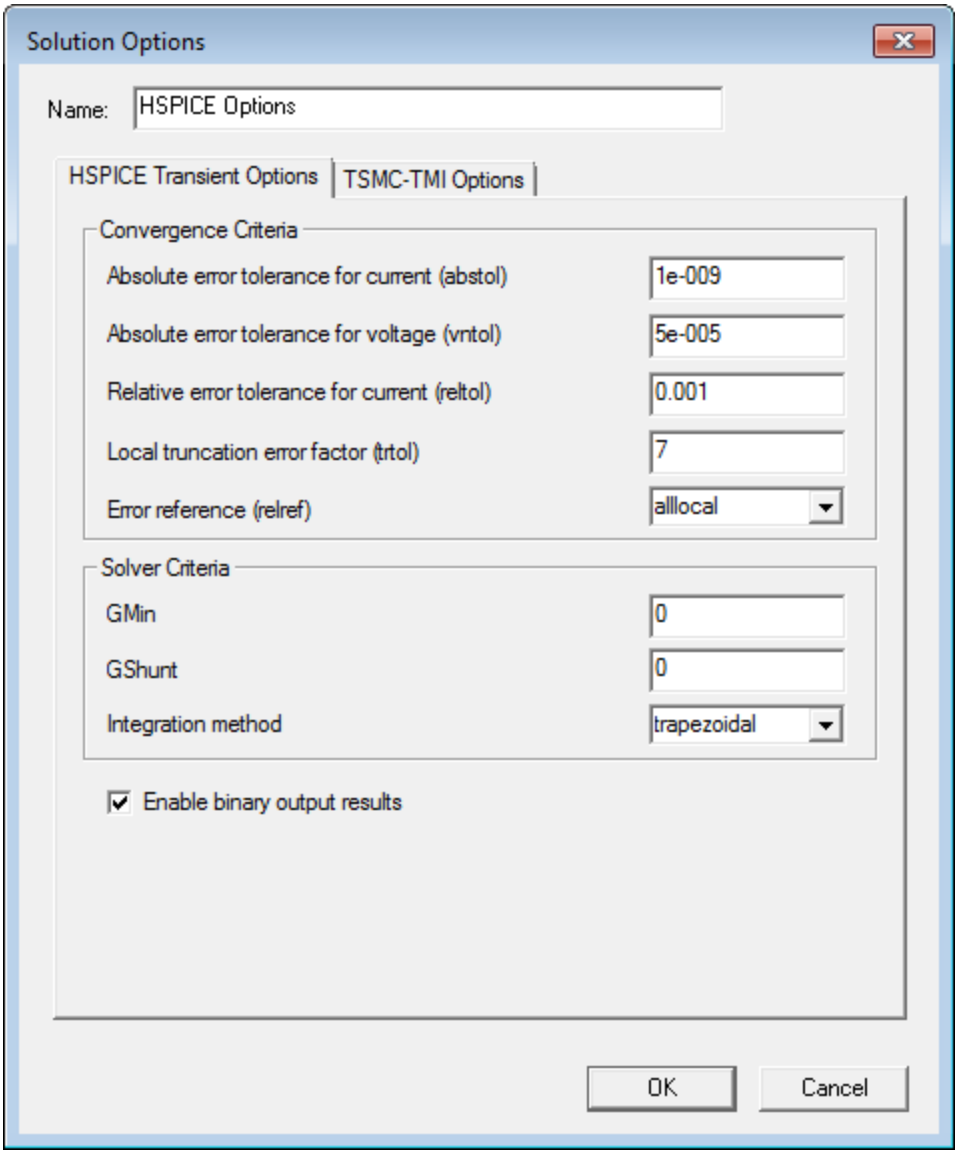
From the **Schematic Editor**, perform the following steps to set up an HSPICE transient analysis, run the analysis, and view the results.

1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add HSPICE Solution Setup** > **Transient Analysis** to open the **HSPICE Transient Analysis** window.
2. Enter an **AnalysisName** or accept the default (e.g., "HSPICE Transient1").
3. For most simulations, leave the **Disable** box unselected. (Selecting this box lets you store multiple solution setups for later use. Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
4. Under **Analysis Control**, specify **Step** time and **Stop** time using the drop-down menus. Optionally, Click the **RunLevel** slider to set the **Accuracy** level.
5. To add a sweep, locate the **Sweep Variable** area in the **Transient Analysis** window.
   - From the **Sweep Variable** area, select **Add** to open the **Add/Edit Sweep** window.
   - In the **Variable** group box, select **Temp** (or the name of a variable, if one has been defined for the design). Next, select one of the following: **Single value, Linear step, Linear count, Decade count,** or **Octave count**.
   - Enter the sweep values into the **Value** field (for **Single** value), or into the **Start**, **Stop**, and **Step** text fields (for **Linear, Decade,** or **Octave count**), and ensure that the appropriate units are selected for each.
   - For more information, see Variable Sweep.
   - Click **Add**, then **OK** to close the **Add /EditSweep** window and reopen the **Transient Analysis** window.
6. Optionally, use the fields in the **Solution Options** group box to select or add **Transient Analysis** options and other **HSPICE** options to the design.
   - Click **Select** on the **Name** field to open the **Select Solution Options** window.
   - If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a named option set that you have previously defined, click the name of the option set, then click **OK** to return to the HSPICE **Transient Analysis**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

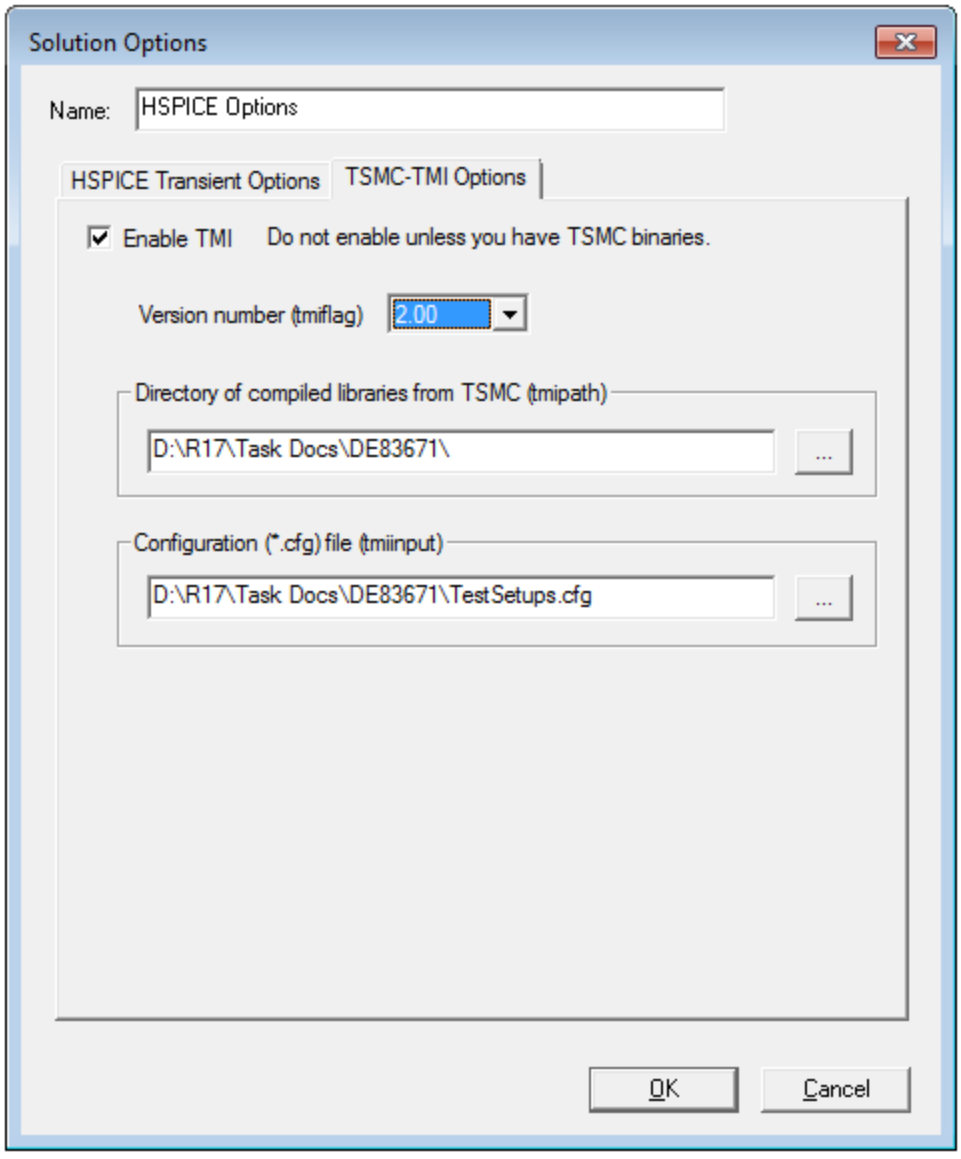
window. The named option set appears in the **Name** field in the **Solution Options** group box.

- To create a new option set, click **New** to open the **Solution Options** window. Click the **Name** field to name the new option set. Make the appropriate changes to option values, then click **OK** to return to the **SelectSolutions** window. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the HSPICE **Transient Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.
- The **HSPICE Transient Options** tab contains basic options for controlling the convergence for transient analysis using HSPICE. See Transient Analysis Options for details on most of these options.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The HSPICE **TSMC-TMI Options** tab contains settings that apply only to HSPICE simulation using TMI models. Your installation must include DLLs from TSMC to use these options. Click the **Enable** check box to enable the HSPICE solver to access the TSMC-TMI DLLs and activate the fields in the **TMI Options** tab. See TSMC-TMI Options for details on the TSMC-TMI analysis options.



7. Optionally, click **Edit** in the **Additional** field on the HSPICE **Analysis Setup** window to open the **Edit Additional Options** text-entry window.

- Click the field to enter any HSPICE options exactly as they are to appear in the netlist. Do not include the keyword ".OPTIONS". The .OPTIONS keyword is automatically inserted at the beginning of the line in the netlist statement. The line can contain multiple options settings. Use spaces to separate the options settings. To modify or delete an option once

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

it has been added, edit or delete its entry in the list. To clear all options, delete the entire line.

8. Click **OK** to return to the HSPICE **Transient Analysis** window. Options in the **Additional** field are automatically added to the netlist when the solution is performed. For more information, see the HSPICE user manuals.
9. To run the simulation, click **Circuit** > **Analyze**.

- If the circuit is set up correctly, the analysis begins and a progress bar appears. (Note, however, that the progress bar does not move during HSPICE simulations as it does with Circuit simulations.)
- If the analysis does not begin or does not complete successfully, check the **Message Manager** window.

10. To display results, click **Circuit** > **Create Report** (Alternatively, select **Create Report** on the **Results** icon in the **Project Manager** window window) to open the **Create Report** window.

- Select a **Report Type** and a **Display Type**, then click **OK**. When the **Report** window appears, make the appropriate selections for context, solution, and plotting range. Next click **Add Trace**, then click **Done** to open a Report window to display a graph of the analysis results.
- For more information, see Generating Reports and Post-processing.

Troubleshooting HSPICE Analysis

Use the following guidelines to troubleshoot HSPICE simulations.

- Check the HSPICE logs.
- Check for a locked project.
- Check for path errors:

  — Verify that the path is correct to specify the HFSS installation directory.

  — Verify that a full path is used to specify the project directory.

The following table lists the nature and solution of some common troubleshooting issues for running HSPICE simulations in the **Electronics Desktop**.

Issue	Solution
HSPICE does not run from within Electronics Desktop.	• Verify that HSPICE runs correctly outside of Ansys. Consult the HSPICE documentation for questions about installation, licensing and basic operation. HSPICE must work correctly on its own before it can be run inside the Ansys framework.
HSPICE runs outside of Electronics Desktop but not from	It is likely that Electronics Desktop cannot locate the HSPICE executable. On Windows and Linux platforms:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

within Electronics Desktop.	• Set the AD_HSPICE_INSTALLDIR environment variable to the full path of the HSPICE executable. For example, on a 64 bit Linux system where the HSPICE executable is hspice64, set AD_HSPICE_INSTALLDIR to be: /opt/hspice-2009.03-SP1/hspice/linux/hspice64 • Note that if AD_HSPICE_INSTALLDIR is set, the value of INSTALLDIR is ignored. On Windows PCs: • Set the AD_HSPICE_INSTALLDIR environment variable to the full path of the HSPICE executable. For example, on Windows where the HSPICE executable is hspice.exe, set AD_HSPICE_INSTALLDIR to be: D:\synopsys\Hsp ice_H-2013.03-S P2\WIN64\hspice.exe • Note the value of the INSTALLDIR environment variable. Look for the HSPICE executable (hspice.exe) in a "bin" directory beneath INSTALLDIR. That is, the executable should be located in: <value of INSTALLDIR>/bin/hspice.exe • If the HSPICE executable is not at this location, adjust the value of INSTALLDIR accordingly or verify your HSPICE installation. • Note that the value of INSTALLDIR is ignored if AD_ HSPICE_INSTALLDIR is set.
HSPICE runs from within Electronics Desktop but does not give expected results.	• Check the HSPICE logs by right-clicking on the analysis setup and selecting "Browse log file." This displays the log file generated by HSPICE. • Check for a locked project. • Check for path errors to libraries and included files.

Virtual Compliance Module Toolkit

The Virtual Compliance Module (VCM) Toolkit is used to test the level of compliance of circuit transient simulations for DDR4/GDDR5 and DDRx. **Electronics Desktop** VCM testing

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

generates reports that utilize both a Compliance Test Viewer and Embedded Waveform Viewer to help you configure:

- Net mapping
- DDR4 net classification
- GDDR5 net classification
- I/O power assignment
- Net type
- Etc

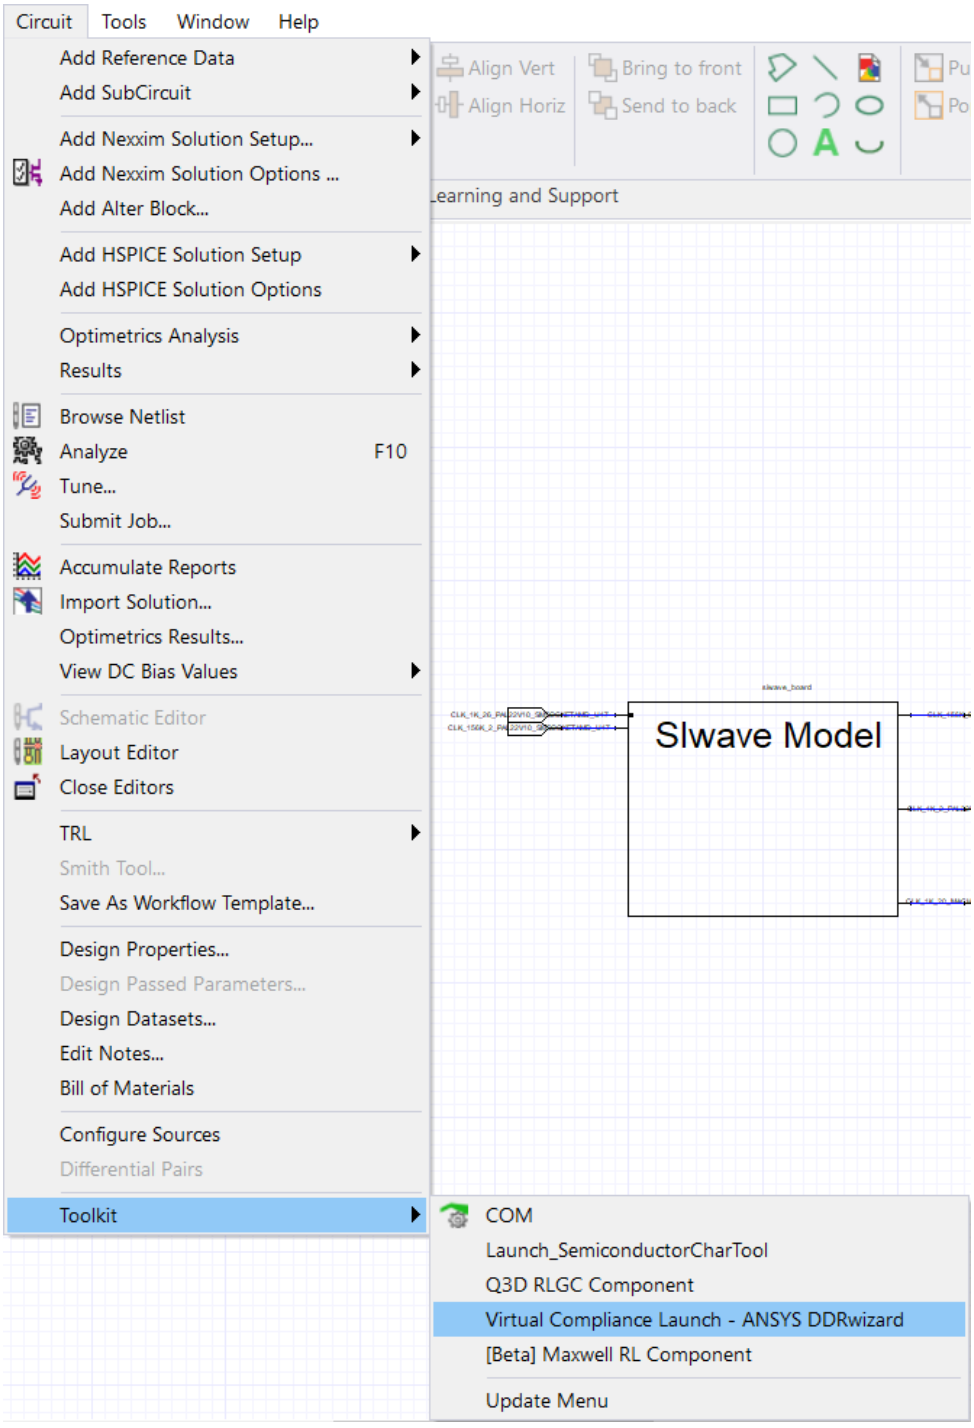
Launch Virtual Compliance Module

To launch the Virtual Compliance Module, the Circuit Schematic has to be created from Ansys SIwave's DDRwizard. For setup instructions, refer to SIWave help:

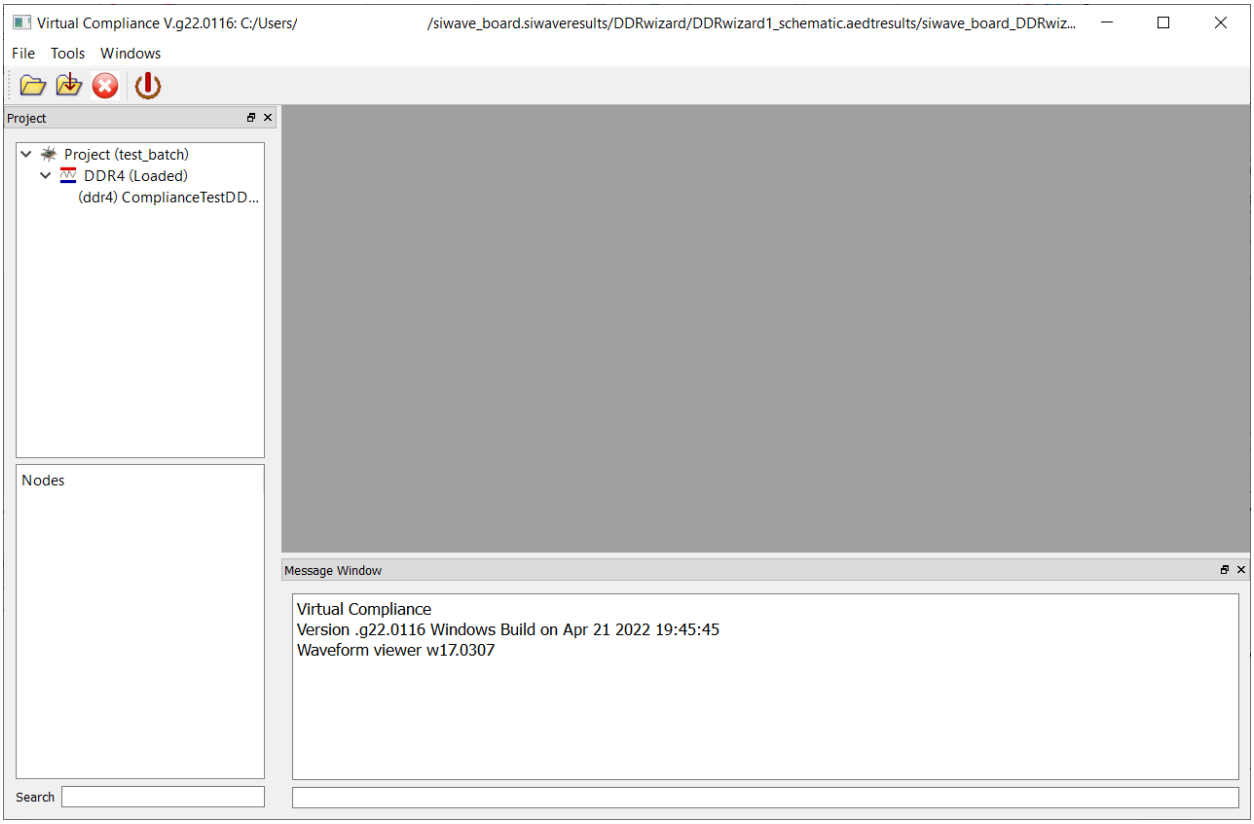
SIWave > Running Simulations > Cosimulation with Ansys Electronics Desktop > Cosimulation using DDR Wizard

Running the DDRWizard from SIWave will automatically open the schematic in Circuit. To launch the Virtual Compliance Tool, select **Circuit > Toolkit > Virtual Compliance Launch - Ansys DDR Wizard**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



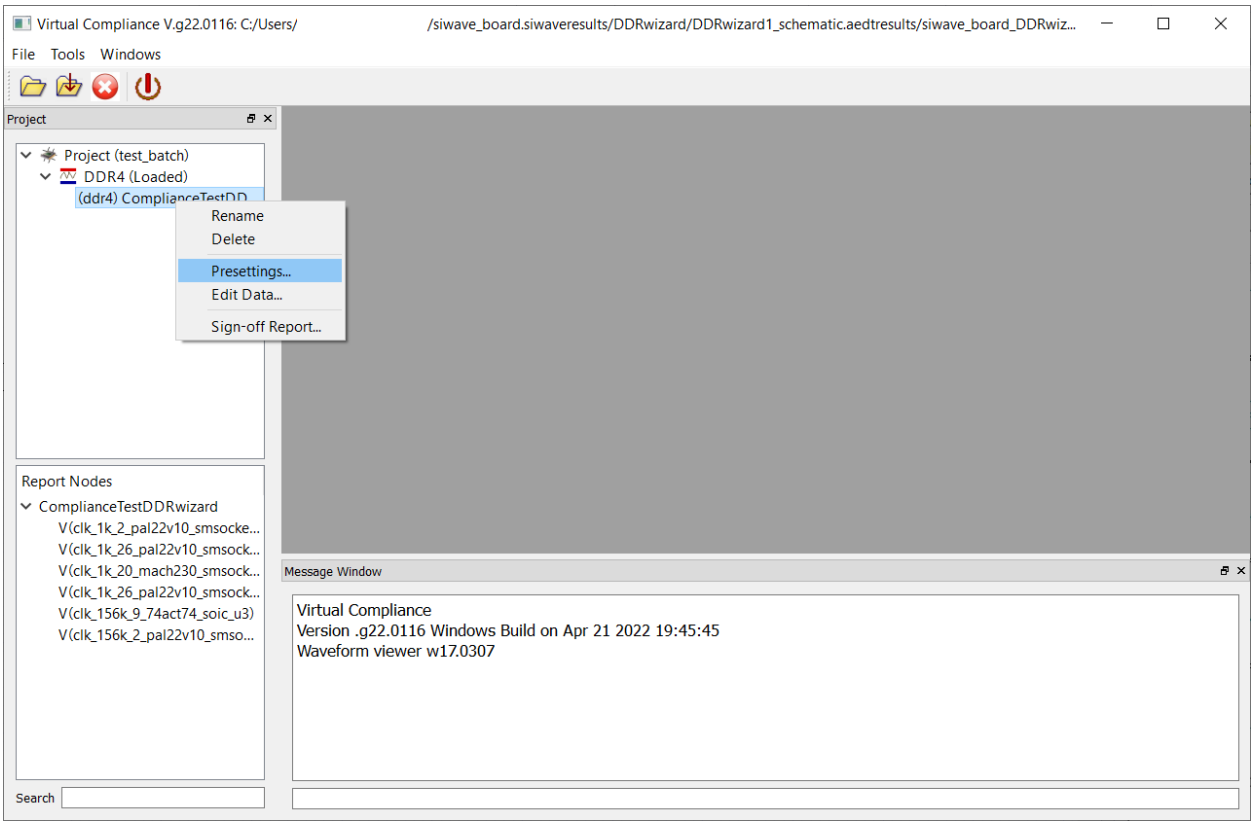
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



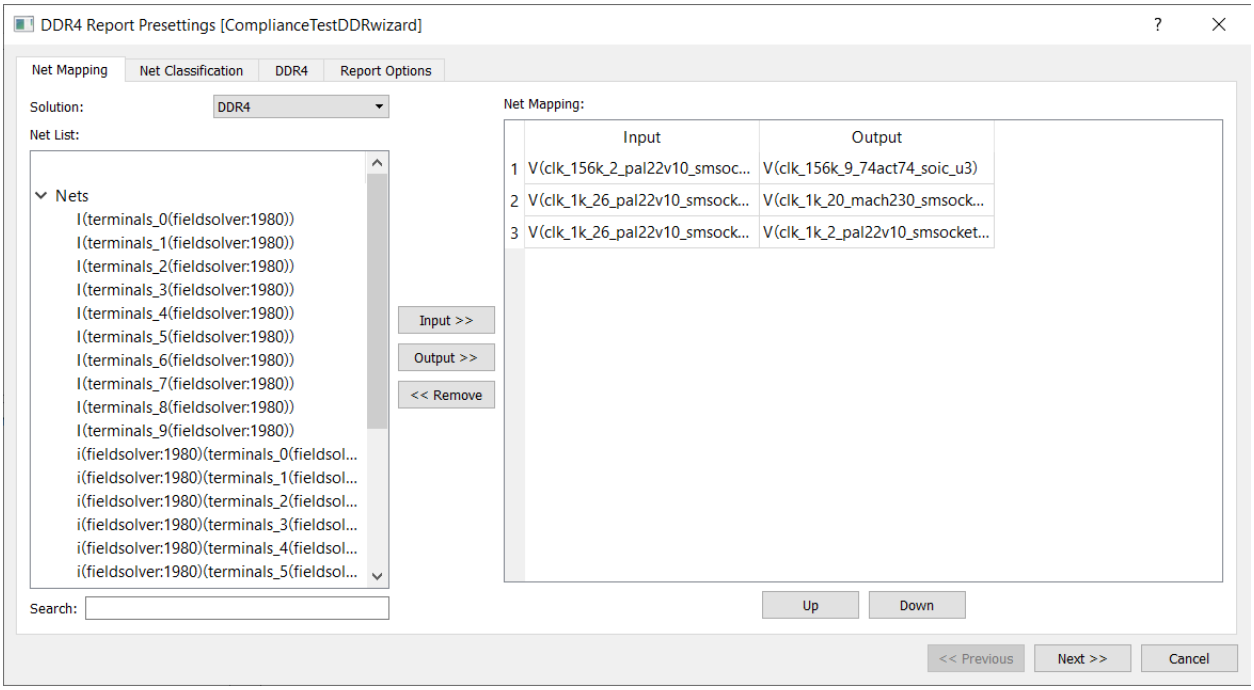
To launch the presettings window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Right -click the DDR Compliance Test.



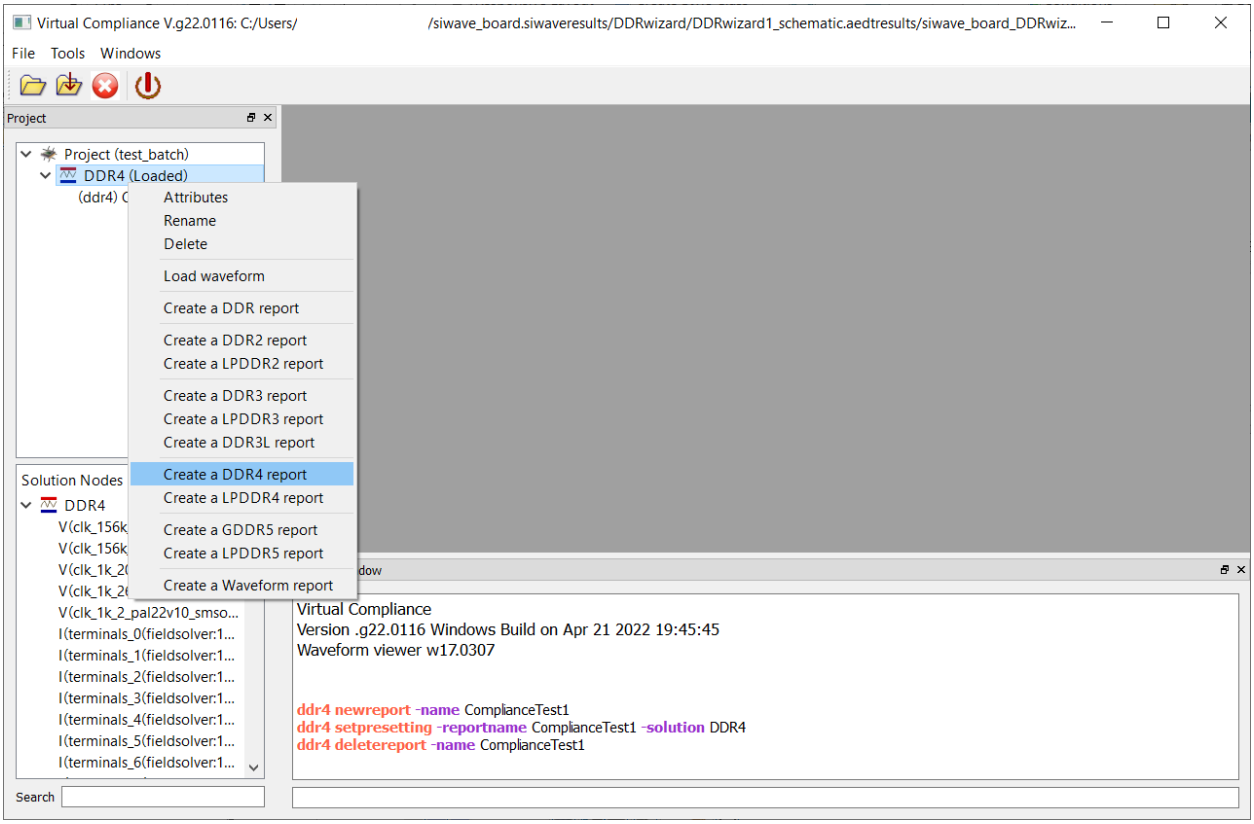
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

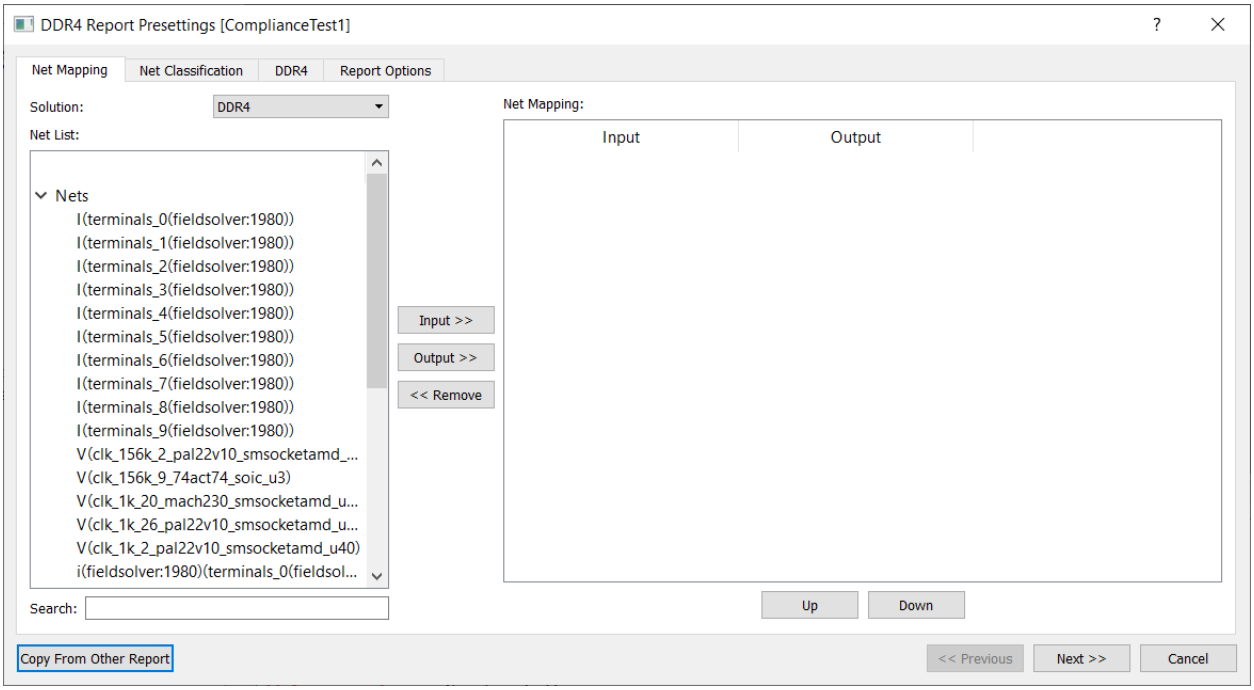


To launch the Report Presettings window:

1. For a DDR design, right-click **DDR** , then click **Create DDR report**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



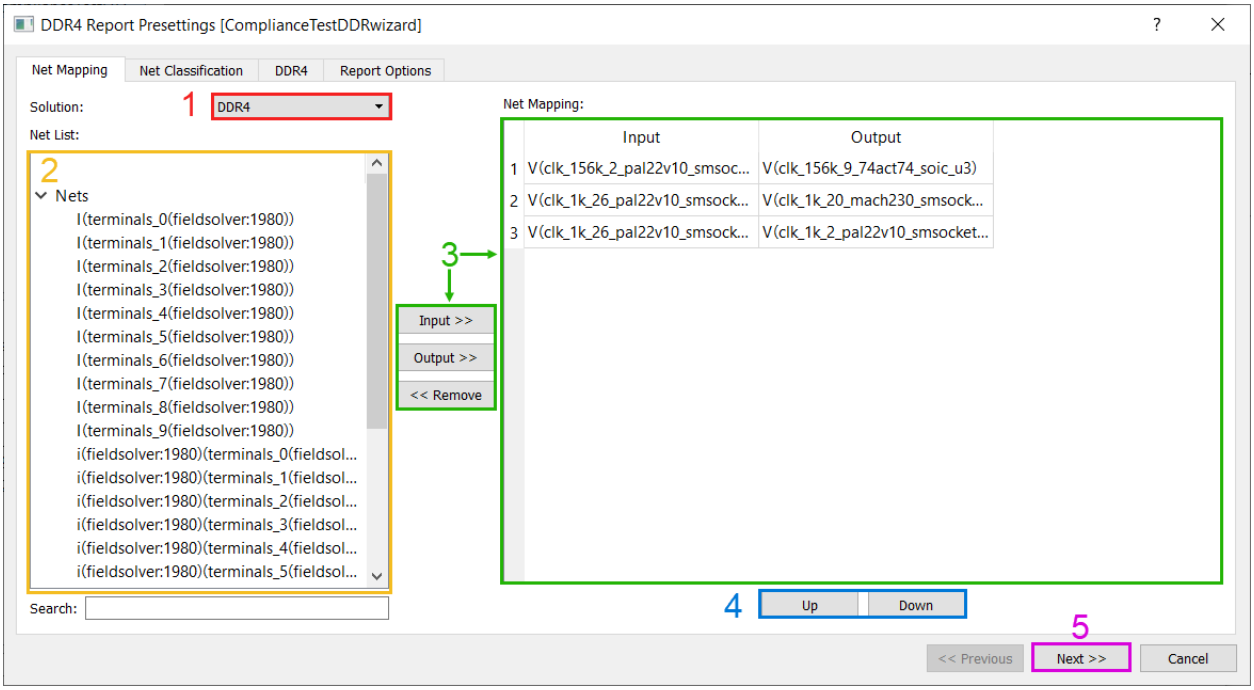


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Virtual Compliance for DDR4 and GDDR5

The following topics describe how to conduct compliance testing for DDR4 and GDRR5.

Net Mapping (DDR4 and GDDR5)

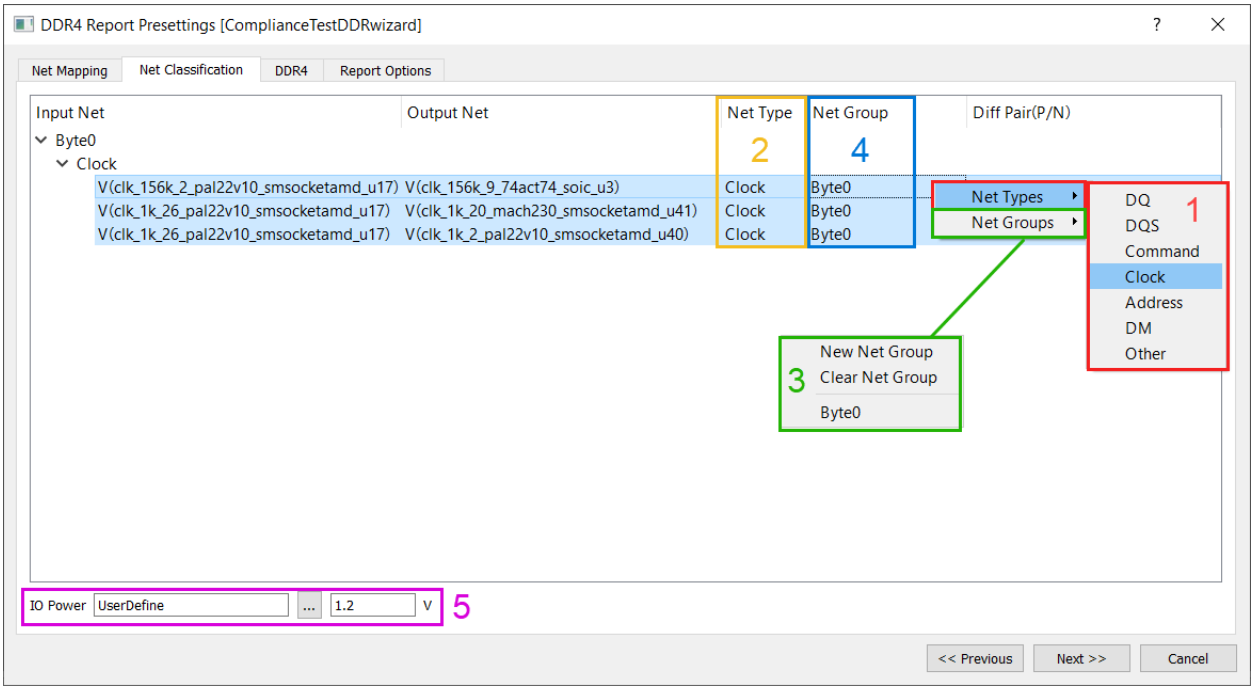


1. List all the analysis setup/solution, each setup/solution loads corresponding waveform information.
2. Net list lists all the nets which have a waveform information, the nets name can be searched by keywords.
3. Select the nets into input or output list for virtual compliance testing, and make the in-out connection.
4. Click **Up** and **Down** to ensure the in-out connection correct, main usage of the in-out connection is Self-delay calculation, the self-delay table calculates the timing delay between Input and Output, if you don't need report self-delay parameter, ignore Input nets and assign Output nets only.
5. You can navigate back and forth through the Presettings pages by clicking **<<Previous** and **Next>>**, or click **Cancel** to quit.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Net Classifications

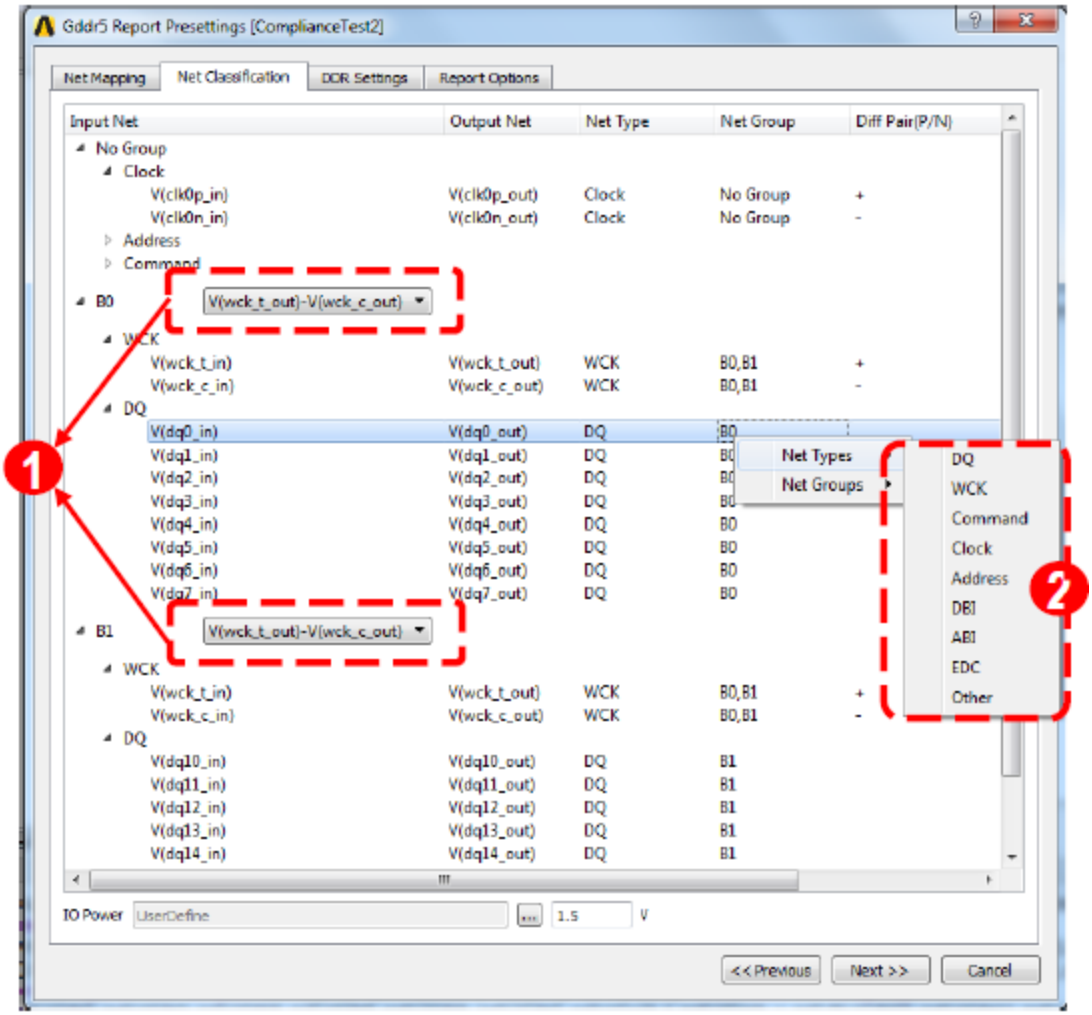
The following shows how to configure **net classification for DDR4**.



1. Right-click the highlight nets to define Net Type for the chosen nets.
2. All the net type defined nets shows their net type in the list, otherwise keep it as Others.
3. Create new net groups or assign nets to a existing group.
4. Net Group column shows all the net group belongings.
5. Define the IO power value, using for logic level calculation and other parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The following shows how to configure **net classification for GDDR5**.



1. Support same strobe pair using in different Byte-lane group (GDDR5 feature).
2. More GDDR5 net types are supported.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

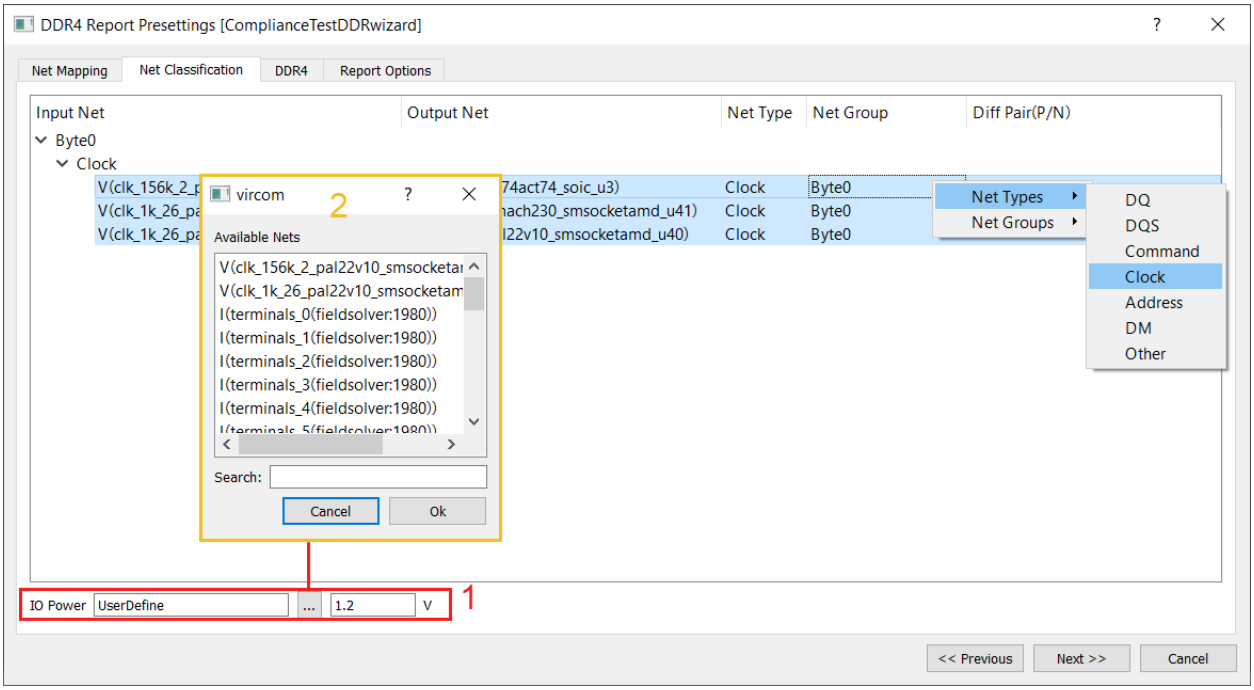
Net Type

NET Type	DDR4	Note
Clock	CK, CK#	Differential Pair
DQS	DQSx, DQSx#	Differential Pair
Command	CKE, CS#, RAS#, CAS#, WE#, ODTx	Reference Voltage: Vrefc
Address	BG[3:0], BA[3:0], A[13:0]	Reference Voltage: Vrefc
DQ	DQx, DMx, DBIx	Reference Voltage: Vrefd

NET Type	GDDR5	Note
Clock	CK_t, CK_c	Differential
Forward Clock (DQS)	WCK01_t, WCK01_c & WCK23_t, WCK23_c	Differential
Command	RAS_n, CAS_n, WE_n, CS_n, and CKE_n	Reference Voltage: Vrefc
Address	BA[3:0], A[13:0], and ABI_n	Reference Voltage: Vrefc
DQ	DQx, DBIx_n, EDCx	Reference Voltage: Vrefd

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

I/O Power Assignment

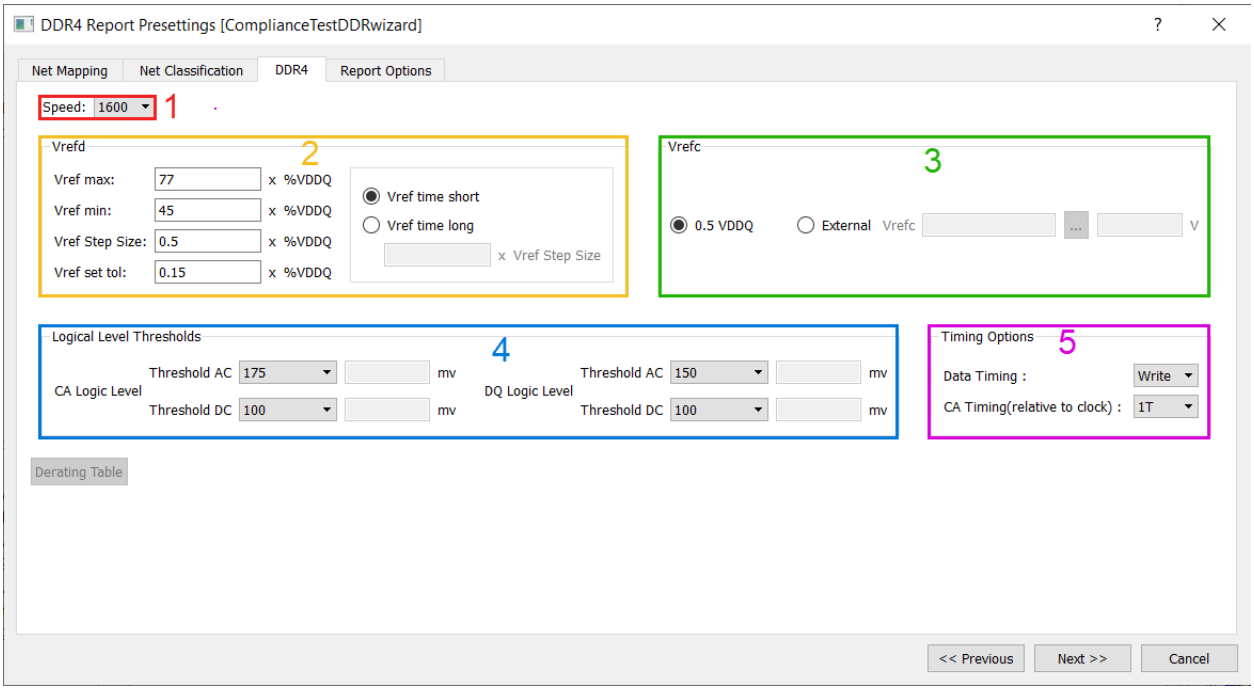


Both virtual I/O power input and real I/O power net assignment are supported:

1. You can input an I/O power value as a virtual I/O power.
2. Or click **[...]** to assign a net as an I/O power net. The Toolkit can automatically calculate the I/O power according to your selections.

DDR4 Related Settings

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



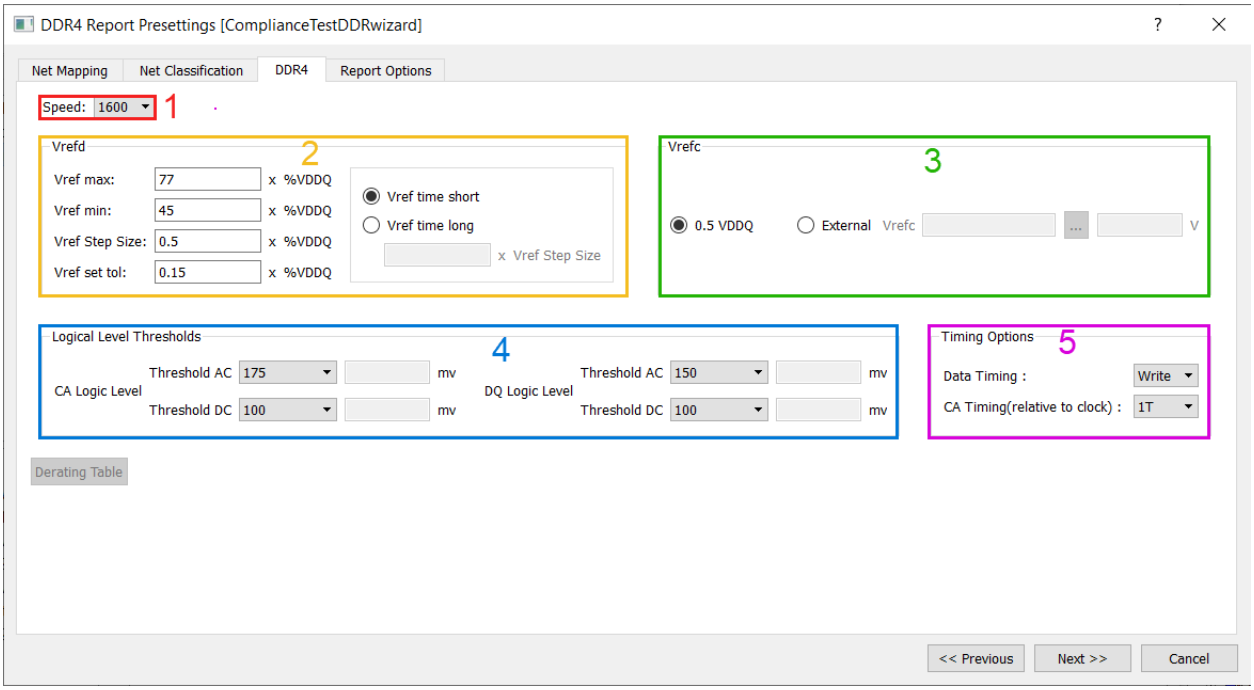
1. Support typical DDR4 speed: 1600Mbps, 1866Mbps, 2133Mbps, 2400Mbps, 2666Mbps and 3200Mbps.
2. All of these settings are Vrefd-related settings that follow **JEDEC Spec JESD79-4 "Table 36 — DQ Internal Vref Specifications** ".
3. Vrefc settings:
    a. Vrefc = 0.5 IO power
    b. External Vrefc; assign a net as Vrefc net. The Toolkit can automatically calculate the Vrefc voltage value according to your selection.
4. dropdown menu for AC/DC Threshold selection; also supports user-defined values.
5. Write/Read options:
    a. Write Mode
    b. Read Mode

    Command, address and timing options:

    a. 1T= CA signal period is 1x the clock period.
    b. 2T = CA signal period is 2x the clock period.

GDDR5 Related Settings

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



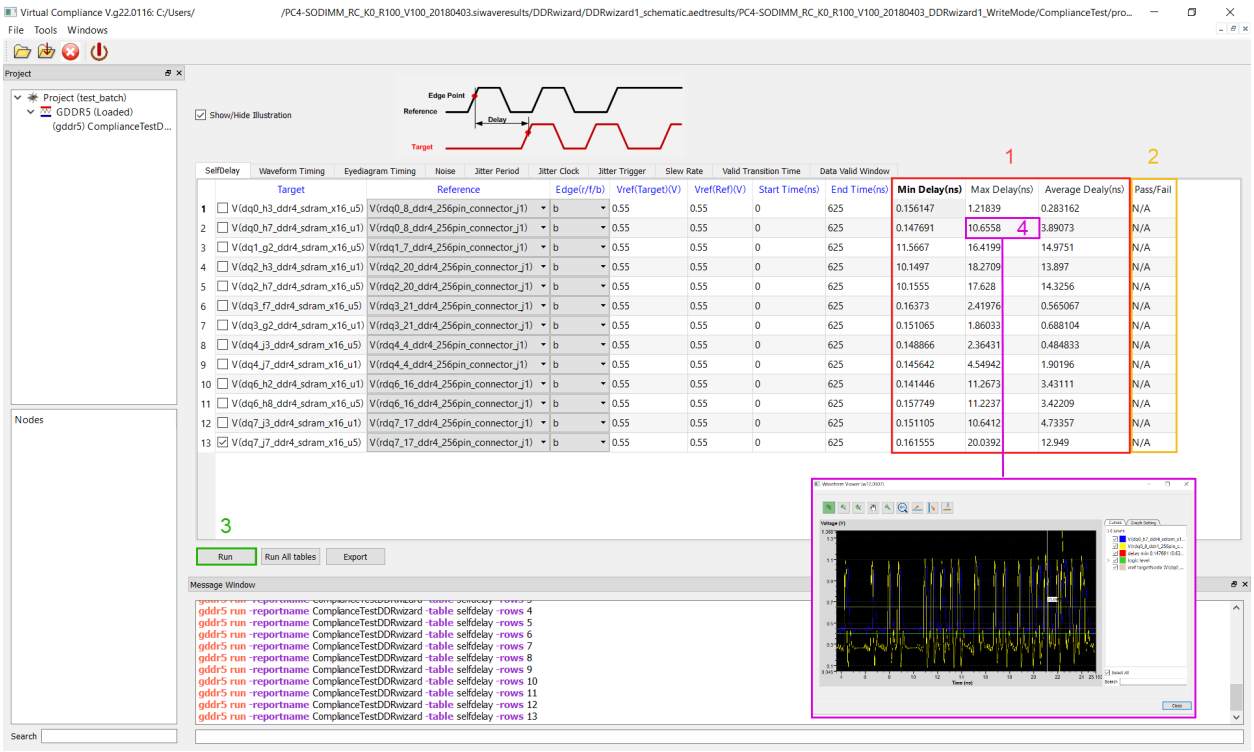
1. It support both idea IO power input and real IO power net assignment 2133Mbps, 2400Mbps, 2666Mbps and 3200Mbps.
2. All of these settings are Vrefd training related setting follow **JEDEC Spec JESD79-4 "Table 36 — DQ Internal Vref Specifications** ".
3. Vrefc settings, 2 Options:
    a. Vrefc = 0.5 IO power
    b. External Vrefc, assign a net as Vrefc net, tools can automatic calculate the Vrefc voltage value according to your selection.
4. dropdown menu for AC/DC Threshold selection, it also support user define values.
5. Write/Read options:
    a. Write Mode
    b. Read Mode

    Command, Address and control timing options:

a. 1T. Means CA signal period is 1 time clock period.
b. 2T. Means CA signal period is twice clock period.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

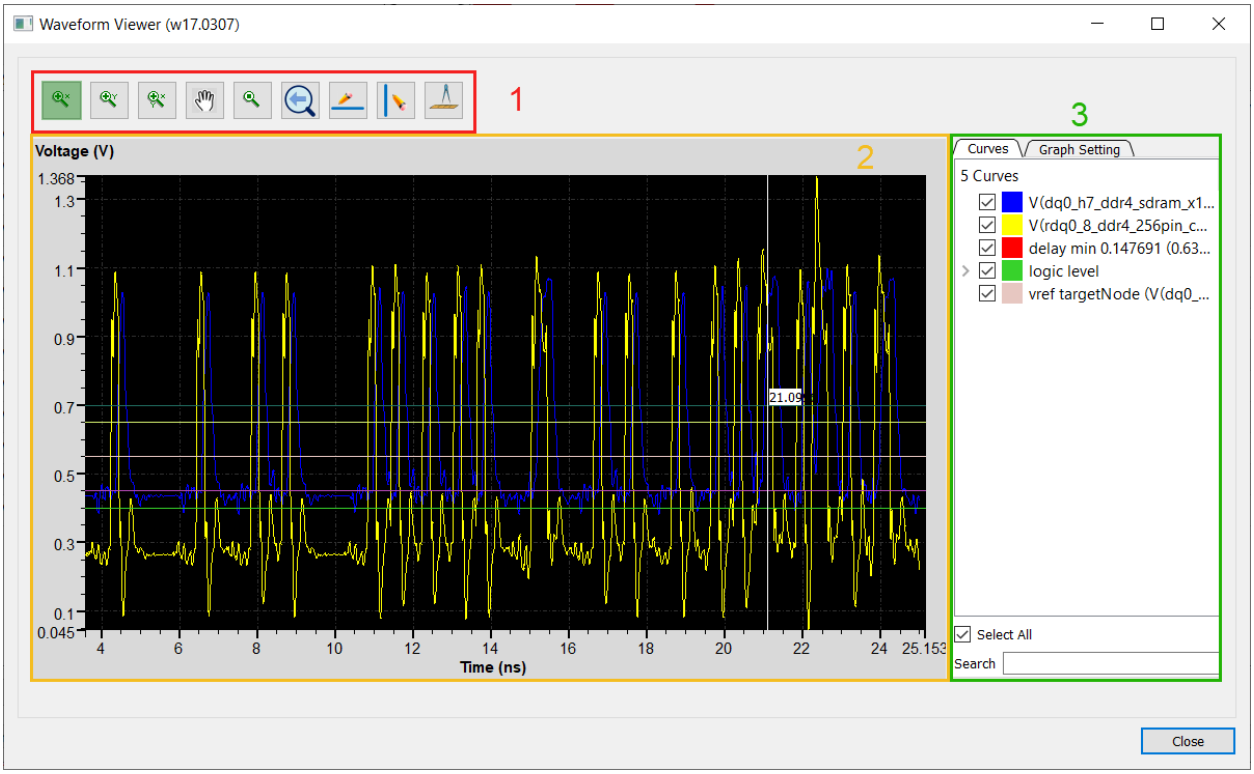
Compliance Test Window (GDDR5)



1. Report-parameter area.
2. Pass/Fail result according to JEDEC SPEC.
3. “Run” parameter calculation and Pass/Fail result.
4. Double-click the report parameter to open the embedded waveform viewer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

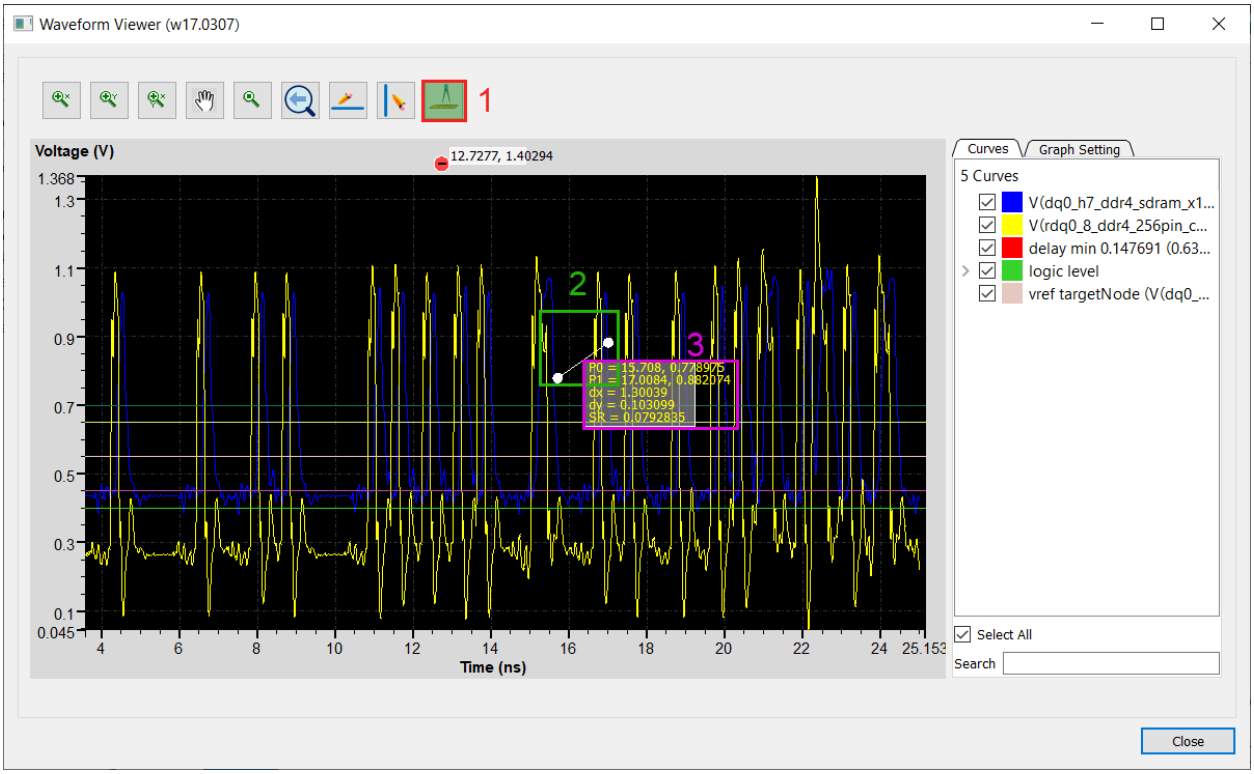
Embedded Waveform Viewer



1. Tool bar: zoom in, fit view, previous view and measuring tools.
2. Waveform Plot area.
3. Curve selection and Graph setting.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Measuring



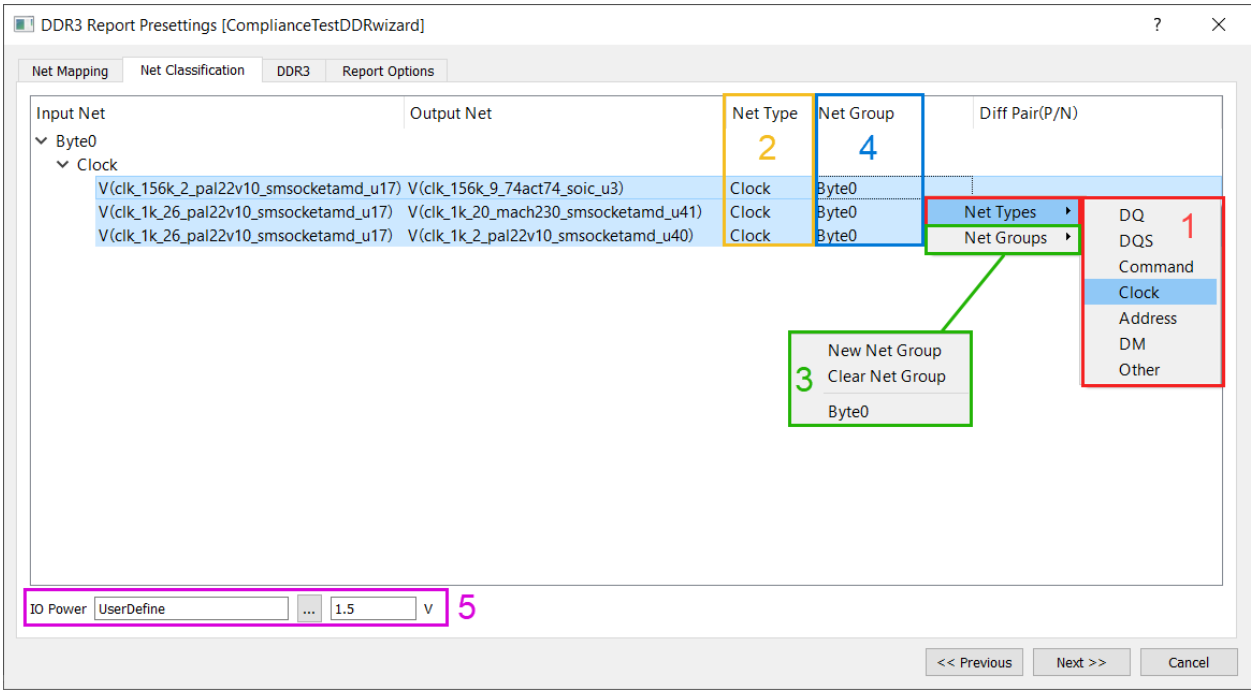
1. Click the “measure point” button.
2. Click in the display to set 2 points.
3. The delta x, delta y and slope of these 2 points is shown in the display.

Virtual Compliance for DDRx

The following topics describe how to conduct compliance testing for other DDRx.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Net Mapping (Other DDRx)



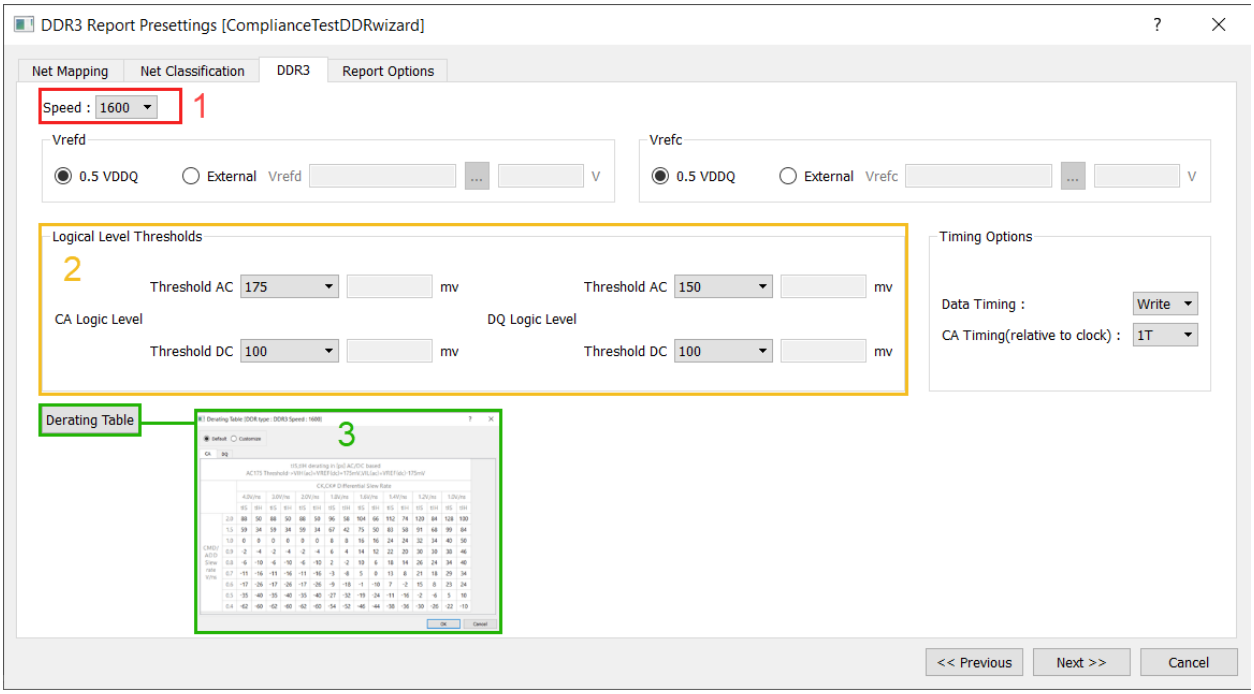
1. Right-click the highlight nets to define a Net Type for the chosen nets.
2. After the net type is defined, the net types are displayed in the list. Undefined net types are displayed as "Others".
3. You can create new net groups or assign nets to an existing group.
4. The Net Group column displays all the net group assignments.
5. Define the I/O power value, using level calculations and other parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Net Type for DDRx

NET Type	LPDDR2	DDR3	Note
Clock	CK_t, CK_c	CK, CK#	Generically differential
DQS	DQSx_t, DQSx_c	DQSx, DQSx#	Generically differential
Command	CKE, CS_c	CKE, CS#, RAS#, CAS#, WE#, ODTx	
Address	CA0~CA9	BA0~BA2, A0~A12	
DQ	DQx, DMx	DQx, DMx	

DDR Related Settings



1. Speed Bins.
2. Select the CA net type AC logic level and DQ net type logic level.
3. Dereating Table button causes a window to show the default dereating value, and user can modify the default value when switch to customized dereating table.

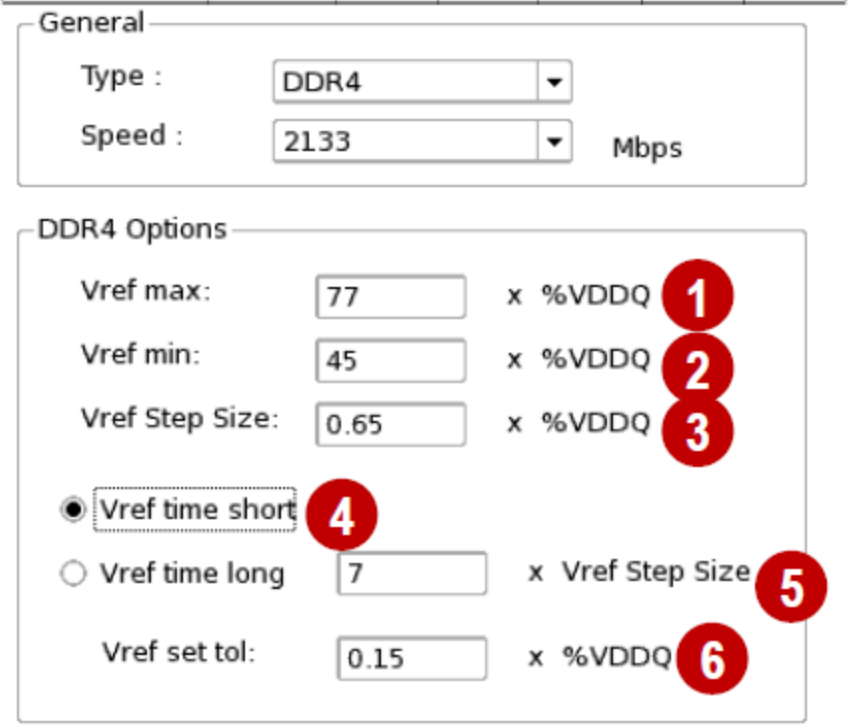
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DDR Special Options

DDR4 has special options to control the Vref training.

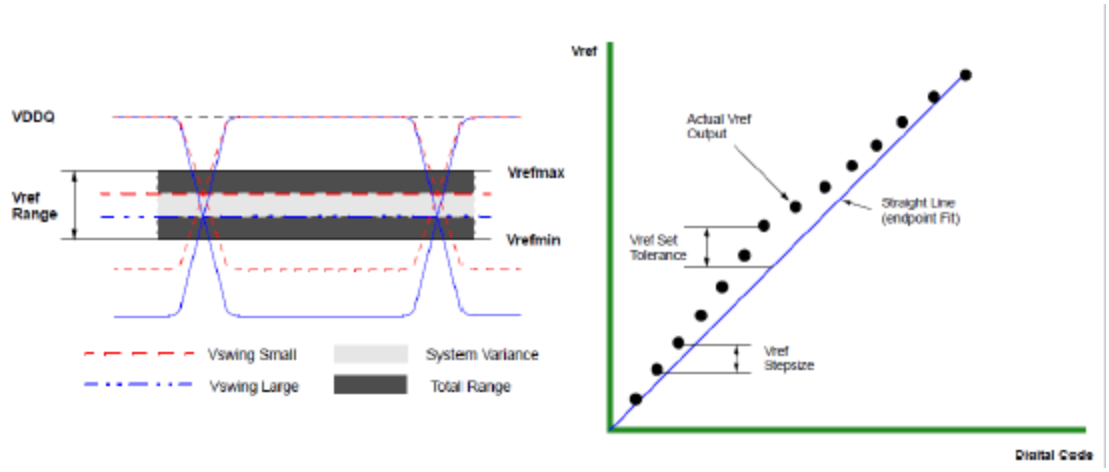
Table 36 — DQ Internal Vref Specifications

Parameter	Symbol	Min	Typ	Max	Unit	NOTE
Vref Max operating point Range1	$V_{ref_max_R1}$	92%	-	-	VDDQ	1, 11
Vref Min operating point Range1	$V_{ref_min_R1}$	-	-	60%	VDDQ	1, 11
Vref Max operating point Range2	$V_{ref_max_R2}$	77%	-	-	VDDQ	1, 11
Vref Min operating point Range2	$V_{ref_min_R2}$	-	-	45%	VDDQ	1, 11
Vref Stepsize	$V_{ref\ step}$	0.50%	0.65%	0.80%	VDDQ	2
Vref Set Tolerance	$V_{ref_set_tol}$	-1.625%	0.00%	1.625%	VDDQ	3,4,6
		-0.15%	0.00%	0.15%	VDDQ	3,5,7
Vref Step Time	$V_{ref_time-Short}$	-	-	60	ns	8,12
	$V_{ref_time-Long}$	-	-	150	ns	9,12
Vref Valid tolerance	$V_{ref_val_tol}$	-0.15%	0.00%	0.15%	VDDQ	10

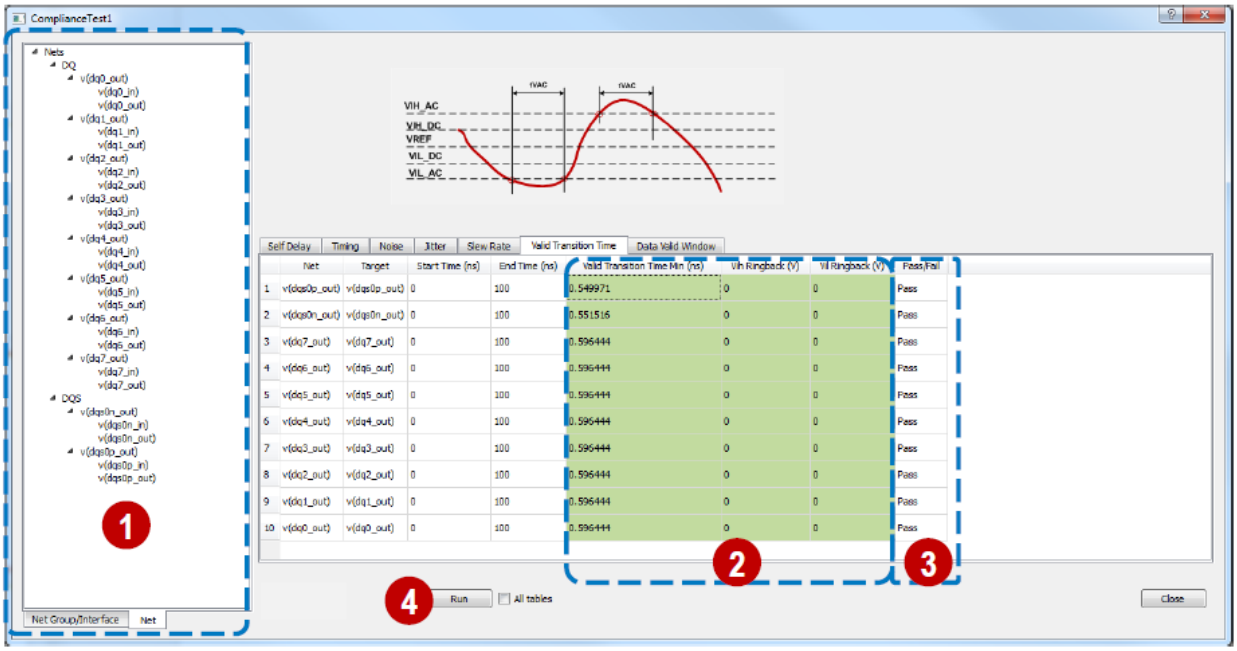


1. Define the fly-by Vref scanning upper limited.
2. Define the fly-by Vref scanning lower limited.
3. Define the fly-by Vref scanning step size.
4. Select Vref time short scans 1 step size a time.
5. Select Vref time long scans >=2 (by input) step size a time.
6. Set the tolerance of Vref scanning.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Compliance Test Window (DDRx)



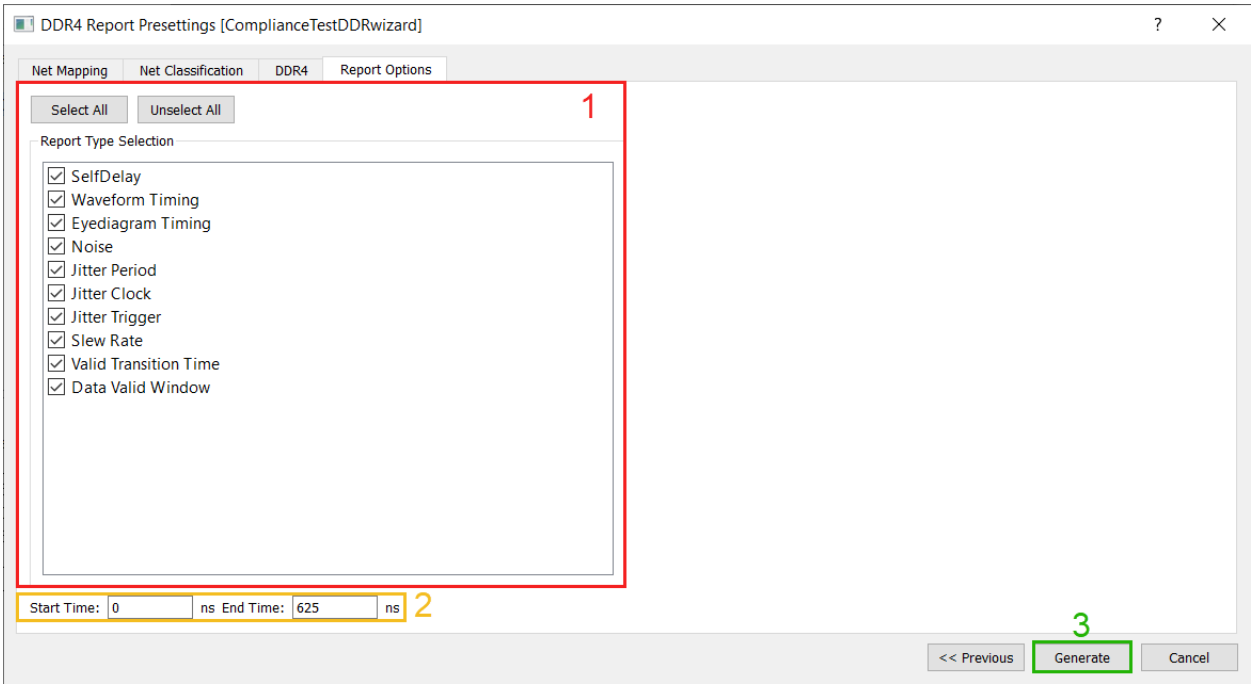
1. Net Group, Interface and Net information tree window, user can manual select target or view waveform.
2. Report parameter area.
3. Pass/Fail judgement according to JEDEC SPEC.
4. “Run” parameter calculation and pass/fail judgement.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VCM Report Tools

A number of reports are available in the Virtual Compliance Toolkit. The following topics describe the reports and report options that are available.

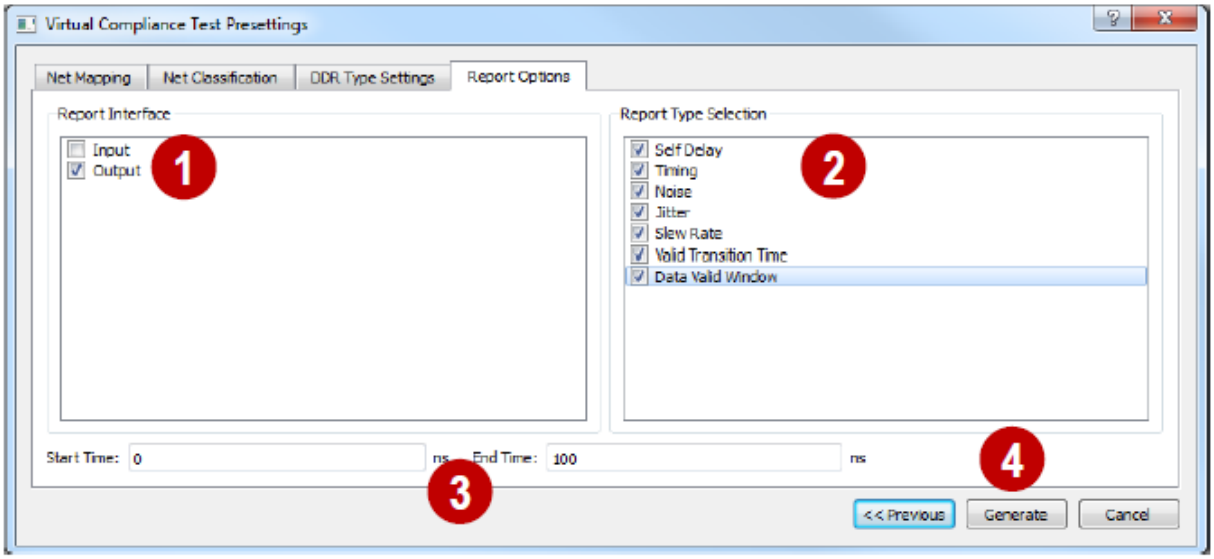
Report Options (DDR4 and GDDR5)



1. Report Options; the default is "Select all".
2. Input Start Time and End Time; the default is 0 ns to simulation end time.
3. After making your selections, click “Generate” to start.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

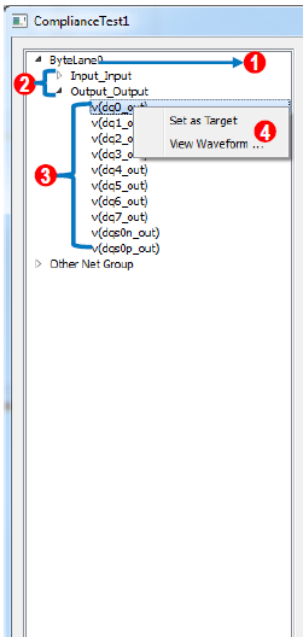
Report Options DDRx



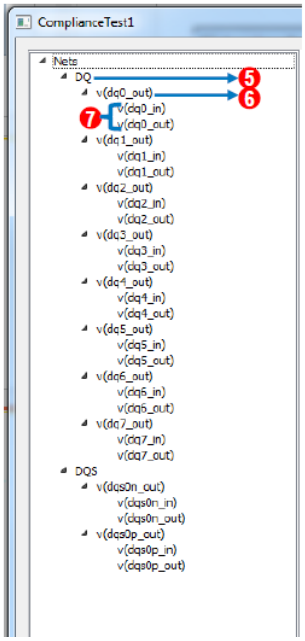
1. Choose a interface to report, (Output Interface is checked by default).
2. Report parameter types selection (all is checked by default).
3. Define the start and end time to report (simulation start/end time is chosen by default).
4. Click **Generate** to open a Compliance Test window.

VCM Report Window

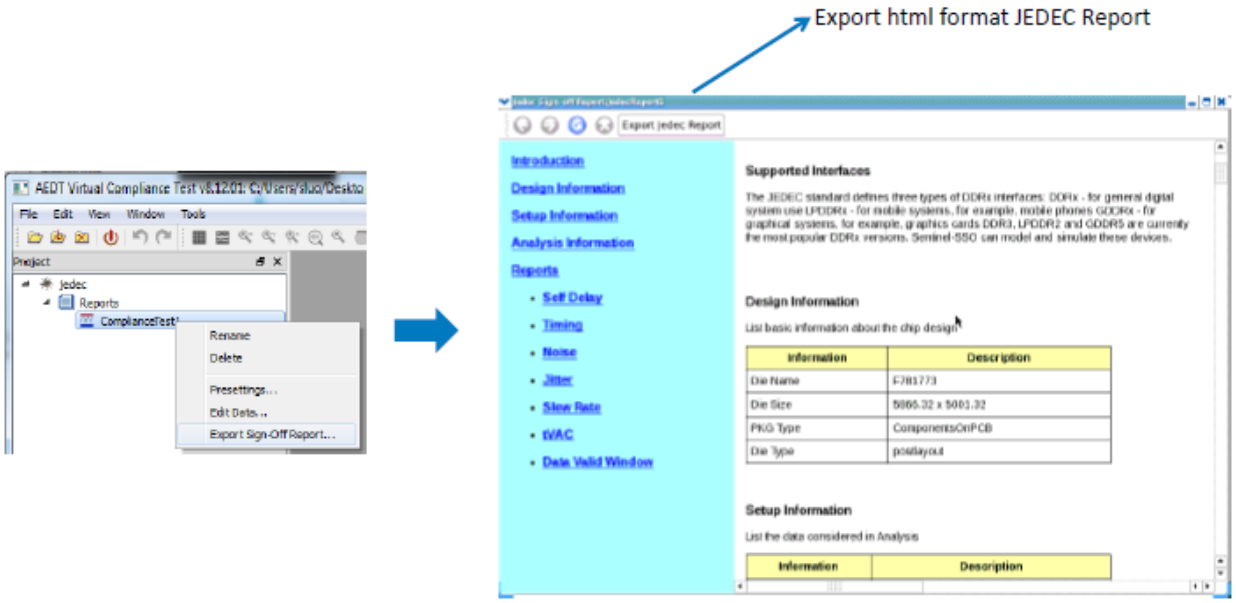
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. Net Group
2. Interface
3. Nets
4. “Set as Target” to view the parameter value; “View Waveform” to view the net waveform.
5. Net type
6. Net names
7. Nodes



View Report

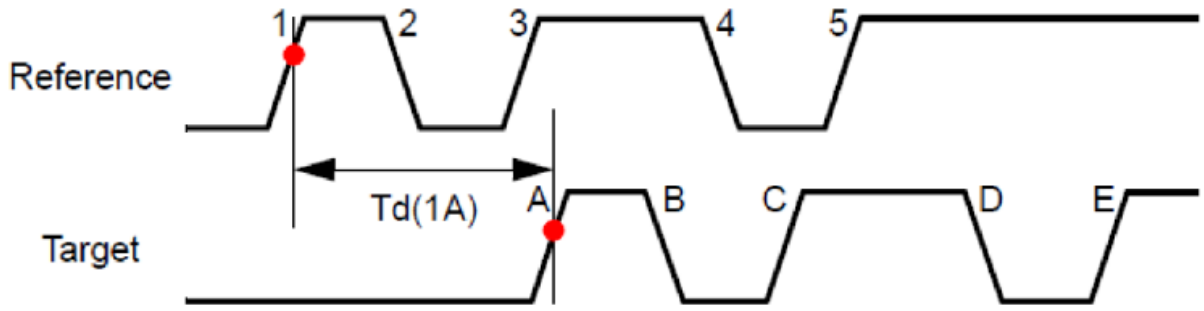


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Virtual Compliance Module Examples

The following topics describe how to set up and run the Compliance Module with a number of signal and timing examples.

Self Delay



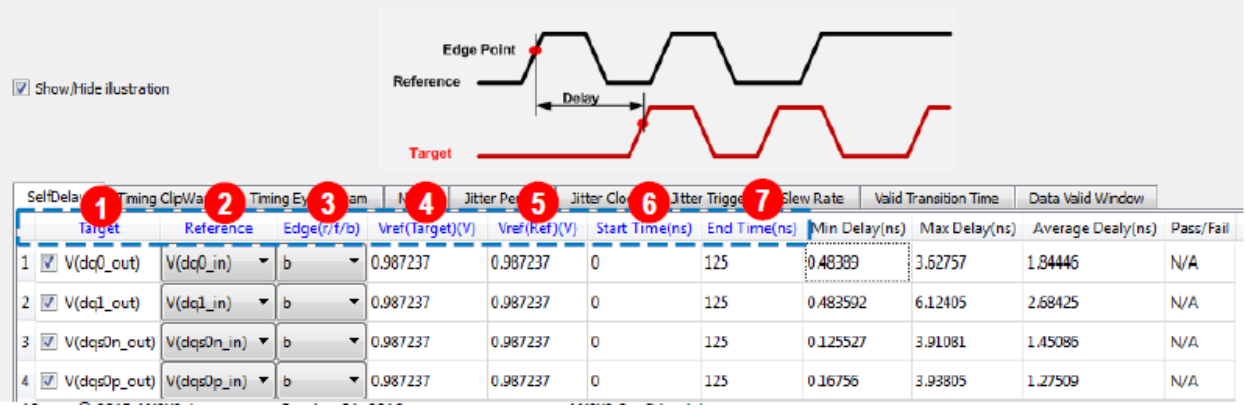
1. Reference and Target are both on the same net and are controlled by the net mapping setting.
2. Use of logic level to detect edges for both Target and Reference. For example, 5 edges of A,B,C,D, E for target and 5 edges of 1,2,3,4, 5 for reference.
3. Select the edge point. For example, the red point.
4. To calculate the delay for each edge. For example, A-1 delay1,B-2 delay2,C-3 delay3,D-4 delay4, and E-5 delay5.
5. Report the min delay and max delay. For example, to get the min delay and max delay among the values: A-1 delay1,B-2 delay2,C-3 delay3,D-4 delay4, and E-5 delay5.

Self Delay Keywords

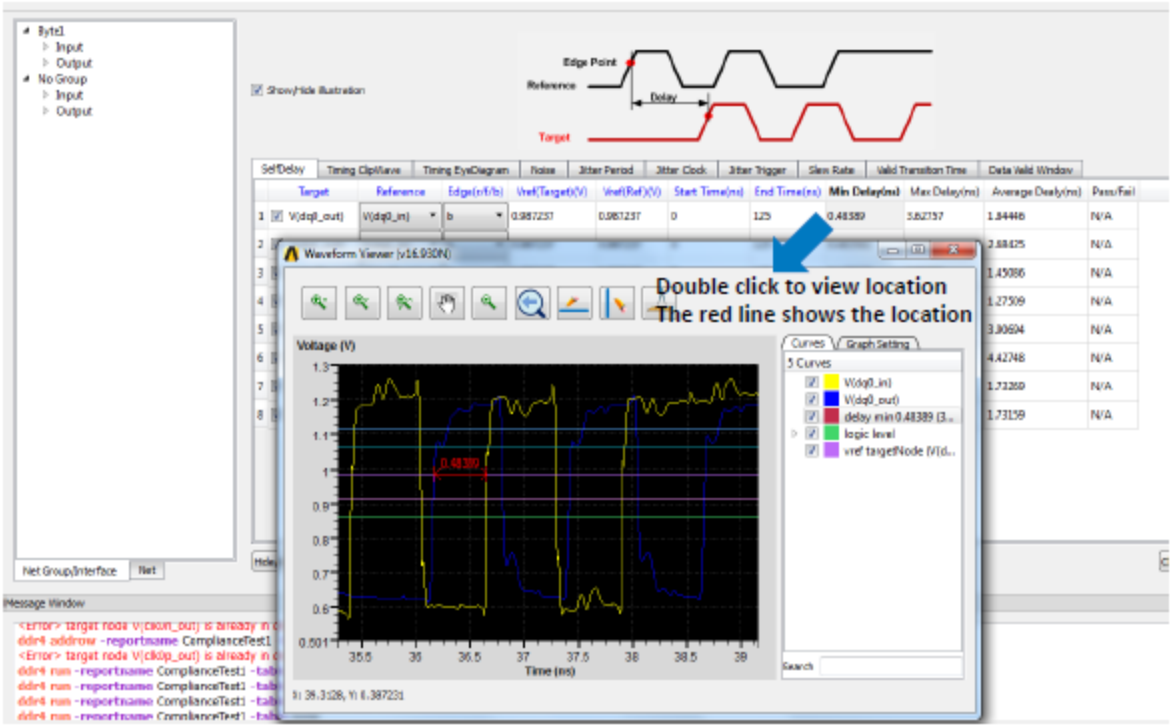
1. Target: Report target.
2. Reference: Default is the input node.
3. Edge(r/f/b): [r|f|b]. Default is both edge and user can change to rising edge or falling edge only. “r” represents rising and “f” represents falling and “b” represents both.
4. Ref_Volt(Target): Default use Vref of Target node. The user can set it manually.
5. Ref_Volt(Reference): Default is Vref of reference node. The user can set it manually.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Start_time: Default is 0. The user can enter any value between 0 and the amount of simulation time. Note that a negative value is not allowed.
7. End_time: Default is simulation time and exceeding it is not allowed.



Self Delay Example

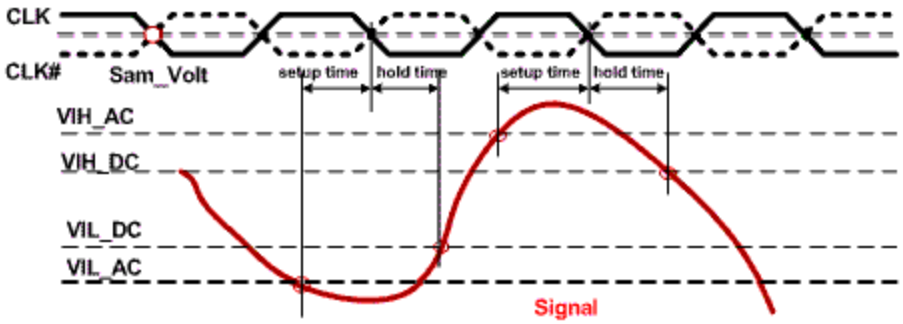


Timing Waveform

Timing: to calculate setup time & hold time

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

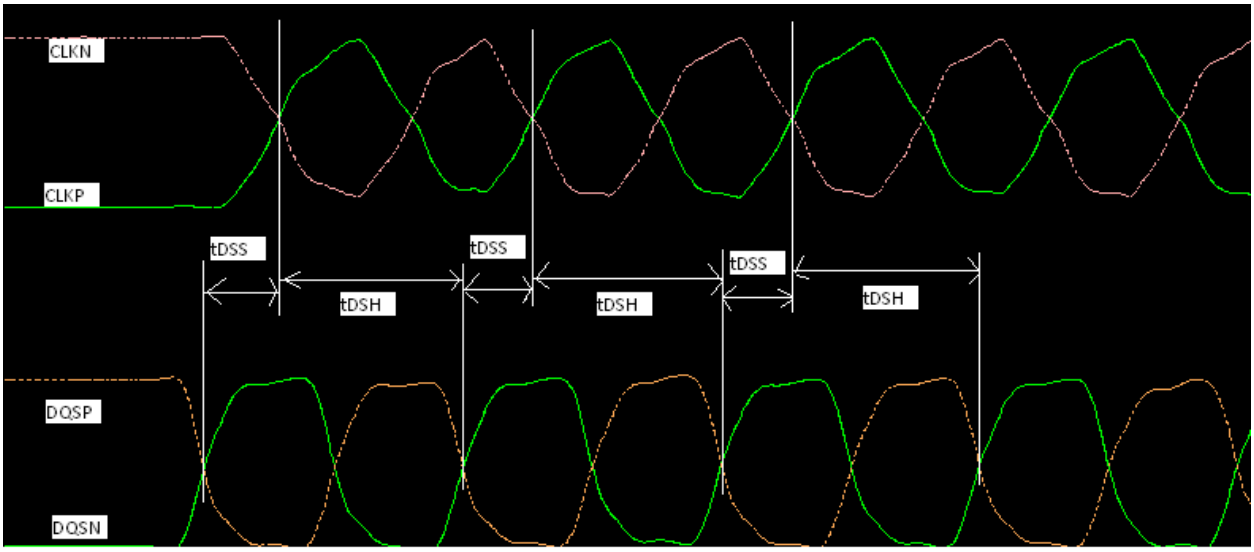
1. Detect edges on Target net.
2. Detect edges on reference net.
3. Detect cross-point on each reference edge.
4. Calculate setup time: The cross-point to the left vih_ac or vil_ac on edge of target is setup time.
5. Calculate hold time: The cross-point to the right vlh_dc or vil_dc on edge of target is hold time.
6. Report out the min & max value for both setup time & hold time.



DQS setup time & hold time

1. When target is differential, calculates DQS timing automatically.
2. Detect rising edges on reference.
3. Select cross-point of reference as sample point.
4. Detect falling edges on target.
5. Calculate setup time for each sample point: the sample point to the left cross-point on falling edge is setup time.
6. Calculate hold time for each sample point: the sample point to the right cross-point on falling edge is hold time.
7. Report out min & max values for both setup time & hold time.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Timing Waveform Example

1. Target: Report target.
2. Reference: Strobes of the target, for DQ it is the DQS strobe in same net group, for Command or Address, it is Clock net.
3. Edge(r/f/b): [r|f|b]. Default is b and user can change it by list. r represents rising & f represents falling & b represents both. If r is selected, only rising edges are used to calculate delay for both target & reference. The same goes to f. If it's DQS timing, it's invalid.
4. Vref: reference voltage for target.
5. Start_time & End_time : Same as Self Delay.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Eye Diagram Timing

1. Using eye mask to judge the violation.
2. User input: Input Data: VdiVW_Total and TdiVW_Total.
3. Tool auto-creates Target vs. Strobe (i.e., DQ vs. DQS) eye diagram.
4. Base on the Strobe cross-point, Vref, VdiVW and TdiVW to create the Rx mask and report the violations.
5. Report TdiPW, Tr, Tf and SRIN_diVW for each DQ.
6. Report Eye-width and Eye-Height @ BER=1e-16.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

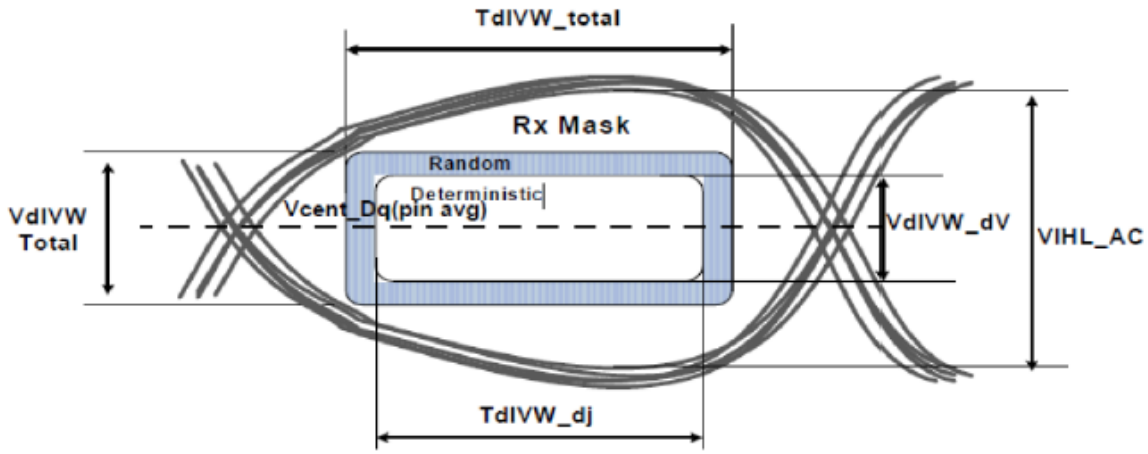

Figure 206 — DQ Receiver(Rx) compliance mask

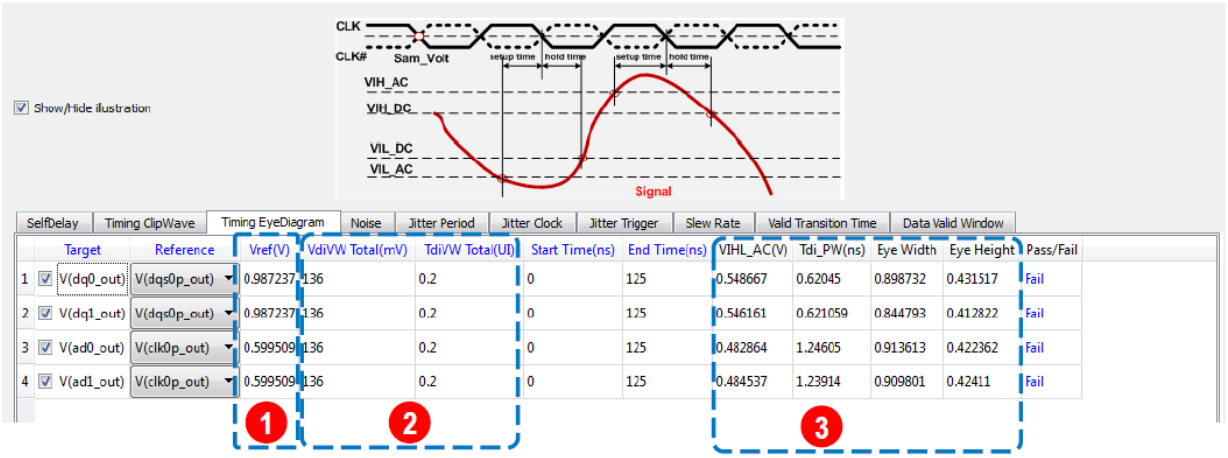
DDR4 DQ Eye Diagram Timing Example

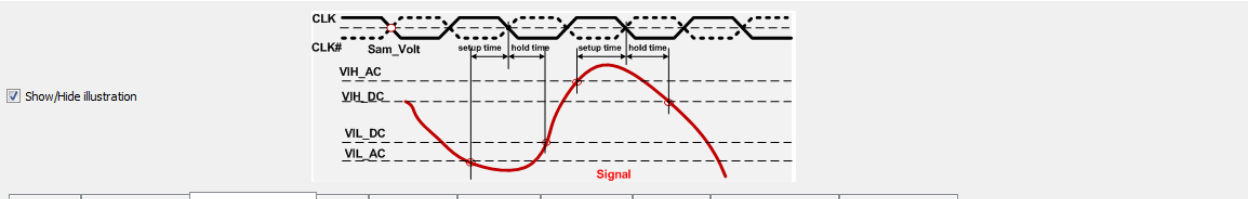
1. Classify and group nets in presetting, fly-by Vref automatically calculates by net group.
2. Input VdiVW_Total and TdiVW_Total.
3. Report the DDR4 DQ Eye-diagram related parameters.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Eye Width and Eye Height

1. Select a node in Timing table and click Run.
2. Report Eye-Height/Eye-Width @BER=1e-16.
3. Double-click the value to open the Bathtub window.



SelfDelay | Timing ClipWave | Timing EyeDiagram | Noise | Jitter Period | Jitter Clock | Jitter Trigger | Slew Rate | Valid Transition Time | Data Valid Window

	Target	Reference	Vref(V)	VdiVW Total(mV)	TdiVW Total(UI)	Start Time(ns)	End Time(ns)	VIHL_AC(V)	Tdi_PW(ns)	Eye Width	Eye Height	Pass/Fail
1	V(dq0_out)	V(dqs0p_out)	0.987237	136	0.2	0	125	0.548667	0.62045	0.898732	0.43144	Fail
2	V(dq1_out)	V(dqs0p_out)	0.987237	136	0.2	0	125	0.546161	0.621059	0.844793	0.412642	Fail

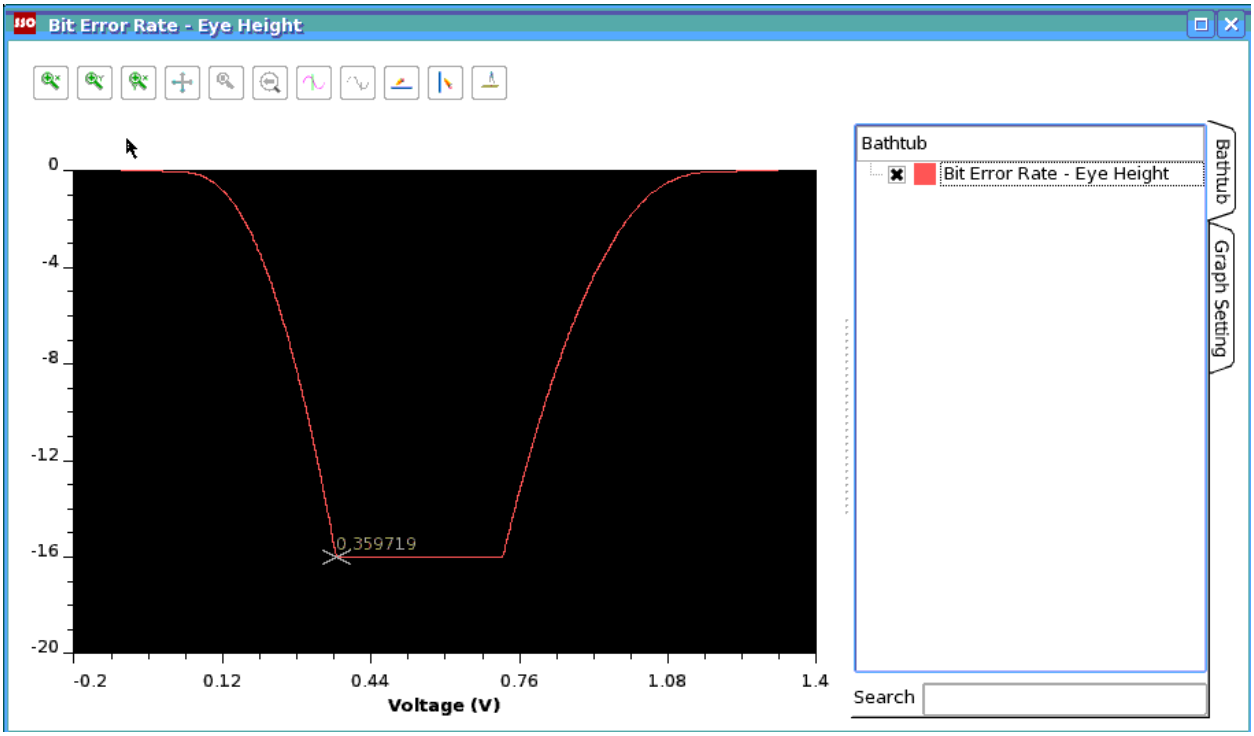
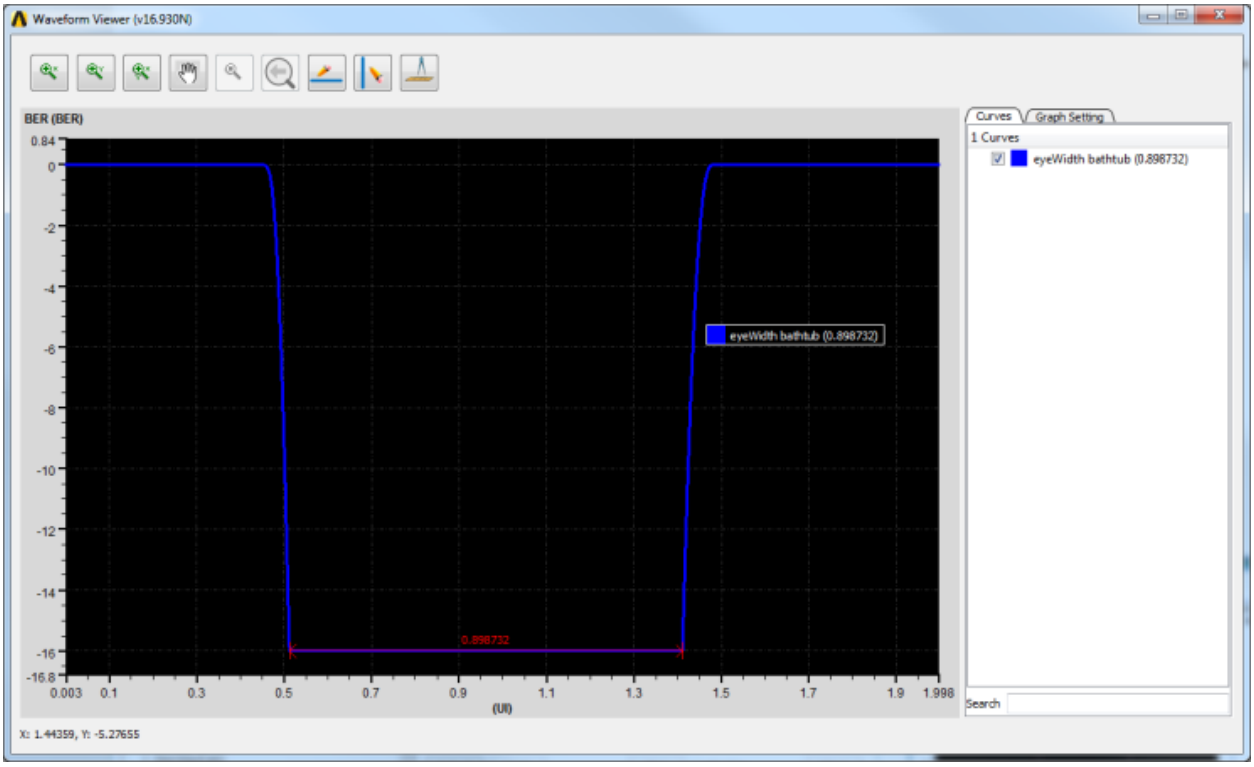
4	V(ad1_out)	V(clk0p_out)	0.599509	136	0.2	0	125	0.484537	1.23914	0.909801	0.42411	Fail

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



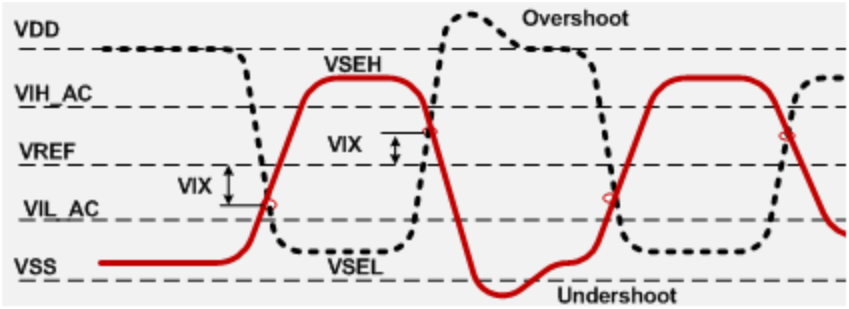


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Noise

Signal and Noise

1. Overshoot: Noise above IO domain power.
2. Undershoot: Nosie below 0.



Differential Noise: VIX

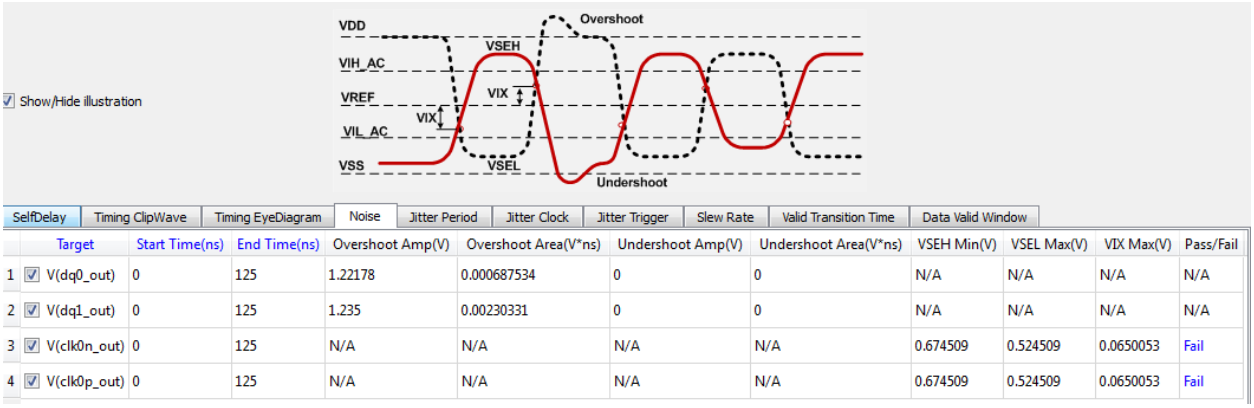
1. Detect edges on target.
2. Get cross-point on edge of target.
3. Get the voltage of each cross-point.
4. To get VIX for each cross-point: |V_cross-point-VREF|= |V_cross-point-0.5*IO_Power|.
5. Report out the max value.

Noise Table Keywords

1. Target: Report target.
2. Type[Single | Differential]: single to report overshoot & undershoot. differential to report VIX&VSEL&VSEH. Differential is only valid for differential pairs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Start_time & End_time : Same as selfdelay.

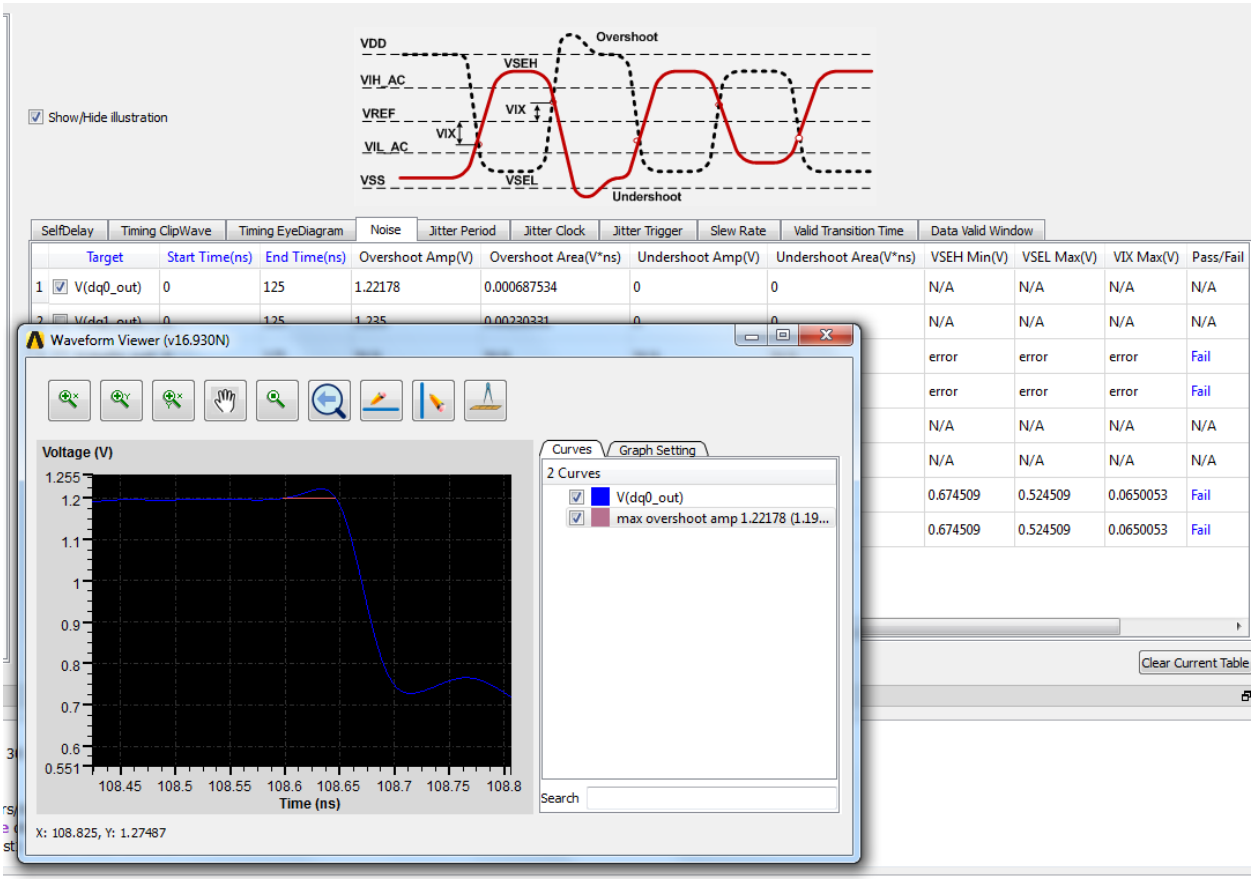


SelfDelay | Timing ClipWave | Timing EyeDiagram | Noise | Jitter Period | Jitter Clock | Jitter Trigger | Slew Rate | Valid Transition Time | Data Valid Window

	Target	Start Time(ns)	End Time(ns)	Overshoot Amp(V)	Overshoot Area(V*ns)	Undershoot Amp(V)	Undershoot Area(V*ns)	VSEH Min(V)	VSEL Max(V)	VIX Max(V)	Pass/Fail
1	V(dq0_out)	0	125	1.22178	0.000687534	0	0	N/A	N/A	N/A	N/A
2	V(dq1_out)	0	125	1.235	0.00230331	0	0	N/A	N/A	N/A	N/A
3	V(clk0n_out)	0	125	N/A	N/A	N/A	N/A	0.674509	0.524509	0.0650053	Fail
4	V(clk0p_out)	0	125	N/A	N/A	N/A	N/A	0.674509	0.524509	0.0650053	Fail

Noise Report Example

1. Select a node and click Run.
2. It reports overshoot value above IO power.
3. Double-click the value, the max overshoot shows-up.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Period Jitter

Signal jitter: to generate eye-diagram to get jitter

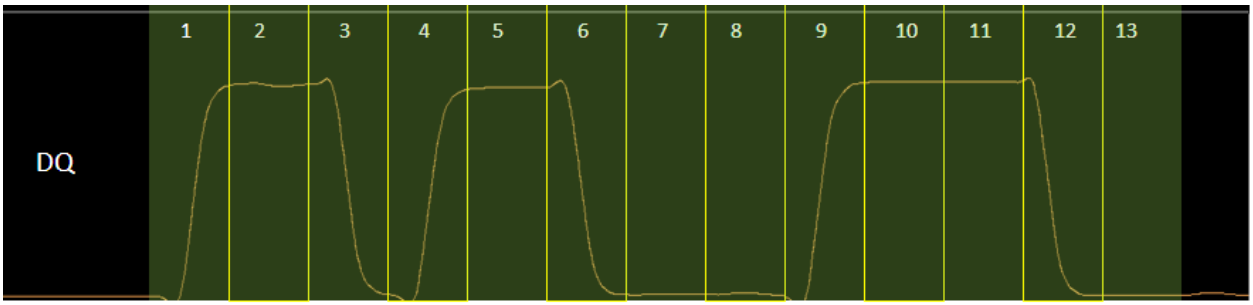
1. Cut-off target to many parts.
2. Overlap all the parts together to generate eye-diagram.
3. Get reference voltage VREF.
4. Report max jitter.

Differential Noise: VIX

1. Detect edges on target.
2. Get cross-point on edge of target.
3. Get the voltage of each cross-point.
4. To get VIX for each cross-point: |V_cross-point-VREF|= |V_cross-point-0.5*IO_Power|.
5. Report out the max value.

Cut-off Pattern

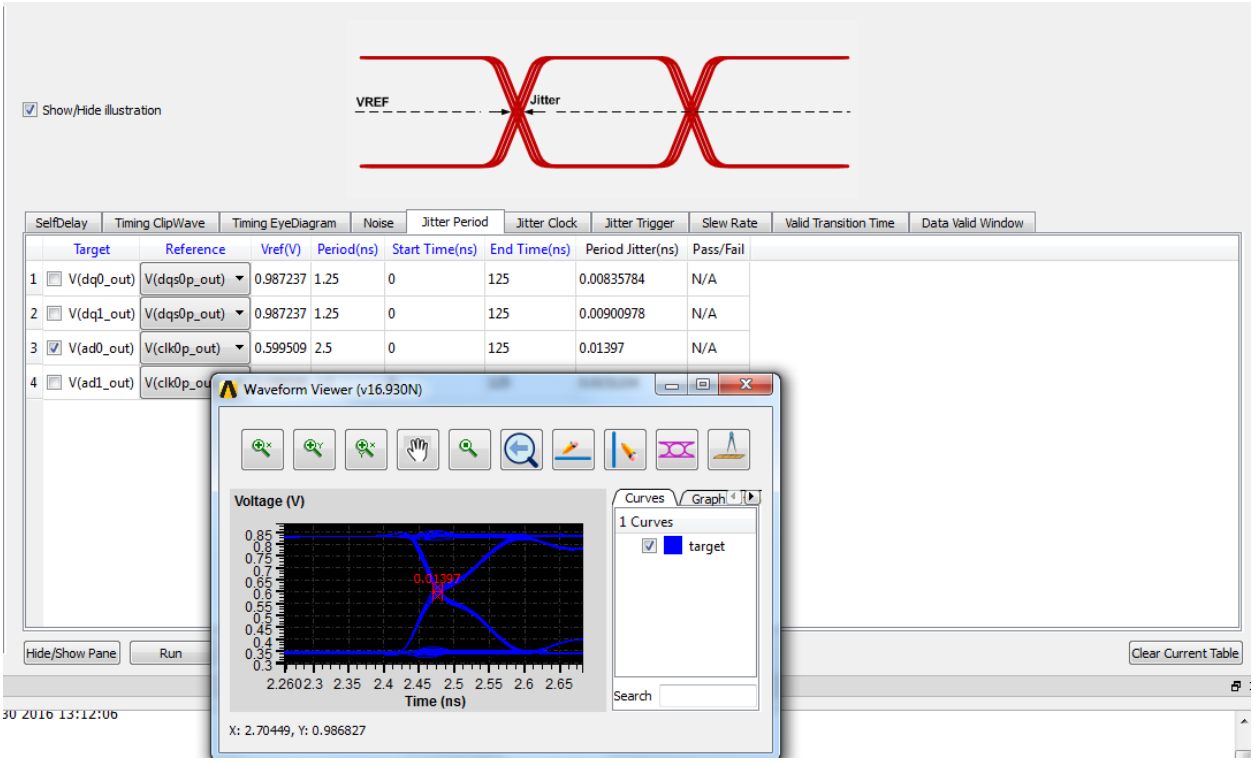
1. Automatically parse out period to cut off target: For example, to cut off DQ to 13 parts by period



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Period Jitter Example: Eye-diagram generation

1. Overlap all the parts together to generate eye-diagram.
2. To report jitter.
3. 2UI eye jitter reports the max one of jitter1 & jitter2.

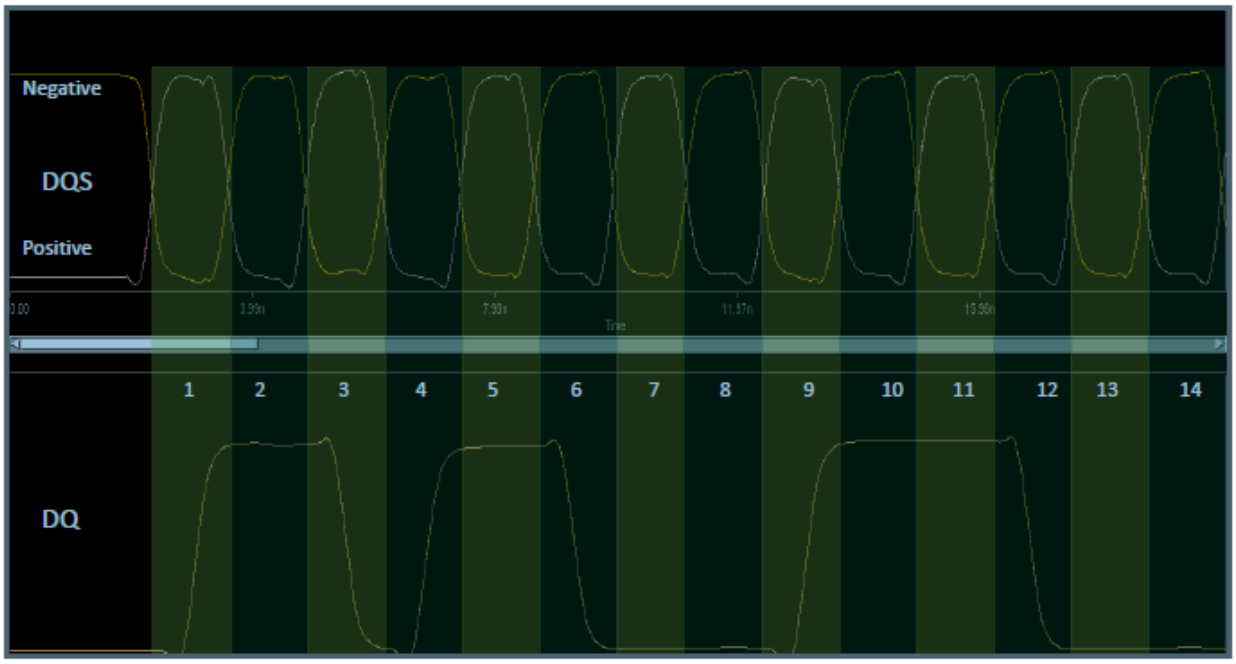


Trigger Jitter

Trigger jitter is almost the same as period Jitter, only difference is the cut off type, trigger jitter is cut off the target by Strobes.

1. Select target's referred clock as trigger to cut off target: for example, using cross points of differential DQS to cut off DQ to 14 parts.

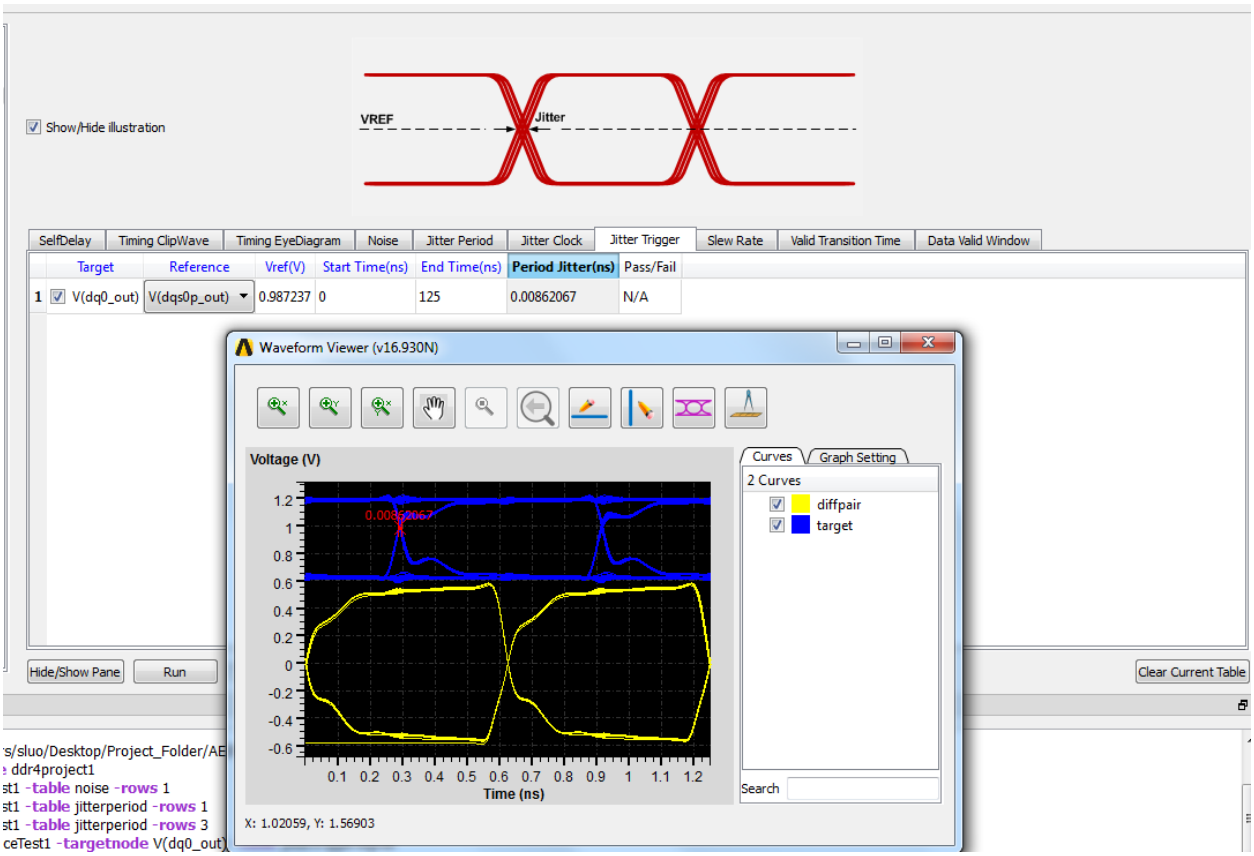
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Trigger Jitter Example

1. Overlap all the parts together to generate eye-diagram.
2. To report jitter.
3. 2UI eye jitter reports the max one of jitter1 & jitter2.

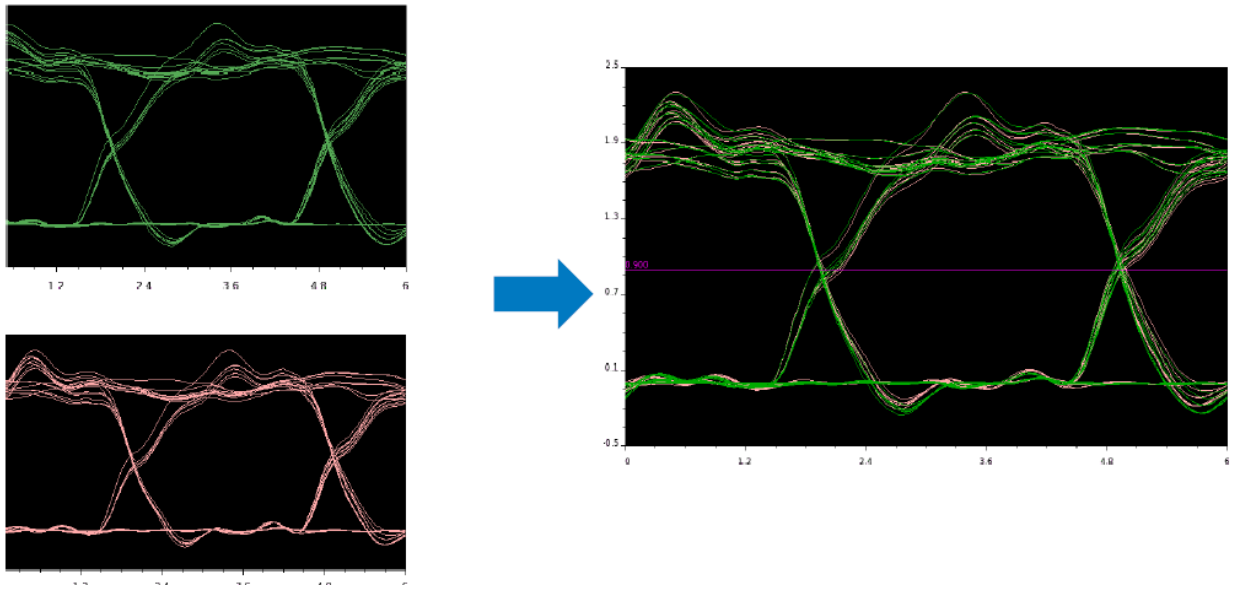
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Overlap Eye Jitter

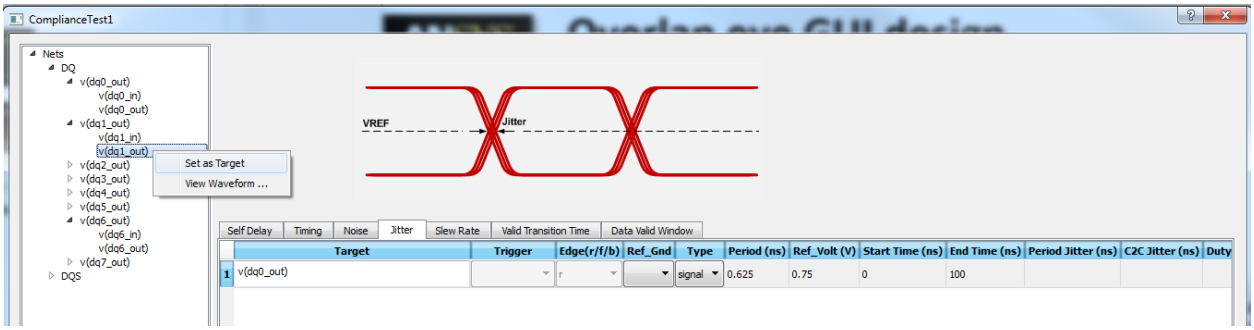
User can overlap multiple signal eyes , then measure the total jitter.

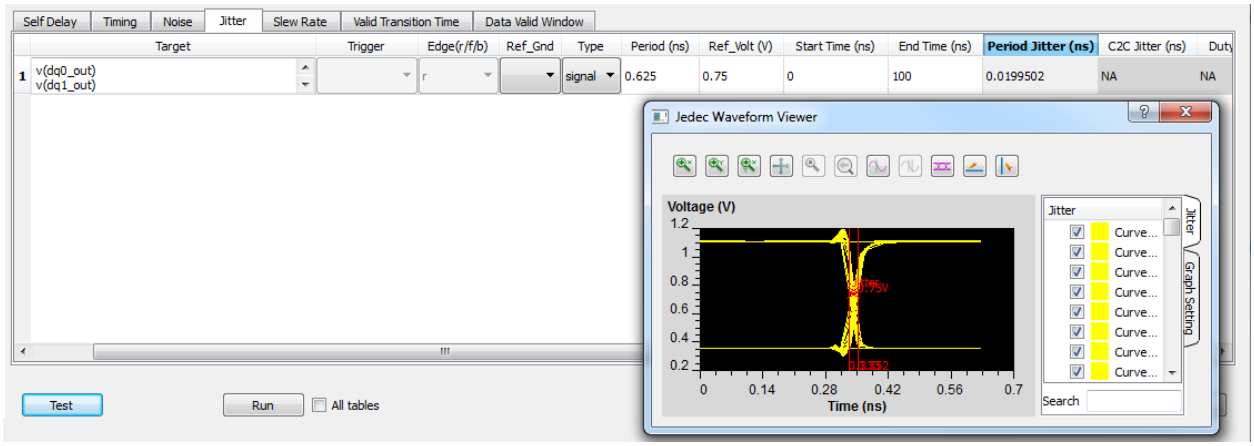


Overlap Eye Jitter Example

1. First set dq0_out as a target in table, and high-light dq0_out row.
2. Select another target dq1_out, dq0_out and dq1_out targets merges together.
3. Click Run to get the total Jitter for 2 targets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

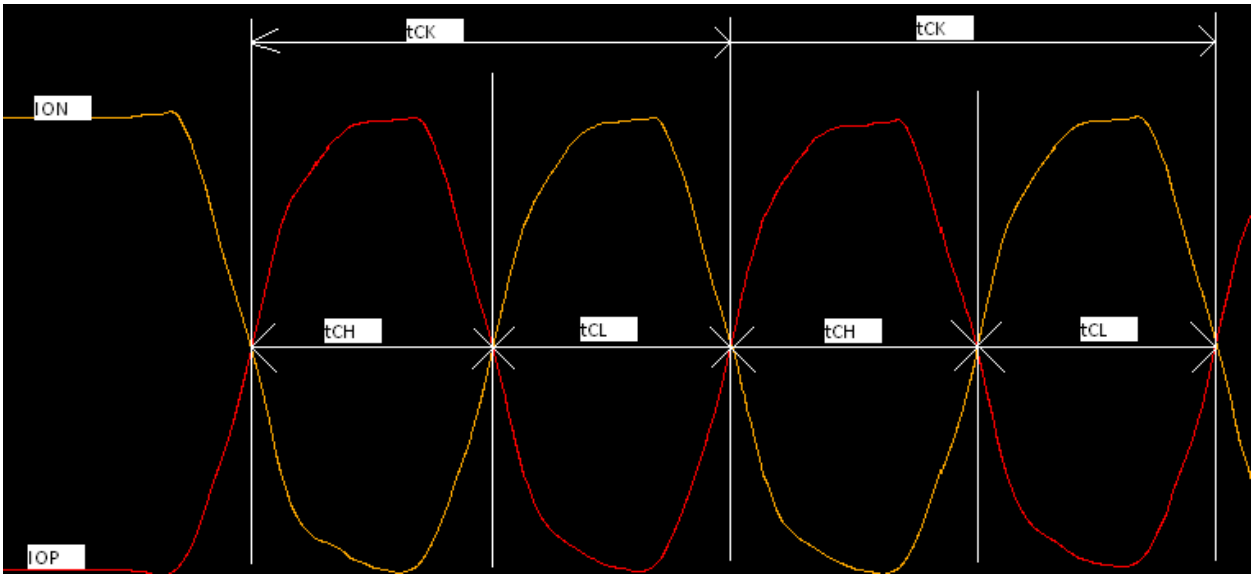




Clock Jitter

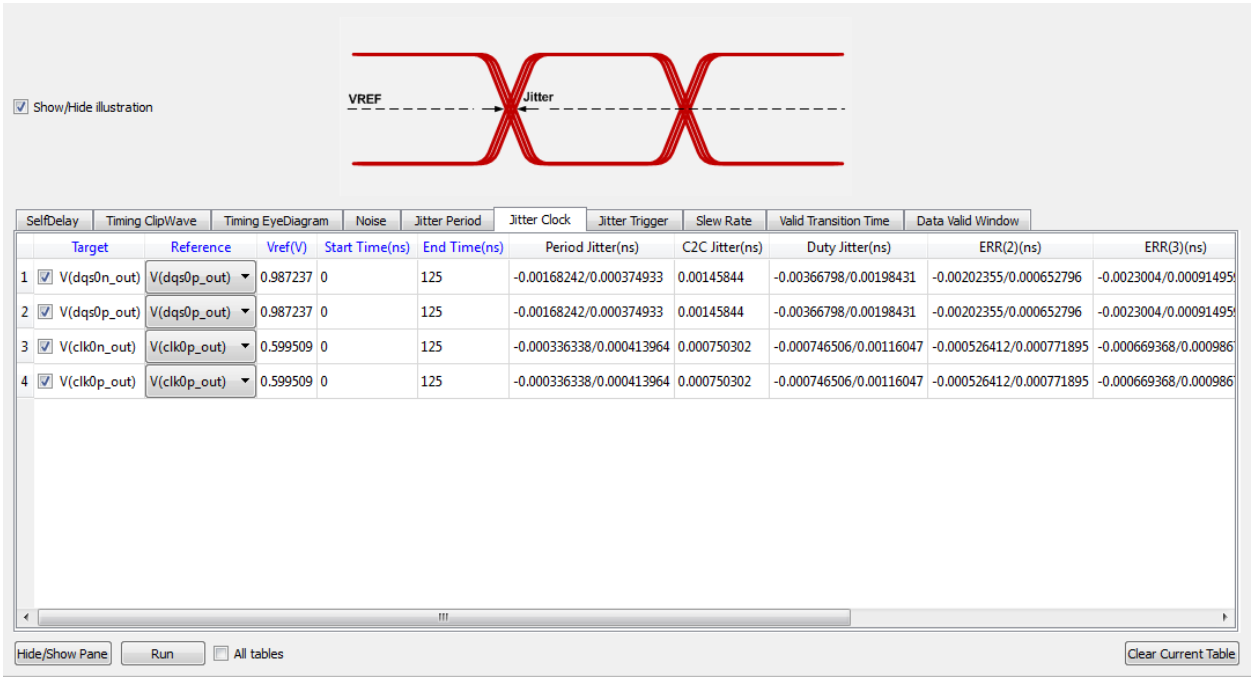
1. Period Jitter: tJIT(per) = min/max of (tCKi – tCK(avg)).
2. Duty jitter:
   a. tJIT(duty),min =MIN[(tCH(abs),min – tCH(avg),min),(tCL(abs),min – tCL(avg),min)] × tCK(avg)
   b. tJIT(duty),max =MAX[((tCH(abs),max – tCH(avg),max),(tCL(abs),max – tCL (avg),max)] × tCK(avg)
3. Cycle to cycle jitter: tJIT(cc) = max of |tCKi + 1 – tCKi|
4. ERR: tERR(nper) =(Σi+n-1 j=i tCKj) – (n*tCK(avg))

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Clock Jitter Example

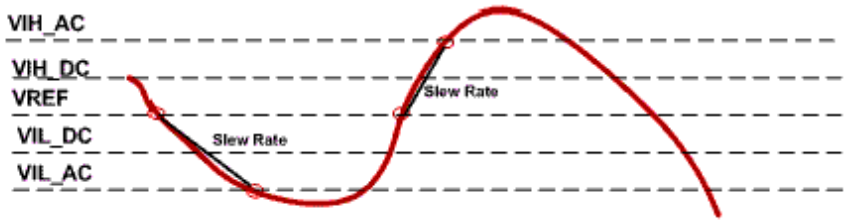
1. Select target from clock net or DQS net.
2. Run to generate report.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Slew Rate

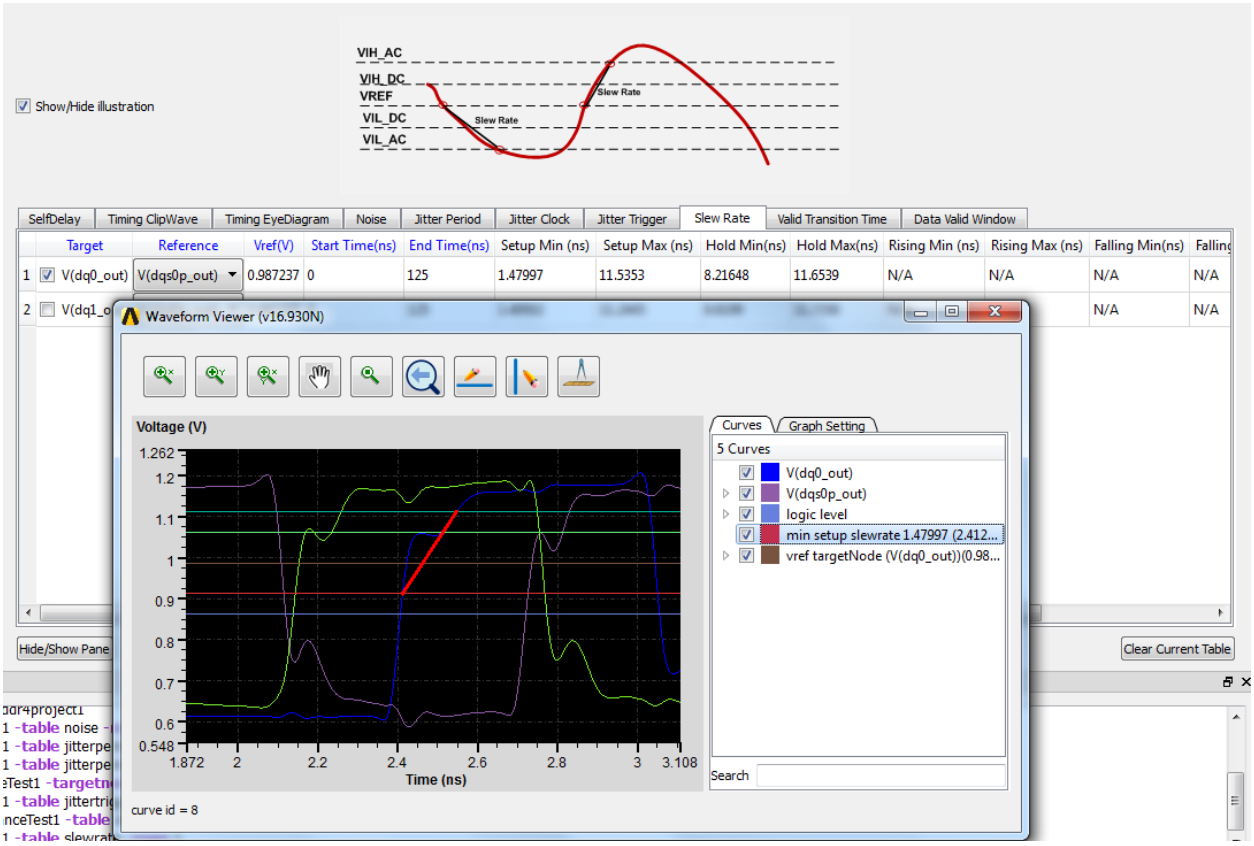
1. Detect edges on target.
2. Get vil_ac & vih_ac cross-point on target edges.
3. Get setup slew rate: slew rate of area between ac point & Vref.
4. Get vil_dc & vih_dc cross-point on target edges.
5. Get hold slew rate: slew rate of area between dc point & Vref.
6. Report out min & max among setup & hold slew.



Slew Rate Example

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select target.
2. Run to generate report

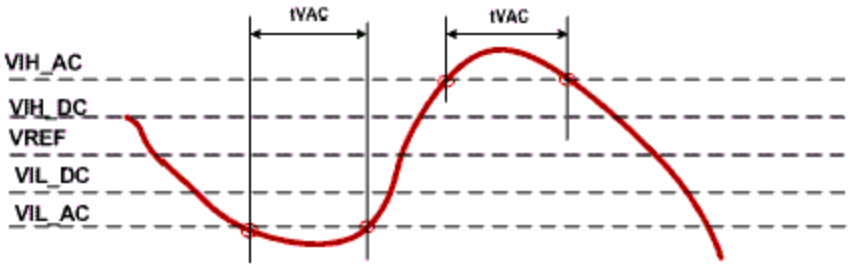


Validate Data Transition

1. Detect edges on target.
2. Select the area under vil_ac or above vih_ac on between 2 continual edges.
3. Get the time length for each area.
4. Report out the min value.
5. Record waveform dips under the AC threshold while not crossing the DC threshold.

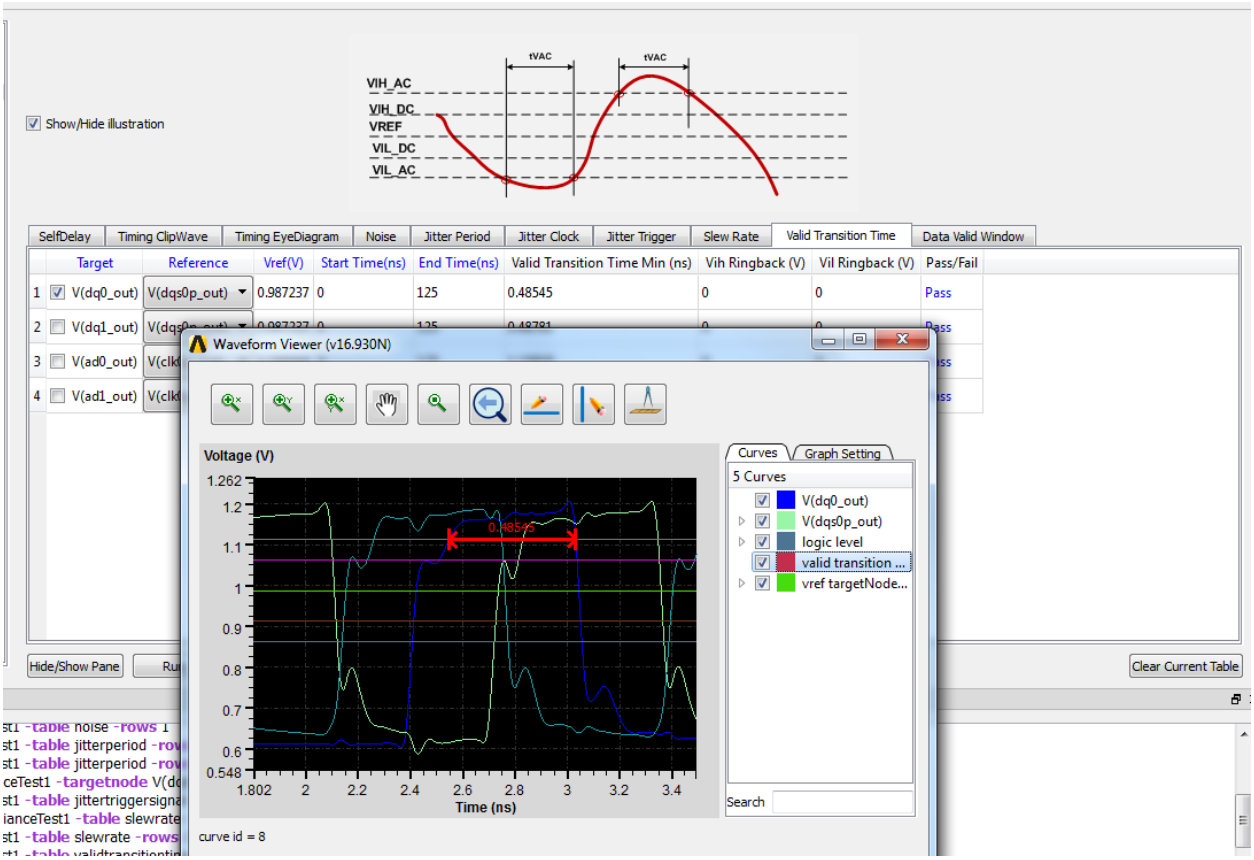
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Report out the Vil Ringback and Vih Ringback.



Valid Data Transition Example

1. Select target.
2. Run to generate report.



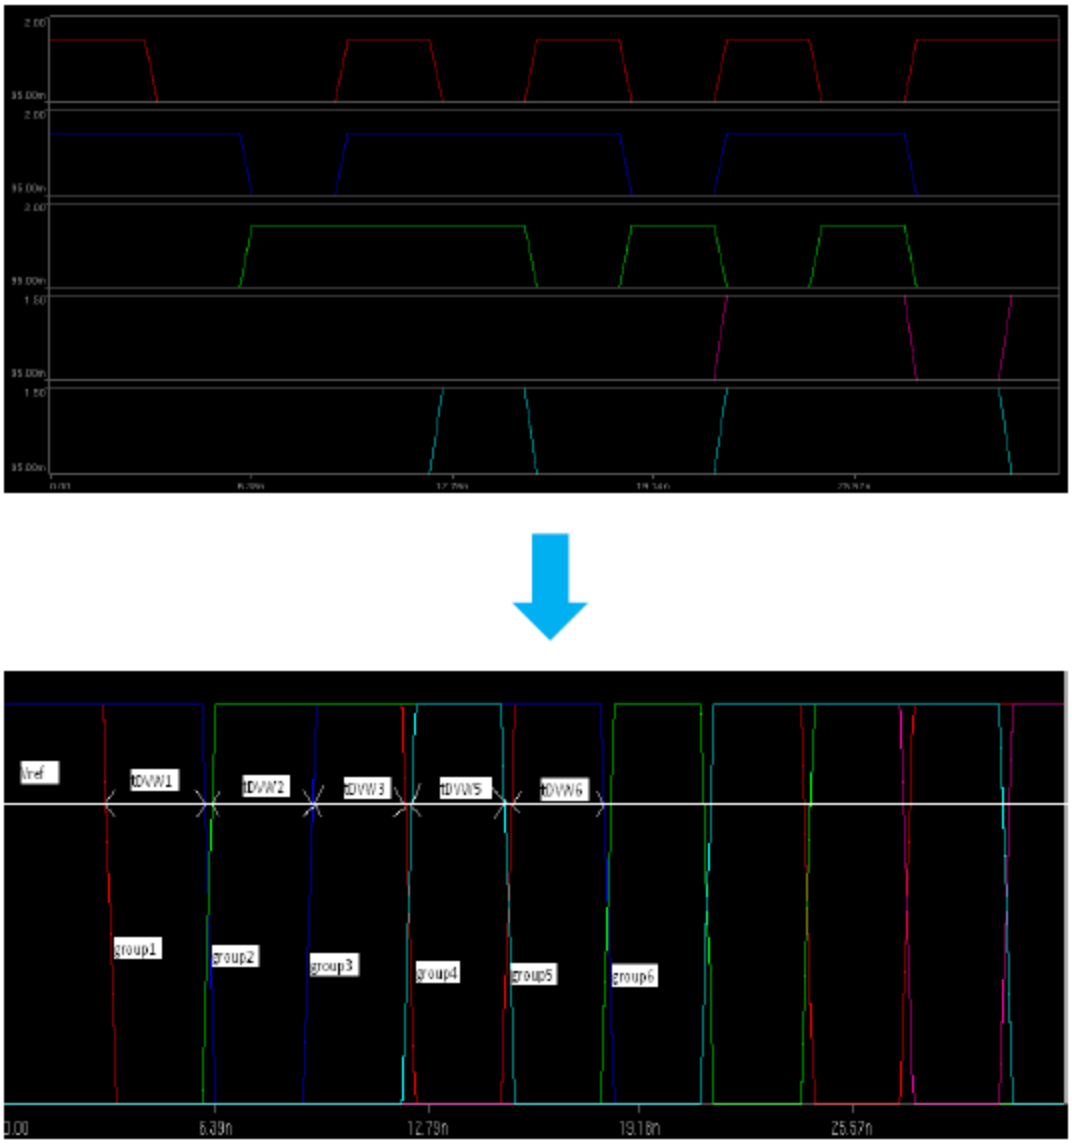
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Validate Data Window

1. Select multiple targets.
2. Overlap them together.
3. Detect edges on all the targets.
4. Group all the edges based on the pulse width.
5. Get edge point on edge.
6. Calculate the window between 2 continual group.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. Report out the min & max value.

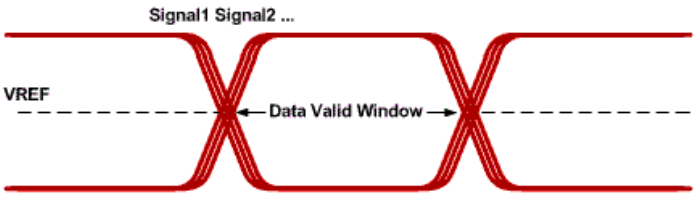


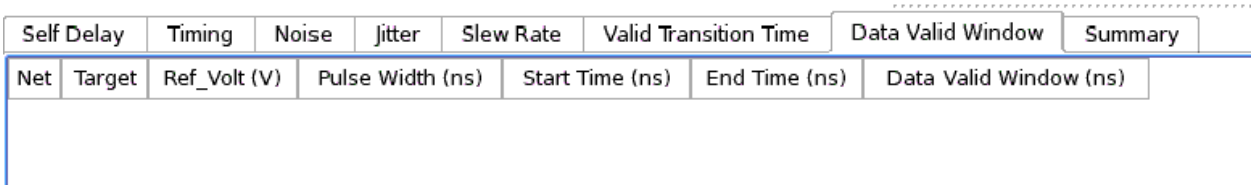
Valid Data Window Keywords

1. Target: report target.
2. Ref_Volt: reference voltage.
3. Pulse width: UI width.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Start_time & End_time : Same as Self-delay.

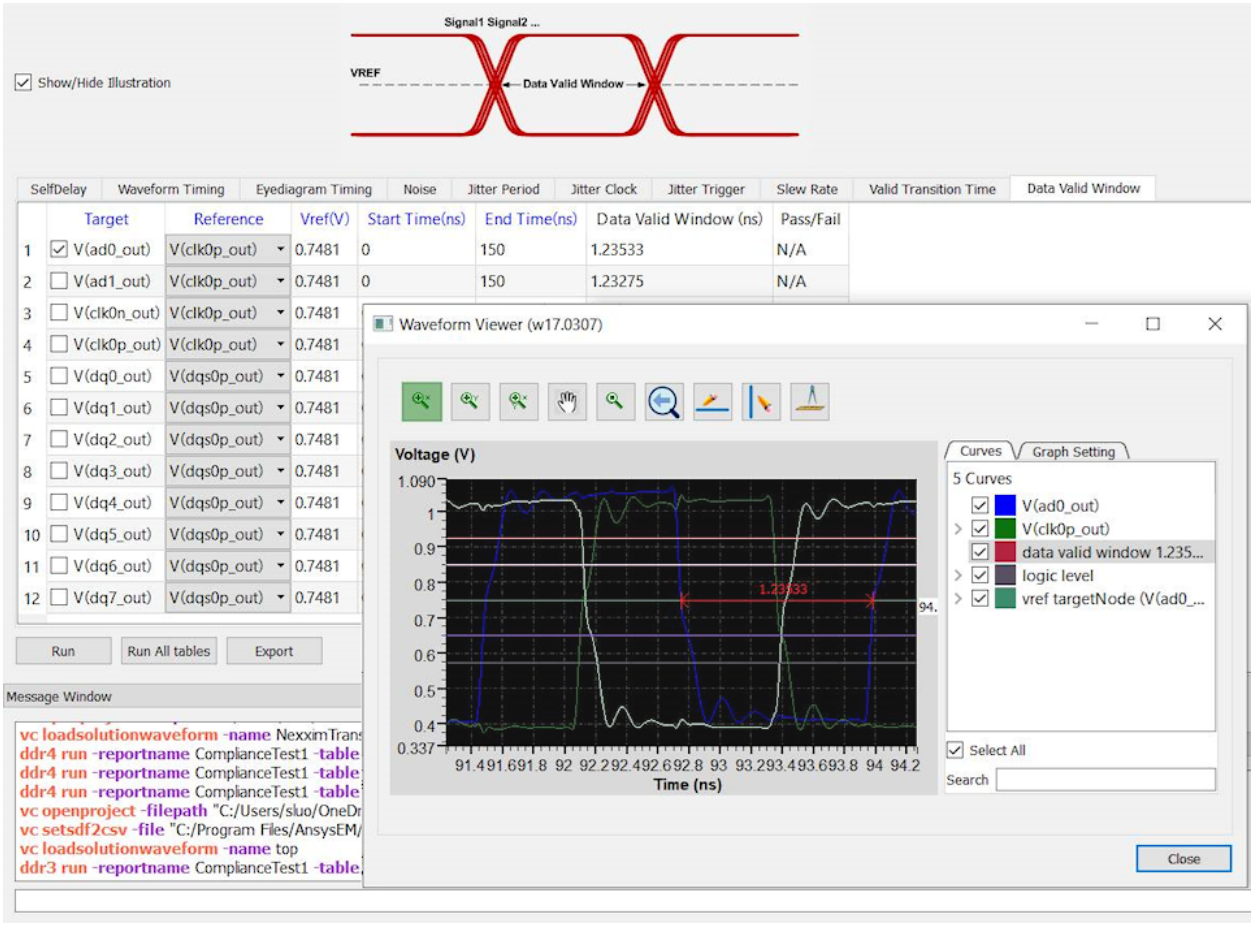




Valid Data Window Example

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select multiple targets.
2. Run to generate report.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

13 - Circuit Frequency Domain Analyses

Nexxim provides a variety of analysis methods for simulating circuit designs in the frequency domain.

Harmonic Balance Analysis

Harmonic balance analyzes the periodic or quasi-periodic steady-state response of a circuit to a periodic input by solving the circuit equations in the frequency domain. Time domain equations are represented by their Fourier series equivalents. In a one-tone or periodic analysis, the input is a sine wave at a specified frequency, and the response is measured over a specified range of harmonics of that frequency. In a multi-tone or quasi-periodic analysis, the input is a combination of sine waves at different frequencies, and the response is a spectrum containing the DC response, the harmonics of the input frequencies, and the sums and differences of the harmonic frequencies.

See Nexxim Harmonic Balance Analysis.

HB Load Pull Analysis

Load-pull analysis is used to determine the optimum load on a circuit. Nexxim load-pull analysis measures the output calculated by harmonic balance while varying the reflection coefficient of one input. The load-pull input is set up as a passive tuner.

See Nexxim Harmonic Balance Analysis.

Oscillator Analysis Tool

Oscillator analysis uses harmonic balance analysis techniques to find the oscillating frequency of a resonant circuit. The resonant frequency is an unknown, although the process of finding it can be aided by providing an estimate that is close to the true value.

The analysis has two phases. First, initial estimates of the oscillating frequency and test voltage are made, either from user input or as directed by simulator options, and those estimates are assigned to the probe. Second, multiple harmonic balance analyses are performed while adjusting the probe frequency and voltage, until a more accurate, final resonant frequency is found.

Oscillator analysis can be set up for single-tone or multi-tone calculations. In single-tone analysis, a single resonant frequency is calculated. In multi-tone analysis, two or more unknown oscillations are analyzed. Including the effects of one or more driving frequencies is optional.

The simulation can be directed to run just the initial estimate phase (resonant frequency search), or to run both the initial and the final phases of oscillator analysis.

The simulation can include phase noise analysis as part of the oscillator analysis.

See Nexxim Oscillator Analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Envelope Analysis

Envelope analysis is commonly used to analyze systems where harmonic balance or transient analysis alone is not adequate. Such systems include circuits with two inputs, where one input is a fast-changing periodic or quasi-periodic source such as a clock or Local Oscillator (LO) and the other input is a non-periodic source such as a baseband RF modulator that changes on a timescale that is orders of magnitude slower than the timescale of the fast-changing input. Transient analysis requires a small timestep to capture the fast-changing input, but then requires a very large number of timesteps to simulate the slowly changing non-periodic input. Harmonic balance fails to analyze the non-periodic input.

Envelope analysis uses transient analysis to simulate the slowly moving signal in the time domain, plus harmonic balance to analyze the fast-moving signal in the frequency domain. The time-domain analysis can use a varying timestep that is appropriate to the slowly changing waveform. At each timestep of the transient analysis, an HB analysis is run. The frequency coefficients at each timestep are stored and returned as the result. From these coefficients, obtain a variety of results including a transient-like time-domain result.

See Envelope Analysis.

Time-Varying Noise Analysis

Time-varying noise analysis (TV-Noise) calculates the response of a circuit to shot, thermal, and flicker noise sources analyzed as small-signal AC perturbations around the periodic steady-state operating point calculated by harmonic balance. The circuit elements are linearized by a DC operating point calculation prior to the harmonic balance analysis. The user specifies the range of frequencies over which the noise is to be calculated, one output whose response is to be calculated, and the output harmonic frequencies of interest. Optionally, an input can be specified to use as an input-referred noise (IRN) source. The response matrix shows the noise power spectrum at the specified harmonic frequencies.

See Nexxim Time-Varying Noise Analysis.

Periodic Transfer Function Calculation

The TV Noise analysis can be extended to include periodic transfer function analysis. Periodic transfer function analysis computes the small-signal transfer function from multiple input sources at multiple frequencies to one output at one frequency, or using the sweep of output frequencies on the TV noise analysis setup. A typical application for periodic transfer function analysis is to determine image rejection.

See Nexxim Time-Varying Noise Analysis.

Linear Network Analysis

Linear network analysis (LNA) computes the frequency-dependent scattering, impedance, and admittance parameters for a linearized circuit. Linear network analysis performs a linear

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

frequency-domain analysis. Circuit components are analyzed using Y-matrix analysis, and any nonlinear devices are linearized around their bias points when computing the bias values.

Optionally, LNA can include group delay analysis. Group delay analysis determines the delay of the propagation of energy at a given frequency point. This analysis is defined as the derivative of the phase of a network parameter with respect to frequency, using the S-parameters as a basis for calculation.

Optionally, LNA can include DC noise analysis. Noise analysis calculates the noise spectral density at designated outputs due to thermal, flicker, and shot noise sources in a circuit that has been linearized around the DC bias operating point.

Optionally, LNA can calculate the AC small-signal transfer functions relating outputs to inputs at selected test frequencies. AC analysis calculates the response of a circuit to small-signal AC perturbations around the DC bias operating point.

See Nexxim Linear Network Analysis.

Smith Tool

The Ansys Smith Tool is an interactive Smith chart utility for the design of amplifiers, oscillators, and matching networks. The Smith Tool is available after a successful linear network analysis.

See Smith Tool.

Nexxim Harmonic Balance

Harmonic balance analysis calculates the periodic or quasi-periodic steady-state response of a circuit to periodic inputs by solving the circuit equations in the frequency domain. Time domain equations are represented by their Fourier series equivalents. In a one-tone analysis, the input is a sine wave at a specified frequency *f*, and the response is usually measured over a specified range of multiples or sub-multiples of that frequency. In a multi-tone analysis, the inputs are at two or more frequencies (f_1, f_2, ...). The response is a spectrum containing the DC response, the harmonics of the input frequencies, and the sums and differences of the harmonic frequencies. An optional load-pull analysis is available for schematic designs.

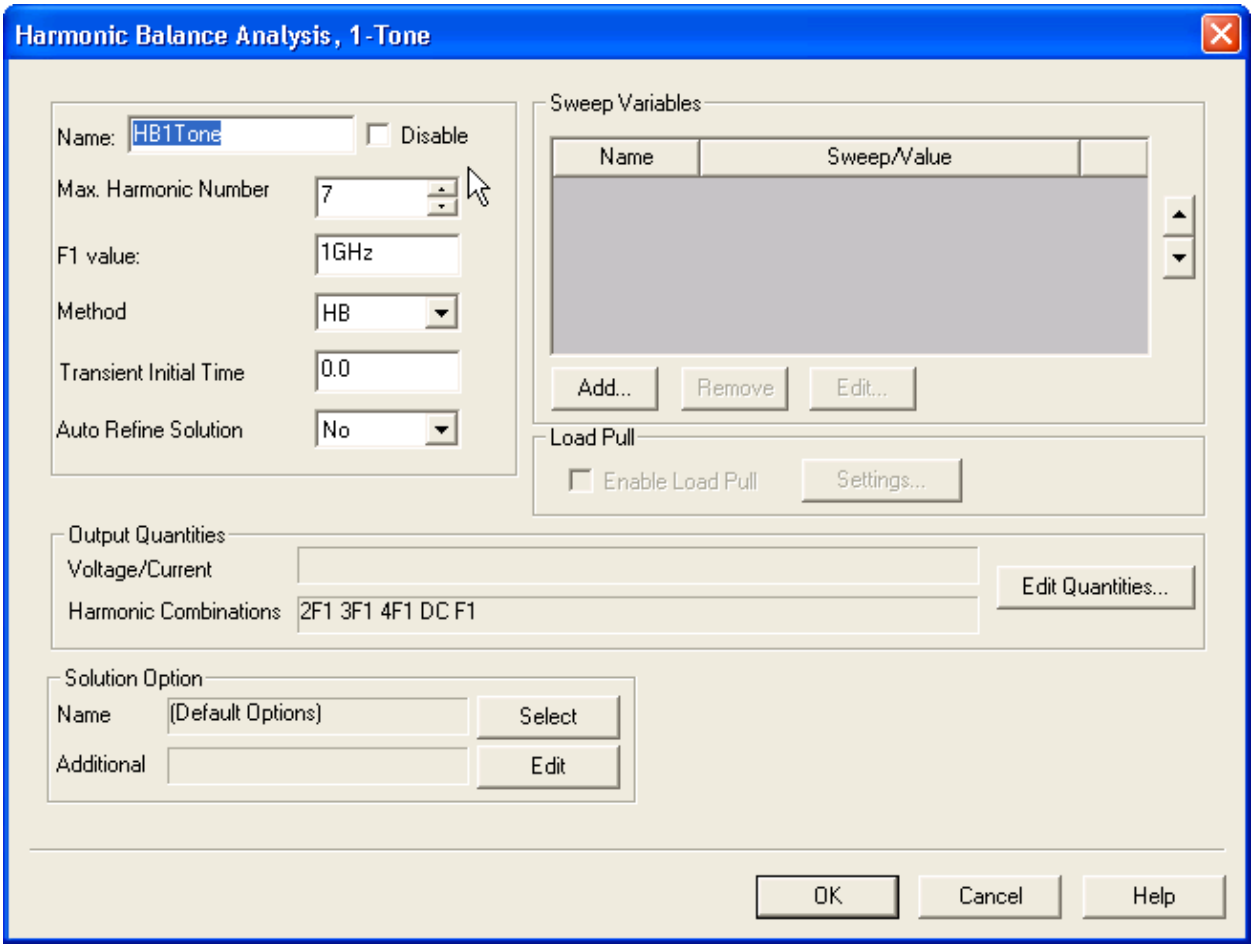
Running Harmonic Balance on the Schematic Editor

From the **Schematic Editor**, perform the following steps to set up and run a harmonic balance analysis using Nexxim.

1. In the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim SolutionSetup** > **Harmonic Balance (1-Tone)** or **Harmonic Balance (N-Tone)**.

   Select **1-Tone Analysis** to open the **Harmonic Balance Analysis, 1-Tone** window.

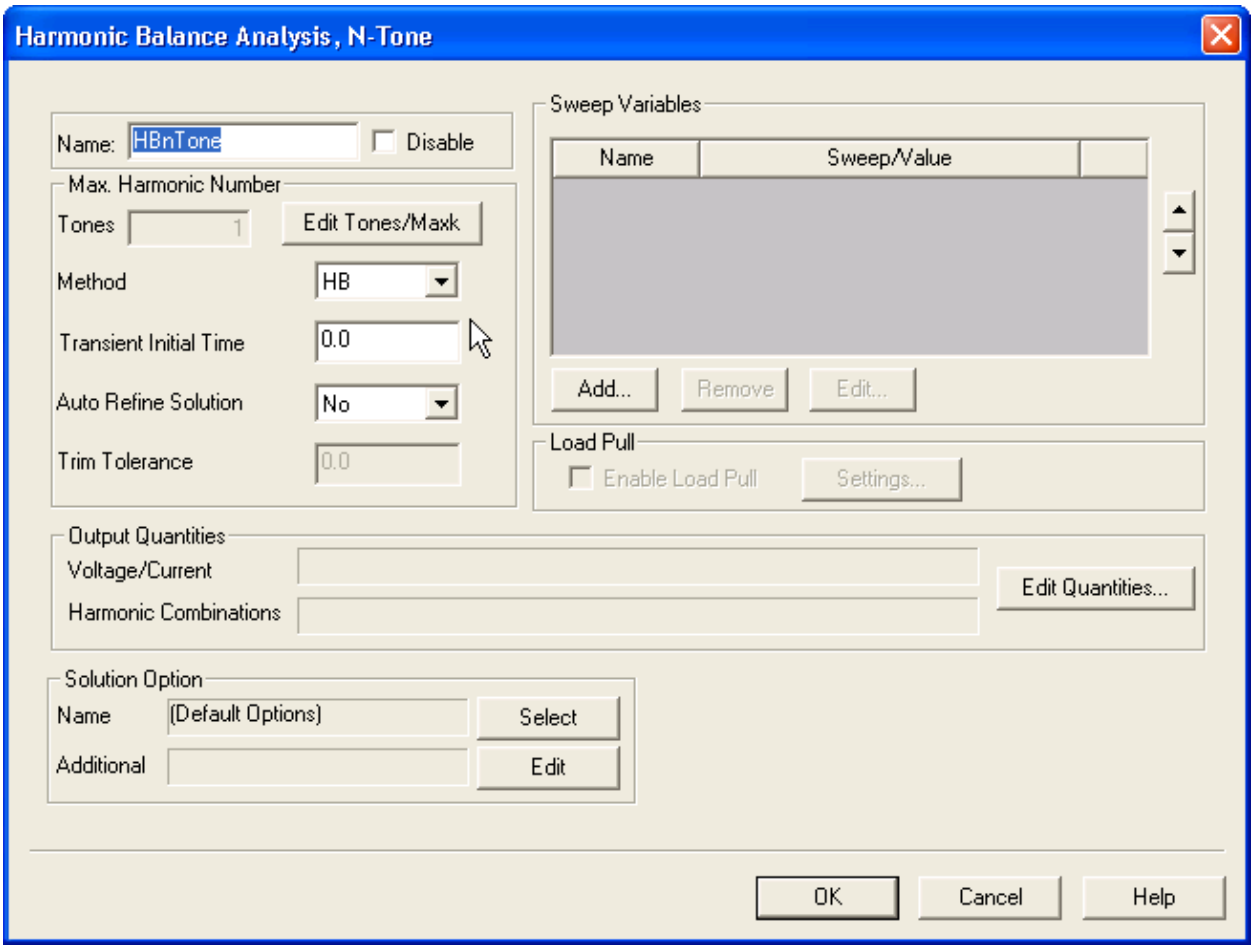
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Type an **Analysis Name** (or accept the default name, for example “HB1Tone”).
- For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
- Specify the maximum harmonic number in the **Max Harmonic Number** field.
- Specify the one-tone frequency in Hz in the **F1 value** field.
- Optionally, select a **Method** (HB or Shooting; HB is the default). See Handling Strongly Nonlinear Circuits for details on the **METHOD** entry in the HB statement.
- Optionally, set **Transient Initial Time** to a positive non-zero value representing time required for Transient to stabilize before HB begins using the result.
- Optionally, set **Auto Refine Solution** to Yes (default is No). See Increasing Accuracy or Speed for details on the **AUTO_REFINE_SOLUTION** entry in the HB statement.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Select **N-tone Analysis** to open the **Harmonic Balance Analysis, N-Tone** window.



- Type an **Analysis Name** (or accept the default name, “HBnTone”).
- For most simulations, leave the **Disable** boxunselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
- Click **Edit Tones/Maxk** to open the **Edit Tones/Maximum Harmonic Number** window. Set the **No. of tones** ; the window shows that number of tones. Click the **Value** field for each tone to enter the appropriate frequency. Click the **MAXK** field for each tone to enter the maximum harmonic number. Click **OK** to close the **Edit Tones/Maximum Harmonic Number** window and return to the **Harmonic Balance Analysis, N-Tone** window.
- If you set the **No. of tones** to 1, the analysis becomes a single-tone analysis. With this setup, the **Method** field is enabled. Select HB or Shooting (HB is the default). See

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Handling Strongly Nonlinear Circuits for details on the **METHOD** entry in the HB statement.

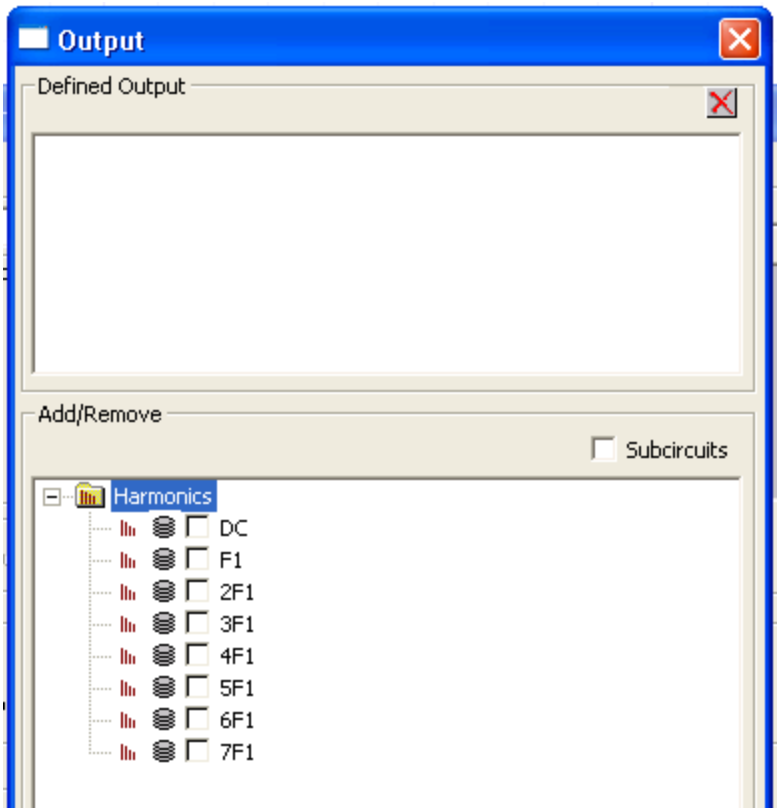
- Optionally, set **Transient Initial Time** to a positive non-zero value representing time required for Transient to stabilize before HB begins using the result.
- Optionally, set **Auto Refine Solution** to Yes (default is No). See Increasing Accuracy or Speed for details on the **AUTO_REFINE_SOLUTION** entry in the HB statement.
- When the number of tones is greater than one, the **Trim Tolerance** field is activated. See Increasing Accuracy or Speed for details on the **TRIM_TOL** entry in the HB statement.

2. To add a sweep, locate the **Sweep Variable** area in the **Harmonic Balance Analysis**window.

- From the **Sweep Variable** area, select **Add** to open the **Add/Edit Sweep** window.
- In the **Variable** list, select **Temp** or the name of a variable (when a variable has been defined for the design), then select one of the following: **Single value**, **Linear step**, **Linear count**, **Decade count**, or **Octave count**.
- Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
- For details on sweeps, see Variable Sweep.
- Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **Harmonic Balance Analysis** window.

3. Click **Edit Quantities** to open the **DefinedOutput** window. In addition to the circuit nets and nodes, select the harmonics to include in the analysis:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Click the check boxes on the **Output** window to select harmonics, and add net voltages and branch currents to the data generated by the harmonic balance analysis. (If no harmonics are selected, harmonics DC, F1, 2F1, 3F1, and 4F1 is automatically selected for output. In the **Report** window, only the selected harmonics are available for plotting.)
- Click **OK** to add the selected output values and return to the **Harmonic Balance Analysis** window.

4. Optionally, use the fields in the **Solution Options** group box to select or add HB analysis options and other Nexxim options to the design.
   - Click **Select** on the **Name** field to open the **Select Solution Options** window.

If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a named option set that you have previously defined, click the name of the option set, then click **OK** to return to the **HB Analysis** window. The named option set appears in the **Name** field in the **Solution Options** group box.

To create a new option set, click **New** to open the **Solution Options** window. Click the **Name** field to name the new option set. Select the **HB Options** tab. Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window box. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

to the **HB Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.

- Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**.

Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Do not include the keyword .OPTIONS; the .OPTIONS keyword is automatically inserted at the beginning of the line in the netlist statement.

The line can contain multiple options settings. Use spaces to separate the options settings.

To modify or delete an option once it has been added, just edit or delete its entry in the list.

To clear all options, delete the entire line.

Click **OK** to return to the **Harmonic Balance Analysis** window.

The options in the **Additional** field are automatically added to the netlist when the solution containing them is performed.

- For more information, see Harmonic Balance Options.

5. Run the simulation:

- From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- The **Message Manager** window signals success or failure.

Running Harmonic Balance on the Netlist Editor

If you use the Netlist Editor to create a design, the netlist should contain the information for running the harmonic balance analysis. No Solution Setup is required.

Run Nexxim Harmonic Balance Analysis

Run the simulation:

- From the **Circuit** menu, select **Analyze with Nexxim**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- The **Message Manager** window signals success or failure.

Nexxim Harmonic Balance Netlist Format

Harmonic balance can be invoked on the netlist with a .HB statement.

The syntax for 1-tone or N-tone harmonic balance analysis uses parentheses to enclose the vector of tone frequencies and the corresponding vector of harmonics:

.HB TONES=(*f1* [**, ...***fN*]**) MAXK=(***M1* [**, ...***MN*]**)** [**METHOD=HB**|**SHOOTING**] [**AUTO_REFINE_SOLUTION=YES**|**NO**] [**TRIM_TOL=***val*] [**TSTAB=***val*]

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The parentheses are required for multitone harmonic balance analysis; they can be omitted for one-tone harmonic balance analysis.

The **TONES** group box in the .HB statement specifies the frequencies to use in the analysis. The frequencies of the actual voltage or current inputs to the circuit must be equal to or integer multiples of the **TONES** frequencies.

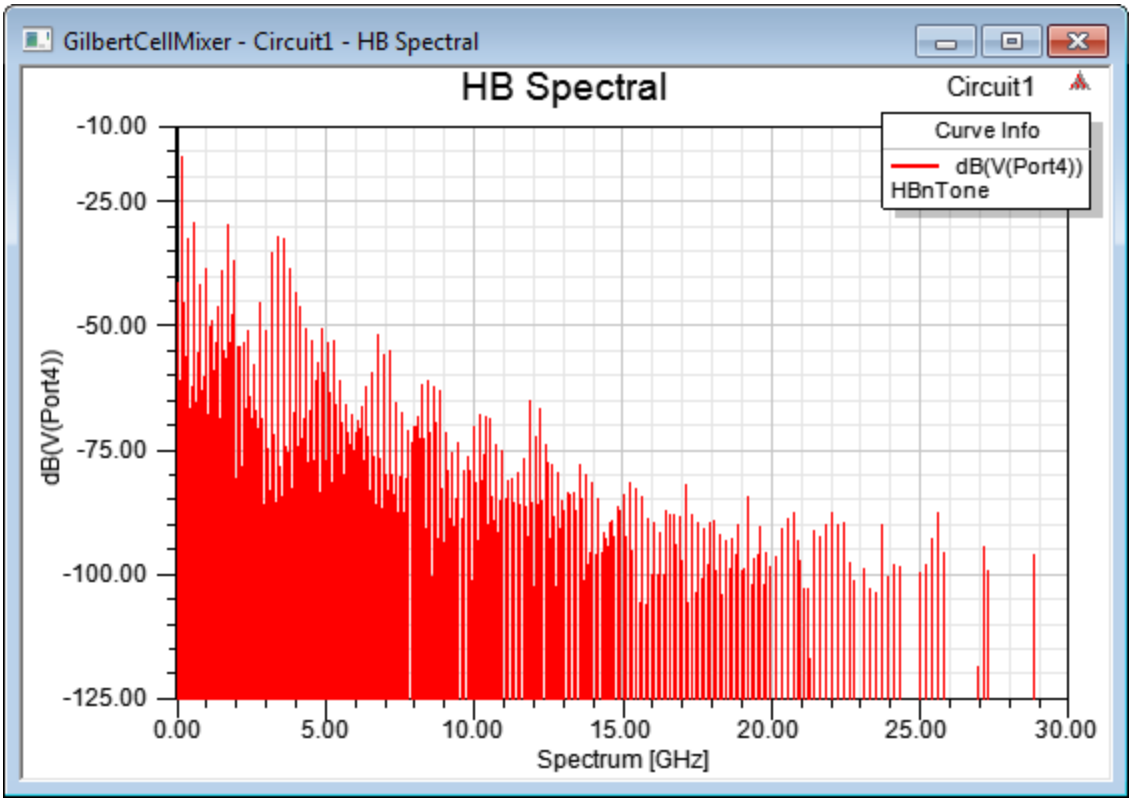
See Handling Strongly Nonlinear Circuits for details on the **METHOD** and **TSTAB** entries in the HB statement.

See Increasing Accuracy or Speed for details on the **AUTO_REFINE_SOLUTION** and **TRIM_TOL** entries in the HB statement.

Harmonic Balance Analysis Outputs

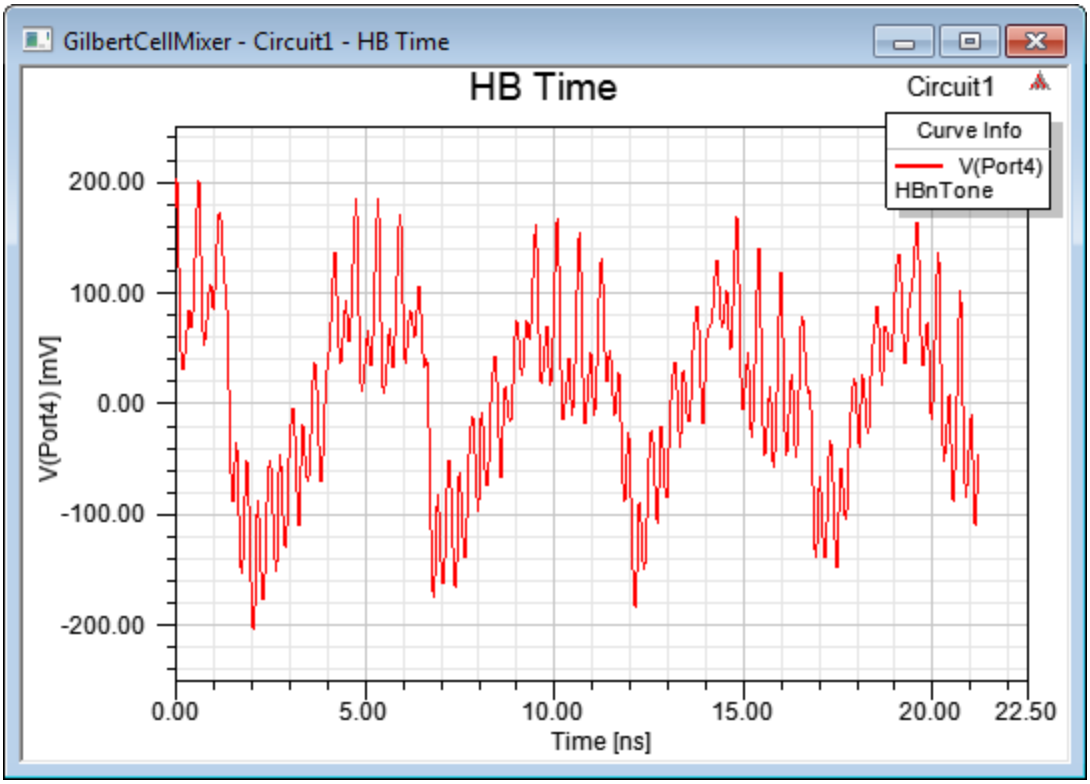
Results on the harmonic balance analysis are available in the spectral domain and in the time domain.

Spectral domain results look like the following:



Time domain results look like the following graph:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For details on creating and modifying reports, see Generating Reports and Post-processing.

See HB Output Notes for details on the relationships between the responses in the frequency and time domains.

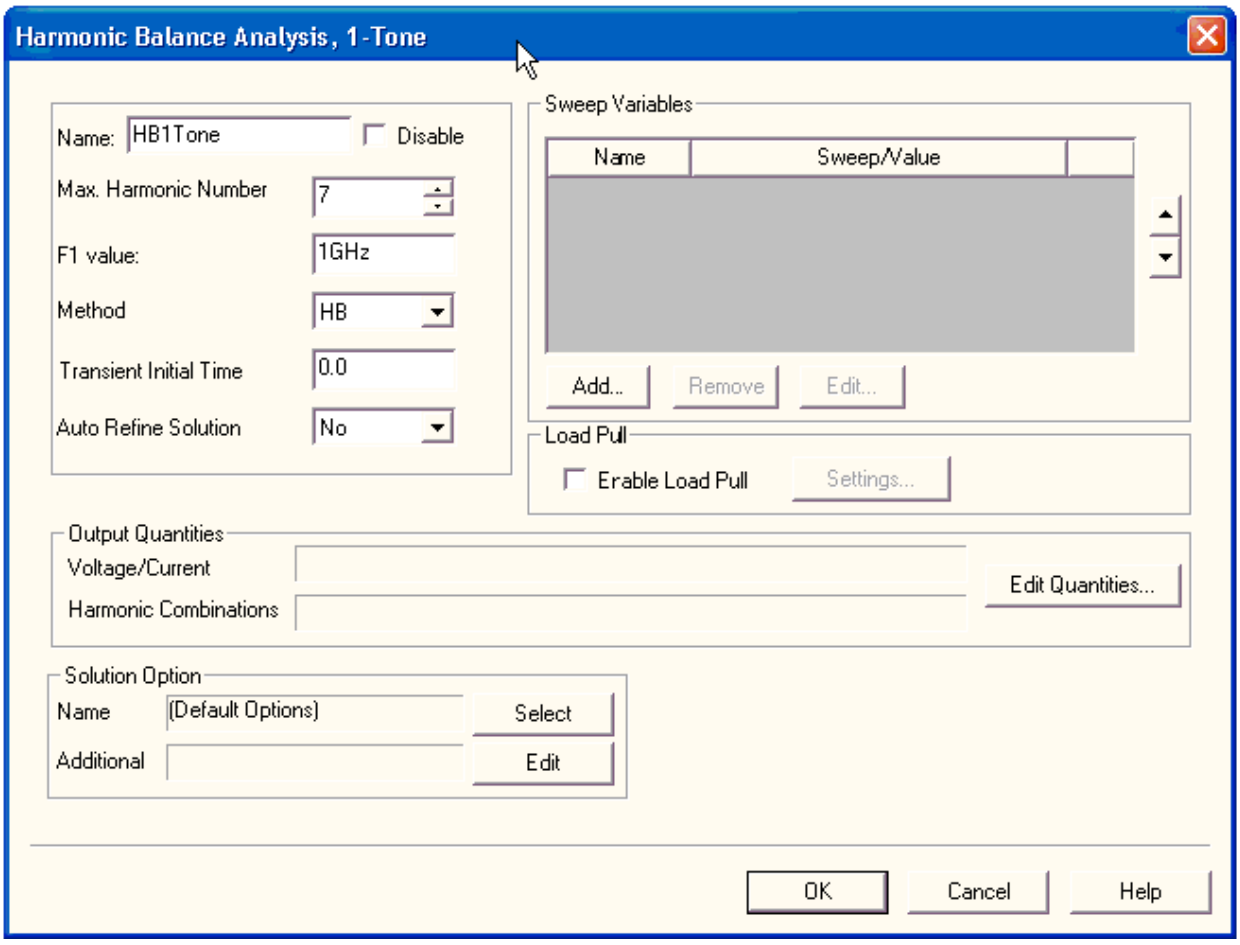
HB Load-Pull Analysis

Load-pull analysis is used to determine the optimum load on a circuit. Nexxim load-pull analysis measures the output calculated by harmonic balance while varying the reflection coefficient of one load. The load-pull load impedance is set up as an ideal tuner.

Load-Pull Analysis in a Schematic

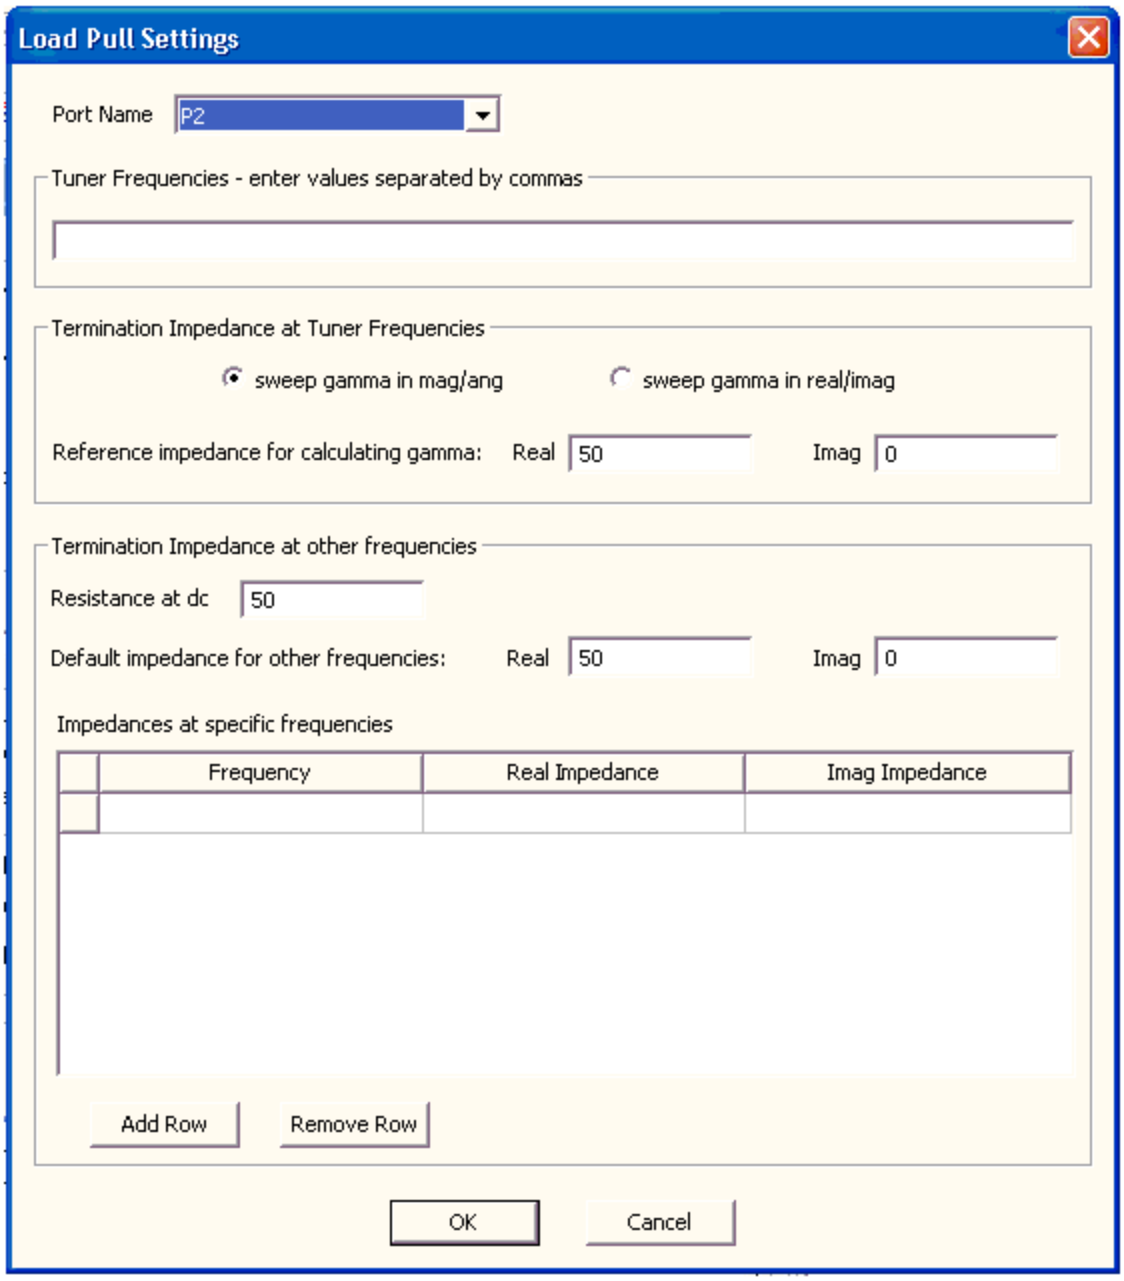
Load-Pull analysis is set up in the **Harmonic Balance Analysis, 1-Tone** window or **Harmonic Balance Analysis, N-Tone** window. The circuit must have at least one port to activate the **Load Pull** group box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. Click the **Enable Load Pull** check box in the **Load Pull** group box to activate load pull analysis. The **Load Pull Settings** window opens:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Make a selection on the port drop-down menu.
- Specify one or more tuner frequencies to be applied in the analysis.
- Select **mag/ang** or **real/imag** as the format for the sweep of the tuner reflection coefficient Gamma. Set the reference impedance to use for the tuner at the specified tuner frequencies. Nexxim automatically creates local variables **ZRho** (sample impedance) and **ZAng** (angle of sample impedance) and sets up the selected port as an ideal tuner with a reflection coefficient defined by the ZRho and ZAng parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Set the termination impedances to use at DC and at frequencies other than the tuner frequencies. You can set specific impedances for particular frequencies in the table, and a default. Click **Add Row** and **Remove Row** to modify the table, as necessary.
- Click **OK** to close the **Load Pull Settings** window.

Nexxim creates linear sweeps of parameters **ZRho** and **ZAng**. The sweep setups are displayed in the **Sweep Variables** group box of the **Harmonic Balance Analysis** window. You can select a load-pull sweep and edit it, but you cannot remove it.

Disabling Load-Pull analysis removes the **ZRho** and **ZAng** sweeps on the setup and removes the **ZRho** and **ZAng** variables on the port.

2. From the **Project Manager** window, expand the **Project Tree** and **Analysis** folder. Then right-click the HB solution setup and select **Analyze**.

- If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- If the analysis is not successful, check the **Message Manager** window for an explanation, and then take corrective action.

Load-Pull Analysis Netlist Format

The netlist can add a load-pull analysis by defining netlist parameters ZRho (sample impedance) and ZAng (angle of sample impedance), using these netlist parameters to set an ideal tuner element, and setting up sweeps of the ZRho and ZAng parameters as part of the HB analysis statement. The **bolded** lines in the folloeing example netlist, show the additions for the load-pull analysis.

```
* Nexxim Load-Pull Netlist Example

.PARAM Freq1=1.5e9
.PARAM Freq2=2.2e9
.PARAM ZRho=1 // Sample impedance for load-pull
.PARAM ZAng=0 // Sample impedance angle

V1 net_0 0 DC=0.5 SIN(0 0.5 Freq1 0 0 0)
V2 net_0 0 DC=0.5 SIN(0 0.5 Freq2 0 0 0)
R2 net_0 Port1 1000

RPort1 Port1 0 PORTNUM=1 // Ideal tuner element
+ GAMMA_MAG=ZRho GAMMA_ANG=ZAng // Reflection coefficient
+ REF_REAL=50 REF_IMAG=0 // Reference impedance
+ TUNER_FREQS=[Freq1, Freq2] // Main tuner frequencies
+ Z_FREQS=['2*Freq1-Freq2', '2*Freq2-Freq1'] // Cluster freqs
+ Z_REAL=[100, 100] Z_IMAG=[0.5, 0.5] // Cluster impedances
+ RDC=50 // Tuner Resistance at DC
+ RDEF=50 XDEF=0 // Default tuner impedance for all frequencies
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

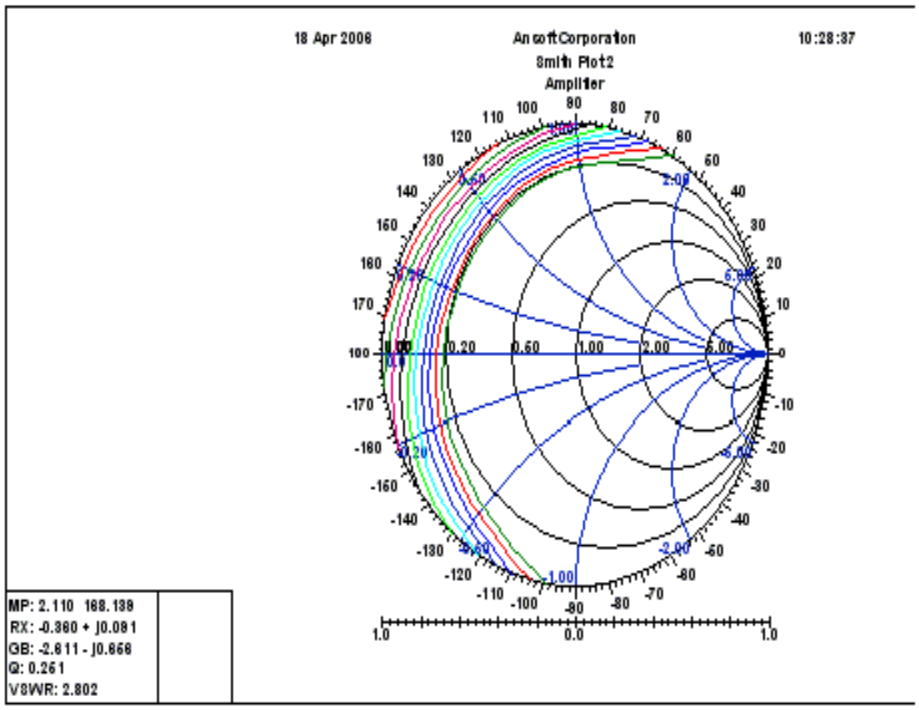
```
.HB
 + TONES=[Freq1, Freq2] MAXK=[2, 2]
 + SWEEP // Sweeps of ZRho and ZAng implement the load-pull
 + ZRho LIN 11 0 1
 + ZAng LIN 13 0 6.283185307
.END
```

For more information, see *Ideal Tuner* in the Nexxim Components help topics for details on the ideal tuner element.

Viewing Load-Pull Analysis Results

To display a Smith Contour chart of the load-pull results after a successful analysis:

1. Click the **Results** icon in the **Project Manager** window.
2. Select **Create Load Pull Report**, then select **Smith Contour Plot**. Click **OK** to open the **Reports** window.
3. From the **Reports** window, select the **HB** analysis and select **LoadPull Contour** as the **Domain**.
4. Select **Power**, select the appropriate port number, and select **<none>**. Click **New Report**. A Report window opens to display a graph of the analysis results.



For details on creating and modifying reports, see Generating Reports and Post-processing.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Harmonic Balance Options

The default values of the harmonic balance analysis options are listed in the Nexxim Harmonic Balance Options Reference. These default values can be changed with a .OPTIONS statement. The syntax is:

.OPTIONS [**hb.**]*option1*=*value1* [[**hb.**]*option2*=*value2* ...]

Use the prefix **hb.** when an option applies only to harmonic balance but not to other tools that recognize the option.

See Analysis-Specific Options for a listing of options that are used by more than one Nexxim analysis.

> **Note:**
>
> Harmonic balance uses 1.0e-7 as the default for **vntol**, the absolute node voltage tolerance. Nexxim DC and transient analysis tools use 50e-6 for the default. Tightening **vntol** allows HB to accurately analyze circuits with normal values in microvolts.

For the subordinate options that are available when an option such as **initial_guess=transient** is in effect, use periods to separate the subordinate option field (e.g., **hb.initial_guess.transient.tmax**).

See Controlling Nexxim Harmonic Balance Analysis for a discussion of the effects of changing these options.

Harmonic Balance Troubleshooting Guide

The following topics are intended to help with specific harmonic balance issues.

A convergence issue can be caused by a circuit or improper solver setting. To improve convergence on the solver side:

1. Weaken nonlinearity by increasing the values of Alpha and Beta.
2. Improve the initial guess as mentioned in HB Convergence Aids and Frequency Divider Circuit Errors.
3. Increase max_newton_iterations and/or decrease limiting_step to aid convergence.
4. Loosening tolerances (abstol, vntol, reltol) may increase the chance of convergence, as mentioned in HB convergence Check Failures. However, loosening tolerances implies increased errors in the solution and such increased errors may adversely affect a convergence problem. Hence, loose tolerances slightly if necessary.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Use the shooting method, see Handing Strongly Nonlinear Circuits. (Nexxim tries the shooting method automatically, for single tone, if HB failed. The simulation time may take longer.)
6. Increase inner iterations, see Inner Iterations Limit Errors.
7. Reduce the finite truncation error by using nonzero values for CMIN, or increasing the number of harmonics.

Note:
1. Modification on Alpha, Beta, and CMIN changes the circuit.
2. Different methods are used for the initial guess alternately. If one failed, try the next. This process may take long and sometimes display error messages in other types of analysis, like transient analysis. If a simulation succeeds at the end, try to manually set pseudo_transient as the continuation method to avoid long simulation time.

Inner Iterations Limit Errors

When the inner linear solver does not converge within the maximum number of iterations set by the option **hb.max_linearsolver_iterations** (the default is 100 iterations), Nexxim generates the following warning:

```
[warning]analysis:hb(warning): Inner iterations limit reached. If
analysis fails, try setting hb.max_linearsolver_iterations = 200 or
higher
```

The option **hb.max_linearsolver_iterations** can be set from in the **Schematic Editor** or in the netlist.

Frequency Divider Circuit Errors

Frequency divider circuits can present a problem for harmonic balance. The options that prove most useful depend somewhat on whether the harmonic balance is a single-tone or multitone analysis

With single-tone analyses, convergence can be achieved by setting the **method** option to **shooting**:

```
.option hb.method=shooting
```

This shooting method for single-tone problems is a time-domain method for achieving a steady state.

Another useful option for single-tone circuits is to use transient analysis to generate the initial guess at voltages:

```
.option hb.initial_guess=transient
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

With multitone problems, successful convergence may be achieved by using the **fewer_tones_transient** strategy:

```
.option hb.initial_guess=fewer_tones_transient
```

The **fewer_tones** strategy in general calculates a single-tone solution as the initial guess for the 2-tone analysis, and proceeds to add more and more tones until the full multitone problem converges. With the **fewer_tones_transient** option, Nexxim uses transient analysis to generate the initial guess for the single-tone.

Convergence can also be improved by doubling or tripling the value of **tstop**:

```
.option hb.initial_guess=fewer_tones_transient.tstop=val
```
k,

HB Convergence Check Failures

The Linear Solver uses function (residue) and delta (update) checks similar to those described under DC Analysis.

- View Function Check.
- View Delta Check.

Sometimes a combination of roundoff error and tight tolerances causes convergence at a particular node to fail with a trace message such as:

```
#|F| = 2.14983e-011 |dx| = 1.11644e-015 |x| = 1.2
<trace>:Residue convergence check failed for node net_1979.
```

If this failure occurs, try loosening **abstol** (absolute current tolerance) to 4e-12 or higher (on the default of 1e-12 for harmonic balance):

```
hb.abstol=4e-12
```

This change affects the entire circuit, not just the problem node. Although it is not a robust solution, loosening **abstol** often achieves convergence on the correct solution.

Nexxim Oscillator Analysis

Oscillator analysis uses harmonic balance analyses to find the oscillating frequency of a resonant circuit. The process of finding the unknown resonant frequency can be aided by providing an estimate that is close to the true value.

Oscillator analysis uses an oscillator probe element to provide a range of test voltages and frequencies. Use of the probe is explained in the Oscillator Analysis Technical Notes topic. The analysis has two phases. First, initial estimates of the oscillating frequency and test voltage are made, either from user input or as directed by simulator options, and those estimates are assigned to the probe. Second, multiple harmonic balance analyses are performed while

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

adjusting the probe frequency and voltage, until a more accurate, final resonant frequency is found.

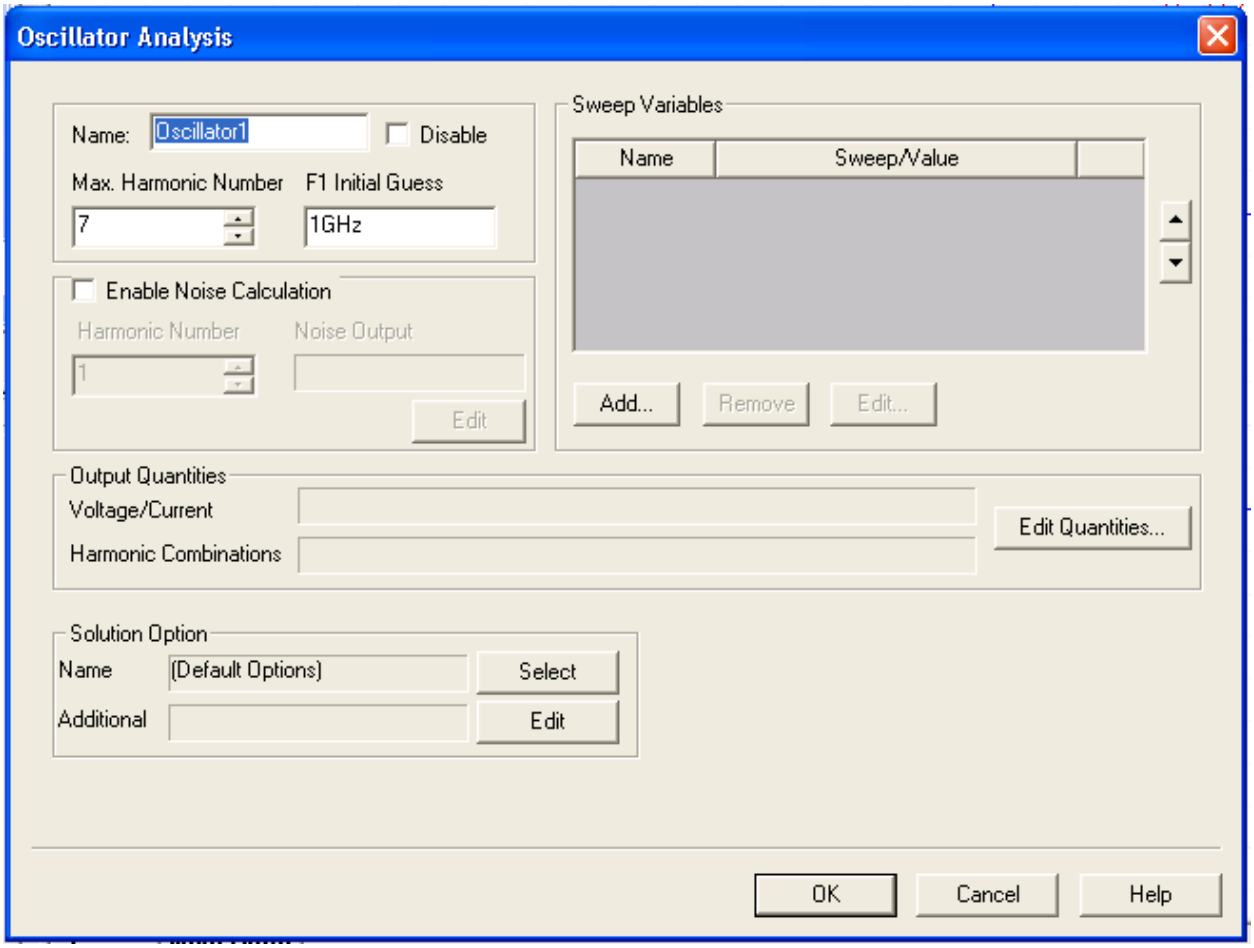
Oscillator analysis can be set up for single-tone or multi-tone calculations. In single-tone analysis, a single resonant frequency is calculated. In multi-tone analysis, two or more unknown oscillations are analyzed. Including the effects of one or more driving frequencies is optional. The simulation can be directed to run an initial estimate (resonant frequency search), or to run both the initial and the final phases of oscillator analysis. The simulation can include phase noise analysis.

Running Single-Tone Oscillator Analysis on the Schematic Editor

Single-tone oscillator analysis is typically used on a circuit that contains an oscillator source of unknown frequency, with no other frequency sources in the circuit. From the **Schematic Editor**, perform the following steps to set up and run a single-tone oscillator analysis using Nexxim.

1. Set up the schematic circuit for oscillator analysis by inserting an oscillator probe between two nodes in your circuit. Edit the probe properties and specify an initial guess for the unknown oscillating frequency (**FREQ** parameter) and an initial voltage (**A** parameter). See Using the Oscillator Probe for details.
2. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **Oscillator Analysis (1-Tone)** to open the **Oscillator Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Type an **Analysis Name** (or accept the default name, for example, “Oscillator”).
4. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
5. The **Oscillator Analysis** window opens. This window allows you to specify the maximum harmonic number to include in the analysis, and a frequency in Hz to be used as the initial guess for the oscillator frequency:

- Specify the maximum harmonic number to use in the analysis by clicking the up and down arrows in the **Max. Harmonic Number** field.
- Specify the frequency for **F1 Initial Guess**. The initial guess should be the same frequency as the **FREQ** parameter on the oscillator probe. The **F1 Initial Guess** value overrides the probe **FREQ** parameter if they are not the same.

6. Optional: To run Phase Noise analysis, check the **Enable Noise Calculation** group box. See Running Phase Noise Analysis on the **Schematic Editor** for details on the other

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

steps in setting up the phase noise analysis.

7. To add a sweep, locate the **Sweep Variable** area in the **Oscillator Analysis** window.

- From the **Sweep Variable** area, select **Add** to open the **Add/Edit Sweep** window.
- In the **Variable** list, select **Temp** or the name of a variable (when a variable has been defined for the design), then select one of the following: **Single value**, **Linear step**, **Linear count**, **Decade count**, or **Octave count**.
- Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
- For details on sweeps, see Variable Sweep.
- Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **Oscillator Analysis** window.

7. Click **Edit Quantities** in the **Output Quantities** field to open the **Defined Output Quantities** window.

Expand the icons for the circuit components (**Nets** and individual devices), and click the check boxes to select quantities for output.

Expand the **Harmonics** icon to display a list of harmonics (the number of available harmonics is set by the **Max Harmonic Number** specified in Step 6). Select and **Add** the harmonics you want to analyze. If you do not select any harmonics, harmonics DC, F1, 2F1, 3F, and 4F1 are automatically selected. In the **Report** window, only selected harmonics are available for plotting.

Click **OK** to return to the **Oscillator Solution Setup** window.

9. Optionally, use the fields in the **Solution Options** group box to select or add Oscillator analysis options and other Nexxim options to the design.

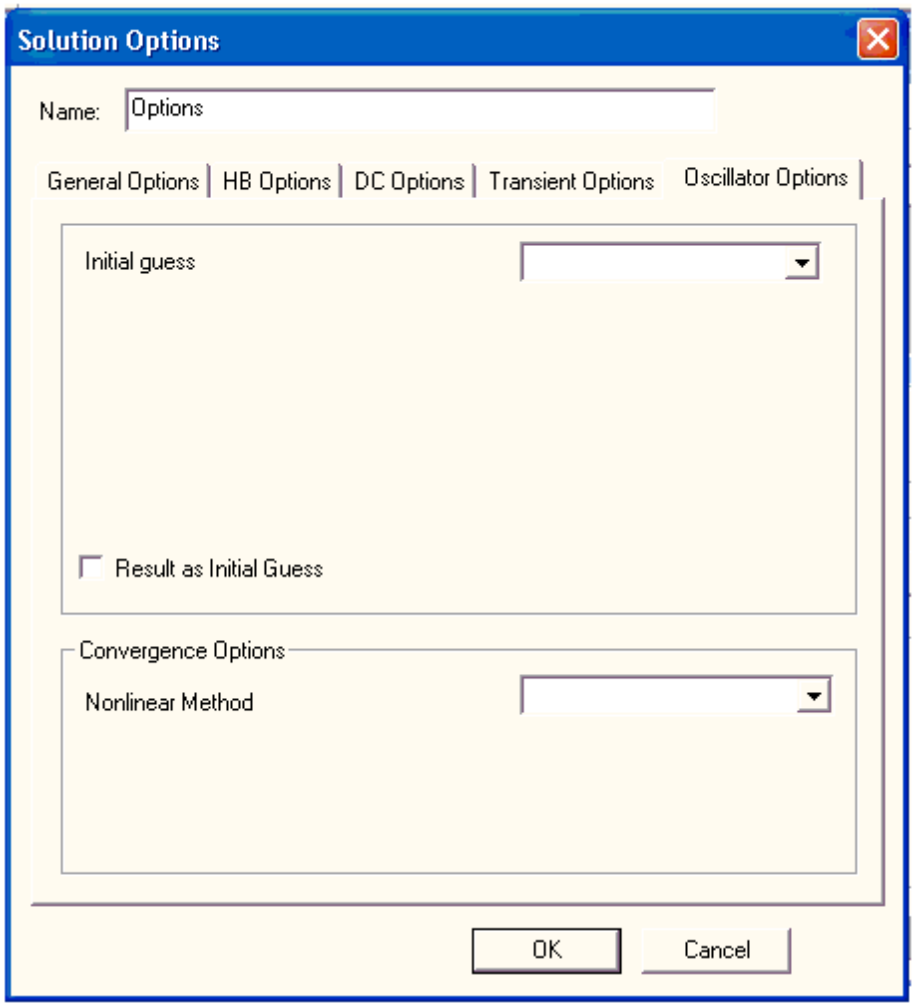
- Click **Select** on the **Name** field to open the **Select Solution Options** window.

If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a named option set that you have previously defined, click the name of the option set, then click **OK** to return to the **Oscillator Analysis** window. The named option set appears in the **Name** field in the **Solution Options** group box.

To create a new option set, click **New** to open the **Solution Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

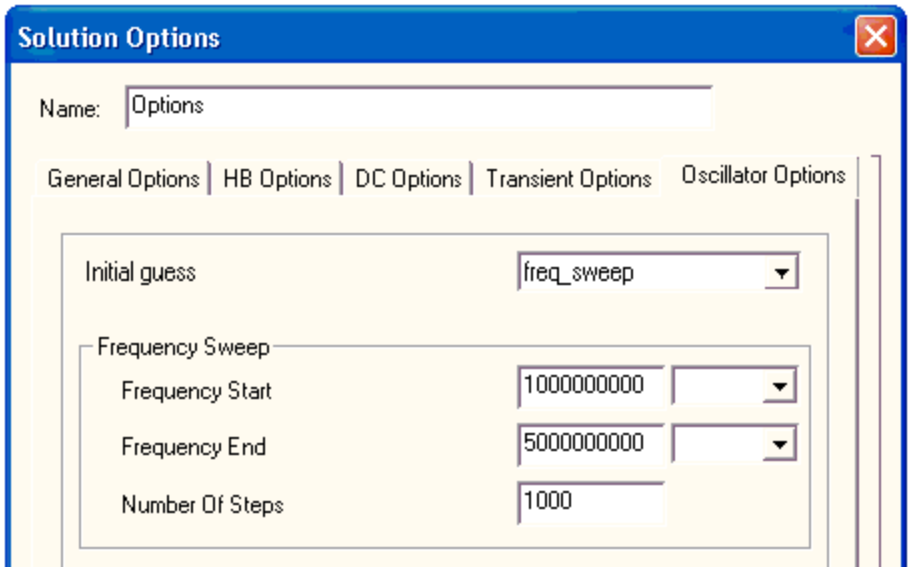
- Select the **Oscillator Options** tab:



- Enter a name for the options, or accept the default name.
- To select an **Initial Guess** option, click in the drop-down menu field. The options are **Frequency Sweep**, **Transient**, and **DC**.

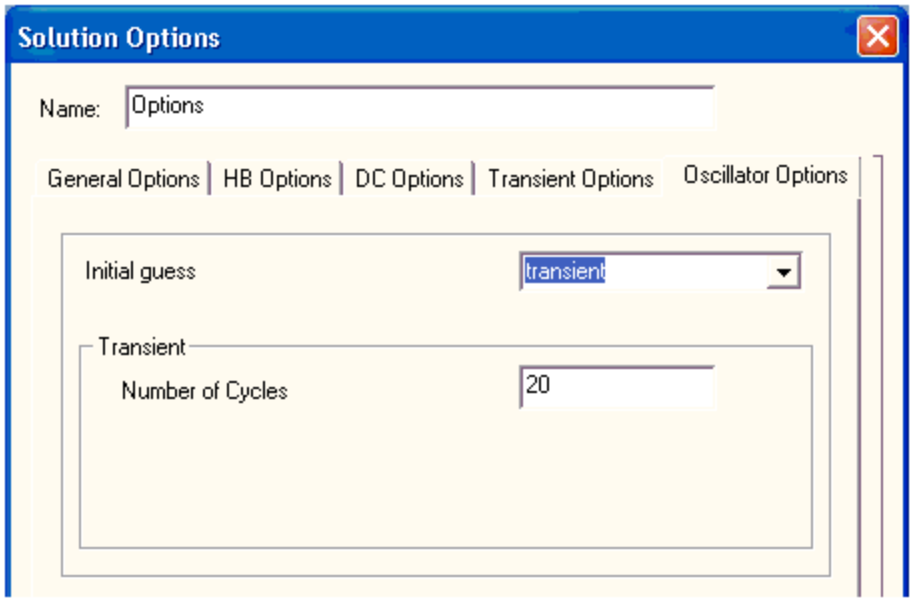
For an **Initial Guess** of **Frequency Sweep**, the window changes to:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Enter the **Frequency Start** and **Frequency End** values. Select the unit (**Hz** or **kHz**) using the drop-down menu.

For an **Initial Guess** of **Transient**, the window changes to:



Enter a **Number of Cycles** if the default is not as appropriate.

- Click the **Result as Initial Guess** group box to use the result on the previous oscillator sweep step as the initial guess for the current step. Use of this setting can avoid repeated

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

analysis runs.

- To select a **Convergence Option**, click in the drop-down menu field. The options are **Newton**, **Descent**, and **Damped Newton**.
- Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window box. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the **DC Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.
- Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**.

Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Do not include the keyword .OPTIONS; the .OPTIONS keyword is automatically inserted at the beginning of the line in the netlist statement.

The line can contain multiple options settings. Use spaces to separate the options settings.

To modify or delete an option once it has been added, just edit or delete its entry in the list.

To clear all options, delete the entire line.

Click **OK** to return to the **Oscillator Analysis** window.

The options in the **Additional** field are automatically added to the netlist when the solution containing them is performed.

- For more information on the option settings, see Oscillator Analysis Options.

10. When all setup steps are as appropriate, click **Finish** on the **Oscillator Analysis** window. The solution setup is added to the **Project Manager** window under the **Analysis** icon.
11. Run the simulation:
    - Click the solution setup in the **Project Manager** window and click **Analyze** on the menu. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
    - If the analysis is not successful, an error message appears in the **Message Manager** window. Check the **Message Manager** window for an explanation, then take corrective action.
12. View results:
    - After a successful oscillator analysis, Nexxim displays a message like the following in the **Message Manager** window, near the end of the messages:

```
[info]analysis:osc(info):
Lowest oscillation frequency is 2.28514e_006 Hz (Time, Date)
```

The frequency value is the one calculated for your circuit, and the time and date shows the time of the analysis on your machine.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

As analysis progresses, oscillator analysis may save messages like the following to the log file:

analysis:osc(status): Probe 0: selecting (*node_name1*,*node_name2*) as alternative location 1.

analysis:osc(status): Probe 0: selecting (*node_name3*, *node_name4*) as alternative location 2.

The *node_name*s are circuit-specific. If oscillator analysis fails, Nexxim automatically reruns the analysis after moving the probe to alternative location 1. If that analysis fails, Nexxim retries using alternative location 2.

Running Multitone Oscillator Analysis on the Schematic Editor

Multi-tone oscillator analysis is typically used on a circuit that includes one or more oscillation sources:

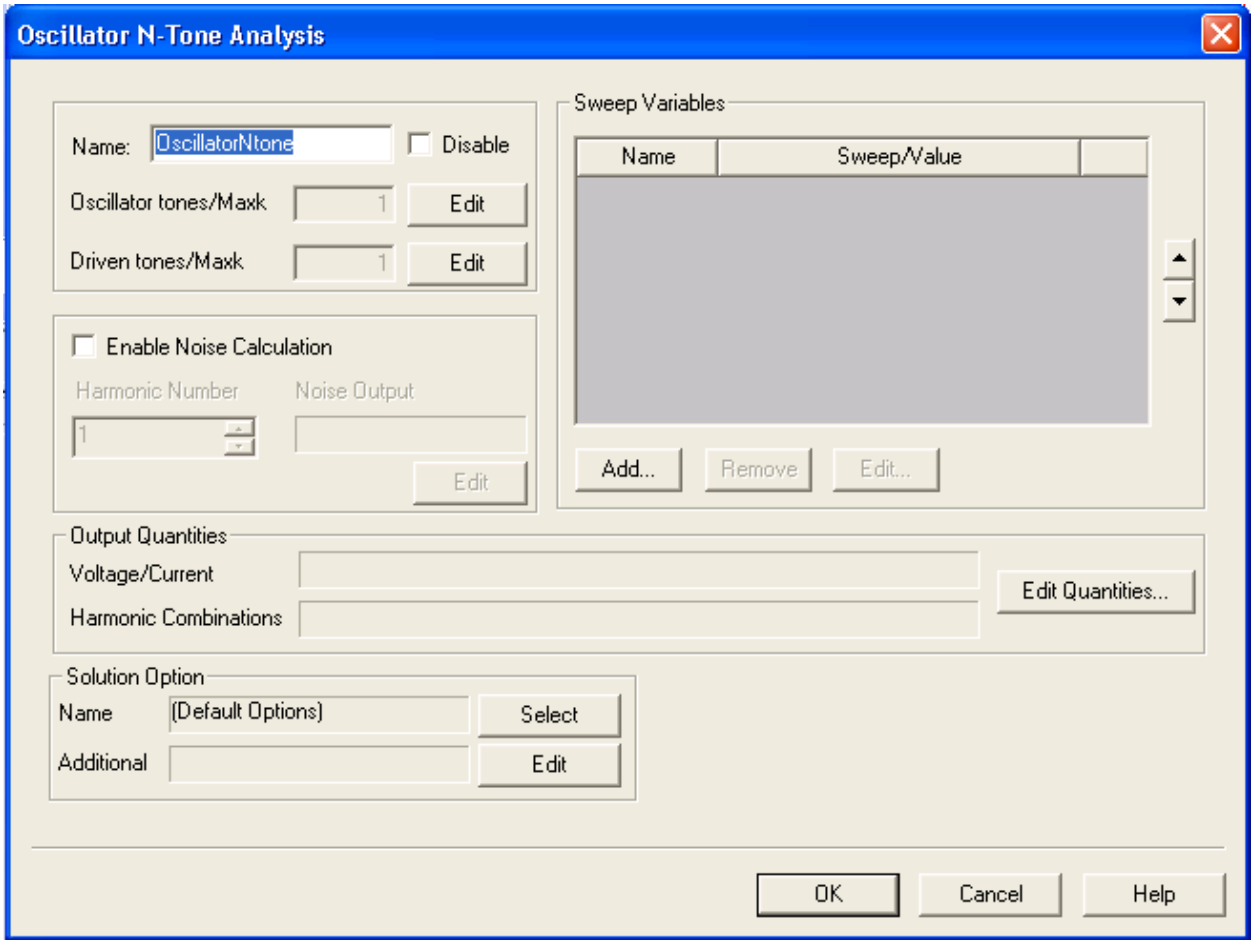
- One unknown resonant frequency (F_1) plus one or more known driven oscillations (RF_1 through RF_M) such as sinusoidal voltage sources.
- Two or more unknown resonant frequencies (F_1 through F_N) with no driven oscillations in the circuit.
- Two or more unknown resonant frequencies (F_1 through F_N) plus one or more known driven oscillations (RF_1 through RF_M).

An example is a mixer circuit connecting one or more voltage-controlled oscillators (VCOs) of unknown frequencies with one or more RF sources of known frequencies to produce a single resultant IF output.

From the **Schematic Editor**, perform the following steps to set up and run a multi-tone oscillator analysis using Nexxim, and view the results.

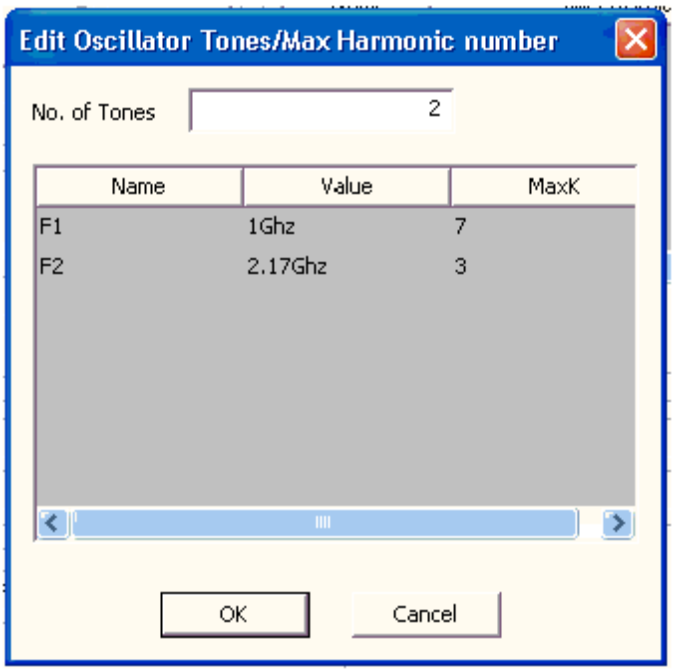
1. Set up the schematic circuit for multi-tone oscillator analysis by inserting oscillator probes between pairs of nodes in your circuit. Each probe represents one unknown oscillation. Edit the probe properties and specify an initial guess for the frequency (**FREQ** parameter) and an initial voltage (**A** parameter) for each probe. See Using the Oscillator Probe for details.
2. From the **Project Manager** window, expand the **Project Tree** and right-click **Analysis**. Then select **Add Nexxim Solution Setup ...** > **Oscillator Analysis (N-Tone)** to open the **Oscillator N-Tone Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. Type an **Analysis Name** (or accept the default name, for example “OscillatorNtone”).
6. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
7. Click the upper **Edit** button to open the **Edit Oscillator Tones/Max Harmonic Number** window:

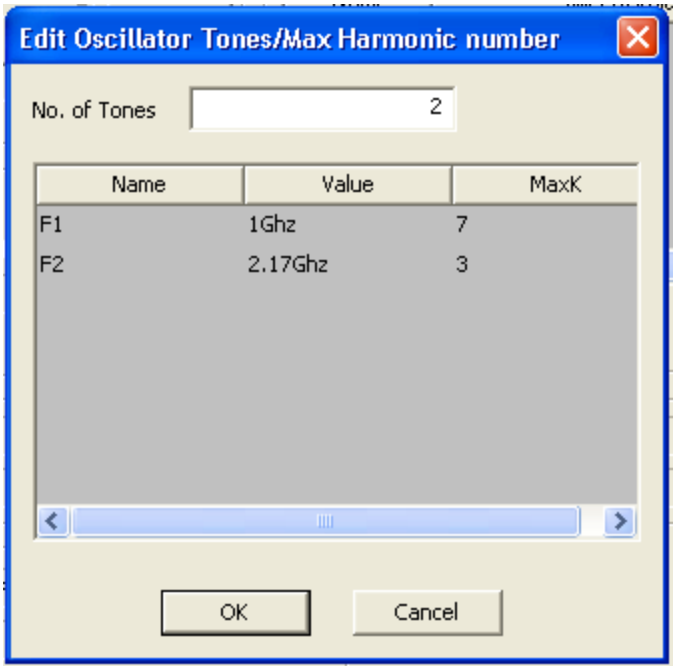
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Specify the number of unknown frequencies to be analyzed in the **No. of Tones** field. The display changes to show that number of tones, labeled **F1** through **F*n***. The names cannot be changed. The illustration above shows two frequencies (however, most analyses have only one unknown frequency). The number of unknown frequencies must be the same as the number of oscillator probes in the circuit.
- Click the **Value** fields for the tones to specify the initial guess frequencies. The initial guess frequencies should be the same as the ones entered in the **FREQ** parameters of the oscillator probes in the circuit. The **Oscillator Tones** values override the probe **FREQ** parameters if they are not the same. The default frequency is 1 GHz.
- Click the **MaxK** field for a tone to specify its maximum harmonic number. The default is 7 harmonics.
- Click **OK** to return to the **Oscillator N-Tone Analysis** window.

8. Click the lower **Edit** button to open the **Edit Driven Tones/Max Harmonic Number** window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Specify the number of driven frequencies in the **No. of Tones** field. The display changes to show that number of tones, labeled **RF1** through **RF*n***. The names cannot be changed. The illustration above shows two driven frequencies. These frequencies represent the known, fixed inputs to the analysis.
- Click the **Value** fields for to specify the frequencies of the driven oscillations. The default frequency is 1 GHz.
- Click the **MaxK** field for a tone to specify its maximum harmonic number. The default is 7 harmonics.
- Click **OK** to return to the **Oscillator N-Tone Analysis** window.

9. Optional: To run Phase Noise analysis, check the **Enable Noise Calculation** group box. See Running Phase Noise Analysis on the **Schematic Editor** for details on the other steps in setting up the phase noise analysis.
10. To add a sweep, Click the **Sweep Variable** area in the **Oscillator N-Tone Analysis** window.

- From the **Sweep Variable** area, select **Add** to open the **Add/Edit Sweep** window.
- In the **Variable** list, select Temp or the name of a variable (when a variable has been defined for the design), then select one of the following: **Single value, Linear step, Linear count, Decade count,** or **Octave count**.
- Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
- For details on sweeps, see Variable Sweep.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **Oscillator N-Tone Analysis** window.

11. Click **Edit Quantities** in the **Output Quantities** field to open the **DefinedOutput Quantities** window.

Expand the icons for the circuit components (**Nets** and individual devices), and click the check boxes to select quantities for output.

Expand the **Harmonic Combinations** icon to display a list of harmonics including combinations. The number of available harmonic combinations is set by the **No. of Frequencies** and the **MaxK** for each frequency set in the **Edit Oscillator Tones/Max Harmonic Number** window in Step 8. Select the harmonics you want to analyze. If you do not select any harmonics, harmonics DC, F1, 2F1, 3F, and 4F1 are automatically selected. In the **Report** window, only selected harmonics are available for plotting.

Click **OK** to return to the **Oscillator Solution Setup** window.

12. Optionally, use the fields in the **Solution Options** group box to select or add Oscillator analysis options and other Nexxim options to the design.

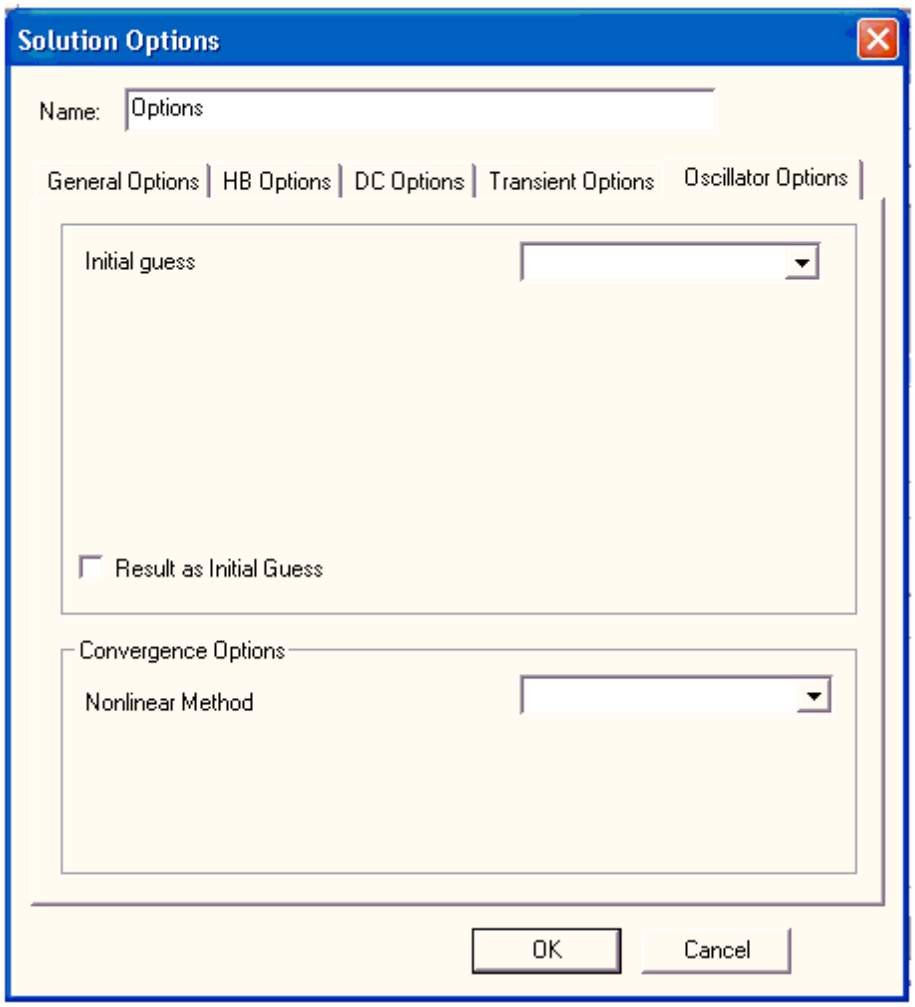
- Click **Select** on the **Name** field to open the **Select Solution Options** window.

If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a named option set that you have previously defined, click the name of the option set, then click **OK** to return to the **Oscillator Analysis** window. The named option set appears in the **Name** field in the **Solution Options** group box.

To create a new option set, click **New** to open the **Solution Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

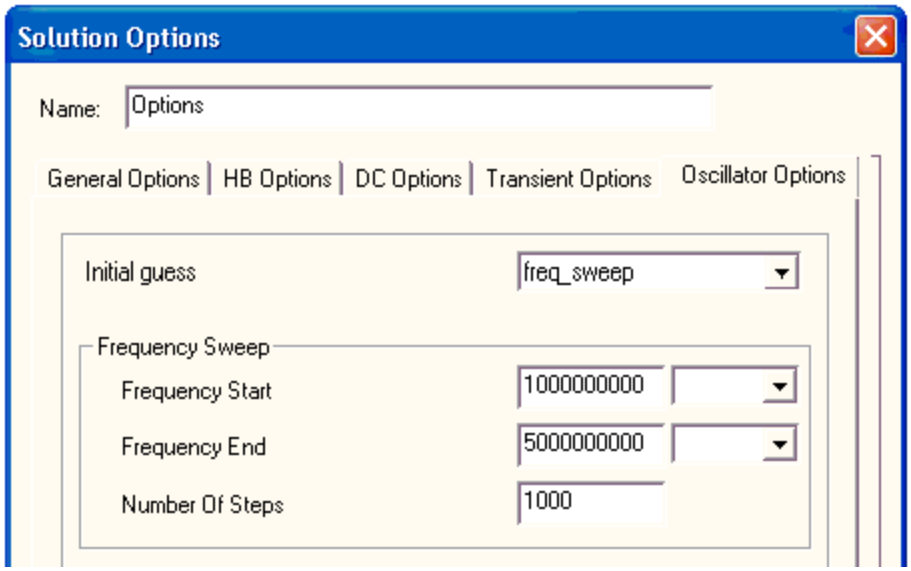
- Select the **Oscillator Options** tab:



- Enter a name for the options, or accept the default name.
- To select an **Initial Guess** option, click in the drop-down menu field. The options are **Frequency Sweep**, **Transient**, and **DC**.

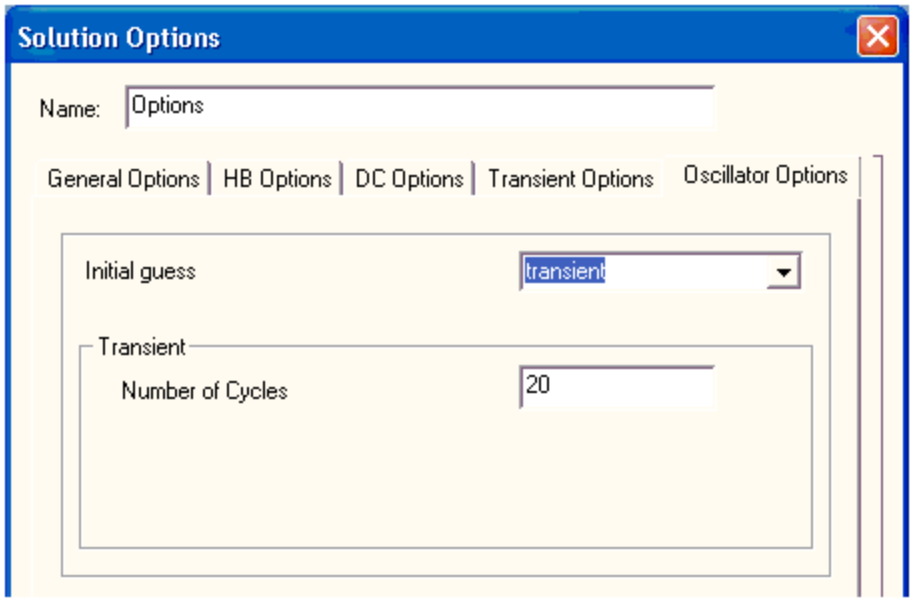
For an **Initial Guess** of **Frequency Sweep**, the window changes to:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Enter the **Frequency Start** and **Frequency End** values. Select the unit (**Hz** or **kHz**) using the drop-down menu.

For an **Initial Guess** of **Transient**, the window changes to:



Enter a **Number of Cycles** if the default is not as appropriate.

- Click the **Result as Initial Guess** group box to use the result on the previous oscillator sweep step as the initial guess for the current step. Use of this setting can avoid repeated

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

analysis runs.

- To select a **Convergence Option**, click in the drop-down menu field. The options are **Newton**, **Descent**, and **Damped Newton**.
- Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window box. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the **DC Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.
- Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**. Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Click **OK** to return to the **Oscillator Analysis** window.
- For more information on the option settings, see Nexxim Oscillator Analysis Options.

13. When all setup steps are as appropriate, click **Finish** on the **Oscillator Analysis** window. The solution setup is added to the **Project Manager** window under the **Analysis** icon.
14. Run the simulation:
    - Click the solution setup in the **Project Manager** window and click **Analyze** on the menu. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
    - If the analysis is not successful, an error message appears in the **Message Manager** window. Check the **Message Manager** window for an explanation, then take corrective action.
15. View results:
    - After a successful oscillator analysis, Nexxim displays a message like the following in the **Message Manager** window, near the end of the messages:

```
[info]analysis:osc(info):
Lowest oscillation frequency is 2.28514e_006 Hz (Time, Date)
```

The frequency value is the one calculated for your circuit, and the time and date shows the time of the analysis on your machine.

Note:

As analysis progresses, oscillator analysis may save messages like the following to the log file:

analysis:osc(status): Probe 0: selecting (*node_name1*,*node_name2*) as alternative location 1.

analysis:osc(status): Probe 0: selecting (*node_name3*, *node_name4*) as alternative location 2.

The *node_name*s are circuit-specific. If oscillator analysis fails, Nexxim automatically reruns the analysis after moving the probe to alternative location 1. If that analysis fails, Nexxim retries using alternative location 2.

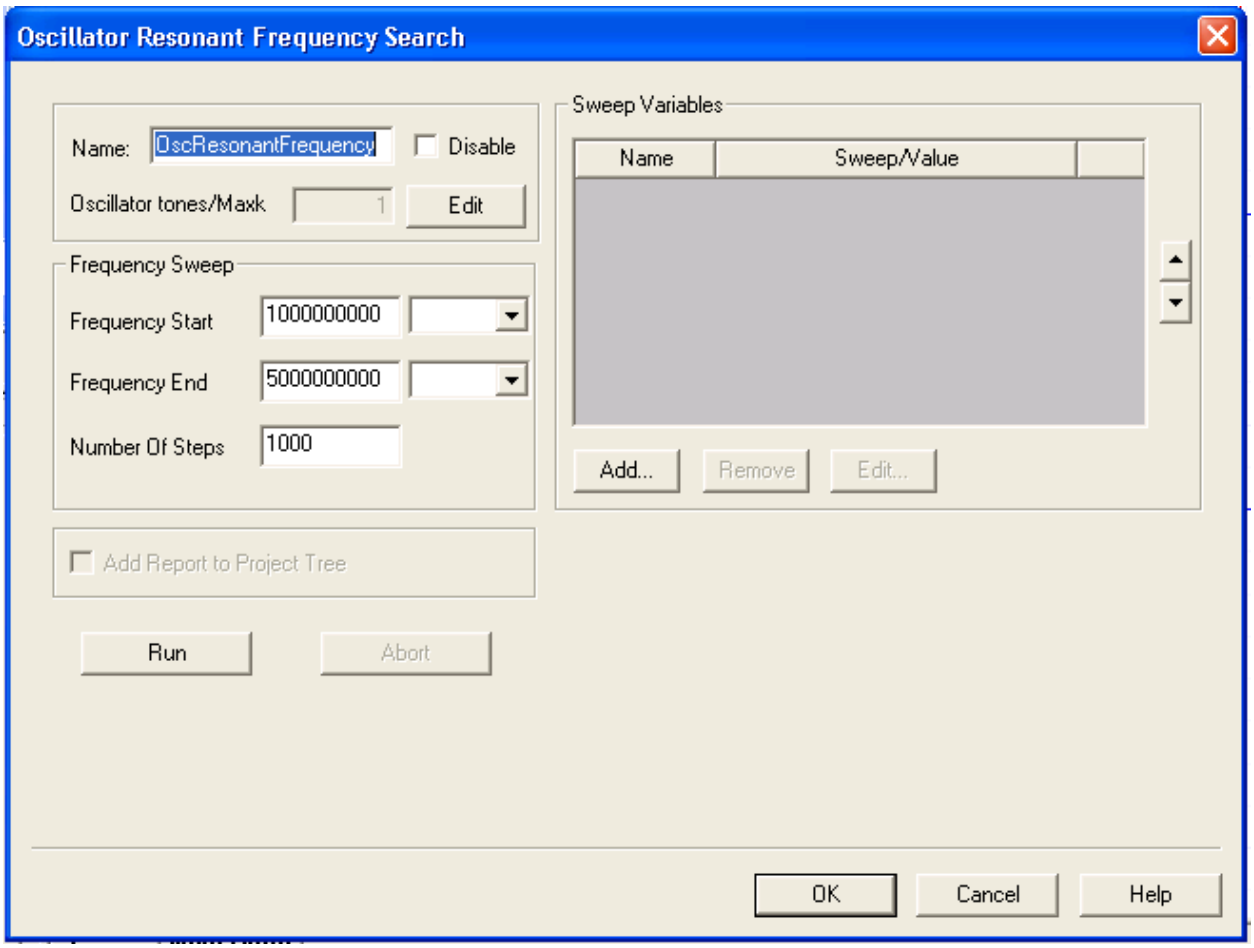
Running Resonant Frequency Search on the Schematic Editor

The Resonant Frequency Search performs a modified form of oscillator analysis to obtain an initial estimate of the resonant frequency of the circuit. From the **Schematic Editor**, perform the following steps to set up and run an oscillator resonant frequency search, and view the results.

1. Set up the schematic circuit for oscillator analysis by inserting an oscillator probe between two nodes in your circuit. Edit the probe properties and specify an initial guess for the frequency (**FREQ** parameter) and an initial voltage (**A** parameter). See Using the Oscillator Probe for details.
2. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **Oscillator Analysis (N-Tone)** to open the **Oscillator Resonant Frequency Search** window.



3. Type an **Analysis Name** (or accept the default name, for example “OscResonantFrequency”).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
5. Click **Edit** to change the number of tones, the frequencies of the tones, and the maximum harmonic numbers to use for each tone. These settings are reflected in the **.OSC** statement in the netlist.
6. Use the fields in the **Frequency Sweep** group box to set the parameters for the initial guess, which always uses the frequency sweep method. The settings in this group box generate **.OPTIONS** statements in the netlist.
7. To add a sweep, use the fields in the **Sweep Variables** group box.
   - From the **Sweep Variable** area, select **Add** to open the **Add/Edit Sweep** window.
   - In the **Variable** list, select Temp or the name of a variable (when a variable has been defined for the design), then select one of the following: **Single value**, **Linear step**, **Linear count**, **Decade count**, or **Octave count**.
   - Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
   - For details on sweeps, see Variable Sweep.
   - Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **Oscillator Resonant Frequency Search** window.
8. Click **Run** to run the analysis directly on the window.
   - If the analysis is successful, Nexxim displays plots of the real and imaginary parts of the probe current. The estimated resonant frequency occurs where the imaginary part of the probe current is zero. This estimated resonant frequency is displayed in the **Resonant Frequencies** field at the top of the Report.
   - After a successful analysis, check **Add Report to Project Tree** to save the plot under the **Results** icon in the **Project Manager** window. The report is added when the setup window is closed with **Finish**.
9. Click **Finish** to add the solution setup (and the results if selected) to the **Project Manager** window and exit the window. You can then run the analysis again by clicking on it and selecting **Analyze** on the menu.
10. To run the Resonant Frequency Search analysis on the **Project Manager** window:
    - Locate the resonant frequency analysis setup icon under the **Analysis** icon on the **Project Manager** window. Click the resonant frequency analysis setup icon and select **Analyze** on the menu. The analysis begins immediately and a progress bar appears.
    - If the analysis is not successful, an error message appears in the **Message Manager** window. Check the **Message Manager** window for an explanation, then take corrective action.
11. View results:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- After a successful oscillator analysis, Nexxim displays a message like the following in the **Message Manager** window, near the end of the messages:

```
   [info]analysis:osc_analysis(info):
 Best chance for oscillation detected at 2.28514e_006 Hz (9:15 AM
May 20, 2005)
```

The frequency value is the one calculated for your circuit, and the time and date show the time of the analysis on your machine.

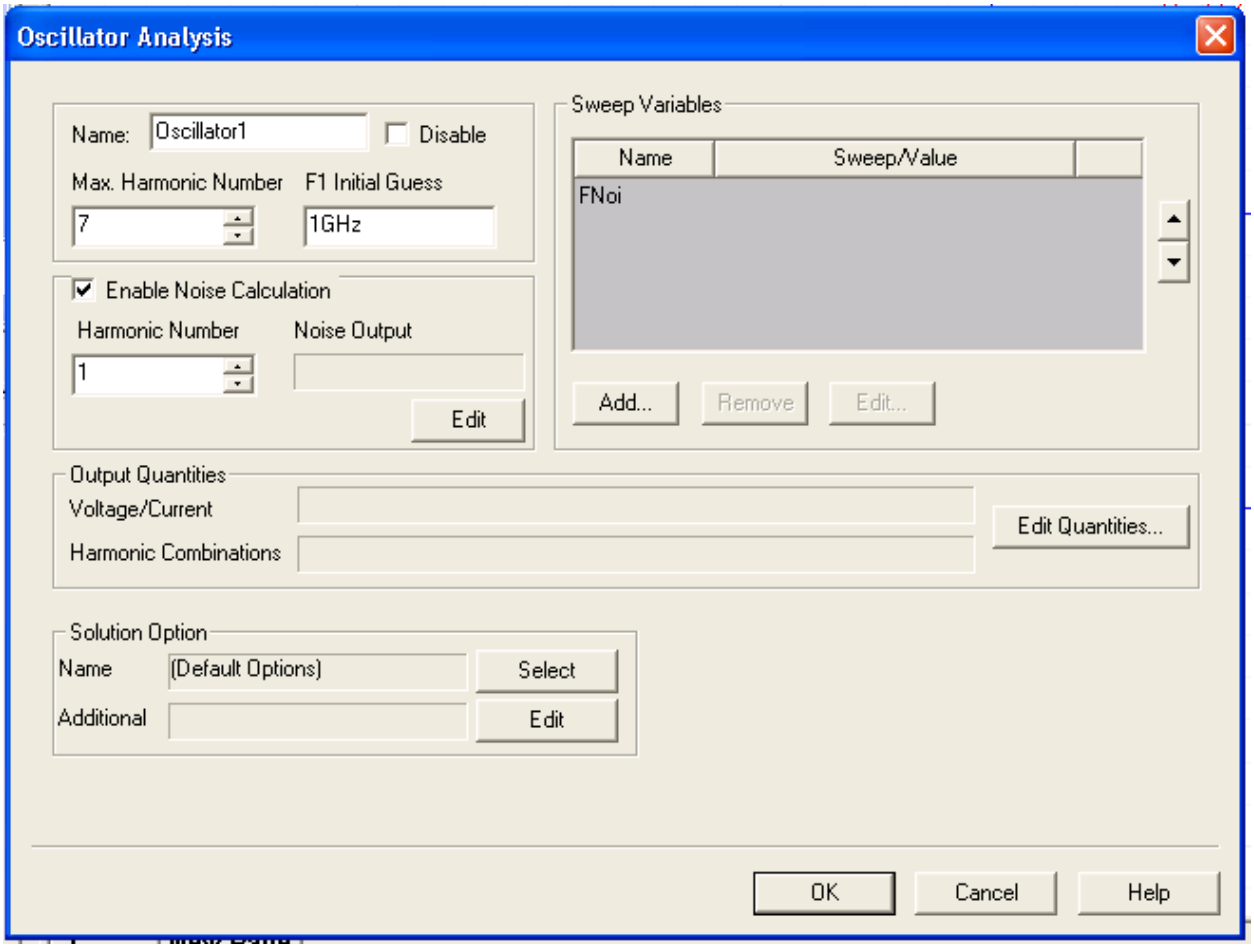
> **Note:**
>
> As analysis progresses, oscillator analysis may save messages like the following to the log file:
>
> analysis:osc(status): Probe 0: selecting (*node_name1*,*node_name2*) as alternative location 1.
>
> analysis:osc(status): Probe 0: selecting (*node_name3*, *node_name4*) as alternative location 2.
>
> The *node_name*s are circuit-specific. If oscillator analysis fails, Nexxim automatically reruns the analysis after moving the probe to alternative location 1. If that analysis fails, Nexxim retries using alternative location 2.

Running Phase Noise Analysis on the Schematic Editor

Nexxim can calculate phase noise as part of oscillator analysis.

Set up the circuit for single-tone or multi-tone oscillator analysis as described in the topics Running Single-Tone Oscillator Analysis on the **Schematic Editor** and Running Multi-Tone Oscillator Analysis on the **Schematic Editor**. Complete the following Phase Noise setup steps before clicking **Finish** on the **Oscillator Analysis** window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. From the **Oscillator Analysis** window, select (check) the box for **Enable Noise Calculation**.
2. In the **Noise Calculation** group box, select the **Harmonic Number**. The **Harmonic Number** value selects one of the harmonics of the oscillator frequency around which to calculate the phase noise. The default is harmonic number 1 (the fundamental oscillating frequency).
3. Click **Edit** in the **Noise Calculation** group box to open the **Noise Output** window. Expand the icons for the nets and devices, then click the check boxes to select one or more outputs for noise analysis.
4. In the **Sweep Variables** group box, you can add a sweep of the noise frequencies to be calculated, with or without a second sweep of temperature. The swept frequencies are offsets from the calculated oscillating frequency.

- To add a sweep of noise frequencies, select **FNoi** on the **Variables** group box and click **Edit** to open the **Add/Edit Sweep** window. Select **Single value**, **Linear step**, **Linear count**, **Decade count**, or **Octave count**, then complete the specification by filling in the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

numeric fields. Click **Add** to add the sweep to the **Sweep Values** list.

- To add a sweep of temperature, click **Add** in the **Sweep Variables** group box to open the **Add/Edit Sweep** window. Select **Temp** on the **Variables** group box. Select **Single value**, **Linear step**, **Linear count**, **Decade count**, or **Octave count**, then complete the specification by filling in the numeric fields. Click **Add** to add the sweep to the **Sweep Values** group box.
- Click **OK** to close the **Add/Edit Sweep** window and return to the **Oscillator Analysis** window.

5. When all setup steps are as appropriate, click **Finish** on the **Oscillator Analysis** window. The solution setup is added to the **Project Manager** window under the **Analysis** icon.
6. Run the simulation:

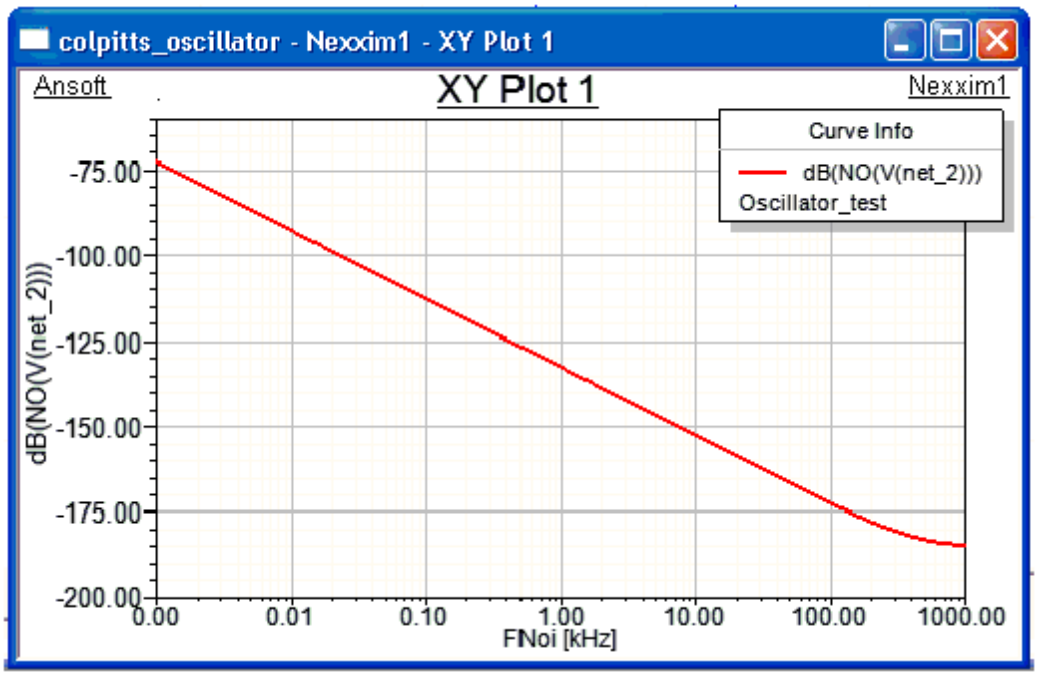
- Click the solution setup in the **Project Manager** window and click **Analyze** on the menu. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- If the analysis is not successful, an error message appears in the **Message Manager** window. Check the **Message Manager** window for an explanation, then take corrective action.

7. Display results:

- From the **Circuit** menu, select **Create Report** (Alternatively, select **Create Report** on the **Results** icon in the **Project Manager** window.) to open the **Create Report** window. Select Standard as the **Report Type** and Rectangular Plot as the **Display Type**. Click **OK**.
- When the **Report** window opens, select the appropriate oscillator analysis on the **Solution** drop-down. Select **Noise** on the **Domain** drop-down.
- Select the **Noise Output** category. The output quantities you specified in the **Noise Output** window (step 3 above) are available for selection. For most noise analyses, select **dB** as the function. Click **New Report**.
- A Report window opens to display a graph of the analysis results.
- Double-click the X-axis (the **FNoi** axis at the bottom of the report) to open the **X-Axis Properties** window. Select the **Scaling** tab, and Select **Log** for **Axis Scaling**. Click **OK** to close the window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The report now shows the phase noise in the common double-log format:



- For details on creating and modifying reports, see Generating Reports and Post-processing.

Running Oscillator Analysis on the Netlist Editor

If you use the Netlist Editor to create a design, the netlist should contain the information for running the oscillator analysis. No Solution Setup is required.

1. Add one oscillator probe to the circuit for each unknown frequency to be calculated. Set the parameters on each probe to specify an initial guess for the unknown frequency (**FREQ** parameter) and an initial voltage to be used in the calculations (**A** parameter). See Using the Oscillator Probe for more information
2. Run the simulation:

- From the **Circuit** menu, select **Analyze with Nexxim**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- If the analysis is not successful, check the **Message Manager** window for an explanation, and then take corrective action.

3. Display results of oscillator analysis:

- After a successful oscillator analysis, Nexxim displays a message like the following in the **Message Manager** window, near the end of the messages:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
[info]analysis:osc_analysis(info):
Lowest oscillation frequency is 2.28514e_006 Hz (9:15 AM May 20,
2005)
```

The frequency value is the one calculated for your circuit, and the time and date shows the time of the analysis on your machine.

Note:

As analysis progresses, oscillator analysis may save messages like the following to the log file:

analysis:osc(status): Probe 0: selecting (*node_name1*,*node_name2*) as alternative location 1.

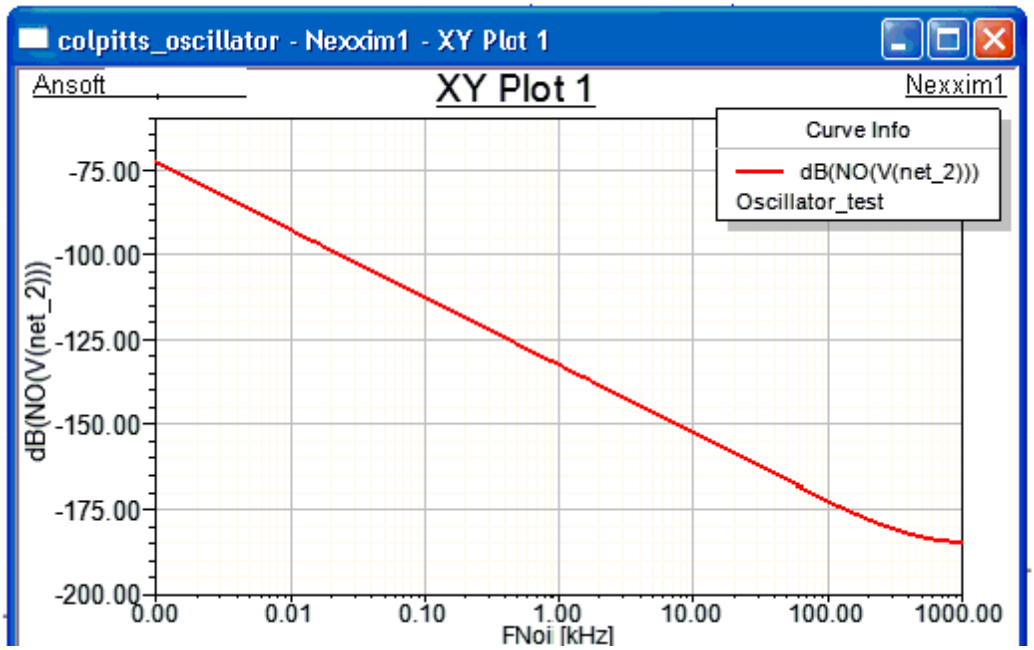
analysis:osc(status): Probe 0: selecting (*node_name3*, *node_name4*) as alternative location 2.

The *node_name*s are circuit-specific. If oscillator analysis fails, Nexxim automatically reruns the analysis after moving the probe to alternative location 1. If that analysis fails, Nexxim retries using alternative location 2.

4. If the **.OSC** statement in the netlist includes phase noise analysis, perform the following steps to display the results of the phase noise analysis on a graph.
    a. From the **Circuit** menu, select **Create Report**. (Alternatively, select **Create Report** on the **Results** icon in the **Project Manager** window.) to open the **Create Report** window. Select Standard as the **Report Type** and **Rectangular Plot** as the **Display Type**. Click **OK**.
    b. Select the appropriate oscillator analysis on the **Solution** drop-down. Select **Noise** on the **Domain** drop-down.
    c. Select the **Noise Output** category. The output quantities specified in the **NOISE_ OUTPUT** entry in the **.OSC** statement that defined the phase noise analysis are available for selection. For most noise analyses, select **dB** as the function (the report uses $10\log_{10}$(magnitude) on the Y-axis). Click **Add Trace**.
    d. Repeat the previous bullet until all appropriate quantities have been selected, then click **Done** to open a Report window open to display a graph of the analysis results.
    e. Double-click the X-axis (the **Fnoi** axis at the bottom of the report) to open the **X-Axis Properties** window. Select the **Scaling** tab, and click **Log** (deselecting the **Linear** button). Click **OK** to close the window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The report now shows the phase noise in the common double-log format:



- If the X-axis units are not as appropriate, double-click the X-axis to open the X-Axis **Properties** window. Select the **Scaling** tab, and deselect the **Autounits** radio button. Select new **Unit**, **Field Width**, and **Precision** values until the X-axis is as appropriate. Click **OK** to close the window.
- For details on creating and modifying reports, see Generating Reports and Post-processing.

Oscillator Analysis Netlist Formats

The following topics provide information about netlist formats and statements related to oscillator analyses.

Oscillator Probe Syntax

To enable oscillator analysis, the circuit must include one oscillator probe device for each unknown frequency to be calculated. The netlist syntax for the oscillator probe device is:

R*xxx n+ n-***OSC_PROBE=1 A=***val****FREQ=***val** [**T=***val* **peak_current=***val*]

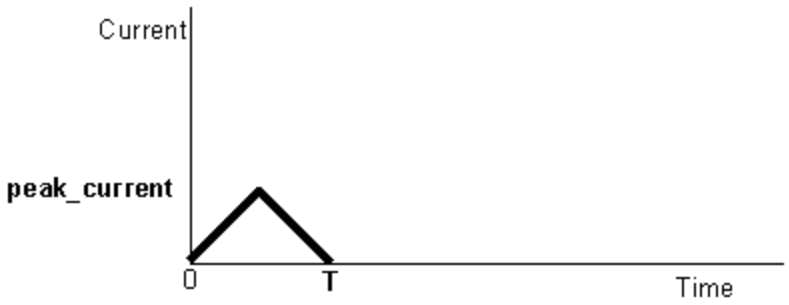
The oscillator probe element can have any name beginning with **R**. The **OSC_PROBE** parameter is required to distinguish the oscillator probe from a resistor.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **FREQ** parameter specifies a frequency to be used as the initial guess for the unknown oscillation. The **A** parameter specifies a voltage to be used in the calculations.

The probe behaves like an oscillating voltage source with amplitude given by the parameter **A** at the frequency given by the parameter **FREQ**. At all other frequencies, the probe current is zero. The default for parameter **A** is 10mV. The default for parameter **FREQ** is 1e6Hz.

Parameters **T** and **peak_current** are specific to transient analysis, and need to be set only when an oscillator circuit does not begin oscillation during time-domain analysis. Choosing a non-zero **peak_current** (Amperes) and positive **T** (seconds) adds a temporary triangular noise current source with a peak value of **peak_current** and duration **T**, starting at time = 0.



The PWL current source acts as extra noise which helps the oscillation to start and reach steady state soon. This current source does not affect the period of oscillation or any other quantity of interest in an oscillator analysis.

.OSC Single-Tone Statement

Oscillator analysis is invoked on the netlist with a **.OSC** statement. The single-tone syntax is used when the circuit has only DC input sources.

.OSC TONES=*val***MAXK=***val*

The **TONES** value in the **OSC** statement specifies an initial estimate of the resonant frequency to find in the analysis. The **TONES** frequency must equal the value of the **FREQ** parameter on the oscillator probe. The **TONES** value overrides the probe **FREQ** parameter if they are not the same.

The **MAXK** value specifies the highest harmonic to include in the analysis.

The entry **INITIAL_GUESS_ONLY=YES** limits the calculation to the initial guess phase. When this entry is present, the second phase with harmonic balance analysis is not performed. By default, or when the entry **INITIAL_GUESS_ONLY=NO** is present, both phases of calculation are performed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Here is an example of a single-tone oscillator analysis netlist:

```
*Single-tone oscillator analysis
.param freq_guess=2e6
//
// circuit details not shown
//
Rosc_probe 2 3 osc_probe=1 A=0.001 FREQ=freq_guess
.OSC TONES=freq_guess MAXK=31
.END
```

.OSC Multi-Tone Statement

The multi-tone syntax for the **OSC** statement is used to analyze a circuit with multiple oscillating frequencies:

- One unknown resonant frequency (F_1) plus one or more known driven oscillations (RF_1 through RF_M) such as sinusoidal voltage sources. The circuit must contain one oscillator probe for the unknown resonance.
- Two or more unknown resonant frequencies (F_1 through F_N) with no driven oscillations in the circuit. The circuit must contain one oscillator probe for *each* of the unknown resonances.
- Two or more unknown resonant frequencies (F_1 through F_N) plus one or more known driven oscillations (RF_1 through RF_M). The circuit must contain one oscillator probe for *each* of the unknown resonances.

An example is a mixer circuit connecting one or more voltage-controlled oscillators (VCOs) of unknown frequencies with one or more RF sources of known frequencies to produce a single resultant IF output.

This form uses parentheses to enclose a comma-separated list of tone frequencies and the corresponding comma-separated list of harmonics:

```
.OSC TONES=[F1 [, ...FN] [, RF1 [, ...RFM]]]
MAXK=[maxkF1 [, ...maxkFN], [maxkRF1 [, ...maxkRFM]]
```

The left and right brackets are required in the multi-tone form of the **OSC** statement.

The first *N* of the **TONES** frequencies (*F1* through *FN* in the syntax above) must equal the **FREQ** parameter settings of the *N* oscillator probes in the circuit. These frequencies are the initial estimates of the unknown resonant frequencies for the circuit, and the corresponding **MAXK** entries (*maxkF1* through *maxkFN*) are the highest harmonics to calculate for the corresponding frequencies.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

After the list of unknown frequency estimates, the **TONES** list should have entries for the *M* known, driven frequency sources in the circuit (*RF1* through *RFM* in the syntax above). The corresponding **MAXK** entries (*maxkRF1* through *maxkRFM*) are the highest harmonics to calculate for the corresponding driven oscillations.

The number of oscillator probes in the netlist determines the number of **TONES** frequencies that are treated as estimates of the unknown frequencies to be calculated. The remaining frequencies in the **TONES** group box are treated as the fixed frequencies of the driven oscillations.

The frequency estimates in the **TONES** group box should be the same as the ones entered in the **FREQ** parameters of the oscillator probes. The **TONES** values override the probe **FREQ** parameters if they are not the same.

Here is an example of a netlist using the multi-tone oscillator analysis syntax:

```
*Oscillator with mixer and driver
\\
\\ circuit details not shown
\\
.param freq_guess=2e6, RF_freq=0.5e6
Rosc_probe 2 3 osc_probe=1 A=0.001 FREQ=freq_guess
.OSC TONES=[freq_guess,RF_freq] MAXK=[31,3]
.END
```

.OSC Resonant Frequency Search Statement

The resonant frequency search syntax is used when only an initial estimate of the oscillating frequency is appropriate. The oscillator analysis line for resonant frequency search is:

.OSC TONES=*val***MAXK=***val* **INITIAL_GUESS_ONLY=YES**

The **TONES** and **MAXK** entries can use either the single-tone format or the multi-tone format. See .OSC Single-Tone Statement and .OSC Multi-Tone Statement for further information.

The entry **INITIAL_GUESS_ONLY=YES** limits the calculation to the initial guess phase. When this entry is present, the second phase with harmonic balance analysis is not performed. By default, the entry **INITIAL_GUESS_ONLY=NO** is present, and both phases of calculation are performed.

The netlist must also contain the following options:

.OPTION initial_guess=freq_sweep
.OPTION initial_guess.freq_sweep.start=*val*
.OPTION initial_guess.freq_sweep.stop=*val*

These options select a frequency sweep for the initial guess at the resonant frequency.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A fourth option may also be used:

.OPTION initial_guess.freq_sweep.num_steps=*val*

This option sets the number of steps to use in the frequency sweep. The default is 50 steps.

Here is an example using the resonant frequency search with two-tone oscillator analysis syntax:

```
*Resonant frequency search with mixer and driver
\\
\\ circuit details not shown
.param freq_guess=2e6, RF_freq=0.5e6
rosc_probe 2 3 osc_probe=1 A=0.001 FREQ=freq_guess
.option osc.initial_guess=freq_sweep
.option osc.initial_guess.freq_sweep.start=freq_guess
.option osc.initial_guess.freq_sweep.stop='4*freq_guess'
.OSC TONES=[freq_guess,RF_freq] MAXK=[31,4]
+ INITIAL_GUESS_ONLY=YES
.END
```

.OSC Phase Noise Analysis Statement

The Nexxim netlist syntax for phase noise analysis consists of extensions to the basic oscillator analysis.

.OSC TONES=*val***MAXK=***val*
NOISE_OUTPUT=[*outputs***] HARMONIC_NUMBER=***val frequency_sweep*

The **TONES** and **MAXK** entries can use either the single-tone format or the multi-tone format. See .OSC Single-Tone Statement and .OSC Multi-Tone Statement for further information.

The **NOISE_OUTPUT** parameter specifies the noise outputs of interest. A noise output can be:

- The voltage at a single node, format **V(***node***)**, for example, V(n1).
- The voltage differential between two nodes, format **V(***node,node***)**, for example, V(n1,n2).
- The current across a branch, format **I(***branch***)**, for example, I(V1)

The **HARMONIC_NUMBER** parameter selects one of the harmonics of the oscillator frequency around which to calculate the phase noise. The default is harmonic number 1 (the fundamental oscillating frequency).

The entry *frequency_sweep* specifies a range of frequencies (offsets on the frequency specified by the **HARMONIC_NUMBER** parameter) to be applied in the analysis.

The *frequency_sweep* field has several formats.

The sweep can be just a single frequency value.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A second form of *frequency_sweep* specifies the starting and ending frequencies, and the incremental step:

[**START=**]*start_val* [**STOP=**]*stop_val* [**STEP=**]*step_val*

If the sweep specification omits the **START=**, **STOP=**, and **STEP=** labels, the start value, stop value and step value must be entered in the order shown. If the labels are used, the values may be entered in any order, but then all three values must have labels.

A third form of the *frequency_sweep* field has the format:

freq_count_type numpoints startfreq stopfreq

This format specifies a set of analysis frequencies defined by *numpoints*, *startfreq* and *stopfreq*, using one of the predefined *freq_count_type* tokens **LIN**, **DEC**, or **OCT**:

LIN
Linear count sweep at *numpoints* different frequencies on the frequency given by *startfreq* to the frequency given by *stopfreq*. The spacing between test frequencies is

(*stopfreq*–*startfreq*) / (*numpoints*– 1).

DEC
Logarithmic count sweep at *numpoints* different frequencies in each decade (10× multiple of *startfreq*) from *startfreq* to *stopfreq*. The spacing between test frequencies is logarithmic within decades.

OCT
Logarithmic count sweep at *numpoints* different frequencies in each octave (2× multiple of *startfreq*) from *startfreq* to *stopfreq*. The spacing between test frequencies is logarithmic within octaves.

A fourth form of *frequency_sweep* has the format:

POI*numpoints freq1* [*freq2 ...*]

This form for *frequency_sweep* provides a space-separated list of *numpoints* test frequencies.

The phase noise analysis can also include a sweep of temperature or any other parameter.

See Variable Sweep for details.

Here are examples of .OSC Phase Noise statements:

```
.OSC TONES=1E10 MAXK=3 NOISE_OUTPUT=[V(1,2),V(NET_3),I(VD)]
+ HARMONIC_NUMBER=2 LIN 100 0.1 2E10
.OSC TONES=1E6 MAXK=3 NOISE_OUTPUT=[V(NET_3),I(VD)]
+ HARMONIC_NUMBER=1 LIN 10 0.5e6 2E6
+ SWEEP TEMP POI 5 15 20 25 30 35
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Oscillator Analysis Options

The oscillator analysis is based on harmonic balance, so all the harmonic balance analysis options are valid. (See Harmonic Balance Options for details on these options.)

Nexxim oscillator analysis has its own options, listed in the Oscillator and Phase Noise Options Reference. The default values of these options can be changed with a .**OPTIONS** statement. The syntax is:

.OPTIONSosc.*option1***=***value1* [[**osc.**]*option2***=***value2* ...]

The prefix **osc.** applies an option only to oscillator analysis but not to other tools that may recognize the same option.

For subordinate options that are available when an option such as **osc.initial_guess=transient_init** is in effect, the netlist uses periods to separate the option fields (e.g., **osc.initial_guess.transient_init.tmax**).

See Controlling Nexxim Oscillator Analysis for a discussion of the effects of changing the oscillator analysis options.

Oscillator Analysis Outputs

After a successful oscillator analysis, Nexxim displays a message like the following in the **Message Manager** window:

```
[info]analysis:osc_analysis(info):
Lowest oscillation frequency is 2.28514e_006 Hz (9:15 AM May 20,
2017)
```

The frequency value is the one calculated for your circuit, and the time and date shows the time of the analysis on your machine.

The outputs on the harmonic balance analysis are also available for report generation. See Harmonic Balance Outputs for further information.

Viewing OSC Noise Contributors

When noise analysis has been specified in the solution setup or in the netlist, view a listing of noise contributors after a successful simulation. Noise contributors are available for Linear Network Analysis (LNA), Time-Varying Noise Analysis (TVNoise) and Oscillator Analysis (OSC).

To enable this feature, the **Oscillator Analysis** setup in a schematic design must have **Noise Analysis** enabled, and must specify at least one **Noise Output** device (node voltage or branch current). In a netlist design, the netlist must include the **NOISE_OUTPUT** entry in the .OSC statement.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For schematic designs, right-click the solution setup icon in the **Project Manager** window and select **Show Noise Contributors** on the menu.
- For netlist designs, right-click the circuit name icon in the **Project Manager** window and select **Show Noise Contributors** from the menu.

The **Noise Contributors** window opens:

	Comp Name	Comp Type	Comp Description	Noise Source	Noise Power (A^2/Hz)	Noise (%)
1	diode_core_level1_d152	DIODE_Level1	diode_core_level1	flicker	1.52094e-011	119.408
2	rs_d139	DIODE_Level1	resistor_simple	thermal	9.28447e-012	72.8916
3	diode_core_level1_d139	DIODE_Level1	diode_core_level1	shot	9.27206e-012	72.7941
4	rrf		port_impedance	thermal	9.27205e-012	72.794
5	diode_core_level1_d139	DIODE_Level1	diode_core_level1	flicker	9.25475e-012	72.6582
6	rlo		port_impedance	thermal	9.25473e-012	72.6581
7	rif		port_impedance	thermal	9.2296e-012	72.4608
8	diode_core_level1_d154	DIODE_Level1	diode_core_level1	shot	9.19113e-012	72.1588
9	diode_core_level1_d154	DIODE_Level1	diode_core_level1	flicker	9.12803e-012	71.6634
10	diode_core_level1_d153	DIODE_Level1	diode_core_level1	shot	9.0141e-012	70.7689
11	diode_core_level1_d153	DIODE_Level1	diode_core_level1	flicker	8.77735e-012	68.9102
12	diode_core_level1_d152	DIODE_Level1	diode_core_level1	shot	8.16436e-012	64.0977
13	sins_vsinusoidal1		vsin_source	external	7.25401e-015	0.0569506
14	v167	V_SIN	vsin_source	external	7.11387e-015	0.0558504

Initially, the noise contributors are listed in order by **Component Name**. (If the window is opened before an analysis has been performed, it is empty.)

- Click in a column header to sort the display by the contents of that column (the example above has been sorted by **Noise (%)**).

In a schematic design, the **Selected Row** group box is enabled.

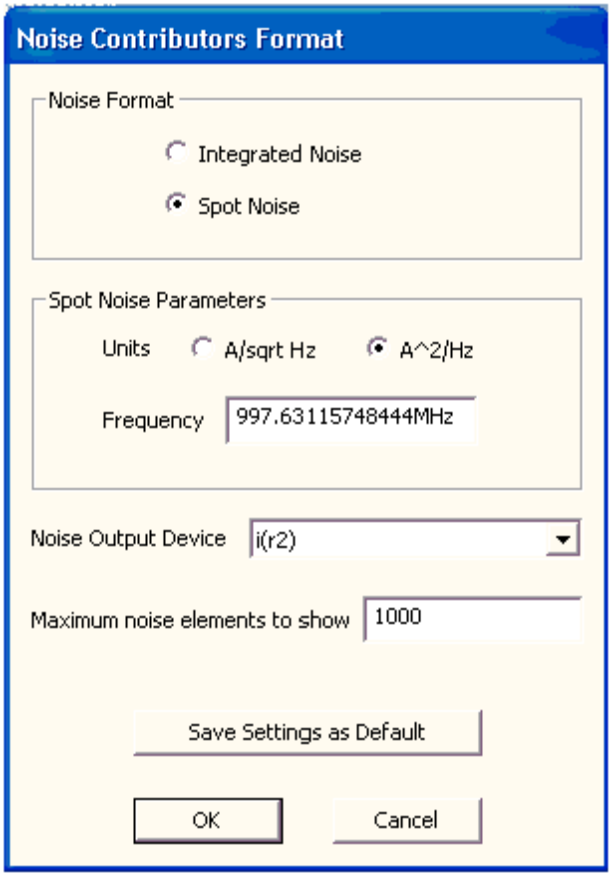
- Select a contributor (row) and click **Select in schematic**. The contributing element is selected in the schematic window. The schematic window is brought to the front (under the **Noise Contributors** window) and scrolled so the selected object is visible. Only one element can be selected at a time.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Select an object in the schematic window and click **Show schematic selection**. The corresponding contributing element is selected in the **Noise Contributors** window. The row containing that element is scrolled into view if necessary.

Initially, the display is set up to show spot noise contributors using default settings.

- Click **Format** to open the **Noise Contributors Format** window:



Choose one noise output device (voltage through node or current through branch) on the **Noise Output Device** field drop-down menu. The list is populated on the output devices selected in the **Oscillator Analysis** setup or in the **NOISE_OUTPUT** entry on the .OSC statement.

Enter a value in the **Maximum noise elements to show** field to restrict the display to that number of elements with the most noise contributions.

When **Spot Noise** is selected, the **Spot Noise Parameters** group box is activated.

- The **Units** button settings depend on the **Noise Output Device**:

When the device is a branch current (as in the illustration above), the choice of units is between Amps/$(Hz)^{½}$ and $(Amps)^2$/Hz.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the device is a node voltage, the choice of units is between Volts/$(Hz)^{½}$ and $(Volts)^2$/Hz.

- The **Frequency** field is initialized to a value drawn on the analysis setup. Change the frequency as appropriate to see how the spot noise contributions vary with frequency.

When **Integrated Noise** is selected, the **Spot Noise Parameters** group box is deactivated. Units are Volts for output device node voltages and Amperes for output device branch currents.

- Click **Save settings as default** to save the **Noise Contributors Format** window settings as the defaults for future displays.
- Click **OK** to close the **Noise Contributors Format** window and return to the **Noise Contributors** window.

Click **Done** to close the **Noise Contributors** window.

The **Noise Contributors** window becomes invalid if the design is modified. If the window is open when the analysis is re-run, the window is refreshed.

Multiple **Noise Contributor** windows may be opened, but only one for a given design.

Nexxim Envelope Analysis

Envelope analysis is commonly used to analyze systems where harmonic balance or transient analysis alone is not adequate. Such systems include circuits with two inputs, where one input is a fast-changing periodic or quasi-periodic source such as a clock or Local Oscillator (LO) and the other input is a non-periodic source such as a baseband RF modulator that changes on a timescale that is orders of magnitude slower than the timescale of the fast-changing input. Transient analysis requires a small timestep to capture the fast-changing input, but then requires a very large number of timesteps to simulate the slowly changing non-periodic input. Harmonic balance fails to analyze the non-periodic input.

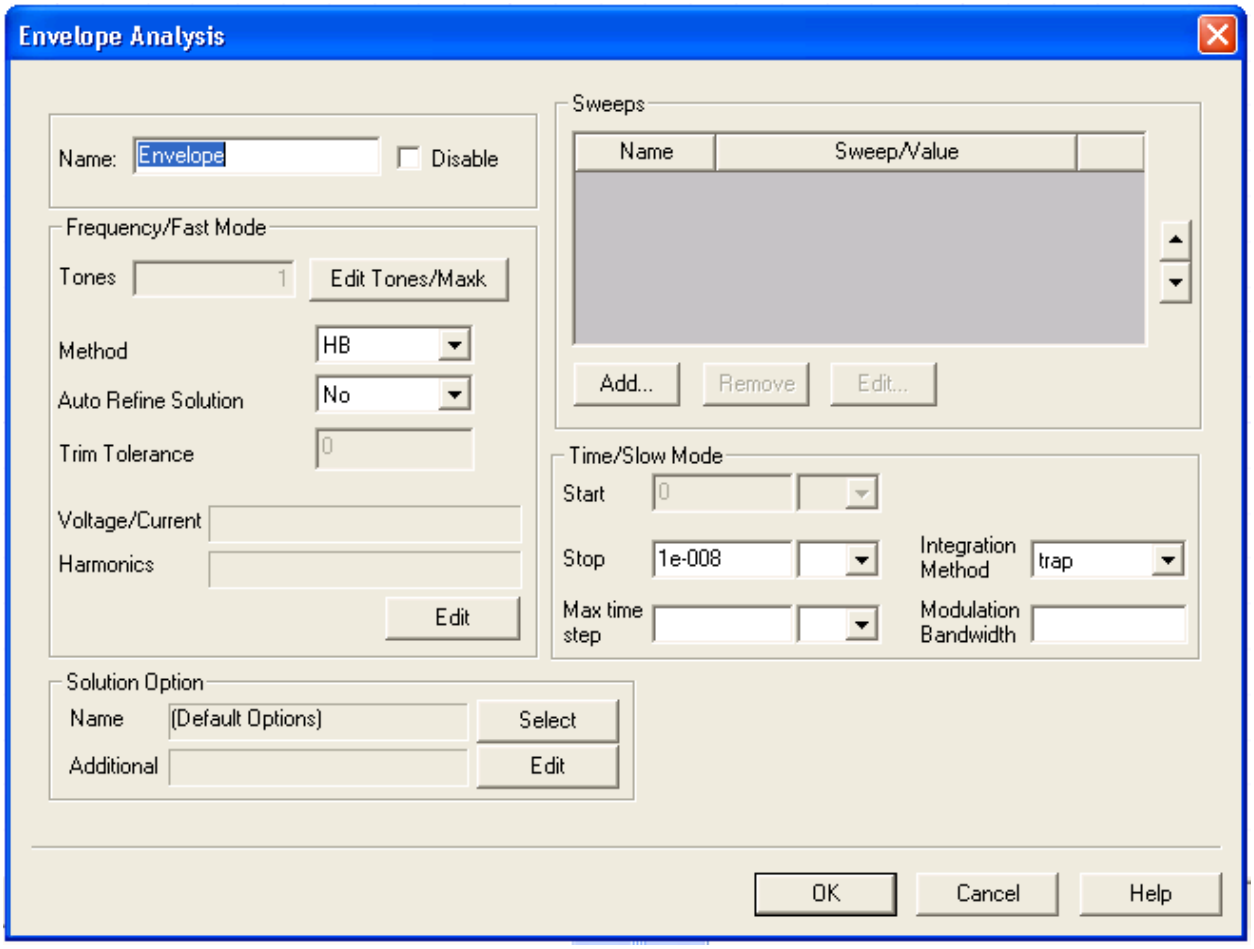
Envelope analysis uses transient analysis to simulate the slowly moving signal in the time domain, plus harmonic balance to analyze the fast-moving signal in the frequency domain. The time-domain analysis can use a varying timestep that is appropriate to the slowly changing waveform. At each timestep of the transient analysis, an HB analysis is run. The frequency coefficients at each timestep are stored and returned as the result. From these coefficients, obtain a variety of results including a transient-like time-domain result.

Running Nexxim Envelope Analysis on the Schematic Editor

From the **Schematic Editor**, perform the following steps to set up and run an envelope analysis using Nexxim.

1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **Envelope Analysis** to open the **Envelope Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Type an **Analysis Name** (or accept the default name, for example “Envelope”).
4. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
5. The **Frequency/Fast Mode** group box controls the harmonic balance analysis.

- Click **Edit Tones/Maxk** to specify the periodic, fast-changing inputs for harmonic balance analysis. On the **Edit Tones/Max Harmonic Number** window, enter the number of inputs in the **No. of Tones** field. The field changes to reflect the number of frequencies specified. The names of the frequencies are F1, F2, etc. and cannot be changed. Click the **Value** field for a frequency to enter the input frequency. Click the **MAXK** field for a frequency to enter the appropriate maximum harmonic number. Click **OK** to close the window and return to the **Envelope Analysis** window.
- When one-tone analysis has been specified, the **Method** field is activated. Use this field to select **HB** or **shooting** (HB is the default). See Handling Strongly Nonlinear Circuits in the HB topic for details on the **Method** entry.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Optionally, Click the **Auto Refine Solution** field to select Yes or No (No is the default). See Increasing Accuracy or Speed in the HB topic for details on the **Auto Refine Solution** entry.
- When multi-tone analysis has been specified, the **Trim Tolerance** field is activated. Use this field to set a tolerance value. See Increasing Accuracy or Speed in the HB topic for details on the **Trim Tolerance** entry.
- Optionally, click **Edit** to open the **Output** window. Click the check boxes on the **Output** window to add net voltages, branch currents, and harmonics to the data generated by the envelope analysis. Click **OK** to add the selected output values and return to the **Envelope Analysis** window.

6. The Time/Slow mode group box controls the transient analysis.

- Set the **Stop** field to the stop time for the transient analysis. The **Start** time is always zero.
- Optionally, set the **Maximum timestep** field to suggest a maximum transient step size.
- Optionally, select a transient analysis integration method on the **Integration Method** drop-down. **TRAP** (trapezoidal rule) is the default, **BDF2** (Gear) is the alternative.
- Optionally, set the **Modulation Bandwidth** field to an estimate of the bandwidth of the RF modulation input.

7. Optionally, use the fields in the **Solution Options** group box to select or add Harmonic Balance analysis options and other Nexxim options to the design. Envelope analysis uses the HB options.

- Click **Select** on the **Name** field to open the **Select Solution Options** window.

If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a previously defined option set to be used in the current analysis, click the name of the option set, then click **OK** to return to the **Envelope Analysis** window. The named option set appears in the **Name** field in the **Solution Options** group box.

To create a new option set, click **New** to open the **Solution Options** window. Click the **Name** field to name the new option set. Select the **HB Options** tab. Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the **Envelope Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.

- Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**.

Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Do not include the keyword .OPTIONS; the .OPTIONS keyword is automatically inserted at the beginning of the line in the netlist statement.

- The line can contain multiple options settings. Use spaces to separate the options settings.
- To modify or delete an option once it has been added, just edit or delete its entry in the list.
- To clear all options, delete the entire line.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click **OK** to return to the **Envelope Analysis** window.

The options in the **Additional** field are automatically added to the netlist when the solution containing them is performed.

- For more information, see Nexxim Envelope Analysis Options.

8. Run the simulation:

- From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
- If the analysis is not successful, check the **Message Manager** window for an explanation, and then take corrective action.
- For details on creating and modifying reports, see Generating Reports and Post-processing.

Running an Envelope Analysis on the Netlist Editor

If you use the Netlist Editor to create a design, the netlist should contain the information for running the envelope analysis. No Solution Setup is required.

Run Nexxim Envelope Analysis

1. From the **Circuit** menu, select **Analyze with Nexxim**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
2. The **Message Manager** window signals success or failure.

- For details on creating and modifying reports, see Generating Reports and Post-processing.

Nexxim Envelope Analysis Netlist Format

Envelope analysis is invoked on the netlist using a variation of the harmonic balance (**.HB**) statement:

```
.HB TONES=(f1 [, ...fN]) MAXK=(M1 [, ...MN]) STOP=val
 [STEP=val] [ENVMETHOD=TRAP|BDF2] [MODULATIONBW=val]
[METHOD=HB|SHOOTING] [AUTO_REFINE_SOLUTION=YES|NO]
[TRIM_TOL=val]
```

- The **TONES** group box specifies the estimated frequency or frequencies of the periodic inputs to the circuit for harmonic balance analysis.
- Each **MAXK** entry M_i specifies the maximum harmonic number to use for the corresponding tone f_i. The harmonic balance analysis is performed using harmonics 1 through M_1 of tone f_1 (frequency f_1 itself is harmonic 1), harmonics 1 through M_2 of tone f_2, up to harmonics 1 through M_N of tone f_N.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The **STOP** entry specifies the stop time in seconds for the transient analysis. The **STOP** entry is required to distinguish an envelope analysis statement from an ordinary harmonic balance statement. All transient analyses start at time 0.
- The optional **STEP** entry affects the maximum time step used in the transient analysis. See the Transient Analysis topic for details on the timestep calculation.
- The optional **ENVMETHOD** entry selects the integration method to be used in the transient analysis. The choices are **TRAP** (trapezoidal rule) and **BDF2** (Second Order Backward Difference Formula, also called Gear.) The default is **TRAP**. See the Transient Analysis topic for details on integration methods.
- The optional **MODULATIONBW** entry is an estimate of the bandwidth of the non-periodic RF modulation input signal.

Harmonic Balance Controls

The Harmonic Balance controls **METHOD**, **AUTO_REFINE_SOLUTION**, and **TRIM_TOL** can be used to refine the HB phase of the analysis.

See Handling Strongly Nonlinear Circuits in the Harmonic Balance topic for details on the **METHOD** entry in the HB statement.

See Increasing Accuracy or Speed for details on the **AUTO_REFINE_SOLUTION** and **TRIM_TOL** entries in the HB statement.

Nexxim Envelope Analysis Options

Envelope analysis options Click the **.hb** prefix. See Envelope Analysis Options Reference for further information. Envelope analysis also uses the "Harmonic Balance Options" on page 13-15 , to control both the harmonic balance analysis and the transient analysis.

The default values of these options can be changed in the netlist with one or more .OPTIONS statement. The syntax is:

```
.OPTIONS hb.option1=value1 [... ]
```

Nexxim Envelope Analysis Outputs

To open the results of an envelope analysis, click on the Results icon in the **Project Manager** window and select **Create Report** to open the **Create Report** window. There are several ways to display the data.

To plot data as an eye diagram:

1. Select **Eye Diagram** as the Report Type and **Rectangular** as the Display Type on the **Create Report** window. Click **OK** to close the **Create Report** window and open the **Report** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Make a selection on the Solution drop-down menu. The Domain is always **Time**.
3. Select one or more quantities on the **IQ Voltage** or **IQ Current** listing, then click **Add Trace**.
4. Click **Done** to close the **Report** and open a new window opens with a graph of the results.

To plot data as a constellation chart:

1. Select **Constellation** as the Report Type and **Rectangular** as the Display Type on the **Create Report** window. Click **OK** to close the **Create Report** window and open the **Report** window.
2. Make a selection on the Solution drop-down menu. The Domain is always **Time**.
3. Select one or more quantities on the **IQ Voltage** or **IQ Current** listing, then click **Add Trace**.
4. Click **Done** to close the **Report** window. The Report window opens with the graph of the results.

To plot a normal voltage or current (not I or Q) against time:

1. Select **Standard** as the Report Type and **Rectangular** as the Display Type on the **Create Report** window. Click **OK** to close the **Create Report** window and open the **Report** window.
2. Make a selection on the Solution drop-down menu and select **Time** as the Domain. This domain plots one HB result per envelope time point.
3. Select one or more quantities on the **Voltage** or **Current** listing, then click **Add Trace**.
4. Click **Done** to close the **Report** window. The Report window opens with the graph of the results.

To plot a normal voltage or current (not I or Q) against transient time:

1. Select **Standard** as the Report Type and **Rectangular** as the Display Type on the **Create Report** window. Click **OK** to close the **Create Report** window and open the **Report** window.
2. Make a selection on the Solution drop-down menu and select **Transient-Time** as the Domain. This domain plots using all the transient time points.
3. Select one or more quantities on the **Voltage** or **Current** listing, then click **Add Trace**.
4. Click **Done** to close the **Report** window. The Report window opens with the graph of the results.

To view the amplitude of a particular frequency over time:

1. Select **Standard** as the Report Type and **Rectangular** as the Display Type on the **Create Report** window. Click **OK** to close the **Create Report** window and open the **Report** window.
2. Make a selection on the Solution drop-down menu and select **Time** as the Domain.
3. Select one or more quantities from any category, then click **Add Trace**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click **Done** to close the **Report** window. The Report window opens with the graph of the results.

To view the spectrum of a particular signal or node:

1. Select **Standard** as the Report Type and **Rectangular** as the Display Type on the **Create Report** window. Click **OK** to close the **Create Report** window and open the **Report** window.
2. Make a selection on the Solution drop-down menu and select **Spectral** as the Domain.
3. Select one or more quantities on the **Voltage** or **Current** listing, then click **Add Trace**.
4. Click **Done** to close the **Report** window. The Report window opens with the graph of the results.

Nexxim Time-Varying Noise Analysis

Time-varying noise analysis (TV Noise) calculates the response of a circuit to thermal, shot, and flicker noise sources analyzed as small-signal AC perturbations around the periodic steady-state operating point calculated by harmonic balance or oscillator analysis. The circuit elements are linearized by a DC operating point calculation prior to the steady-state analysis.

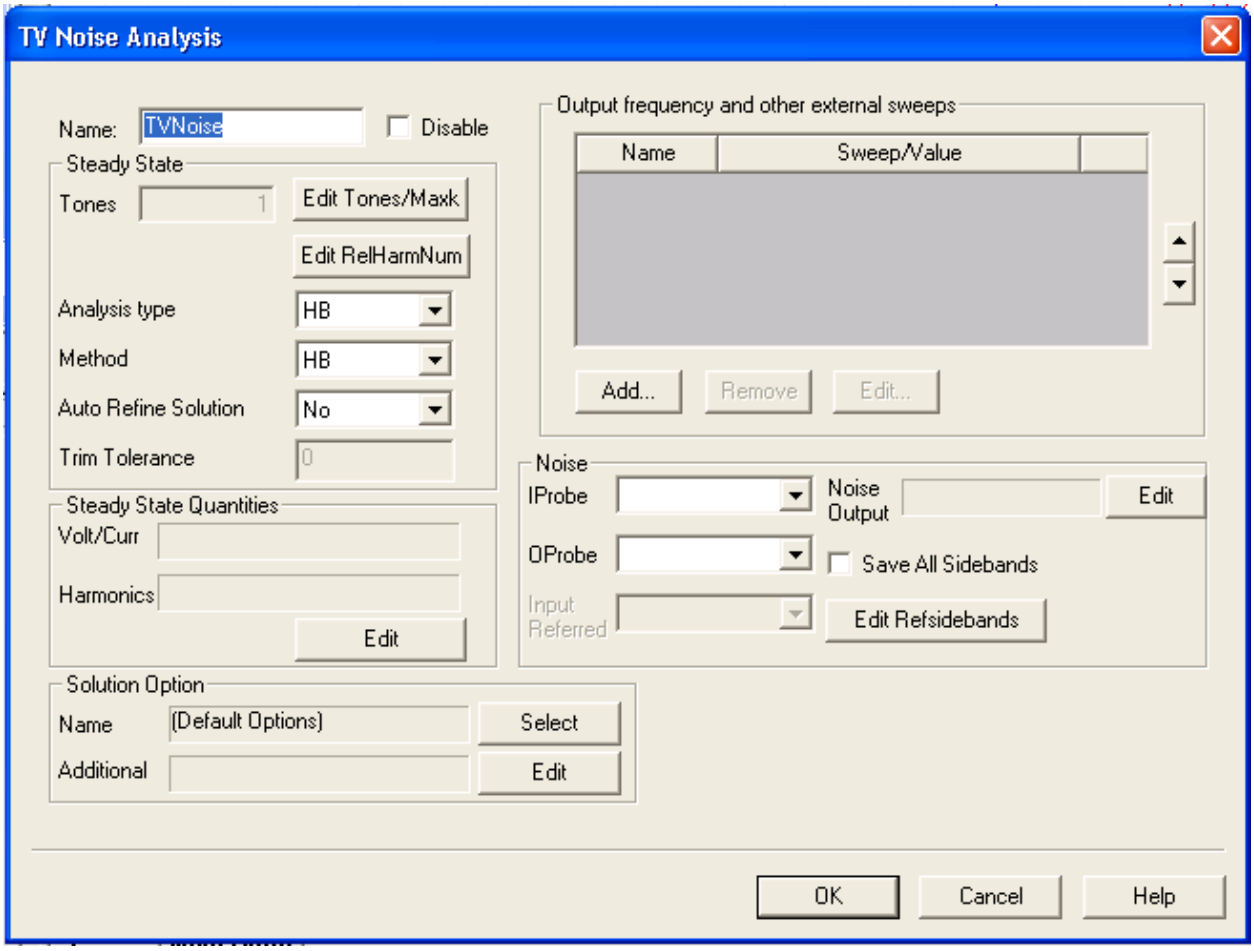
The TV Noise analysis can be extended to include periodic transfer function analysis. Periodic transfer function analysis computes the small-signal transfer function from multiple input sources at multiple frequencies to one output at one frequency, or using the sweep of output frequencies on the TV noise analysis setup. A typical application for periodic transfer function analysis is to determine image rejection.

Running TV Noise Analysis on the Schematic Editor

From the **Schematic Editor**, perform the following steps to set up and run a Time-Varying Noise analysis using Nexxim.

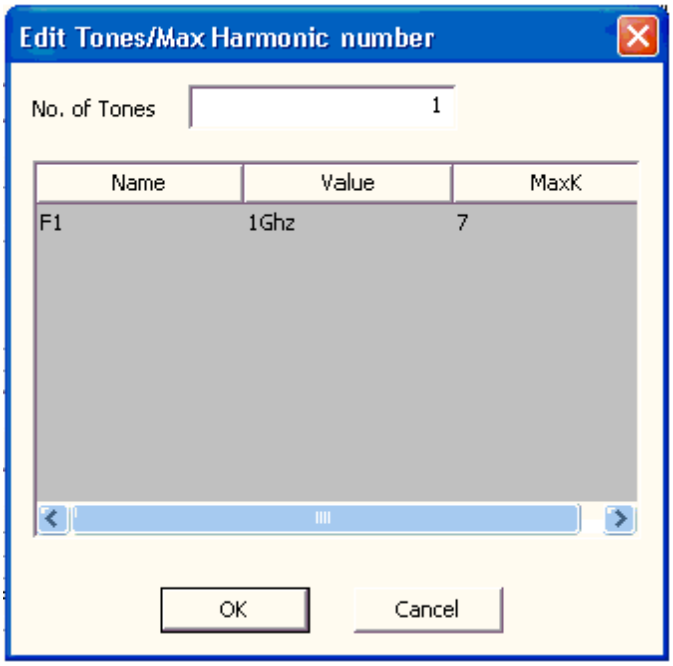
1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **TV Noise Analysis** to open the **TV Noise Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Type an **Analysis Name** (or accept the default name, for example “TVNoise”).
3. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
4. In the **Steady State** group box, click **Edit Tones/MaxK**. The **Edit Tones/Max Harmonic number** window opens:

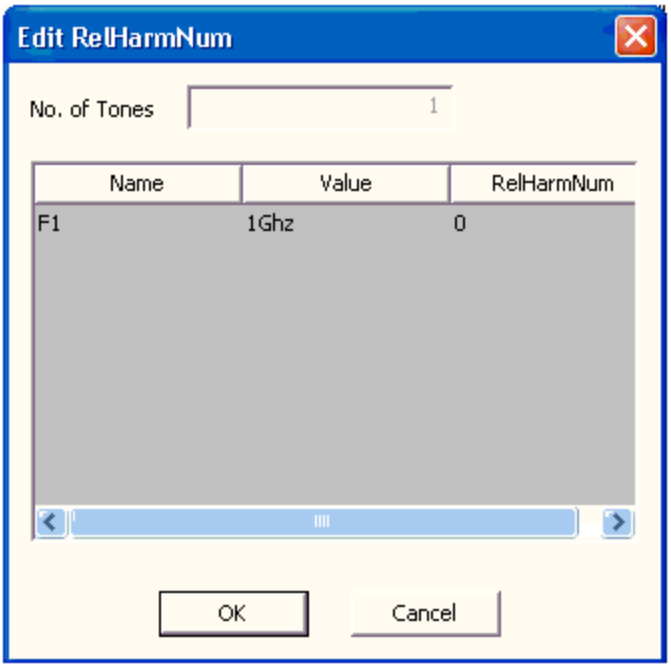
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Enter the number of tones to be used in the steady-state phase of the analysis. The tones are listed with names **F1**... **F*n***. These names cannot be changed.
- Click a **Value** field in the row for one of the tones to enter the frequency for the steady-state analysis for that tone.
- Click a **MaxK** field in the row for one of the tones to enter the **Max. Harmonic Number** for the steady-state analysis for that tone.
- Click **OK** to close the **Edit Tones/Max Harmonic Number** window and return to the **TV Noise Analysis** window. The **Number of tones** field now shows the number of tones you specified in the window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Optionally, click **Edit RelHarmNum** to open the corresponding window:



- The **No. of tones**, **Name**, and **Value** fields reflect the settings on the **Edit Tones/Maxk** window. The number, name, and value of tones cannot be changed in the **Edit RelHarmNum** window.
- Click in the **RelHarmNum** field for a frequency to set the relative harmonic number offset for that tone. See the TV Noise Technical Notes topic for information on the use of the **RelHarmNum** offsets.

Click **OK** to return to the **TV Noise Analysis** window.

6. Select the **Analysis type** on the drop-down. The default is harmonic balance (**HB**). Choose oscillator analysis (**OSC**) instead.

- When **HB** is the **Analysis type** and one-tone analysis has been specified, the **Method** field is activated. Use this field to select **HB** or **shooting** (HB is the default). See Handling Strongly Nonlinear Circuits in the HB topic for details on the **Method** entry.
- When **HB** is the **Analysis type**, the **Auto Refine Solution** field is activated. Use this field to select Yes or No (No is the default). See Increasing Accuracy or Speed in the HB topic for details on the **Auto Refine Solution** entry.
- When **HB** is the **Analysis type** and multi-tone analysis has been specified, the **Trim Tolerance** field is activated. Use this field to set a tolerance value. See Increasing Accuracy or Speed in the HB topic for details on the **Trim Tolerance** entry.

7. Optionally, click **Edit** at the lower-right of the **Steady State** group box to add voltages, currents, and harmonic outputs on the underlying analysis (HB or OSC). These additional

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

output quantities are available in the Report window after simulation has been performed.

Expand the **Nets** and devices icons to display lists of the available quantities. To have Nexxim calculate outputs on the steady state analysis step, click the check boxes to select the outputs.

Expand the **Harmonics** icon to display a list of the available harmonics. To specify particular harmonics for Nexxim to use when calculating outputs on the steady state analysis step, click the check boxes to select the harmonics. If you do not select any harmonics, harmonics DC, F1, 2F1, 3F, and 4F1 are automatically selected. In the **Report** window, only selected harmonics are available for plotting.

Click **OK** to return to the **TV Noise Analysis** window.

8. TV Noise analysis requires a sweep of input frequencies. Click the **F** entry in the **Sweep Variables** field and click **Edit** (or **Add**) to open the **Add/Edit Sweep** window.
   - Select one of the following: **Single value**, **Linear step**, **Linear count**, **Decade count**, or **Octave count**.
   - Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
   - Click **Add**, then click **OK** to close the window and reopen the **TV Noise Analysis** window. The sweep definition appears in the **Sweep Variables** field. (The **Sweep Variables** display includes fields labeled **Offset of F1** and **Sync**. These fields are not used by Nexxim TV Noise analysis.)
9. In the **Noise** group box, use the drop-down menu in the **IProbe** field to select a port, current source, or voltage source for the small-signal input to the circuit. If a port is selected, Nexxim computes the noise figure and conversion gain. For current and voltage sources, Nexxim computes the gain, but not the noise figure.

> **Note:** The port definition window has fields to specify noise parameters (See Editing an Interface Port Definition.) If the Input Port is defined with noise parameters (in particular, with a Noise Temperature), the analysis uses the temperature value specified. If these parameters are not in the definition, Nexxim adds thermal noise to the specified port for computing the noise factor and conversion gain with the formula 4KT/R, where K is Boltzmann's constant, R is the port impedance, and T is the noise temperature, using 290° Kelvin for T.

Gain for a port input is calculated in Volts, in the sense of available power. The input units are Volts for a voltage source and Amperes for a current source. If no **IProbe** input is selected, Nexxim computes the output noise only.

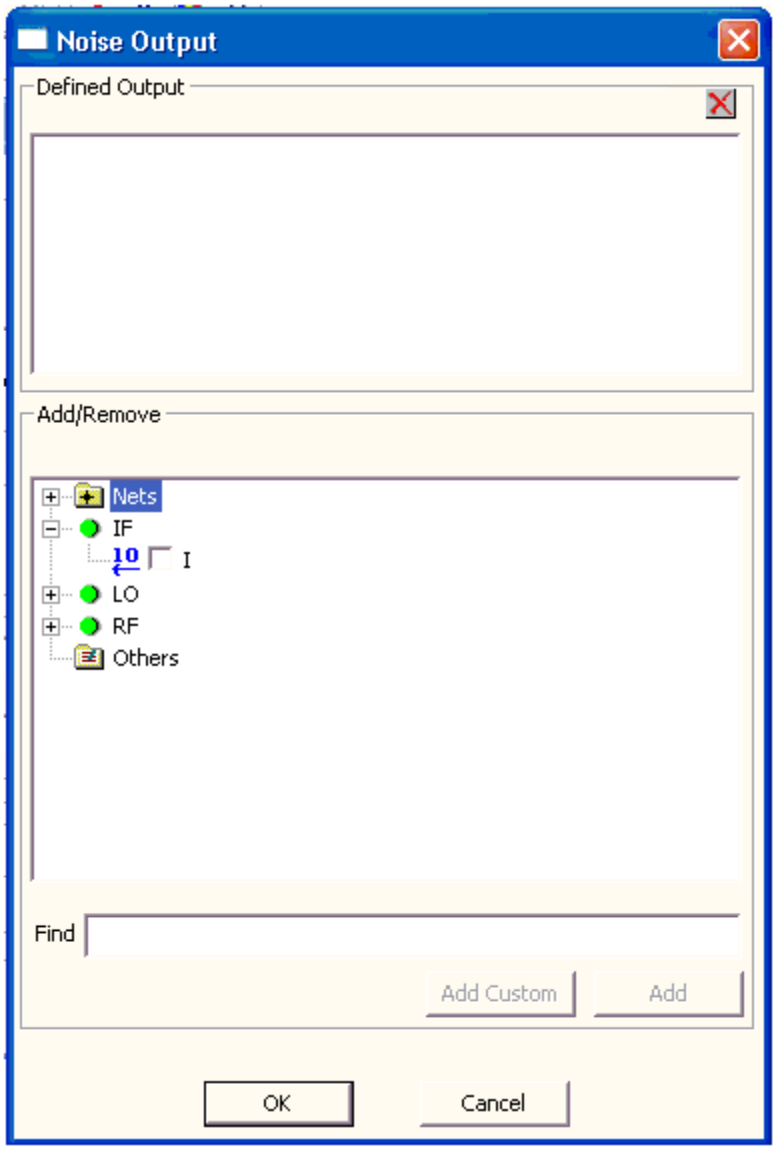
10. Use the drop-down menu in the **OProbe** field to select a port, resistor, current source, voltage source, or current probe for the small-signal output on the circuit.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: The port definition window has fields to specify noise parameters (See Editing an Interface Port Definition.) The Output Port may be defined with noise parameters, but the analysis ignores the noise data for the output port.

When a port, current source, or resistor is selected, output units are Volts. When a voltage source or current probe is selected, output units are Amperes.

11. Click **Edit** next to the **Noise Output** field to open the **Noise Output** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

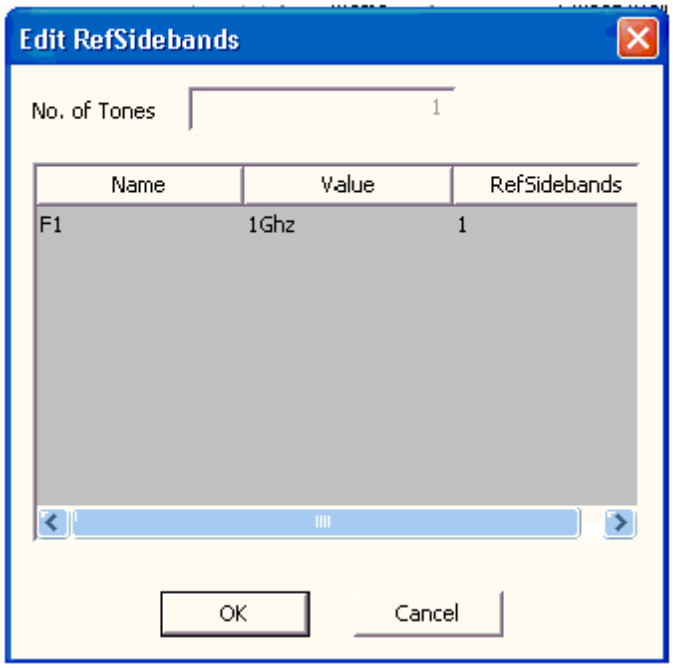
- Expand the **Nets** and devices icons to display lists of the available quantities. Click the check boxes to select noise outputs. (The **IProbe** and **OProbe** devices are always included as noise data outputs, so they do not appear in the list).
- **Adding a Custom Quantity (Differential Voltage Output)** To specify a noise output other than a single node voltage or branch current—for example, a differential voltage such as V(net1,net2)—type the output into the **Find** field , then click **Add Custom**. (**Add Custom** becomes active when a noise output in the **Find** field cannot be found in the list of Nets and devices.)

The custom output quantity is passed to the netlist as a **NOISE_OUTPUT** entry in the **TV_NOISE** statement. For example, the differential voltage example above netlists as:

```
NOISE_OUTPUT=[v(net1,net2)]
```

No validation is performed on the custom output quantity before it is written out to the netlist.

12. Click **OK** to close the **Noise Output** window and return to the **TV Noise Analysis** window.
13. After one or more elements have been added in the Output Noise field, use the drop-down menu in the **Input Referred Noise** field to select a node voltage or branch current for input-referred noise analysis. The **Input Referred Noise** selection is active only when at least one item has been selected in the **Noise Output** field. The **Input Referred Noise** entry does not have to be the same as any of the **Noise Output** selections.
14. Optionally, click **Edit RefSidebands** to open the corresponding window:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The **No. of tones**, **Name**, and **Value** fields reflect the settings on the **Edit Tones/MaxK** window. The number, names, and values of tones cannot be changed in the **Edit Refsidebands** window.
- Click in the **RefSidebands** field for a frequency to set the reference sideband coefficient for that frequency. The **REFSIDEBAND** coefficients are positive or negative integers plus zero. See the TV Noise Technical Notes topic for information on the use of the **Refsidebands** quantities.

> **Note:** When an **IProbe** device is specified, the netlist must also have the **Refsideband** list of coefficients for the **Edit Tones** frequencies in order to perform the conversion gain calculation. When no **IProbe** device is specified, the **Refsideband** entry is optional; the default coefficient value is 1.

15. Optionally, click the **Save All Sidebands** box to have Nexxim store the contributions from all noise sidebands. The default is not to save all contributions to save analysis time and memory usage, since the file is potentially very large.
16. Optionally, use the fields in the **Solution Options** group box to select or add HB or OSC analysis options and other Nexxim options to the design.
- Click **Select** on the **Name** field to open the **Select Solution Options** window.

If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a named option set that you have previously defined, click the name of the option set, then click **OK** to return to the **TV Noise Analysis** window. The named option set appears in the **Name** field in the **Solution Options** group box.

To create a new option set, click **New** to open the **Solution Options** window. Click the **Name** field to name the new option set. Select the **HB Options** or **OSC Options** tab. Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the **TV Noise Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.

- Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**.

Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Do not include the keyword .OPTIONS; the .OPTIONS keyword is automatically inserted at the beginning of the line in the netlist statement.

The line can contain multiple options settings. Use spaces to separate the options settings.

To modify or delete an option once it has been added, just edit or delete its entry in the list. To clear all options, delete the entire line.

Click **OK** to return to the **TV Noise Analysis** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The options in the **Additional** field are automatically added to the netlist when the solution containing them is performed.

17. Click **Finish** to close the **TV Noise Analysis** window. The solution setup is added to the Project tree under the **Analysis** icon.
18. Run the simulation:
    - Expand the **Analysis** icon on the Project tree, click the appropriate solution setup, and select **Analyze** from the menu. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
    - The **Message Manager** window signals success or failure.
    - For details on creating and modifying reports, see Generating Reports and Post-processing.

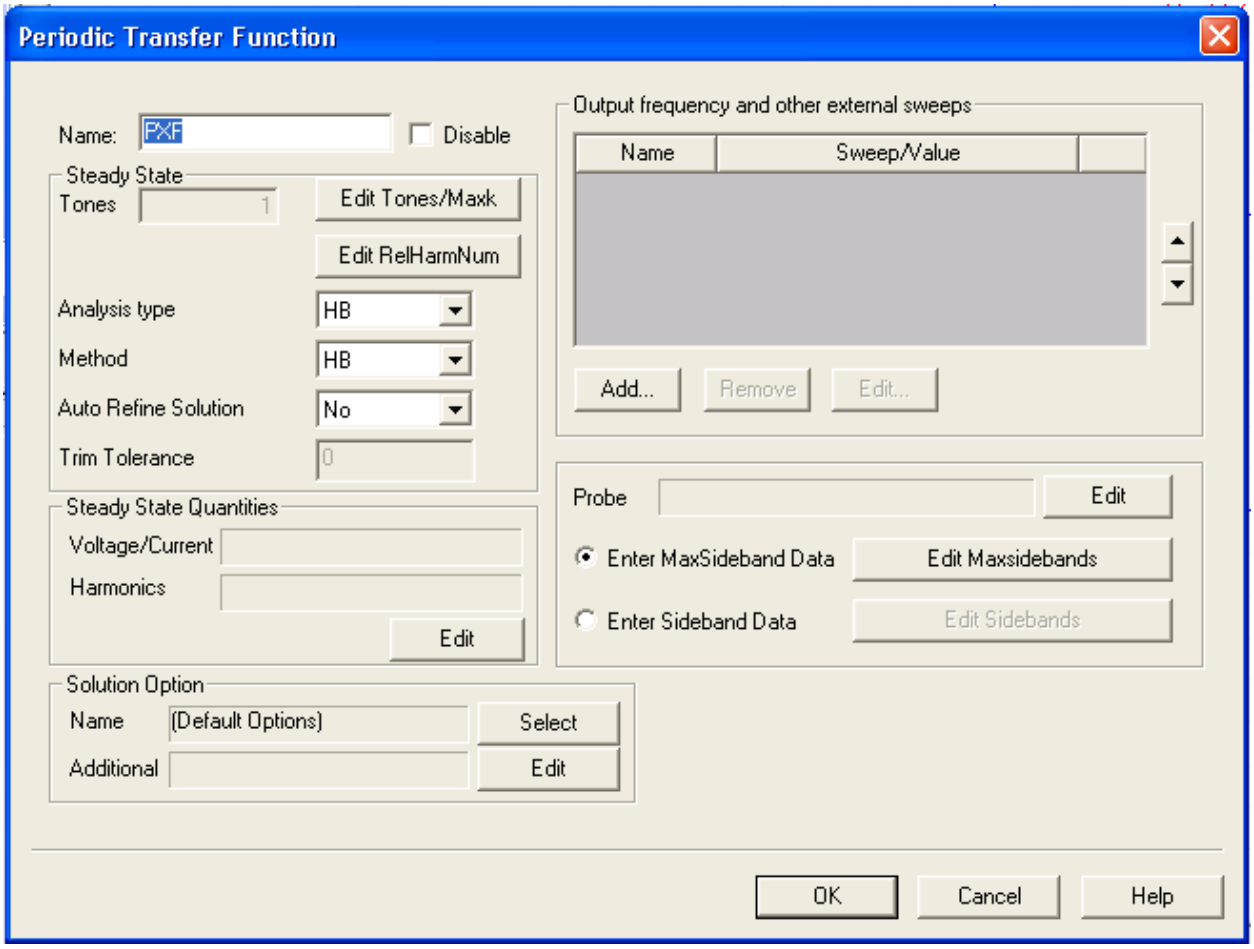
Running Periodic Transfer Function Analysis from the Schematic Editor

Periodic transfer function (PXF) analysis computes the small-signal transfer function from selected voltage and current sources in the circuit to a specified single output at a frequency that can be swept. A steady-state HB or OSC analysis first computes the periodic or quasi-periodic operating point, on which the small-signal PXF analysis is calculated. In Nexxim, PXF analysis is an extension of the time-varying noise analysis.

To run a periodic transfer function analysis on a Nexxim schematic design, perform the following steps:

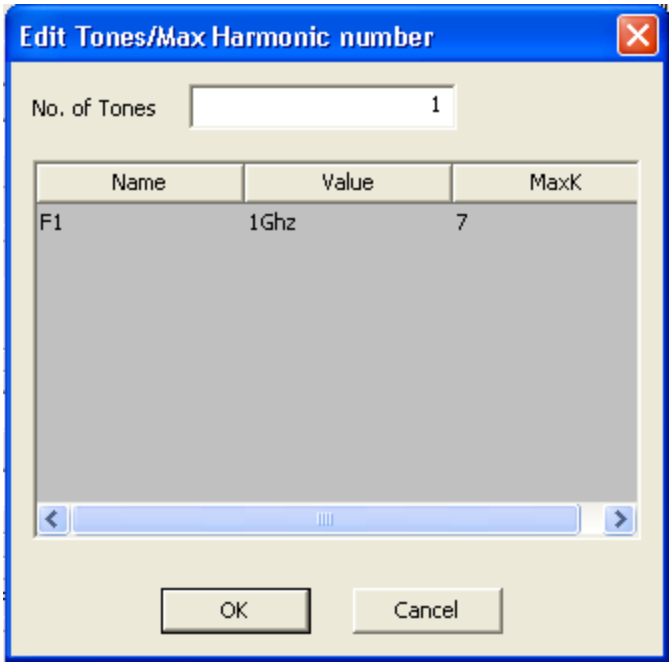
1. In **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **Periodic Transfer Function (PXF)**. The **Periodic Transfer Function** solution setup window opens:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Type an **Analysis Name** (or accept the default name, for example “PXF”).
3. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
4. In the **Steady State** group box, click **Edit Tones/MaxK** to open the **Edit Tones/Max Harmonic Number** window.

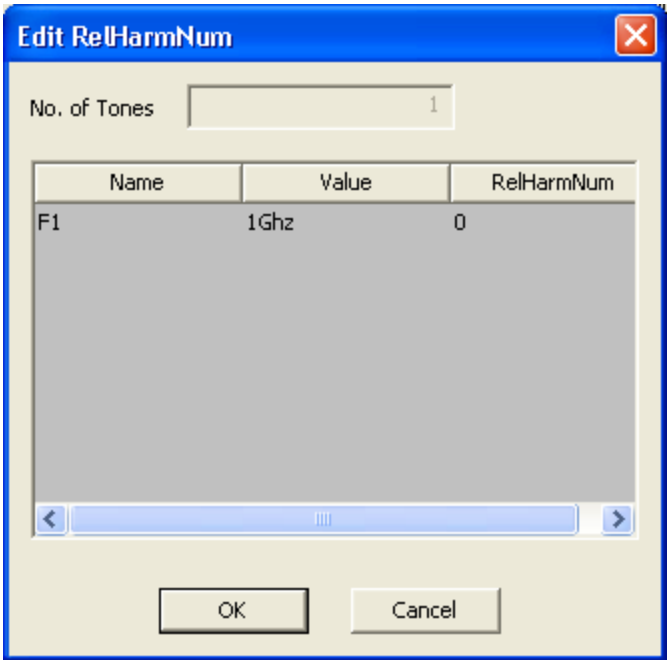
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Enter the number of tones to be used in the steady-state phase of the analysis. The tones are listed with names **F1**... **F*n***. These names cannot be changed.
- Click a **Value** field in the row for one of the tones to enter the frequency for the steady-state analysis for that tone.
- Click a **MaxK** field in the row for one of the tones to enter the **Max. Harmonic Number** for the steady-state analysis for that tone.
- Click **OK** to close the **Edit Tones/Maxk** window and return to the **Periodic Transfer Function** window. The **Number of tones** field now shows the number of tones you specified in the window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Optionally, click **Edit RelHarmNum** to open the corresponding window.



- The **No. of tones**, **Name**, and **Value** fields reflect the settings on the **Edit Tones/Maxk** window. The number, name, and value of tones cannot be changed in the **Edit RelHarmNum** window.

Click **OK** to return to the **Periodic Transfer Function** window.

- Click in the **RelHarmNum** field for a frequency to set the relative harmonic number offset for that tone. See the TV Noise Technical Notes topic for information on the use of the **RelHarmNum** offsets.

Click **OK** to return to the **Periodic Transfer Function** window.

6. Select the **Analysis type** on the drop-down. The default is harmonic balance (**HB**). Choose oscillator analysis (**OSC**) instead.

- When **HB** is the **Analysis type** and one-tone analysis has been specified in the **Edit Tones/Maxk** window, the **Method** field is activated. Use this field to select **HB** or **shooting** (HB is the default). See Handling Strongly Nonlinear Circuits in the HB topic for details on the **Method** entry.
- When **HB** is the **Analysis type**, the **Auto Refine Solution** field is activated. Use this field to select Yes or No (No is the default). See Increasing Accuracy or Speed in the HB topic for details on the **Auto Refine Solution** entry.
- When **HB** is the **Analysis type** and more than two tones have been specified in the **Edit Tones/Maxk** window, the **Trim Tolerance** field is activated. Use this field to set a

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

tolerance value. See Increasing Accuracy or Speed in the HB topic for details on the **Trim Tolerance** entry.

7. Optionally, click **Edit** at the lower-right of the **Steady State Quantities** group box to add voltages, currents, and harmonic outputs on the underlying analysis (HB or OSC). These additional output quantities are available in the Report window after simulation has been performed.

Expand the **Nets** and devices icons to display lists of the available quantities. To have Nexxim calculate outputs on the steady state analysis step, click the check boxes to select the outputs.

Expand the **Harmonics** icon to display a list of the available harmonics. To specify particular harmonics for Nexxim to use when calculating outputs on the steady state analysis step, click the check boxes to select the harmonics. If you do not select any harmonics, harmonics DC, F1, 2F1, 3F, and 4F1 are automatically selected. In the **Report** window, only selected harmonics are available for plotting.

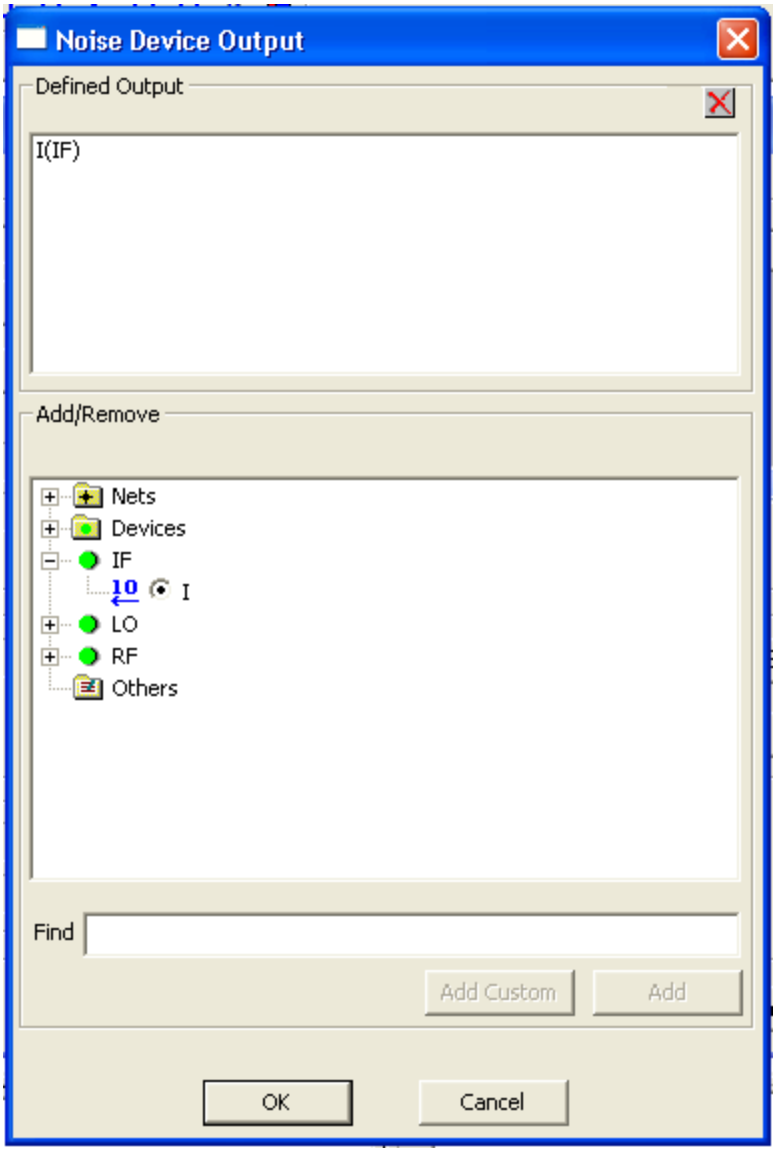
Click **OK** to return to the **Periodic Transfer Function** window.

8. The underlying TV Noise analysis requires a sweep of output frequencies. Click **Add** in the **Output frequency and other sweeps** field to open the **Add/Edit Sweep** window.

- Ensure **F** (frequency) is the entry in the **Variable** field.
- Use the radio buttons to select one of the following: **Single value**, **Linear step**, **Linear count**, **Decade count**, or **Octave count**.
- Type the sweep values into the **Value** text box (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units are selected for each.
- Click **Add**, then click **OK** to close the window and reopen the **Periodic Transfer Function** window.
- The sweep definition appears in the **Output frequency and other sweeps** field. (The **Output frequency and other sweeps** display includes fields labeled **Offset of F1** and **Sync**. These fields are not used by Nexxim PXF analysis.)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9. Click **Edit** next to the **Probe** field to open the **Noise Device Output** window.



Expand the **Nets** and **Devices** icons to display lists of the available quantities. Click in the check box for the single output to be used in the PXF analysis.

Click **OK** to return to the **Periodic Transfer Function** window.

10. If you have specified a single frequency in the Steady State **Tones** field, use the radio buttons to select **Enter MaxSideband Data** or **Enter Sideband Data**. See the TV Noise Technical Notes topic for details.

- To enter a maximum sideband to use in calculating the input frequencies, select **Enter MaxSideband Data** and click **Edit Maxsidebands**. Click in the **MaxSidebands** field at

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the right and enter the number of sidebands to use. (The **Name** and **Value** fields reflect your selection in the Steady State **Tones** field, and cannot be changed in the **Edit MaxSidebands** window). Click **OK** to return to the **Periodic Transfer Function** window.

- To enter specific sidebands to use, select **Enter Sideband Data** and click **Edit Sidebands**. Enter the first sideband value, then click **Add Row** to open another line in the window. To delete a row, select it and click **Delete Row**. When you have finished entering sidebands, click **OK** to return to the **Periodic Transfer Function** window.

11. If you have specified multiple frequencies in the Steady State **Tones** field, only the radio **Enter Sideband Data** button is active. See the TV Noise Technical Notes topic for more information on the use of the **Sideband Data** entries.
    - To enter specific sidebands to use, click **Edit Sidebands**. Enter the first set of sideband values (one value per frequency), then Click **Return** or **Tab** to open another line in the window. When you have finished entering sidebands, click **OK** to return to the **Periodic Transfer Function** window.
12. Optionally, use the fields in the **Solution Options** group box to add analysis options and other Nexxim options to the design.
    - Click **Select** on the **Name** field to open the **Select Solutions** window. From the **Select Solutions** window, click **New** to open the **Solution Options** window.

    Click the **Name** field to name the new option settings. Select the **HB Options** or **OSC Options** tabs, depending on the selection for the **Underlying analysis type** made earlier (Step 8). Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window.

    From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the **Periodic Transfer Function** window. The name of the new option settings appears in the **Name** field of the **Solution Option** group box.

    - Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**. Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Click **OK** to return to the **Periodic Transfer Function** window.
13. Click **Finish** to close the **Periodic Transfer Function** window. The solution setup is added to the Project tree under the **Analysis** icon.
14. Run the simulation:
    - Expand the **Analysis** icon on the Project tree, click the appropriate solution setup, and select **Analyze** from the menu. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
    - The **Message Manager** window signals success or failure.
    - For details on creating and modifying reports, see Generating Reports and Post-processing.

Running TV Noise Analyses on the Netlist Editor

TV Noise analysis is controlled from in the netlist using the **.TV_NOISE** analysis statement.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Running TV Noise Analyses

1. From the **Circuit** menu, select **Analyze with Nexxim**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
2. The **Message Manager** window signals success or failure.
3. Display results of successful analysis:
   - From the **Circuit** menu, select **Create Report** to open the **Create Report** window.
   - See TV Noise Results for details on the outputs from TV Noise analysis.
   - For details on creating and modifying reports, see Generating Reports and Post-processing.

TV Noise Netlist Syntax

The syntax of the **.TV_NOISE** statement in Nexxim is:

```
.TV_NOISE
 + output_freq_sweep
 + SS_ANALYSIS=HB|OSC
 + SS_TONES=[val [,val]...]
 + SS_MAXK=[val [,val]...]
 + [RELHARMVEC=[val [,val]...]]
+ [IPROBE=device_name]
+ [OPROBE=device_name]
+ [NOISE_OUTPUT=[nets_currents]
 + [INPUT_REFERRED_NOISE=[nets_currents]]]
+ [REFSIDEBAND=[val [,val]...]]
+ [SAVEALLSIDEBANDS=NO|YES]
+ [METHOD=HB|SHOOTING]
+ [AUTO_REFINE_SOLUTION=YES|NO]
+ [TRIM_TOL=val]
```

In this syntax:

- For clarity, elements are shown one per line using the continuation character (+). Elements can be entered on a single line using spaces as separators.
- Brackets shown in bold (**[ ]**) are required when more than one item is specified.
- Brackets in plain font ([ ]) denote optional entries or fields.

Output Frequency Sweep

The required entry *output_freq_sweep* specifies a range of output frequencies to apply in the noise calculation. The sweep specification should be the first field in the TV_NOISE statement (after the **.TV_NOISE** keyword).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(See the TV Noise Technical Notes topic for information on the use of the swept output frequencies.)

The *output_freq_sweep* field has several formats.

The sweep can be just a single frequency value.

A second form of *output_freq_sweep* specifies the starting and ending frequencies, and the incremental step:

`[START=]start_val [STOP=]stop_val [STEP=]step_val`

If the sweep specification omits the **START=**, **STOP=**, and **STEP=** labels, the start value, stop value and step value must be entered in the order shown. If the labels are used, the values may be entered in any order, but then all three values must have labels.

A third format for *output_freq_sweep* is:

`count_type numpoints startfreq stopfreq`

The *count_type* entry (**LIN**, **DEC**, or **OCT**) specifies a pattern of frequencies to be swept with *numpoints*, *startfreq* and *stopfreq*:

The **LIN** (linear) count type specifies a linear sweep at *numpoints* different frequencies on the frequency given by *startfreq* to the frequency given by *stopfreq*. The spacing between test frequencies is (*stopfreq*–*startfreq*) / *numpoints*.

The **DEC** (decade) count type specifies a logarithmic sweep at *numpoints* different frequencies in each decade (10× multiple of *startfreq*) from *startfreq* to *stopfreq*. The spacing between test frequencies is logarithmic within decades.

The **OCT** (octave) count type specifies a logarithmic sweep at *numpoints* different frequencies in each octave (2× multiple of startfreq) from *startfreq* to *stopfreq*. The spacing between test frequencies is logarithmic within octaves.

A fourth format for *output_freq_sweep* is:

POI*numpoints freq1 [freq2 ...]*

The **POI** format specifies a space-separated list of individual frequency points. The entry *numpoints* is the number of frequency points in the list.

SS_ANALYSIS

The **SS_ANALYSIS** entry selects between harmonic balance (**HB**) and oscillator analysis (**OSC**) to compute the steady-state values. **HB** is the default.

SS_TONES

The **SS_TONES** entry specifies one or more frequencies to use in the steady-state harmonic balance calculations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SS_MAXK

The **SS_MAXK** entry specifies the maximum harmonic numbers to use for the corresponding **SS_TONES** frequencies in the steady-state harmonic balance calculations. The number of **SS_MAXK** entries should be the same as the number of **SS_TONES** frequencies.

RELHARMVEC

The **RELHARMVEC** entry specifies offset multipliers for the corresponding **SS_TONES** frequencies. The number of **RELHARMVEC** entries should be the same as the number of **SS_TONES** frequencies.

> **Note:**
>
> When just one offset is specified, the netlist can use the entry **RELHARMNUM** instead of **RELHARMVEC**, and can omit the brackets around the offset value.
>
> See the TV Noise Technical Notes topic for information on the use of the **RELHARMVEC** offsets.

IPROBE

The **IPROBE** entry specifies the input RF device to use for the small-signal input to the circuit.

The device can be a port, a current source, or a voltage source.

When a port is specified as the input device, Nexxim computes the noise figure and the conversion gain. Gain for a port is in units of Volts, in the sense of available power.

> **Note:**
>
> The definition of the port in the netlist uses the Port Impedance Resistor syntax.
>
> If the port definition includes the noise parameters NOISE and NOISETEMP, the analysis uses the temperature value specified. If these parameters are not in the definition, Nexxim adds thermal noise to the specified port for computing the noise factor and conversion gain with the formula 4KT/R, where K is Boltzmann's constant, R is the port impedance, and T is the noise temperature, using 290° Kelvin for T.

For current and voltage source input devices, only the gain is computed. The input units are Amperes and Volts, respectively.

If **IPROBE** is not specified, only the **Onoise** figure is calculated.

OPROBE

The **OPROBE** entry specifies the device to use for the small-signal output on the circuit.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The device can be a port, a current source, a voltage source, a resistor, or a current probe.

> **Note:**
>
> The definition of the port in the netlist uses the Port Impedance Resistor syntax.
>
> The port definition can include noise parameters NOISE and NOISETEMP, but the analysis ignores the noise data for the output port.

When a port, current source, or resistor is specified as the **OPROBE** device, the output units are in Volts. When a voltage source or current probe is specified, the units are in Amperes.

REFSIDEBAND

The **REFSIDEBAND** entry specifies coefficients to apply to the **SS_TONES** frequencies in the calculation of the RF/input frequency. The **REFSIDEBAND** coefficients are positive or negative integers plus zero. See the TV Noise Technical Notes topic for more information on the use of the **REFSIDEBAND** coefficients.

> **Note:**
>
> When an **IPROBE** device is specified, the netlist must also have the **REFSIDEBAND** list of coefficients for the **SS_TONES** frequencies in order to perform the conversion gain calculation. When no **IPROBE** device is specified, the **REFSIDEBAND** entry is optional; the default coefficient value is 1.

NOISE_OUTPUT

The **NOISE_OUTPUT** entry is a comma-separated list of node voltages and branch currents for which noise output is appropriate, in addition to the noise data calculated for the **IPORT** and **OPORT** devices. (No noise factor or conversion gain is computed for these additional outputs.

Voltage outputs are specified using the format:

V(*net1***,***net2***)**

Noise output for nets has units V^2/Hz.

Branch currents are specified using the format:

I(*device***)**

Noise output for branch currents has units A^2/Hz.

See TV Noise Results for details on the outputs from TV Noise analysis.

INPUT_REFERRED_NOISE

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **INPUT_REFERRED_NOISE** entry specifies a single node voltage or branch or current to be used as the source for an input-referred noise calculation.

A node voltage is specified using the format:

V(*net1*,*net2***)**

A branch current is specified using the format:

I(*device***)**

The **INPUT_REFERRED_NOISE** entry can be specified only when the **NOISE_OUTPUT** entry is also specified.

Harmonic Balance Controls

When **SS_ANALYSIS=HB** is specified, the additional controls **METHOD**, **AUTO_REFINE_SOLUTION**, and **TRIM_TOL** can be used.

See Handling Strongly Nonlinear Circuits in the Harmonic Balance topic for details on the **METHOD** entry in the HB statement.

See Increasing Accuracy or Speed for details on the **AUTO_REFINE_SOLUTION** and **TRIM_TOL** entries in the HB statement.

TV Noise Netlist Example

```
.TV_NOISE
+ START=1000000000 STOP=2000000000 STEP=500000000
+ OPROBE=[Z167]
+ SS_MAXK=[7]
+ SS_TONES=[1000000000]
+ SS_ANALYSIS=HB
+ NOISE_OUTPUT=[V(IF),I(LO)]
+ INPUT_REFERRED_NOISE=[RIF]
+ REFSIDEBAND=[1]
+ SAVEALLSIDEBANDS=no
```

Periodic Transfer Function Netlist Syntax

The syntax of the **.TV_NOISE** statement in Nexxim is:

.TV_NOISE
+ *output_freq_sweep*
+ **SS_ANALYSIS=HB**|**OSC**
+ **SS_TONES=[***val* [,*val*]...**]**
+ **SS_MAXK=[***val* [,*val*]...**]**
+ [**RELHARMVEC=[***val* [,*val*]...**]**]

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
+ PXF=1
 + PROBE=[net_current]
 + MAXSIDEBAND=val | SIDEBAND=[val [,val]...]
 + [METHOD=HB|SHOOTING]
+ [AUTO_REFINE_SOLUTION=YES|NO]
+ [TRIM_TOL=val]
```

In this syntax:

- For clarity, elements are shown one per line using the continuation character (+). Elements can be entered on a single line using spaces as separators.
- Brackets shown in bold (**[ ]**) are required when more than one item is specified.
- Brackets in plain font ([ ]) denote optional entries or fields.

Output Frequency Sweep

The required entry *output_freq_sweep* specifies a range of output frequencies to apply in the noise calculation. The sweep specification should be the first field in the TV_NOISE statement (after the **.TV_NOISE** keyword).

(See the TV Noise Technical Notes topic for information on the use of the swept output frequencies.)

The *output_freq_sweep* field has several formats.

The sweep can be just a single frequency value.

A second form of *output_freq_sweep* specifies the starting and ending frequencies, and the incremental step:

```
[START=]start_val [STOP=]stop_val [STEP=]step_val
```

If the sweep specification omits the **START=**, **STOP=**, and **STEP=** labels, the start value, stop value and step value must be entered in the order shown. If the labels are used, the values may be entered in any order, but then all three values must have labels.

A third format for *output_freq_sweep* is:

```
count_type numpoints startfreq stopfreq
```

The *count_type* entry (**LIN**, **DEC**, or **OCT**) specifies a pattern of frequencies to be swept with *numpoints*, *startfreq* and *stopfreq*:

The **LIN** (linear) count type specifies a linear sweep at *numpoints* different frequencies on the frequency given by *startfreq* to the frequency given by *stopfreq*. The spacing between test frequencies is (*stopfreq*–*startfreq*) / *numpoints*.

The **DEC** (decade) count type specifies a logarithmic sweep at *numpoints* different frequencies in each decade (10× multiple of *startfreq*) from *startfreq* to *stopfreq*. The spacing between test frequencies is logarithmic within decades.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **OCT** (octave) count type specifies a logarithmic sweep at *numpoints* different frequencies in each octave (2× multiple of startfreq) from *startfreq* to *stopfreq*. The spacing between test frequencies is logarithmic within octaves.

A fourth format for *output_freq_sweep* is:

POI*numpoints freq1 [freq2 ...]*

The **POI** format specifies a space-separated list of individual frequency points. The entry *numpoints* is the number of frequency points in the list.

SS_ANALYSIS

The **SS_ANALYSIS** entry selects between harmonic balance (**HB**) and oscillator analysis (**OSC**) to compute the steady-state values. **HB** is the default.

SS_TONES

The **SS_TONES** entry specifies one or more frequencies to use in the steady-state harmonic balance calculations.

SS_MAXK

The **SS_MAXK** entry specifies the maximum harmonic numbers to use for the corresponding **SS_TONES** frequencies in the steady-state harmonic balance calculations. The number of **SS_MAXK** entries should be the same as the number of **SS_TONES** frequencies.

RELHARMVEC

The **RELHARMVEC** entry specifies offset multipliers for the corresponding **SS_TONES** frequencies. The number of **RELHARMVEC** entries should be the same as the number of **SS_TONES** frequencies.

> **Note:**
>
> When just one offset is specified, the netlist can use the entry **RELHARMNUM** instead of **RELHARMVEC**, and can omit the brackets around the offset value.
>
> See the TV Noise Technical Notes topic for information on the use of the **RELHARMVEC** offsets.

PXF

The entry **PXF=1** is required to invoke periodic transfer function analysis.

PROBE

The **PROBE** entry specifies the device to use for the small-signal transfer function output.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The *device* can be a port, a current source, a voltage source, or the voltage drop across a pair of nodes, using the format **V(***n1*,*n2***)**.

When a port, voltage source, or voltage drop is specified as the **PROBE** device, the output units are in Volts. When a current source is specified, the units are in Amperes.

MAXSIDEBAND or SIDEBAND

The netlist must specify the combination of harmonics of the steady state **SS_TONES** frequencies, using either **MAXSIDEBAND** or **SIDEBAND**.

(See the TV Noise Technical Notes topic for information on the use of the **MAXSIDEBAND** and **SIDEBANDS** entries.)

When the **SS_TONES** group box has only one frequency, click the **MAXSIDEBAND** entry to specify the maximum harmonic of that frequency.

Alternatively, specify a set of specific sidebands to use for the single output frequency, using the **SIDEBAND** entry.

When the **SS_TONES** group box specifies more than one frequency, you must Click the **SIDEBAND** entry to specify the combinations of harmonics that are of interest as input frequencies (**MAXSIDEBANDS** is not valid with multiple **SS_TONES** frequencies).

Harmonic Balance Controls

When **SS_ANALYSIS=HB** is specified, the additional controls **METHOD**, **AUTO_REFINE_SOLUTION**, and **TRIM_TOL** can be used.

See Handling Strongly Nonlinear Circuits in the Harmonic Balance topic for details on the **METHOD** entry in the HB statement.

See Increasing Accuracy or Speed for details on the **AUTO_REFINE_SOLUTION** and **TRIM_TOL** entries in the HB statement.

Periodic Transfer Function Netlist Example

```
.TV_NOISE
+ START=1000000000 STOP=2000000000 STEP=500000000
+ SS_MAXK=[7]
+ SS_TONES=[1.0e9, 2.17e9]
+ SS_ANALYSIS=HB
+ PXF=1
+ PROBE=[V22]
+ SIDEBAND=[1,0,2,-1,1,1]
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TV Noise Results

TV Noise analysis can compute several kinds of outputs. To view the available quantities for output in a report, specify **Noise** in the **Domain** field on the **Report** window. The following categories of outputs can be displayed in a report:

Variables

This category contains the swept frequency variable **F** and any other variables defined in the design.

Output Variables

This category contains the output variables on the steady-state harmonic balance calculation specified in the solution setup. In a schematic, the Output Variables quantities are specified by editing the **Output Variables** field in the **TV Noise Analysis** window. In a netlist, the Output Variables quantities are specified with a **.PRINT HB** statement.

Noise Output

This category contains the noise outputs at the nodes or branches identified in the solution setup. In a schematic, the Noise Output quantities are specified by editing the **Noise Output** field in the **TV Noise Analysis** window. In a netlist, the Noise Output quantities are specified with the **NOISE_OUTPUT** entry in the **.TV_NOISE** statement. For voltages, the noise output is expressed in V^2/Hz. For currents, the noise output is expressed in A^2/Hz. No noise factor or conversion gain is computed for these outputs. (The noise factor and conversion gain are computed for the following Onoise figure.)

Input Referred Noise

The solution setup can specify one input (port, resistor, or source) to use as an input-referred noise source. Nexxim creates a result for each noise output. For voltage sources, the input-referred noise is expressed in V^2/Hz. For all other devices, the input-referred noise is expressed in A^2/Hz.

Noise

This category includes the Onoise, Noise Factor, and Noise Figure outputs.

Onoise is the noise output for the specified output frequency at the specified output port, in dB. The Noise Factor/Noise Figure and Conversion Gain outputs are referenced to Onoise.

The Noise Factor and Noise Figure are computed when both input and output ports are specified. The calculation uses the thermal noise parameters on the input port specification, if present, otherwise defaulting to a noise temperature of 290°K. Noise parameters for the output port are ignored in the calculation.

The Nexxim TV Noise Factor is the IEEE single-sideband figure. The Noise Figure is the Noise Factor converted to dB.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- to open the Noise Factor, select **NF11** on the **Quantities** group box, and select **<none>** from the **Functions** group box in the **Report** window.
- to open the Noise Figure, select **NF11** on the **Quantities** group box, and select **dB** on the **Functions** list in the **Report** window.

Conversion Gain

The Conversion Gain output (quantity **CG11**) is the power conversion gain between the input port at the input frequency and the output port at the output frequency, in dB.

The Conversion Gain is computed when both input and output ports are specified. The calculation uses the thermal noise parameters on the input port specification, if present, otherwise defaulting to a noise temperature of 290°K. Noise parameters for the output port are ignored in the calculation.

Viewing TV Noise Contributors

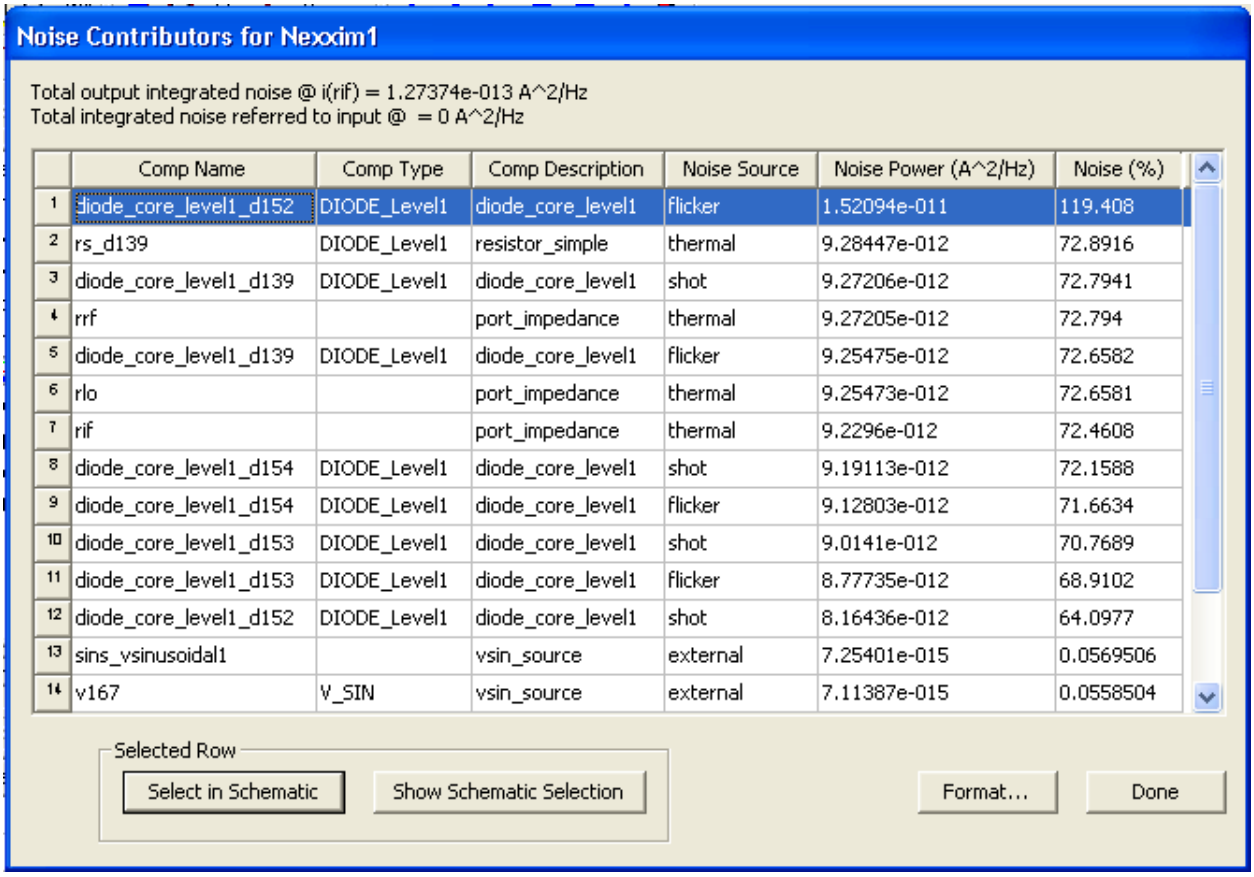
When noise analysis has been specified in the solution setup or in the netlist, view a listing of noise contributors . Noise contributors are available for Linear Network Analysis (LNA), Time-Varying Noise Analysis (TVNoise) and Oscillator Analysis (OSC).

To enable this feature, the **TV_Noise Analysis** setup in a schematic design must specify at least one **Noise Output** device (node voltage or branch current). In a netlist design, the netlist must include the **NOISE_OUTPUT** entry in the .TV_NOISE statement.

- For schematic designs, right-click the solution setup icon in the **Project Manager** window and select **Show Noise Contributors** on the menu.
- For netlist designs, right-click the circuit name icon in the **Project Manager** window and select **Show Noise Contributors** from the menu.

The **Noise Contributors** window opens:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Initially, the noise contributors are listed in order by **Component Name**. (If the window is opened before an analysis has been performed, it is empty.)

- Click in a column header to sort the display by the contents of that column (the example above has been sorted by **Noise (%)**).

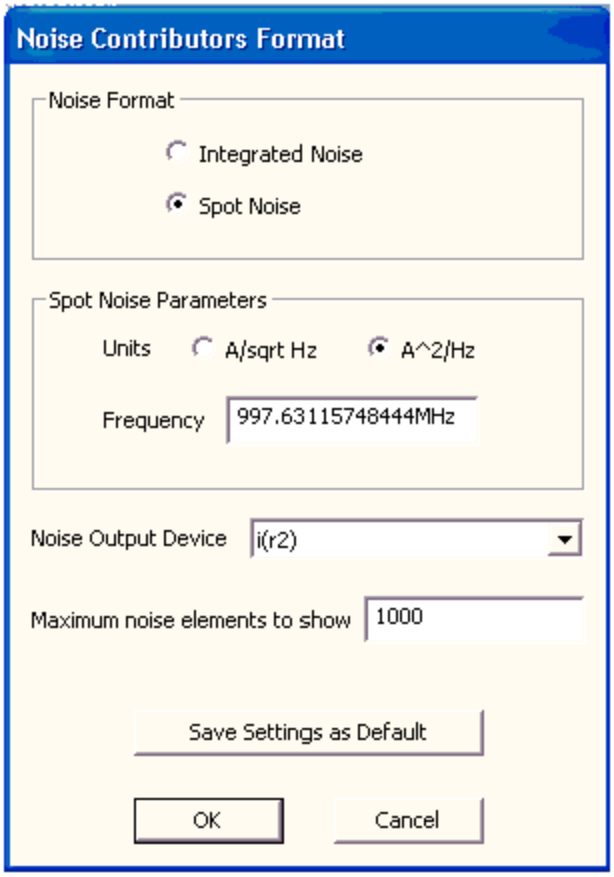
In a schematic design, the **Selected Row** group box is enabled.

- Select a contributor (row) and click **Select in schematic**. The contributing element is selected in the schematic window. The schematic window is brought to the front (under the **Noise Contributors** window) and scrolled so the selected object is visible. Only one element can be selected at a time.
- Select an object in the schematic window and click **Show schematic selection**. The corresponding contributing element is selected in the **Noise Contributors** window. The row containing that element is scrolled into view if necessary.

Initially, the display is set up to show spot noise contributors using default settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **Format** to open the **Noise Contributors Format** window:



Choose one noise output device (voltage through node or current through branch) on the **Noise Output Device** field drop-down menu. The list is populated on the output devices selected in the **TV_Noise Analysis** setup or in the **NOISE_OUTPUT** entry on the .TV_NOISE statement.

Enter a value in the **Maximum noise elements to show** field to restrict the display to that number of elements with the most noise contributions.

When **Spot Noise** is selected, the **Spot Noise Parameters** group box is activated.

- The **Units** button settings depend on the **Noise Output Device**:

When the device is a branch current (as in the illustration above), the choice of units is between Amps/$(Hz)^{½}$ and $(Amps)^2$/Hz.

When the device is a node voltage, the choice of units is between Volts/$(Hz)^{½}$ and $(Volts)^2$/Hz.

- The **Frequency** field is initialized to a value drawn on the analysis setup. Change the frequency as appropriate to see how the spot noise contributions vary with frequency.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When **Integrated Noise** is selected, the **Spot Noise Parameters** group box is deactivated. Units are Volts for output device node voltages and Amperes for output device branch currents.

- Click **Save settings as default** to save the **Noise Contributors Format** window settings as the defaults for future displays.
- Click **OK** to close the **Noise Contributors Format** window and return to the **Noise Contributors** window.

Click **Done** to close the **Noise Contributors** window.

The **Noise Contributors** window becomes invalid if the design is modified. If the window is open when the analysis is re-run, the window is refreshed.

Multiple **Noise Contributor** windows may be opened, but only one for a given design.

TV Noise Options

The TV Noise and Periodic Transfer Function (PXF) analysis options are listed in the TV Noise and PXF Analysis Options Reference. The TV Noise and PXF option values can be changed with a **.OPTIONS** statement in a netlist.

> **Note:**
>
> The TV Noise option values cannot be changed in a schematic design.

The syntax for the .OPTIONs statement is:

.OPTIONS tv_noise.*option1***=***val1* [**tv_noise.***option2***=***val2* ...]

Enter the prefix **tv_noise.** to apply the option value only to time-varying noise analysis but not to other tools that recognize the option.

Nexxim Linear Network Analysis

Linear network analysis (LNA) computes the frequency-dependent scattering (S), admittance (Y), and impedance (Z) parameters for a circuit linearized around the DC bias point. Optionally, group delay analysis and DC noise analysis can be included.

LNA Circuit Configuration

To configure the circuit for linear network analysis, you must add test ports to the circuit. The procedure depends on the type of design — circuit or netlist.

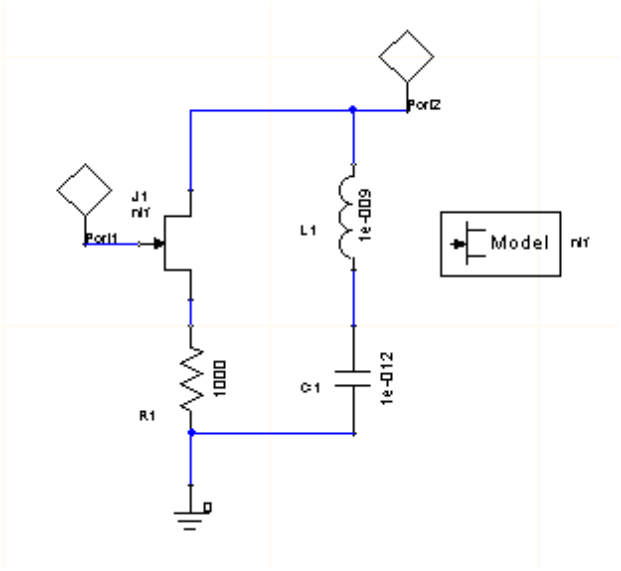
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> A port or port impedance resistor is not required for a linear network analysis that consists only of noise calculations.

LNA Circuit Schematic Configuration

In the **Schematic Editor**, you add the editor's built-in I/O ports. Select the **Interface Port** icon on the Schematic Editor menu. Drag and place one or more ports, then connect them to the circuit at the appropriate places.

The following figure shows a simple JFET circuit configured with Schematic ports for LNA:



LNA Circuit Netlist Configuration

If you are using the Netlist Editor to create a design, you add the test ports to the netlist with port impedance resistors. See *Resistor, Port Impedance* in the Nexxim Components help for further information.

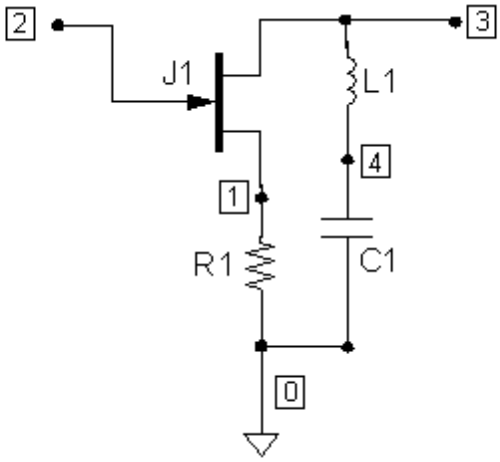
Suppose the circuit consists of the four elements in the following netlist:

```
* JFET circuit example
J1 3 2 1 njf
L1 3 4 1e-9
C1 4 0 1e-12
R1 1 0 1000
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
.MODEL njf NJF level=1 $ parameters not shown
.END
```

The corresponding schematic is illustrated in the following figure:



To create a test port, add a port impedance resistor from an input node to ground. The port impedance resistor includes a **PORTNUM** parameter specifying a port number, and specifies the port impedance with parameters **RZ** and **IZ**. (See Resistor, Port Impedance in the Nexxim Component Library documentation for details on the **PORTNUM**, **RZ**, and **IZ** parameters.) The **ZERO_PORT_VALUES=1** option tells Nexxim to treat the port resistors as external to the circuit (See LNA Options).

In combination with the network analysis, Nexxim can perform an analysis of the AC small-signal transfer functions. (See LNA-Associated AC Analysis for further information.) To enable AC analysis, the netlist includes one or more voltage or current sources with the AC parameter to specify the magnitude and phase of the AC value. The netlist also includes a **.PRINT AC** statement to specify the outputs to be analyzed.

> **Note:**
>
> Port impedance resistors are not required for a linear network analysis that consists only of AC small-signal analyses.

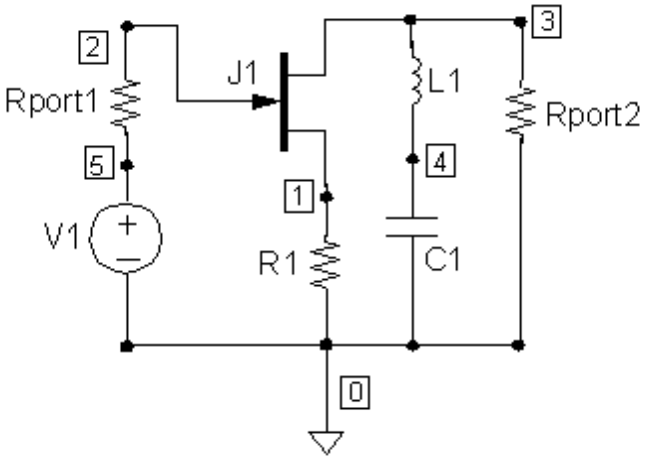
Here is the netlist with added port resistors with **ZERO_PORT_VALUES** option, and statements to provide for AC transfer function analysis:

```
* JFET circuit with Port Resistors for Linear Network Analysis
J1 3 2 1 njf
L2 3 4 1e-9
C1 4 0 1e-12
R1 1 0 1000
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
V1 5 0 5 AC 1 0 $ Voltage source for AC analysis
Rport1 2 5 PORTNUM=1 RZ=50 IZ=0 $ Port 1 impedance resistor
Rport2 3 0 PORTNUM=2 RZ=50 IZ=0 $ Port 2 impedance resistor
.MODEL njf NJF level=1 $ parameters not shown
.LNA dec 10 5e8 5e9 flag='LNA'
.OPTIONS ZERO_PORT_VALUES=1
.PRINT AC V(1) I(V1) $ Outputs for AC analysis
.END
```

The following figure illustrates the netlist as a schematic:



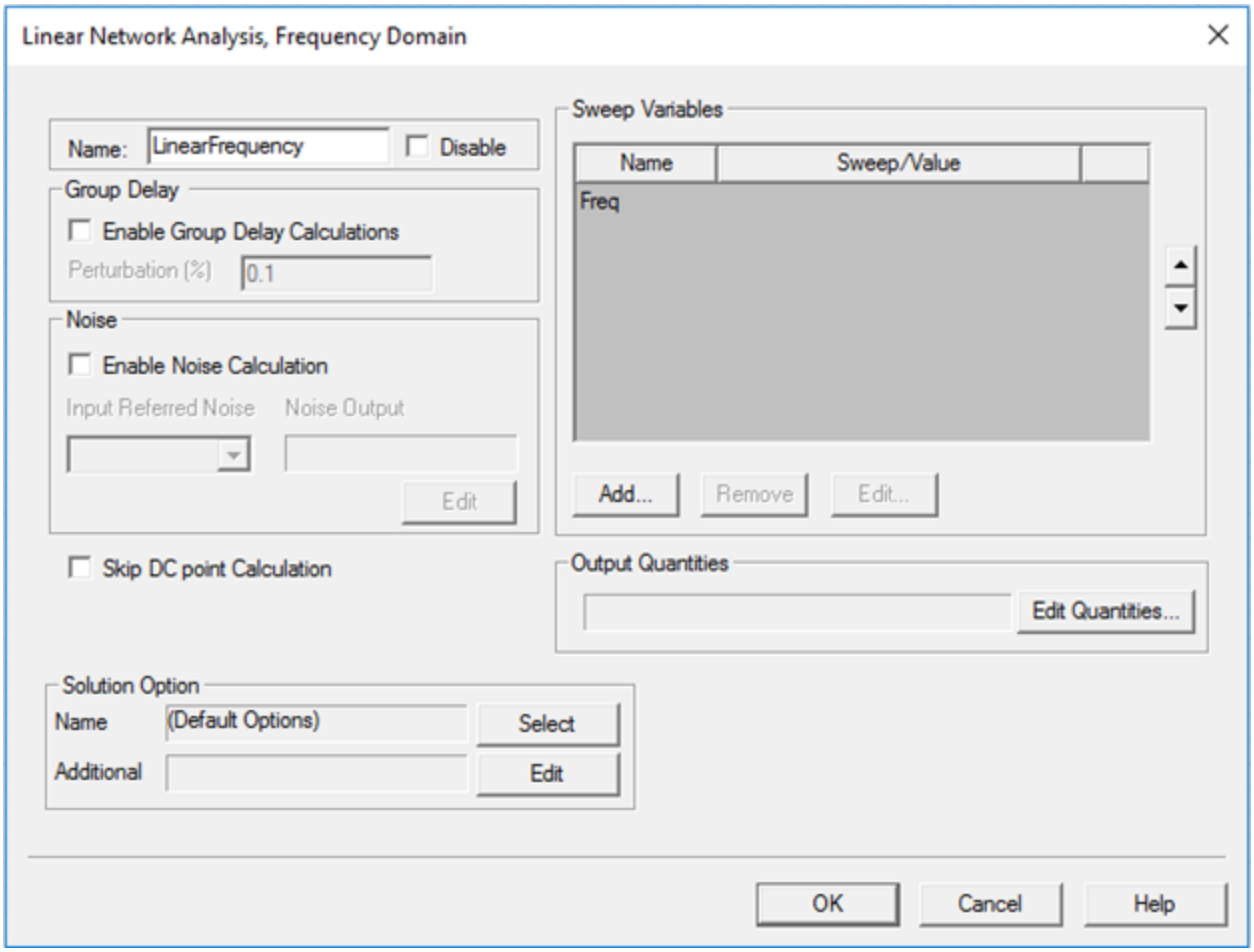
In a design entered with the schematic editor, the schematic uses Interface (I/O) ports instead of the port impedance resistors, and uses a voltage probe instead of the voltage source.

Running LNA on the Schematic Editor

From the **Schematic Editor**, perform the following steps to set up a Nexxim linear network analysis, and run the analysis.

1. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Add Nexxim Solution Setup ...** > **Linear Network Analysis** to reopen the **Linear Network Analysis, Frequency Domain** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Type an **Analysis Name** (or accept the default name, for example “LinearFrequency1”).
3. For most simulations, leave the **Disable** group box unselected (the default setting). Selecting this box lets you store multiple solution setups for later use. (Note that if a solution setup is deactivated before the analysis is run, any changes made to the design invalidates the simulation results.)
4. Depending on the requirements of the project, select **Enable Group Delay Calculations** and specify a **Perturbation** as a percentage of the test frequency. (See Group Delay Analysis later in this topic).
5. Depending on the requirements of the project, select **Enable Noise Calculation**. When the **Enable Noise Calculation** group box is checked, the **Noise Output** field is activated. When at least one Noise Output has been added, the **Input Referred Noise** field is activated.
    a. Click **Edit** under the **Noise Output** field to open a **Noise Output** window. Select one or more currents through devices or voltages through nets, then click **OK** to close the **Noise Output** window (or click **Cancel** to close the window without selecting any outputs).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. After adding one or more **Noise Output** elements, select a source for the input-referred noise calculation from the list in the **Input Referred Noise** drop-down.

See the LNA Technical Notes for more information on LNA noise calculations.

6. By default, the field solvers solve for the DC frequency. To deactivate the DC calculation, check **Skip DC Point Calculation**.The results without the DC calculation are reliable only for circuits with linear devices and no non-zero-valued sources (AC sources are OK).
7. To add a basic frequency sweep, locate the **Sweep Variable** area in the **Linear Network Analysis, Frequency Domain** window box.
   a. From the **Sweep Variable** area, select the frequency **Freq** > **Edit** to open the **Add/Edit Sweep** window.
   b. In the **Variable** list, frequency **Freq** is selected (and cannot be changed). Select one of the following: **Single value**, **Linear step**, **Linear count**, **Decade count**, or **Octave count**.
   c. Type the sweep values into the **Value** field (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units (GHz, MHz, kHz) are selected for each.
   d. Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **Linear Network Analysis, Frequency Domain** window.
   f. For more information, see Variable Sweep.
7. Click **Edit Quantities** in the **Output Quantities** field to open the **Output Quantities** window. Select and **Add** the outputs to be analyzed, then click **OK** to return to the **Linear Network Analysis, Frequency Domain** window.

> **Note:** Any voltage or current probes that are present in the schematic is included as output quantities.

8. Optionally, use the fields in the **Solution Options** group box to select or add DC analysis options and other Nexxim options to the design.

- Click **Select** on the **Name** field to open the **Select Solution Options** window.

If any options sets have been defined, their names appear in the **Select Solution Options** group box. To select a named option set that you have previously defined, click the name of the option set, then click **OK** to return to the **LNA Analysis** window. The named option set appears in the **Name** field in the **Solution Options** group box.

To create a new option set, click **New** to open the **Solution Options** window. Click the **Name** field to name the new option set. Select the **DC Options** tab. Make the appropriate changes to option values, then click **OK** to return to the **Select Solutions** window box. From the **Select Solutions** window, click the name of the new option settings, then click **OK** to return to the **DC Analysis** window. The name of the new option settings appears in the **Name** field in the **Solution Options** group box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **Edit** on the **Additional** field to open a text-entry window, **Edit additional options**.

Use the field to enter any Nexxim options exactly as they are to appear in the netlist. Do not include the keyword .OPTIONS; the .OPTIONS keyword is automatically inserted at the beginning of the line in the netlist statement.

The line can contain multiple options settings. Use spaces to separate the options settings.

To modify or delete an option once it has been added, just edit or delete its entry in the list.

To clear all options, delete the entire line.

Click **OK** to return to the **Linear Network Analysis, Frequency Domain** window.

The options in the **Additional** field are automatically added to the netlist when the solution containing them is performed.

For more information, see DC Analysis Options.

11. Click **Finish** to close the **Linear Network Analysis, Frequency Domain** window.
12. Run the simulation:
    - From the **Circuit** menu, select **Analyze**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
    - The **Message Manager** window signals success or failure.
    - For details on creating and modifying reports, see Generating Reports and Post-processing.

> **Note:**
>
> In the **Schematic Editor**, nodes to be output are identified by attaching Ports in the schematic (See LNA Circuit Configuration for an example).

Running LNA on the Netlist Editor

If you use the Netlist Editor to create a design, the netlist should contain the information for running the linear network analysis. No Solution Setup is required.

Running Nexxim Linear Network Analysis

1. From the **Circuit** menu, select **Analyze with Nexxim**. If the circuit is set up correctly, the analysis begins immediately and a progress bar appears.
2. The **Message Manager** window signals success or failure.

- For details on creating and modifying reports, see Generating Reports and Post-processing.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LNA Netlist Syntax

The netlist syntax of the Linear Network Analysis statement is:

.LNA*frequencies* [**FLAG=***analysis_flag*] [**GROUP_DELAY_PERT=***val*]
[**NOISE_OUTPUT=[***list_of_outputs***]**]
[**INPUT_REFERRED_NOISE=[***source***]**]

Optionally, the netlist may also contain an output statement of the form:

.PRINT AC*list_of_outputs*

LNA Frequency Sweep

The entry *frequencies* specifies a sweep of frequencies to be applied in the analysis.

The *frequencies* field has several formats.

The sweep can be just a single frequency value.

A second form of *frequencies* specifies the starting and ending frequencies, and the incremental step:

[**START=**]*start_val* [**STOP=**]*stop_val* [**STEP=**]*step_val*

If the sweep specification omits the **START=**, **STOP=**, and **STEP=** labels, the start value, stop value and step value must be entered in the order shown. If the labels are used, the values may be entered in any order, but then all three values must have labels.

A third form for the *frequencies* field has the format:

freq_sweep_type numpoints startfreq stopfreq

This format specifies a count of analysis frequencies defined by *numpoints*, *startfreq* and *stopfreq*, using one of the predefined *freq_sweep_type* tokens **LIN**, **DEC**, or **OCT**:

LIN
Linear sweep at *numpoints* different frequencies on the frequency given by *startfreq* to the frequency given by *stopfreq*. The spacing between test frequencies is

`(stopfreq - startfreq) / (numpoints - 1).`

DEC
Logarithmic sweep at *numpoints* different frequencies in each decade (10× multiple of *startfreq*) from *startfreq* to *stopfreq*. The spacing between test frequencies is logarithmic within decades.

OCT
Logarithmic sweep at *numpoints* different frequencies in each octave (2× multiple of *startfreq*) from *startfreq* to *stopfreq*. The spacing between test frequencies is logarithmic within octaves.

A fourth format for the *frequencies* field is:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

POI*numpoints freq1 [freq2 ...]*

This form provides a space-separated list of *numpoints* test frequencies.

LNA Analysis Flag

The *analysis_flag* is a string (enclosed in single quotes) that specifies the analyses to be performed. The valid entries for *analysis_flag* are:

'LNA'
Linear network analysis

'NOISE_DC'
DC noise analysis

'LNAN'
Linear network and DC noise analyses

'LNAG'
Linear network and group delay analyses

'LNANG'
(Default) Linear network, DC noise, and group delay analyses (**LNAGN** is a synonym for **LNANG**)

Group Delay Perturbation Factor

When the *analysis_flag* on the LNA statement is 'LNAG' or 'LNANG', group delay analysis is enabled. The entry **GROUP_DELAY_PERT** specifies the perturbation to be applied in calculating group delay. The perturbation is specified as a *percentage* of the test frequency (See the LNA Technical Notes).

Noise Contributions

The .LNA statement can include specifications for noise output and for input-referred noise.

The syntax entry:

NOISE_OUTPUT=[*list_of_outputs***]**

specifies that noise output is to be calculated for the list of outputs in square brackets. The outputs in the list are node voltages or device currents separated by commas, for example:

```
NOISE_OUTPUT=[V(1), I(R3), V(Port2)]
```

The syntax entry:

INPUT_REFERRED_NOISE=[*source***]**

specifies that the single node voltage or device current in square brackets is to be used as the source for an input-referred noise calculation, as in these examples:

```
INPUT_REFERRED_NOISE=[V(1)]
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
INPUT_REFERRED_NOISE=[I(R3)]
```

> **Note:**
>
> A port or port impedance resistor is not required for a linear network analysis that consists only of noise calculations.

AC Calculation

On a line that is separate on the .LNA statement, the netlist can contain a PRINT AC statement of the form:

.PRINT AC*list_of_outputs*

To request the output of small-signal AC analysis that is calculated by the linear network analysis tool. The outputs in the list are node voltages or device currents separated by commas. See LNA-Associated AC Analysis for further information.

Support for Small Signal Analysis in Imported Netlists

In addition to the linear network analysis netlist syntax, Nexxim supports small-signal AC analysis in HSPICE™ syntax in netlists imported from other design environments. The supported statement type is:

.AC

LNA Results

The results for linear network, DC noise, and group delay analyses are summarized in the following tables. The parameters for N-ports are listed first, the results for 2-port networks.

Netlist Parameters for N-Port Circuits

TF	Transfer function. When ports are used as described earlier, the transfer function describes the relationship between input voltage and output current.
Y	Complex *Y* admittance parameter matrix, I = YV where I = vector of output currents, V = vector of input voltages
Z	Complex *Z* impedance parameter matrix, V = ZI
S	Complex *S* scattering parameter matrix, B = SA where E_i = vector of incident waves, E_r = vector of reflected waves, $V = E_i + E_r$, $I = (E_i - E_r)/Z_0$, Z_0 = characteristic impedance, $A = E_i/Z_0$, $B = E_r/Z_0$
GD	Real Group Delay,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$GD_{ij} = \frac{-d\phi_{ij}}{d\omega}$$

where ϕ_{ij}=phase(S_{ij})

Single Port Netlist Parameters for N-Port Circuits

Complex Reflection coefficient,

RHO*i*

$$\mathrm{RHO}i = S_{ii}$$

Real Return loss

RTL*i*

$$\mathrm{RTL}i = \left|S_{ii}\right|$$

Real Voltage standing wave ratio,

VSWR*i*

$$\mathrm{VSWR}i = \left|\frac{1+\left|S_{ii}\right|}{1-\left|S_{ii}\right|}\right|$$

Noise Parameters for N-Port Circuits

N×N matrix of square roots of noise power spectra (Volt/Hz$^{1/2}$ or Amp/Hz$^{1/2}$).

$$Syy = [TF(\omega) \times Sxx(\omega) \times TF(\omega)^{H}]$$

Onoise

$$Onoise = \sqrt{Syy}$$

Inoise Input-referred noise.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$Inoise(out,in) = \frac{Onoise(out,out)}{\sqrt{TF(out,in) \times (TF(out,in))^*}}$$

Noise Parameters for Two-Port Circuits

FMIN Real Minimum noise figure power ratio. FMIN is derived from fundamental noise quantities.

NF Real Noise figure power ratio. NF is derived from fundamental noise quantities. The reference temperature for the source (port) used in NF calculations is 27 degrees Celsius.

NT

$$\mathrm{NT} = (\mathrm{NF} - 1) * 290$$

Real Equivalent noise temperature,

RN Real Equivalent normalized noise resistance ratio. RN is derived from fundamental noise quantities.

RNU

$$\mathrm{RNU} = \mathrm{RN} * Z_{REF}$$

Real Equivalent un-normalized noise resistance,

Complex Optimum noise figure reflection coefficient,

GOPT

$$\mathrm{GOPT} = \frac{\mathrm{Zopt} - Zs}{\mathrm{Zopt} + Zs}$$

Complex Optimum noise figure source admittance,

YOPT

$$\mathrm{YOPT} = Go + jBo$$

where *Go* and *Bo* are derived from fundamental noise quantities.

Complex Optimum noise figure source impedance,

ZOPT

$$\mathrm{ZOPT} = 1/\mathrm{YOPT}$$

Netlist Parameters for Two-Port Circuits

ABCD *ij* Complex ABCD parameters (chain parameters).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\begin{bmatrix} v_1 \\ i_1 \end{bmatrix} = \begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{bmatrix} v_2 \\ -i_2 \end{bmatrix}$$

Complex Hybrid parameters

H*ij* $$\begin{bmatrix} v_1 \\ i_2 \end{bmatrix} = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} i_1 \\ v_2 \end{bmatrix}$$

G*ij* Complex Inverse Hybrid parameters, $G = H^{-1}$

Gain and Matching Parameters for Two-Port Circuits

Available power gain,

GA
$$GA = \frac{1-|\Gamma_s|^2}{|1-S_{11}\Gamma_s|^2} |S_{21}|^2 \frac{1}{1-|\Gamma_{out}|^2}, \quad where$$
$$\Gamma_{out} = S_{22} + \frac{S_{12}S_{21}\Gamma_s}{1-S_{11}\Gamma_s}$$

GFMN Gain when the input impedance (Zopt) is used to achieve minimum noise figure (FMIN)

Real Maximum available gain,

GMAX
$$GMAX = \begin{cases} \frac{1}{1-|S_{11}|^2}|S_{21}|^2\frac{1}{1-|S_{22}|^2}, & unilateral\ case \\ \frac{|S_{21}|}{|S_{12}|}\left(K-\sqrt{K^2-1}\right), & bilateral\ case \end{cases}$$

Complex Optimum gain reflection coefficient for Load at maximum available gain (GMax),

GML
$$GML = \frac{B_2 \pm \sqrt{B_2^2 - 4|C_2|^2}}{2C_2}$$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

where

$$B_2 = 1 + |S_{22}|^2 - |S_{11}|^2 - |\Delta|^2$$

$$C_2 = S_{22} - \Delta S_{11}^*$$

and

$$\Delta = S_{11}S_{22} - S_{12}S_{21}$$

Complex Optimum gain reflection coefficient for Source at maximum available gain (GMax), ,

$$\mathrm{GMS} = \frac{B_1 \pm \sqrt{B_1^2 - 4|C_1|^2}}{2C_1}$$

where

GMS

$$B_1 = 1 + |S_{11}|^2 - |S_{22}|^2 - |\Delta|^2$$

$$C_1 = S_{11} - \Delta S_{22}^*$$

and

$$\Delta = S_{11}S_{22} - S_{12}S_{21}$$

GP Power gain,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\mathrm{GP} = \frac{1-|\Gamma_L|^2}{|1-S_{22}\Gamma_L|^2}\,|S_{21}|^2\,\frac{1}{1-|\Gamma_{IN}|^2},\ \textit{where}$$

$$\Gamma_{IN} = S_{11} + \frac{S_{12}\,S_{21}\,\Gamma_L}{1-S_{22}\Gamma_L}$$

Transducer power gain,

TG

$$TG = \frac{1-|\Gamma_S|^2}{|1-S_{11}\Gamma_S|^2}\,|S_{21}|^2\,\frac{1-|\Gamma_L|^2}{|1-\Gamma_{OUT}\Gamma_L|^2}$$

Real Maximum stable gain,

MSG

$$\mathrm{MSG} = \frac{|S_{21}|}{|S_{12}|}$$

Unilateral power gain,

UPG

$$\mathrm{UPG} = \frac{1}{1-|S_{11}|^2}|S_{21}|^2\,\frac{1}{1-|S_{22}|^2},\ \textit{when}\ S_{12}=0$$

Source admittance at maximum available gain (GMAX),

YMS

$$\mathrm{YMS} = \frac{1}{Z_S}\left(\frac{1-\mathrm{GMS}}{1+\mathrm{GMS}}\right)$$

where Z_S is the source impedance.

YML Load admittance at maximum available gain (GMAX),

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$YML = \frac{1}{Z_L}\left(\frac{1-GML}{1+GML}\right)$$

where Z_L is the load impedance.

Source impedance at maximum available gain (GMAX)

ZMS $$ZMS = \frac{1}{YMS}$$

Load impedance at maximum available gain (GMAX),

ZML $$ZML = \frac{1}{YML}$$

Port Parameters for Two-Port Circuits

Input admittance with port 2 terminated,

YIN $$YIN = Y_{11} - \frac{Y_{12}Y_{21}}{Y_{22}+Y_L}$$

where Y_L is the load admittance.

Output admittance with port 1 terminated,

YOUT $$YOUT = Y_{22} - \frac{Y_{12}Y_{21}}{Y_{11}+Y_S}$$

where Y_S is the source admittance.

Input impedance with port 2 terminated,

ZIN $$ZIN = Z_{11} - \frac{Z_{12}Z_{21}}{Z_{22}+Z_L}$$

where Z_L is the load impedance.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Output impedance with port 1 terminated,

ZOUT

$$\mathrm{ZOUT} = Z_{22} - \frac{Z_{12} Z_{21}}{Z_{11} + Z_S}$$

where Z_S is the source impedance.

Stability Parameters for Two-Port Circuits

B1 term of the stability factor,

$$\mathrm{B1} = 1 + |S_{11}|^2 + |S_{22}|^2 - |\Delta|^2$$

B1

where

$$\Delta = S_{11}S_{22} - S_{12}S_{21}$$

Real Stability factor k

K

$$\mathrm{K} = \frac{1 - |S_{11}|^2 - |S_{22}|^2 + |\Delta|^2}{2|S_{21}S_{12}|}$$

Real Stability factor mu

MU

$$\mathrm{MU} = \frac{1 - |S_{22}|^2}{|S_{11} - (\Delta)S_{22}^*| + |S_{21}S_{12}|}$$

Real Stability circle radius for Source,

KCSR

$$\mathrm{KCSR} = \left| \frac{S_{12}S_{21}}{|S_{11}|^2 - |\Delta|^2} \right|$$

KCLR Real Stability circle radius for Load,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\mathrm{KCLR} = \left| \frac{S_{12}S_{21}}{\left|S_{22}\right|^2 - \left|\Delta\right|^2} \right|$$

Complex Stability circle origin for Source,

KCSO

$$\mathrm{KCSO} = \frac{\left(S_{11} - \Delta S_{22}^*\right)^*}{\left|S_{11}\right|^2 - \left|\Delta\right|^2}$$

Complex Stability circle origin for Load

KCLO

$$\mathrm{KCLO} = \frac{\left(S_{22} - \Delta S_{11}^*\right)^*}{\left|S_{22}\right|^2 - \left|\Delta\right|^2}$$

Two-Port Voltage Gain Parameters

Complex Voltage gain input-output,

VGIO

$$\mathrm{VGIO} = V_2 / V_1$$

Complex Voltage gain insertion,

VGIN

$$VGIN = VGSL \left(1 + Z_s / Z_L\right)$$

Complex Voltage gain source-load,

VGSL

$$VGSL = V_2 / V_s$$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Exporting LNA Results

You can export the results of a linear network analysis to a Touchstone™ file for use by other analyses. Results can be exported from both Schematic Editor designs and Netlist Editor designs.

See Exporting LNA Results to a File in the Importing and Exporting Data topic for further information.

Please See the documentation for your design environment for the syntax definitions of this statement.

> **Note:**
>
> Port impedance resistors are not required for an AC small-signal analysis that uses the .AC statement.

LNA Options

In a netlist, options are specified with the **.OPTIONS** statement. In **Schematic Editor** designs, options are specified with the **Add Solution Options** window. See Linear Network Analysis Options Reference for details on the LNA options.

ZERO_PORT_VALUES

Port impedance resistors specify the port impedances with their PORTNUM parameters.

See *Resistor, Port Impedance* in the Nexxim Component help for further information.

LNA needs to treat these impedances as external to the circuit. The model option **ZERO_PORT_VALUES=1** is therefore required for LNA.

The **ZERO_PORT_VALUES** option is automatically enabled with any design entered through the **Schematic Editor**. It does not appear on the list of Analysis Options in the **Schematic Editor**. For designs entered with the Netlist Editor, the **ZERO_PORT_VALUES** option must be entered explicitly with a **.OPTIONS** statement.

Nexxim DC Analysis Options in LNA

All DC Analysis options apply to the operating point analysis that is performed at the start of LNA. See DC Analysis Options in Nexxim Help.

Nexxim S-Parameter Element Options in LNA

For designs that incorporate s-parameter elements, setting the s-parameter option **time_domain_s_model=1** causes Nexxim to create a state-space system for the analysis. Normally, a state-space system is not generated for frequency-domain analyses such as LNA.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

LNA References

Smith Tool

The Ansys Smith Tool is an interactive Smith chart utility for the design of amplifiers, oscillators, and matching networks. The Smith Tool is available after a successful linear network analysis.

Smith Tool Capabilities

The Smith Tool addresses amplifier design for gain and noise, design of general matching circuits, and initial design of oscillators. Circles of constant gain, noise, reflection, and stability regions are used to select circuit impedances and design parameters. Capabilities of the Smith Tool include:

- Arbitrary grids for impedance, admittance, *Q*, VSWR, et cetera
- Constant available gain and power gain circles
- Constant noise circles
- Stability circles
- Circles of constant reflection for oscillator design
- Bilateral mapping between source and load planes with gain mismatch circles
- Ladder matching circuits using discrete and distributed elements

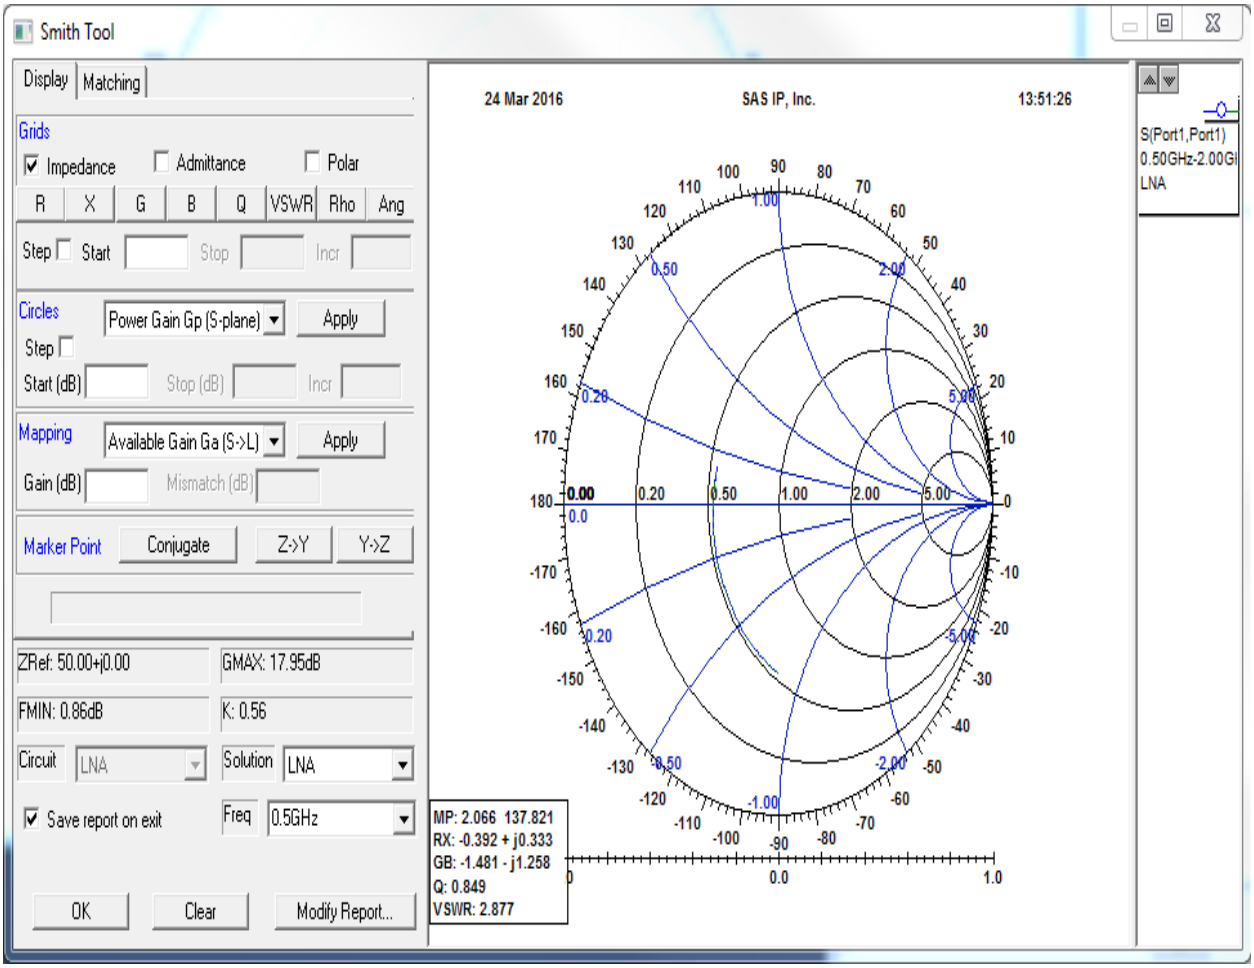
> **Note:**
>
> The Smith Tool is available to analyze the results of linear network analyses performed by the Nexxim simulator on schematic-based designs. Netlist-only Nexxim designs cannot be analyzed with the Smith Tool.

Running the Smith Tool

To start a Smith Tool session, after running a successful linear network analysis, do either of the following to open the **SmithTool** window:

- Click **Product>Smith Tool**.
- With a polar report or Smith-chart report selected and active, click **Report2D** > **Smith Tool**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



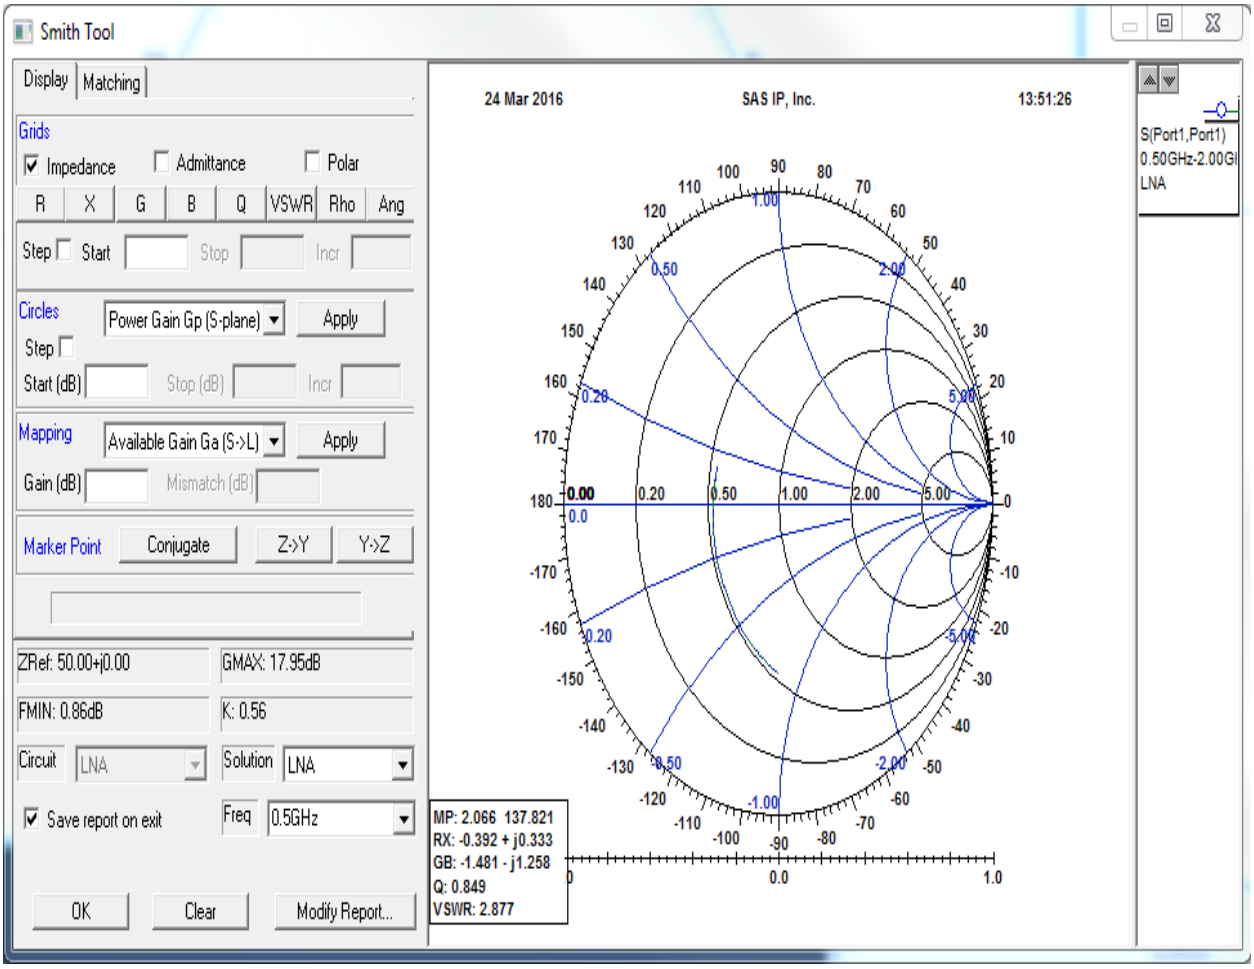
The **SmithTool** performs interactive matching-network synthesis at a single analysis frequency for a particular analysis of a specified circuit/subcircuit. Because multiple analyses may be available for multiple circuits when the Smith Tool window opens, be sure to begin each session by adjusting/confirming these settings at the bottom of the **SmithTool** window:

- In the **Circuit** group box, select the circuit to which you want to add a matching network or networks. The matching network(s) you create becomes as subcircuits of the circuit you select.
- In the **Solutions** group box, select the analysis on which you want to base your Smith Tool session.
- In the **Freq** group box, select the frequency for which your matching network(s) is designed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Smith Tool window

The **Smith Tool** window is re-sizable and consists of control sections at left and a Smith chart display at right.



- The control section at left contains **Display** and **Matching** tabs and controls settings for session parameters.
- The display group box at right contains a Smith chart representation of the parent circuit's S_{11} response.

Settings for Smith Tool Session Parameters

The bottom portion of the Smith Tool control window displays the following information:

- Reference impedance (**ZRef**)
- Minimum possible noise figure (**FMIN**)

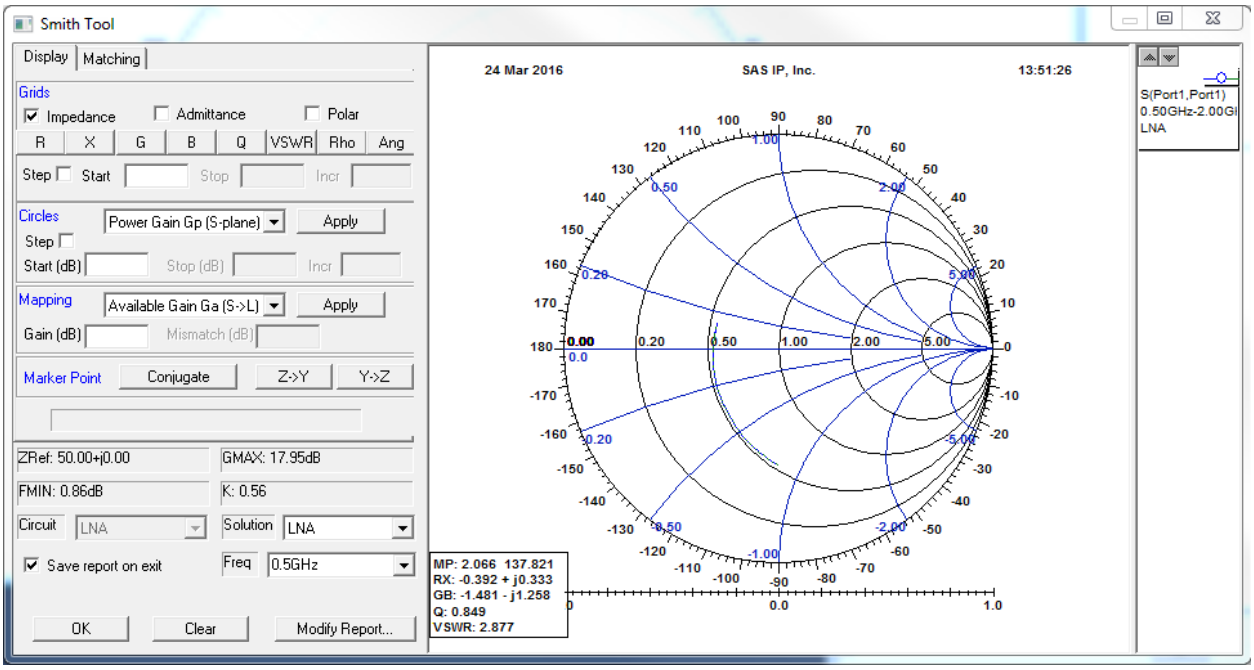
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Maximum gain (**GMAX**)
- Stability factor (**K**) for the selected **Circuit**, **Solution**, and **Freq** uency.

> **Note:** For a Smith Tool session based on a swept-frequency analysis, the **Freq** selection defaults to the lowest frequency in the sweep. Be sure to select the correct frequency as you begin your Smith Tool session.

Smith Tool Display Tab

The **Display** tab is divided into group boxes that enable control of the grid-circle display and reference-plane mapping. The group boxes are: Grids, Circles, Mapping, Marker Point.



Grids in Smith Charts

This group controls the display of grids.

Display any combination of available grids by selecting the following check boxes:

- **Impedance**
- **Admittance**
- **Polar**

The buttons under the **Grid** check boxes allow you to display grids of constant value for eight parameters:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **R** (resistance)
- **X** (reactance)
- **G** (conductance)
- **B** (susceptance)
- **Q** (quality factor)
- **VSWR** (voltage standing wave ratio)
- **Rho** (reflection coefficient magnitude)
- **Ang** (reflection coefficient angle)

You can specify a grid by typing its value or by clicking in the graph.

To display a grid by typing its value:

1. In the **Start** group box, type the normalized value of the grid you want to display.
2. Click the button in the appropriate **Value** field.

To display a family of grids:

1. Select **Step**.
2. In the **Start** group box, type the normalized value of the lowest-value grid you want to display.
3. In the **Stop** group box, type the normalized value of the highest-value grid you want to display.
4. In the **Incr** group box, type the step increment.
5. Click the button in the appropriate **Value** field.

To display a grid by clicking in the graph:

1. Click the button in the appropriate **Value** field. The mouse cursor moves to the graph center, and the corresponding parameter value (in normalized form) appears in the **Start** group box.
2. Click the graph at any point through which the appropriate grid must pass.

Circles in Smith Charts

This group controls the display of circles in the chart display of the **Smith Tool** window.

The display of constant circles is controlled by the following parameters. All quantities except circles of constant noise-figure are available at the source and load planes.

Parameter	Symbol	Reference Plane
Power Gain	Gp	Source and load planes

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Available Gain	Ga	Source and load planes
Stability Factor	K	Source and load planes
	Noise	Source plane
Reflection Coefficient	Refl	Source and load planes

To display a circle:

1. Select a circle type.
2. Type a value in the **Start** group box.
3. Click **Apply**.

To display a family of circles:

1. Select a circle type.
2. Select **Step**.
3. In the **Start** group box, type the normalized value of the lowest-value grid you want to display.
4. In the **Stop** group box, type the normalized value of the highest-value grid you want to display.
5. In the **Incr** group box, type the step increment.
6. Click in the appropriate parameter **Value** field.

Mapping in Smith Charts

This group controls the relationship between the circuit's source and load planes.

To map impedances at one plane to another:

1. Select a mapping function.
2. In the **Gain (dB)** group box, type the appropriate gain at the known plane.
3. Click **Apply:**

   — Circles corresponding to the specified gain in the known and target planes appear in the graph. If you have already plotted a gain circle for the specified value, the known-plane mapping circle overlays.

   — Tracking markers on the known- and target-plane circles indicate points of correspondence between them. As you use your mouse to move the known-plane marker to various impedances on its circle, the target-plane marker tracks to indicate the target-plane impedance that produces the specified gain.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. When you have moved the known-plane marker to the impedance you want to map, click to mark the source and load-plane impedances on the graph. The source and load-plane gain circles remains on the graph.

Mismatch Mapping in Smith Charts

Mismatch S →L and **Mismatch L →S** mapping functions allow you to explore the sensitivity of a network's gain to the variations in source and load impedance.

- **Mismatch S →L** plots a *load*-mismatch circle.
- **Mismatch L →S** plots a *source*-mismatch circle.
- If you enter 0 in **Mismatch** or leave it blank, Smith Tool assumes a tolerance of 0 and displays a mismatch circle of zero radius.
- Terminating the network with an impedance within a **Mismatch S →L** circle, or exciting the network with a source having an impedance with a **Mismatch L →S** circle, results in a gain in excess of **Gain (dB)** −|**Mismatch**| dB.

To implement mismatch mapping:

1. Select the appropriate response in the mapping response list.
2. In the **Gain (dB)** group box, enter the target gain.
3. In the **Mismatch** group box, enter the tolerable deviation on the target gain value, then click **Apply**.

   — Known-plane and target-plane circles appear; tracking markers on the circles indicate points of correspondence between them.

4. Click the appropriate known-plane impedance to mark the target-plane impedance and plot a mismatch circle around it.

Marker Points in Smith Charts

This group allows you to mark the conjugate of a point, transform an admittance to an impedance, and transform an impedance to an admittance.

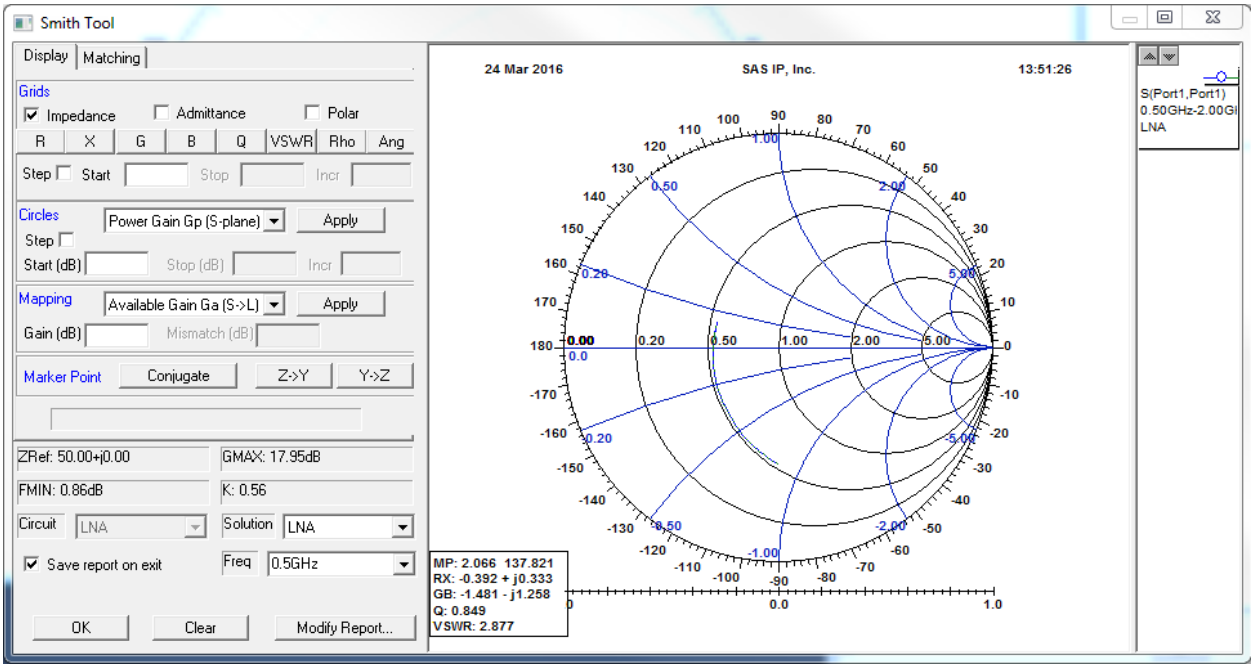
To mark the conjugate of a point:

1. Click **Conjugate**.
2. Move the cursor to the appropriate point (for example, 0.5–*j*0.2) and click. A circle appears at the conjugate point (in this case, 0.5+*j*0.2). The **X →Y** and **Y →Z** functions work similarly.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Smith Tool Matching Tab

The **Matching** tab in the **SmithTool** window allows you to add matching networks made up of various components including series and shunt resistors, capacitors, inductors, transmission lines, stubs, and transformers.



Each component is selectable by clicking a corresponding button in the **Matching** tab window:

Resistor

Grounded Resistor

Capacitor

Grounded Capacitor

Inductor

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Grounded Inductor

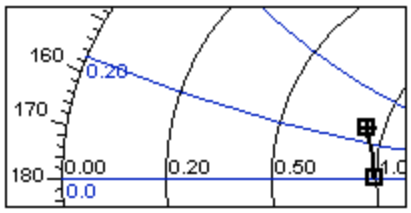
Transmission Line Shorted Stub

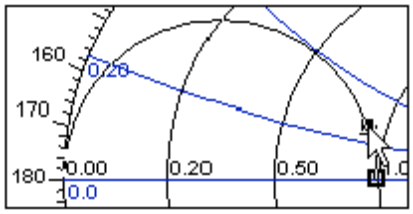
Ideal Transformer

Open Stub

Transmission Line with Reference Node (Nexxim only)

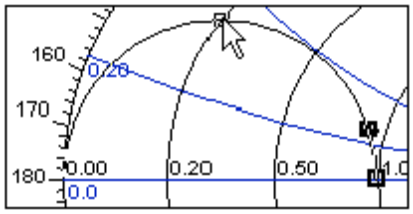
These matching components become available when you start a matching-network design (by clicking **New Match**). Once you have begun a match, add it to the network by clicking any matching component. When you add a component to the network, an arc that depicts a segment of its impedance-transformation range appears on the graph:



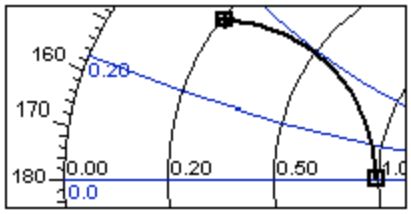


Drag the adjustment box on the arc to select a value:

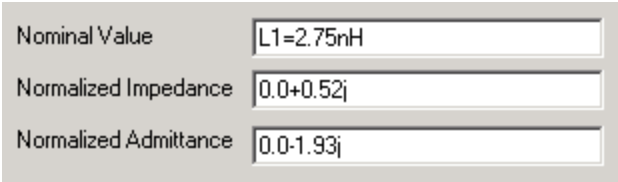
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Release the adjustment box to set the value:



The **Nominal Value**, **Normalized Impedance**, and **Normalized Admittance** group boxes update to show the value of the new component:



- To change the value of an existing matching component, do either of the following:

  — Drag its adjustment box to a new value.

  — Select it by clicking its adjustment box, type a new value into the **Nominal Value**, **Normalized Impedance**, or **Normalized Admittance** field, then press **Enter**.

- To remove the most recently placed matching component, click **Delete Last**. Click **Delete Last** repeatedly to remove multiple components.
- To copy your matching network to the current circuit as a subcircuit, click **Export**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

- You can create multiple matching networks during a Smith Tool session.
- To selectively export one of the networks, click on the network to select/highlight it , then click **Export**.
- If multiple matching networks exist and you do not select one before clicking **Export**, Smith Tool automatically exports the most recently created network.

Creating Matching Networks in Smith Tool

To create a matching network with the Smith Tool:

1. Click **New Match** to place a starting-point impedance on the Smith chart. The cursor moves to the graph center.
2. Move the cursor to the impedance you want to match, and click it.
3. Click a component button.

An arc on the Smith chart shows the effect of the impedance transformation the component performs. Crosshairs in the box at one end of the arc identify that end as adjustable.

4. Click the adjustment box ⊞ to open the locus of values available for that component.
5. Adjust the component's value by dragging its adjustment box to the appropriate point on its arc.

As you place and adjust matching components, the values shown in the **Nominal Value**, **Normalized Impedance** and **Normalized Admittance** group boxes update to show the value of the current component.

Modify the value of an existing matching component with your mouse or your keyboard.

- To adjust a matching component with your mouse:

  — Click the component's adjustment box with your mouse.

  — Drag the box adjustment box to a new value.

- To adjust a matching component with your keyboard:

  — Click the component's adjustment box to select it.

  — Type a new value in the **Nominal Value**, **Normalized Impedance**, or **Normalized Admittance** group box.

  — Press **Enter**.

6. Continue placing appropriate components to transform the impedance until you reach the chart origin (or your target impedance).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

— At any time, click the endpoint of any existing matching component and drag it to a new value. The display updates to show the new match.

— To delete the current component, click **Delete Last**. Click **Delete Last** repeatedly to undo the current matching session element by element.

7. Once you're satisfied with the match, click **Export**.

Your new matching network is copied to the current circuit as a subcircuit.

> **Note:** You can create multiple matching networks during a given Smith Tool session. To selectively export any one among multiple existing networks, select it—click it to highlight it — before you click **Export**. If multiple matching networks exist and you do not select one before clicking **Export**, Smith Tool exports the most recently created network.

14 - Circuit Nexsys Analyses

The Circuit simulator designs can incorporate behavioral components on the Nexsys component library. Circuits composed of electrical and behavioral components can be simulated using Nexsys time domain and frequency domain analyses

Nexsys Discrete Time-Domain Analysis

In a Nexsys design, functional and electrical components and sub-designs may be connected arbitrarily. Nexsys analysis seamlessly integrates with Nexxim Transient analysis and Envelope analysis to solve mixed-mode design problems at differing levels of abstraction. Nexsys time domain analysis allows the simulation of arbitrary wired/wireless communications system topologies and other system-level applications.

For details on Nexsys Analysis, see Nexsys Discrete Time Domain Analysis.

System Frequency-Domain Analysis

System (Nexsys) frequency domain analysis allows you to evaluate and troubleshoot RF/high-frequency designs for wireless and microwave applications.

Results available with System Frequency Domain analysis include:

- The output power (**Pout**) at all external output ports.
- The voltage and power spectra and steady state time domain responses at the points where Nexsys voltage probes have been placed.
- The analysis results may be viewed in the spectral domain or in the time domain.

For more information, see System Frequency Domain Analysis.

For more information, see Frequency Dependent Sources in Nexxim.

Nexsys Discrete Time Domain Analysis

Nexsys discrete time domain simulation is a comprehensive simulation environment for mixed-mode systems containing both functional and electrical components.

- *Functional* components are time-domain behavioral components with an input-output transformation and a unidirectional data flow (signals flow in one direction on the input to the output).
- *Electrical* components are bi-directional components (signals propagate in both directions). Linear electrical networks can be described in the frequency domain using S-parameters or the equivalent. Nonlinear components such as transistors and diodes use time domain models.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In a Nexsys design, functional and electrical components and sub-designs may be connected arbitrarily. Nexsys analysis seamlessly integrates with Nexxim Transient analysis and Envelope analysis to solve mixed-mode design problems at differing levels of abstraction. Nexsys time domain analysis allows the simulation of arbitrary wired/wireless communications system topologies and other system-level applications. A Matlab user-defined model capability allows the designer to take advantage of the enormous existing Matlab functionalities in DSP, communications, vector manipulation and optimization to co-simulate with Nexsys.

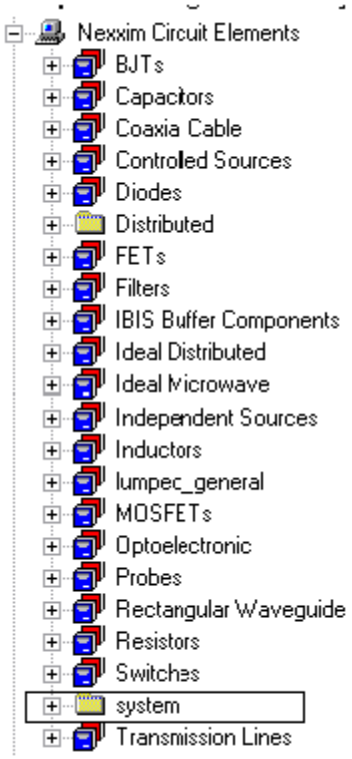
Creating and Simulating a Nexsys Design

A Nexsys design starts with a Circuit design project.

Open an existing Circuit design, or start a new Circuit Design. Then use the Components window to select and place both Circuit components for Nexxim and System components for Nexsys. When the circuit is complete, set up and run the analyses.

Add Nexsys and Nexxim Components

The Nexsys functional components are in the System folder under Nexxim Circuit Elements.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

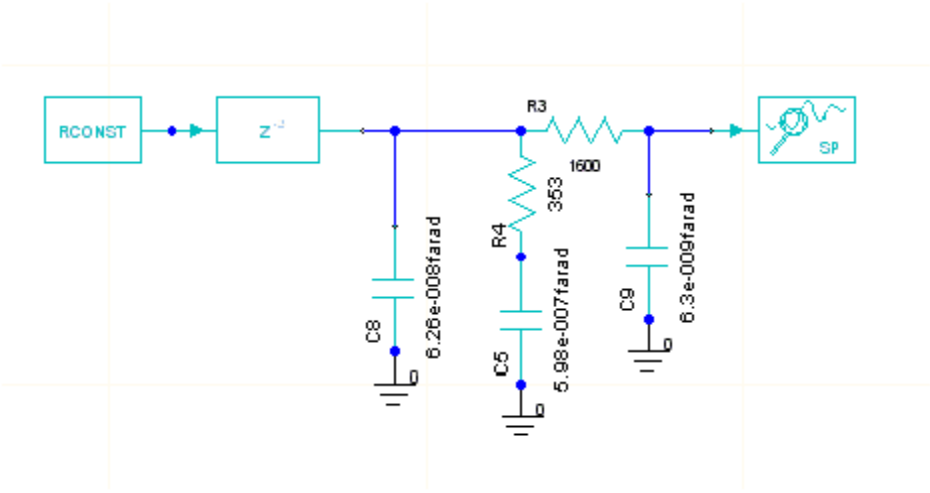
Place one or more of the Nexsys components in the Nexxim design. Nexxim automatically sets up the Nexsys component for discrete time domain simulation.

When mixing Nexxim and Nexsys components, two important issues are the selection of sources and the need for special interface elements.

Nexxim and Nexsys Sources

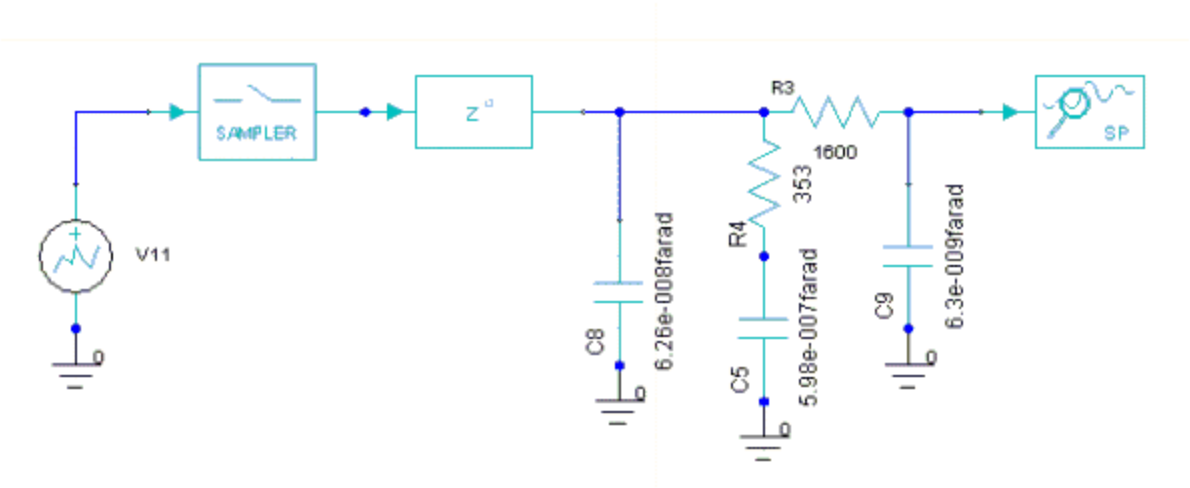
The library used for voltage, current, and power sources determines the timestep and duration to be used in the time domain analysis.

- When sources are on the System folder, the time step is fixed and is taken on the sample rates in the System sources.
- Any timestep or stop time set in the Transient analysis setup is ignored.
- In the loop_filter_1 example, the RCONST source determines the simulation length and the timestep with its parameters NSAMP and SAMPLE_RATE.



When any source is an interface source, the stop time taken on the Transient analysis setup, and a SAMPLER component is required to interface the interface source to the Nexsys behavioral subsection and provide the timestep (inverse of the SAMPLER sample rate). In the loop_filter_2 following example, the interface source sets the simulation length to the Stop setting in the Transient analysis setup. The timestep is provided by the SAMPLER component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

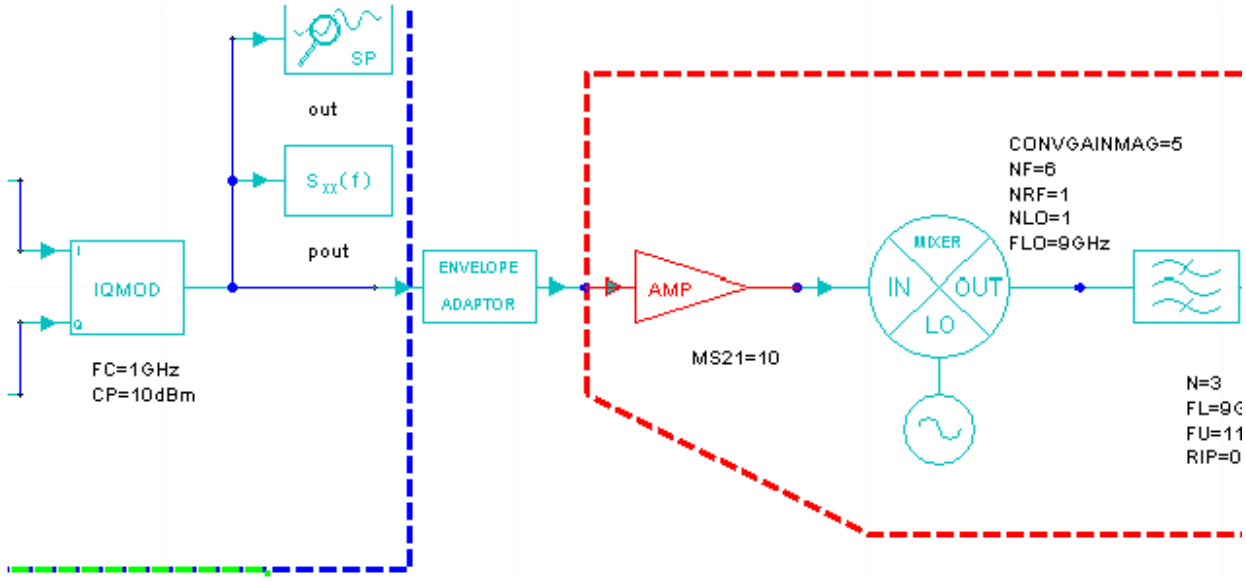


Interfacing Elements

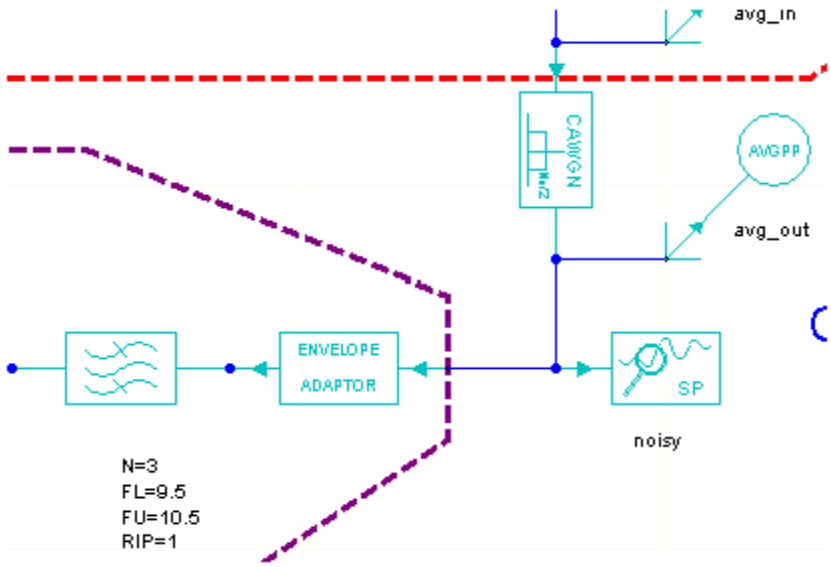
When a Nexxim continuous source connects to a Nexsys behavioral component, a **SAMPLER** component must be placed between them to prevent a fatal simulation error (See the loop_filter_2 example above). The **SAMPLER** component is located under the System subdirectory of Nexxim components in the **Miscellaneous** folder. The sampling rate and number of samples set for the **SAMPLER** component control the time domain analysis.

Following are two examples using the **ENVELOPEADAPTOR** component, on the MPSK_Nexxim_System example in the Examples directory.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



In the following circuit, the Envelope adaptor interfaces the behavioral channel element with the electrical elements in the RF Receiver.



- In the circuit fragment above, the Envelope adaptor is required to connect the Baseband transmitter stage.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- With only behavioral components, the RF transmitter stage includes electrical components.
- The Envelope adaptor identifies the waveform as an envelope to the Nexxim portion of the simulation.
- The Nexxim simulation then knows to send on an envelope waveform.

Set Up and Run Nexxim and Nexsys Analyses

The Nexsys time domain simulation shares the same analysis setup with transient analysis.

To add a Transient analysis solution setup.

1. Right-click the **Analysis** menu in the **Project Manager** window to open a menu. Select **Add Nexxim Solution Setup** on the menu, then slide the cursor to select **Transient Analysis** on the subordinate menu.
2. Set the **Step** and **Stop** times to control the analysis when an interface source is driving the system. These analysis control parameters are ignored by the Nexsys simulator if there are no interface sources present in the design.
3. Click **OK** to close the Transient Analysis Setup.
4. Click the project and select **Analyze All** on the menu.

Display Nexsys Simulation Results

The results of Nexsys discrete time simulations may be viewed in one of the following domains in the Reporter:

- Sweep Domain
- Time Domain (Standard, Constellation, Eye Diagram and Statistical report types)
- Spectral Domain

Nexsys Probes

Obtaining measurements for discrete time analysis requires the use of **probes**. Some probes are applicable only to the **Sweep Domain.** Examples of such probes include the **BERP** and **ACPRP** probes (since the BER and ACPR responses are typically plotted against some swept parameter). Signal, voltage, and power probes are applicable only to the **Time** and **SpectralDomains**, since the response obtained on these probes is typically plotted against time or frequency. Time and Spectral displays may also be viewed for different swept values. A special class of probes provides statistical displays of time domain signals, such as histogram and CCDF probes.

Currently, the following probes are available:

ACPRP: Adjacent Channel Power Ratio Probe (Sweep Domain).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AVGPP: Average Power Probe (Sweep Domain)

BERP: Bit Error Rate Probe (Sweep Domain)

CCDFP: Complementary Cumulative Distribution Function Probe (Statistical Time Domain)

CDFP: Cumulative Distribution Function Probe (Statistical Time Domain)

CFP: Crest Factor Probe (Sweep Domain)

EVMP: Error Vector Magnitude Probe (Sweep Domain)

FTRAJP: Frequency Trajectory Probe (Time Domain) for tracking frequency changes in a PLL. This probe may be connected to the output of a VCO.

HISTP: Histogram Probe (Statistical Time Domain)

PAPP: Peak-to-Average Power Probe (Sweep Domain)

PDFP: Probability Density Function Probe (Statistical Time Domain)

PSDP: Power Spectral Density Probe (Spectral Domain).

RMSP: Root Mean Square Probe (Sweep Domain)

SNDP: Signal to Noise and Distortion Probe (Sweep Domain).

SP: Signal Probe (Time and Spectral Domains)

PNP: Phase Noise Probe.

For more information on the measurements obtained by each probe, See the probe component help topics.

Generating Reports

Once the signal analysis is performed, bring up the **Create Report** editor to open the results for the Standard, Constellation, Eye Diagram or Statistical Reports. After selecting the solution (analysis) of interest and one of the available domains (**Time**, **Spectral** or **Sweep**) on the **Domain** field, select the probe responses available for display on the **Quantity** field of the editor. Once a specific probe response is selected, a list of functions and units in the **Function** field is displayed. The user can then view the probe response in any of the forms available in the **Function** list.

For details see Generating Reports and Post-processing.

Overview of Nexsys Discrete Time Domain Analysis

A typical communications system for Nexsys discrete time domain simulation (Figure 1) consists of:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- A propagation channel, such as AWGN and Multi-path Fading channels
- RF functional and electrical bandpass components for the RF transceiver
- Functional baseband components for transmitter/receiver digital-signal processing

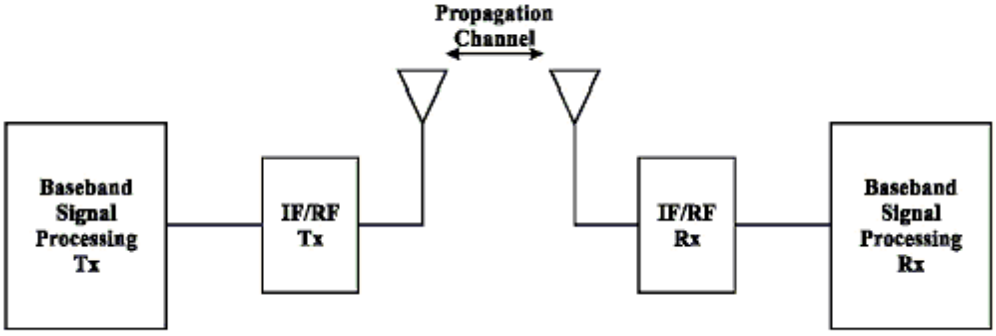


Figure 1 – General Wireless Communications System

Arbitrary transmit/receive topologies may be simulated using discrete time analysis, including:

- Carrier recovery
- Phase locked loops
- Bit synchronization
- Frequency synthesizers
- Symbol/bit-timing recovery
- Arbitrary feedback and digital signal processing topologies

Discrete time-signal analysis yields system performance (BER/ACPR) and a probable response in the time/spectral/sweep domains at any node. Discrete time-signal analysis applies both to mixed mode systems and also to systems with functional components only.

Signal and Noise Waveforms

The signals and waveforms present in a system are Baseband Signals, Bandpass Signals, and Noise Waveforms

Baseband Signals

The general form of any baseband signal may be represented in the following form:

$$S(t) = V_S(t)$$

where $V_S(t)$ represents a time-varying voltage signal.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Bandpass Signals

A baseband signal becomes a bandpass signal once it modulates an RF carrier. The general form of any bandpass signal is:

$$S(t) = V_S(t)\cos(2\pi f_c t + \theta_S(t))$$

$$= I_S(t)\cos(2\pi f_c t) - Q_S(t)\sin(2\pi f_c t)$$

Where f_c is the carrier frequency and θ_S is the phase of the input modulated signal.

The quantity

$$\tilde{V}_S(t) = V_S(t)\exp\{2\pi j\theta_S(t)\} = I_S(t) + jQ_S(t)$$

is known as the complex envelope of the bandpass signal $S(t)$. $I_S(t)$ and $Q_S(t)$ are the In-phase and Quadrature-phase baseband information-bearing signals.

Noise Waveforms

Noise is random fluctuations of a signal. This randomness is typically governed by a statistical distribution. For example, a White Gaussian noise process has a Gaussian distribution. The noise processes supported by the Nexsys discrete time analysis are assumed stationary (the statistical distribution of the noise level does not vary with time).

A baseband random noise signal may be represented in the following form:

$$N(t) = V_N(t)$$

where $V_N(t)$ is a time-varying noise voltage.

A bandpass random noise signal is represented in the following form:

$$N(t) = V_N(t)\cos(2\pi f_c t + \theta_N(t))$$

where f_c is the carrier frequency.

The quantity

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\tilde{V}_N(t) = V_N(t)\exp\{2\pi j\theta_N(t)\} = I_N(t) + jQ_N(t)$$

is known as the complex envelope of the bandpass Noise $N(t)$. $I_N(t)$ and $Q_N(t)$ are the In-phase and Quadrature-phase baseband noise-bearing signals.

Any noise process may be classified as uncorrelated or correlated. An uncorrelated noise process implies that the noise samples $N(t)$ at time t and $N(t + dt)$ at time $t + dt$ are not correlated. A correlated process implies that the samples $N(t)$ and $N(t + dt)$) tend to be correlated. An example of an uncorrelated process is White Gaussian noise. Examples of correlated processes are colored Gaussian noise and Rayleigh fading.

The power spectral density of a noise process typically represents the correlation. For weakly correlated processes, this power spectral density tends to be wideband. A strongly correlated process tends to have a narrowband power spectral density.

Discrete Time Simulation of Signals and Noise

In discrete time simulation, all waveforms (signal and noise) are represented in a discrete (sampled) form. This implies that baseband signal and noise waveforms may be simulated using the discrete signals

$$S(nt_s) = V_S(nt_s) \quad n \geq 0$$

,

and

$$N(nt_s) = V_N(nt_s) \quad n \geq 0$$

,

where

f_s = Waveform sampling frequency or sampling rate,

$$t_s = \frac{1}{f_s}$$

and = Waveform simulation timestep.

The Nyquist criterion states that if a continuous time signal $S(t)$ is sampled at a rate that is at least twice its highest frequency content (i.e., bandwidth), this signal may be completely reconstructed from its sampled version $S(nt_s)$. The minimum sampling rate needed to completely recover a continuous signal from its sampled version is known as the Nyquist rate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

It is the responsibility of the user to be aware of the signal $S(t)$ bandwidth. It is highly recommended that the actual simulation sampling rate be chosen well above the Nyquist rate for more accurate simulations. This added accuracy typically results in a longer simulation time.

Most bandpass signals encountered in practical communications systems are narrowband signals. A narrowband bandpass signal has a bandwidth that is much less than its carrier frequency. The Nexsys discrete time simulator can utilize envelope modulation techniques where only the complex envelope of the bandpass signal or band-limited noise is sampled, as opposed to sampling the carrier as in Nexxim transient analysis. As a result, the Nexsys simulation sampling rate may be orders of magnitude less than that of a Nexxim simulation. This translates into a much faster simulation time.

The information of a continuous bandpass signal and noise may be recovered from knowledge of their corresponding sampled complex envelope signals:

$$\tilde{V}_S(nt_s) = V_S(nt_s)\exp\{2\pi j\theta_S(nt_s)\}$$

and

$$\tilde{V}_N(nt_s) = V_N(nt_s)\exp\{2\pi j\theta_N(nt_s)\}$$

respectively, and the carrier frequency f_c.

Thus, the information of a continuous bandpass signal and noise may be recovered on the triplets ($I_S(nt_s)$, $Q_S(nt_s)$, f_c) for the signal information and ($I_N(nt_s)$, $Q_N(nt_s)$, f_c) for the noise information.

To ensure that the Nyquist criterion still holds for narrowband bandpass signals, the user needs to choose a simulation sampling rate that is at least twice the highest frequency content (bandwidth) of the complex envelope .

$$\tilde{V}_S(t) = V_S(t)\exp\{2\pi j\theta_S(t)\}$$

The choice for the simulation sampling rate f_s affects the outcome of the simulation. Choosing a simulation sampling ratef_s that is higher than $2f_c$ results in the sampling of the carrier. In this case, the bandpass signal with a complex envelope representation is converted to a baseband real signal of the form:

$$S(nt_s) = V_s(nt_s)\cos(2\pi f_c nt_s + \theta_S(nt_s)) \quad n \geq 0$$

,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$N(nt_s) = V_N(nt_s)\cos(2\pi f_c nt_s + \theta_N(nt_s)) \quad n \geq 0$$

,

Conversely, time domain simulation results for bandpass signals with a sampling rate

$f_s \leq 2f_c$

may be viewed only in terms of their complex envelopes.

Discrete Time Simulation of Nonlinear Behavioral Components

The nonlinear discrete time simulation technique described here is used for processing bandpass modulated signals through nonlinear behavioral components (e.g., amplifiers, mixers, frequency multipliers). Generally, nonlinear behavioral components are not only power dependent, but also frequency and/or temperature dependent. An equivalent model is used for nonlinear components in discrete time simulation to separate the power dependent characteristics from frequency and temperature dependent characteristics.

All nonlinear behavioral two-port components are assumed unidirectional (e.g., $S_{12} = 0$). Each nonlinear component is partitioned into three segments: a linear electrical (active) input component, a nonlinear functional component, and a linear electrical (passive and noiseless) output component. This arrangement is shown in Figure 2.

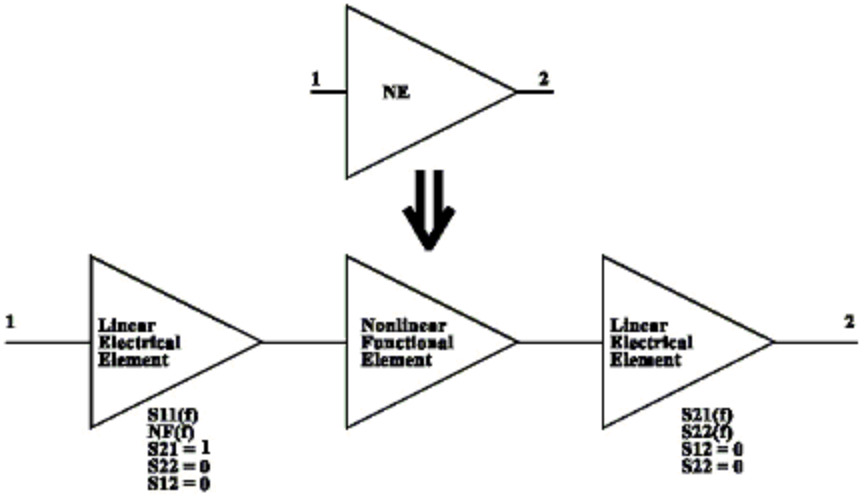

Figure 2– Equivalent Model for Discrete Time Simulation of Nonlinear Electrical Components

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In this model, the power dependent characteristics of S_{11}, S_{12} and S_{22} are ignored. The frequency and temperature dependent small signal S_{11} and NF are associated with the input linear electrical component. The power dependent characteristics of S_{21} are associated with the nonlinear functional component. The frequency and temperature dependent small signal S_{21} and S_{22} are associated with the output linear electrical component.

For discrete time simulation, the linear electrical input and output components are associated with other connected linear electrical components and simulated as a linear electrical sub-design as discussed previously.

The nonlinear characteristic of a two-port component is described by its nonlinear figures-of-merit or nonlinear measured data. Only the nonlinear characteristic of S_{21} is considered in discrete time analysis techniques even though S_{11}, S_{12} and S_{22} may possibly be power dependent too.

> **Note:** For the two-port nonlinear mixer model, the arrangement in Figure 2 still holds. The nonlinear functional component is associated with the actual frequency conversion and discrete time phase noise simulation. As a result of that, the input linear electrical component in Figure 2 is associated with the mixer's input frequency while the output linear electrical component is associated with the mixer's output frequency.

Modeling Nonlinearity with Polynomial Power Series

It is always assumed that nonlinear measurements are obtained when the input and output ports of the nonlinear component are terminated in 50Ω. Nonlinear measurements of a two-port component typically include the AM-AM and AM-PM effects. This nonlinear relationship between $S_{21}$and P_1 (the available input power) or, equivalently, between P_{out} and P_1 is represented by the following power series polynomials:

$$\sqrt{P_{out}}\cos\phi = a_1X + a_3X^3 + \dots$$

$$\sqrt{P_{out}}\sin\phi = b_1X + b_3X^3 + \dots$$

where

P_1 = the available input power on the source (with RS = 50Ω)

$P_{out} = |S_{21}|^2 P$
= the output load power (assuming RL = 50Ω)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$X = \sqrt{P_1}$$

S_{21ss} = the small signal gain.

$$\phi = \angle S_{21} - \angle S_{21ss}$$

The coefficients a_1, a_3, a_5... and b_1, b_3, b_5... are calculated using a least-squares curve fitting technique based on the user-supplied measurements P_1 - P_{out} data or P_1 - S-parameters data. For example, a set of coefficients can be obtained based on the following power amplifier P_1 - P_{out} measured data (in 50ohm terminations).

RTH_PA 2-port

POUT dBm

P1 dBm, FREQ = 900MHz

* P1	Pout	Phase (degrees)
5.00	25.68	88.75
7.00	27.67	88.75
9.00	29.66	88.75
11.00	31.64	88.75
13.00	33.61	88.75
15.00	35.56	88.75
17.00	37.48	88.76
19.00	39.35	88.76
21.00	41.16	88.76
23.00	42.86	88.75
25.00	44.38	88.71
27.00	45.65	88.66
29.00	46.53	88.76
31.00	47.17	91.85
33.00	47.50	97.08
35.00	47.66	102.81

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

If the error obtained using the least squares curve fitting technique for the a and b coefficients exceeds 1e-5, an alternate approach based on cubic spline interpolation is used to compute the output power level for a given input signal power

If the input signal power to the nonlinear component exceeds the maximum supplied measured input power P1, the simulator assumes the last supplied output power entry in the measured data to be the saturation power.

The above mentioned data is given at FREQ = 900MHz. Additional nonlinear measured data at other frequencies may be provided. The discrete time analysis is capable of locating the actual operating point using multi-dimensional data interpolation. For more information, please See the Nonlinear RF Component Models documentation.

If the user chooses to provide the nonlinear figures-of-merit (OIP3 or P1dB and Psat) instead of measurement data, the power series coefficients are approximated by

$$a_1 = |S_{21}|$$

$$a_3 = \frac{-\left(\frac{4}{3}\right)|S_{21}|^3}{OIP3}$$

$a_i = 0$, $i = 5,7, \ldots$

$b_i = 0$, $i = 1,3,5, \ldots$

where:

S_{21} is the linear small signal gain

OIP3 is the output power at the third order intercept point.

In this case, the simulations tend to be less accurate.

Calculating a Nonlinear Output Voltage

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Assuming a bandpass modulated input signal of the form:

$$S(t) = V_s(t)\cos(\omega_c t + \theta_s(t)) = I_s(t)\cos\omega_c t - Q_s(t)\sin\omega_c t$$

where

$V_s(t)$ is the baseband input voltage.

$$\theta_s(t)$$

is the phase of the input modulated signal.

$$I_s(t) = V_s(t)\cos\theta_s(t)$$

is the In-phase envelope of the input signal.

$$Q_s(t) = V_s(t)\sin(\theta_s(t))$$

is the Quadrature-phase envelope of the input signal.

$$\omega_c = 2\pi f_c$$

is the carrier frequency in radians per second, where f_c is the carrier frequency in Hz.

The nonlinear output voltage is calculated as:

$$S_{out}(t) = V_{out}(t)\cos(\omega_c t + \theta_{out}(t)) = I_{out}(t)\cos\omega_c t - Q_{out}(t)\sin\omega_c t$$

where:

$$V_{out}(t) = \sqrt{P_{out}(t)R_{out}} = \sqrt{I_{out}^2(t) + Q_{out}^2(t)}$$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$\theta_{out}(t) = \operatorname{atan}\left(\frac{Q_{out}(t)}{I_{out}(t)}\right)$$

$$I_{out}(t) = \sqrt{Rout}\{ GIV(t)\cos\theta_s(t) - GQV(t)\sin\theta_s(t)\}$$

$$Q_{out}(t) = \sqrt{Rout}\{ GIV(t)\sin(\theta_s(t)) - GQV(t)\cos(\theta_s(t))\}$$

with

$$GIV(t) = \left(\frac{a_1}{MS_{21}}\right)X(t) + \left(\frac{a_3}{MS_{21}}\right)X(t)^3 + \left(\frac{a_5}{MS_{21}}\right)X(t)^5 + \ldots$$

$$GQV(t) = \left(\frac{b_1}{MS_{21}}\right)X(t) + \left(\frac{b_3}{MS_{21}}\right)X(t)^3 + \left(\frac{b_5}{MS_{21}}\right)X(t)^5 + \ldots$$

and

$$X(t) = \sqrt{P_1(t)}$$

$$P_1(t) = \frac{V_s^2(t)}{4Rin}$$

$$MS_{21} = \sqrt{a_1^2 + b_1^2}$$

The source resistance *Rin* and the load resistance *Rout* are always defaulted to 50Ω, but they can be individually specified for each input and output, respectively.

Nexsys Simulation of a Mixed Mode Topology

A mixed-mode communications system is composed of functional (time based) and electrical (frequency based) components. Functional components are time-domain behavioral components with an input-output transformation and a unidirectional data flow. Electrical components are physical and bidirectional, and may use frequency-domain descriptions such as S-parameters.

This topic provides information on how Nexsys handles mixed mode systems.

Nexsys Partitioning and Scheduling Process

Prior to running the discrete time system simulation, Nexsys partitions the mixed mode system, converting the mixed-mode topology to a purely functional topology where the signal flow is unidirectional. Electrical subcircuits must be modeled functionally or behaviorally after accounting for all impedance mismatches, noise, and other electrical effects.

After finishing the partitioning is completed, the process of scheduling all components inside the system for discrete time simulation begins. Since discrete time signals flow unidirectionally from input to output, the order in which components are scheduled is critical during discrete time simulation.

The scheduling process begins with the source components in the system , then iteratively schedules each remaining component (after ensuring that all components leading to the input of that component have already been scheduled). A **SAMPLER** component is placed at the physical/functional interface where each interface source connects to a Nexsys component. The sampling rate specified for the **SAMPLER** sets the Nexsys timestep.

During partitioning, Nexsys packs each set of connected electrical components into an internal functional model based on the signal type (baseband or bandpass) of the input to the electrical components.

Nexsys Transient Co-simulation Model

When the input signal type is baseband, Nexsys uses a Transient Co-simulation model (tran_ cosim_model). When the Nexsys time domain simulation encounters a tran_cosim_model, the transient analysis engine is invoked and stays open during the course of the simulation. Data is exchanged at each timestep between the top-level Nexsys simulator and the transient engine. (See Figure 3)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

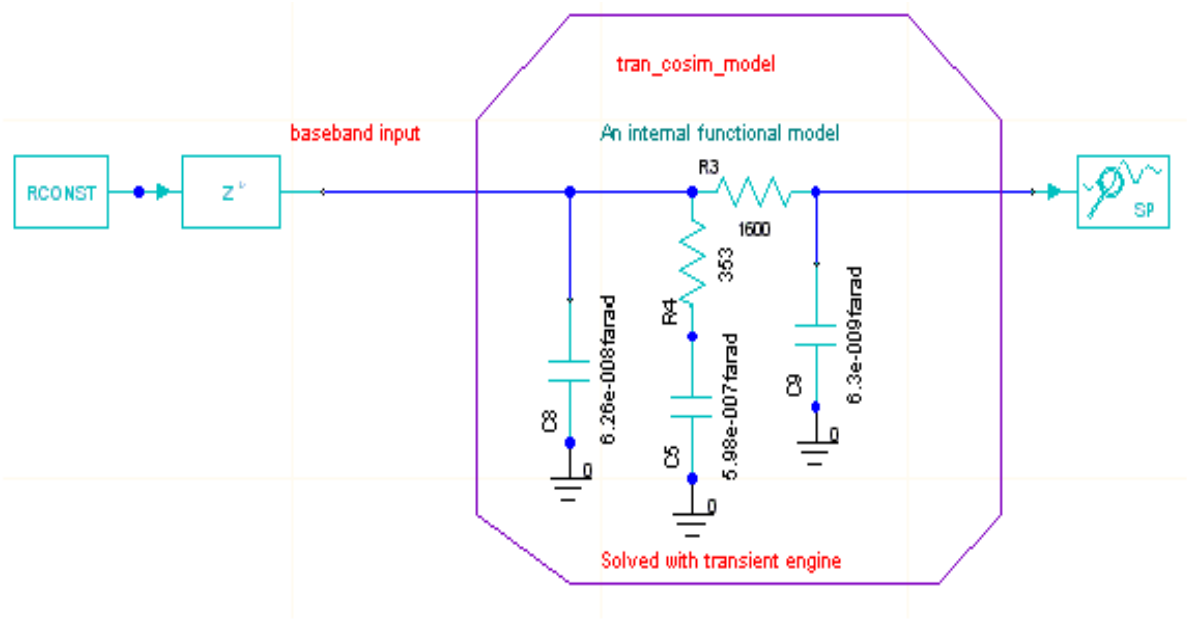

Figure 3 – Nexsys Transient Cosimulation Model

Envelope Co-simulation Model

When the input signal type is bandpass, Nexsys uses an Envelope Co-simulation model (envelope_cosim_model).

An **ENVELOPEADAPTOR** component must be placed at the interface of a bandpass or modulated signal entering a Nexxim subcircuit from a Nexsys functional component. The **ENVELOPEADAPTOR** component helps the simulation engine to partition the system for simulation and to select the appropriate analysis for the Nexxim subcircuit.

The envelope_cosim_model employs two simulation strategies, one for linear subcircuits and another for nonlinear subcircuits such as amplifiers, mixers, and frequency multipliers.

Linear Subcircuits. When the sub-circuit is linear, the top level Nexsys simulation engine calls Nexxim Linear Network analysis (LNA) to obtain the frequency response and convert it to the time domain impulse response. Convolution is then used to calculate the output signal. (See Figure 4).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

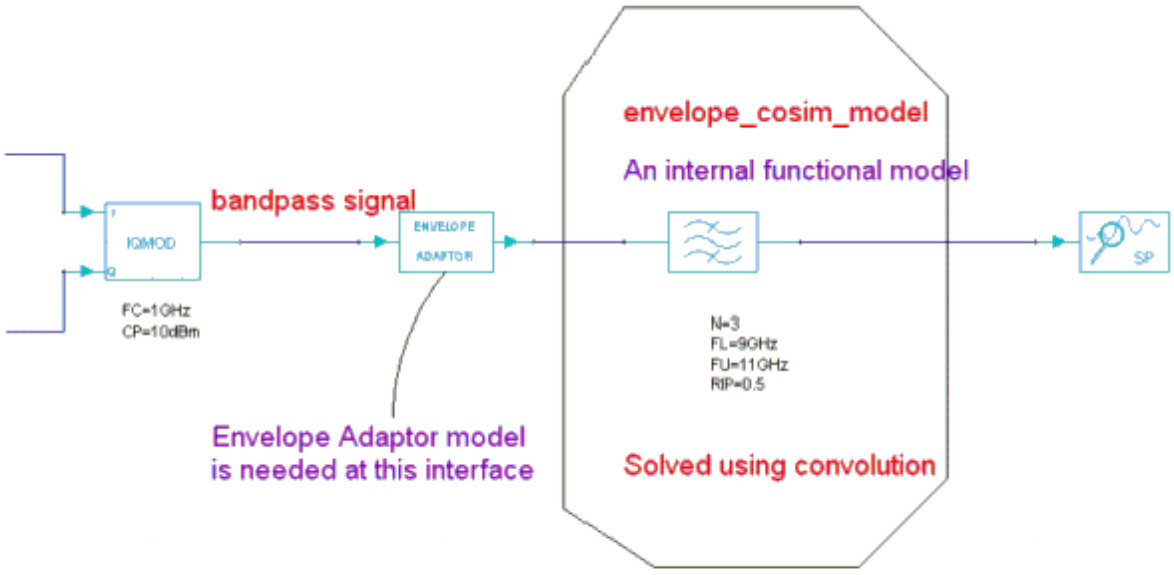

Figure 4 – Nexsys Envelope Cosimulation Model: Convolution Analysis of Linear Electrical Sub-Circuit with Envelope Input

Nonlinear Subcircuits. When the Envelope Co-simulation model sub-circuit is nonlinear, the top level Nexsys simulation engine runs Nexxim Envelope Analysis to solve the circuit and interactively exchange data as described above for the tran_cosim_model. (See Figure 5).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

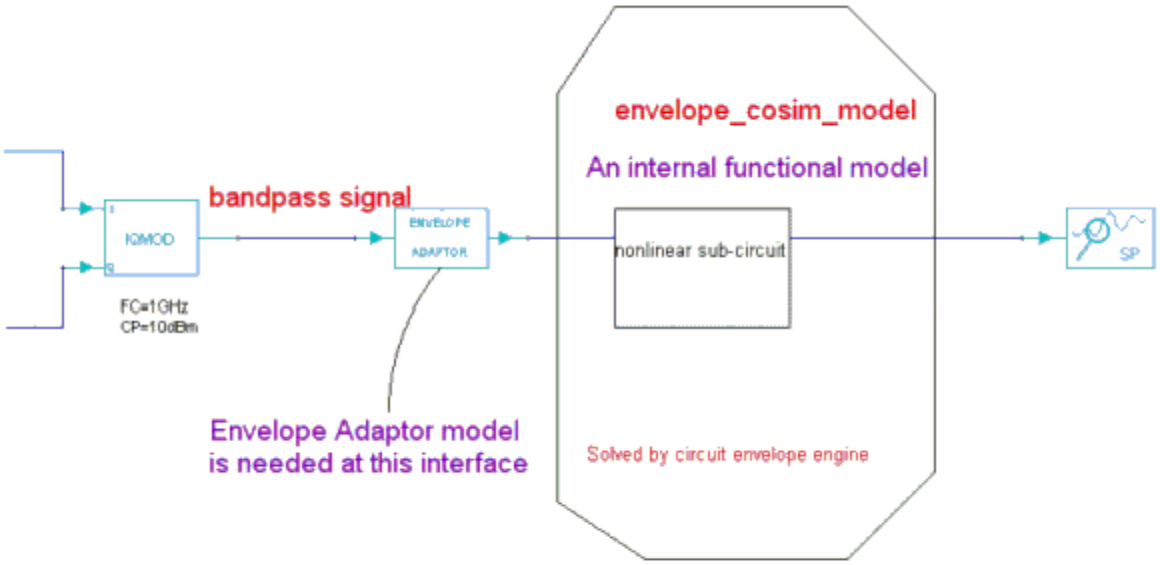

Figure 5 – Nexsys Envelope Cosimulation Model: Circuit Analysis of Nonlinear Electrical Sub-Circuit with Envelope Input

Scheduling Feedback Loops

Scheduling of feedback loops starts with the first component in the feed-forward path and continues around the loop until the feedback input is reached. To prevent a possible deadlock in the discrete time simulation of a feedback loop, the feedback signal in the loop is primed at time *t*=0 with one discrete time sample having a zero value. The user instead can force the priming to occur anywhere inside the feedback loop by placing an RDELAY or CDELAY component at the appropriate priming point. If the simulator does not detect the presence of any RDELAY or CDELAY components in the feedback loop, Nexsys automatically performs the minimum number of primings needed to resolve the deadlock.

An example of a simple feedback loop is the phase locked loop example shown in Figure 6.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

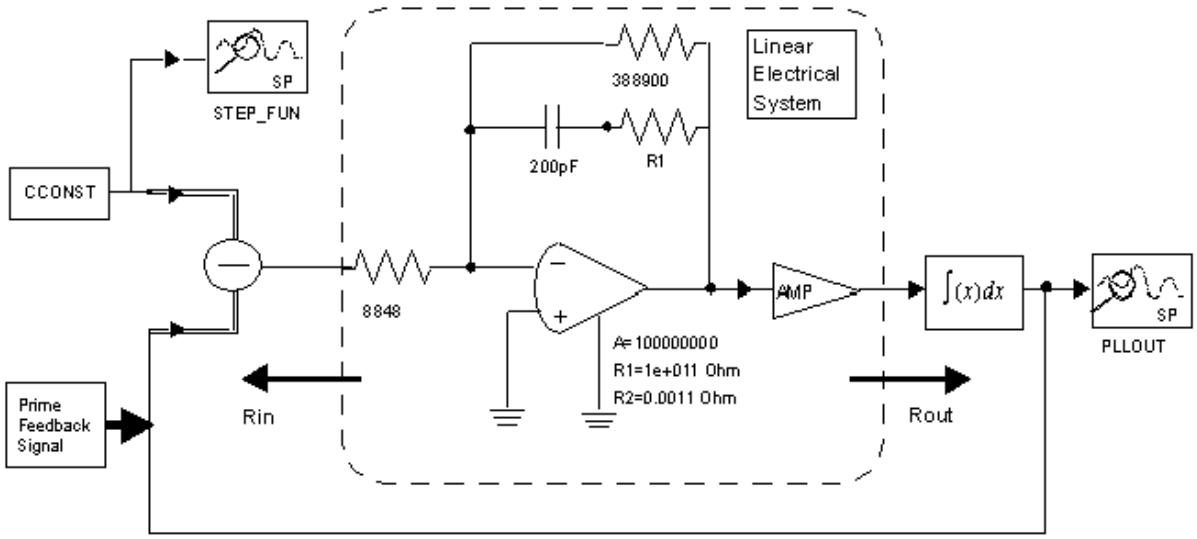

Figure 6 – PLL Example with a Primed Feedback Loop

To break the deadlock, the feedback signal leading to the input of the complex subtractor CSUB (the component with the minus sign) is initially primed with a zero sample.

Assumptions for Nexsys Partitioning

The following assumptions govern the partitioning process.

1. The impedance seen by an electrical component or sub-design looking into an input port of a functional component is assumed to be **Rin**, always defaulted to an open or infinity Ω. In other words, when an electrical component or sub-design port is terminated into the input port of a functional component, the termination resistance is **Rin**. This load resistance can be adjusted by assigning a different value to the **Rin** parameter of the functional component. This resistance has no noise contribution.
2. The impedance seen by an electrical component or sub-design looking into an output port of a functional component is assumed to be **Rout** (defaulted to a short or 0Ω). In other words, when an electrical component or sub-design input port is connected to the output port of a functional component, the assumed source resistance is **Rout**. This source resistance can be adjusted by assigning a different value to the **Rout** parameter of the functional component. Note that in reference image, the input voltage to the electrical sub-design V2 equals f(V1) if the impedance seen by the functional component looking into the electrical sub-design is 50Ω, provided that **Rout** is set to 50Ω. The notation **f(.)** represents the equivalent signal processing operation of the functional component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

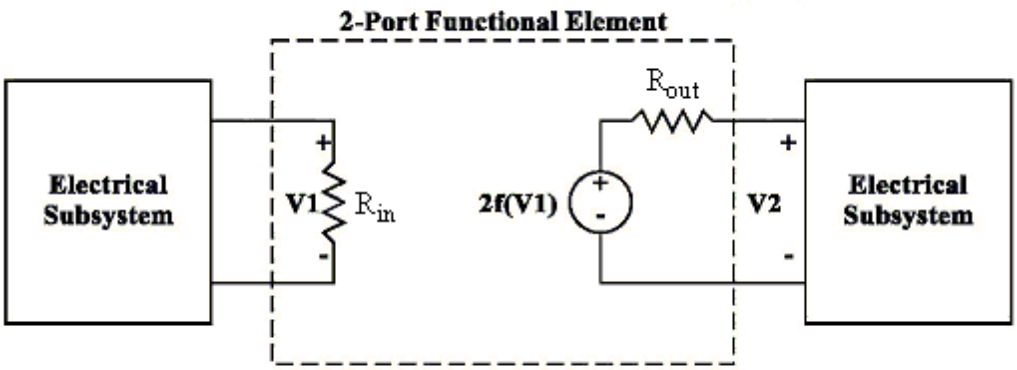

Figure 7– Equivalent Model for Functional-Electrical Connections

3. The impedance seen by a functional component looking into an input port of another functional component is assumed to be **Rin** (typically defaulted to infinity) and the impedance seen by a functional component looking into an output port of another functional component is assumed to be Rout (typically defaulted to zero).

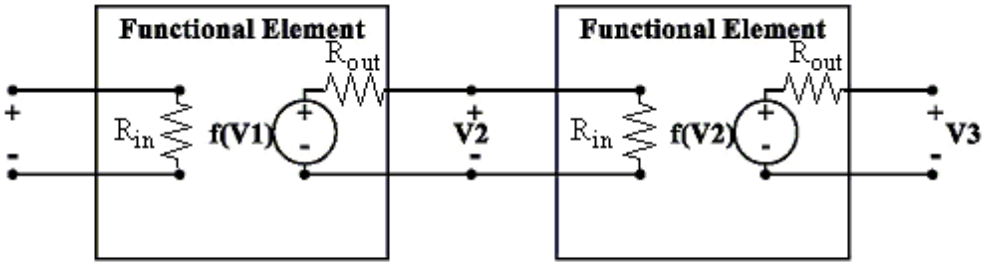

Figure 8 – Equivalent Model for Functional-Functional Connections

4. All nonlinear electrical two-port components (AMP and MIXER) are assumed to be unidirectional (e.g., $S_{12} = 0$). Each nonlinear electrical component is partitioned into three segments: a linear active input stage, a nonlinear functional stage, and a linear electrical passive output stage. This arrangement is discussed later in more detail.
5. During signal analysis, any signal path in the system is described by its complex envelope and carrier frequency (the triplet ($I(t)$, $Q(t)$, f_c)) and the simulation timestep t_s. In general, the signal (($I(t)$, $Q(t)$) information bandwidth, carrier frequency f_c, and simulation timestep t_s vary from one point in the system to another. The user must measure the signal (($I(t)$, $Q(t)$) information bandwidth, the carrier frequency f_c, and simulation timestep t_s at the correct points in the system to generate meaningful results. A baseband signal is described by its real signal value and the timestep.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. If interface sources are interfaced with Nexsys components, a **SAMPLER** component must be placed at the physical/functional interface, otherwise the simulation engine issues an error. The user specifies the sampling rate for the **SAMPLER** component.
7. An **ENVELOPEADAPTOR** component must be placed at the interface of bandpass signal (or modulated signal) entering a Nexxim sub-circuit from a Nexsys functional component. The **ENVELOPEADAPTOR** component helps the simulation engine to recognize what circuit simulation analysis is needed to call to solve the Nexxim sub-circuit.

Nexsys MATLAB user-defined Models

Nexsys can simulate with user-defined models (UDMs) for behavioral (functional) components using the MATLAB® interpretive language (MATLAB® is a registered trademark of The Mathworks, Inc.) The user supplies a model file defining the model name and the corresponding MATLAB functionality. When Nexsys encounters a component defined with a MATLAB UDM, Nexsys calls the MATLAB function defined in the model file, and the MATLAB engine carries out the computations for the model.

Using MATLAB co-simulation, the user can combine the Nexsys system design environment and report generator with the enormous existing MATLAB functionality in DSP, communications, vector manipulation, and optimization. MATLAB can be also used to display the simulation results in real time.

Setting Up Nexsys Co-simulation with MATLAB

Nexsys/MATLAB co-simulation requires the MATLAB software installed on the same system with Nexsys. If MATLAB is not installed properly, Nexsys analysis containing MATLAB models fails with an error message.

All files related to MATLAB UDMs should be put in *InstallDirectory***userlib**, where *InstallDirectory* is the Nexsys installation directory.

The Nexsys MATLAB Model File

The file containing the MATLAB code for the model must be named *model_name***.m**. The **.m** file defining a Nexsys MATLAB UDM has two required elements:

- The model definition line (a comment line at the top of the file).
- The MATLAB function definition specifying the model computations.

MATLAB Nexsys Model Definition Line

The model definition line identifies the name of the model, the inputs and outputs on the model, and the names and initial values of any model parameters. The netlist syntax for the model definition line is:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

% NEXSYS Functional_Model("*model_name*", "*In_N*", "*In_Types*", "*In_Num_Sample_Needed*", "*Out_N*", "*Out_types*", "*Out_Num_Sample_Generated*", "*data_flag*", "*probe_domain*", "*parameter_string*")

> **Note:**
>
> Each entry in the parentheses ( ) must be double quoted, or else an error occurs.

Nexsys MATLAB UDM Netlist Entries

Netlist Entry	Description
model_name	The name for the MATLAB UDM
In_N	The number of input ports
In_Types	A character string of length In_N specifying the data type for each corresponding input port. The characters are **r** for real, **c** for complex.
In_Num_Sample_Needed	The number of input samples needed per invocation (execution) of the model. This entry can be an expression using the parameters listed in the **parameter_string** entry.
Out_N	The number of output ports
Out_Types	A character string of length Out_N specifying the data type for each corresponding output port. The characters are **r** for real, **c** for complex.
Out_Num_Samples_Generated	The number of output samples generated per invocation (execution) of the model. This entry can be an expression using the parameters listed in the **parameter_string** entry.
data_flag	Flag. Set to DATA_REQ when external data needed, NO_DATA_REQ to reset.
probe_domain	Domain for displaying probe data: TF_DOM for time and frequency domain FREQ_DOM for frequency domain only SWEEP_DOM for sweep domain NOT_APPLICABLE for non-probe elements
parameter_string	List of keywords and their with default values (*keyword*=*val*) separated by commas.

MATLAB Nexsys Model Function Definition

After the model definition line, the model file contains the definition of the function that implements the model code.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The second line in the model file must be the MATLAB function declaration line. The format of the function declaration line depends on the model type. Nexsys supports modeling of sources or input/output (I/O) model types, defined by the numbers of inputs and outputs.

A **SOURCE** model has no input ports (**In_N** =0) and one or more output ports (**Out_N** >0). A **SOURC** E model must have parameters **NSAMP** and **SAMPLE_RATE** in the *parameter_list* in the model definition line.

An **I/O** model has one or more input ports (**In_N** >0) and one or more output ports (**Out_N** >0). The format for the function declaration of an I/O model depends on whether or not it has a *parameter_list* in the model definition line.

For **SOURCE** UDMs the syntax for the function declaration line is:

function[*outputs*,**SV]** = *function_name*(*parameters*, **SV, status_in)**

For **I/O** UDMS with no *parameter_list* in the model definition line:

function[*outputs*,**SV]** = *function_name*(*inputs*, **SV, status_in)**

For **I/O** UDMS (In_N > 0) with a non-empty *parameter_list* in the model definition line:

function[*outputs*,**SV]** = *function_name*(*inputs*, *parameters*, **SV, status_in)**

The entries in the function declarations are defined as follows:

- ***outputs*** is the user-defined name of a two dimensional array with ***Out_N*** rows, each row corresponding to an output port in the same order specified in the UDM definition.
- ***inputs*** is a the user-defined name of a two dimensional array with ***In_N*** rows, each row corresponding to an input port in the same order specified in the UDM definition.
- ***parameters*** is the user-defined name of a one dimensional array containing the parameter values entered for the model instance in the same order defined in ***parameter_string***.
- **SV** is a system-defined structure that retains the state variables of a MATLAB UDM. State variables are any structured data defined by the model file that must be saved between calls to the model. The first time a model is called, the simulator assigns a zero value to **SV** before passing it to the user-defined MATLAB function. During initialization (**status_in** = 0), the model saves any needed data structures in **SV** before passing the **SV** data back to Nexsys with the output of the function. Nexsys retains the **SV** information and passes it back to the MATLAB UDM function on the next invocation. If data retention is not required, the function does not need to initialize or set **SV**.
- **status_in** is a system-defined flag to indicate the input status when calling a MATLAB UDM function. (**status_in** = 0 for the initialization stage, nonzero otherwise.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Global Variables for Timestep and Center Frequency

The MATLAB model can access and change the timestep and center frequency on a port-by-port basis using MATLAB global variables **TS_IN**, **TS_OUT**, **CF_IN**, and **CF_OUT**.

- **TS_IN** is a vector containing the timesteps associated with all input signals. **TS_IN** (j) is the timestep associated with the signal of the *jth* input port.
- **TS_OUT** is a vector containing the time steps associated with all output signals. **TS_OUT** (j) is the time step associated with the signal of the *jth* output port.
- **CF_IN** is a vector containing the center (carrier) frequencies associated with all input signals. **CF_IN** (j) is the center frequency associated with the signal of the jth input port.
- **CF_OUT** is a vector containing the center (carrier) frequencies associated with all output signals. **CF_OUT** (j) is the center frequency associated with the signal of the jth output port.

The global Statement

To access these Nexsys global variables during simulation, the model includes a **global** statement on the line after the function declaration, listing the global variables to be accessed. For example, the statement

```
global TS_IN TS_OUT
```

allows users to access the global input and output time steps.

Accessing and Changing the Time Step

To access or set the timestep for output signals the model reads and writes the global vectors TS_IN and TS_OUT. For example, the statement

```
TS_OUT (2) = 2 * TS_IN (1)
```

sets the timestep of the second output port to be twice the timestep of the first input port. If the timestep for the output ports (**TS_OUT**) of a functional SOURCE UDM is not set explicitly in the code, the engine assigns 1/sample_rate to each of them. If **TS_OUT** is not set by a functional I/O model, the program assumes the output sample rates are equal to the first input sample rate.

Accessing and Changing the Center Frequency

Setting up the center frequencies for output signals can be done by accessing the vectors CF_IN and CF_OUT. For example, the statement

```
CF_OUT(2) = 2 * CF_IN(1)
```

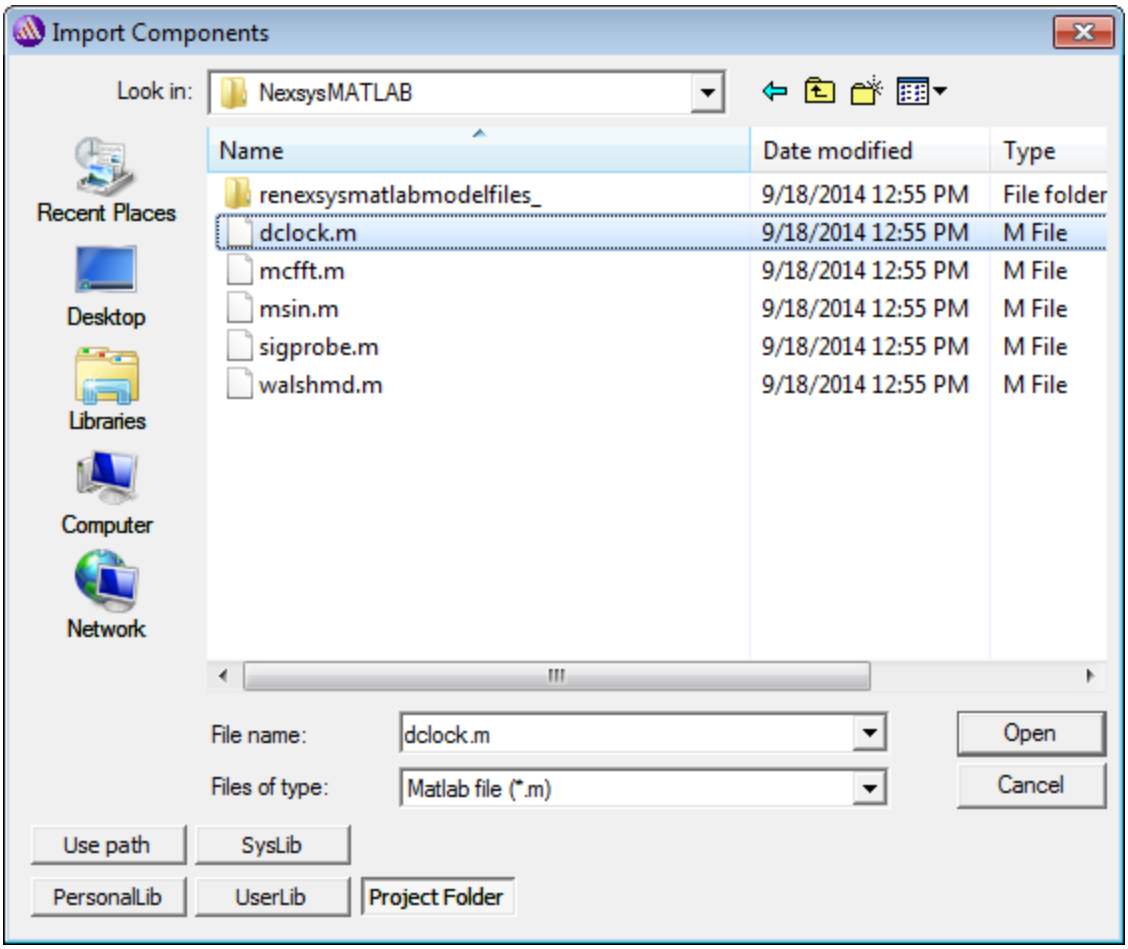
sets the center frequency of the second output port to be twice the center frequency of the first input port. If CF_OUT is not set by a MATLAB functional UDM, all output port frequencies assumes the center frequency of the first input port for an I/O model and a zero center frequency for a SOURCE model.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Creating a MATLAB UDM Schematic Component

To create a schematic component for the Nexsys Matlab UDM, follow these steps.

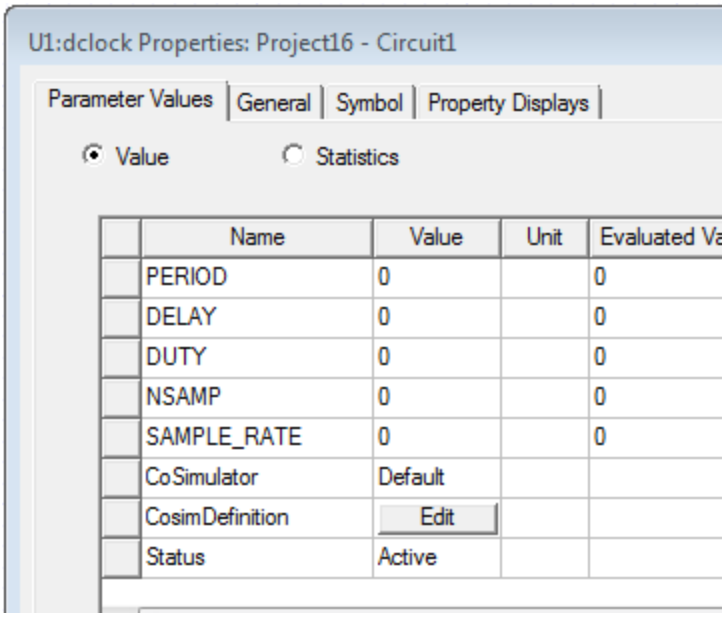
1. In a Circuit design project, click the **View** menu to open the **Components Manager**. Then select the **Symbols** tab and click **Import Models**. Finally, click the **Matlab** icon to open the **Import Components** window.



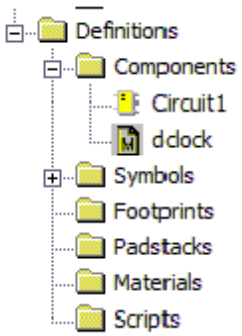
3. Browse to the directory that contains the MATLAB model file, select the file, then click **Open**.
4. An instance of the component is attached to the cursor. Drag and drop it into the schematic.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Double-click the component to select it and display its **Properties** window.



Click **OK** to close the **Properties** window. The MATLAB UDM (**dclock** in this case) appears in the **Components** group box.



Example MATLAB Nexsys Model Files

The following topics describe various examples of Nexsys MATLAB model files.

Nexsys Digital Clock Model

Here is a model for a digital clock source. This SOURCE type model has no inputs and one output. Here is a listing of the model file, **dclock.m**, with explanations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The initial comment line (identified by **%NEXSYS**) is the model definition line. Nexsys reads the model definition into a structure that contains various information the simulator needs.

```
% NEXSYS FUNCTIONAL_MODEL ("dclock", "0","", "", "1","r", "1","NO_
DATA_REQ", "NOT_APPLICABLE", "PERIOD,DELAY=0,DUTY=0,NSAMP,SAMPLE_
RATE")
```

Here are explanations for the entries in the **dclock** model definition

“dclock”	Model name. The model name, dclock, is also the Matlab function name.
“0”	No inputs
“”	No input data types
“”	No input number of samples
“1”	One output
“r”	The single output is real
“1”	One (1) sample is to be generated per invocation
“NO_DATA_REQ”	No extra data reference is required
“NOT_APPLICABLE”	No probe domain applies
"PERIOD,DELAY=0,DUTY=0,NSAMP,SAMPLE_RATE"	Parameters for the model

Here is the Matlab function declaration for the digital clock. The function name, **dclock** in this example, is the same as model name.

```
function [ y, SV ] = dclock (p, SV, status_in)
```

The input and output variables for the function are:

p	Parameter values of the model
SV	State variable (in)
status_in	Input status
y	Output signal
SV	State variable (out)

The first step is to read the values on the parameters passed to the function.

```
% Get parameters from function argument p
period = p(1)
delay = p(2)
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
duty = p(3)
sample_rate = p(5)
time_step = 1.0/p(5)
```

During the initialization call, the **dclock** model sets up its state variables structure **SV**. During later calls, the model retrieves the data.

```
total_num_out = 0;
% (status_in == 0) => Analysis initialization stage
if status_in == 0
delay_mode = 0;
if (delay > 0)
delay_mode = 1;
end
time_pos = 0.0;
total_out_num = 0;
SV = [delay_mode time_pos total_num_out]
else
delay_mode = SV(1);
time_pos = SV(2);
total_num_out = SV(3);
end
```

Here is how **dclock** calculates the output (digital clock) values:

```
out_value = 0.0;
if delay_mode == 1
time_elapsed = (total_num_out + 1) / sample_rate;
if (delay > time_elapsed)
out_value = 0.0;
else
delay_mode = 0;
end
else
if ((time_pos>=0) && (time_pos < (duty * period)))
out_value = 1.0;
else
out_value = 0.0;
end
%re-calculate the time position
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
time_pos = time_pos + 1.0 / sample_rate;
if (time_pos >= period)
time_pos = time_pos - period;
elseif (time_pos == period)
time_pos = 0.0;
end
end
y(1) = out_value;
total_num_out = total_num_out + 1;
```

Finally, **dclock** saves its state variables **SV** and returns.

```
SV = [delay_mode time_pos total_num_out];
return
```

Nexsys Sinusoidal Source Model

Here is a model of a sinusoidal source, **sin.m**. This SOURCE type model has no inputs and one output.

The model name, **sin**, matches the Matlab function name.

```
% NEXSYS FUNCTIONAL_MODEL ("sin", "0","", "", "1","r", "1","NO_DATA_
REQ", "NOT_APPLICABLE", "NSAMP=256,SAMPLE_
RATE=102.4e6,AMPLITUDE=1,FOSC=10e6,PHASE=0" )
```

Here are explanations for the entries in this line:

“dclock”	Model name and function name
“0”	No inputs
“”	No input type
“”	No samples needed per invocation
“1”	One output
“r”	Output is real
“NSAMP”	“NSAMP” sample to be generated per invocation (all samples are sent to the output port at once)
“NO_DATA_REQ”	No extra data reference is required
“NOT_APPLICABLE”	No probe domain
" NSAMP=256, SAMPLE_RATE=102.4e6, AMPLITUDE=1, FOSC=10e6, PHASE=0"	Parameters for the model

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Here is the Matlab **sin** function definition.

```
function [ output, SV ] = sin (parameters, SV, status_in)
```

The input and output variables for the function are:

parameters	Parameter values of the model
SV	State variable (in)
status_in	Input status
output	Output signal
SV	State variable (out)

Get parameters.

```
% Get parameters from function argument p
samples = parameters(1);
sample_rate = parameters(2);
amplitude = parameters(3);
fosc = parameters(4);
phase = parameters(5)*pi/180;
```

Calculate and set output and return:

```
time = (0:samples-1)/sample_rate;
output = amplitude*cos(2*pi*fosc*time + phase);
return
```

The sinusoidal source does not require any state variables (**SV**) to be saved or retrieved.

Nexsys Walsh Modulator Model

This example is a Walsh modulator model, **walshmd.m**. This **I/O** type model has one input and one output. The model definition line is:

```
% NEXSYS Functional_Model ("walshmd", "1","r", "N", "1","r", "2^N",
"NO_DATA_REQ", "NOT_APPLICABLE", "N" )
```

Here are explanations for the entries:

“walshmd”	Model name (and function name)
“1”	One input
“r”	Input type is real

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

“N”	N samples needed per invocation
“1”	One output
“r”	Output is real
“2^N”	2^N samples generated per invocation
“NO_DATA_REQ”	No extra data reference is required
“NOT_APPLICABLE”	No probe domain
"N"	Parameter for the model

Here is the **walshmd** function declaration:

```
function [ y, SV ] = walshmd ( x, p, SV, status_in)
```

The input and output variables for the function are:

x	Input signal
p	Parameter values of the model
SV	State variable (in)
status_in	Input status
y	Output signal
SV	State variable (out)

Access input and output timestep through global variables.:

```
% Declare the global variables this model need to access from Nexsys
engine
global TS_OUT TS_IN
```

Get parameters:

```
% Get parameters from function argument p
N = p(1)
```

Generate the Walsh Matrix once initially and save it into the **SV** state_variables, then retrieve it on later passes.

```
nrows = 2^N
ncols = 2^N
num_mod_symbols = 1
outnsamp = num_mod_symbols*ncols
% (status_in == 0) => Analysis initialization stage
if status_in == 0
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
size = 1
mask = 1
WM(1,1) = 0
for i = 1:N
for m = 1:size
for n = 1:size
WM(m,n+size) = WM(m,n)
WM(m+size,n) = WM(m,n)
if rem(WM(m,n),2) == 1
WM(m+size,n+size) = 0
else
WM(m+size,n+size) = 1
end
end
end
size = size*2
end
SV = WM
else
WM = SV
end
```

Set output timestep:

```
TS_OUT(1) = TS_IN(1)*N/ncols
```

Calculate output values and return:

```
cnt = 1
for j = 1:num_mod_symbols
factor = 1
mod_index = 1
for i = 1:N
mod_index = mod_index + factor * x(i+N*(j-1))
factor = 2*factor
end
for i = 1:ncols
y(cnt,1) = WM(i,mod_index)
cnt = cnt + 1
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
end
end
return
```

Nexsys Complex FFT Model

This **I/O** model, **cfft.m**, performs a Fast Fourier transform (FFT) on the incoming complex signal.

```
% NEXSYS Functional_Model ("cfft", "1","c", "length", "1","c",
"length", "NO_DATA_REQ", "NOT_APPLICABLE", "length" )
```

Here are the inputs and outputs for this model:

“cfft”	Model name and function name
“1”	One input
“c”	Input type is complex
“length”	“length” samples needed per invocation
“1”	One output
“c”	Output is complex
“length”	“length” samples generated per invocation
“NO_DATA_REQ”	No extra data reference is required
“NOT_APPLICABLE”	No probe domain
“length”	Parameter for the model

Here is the **cfft** function definition.

```
function[output, SV] = cfft(input, parameters, SV, status_in)
```

The input and output variables for the function are:

input	Input signal
parameters	Parameter values of the model
SV	State variable (in)
status_in	Input status
output	Output signal
SV	State variable (out)

Get Parameters:

```
length = parameters(1);
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Calculate output and return:

```
output = fft(input(1:length));
return
```

Nexsys Options

The Nexsys behavioral simulator Nexsys uses an option to prevent division by zero. The syntax is:

.OPTIONSbehavioral_minimum_divisor=*val*

Setting **behavioral_minimum_divisor** to a nonzero value prevents division by zero when evaluating behavioral devices in a Nexsys analysis.

System Frequency Domain Analysis

System frequency domain analysis allows you to evaluate and troubleshoot RF/high-frequency designs for wireless and microwave applications.

Results available with System Frequency Domain analysis include:

- The output power (**Pout**) at all external output ports.
- The voltage and power spectra and steady state time domain responses at the points where Nexsys voltage probes have been placed.
- The analysis results may be viewed in the spectral domain or in the time domain.

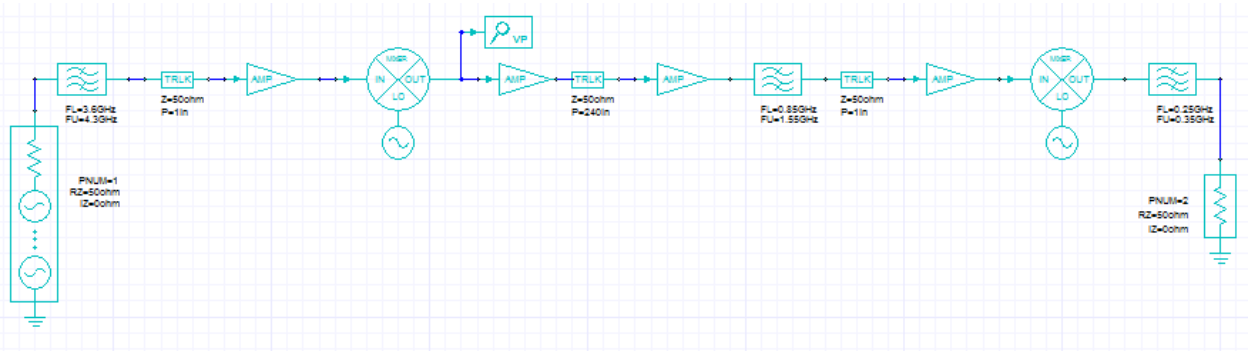
Running Frequency Domain Analysis

To set up a design and run frequency domain analysis

1. Open a new Circuit design.
2. Place the Components.
   - Nexsys behavioral MIXER and AMP elements are located in **Components>System>nonlinear_RF**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

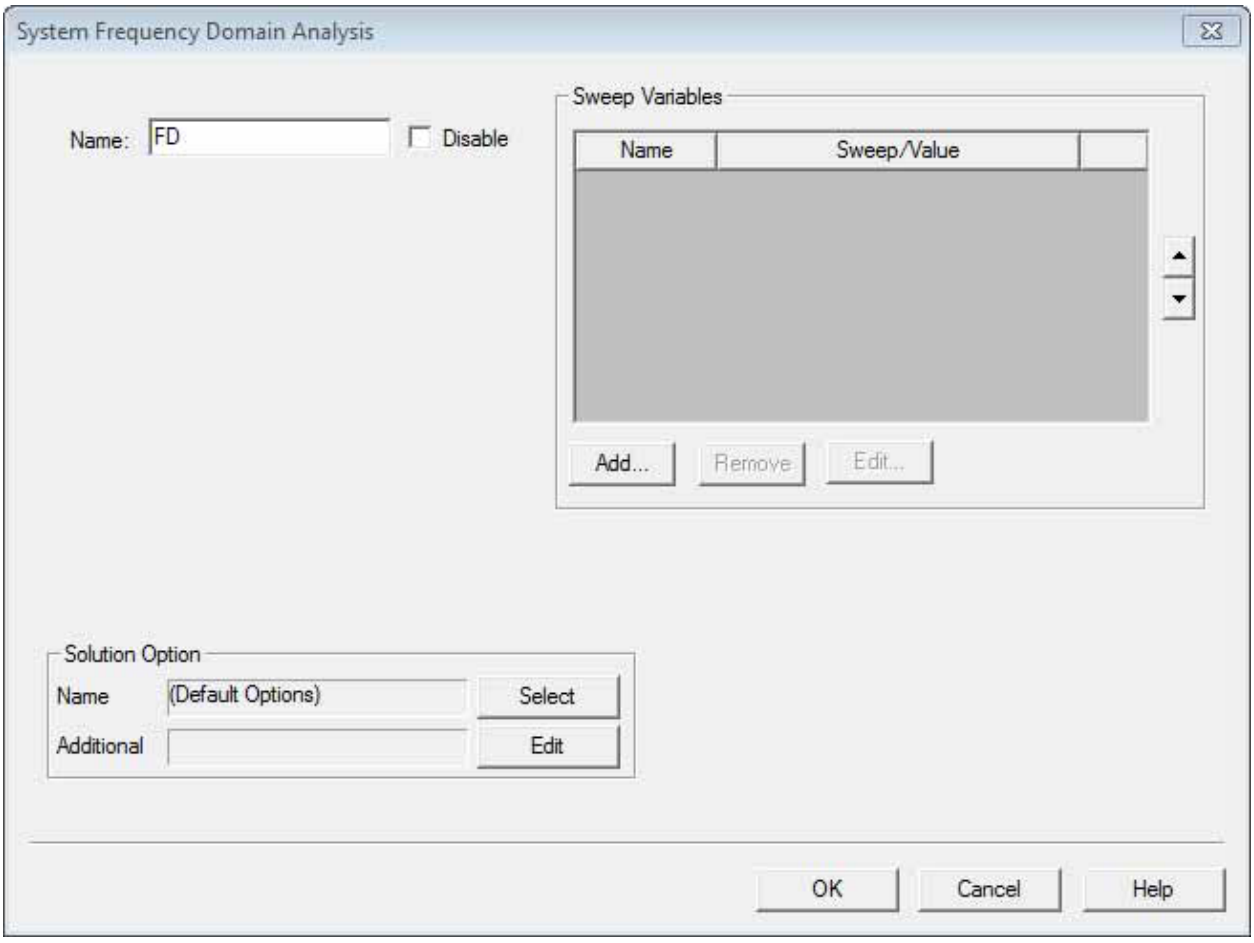
- The behavioral AMP and MIXER components can be connected directly to the electrical (Nexxim) components, as in the following example:



3. Add ports to external output nodes.
   - Ports are added by clicking the port symbol in the menu. See Ports in Schematics for further information.
   - Power and voltage results are calculated for every output port.
4. Place and name Nexsys voltage probes (VP) on internal nodes of interest.
   - Nexsys voltage probes are in **Components>System>Probes**.
   - Voltage and power spectra and steady state time domain responses are calculated at every probe location.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Select **Circuit>Add Nexxim Solution Setup>System Frequency Domain Analysis**.



- Select an analysis **Name** or use the default (SystemFDAnalysis*n*).
- Click Add in the Sweep Variables group box. Add a frequency sweep:
  a. In the **Variable** list, frequency **F**is selected (and cannot be changed). Select one of the following: **Single value, Linear step, Linear count, Decade count,**or **Octave count**.
  b. Type the sweep values into the **Value** field (for **Single value**), or into the **Start**, **Stop**, and **Step** text fields (for **Linear**, **Decade**, or **Octave count**), and ensure that the appropriate units (**GHz, MHz, kHz**) are selected for each.
  c. Click **Add**, then click **OK** to close the **Add/Edit Sweep** window and reopen the **Frequency Domain Analysis**window.
  e. For more information, see Variable Sweep.
- Click **OK** to complete the Frequency Domain analysis setup.

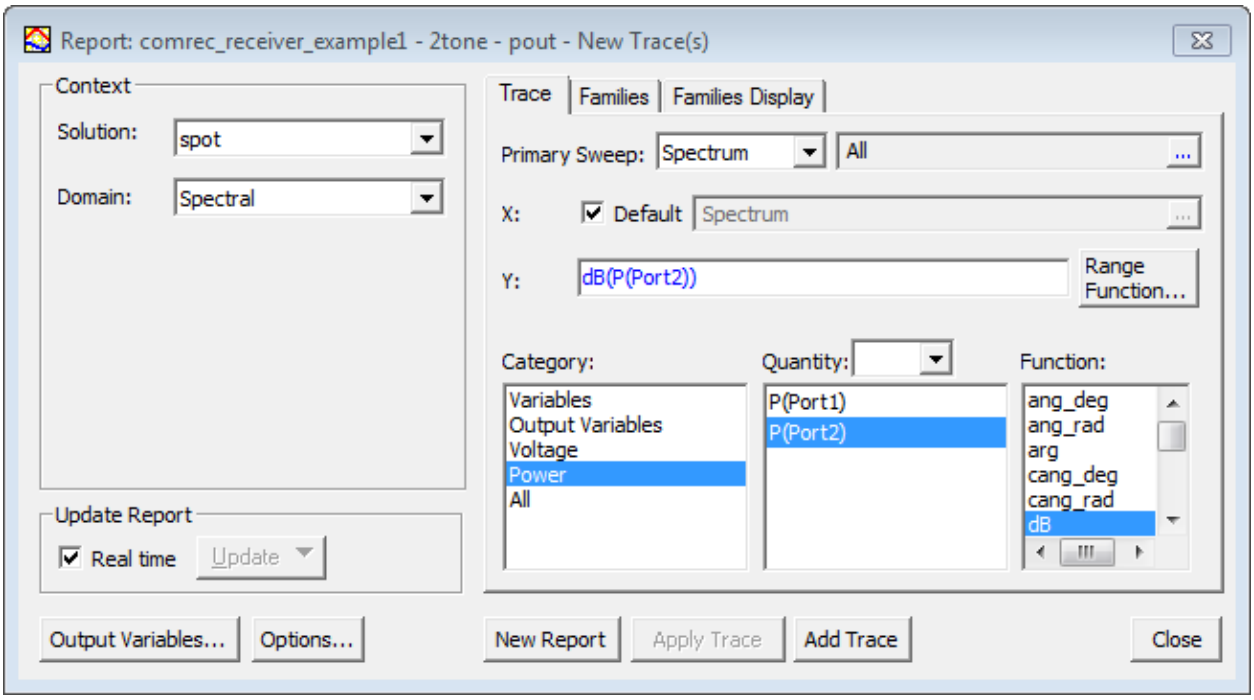
6. Expand the **Project Manager** window and the Analysis folder. Right-click the **FDAnalysis** setup and select **Analyze** on the menu. The progress bar shows the analysis proceeding

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

to completion.

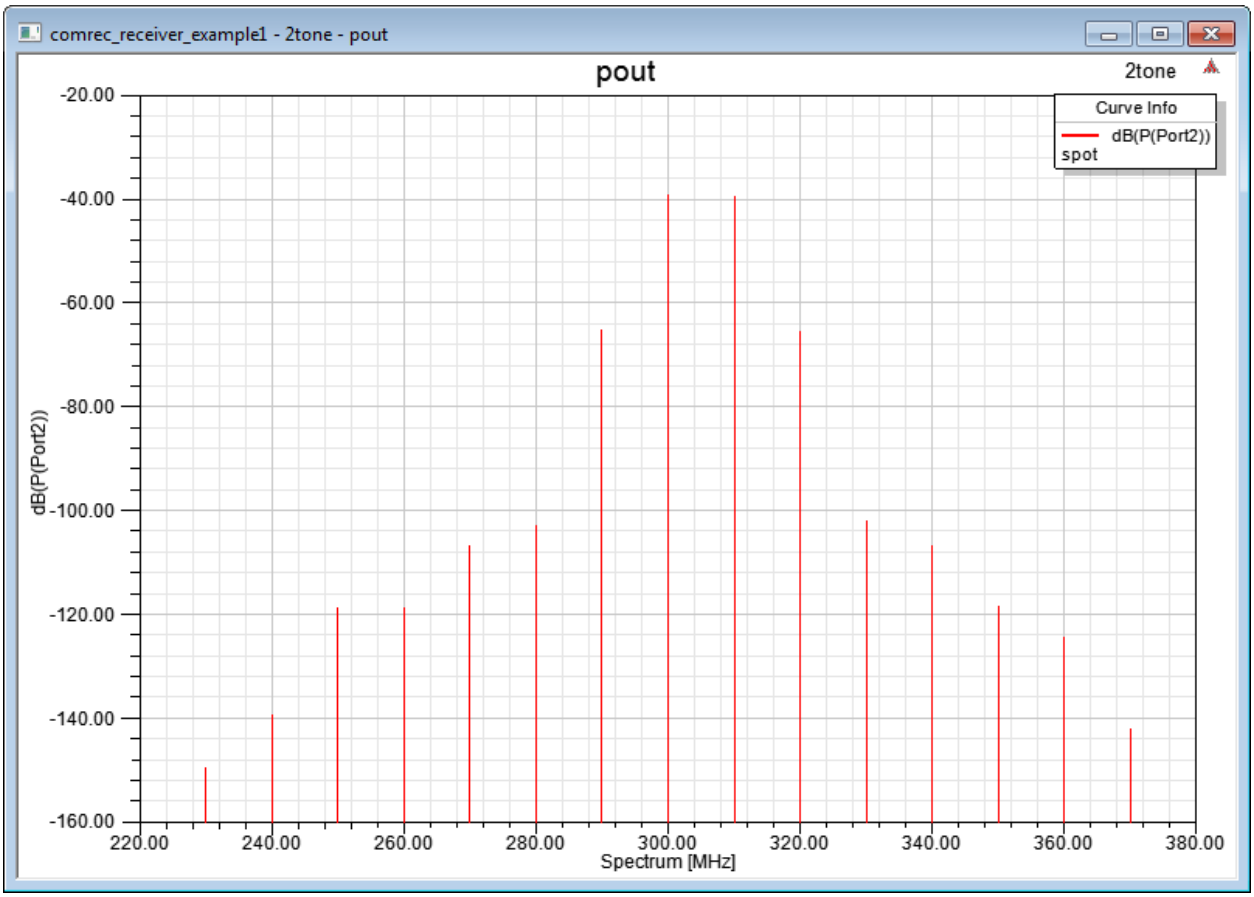
7. When the analysis has run to completion, view the results.

- Click **Results>Create Standard Report>Rectangular Plot**.
- Select the Solution and the Domain. The FD analysis results may be viewed in the spectral domain or in the time domain.
- Select Power or Voltage, the output ports, and dB. Here is an example report setup:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **New Report**. Here is an example of an output power plot.



Frequency Domain Analysis

Frequency domain analysis is a system-level simulation for electrical systems of linear elements (including S-parameter elements) and nonlinear behavioral electrical elements such as amplifiers and mixers.

Figure 1 shows a multi-channel nonlinear electrical topology made up of multi-port linear passive elements and two-port linear or nonlinear active elements.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

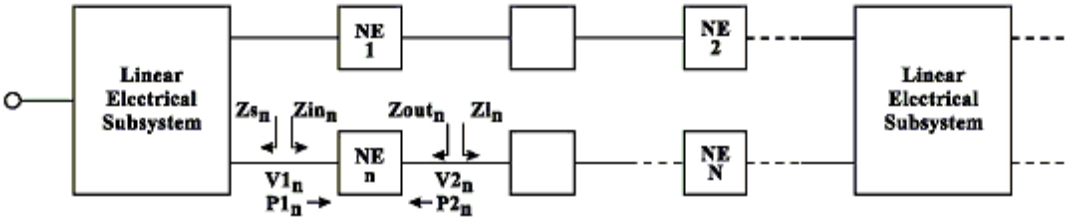


Figure 1. General nonlinear electrical topology containing N nonlinear elements (NE = nonlinear element)

Frequency-domain analysis is applicable only to electrical systems made up of linear/nonlinear frequency-based elements like the example in Figure 1. Systems containing functional time-based elements may not be analyzed in the frequency domain.

The multi-port system can be excited from any set of external sources. Frequency domain analysis can be performed with both single-tone and multi-tone excitations. When the source provides multi-tone excitations, frequency domain analysis can predict the inter-modulation distortion (IMD) or harmonics generated by nonlinear elements (mixers and amplifiers) in the system.

Note:

Assumptions for Frequency Domain Analyses:

1. All external ports are assumed to have a complex termination (defaulted to 50Ω). This load impedance can be adjusted by assigning a different value in the port definition.
2. All two-port nonlinear components are treated as unidirectional components (e.g., S12 = 0).
3. The IMD and harmonic measurements for each individual nonlinear element are obtained when the input and output ports have 50Ω terminations and the applied RF sources represent a single-tone bandpass input.
4. Nonlinear measurements are obtained when the input and output ports of the nonlinear component are terminated in 50Ω.

The Equivalent Model for Nonlinear Behavioral Components

Generally, nonlinear electrical components are not only power dependent, but also frequency and temperature dependent. The equivalent model used for nonlinear components in discrete time simulation separates the power-dependent characteristics on the frequency-dependent and temperature-dependent characteristics.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Each nonlinear electrical component is partitioned into three elements: a linear electrical (active) input component, a nonlinear functional component modeled in the time domain, and a linear electrical (passive and noiseless) output component. This arrangement is shown in Figure 2.

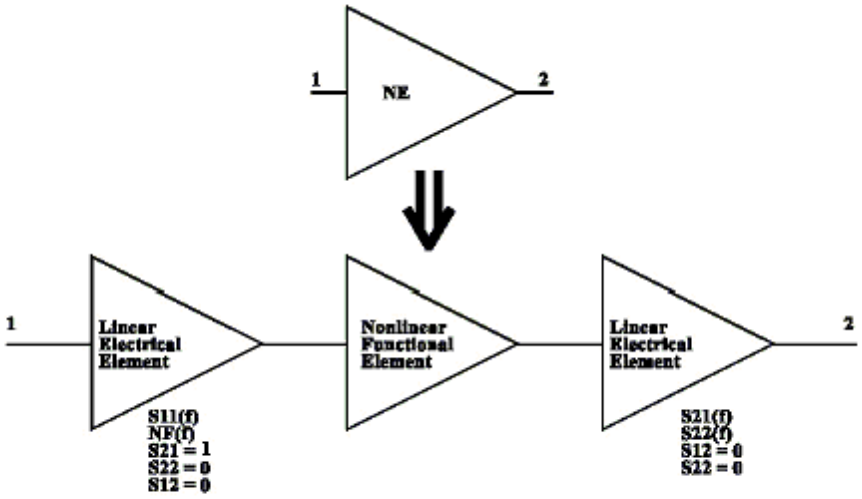

Figure 2 – Equivalent Model for Nonlinear Behavioral Components

All nonlinear electrical two-port components are assumed to be unidirectional (e.g., $S_{12} = 0$). In this model, the power-dependent characteristics of S_{11}, S_{12} and S_{22} are ignored. The frequency and temperature dependent small-signal S_{11} and noise figure NF are associated with the input linear electrical component. The power-dependent characteristics of S_{21} are associated with the nonlinear functional component. The frequency and temperature dependent small signal S_{21} and S_{22} are associated with the output linear electrical component.

The linear electrical input and output components are associated with other connected linear electrical components and simulated as a linear electrical sub-design, as described in The Algorithm for Response Evaluation of Nonlinear Systems. See Time Domain Representation of a Bandpass Envelope Multitone RF Signal for the calculation formulas.

The nonlinear characteristic of a two-port component is described by its nonlinear figures-of-merit or, alternatively, by measured nonlinear data. Only the nonlinear characteristic of S_{21} is considered, even though S_{11}, S_{12} and S_{22} may also be power-dependent. The topic Modeling Nonlinearity with Polynomial Power Series describes the modeling of this nonlinear functional component.

The measurements obtained for a two-port nonlinear amplifier typically represent the AM-AM and AM-PM distortion (e.g., output power and phase vs. input power). These quantities are typically measured for a given input frequency or set of frequencies while the available input power is swept. These measurements are then used during frequency domain analysis (taking

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the operating point for the nonlinear element into account) for computing the IMD generated by this element when it is embedded in a general topology such as the one shown in Figure 1 in the topic "Frequency Domain Analysis" on page 14-41. See IMD Calculations for Nonlinear Two-Port Elements for more on this calculation.

The harmonics generated by a mixer can be measured when the RF and IF ports are both terminated in 50Ω and a single RF tone with a given frequency and available input power is applied to the RF port of the mixer. The measured harmonics (called MIXERSPURS data) may then be used to predict the harmonics generated by this element when it is embedded in a general topology such as the one in Figure 1 in the topic "Frequency Domain Analysis" on page 14-41. See IMD Calculations for Mixers with MIXERSPURS Data Tables for more on this calculation.

The Algorithm for Response Evaluation of Nonlinear Systems

The nonlinear frequency domain algorithm described here accounts for all nonlinearities and inter-stage mismatches in the system. For a multi-channel nonlinear topology with N nonlinear elements (refer to Figure 1 in the topic "Frequency Domain Analysis" on page 14-41), it is always assumed that parallel nonlinear channels connected to the same linear multi-port subsystem are not coupled (i.e., non-interacting). This is ensured during multi-tone analysis by assuming that S_{12} is very close to zero for all nonlinear elements. This effectively implies that the topology has a feed-forward nature. As a result, the impedances Zin_n and $Zout_n$ for the n^{th} nonlinear element (1<=*n*<=N) are only a function of S11 and S22 respectively for the n^{th} nonlinear element (i.e., each nonlinear element is effectively unidirectional). With that important assumption, the algorithm used for evaluating the IMD and harmonic responses, in the system, proceeds as follows:

1. The nonlinear behavioral models are decomposed into three pieces (as shown in Figure 2 in the topic "The Equivalent Model for Nonlinear Behavioral Components " on page 14-42: one front end linear input component, one nonlinear functional behavioral model and one back end linear output component.
2. The topology is then partitioned into linear electrical subsystems (touching linear models) and nonlinear functional elements and all the partitioned components are scheduled on the left (input) to the right (output).
3. The linear electrical subsystems are solved with Nexxim linear network analysis (LNA) cosimulation, and the results are sent back to the top level frequency domain solver. The simulation takes into account all impedance mismatches Zin_n, $Zout_n$ seen looking into nonlinear elements connected to each linear subsystem (See Figure 1 in the topic "Frequency Domain Analysis" on page 14-41).
4. Harmonics at the input of each nonlinear element are transformed based on the nonlinear transformation characteristics of that element. First, the frequency domain signal at the input is transformed into time domain data. Next, the time domain output is calculated

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

based on the power series model described in Modeling Nonlinearity. Finally, the time domain signal is transformed back to frequency domain and sent to the next state. This calculation takes into account all impedance mismatches Zs_n, Zl_n seen looking into the ports of other elements connected to each nonlinear element (See Figure 1 in the topic "Frequency Domain Analysis" on page 14-41). These impedances are evaluated at all input and output harmonics. Calculations of harmonics and IMD products generated by mixers and nonlinear amplifiers is discussed later. See IMD Calculations for Nonlinear Two-Port Elements.

When two or more carriers are applied to a system that includes one or more nonlinear components, inter-modulation frequency components is generated. The frequency domain analysis predicts these inter-modulation distortions (IMD) at all external output ports and at internal nodes where voltage and/or power probes are placed.

The frequency domain analysis accounts for all the inter-modulation frequency components generated by all the nonlinear elements within a system. This analysis tends to be more accurate if nonlinear measurements such as Pout vs. Pin are provided for nonlinear electrical components, as opposed to just providing the nonlinear figures of merit OIP3, P1dB, or Psat.

Frequency Domain Measurements

Two kinds of measurements are available with frequency domain analysis.

- The output power (**Pout**) at all external output ports.
- The voltage and power spectra and steady state time domain responses at the points where voltage probes have been placed. A voltage probe may be placed anywhere inside a nonlinear electrical system prior to running the analysis. Each probe must be given a label or a name. Careful placement of voltage probes can help identify the effect on the overall IMD results produced by each individual component in the system.

The analysis results may be viewed in the spectral domain or in the time domain.

Modeling Nonlinearity with Polynomial Power Series

Nonlinear measurements of a two-port component typically include the AM-AM and AM-PM effects. The nonlinear relationship between $S_{21}$and P_1 (the available input power) or, equivalently, between P_{out} and P_1 may be represented by power series polynomials:

$$\sqrt{P_{out}}\cos\phi = a_1X + a_3X^3 + \dots$$

$$\sqrt{P_{out}}\sin\phi = b_1X + b_3X^3 + \dots$$

where:

$$P_{out} = |S_{21}|^2 P$$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

= the output load power (assuming RL = 50Ω)

$$X = \sqrt{P_1}$$

P_1 = the available input power on the source (with RS = 50Ω)

$$\phi = \angle S_{21} - \angle S_{21\,ss}$$

S_{21ss} = the small signal gain.

The coefficients a_1, a_3, a_5... and b_1, b_3, b_5... are calculated using a least-squares curve fitting technique based on the user-supplied measurements P_1 - P_{out} data or P_1 - S-parameters data. For example, a set of coefficients can be obtained based on the following power amplifier P_1 - P_{out} measured data (in 50-ohm terminations).

RTH_PA 2-port
Pout dBm
P1 dBm, FREQ=900MHz

P1	Pout	Phase(degrees)
5.00	25.68	88.75
7.00	27.67	88.75
9.00	29.66	88.75
11.00	31.64	88.75
13.00	33.61	88.75
15.00	35.56	88.75
17.00	37.48	88.76
19.00	39.35	88.76
21.00	41.16	88.76
23.00	42.86	88.75
25.00	44.38	88.71
27.00	45.65	88.66
29.00	46.53	88.76
31.00	47.17	91.85
33.00	47.50	97.08
35.00	47.66	102.81

Figure 3. Pin Pout Data Example

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the user chooses to provide the nonlinear figures-of-merit (OIP3 or P1dB and Psat) instead of measurement data, the power series coefficients are approximated by:

$$a_1 = |S_{21}| \quad a_3 = \frac{-\left(\frac{4}{3}\right)|S_{21}|^3}{OIP3}$$

$a_i = 0$, $i = 5,7, \ldots$

$b_i = 0$, $i = 1,3,5, \ldots$

where:

S_{21} is the linear small signal gain

OIP3 is the output power at the third order intercept point.

In this case, the simulations tend to be less accurate.

Time Domain Representation of a Multitone RF Source

The nonlinear functional component part of a nonlinear behavioral element (See Figure 2 in the topic "The Equivalent Model for Nonlinear Behavioral Components " on page 14-42) is modeled in the time domain. An important step for calculating IMD products in the time domain is to derive an equivalent envelope time domain representation for a given bandpass RF multi-tone source.

Complex Envelope of an RF Source

An RF multi-tone source typically contains a fundamental carrier and at least one additional carrier. The equivalent source voltage S(t) of an RF source that has a total of *n* carriers (including the fundamental carrier) may be expressed as:

$$S(t) = \sum_{i=1}^{n} V_i \cos(2\pi f_i t + \theta_i) = I_s(t)\cos(\omega_c t) - Q_s(t)\sin(\omega_c t)$$

$$I_s(t) + jQ_s(t)$$

= The complex envelope of the signal *S(t)*

$$I_s(t) = \sum_{i=2}^{n} V_i \cos(2\pi(f_i - f_1)t + \theta_i - \theta_1)$$

= In-phase envelope signal

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$Q_s(t) = \sum_{i=2}^{n} V_i \sin(2\pi(f_i - f_1)t + \theta_i - \theta_1)$$

= Quadrature-phase envelope signal

$$V_i = \sqrt{4R_s P_i}$$

$$1 \le i \le n$$

Where:

f_i = The i^{th} carrier frequency

$f_1 = f_c$ = Fundamental carrier frequency

$\theta_1 = 0$

θ_i = The i^{th} carrier phase

P_i = The i^{th} carrier available input power

P_1 = Fundamental carrier available input power

Nonlinear Output Voltage

The nonlinear output voltage is calculated in the time domain as:

$$S_{out}(t) = V_{out}(t)\cos(\omega_c t + \theta_{out}(t)) = I_{out}(t)\cos(\omega_c t) - Q_{out}(t)\sin(\omega_c t)$$

Where:

$$V_{out}(t) = \sqrt{P_{out}(t)R_{out}} = \sqrt{I_{out}^2(t) + Q_{out}^2(t)} \quad \theta_{out}(t) = \operatorname{atan}\left(\frac{Q_{out}(t)}{I_{out}(t)}\right)$$

$$I_{out}(t) = \sqrt{R_{out}} \times [GIV(t)\cos(\theta_s(t)) - GQV(t)\sin(\theta_s(t))]$$

$$Q_{out}(t) = \sqrt{R_{out}} \times [GIV(t)\sin(\theta_s(t)) - GQV(t)\cos(\theta_s(t))]$$

$$GIV(t) = \left(\frac{a_1}{MS_{21}}\right)X(t) + \left(\frac{a_3}{MS_{21}}\right)X(t)^3 + \left(\frac{a_5}{MS_{21}}\right)X(t)^5 + \ldots$$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$GQV(t) = \left(\frac{b_1}{MS_{21}}\right)X(t) + \left(\frac{b_3}{MS_{21}}\right)X(t)^3 + \left(\frac{b_5}{MS_{21}}\right)X(t)^5 + \ldots \quad X(t) = \sqrt{P_1(t)} \quad P_1(t) = \frac{V_s^2(t)}{4R_{in}}$$

$$MS_{21} = \sqrt{a_1^2 + b_1^2}$$

The source resistance R_{in} and the load resistance R_{out} default to 50Ω, but they can be individually specified for each input and output, respectively.

Constraints on the Carrier Frequency

The accuracy of the envelope multi-tone analysis puts constraints on the minimum spacing between carrier frequencies:

$$f_c = f_1 + k\Delta f \quad \Delta f = min(f_i - f_j)$$

$i \neq j$
, , $i,j = 1,2...,n$

k = positive or negative integer.

Envelope multitone frequency domain analysis results may lose accuracy when Δf is too large. In general, the condition $\Delta f << f_1$ must hold for accurate results.

IMD Calculations for Nonlinear Two-port Elements

Intermodulation distortion (IMD) calculations through a nonlinear two-port element (e.g., amplifier, mixer, frequency multiplier) are carried out in the time domain based on the envelope modulation technique discussed in Time Domain Representation of a Bandpass Envelope Multitone RF Signal. The envelope modulation technique is based on the assumption that the frequency separation between the input carriers is much less than the fundamental input carrier frequency. For the envelope modulation technique, all input carriers can be resolved in terms of the fundamental input carrier to yield a time-domain envelope signal, which modulates the fundamental carrier. The non-linearity may then be applied to this envelope signal in the time domain to generate the distorted time domain output envelope. This output envelope can then be transformed back to the frequency domain to yield the output IMD frequency components. This technique is much more effective (especially for a large number of input carriers) than performing the nonlinear transformation in the frequency domain and having to account for all the possible IMD products.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IMD Calculations for Mixers with MIXERSPURS Data Tables

When a carrier mixes with the local oscillator frequency in a mixer, intermodulation and harmonic frequency components is generated at the output of the mixer. These harmonic frequency components are called Mixer Spurs.

Generally, mixing can produce energy at all frequencies equal to:

$$N_{RF}f_{RF} + N_{LO}f_{LO}$$

where:

f_{RF} is the frequency of the carrier at the input of the mixer

f_{LO} is the frequency of the local oscillator

N_{RF} and N_{LO} are integers representing the RF and LO multipliers respectively.

You can control how many spurs get generated by specifying the MAXORDER, MINF, MAXF, and MINP parameters for each mixer, where:

$$|N_{RF}| + |N_{LO}| \leq$$

MAXORDER: maximum order of spurs, MAXORDER

MINF: minimum spur frequency (spurs below MINF are ignored)

MAXF: maximum spur frequency (spurs above MAXF are ignored)

MINP: minimum spur power, (spurs below MINP are ignored)

The power of a spur at the output of a mixer is calculated using the MIXERSPURS data table provided for the mixer. Once generated, each spur is carried through the remainder of the system with all mismatches taken into account. Figure 4 shows a representative mixer spurs table. Essentially, the rows in Figure 4 represent relative power levels for harmonic RF multipliers, and the columns represent relative power levels for harmonic LO multipliers. The image power level can also be specified.

Figure 4. Mixer Spurs Table Data Example

It is always assumed that mixer spur tables are obtained at the output IF port when the RF and IF ports of a mixer are both terminated in 50Ω and a single-tone RF source (with a given frequency and available input power) is applied to the mixer's RF port.

Mixer Spurs Indices

Mixer spurs indices can be viewed at any external port or voltage/power probe to indicate the spectral origin in terms of each RF and LO multiplier through all mixing stages.

The following assumptions are made when computing these indexes:

1. Mixer spurs are calculated only for the principal carrier. If more than one mixer is present in the system, the calculation proceeds in this manner: new mixer spurs are generated using only the principal carrier at the input to each mixer. Previously generated mixer spurs (available at the input of each mixer) are translated through each mixer using the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

principal integer multipliers N_{RF} and N_{LO}, (N_{RF} = 1, N_{LO} = -1), without generating any additional Mixer Spurs. This assumption is based on the fact that additional spurs are typically either filtered out or too weak compared to the spurs generated by the principal RF carrier.

2. The index calculations do not account for IMD harmonics generated by nonlinear two port components in the system such as amplifiers.

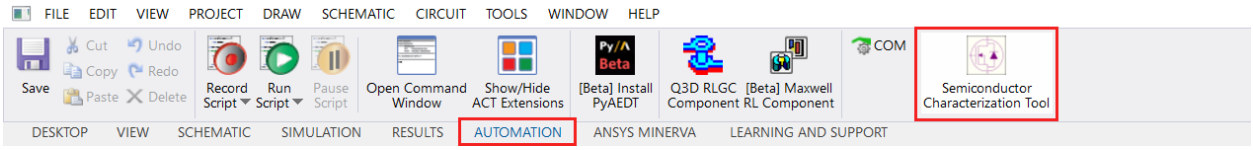
15 - Semiconductor Characterization Tool

The semiconductor characterization tool aims to enable users to create physics-based models of various electronics devices for operation at a desired characteristic. Currently, the tool supports modeling of SiC power MOSFET devices.

Upon first selecting the Semiconductor Characterization tool, you will be prompted with set up instructions.

In the main ribbon, select **Automation**, then **Semiconductor Characterization Tool**.

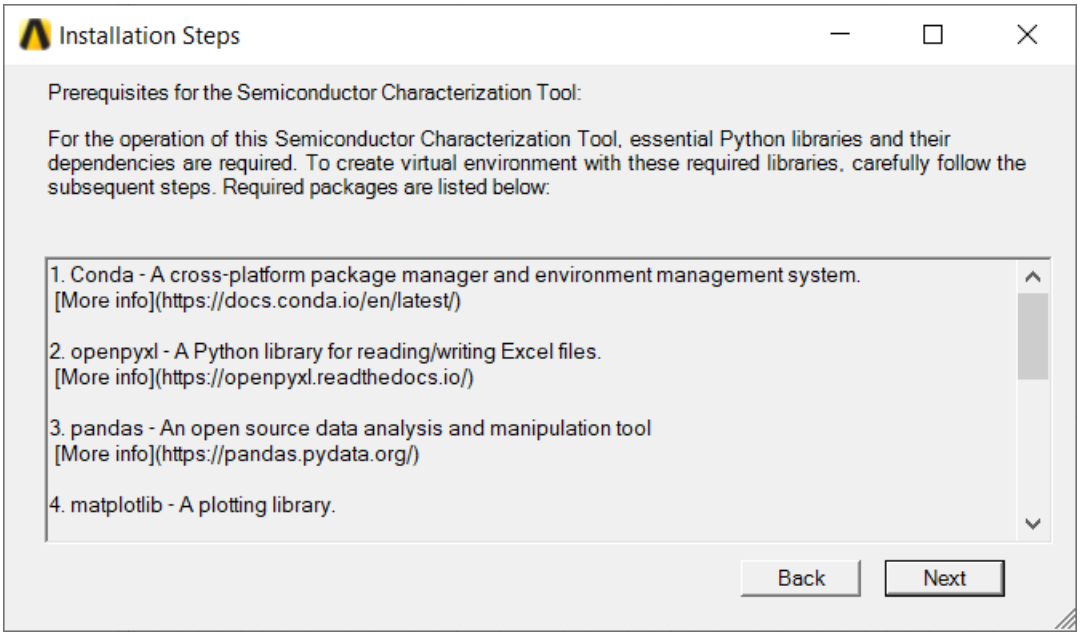


The steps will walk you through the following processes:

- Prerequisite Information
- Conda Installation
- Creating a Virtual Environment
- Installing Essential Libraries
- Installing Essential Library "pygmo"

Prerequisites

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. Conda - A cross-platform package manager and environment management system.

   [More info](https://docs.conda.io/en/latest/)
2. openpyxl - A Python library for reading/writing Excel files.

   [More info](https://openpyxl.readthedocs.io/)
3. pandas - An open source data analysis and manipulation tool

   [More info](https://pandas.pydata.org/)
4. matplotlib - A plotting library.

   [More info](https://matplotlib.org/)
5. numpy - The fundamental package for numerical computations in Python.

   [More info](https://numpy.org/)
6. scikit-learn - Machine learning library in Python.

   [More info](https://scikit-learn.org/)
7. pyside6 - The official Python module from Qt for creating UIs.

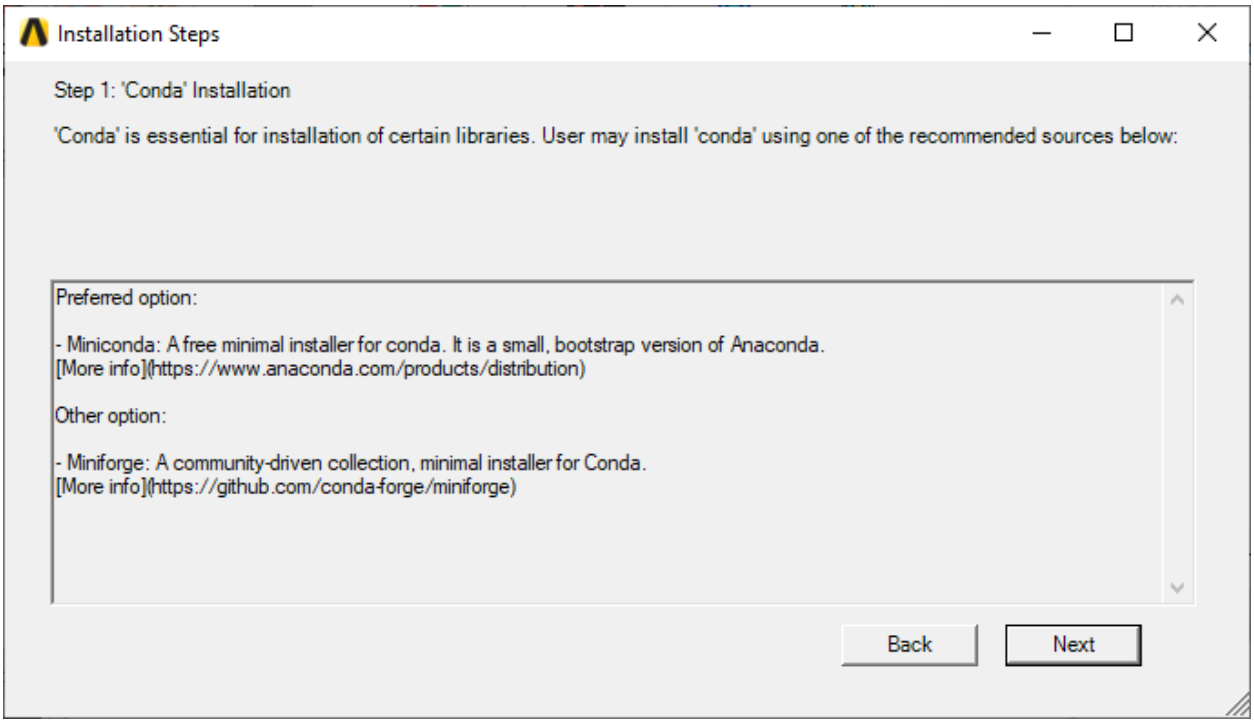
   [More info](https://doc.qt.io/qtforpython/)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

8. pygmo - A parallel optimization tool, useful for algorithmic research.

   [More info](https://esa.github.io/pagmo2/)

Step 1: Conda Installation



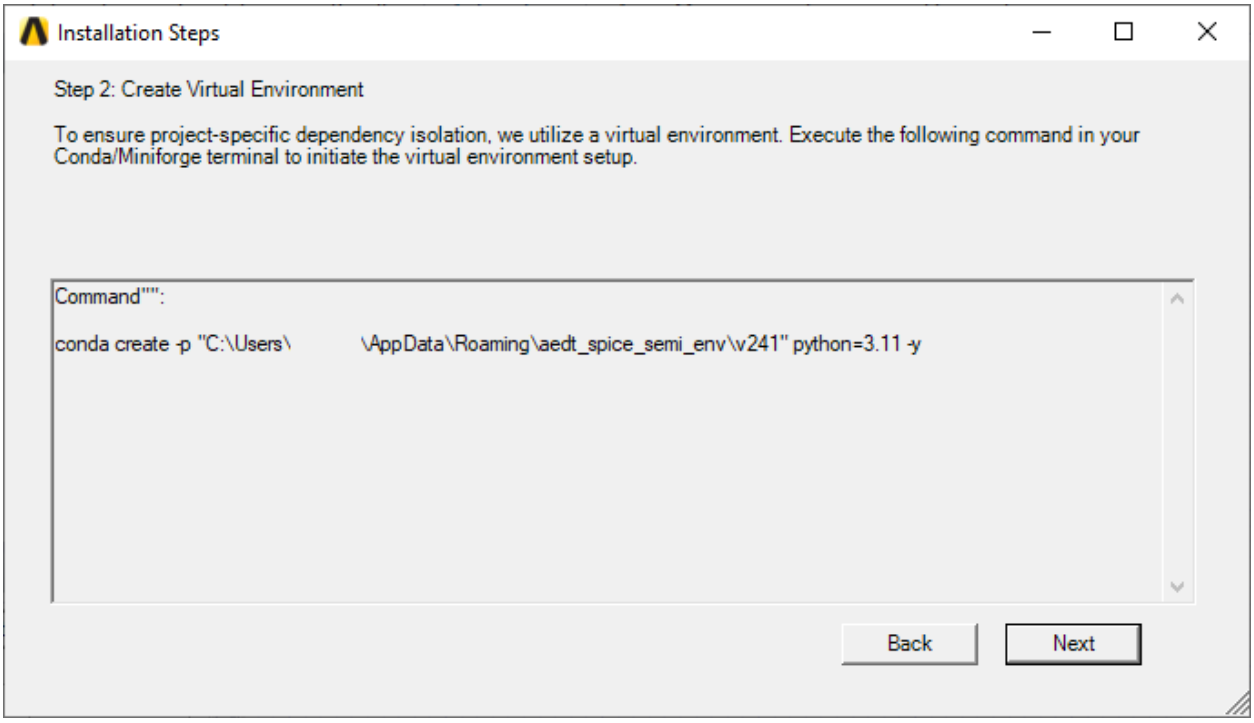
- Miniconda: A free minimal installer for conda. It is a small, bootstrap version of Anaconda.

  [More info](https://www.anaconda.com/products/distribution)
- Miniforge: A community-driven collection, minimal installer for Conda.

  [More info](https://github.com/conda-forge/miniforge)

Step 2: Create Virtual Environment

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

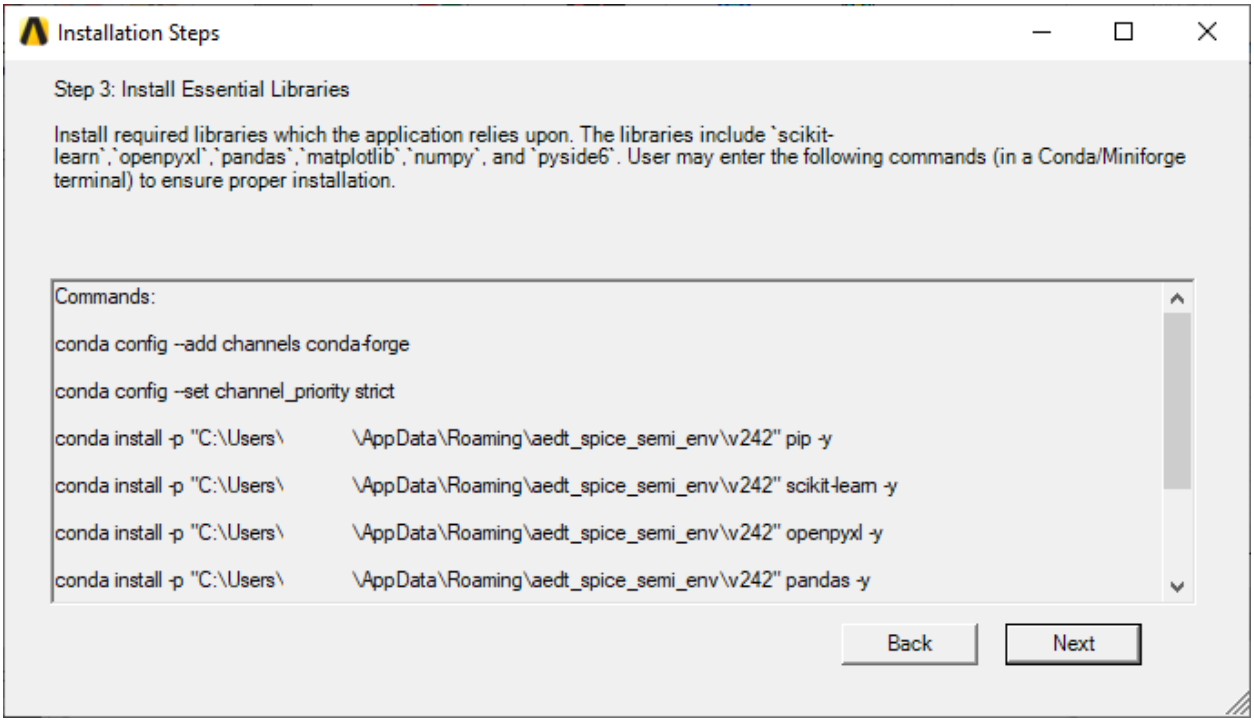


Command:

```
conda create -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" -y
```

Step 3: Installing Essential Libraries.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

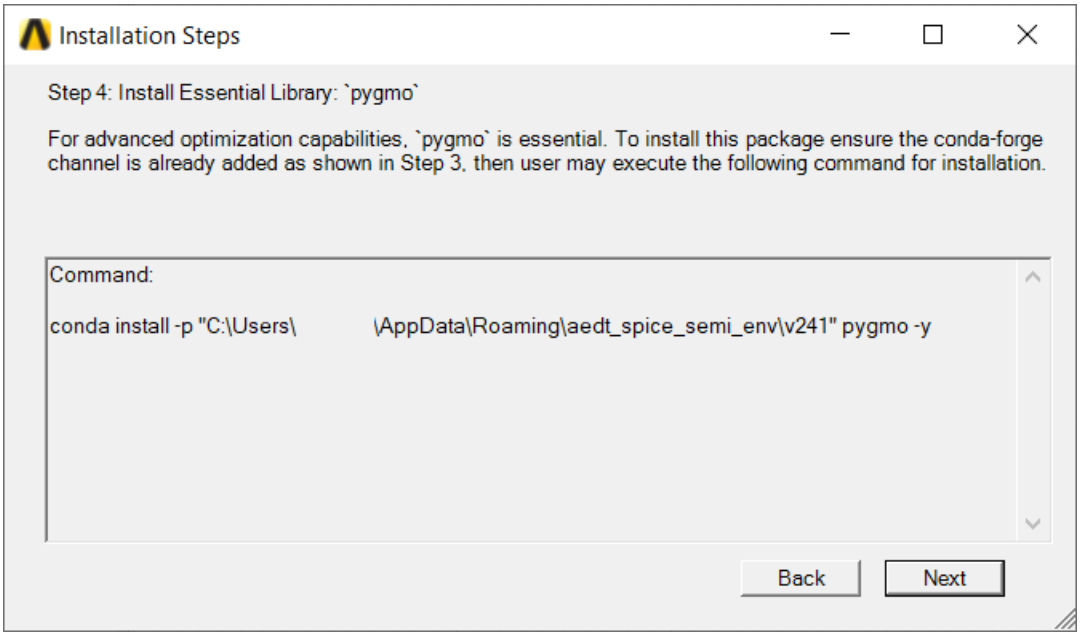


Commands:

```
conda config --add channels conda-forge
conda config --set channel_priority strict
conda install -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" pip -y
conda install -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" scikit-learn -y
conda install -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" openpyxl -y
conda install -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" pandas -y
conda install -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" matplotlib -y
conda install -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" numpy -y
conda install -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" pyside6=6.4.3 -y
```

Step 4: Install Essential Library: "pygmo"

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Command:

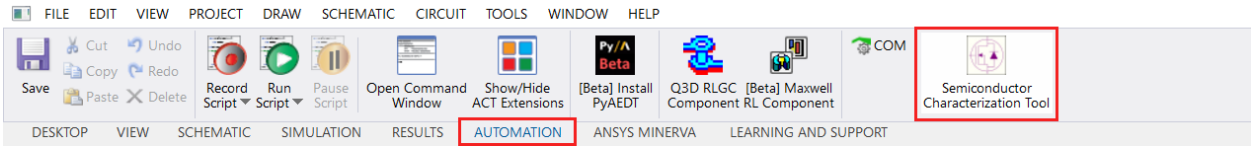
```
conda install -p "C:\Users\UserName\AppData\Roaming\aedt_spice_semi_
env\v252" pygmo -y
```

At the end of these steps, the toolkit will be ready to launch.

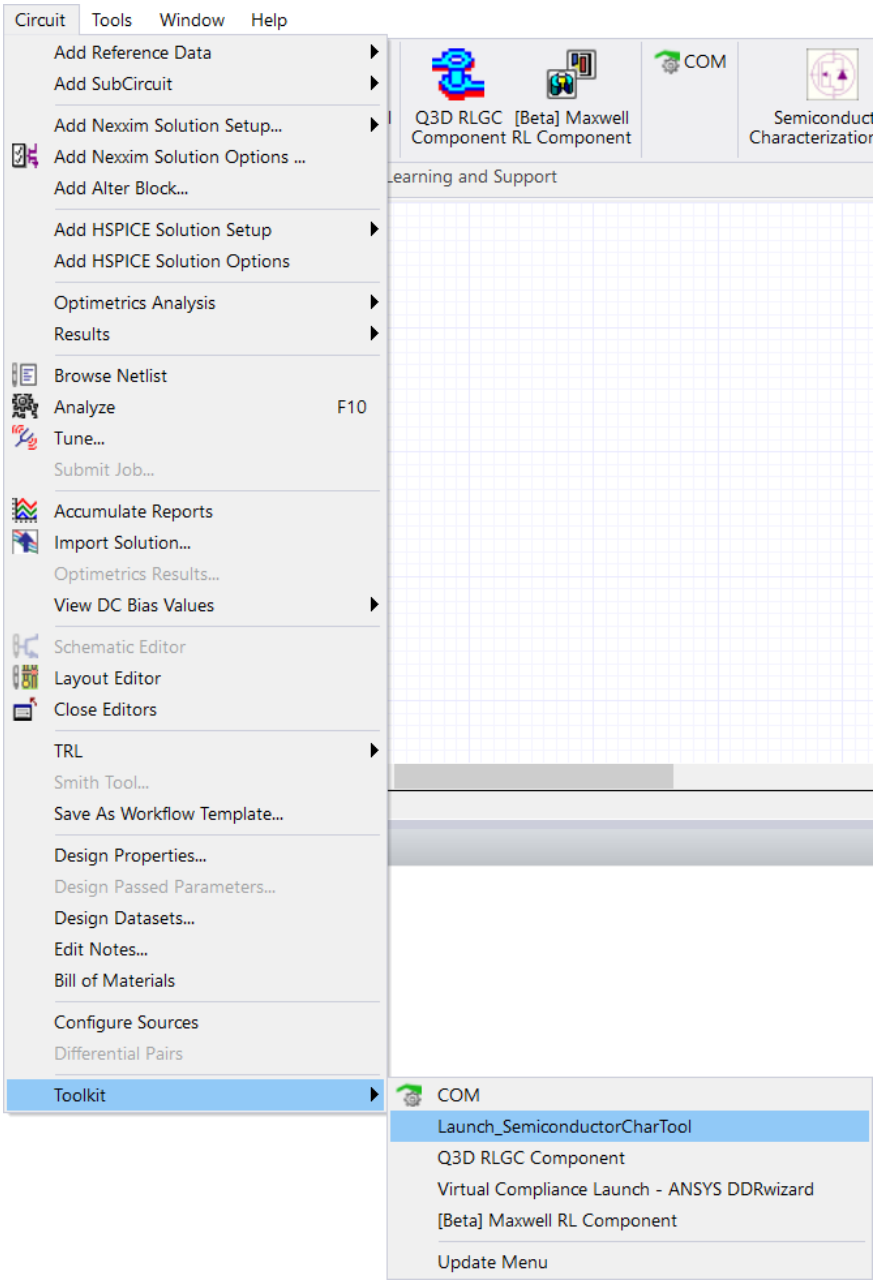
Semiconductor Characterization Tool

Overview

Click the **Semiconductor Characterization Tool** in the **Automation** tab of the main ribbon, or select **Circuit>Toolkit> Launch Semiconductor_CharTool**.

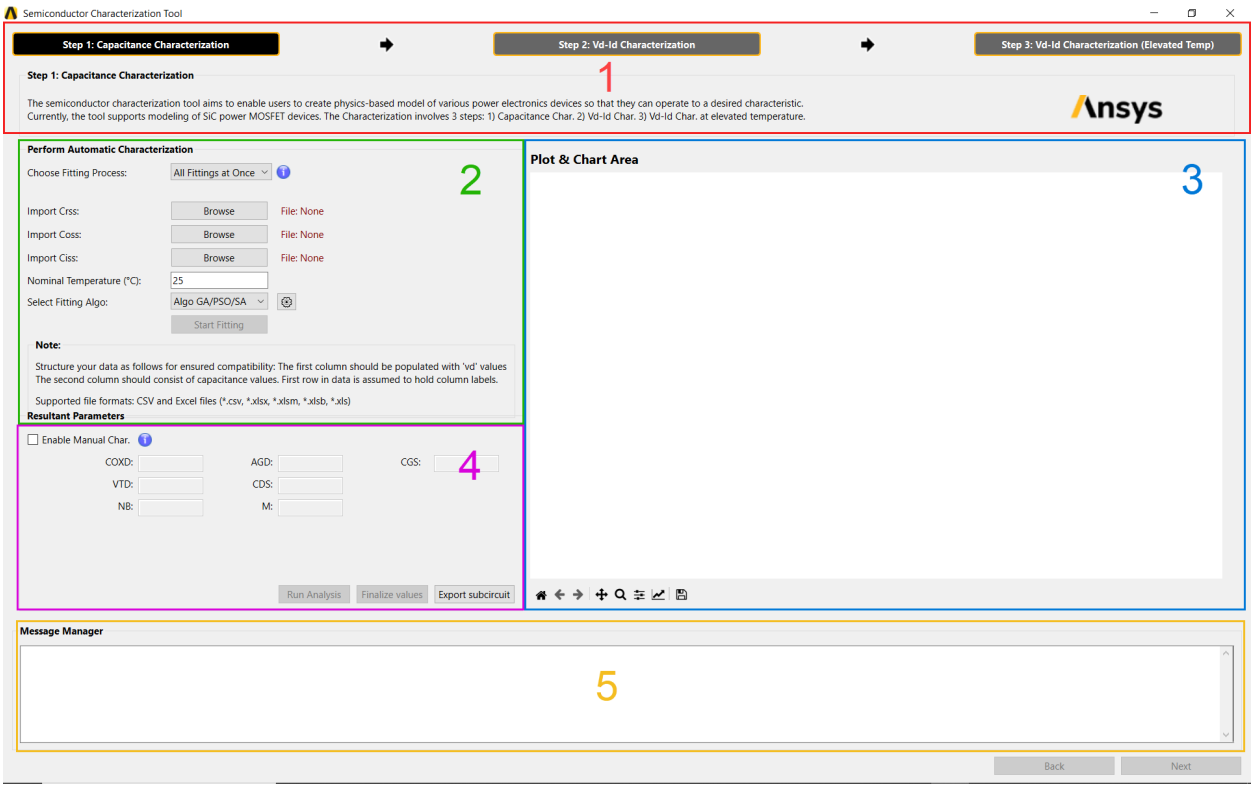


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Overview

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. Lists the Step in the characterization process. The window will update according to the step number.

   The tool is comprised of 3 characterization steps.

   - **Step 1**: Capacitance Characterization
   - **Step 2**: Vd-Id Characterization
   - **Step 3**: Vd-Id Characterization (Elevated Temp)

2. **Perform Automatic Characterization** group box. Choose the fitting process, input the data files and temperature, and choose the fitting algorithm for analysis.

   There are two options for the fitting process:

   - **All Fittings at Once** - import / input the data for each step. After the data is loaded, select **Fit All** in Step 3.
   - **Step-by-Step Fitting** - perform each fitting one step at a time. This method ensures a good fit at each step.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. **Plot & Chart Area**. The graph will update automatically to display the reference data and the simulated data.
4. **Enable Manual Characterization** group box. Users can input parameter values to run analysis.
5. **Message Manager**. Displays tool information such as file locations, step in analysis, and parameter values.

> **Note:** Structure your data as follows for ensured compatibility:
> The first column should be populated with 'vd' values. The second column should consist of capacitance values.
> The first row in the data file is assumed to hold column labels. Supported file formats inclue CSV and Excel files (*.csv, *.xlsx, *.xlsm, *.xlsb, *.xls).

Semiconductor Characterization Tool

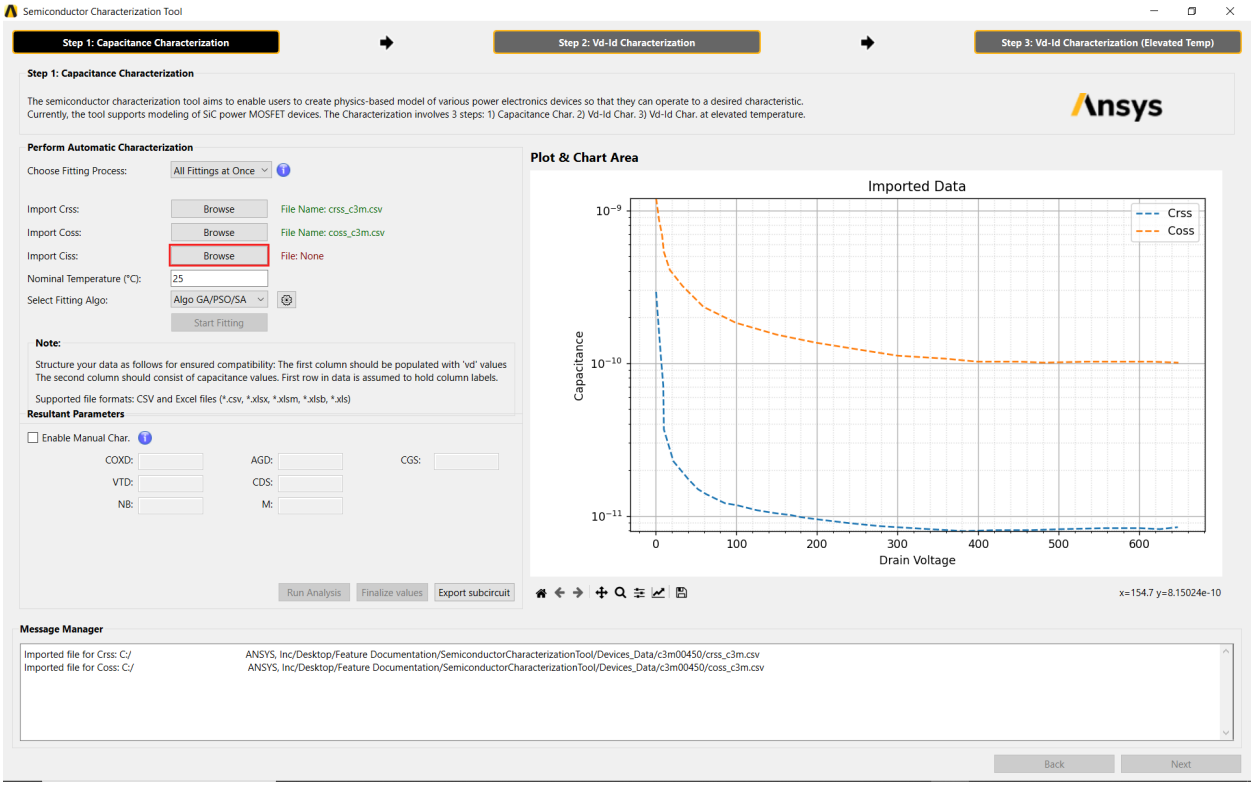
Characterization Process

Step 1: Capacitance Characterization

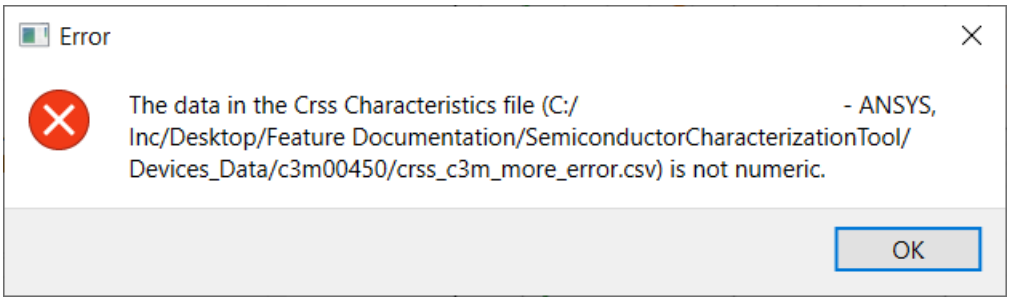
Capacitance characterization involves sequential fitting of 3 curves: Crss, Coss, Ciss.

1. Use the **Browse** button for each curve type to import the appropriate file. The data will be plotted in the **Plot & Chart Area**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

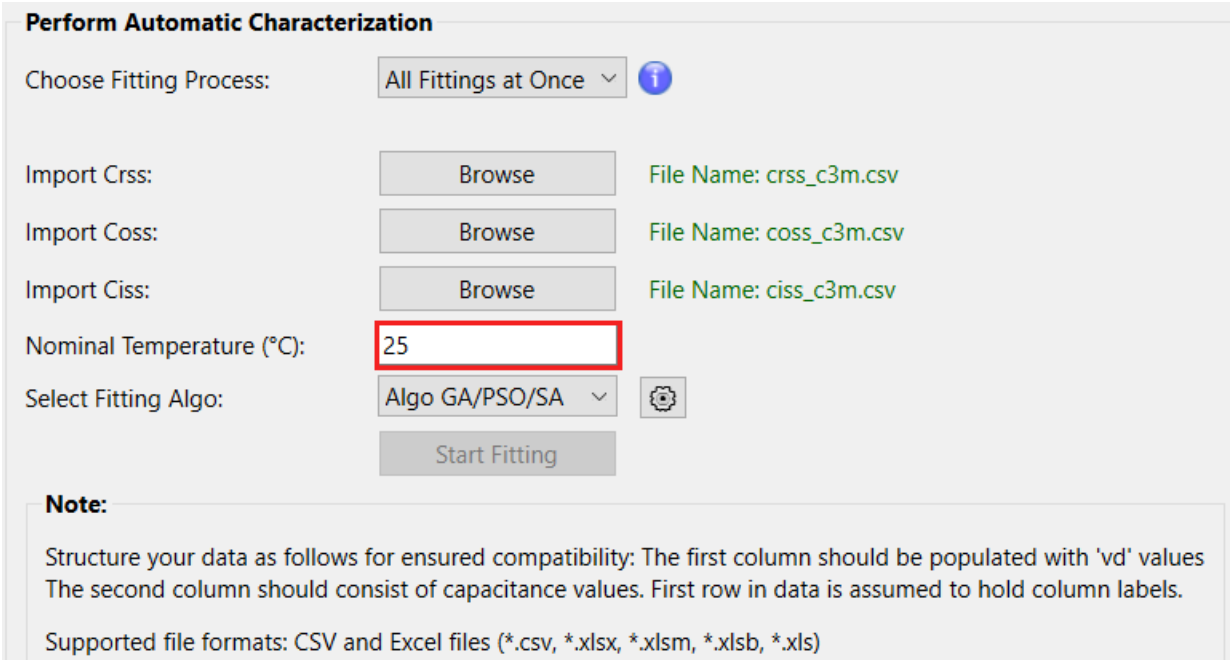


The tool will provide an error message if there is a non-numerical value in the data.

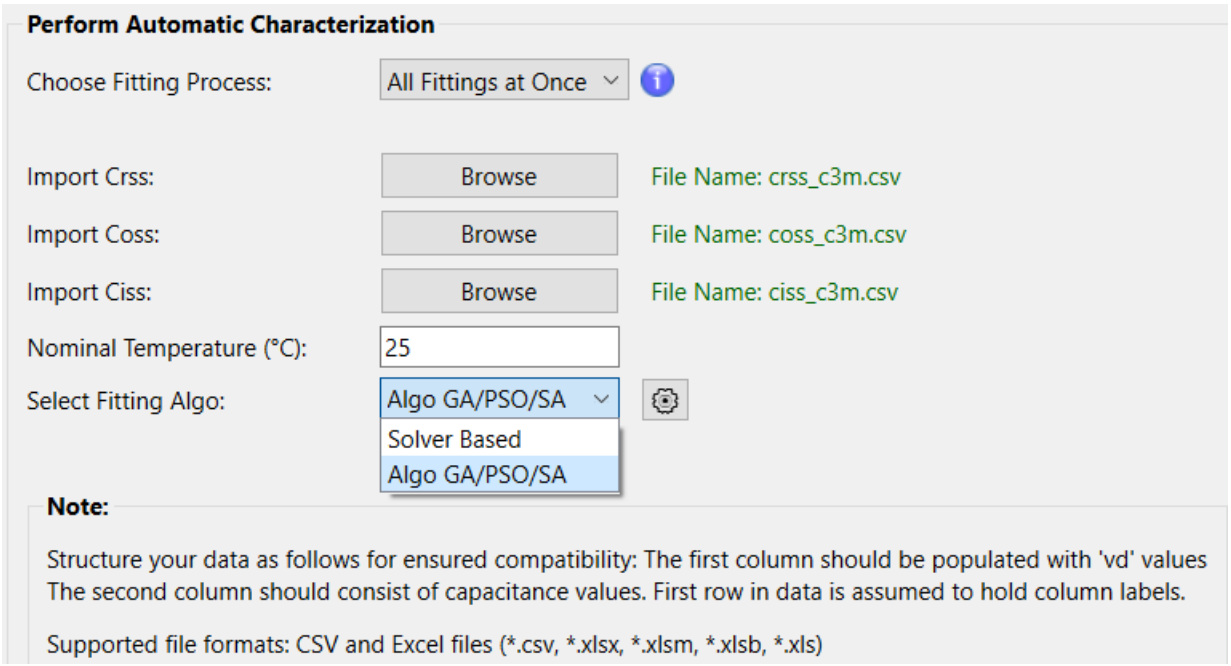


2. Enter the temperature at which the data has been obtained.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Select the fitting algorithm:

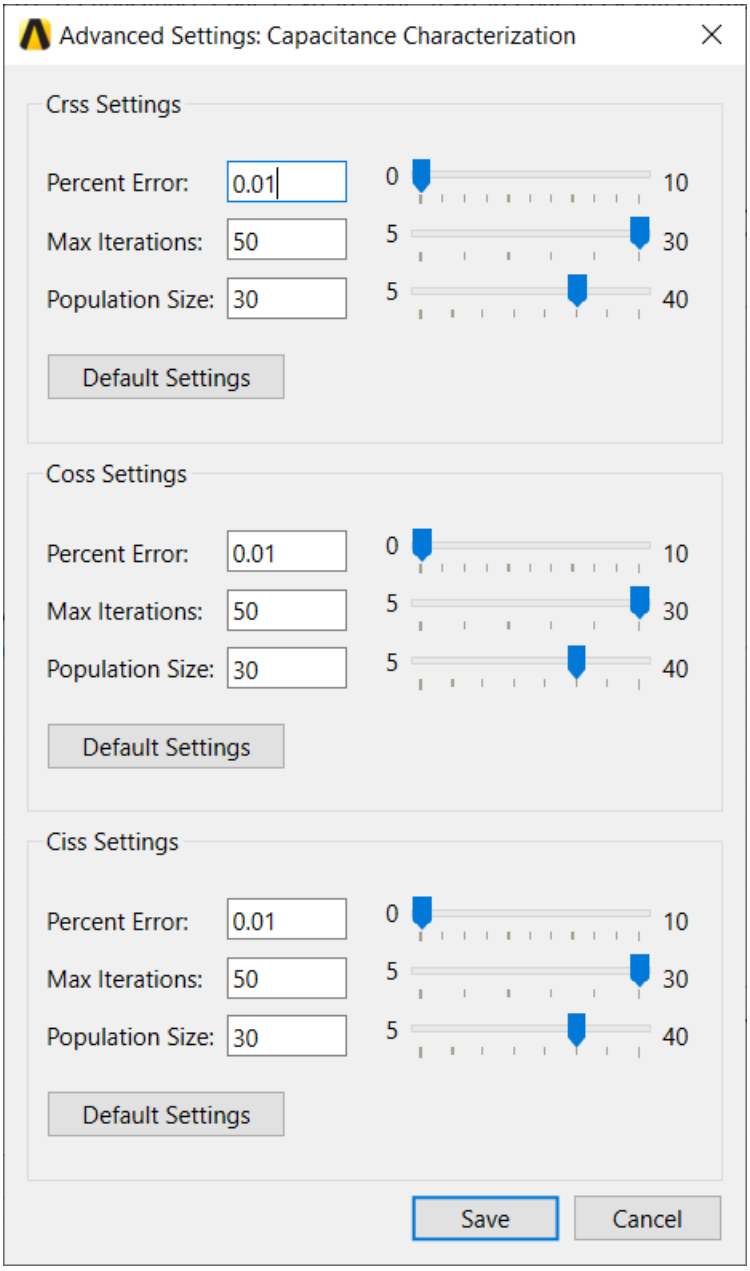


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

i. Solver Based- local optimization-based approach.

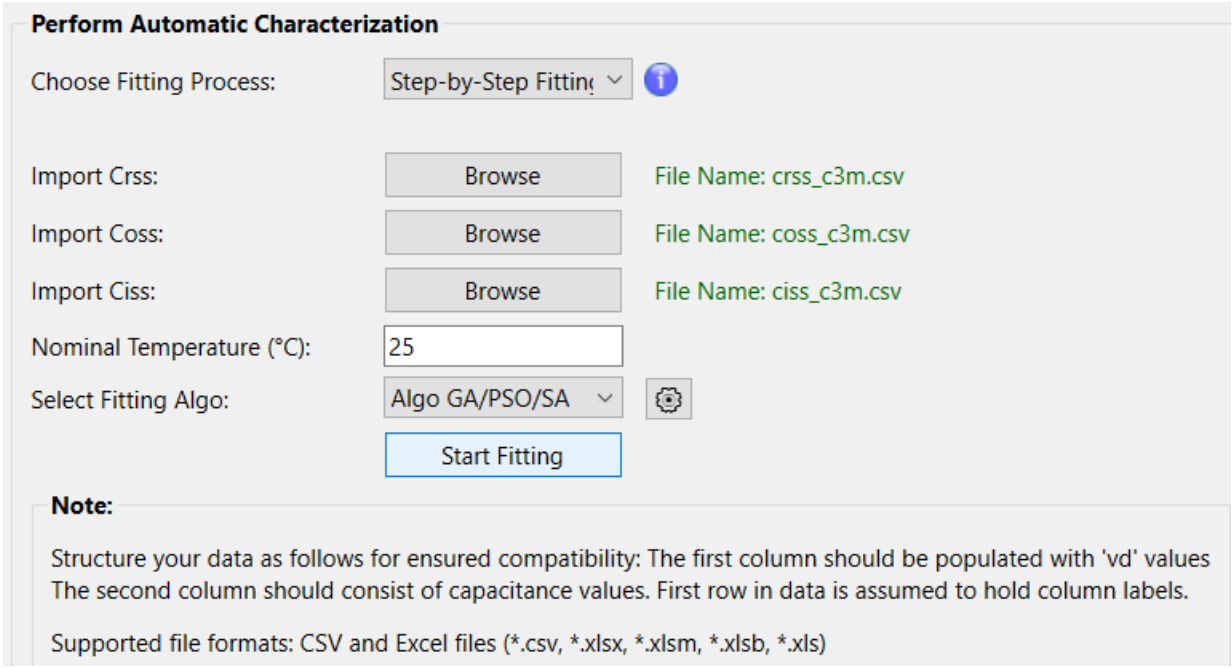
ii. Algo GA/PSO/SA

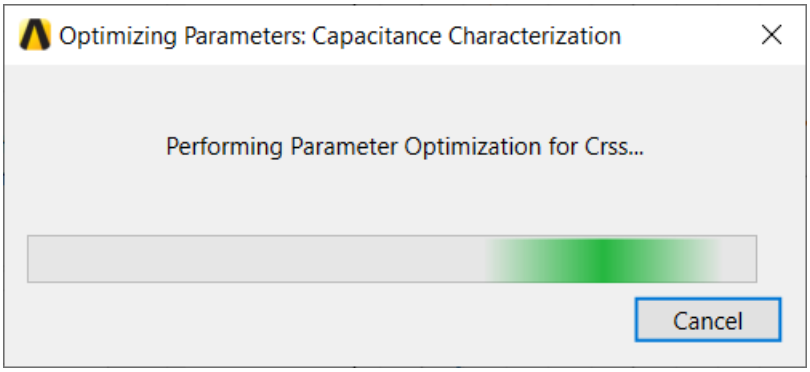
iii. Advanced Settings- User defined settings.



4. Select **Start Fitting**

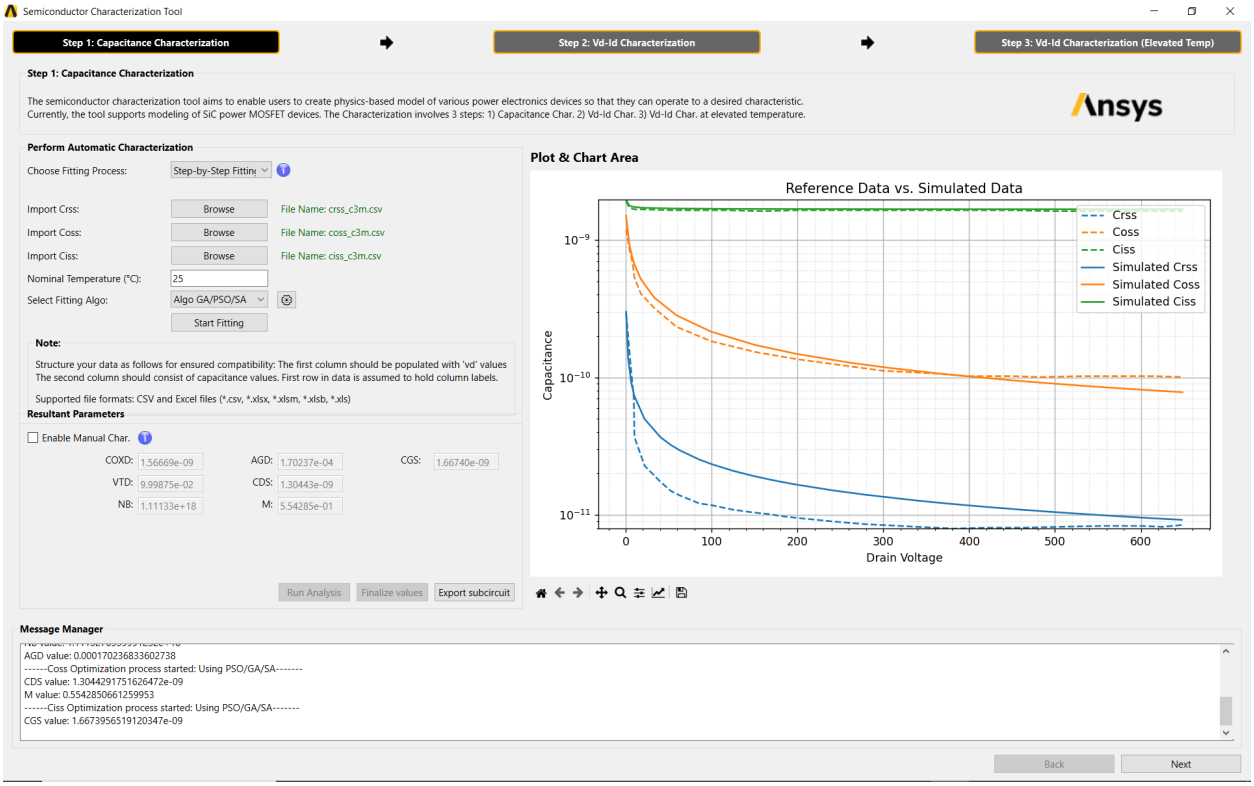
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



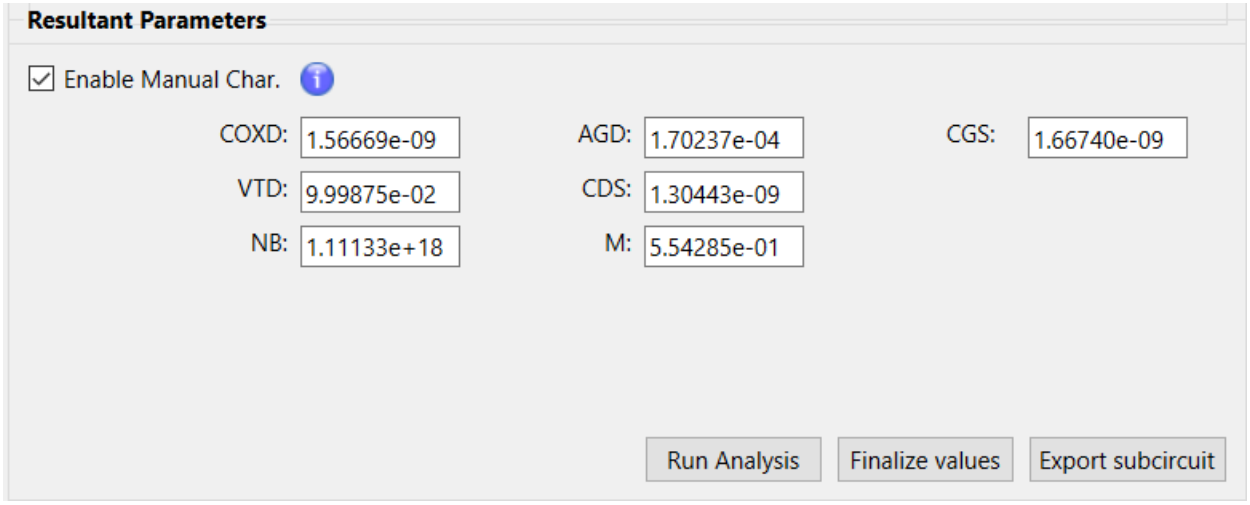


Once the fitting is complete, the **Plot & Chart Area** will update and the corresponding parameters will be populated in the **Resultant Parameters** dialog box. Note, the **Plot & Chart Area** will show the Reference Data and the Simulated Data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. (Optional) **Enable Manual Char.** button allows the user to enter values for the parameter fitting. Select **Run Analysis**. Once the results are satisfactory, select **Finalize Values**.



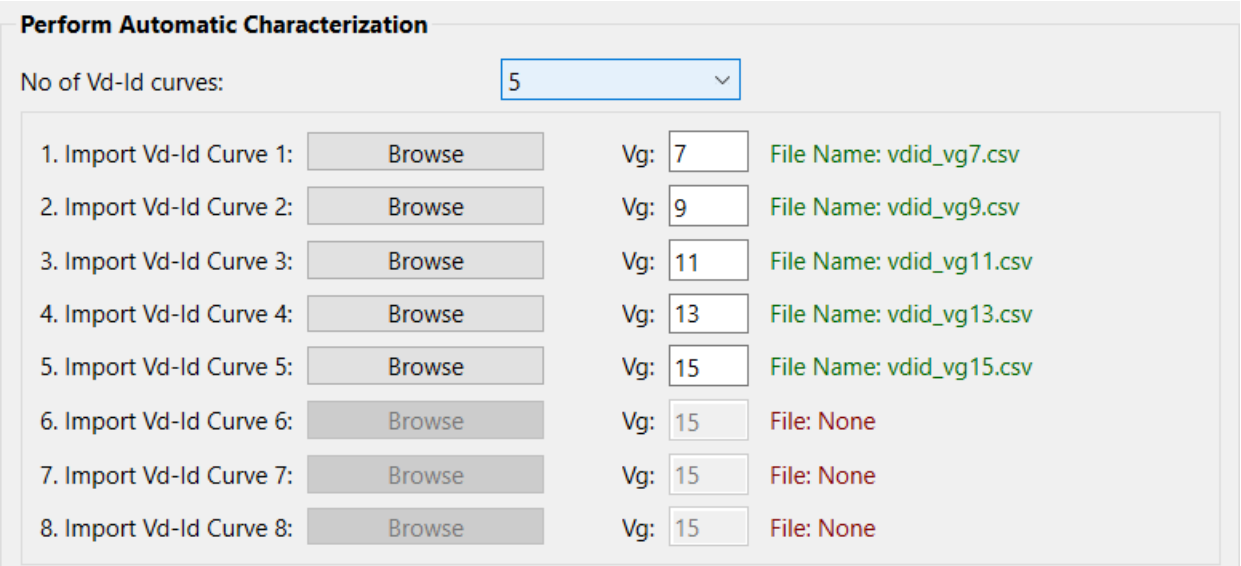
6. (Optional) The parameters may be exported using the **Export Subcircuit** button.
7. Select **Next** in the Semiconductor Characterization Tool window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note, the activation status of the **Next** button depends on the chosen **Fitting Type** as well as the presence of imported data and existing parameter values.

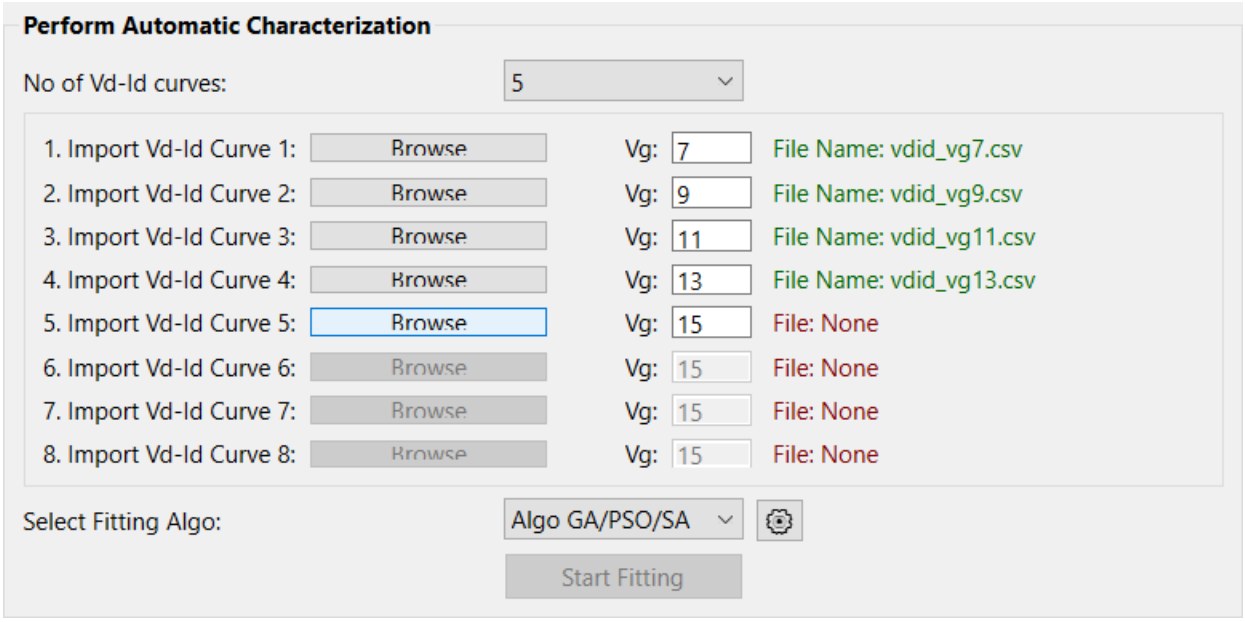
Step 2: Vd-Id Characterization

1. Select the number of **Vd-Id curves**.

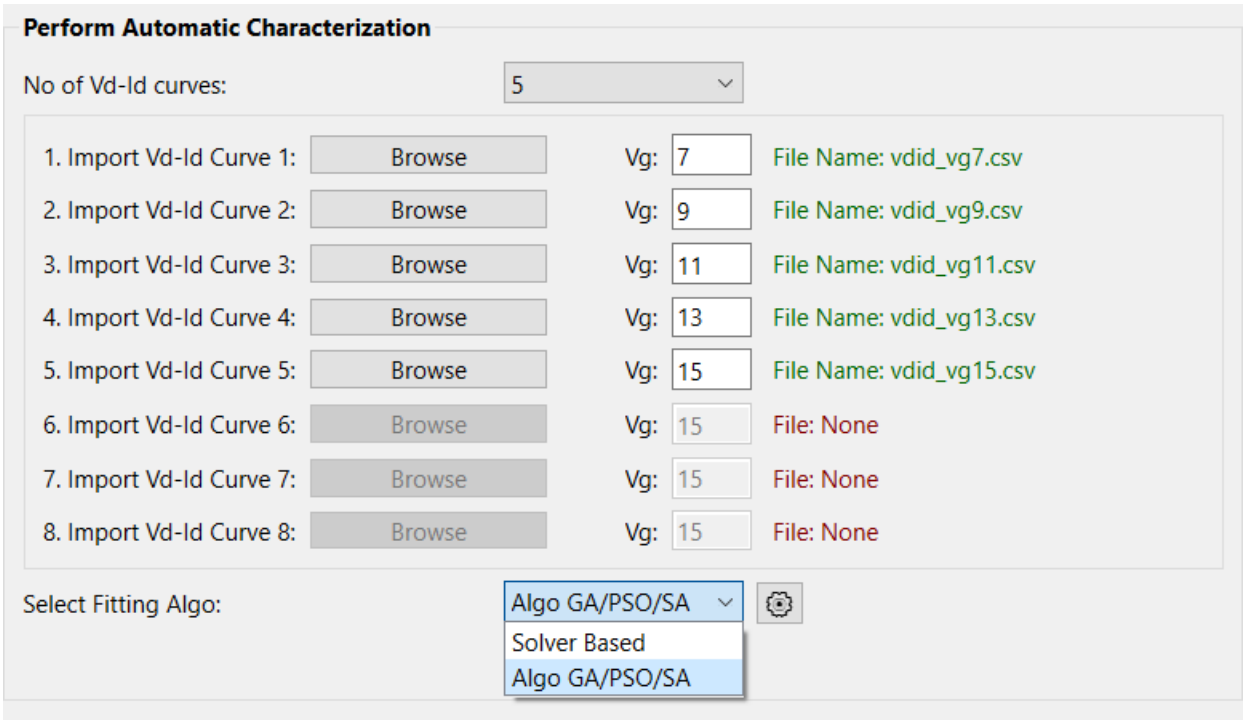


2. Use the **Browse** button for each curve to import the appropriate file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Select the fitting algorithm:

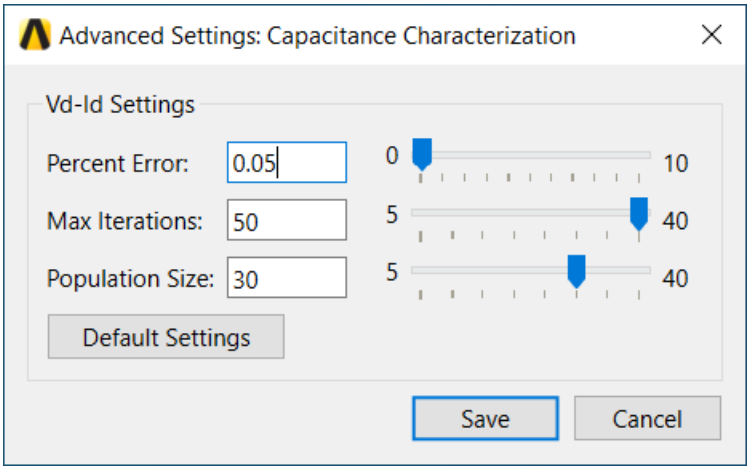


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

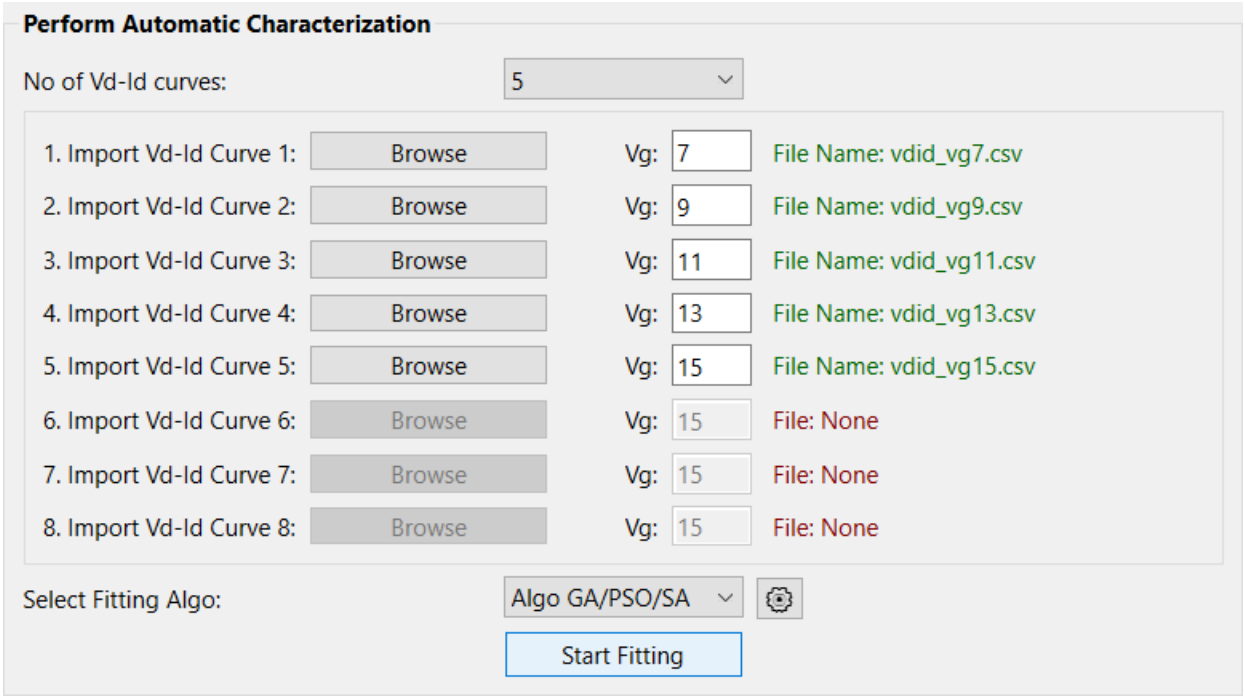
i. Solver Based- local optimization-based approach.

ii. Algo GA/PSO/SA

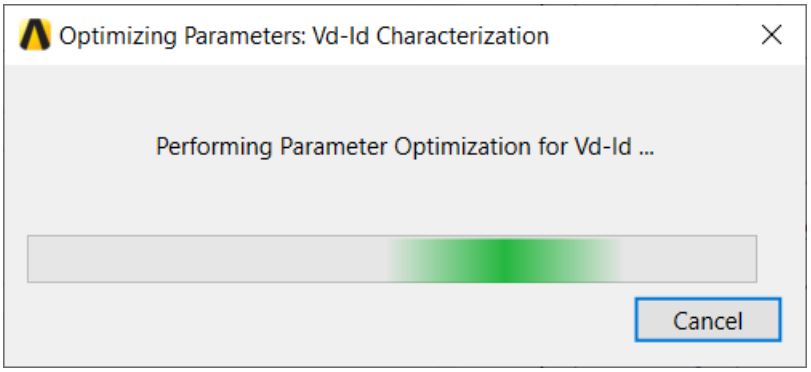
iii. Advanced Settings- User defined settings.

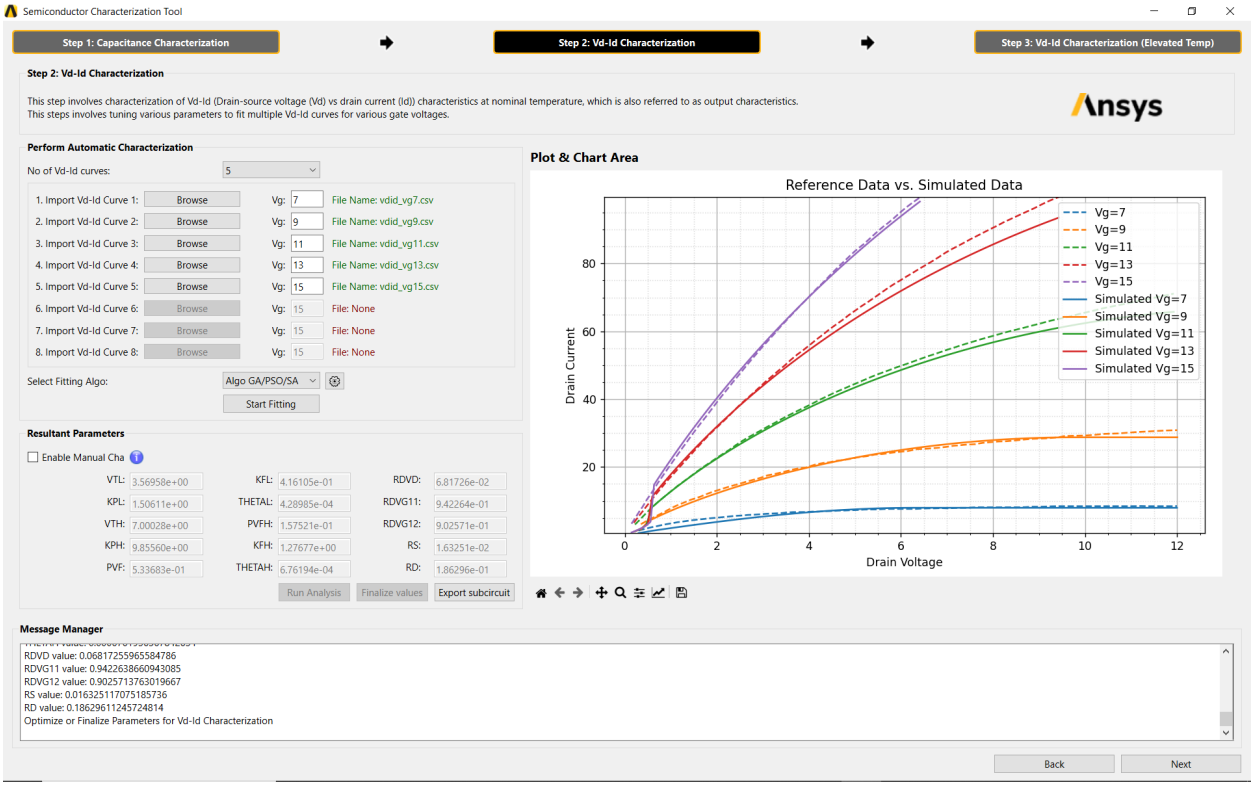


4. Select **Start Fitting**. The **Plot & Chart Area** will update and the corresponding parameters will be populated in the **Resultant Parameters** dialog box. Note, the Plot & Chart Area will show the Reference Data and the Simulated data.



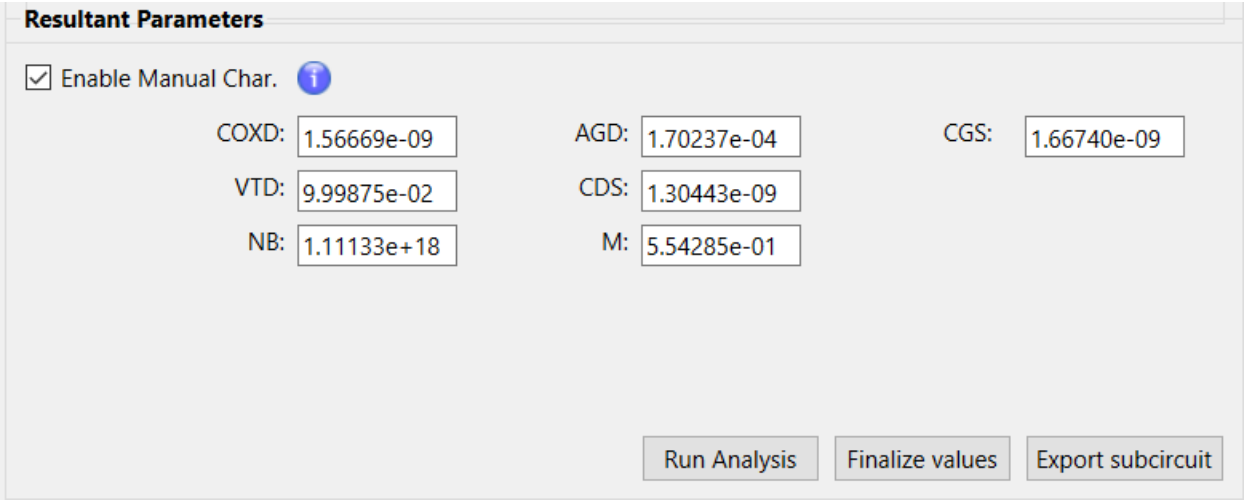
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





5. (Optional) **Enable Manual Cha** button allows the user to enter values for the parameter fitting. Select **Run Analysis**. Once the results are satisfactory, select **Finalize Values**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



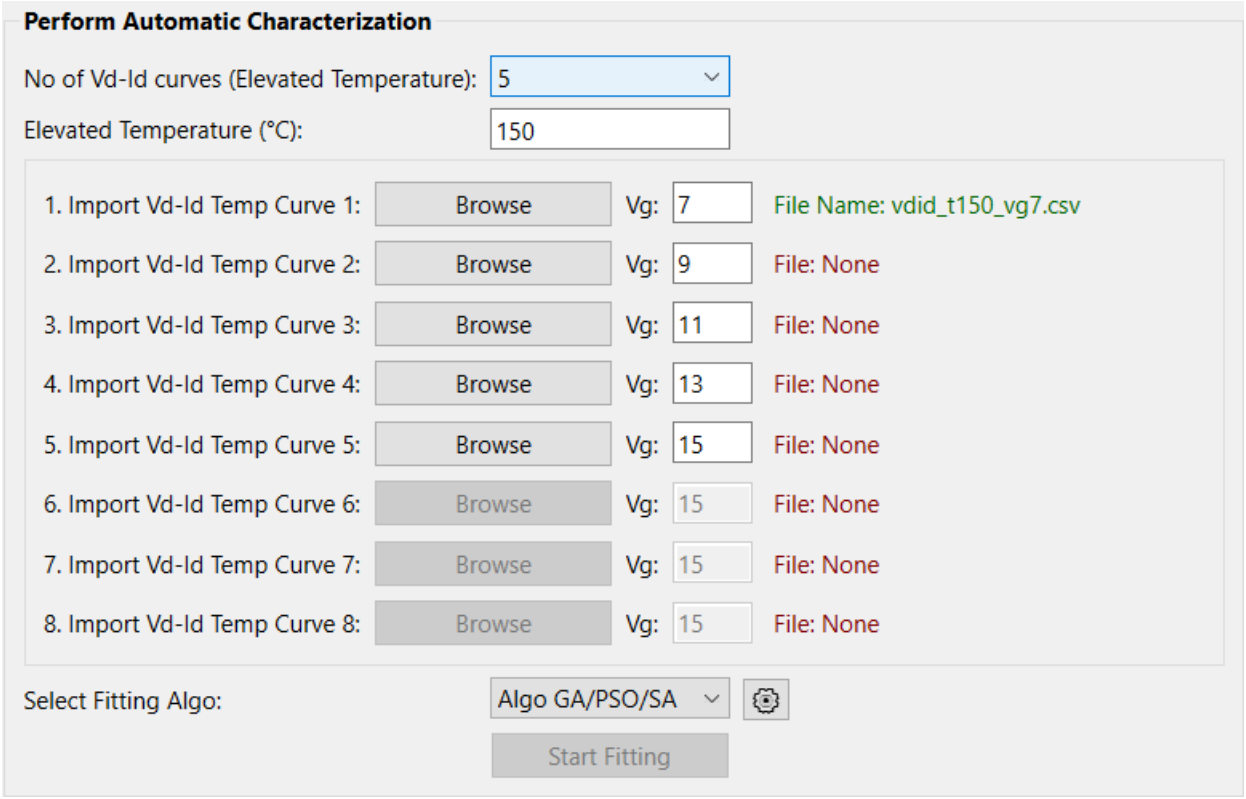
6. These parameters may be exported using the **Export Subcircuit** button.
7. Select **Next**

Step 3: Vd-Id Characterization (Elevated Temp)

The Vd-Id Characterization at Elevated Temperature is like the Step 2 process, with the additional parameter of the user-entered Elevated Temperature.

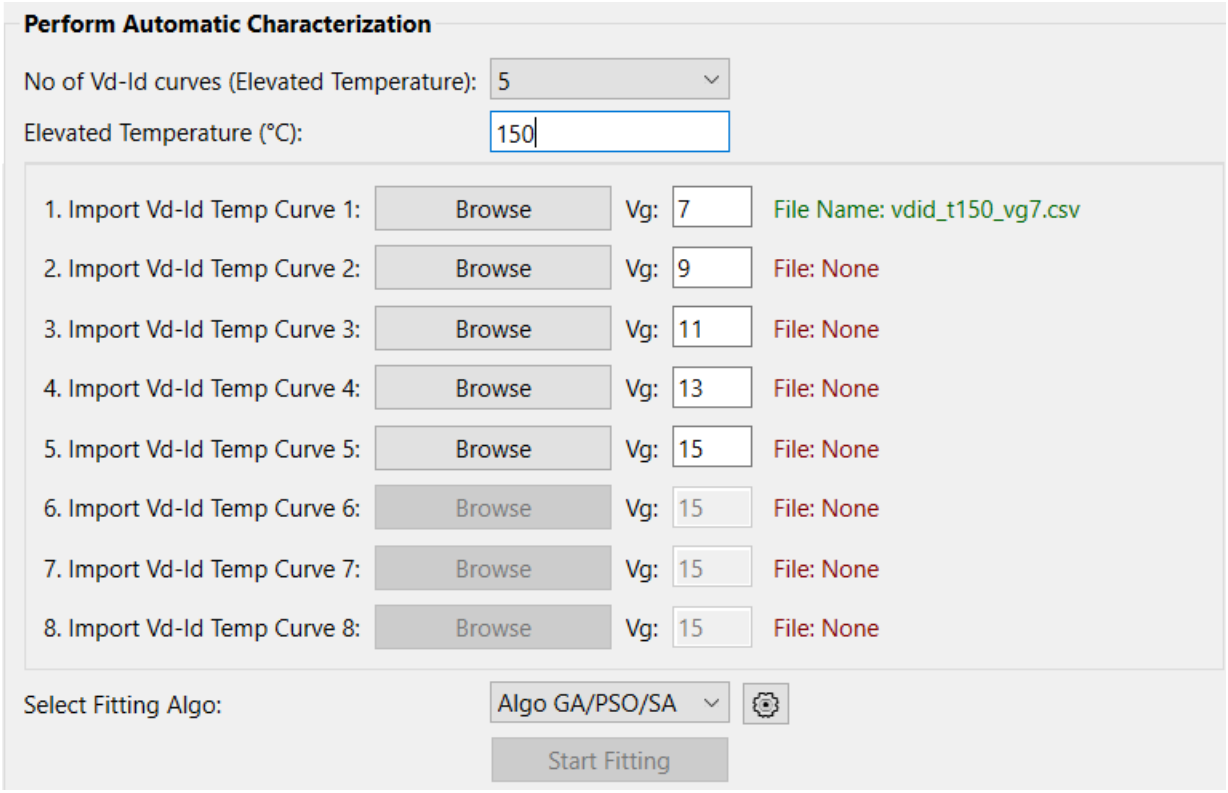
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select the number of **Vd-Id curves**.



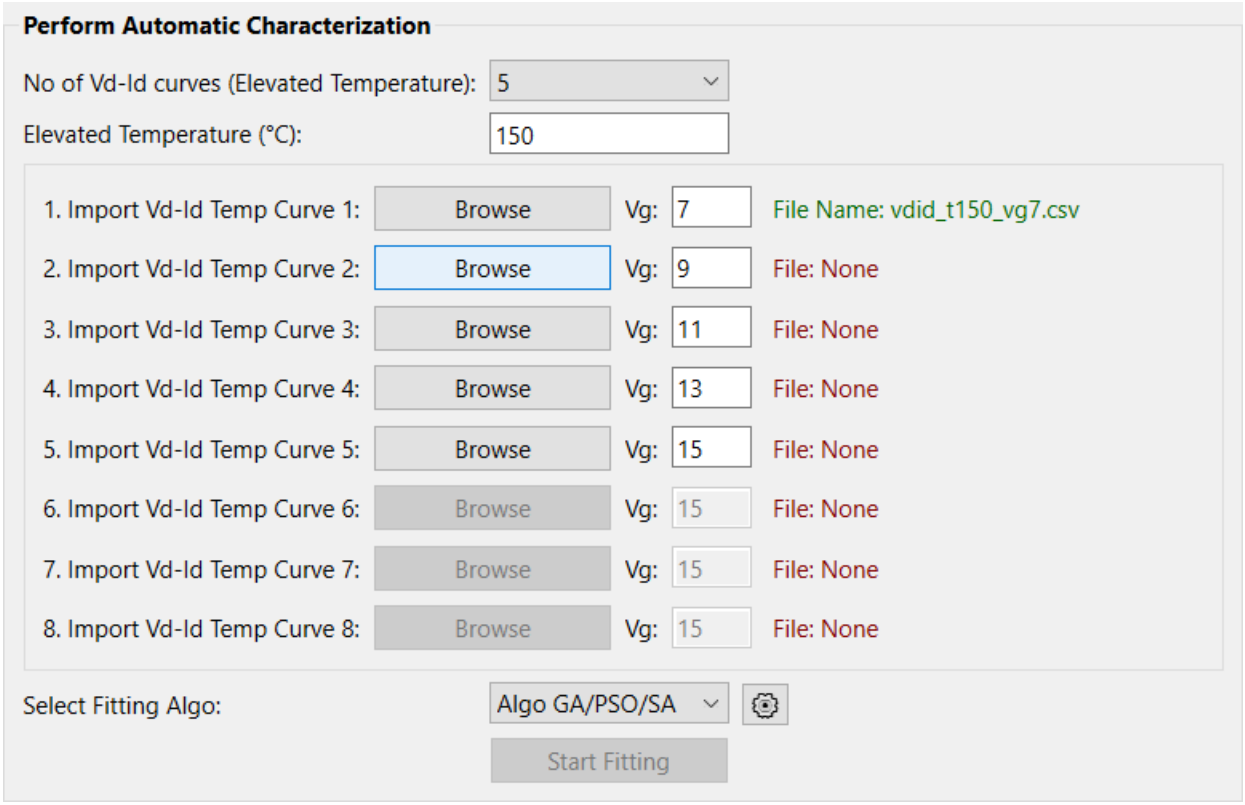
2. Enter the **Elevated Temperature** in degrees C.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



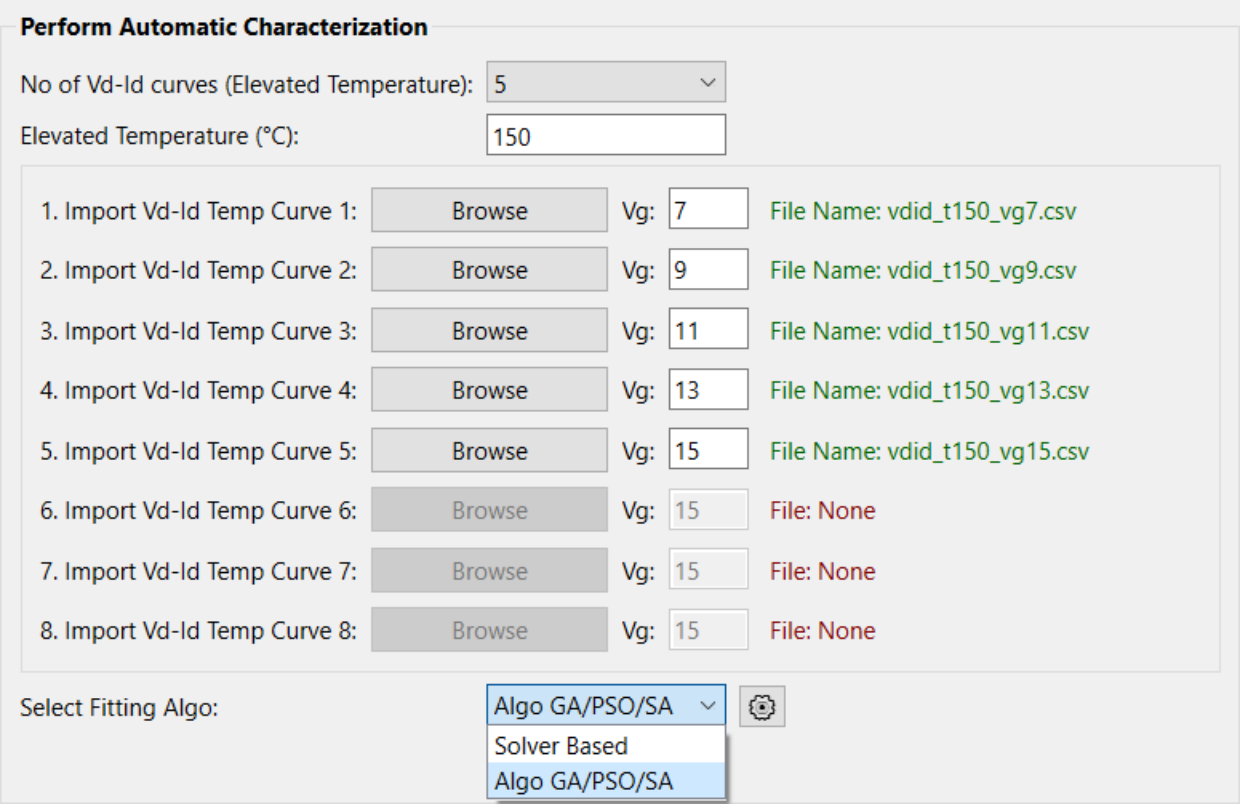
3. Use the **Browse** button for each curve to import the appropriate file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Select the fitting algorithm:

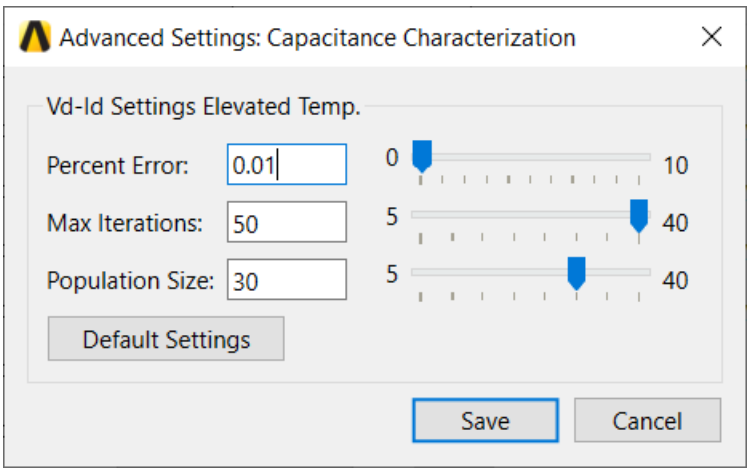
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



i. **Solver Based** - local optimization-based approach.

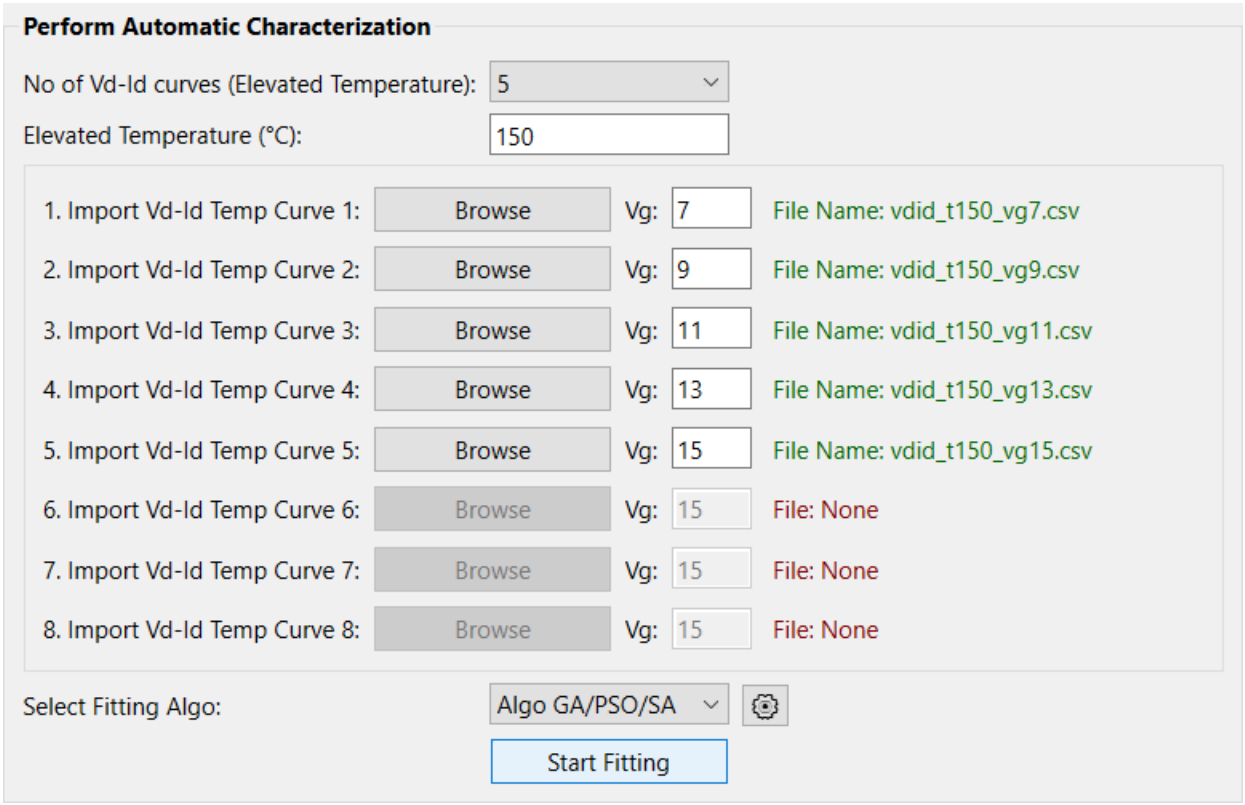
ii. **Algo GA/PSO/SA**

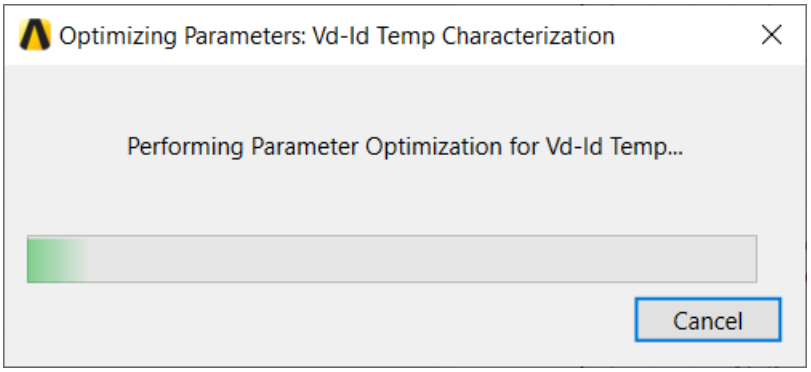
iii. **Advanced Settings icon** Launches a dialog. Default settings option.



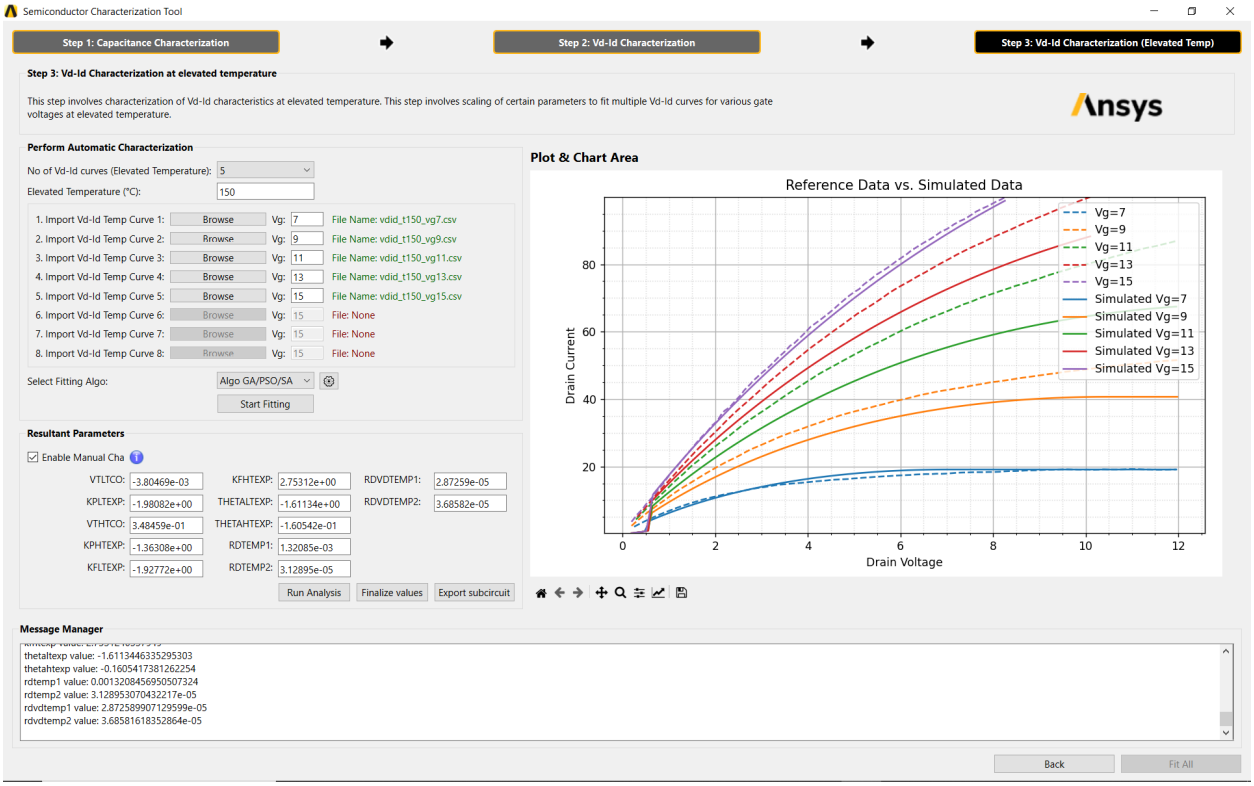
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Select **Start Fitting**. The **Plot & Chart Area** will update and the corresponding parameters will be populated in the **Resultant Parameters** dialog box. Note, the Plot & Chart Area will show the Reference Data and the Simulated data.





Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



6. (Optional) **Enable Manual Cha** button allows the user to enter values for the parameter fitting. Select **Run Analysis**. Once the results are satisfactory, select **Finalize Values**.

7. (Optional)The parameters may be exported using the **Export Subcircuit** button.

16 - SPISim

Ansys SPISim is a simulation technology that performs modeling and signal integrity analysis. It features:

- IBIS Modeling Suite, a simplified workflow for generating new IBIS and IBIS-AMI models and for inspecting existing components.
- COM and USB Channel Compliance Testing, a wizard-based approach for setting up and reviewing criteria for channel performance.
- Full channel operating margin (COM) analysis summary report that can be generated through SPISim or through Electronic Desktop. Refer to Generate a COM Analysis Report for details.
- S-parameter capabilities support Ansys's proprietary State-Space Model format (i.e., extension .sss), as well as Touchstone 1.0 and Touchstone 2.0 formats (e.g., extensions .s1p, s2p, s3p, .s*n*p, etcetera).

Launch SPISim

SPISim is available with an Ansys Electronics Enterprise license. It is launched on the **Electronics Desktop**. In the menu bar, click **Tools** > **SPISim**.

You can also launch SPISim from a command prompt. In Microsoft Windows, run the executable %ProgramFiles%\AnsysEM\<version>Win64\spisim\bin\spisim64.exe.

On Linux, run the script <installdir>Linux64/spisim/bin/SPISIM. Built-in NPort and IBIS models for on-the-fly specification model generation can be accessed though the Schematic editor.

SPISim Modules

SPISim offers several modules for different functions.

- SPISim AMI, a free tool to test drive IBIS AMI modeling.
- SPISim AMI Modeling and Testing, how to generate AMI models and test the model.
- SPISIM Full AMI Modeling Flow, six demonstrations of modeling and other key features.
- SPISim BPro, an IBIS model generation and processing module.
- SPISim BPro Advanced Features, advanced modeling features in BPro.
- SPISim IBIS Hands-On Workshop, demonstrations with SPIPro.
- SPISim MPro, a modeling tool.
- SPISim Proxy, an IBIS-AMI modeling proxy module.
- SPISim SPro, a S-parameter model.
- SPISim TPro, a transmission line analysis and stackup model.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- SPISim VPro, a waveform viewer and analysis module.
    - Effective return loss (ERL) calculations are conducted by SPISim via the VPro waveform viewer and analysis module. Refer to Calculating Effective Return Loss for details.

See the online help for videos about these modules.

Navigate Between Modules

From the SPISim application window, select **Module** from the main ribbon to view the available modules. Select the module to open it in the current application window.

SPISim and Nexxim

SPISim uses Nexxim as the default simulator for IBIS and TLine model generation. To use another simulator, open SPISim and click **Tools** > **Options**. In the **Options** window, click **SPISim** and open the **Main** tab. Enter the new simulator path in the **Spice simulator** field and click **OK**.

SPISim AMI

This utility is an IBIS-AMI compliant model driver. It can be used by model users, developers and publishers for IBIS AMI testing and development.

See the Online Help for a video on this module.

In this Section:

- Generate Spec. IBIS-AMI model.
- Sample IBIS-AMI Models.

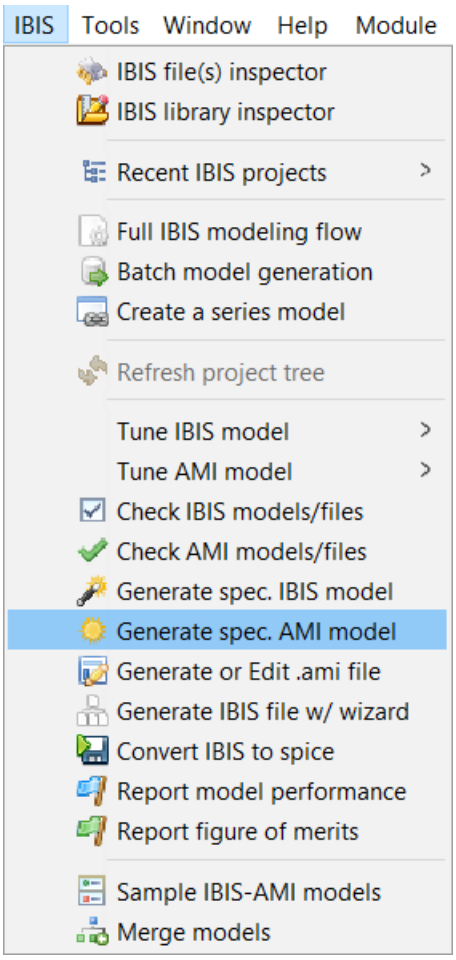
Generate Spec. IBIS-AMI model: Overview

This section contains information and usage guides for Spec. IBIS-AMI model generation.

To launch the Generate Spec IBIS-AMI window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

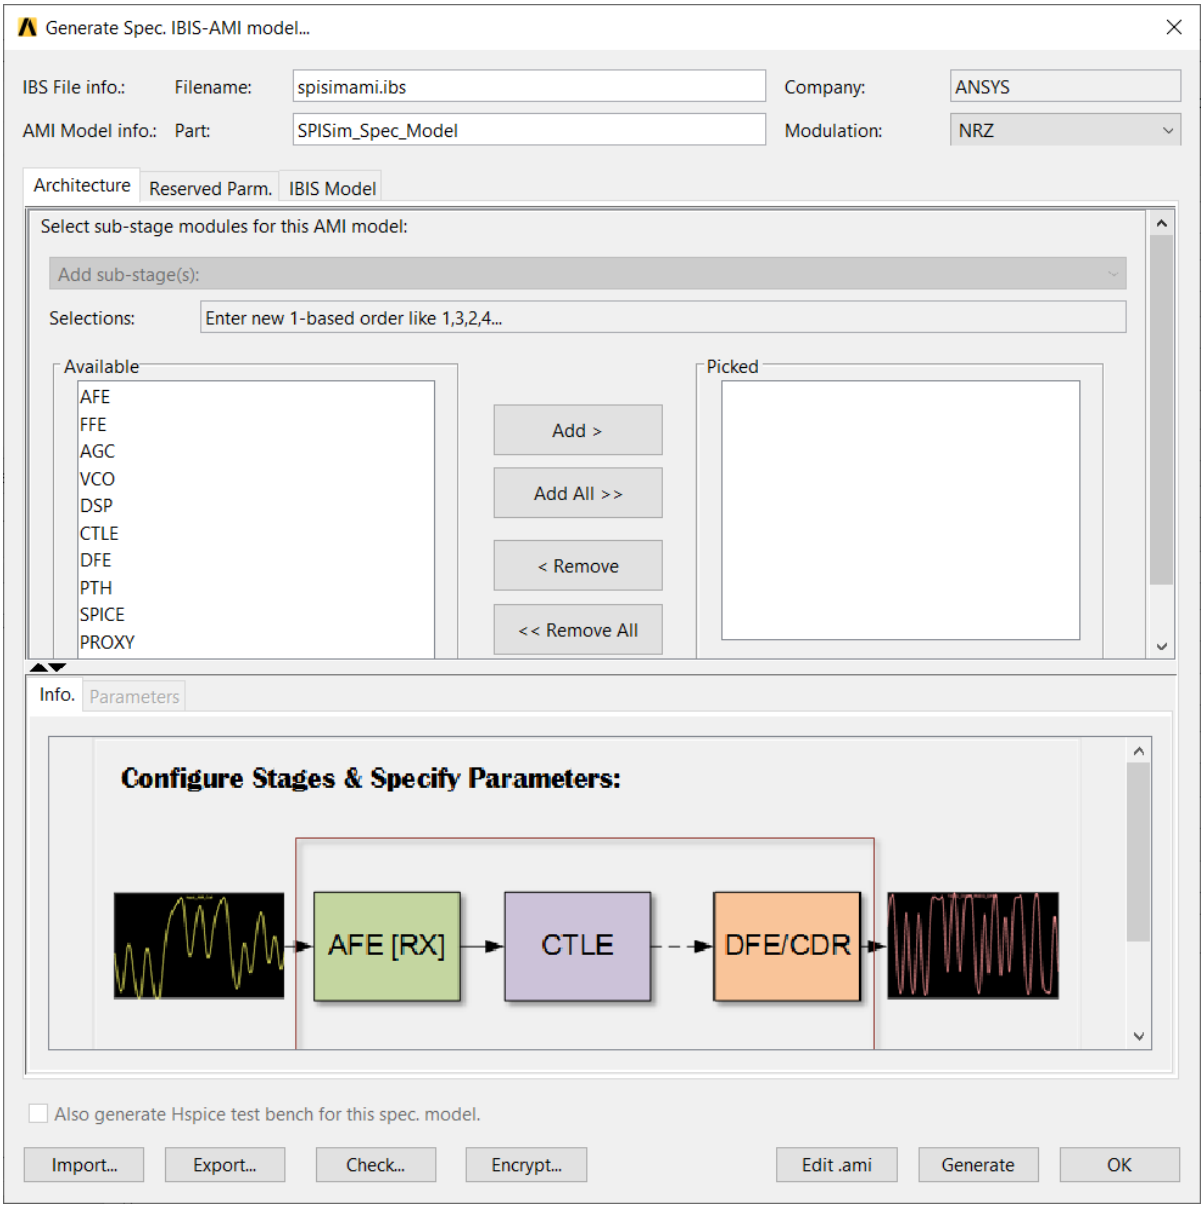
1. From the IBIS menu, select Generate Spec. AMI



The Generate Spec. IBIS-AMI window will launch. Model generation configurable parameters have been separated into three tabs:

- Architecture
- Reserved Parm.
- IBIS Model

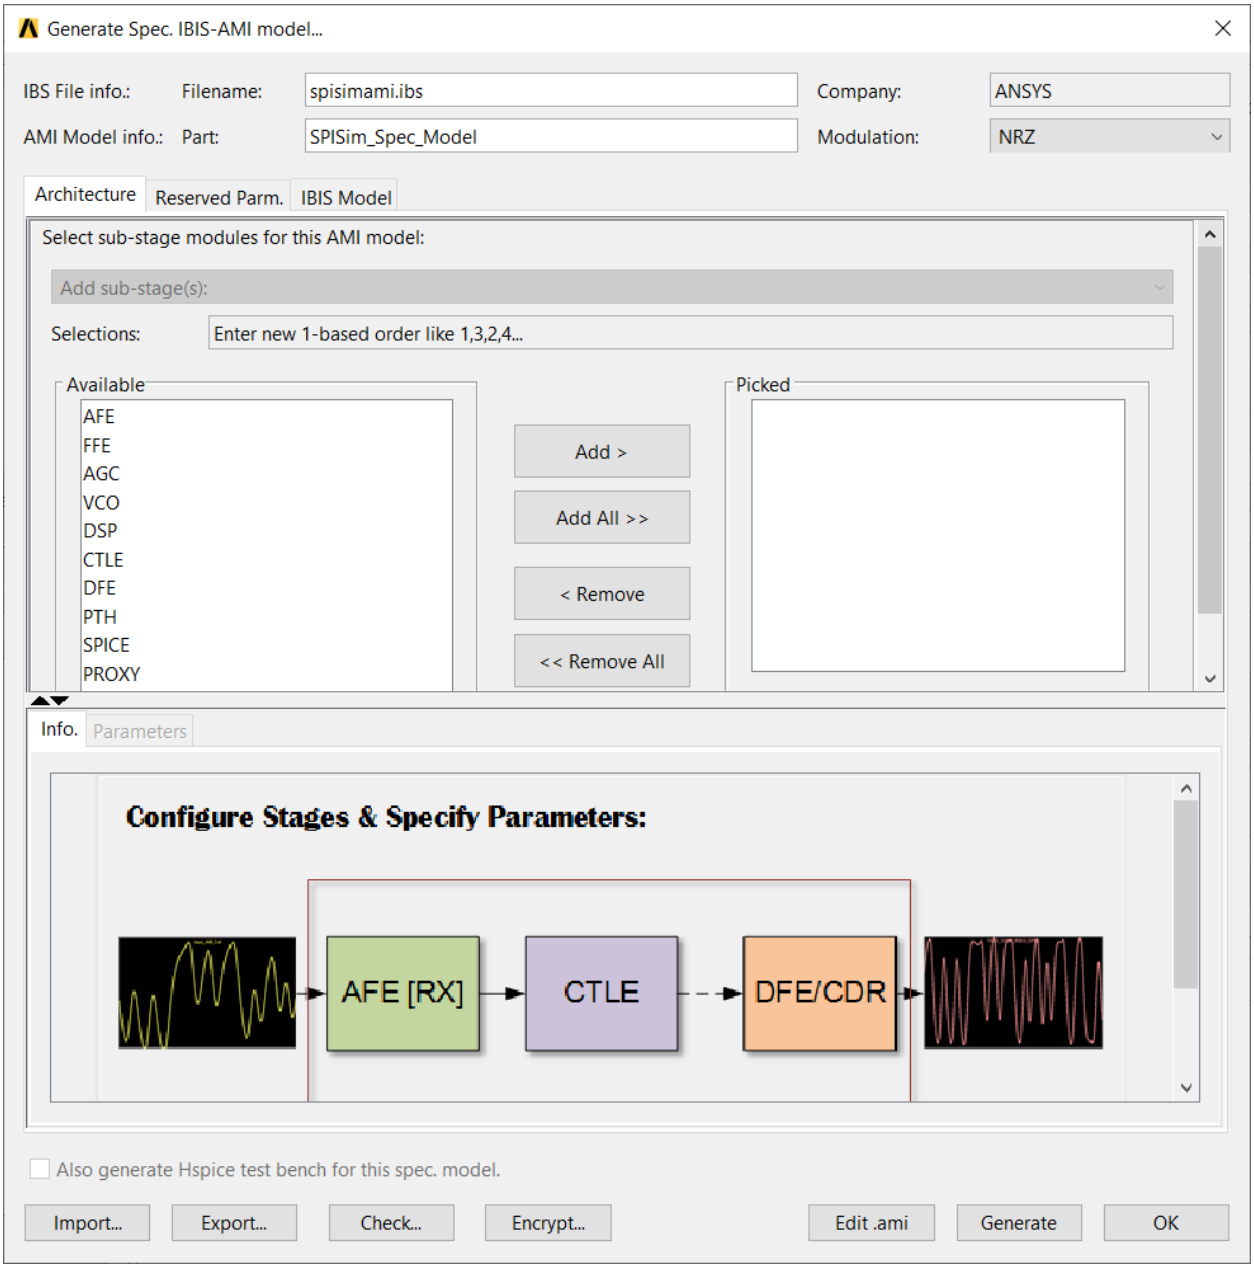
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Generate Spec. IBIS-AMI model: Architecture Tab

From the **Architecture** tab, choose model generation sub-stages by adding, reordering, and/or removing sub-stages, and customizing the parameters of each sub-stage, as before.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Model Name	Description	Notes
AFE	Analog Front End	PX: Pulse Shaping. Shape digital input to output with slew rates. RX: Apply input impedance + CComp Load to RX input. TX: [PX]+ Output Impedance + CComp load after TX output.
FFE	Feed Forward Equalizer	Finite Impulse Response based filter. Calculate tap coefficients (unit-less) based on spec. Normalized: Sum(abs(Ci)=1) , Ci includes main cursor. An Rx model that takes a forwarded clock signal of type "Times" will output (return) the same clock times it received. These settings can be enabled in the Reserved Parm tab. Models that take a forwarded clock signal of type "Wave" will not output clock times.
AGC	Automatic Gain Controller	Adjust gain such that amplitude ~= reference value. Attack rate/ Decay rate specify how fast to adjust the gain.
VCO	Voltage Control Oscillator	$V_{out} = F(2\pi f_0 t + 2\pi\alpha \int_0^t V_{inp}(\tau)d\tau + \theta)$ F: Waveform function (sin, square, etc) f_0: Fundamental frequency θ: Initial Phase α: Scaling constant
DSP	Digital Signal Processing	Various digital filters based on DSP algorithms LP: Low Pass, HP: High Pass, BP: Band Pass, BG: Band Gap LS: Low Shelf, HS: High Shelf, BS: Band Shelf
CTLE	Continuous Time Linear Equalizer	Parameter controlled or frequency response csv file. Real/Imag, Mag/Deg, or DB/Deg for column headers. Model will sample uniformly for given csv data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Model Name	Description	Notes
		An Rx model that takes a forwarded clock signal of type "Times" will output (return) the same clock times it received. These settings can be enabled in the Reserved Parm tab. Models that take a forwarded clock signal of type "Wave" will not output clock times.
DFE	Decision Feedback Equalizer Clock Data Recovery	Post-cursor with adaptation will be applied to current input Bang-bang phase detector is used for clock sampling. Slicer will take modulation scheme into account.
PTH	Pass Through	Scale inputs to outputs with optional gain and DC-offset. User can specify a fixed offset and gain, y' = (y-offset)*gain. Or auto calculate scale and offset to clamp output ranges (bit-by-bit). This is useful to convert single-ended signals to differential ones. Inverse clamp can restore back to single-ended signals. An Rx model that takes a forwarded clock signal of type "Times" will output (return) the same clock times it received. These settings can be enabled in the Reserved Parm tab. Models that take a forwarded clock signal of type "Wave" will not output clock times.
SPICE	SSolver/NGSpice	User's SSolver/NGSpice compatible .subckt definitions. Terminals are two inputs followed by two outputs. Assuming High-Z. Support parameters override. Simulator built-in, in this model.
PROXY	Script based proxy model	User's Matlab, Python, C models as a .dll/.so, or executable without AMI compilation. License to make direct C-Python call for optimum performance.

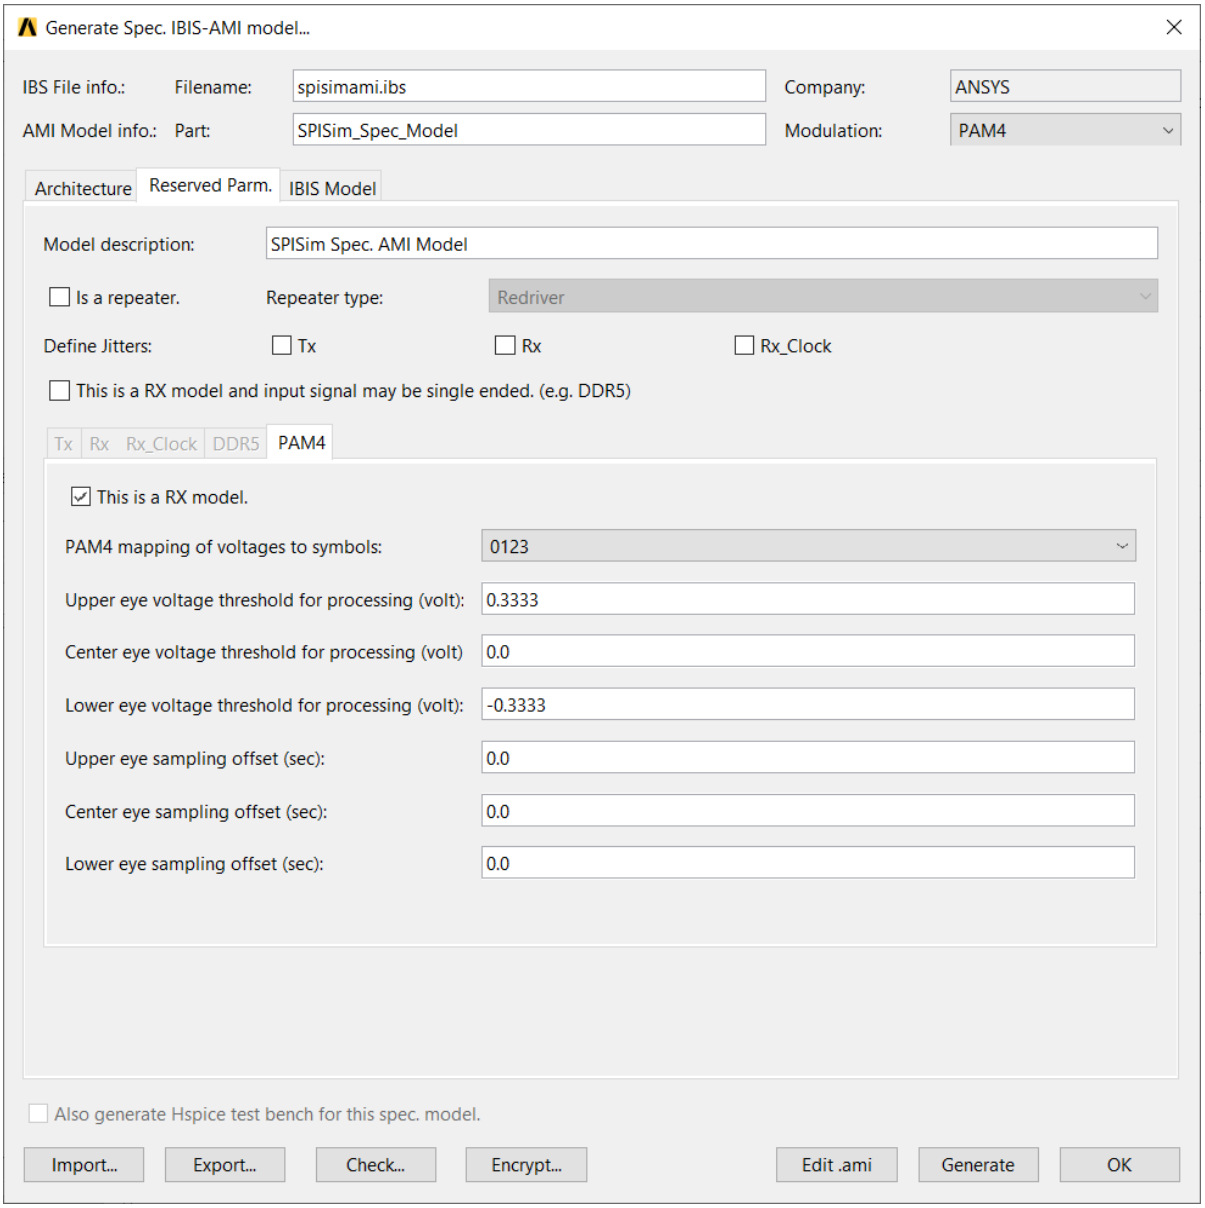
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Model Name	Description	Notes
		Note, currently, proxy AMI model does not work with other modules.

Generate Spec. IBIS-AMI model: Reserved Parm. Tab

From the *Reserved Parm.* tab, customize the available parameters (e.g., depending on user-selection, **Modulation**, **Repeater type**, and *TX*, *Rx*, *Rx_Clock*, *DDR5*, and *PAM4* model tabs).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



PAM4 Modulation and Analyses

Run a PAM4 model analysis for SerDes (Serializer/Deserializer) running 56Gbps or faster, by choosing **PAM4** on the **Modulation** drop-down menu. Select the *PAM4* tab to configure parameters. By default, only the **PAM4 mapping of voltages to symbols** field is editable. To customize RX-model parameters, check the box next to **This is a RX model and input signal may be single ended. (e.g., DDR5).**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** Most AMI models (e.g., FFE, CTLE and PTH) are modulation agnostic. Selecting **NRZ** or **PAM4** on the **Modulation** drop-down menu will **not** change model behavior. DFE and CDR models are modulation dependent (e.g., if the AMI model is DFE and **PAM4** is the selected **Modulation**, the model's settings will automatically change to **MOD_TYPE_PAM4**.)

DDR5 Analyses

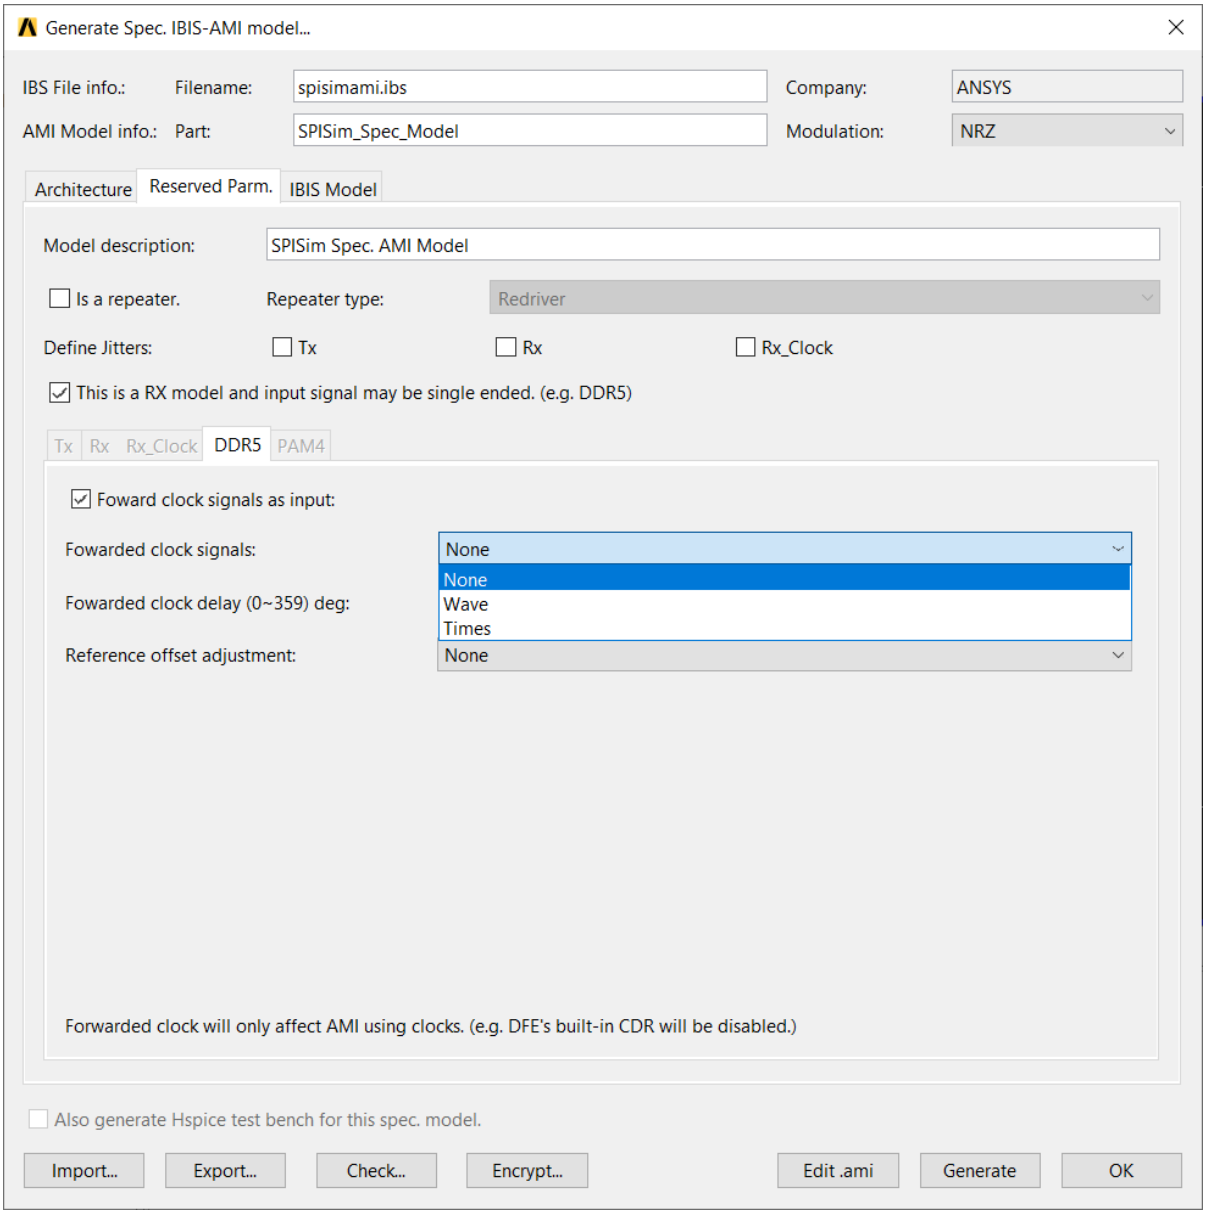
Run a **DDR5** model analysis for SerDes (Serializer/Deserializer) type single-ended signals (e.g., DDR5's DQ signals). The IBIS v6.1 parser is used by default. To enable , set **Modulation** to **NRZ** and check the box next to **This is a RX model and input signal may be single ended. (e.g., DDR5).** Then click the **DDR5** tab.

> **Note:** The **DDR5** tab is selectable if **Modulation** is set to **PAM4**, but will result in an error. At this time, **DDR5** modeling can only be used in conjunction with **NRZ Modulation**.

Rx Clock Forwarding

To generate a Rx model with clock forwarding:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. Enable **Forward clock signals as input**.
2. Select **Forwarded clock signals** as either **None**, **Wave** or **Times**.
3. If needed, specify **Forwarded clock delays** with an integer value between 0 - 359.

The settings will enable the following corresponding changes in the generated .ami file:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- IBIS version will automatically be marked as “7.1”
- `Rx_Use_Clock_Input` keyword with specified value will appear under **Reserved parameters** session.
- `MDL_FCLK_OFS` keyword for specified offset value will appear under **Model_Specific** section.

Setting Descriptions:

`Rx_Use_Clock_Input`:

- `None` model will be used as if there is no clock forwarding.
- `Wave` model will use forwarded waveform for reference clock.
- `Time` model will synthesize clock signal based on forwarded time ticks.

`MDL_FCLK_OFS`: model will shift the forwarded waveform or time-tick by the specified degree before using it as a sample signal. The full phase is equal to 360 degrees.

Load and Test Drive an Rx Model with Clock Forwarding

To use the Command Line Interface Tool **SPISimAMI.exe** model driver, which comes as part of AEDT/SPISim, define the following parameters:

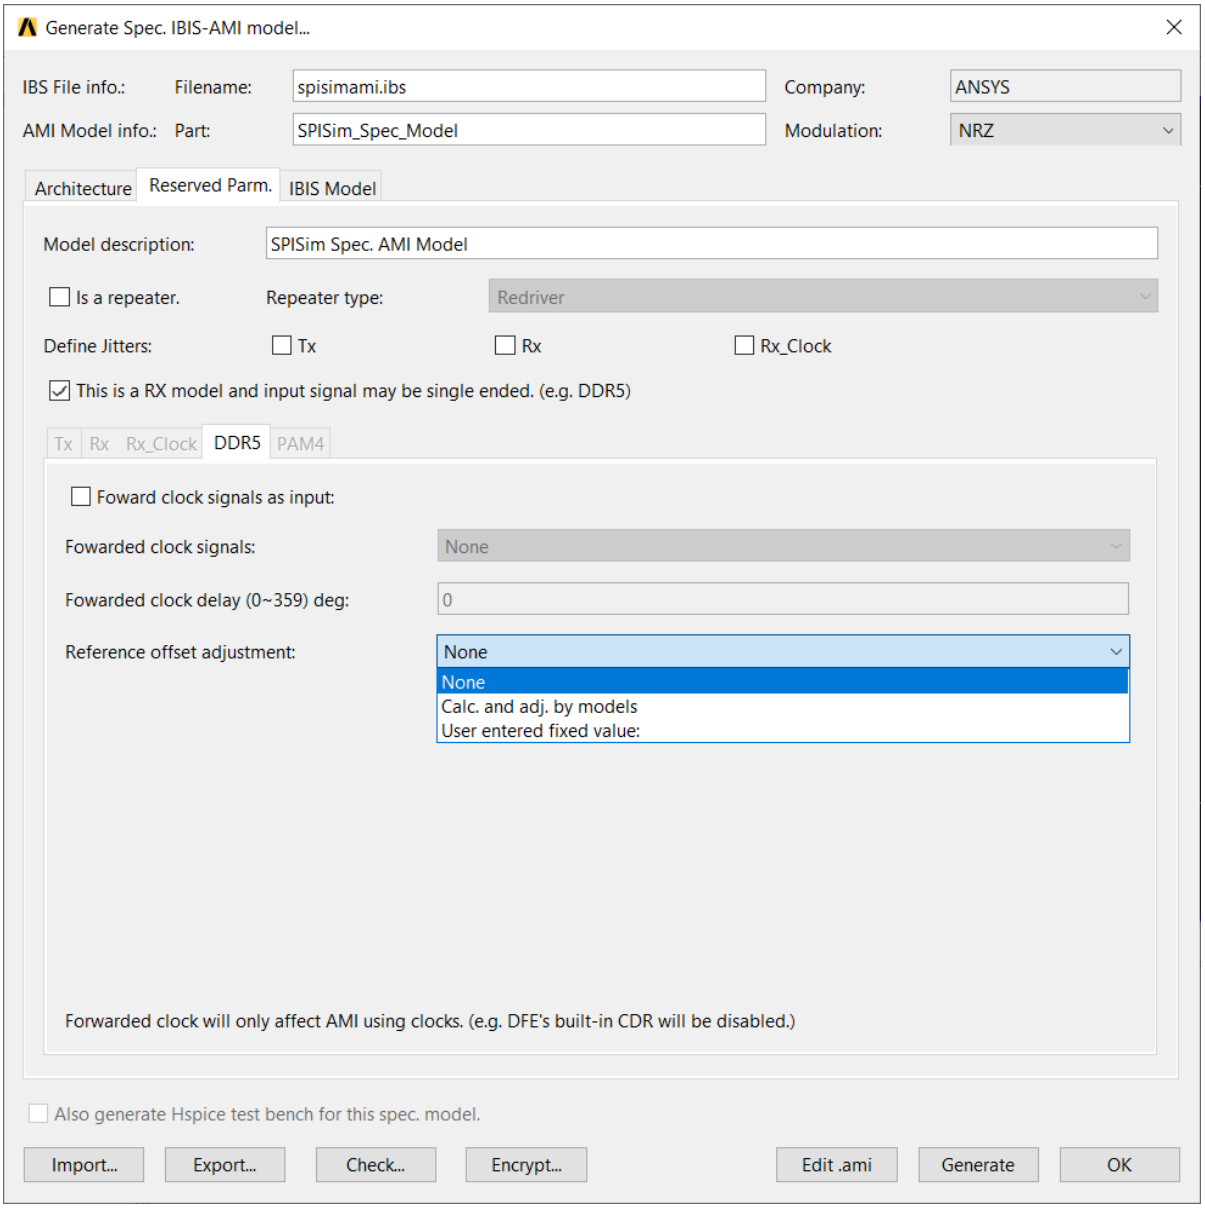
`CLK_INPT`: pre-defined string signifying start of clock data.

`clk_file`: Clock data as an input to AMI_Getwave's clock_time.

Existing tests using SPISimAMI.exe will not be affected by newly added `CLK_INPT clk_file` optional parameters. When the user provides a clock file for input to drive the given models, it will be sent into the model to mimic simulator’s corresponding forwarding features.

DC_Offset Keyword (NRZ Modulation Only)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



From the **DDR5** tab, select one of the following options on the **Reference offset adjustment** (i.e., **DC_OFFSET**) drop-down menu.

- **None**: for IBIS v7.1-compliant channel simulators (e.g., Nexxim). The simulator will adjust single-ended signals to differential before updating the model(s) (e.g., model(s) do not need to perform any processing, as all signals received will be differential).
- **Calc. and adj. by models**: for simulators that do not adjust the single-ended signals automatically. **Calc. and adj. by models** instructs the model(s) to calculate offset, then

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

apply the offset to the signal before processing begins. After processing and before data is returned to the simulator, the offset is subtracted on the output, so the returned data will be single-ended.

- **User entered fixed value**: enter values directly into the field to instruct models to perform an offset adjustment before and after processing.

> **Note:** Values can be entered manually in two ways:
>
> 1. Enter a value directly in the **Reference offset adjustment** field, clearing out any other text or selected choice present, if necessary (e.g., **0.55**).
>
> >
>
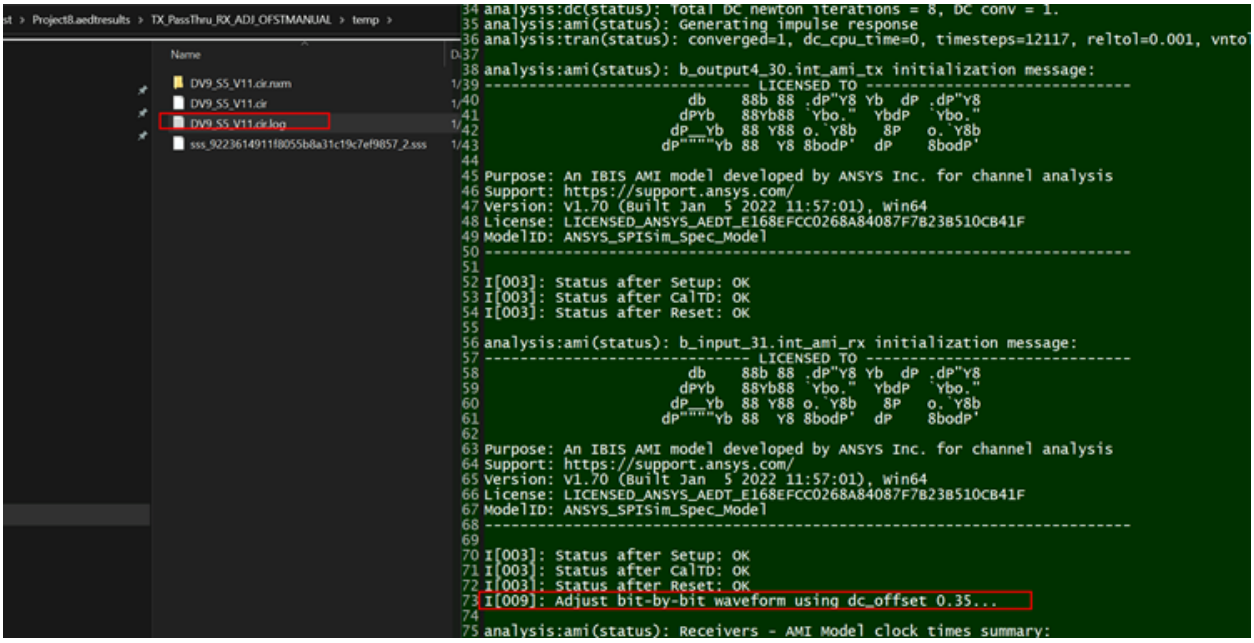
> 2. Select **User entered fixed value** on the **Reference offset adjustment** drop-down menu and enter the offset value directly after the existing text in the field (e.g., **User entered fixed value: 0.55**).
>
>
>

DC_OFFSET Adjustment at Command Line

While all three **Reference offset adjustment** options automatically adjust the appropriate value before and after signal processing, users have additional options at the command line.

After the simulation is complete, open the log file and ensure the `DC_OFFSET` value was applied.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Change the following variables, as appropriate:

- `SPISIMAMI_NOADJ_DCOFSTINP=T`: cancel the `DC_OFFSET` adjustment before processing begins.
- `SPISIMAMI_NOADJ_DCOFSTOUT=T`: cancel the `DC_OFFSET` adjustment after processing ends.

If the `DC_OFFSET` value reported in the log file is *d*V, and the model output without either variable set is V1 ~ V2, the same variables react as follows:

- `SPISIMAMI_NOADJ_DCOFSTINP=T`: output will be V1+*d*V ~ V2+*d*V (extra *d*V applied after processing)
- `SPISIMAMI_NOADJ_DCOFSTOUT=T`: output will be V1-*d*V ~ V2-*d*V (extra *d*V applied before processing, but not restored after processing)

Set both variables **=T** and it will appear as if no `DC_OFFSET` adjustment has been applied, even if the log reports adjusted values.

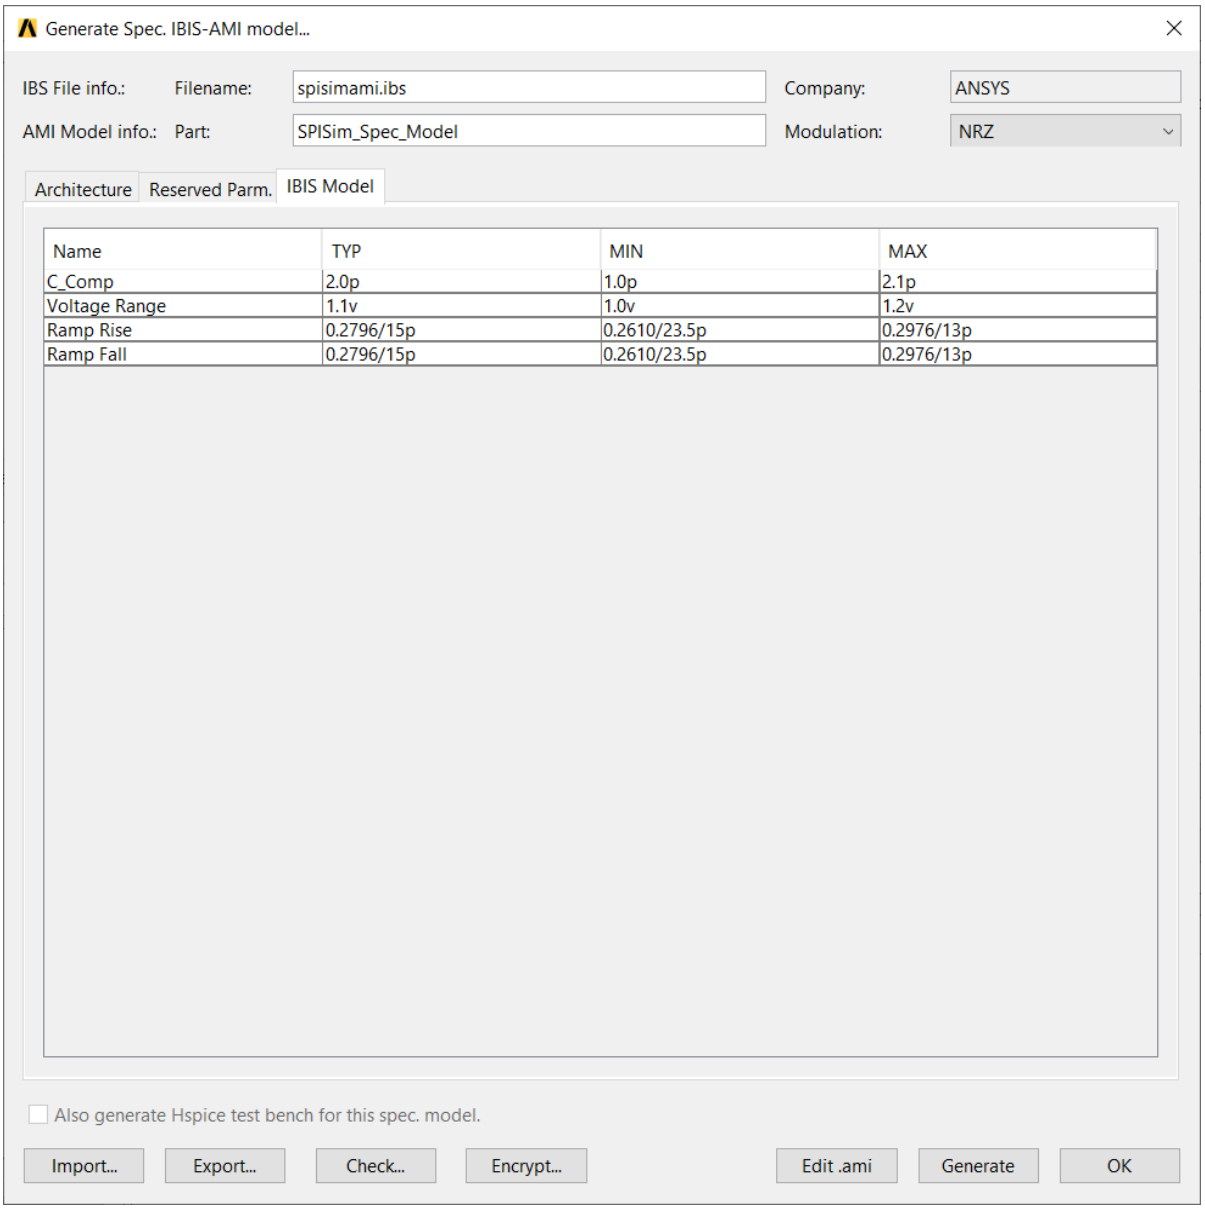
> **Note:** If environmental variables are changed, the user needs to relaunch **Electronic Desktop** to see the new values applied.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Generate Spec. IBIS-AMI model: IBIS Model Tab

The IBIS Model tab allows configuration of major analog properties such as C_Comp, voltage range, rise, and fall time for the associated IBIS model.

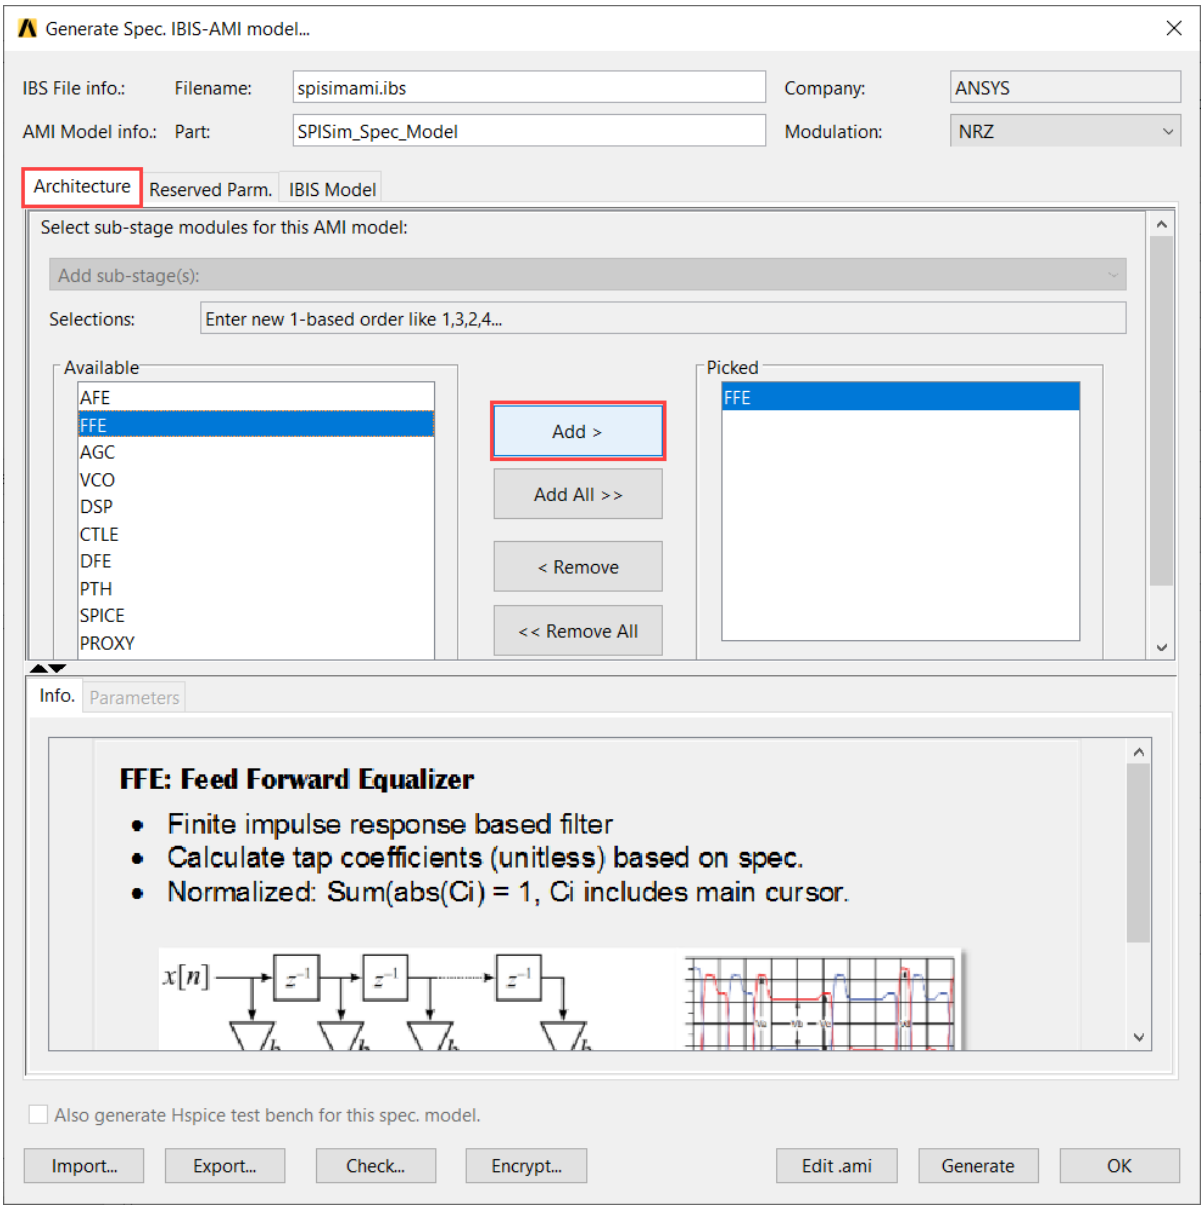
The generated .ibs will use the specified properties.



To use:

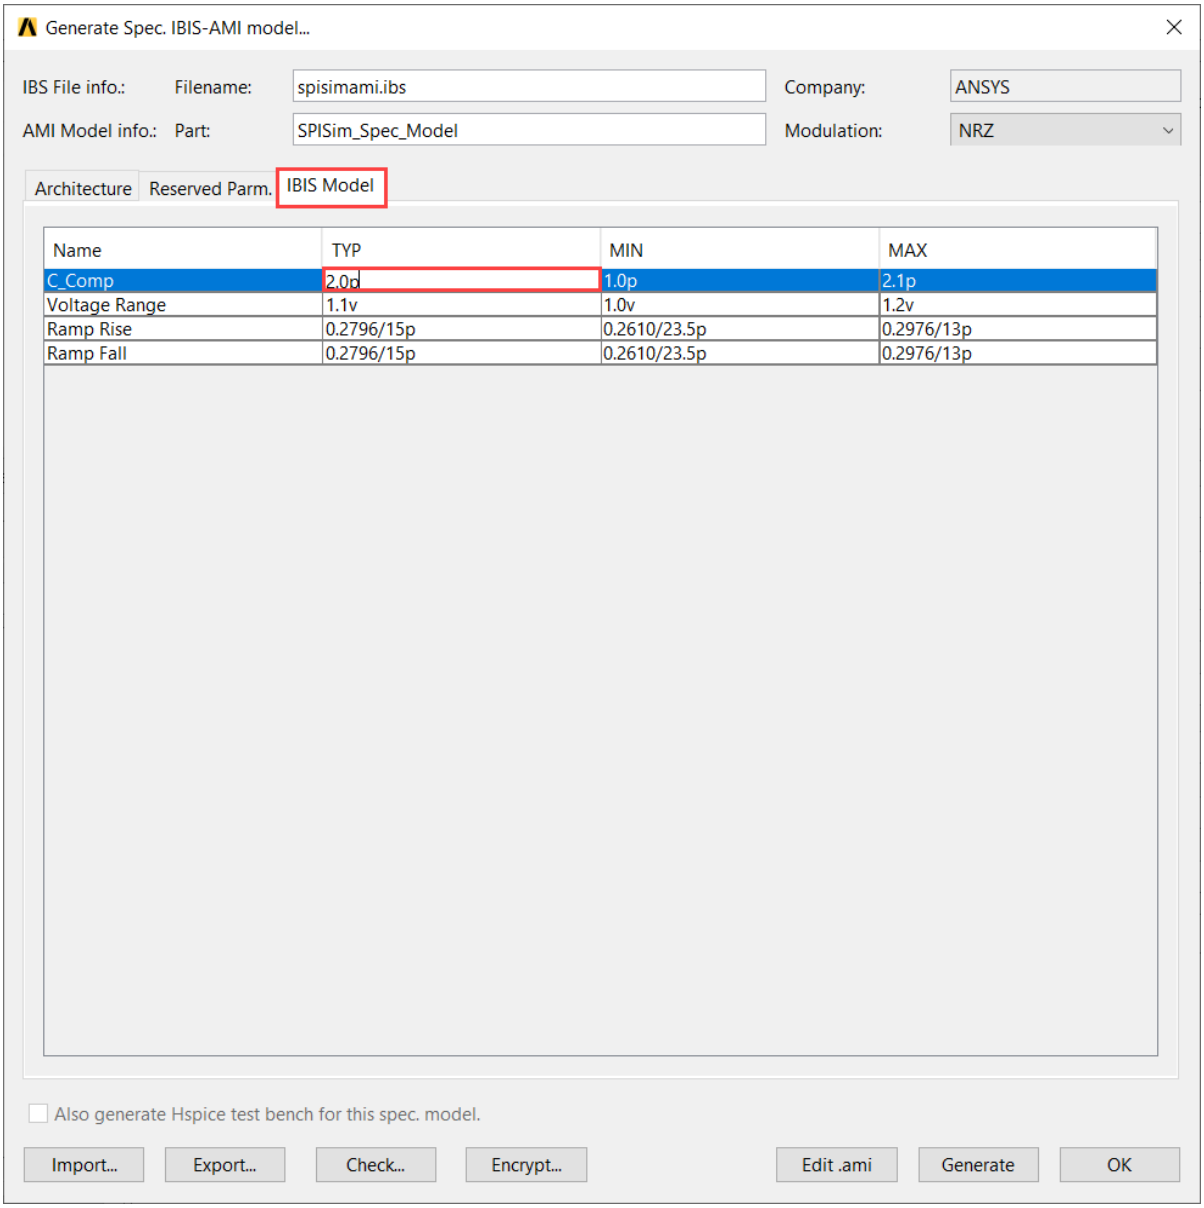
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select at least one sub-stage from the **Architecture Tab**.



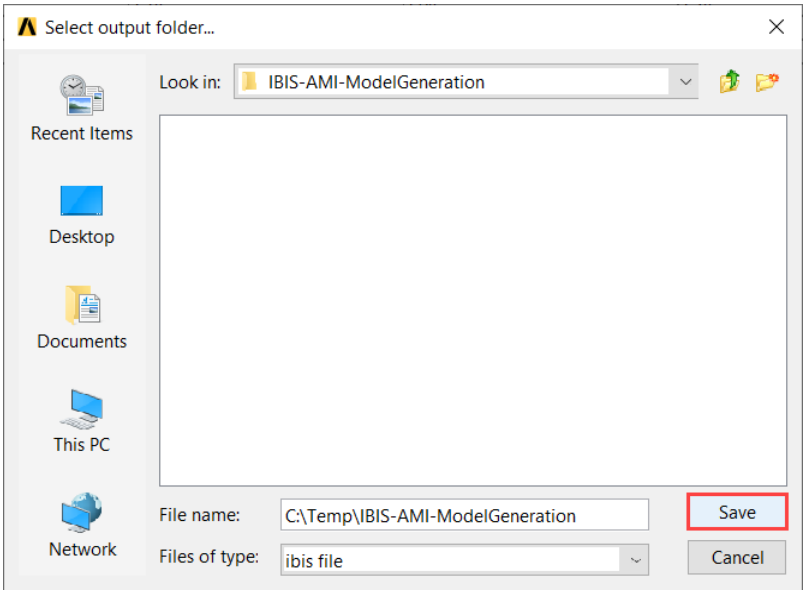
2. Select the **IBIS Model Tab** and enter **TYP**, **MIN**, and **MAX** configuration values for **C_ Comp**, **Voltage Range**, **Ramp Rise**, and **Ramp Fall**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



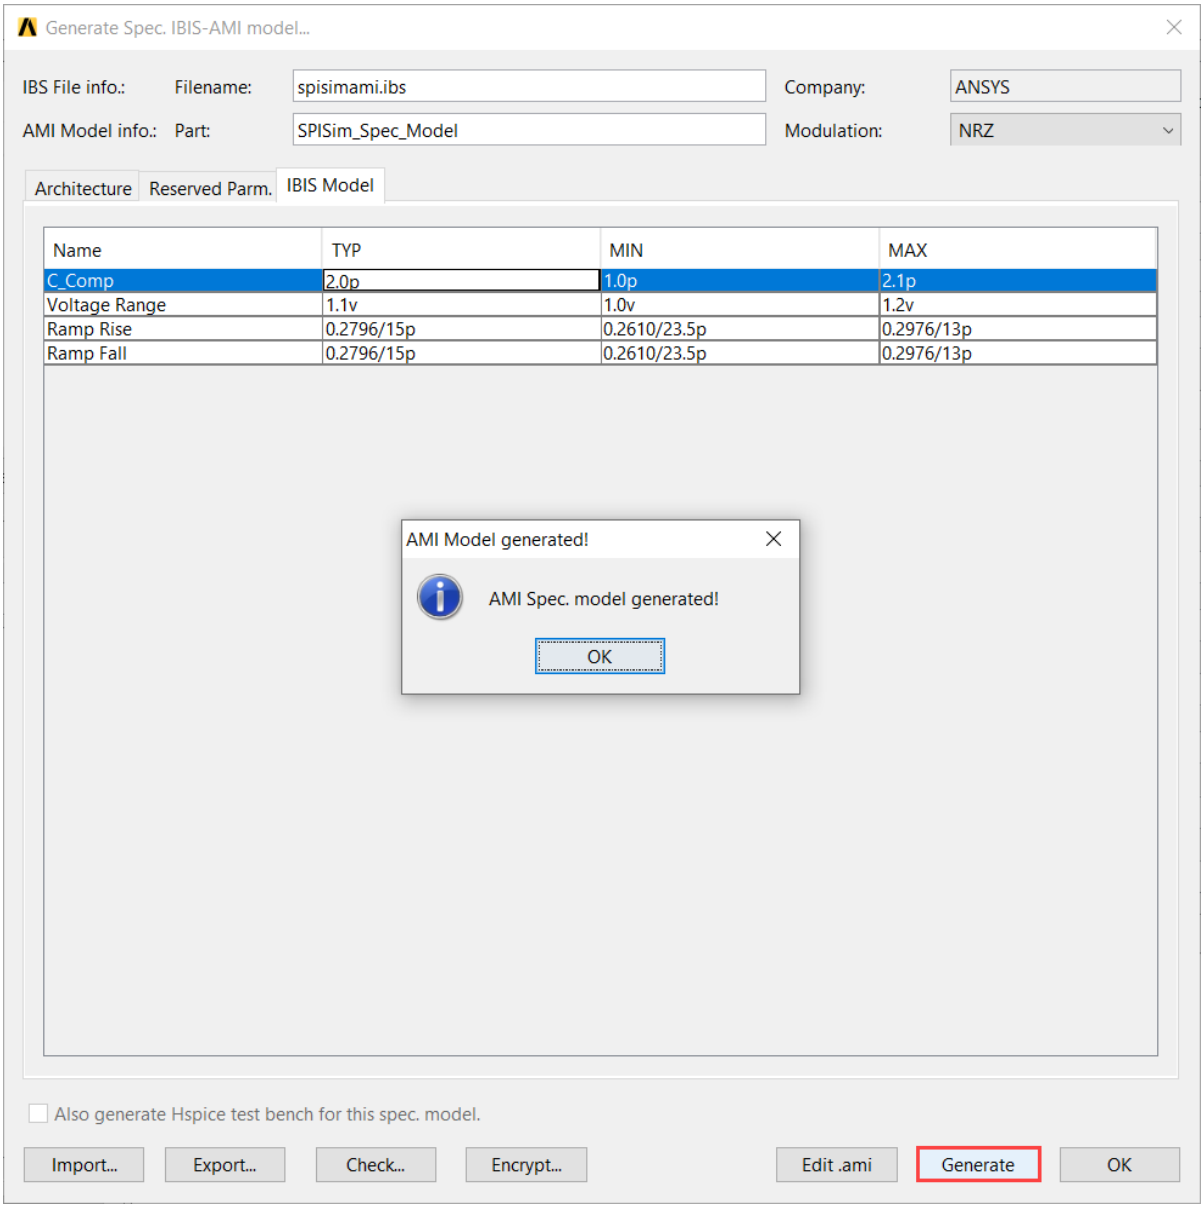
3. Click **Generate** and select an output folder. Click **Save**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. The AMI Spec. model will be generated and located in the selected output folder.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Sample IBIS-AMI Models

Example industry standard models are provided, they can be generated from SPISim or from AEDT directly.

- DDR5_Tx
- PCIeG2_Tx
- PCIeG4_Rx

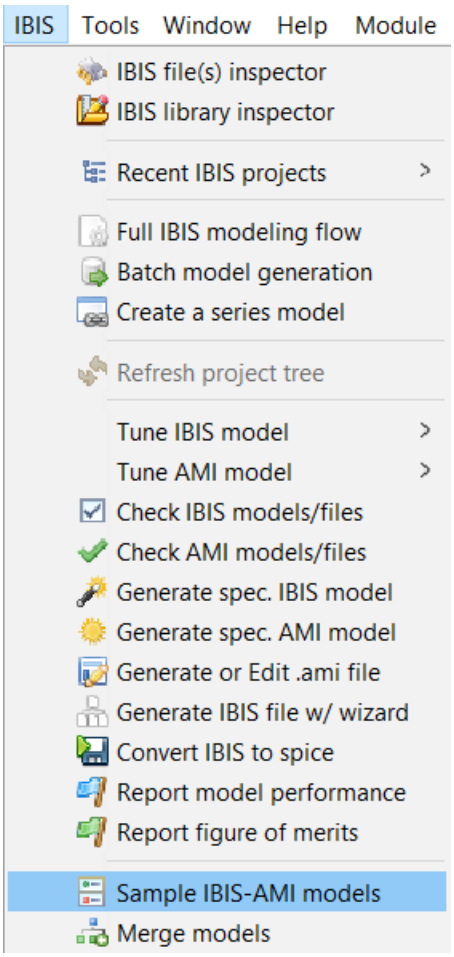
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- PCIeG4_Tx
- PCIeG5_16GT
- PCIeG5_32GT
- PCIeG5_8GT
- PCIeG5_Tx
- PCIeG6_TxRx
- RX_PassThru
- RX_PassThru_PAM4
- TX_PassThru
- TX_PassThru_PAM4
- UCIe1p1_TxRx
- USB3P2G1_LongCh
- USB3P2G1_ShortCh
- USB3P2G2_Rx
- USB3P2_Tx
- USB4_Rx
- USB4_Tx

To generate a sample model in SPISim:

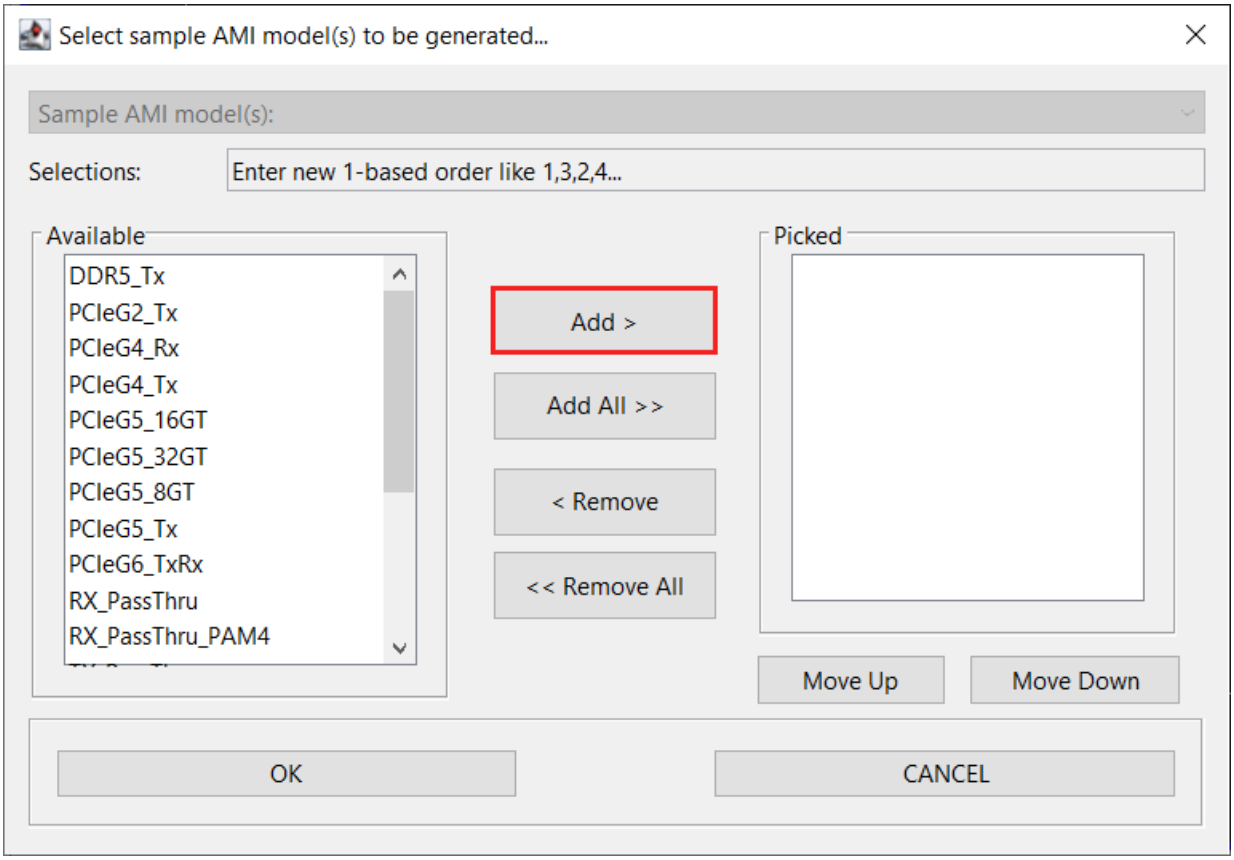
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select **Sample IBIS-AMI Models** from the **IBIS** menu.



2. Select the model(s) by double-clicking the model name or by using the **Add >** button.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



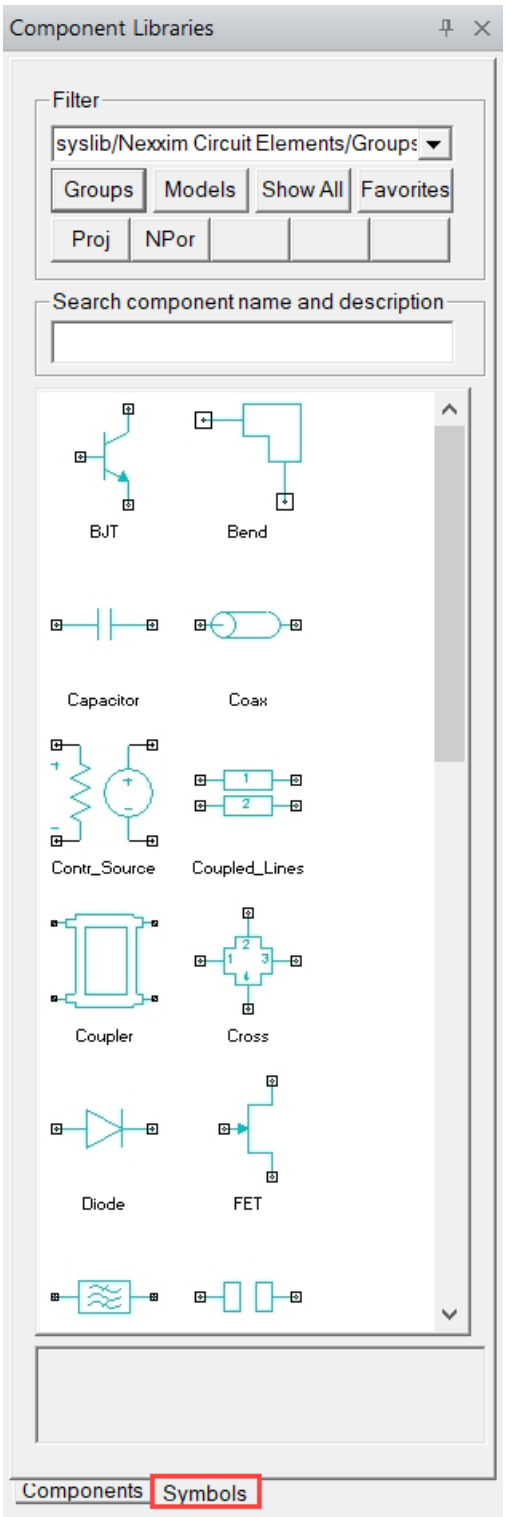
3. Click **OK**.

The model(s) will be generated in the working directory.

To generate the models directly from AEDT's schematic editor for channel simulation:

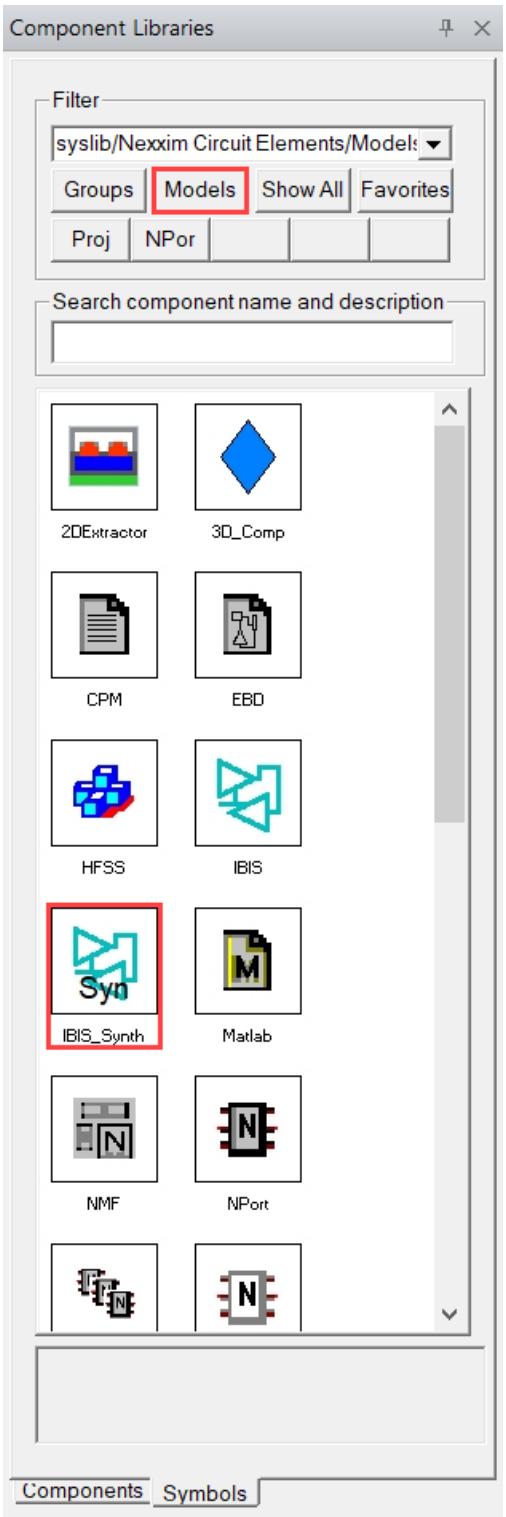
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select **Symbols** from the **Component Libraries** window.



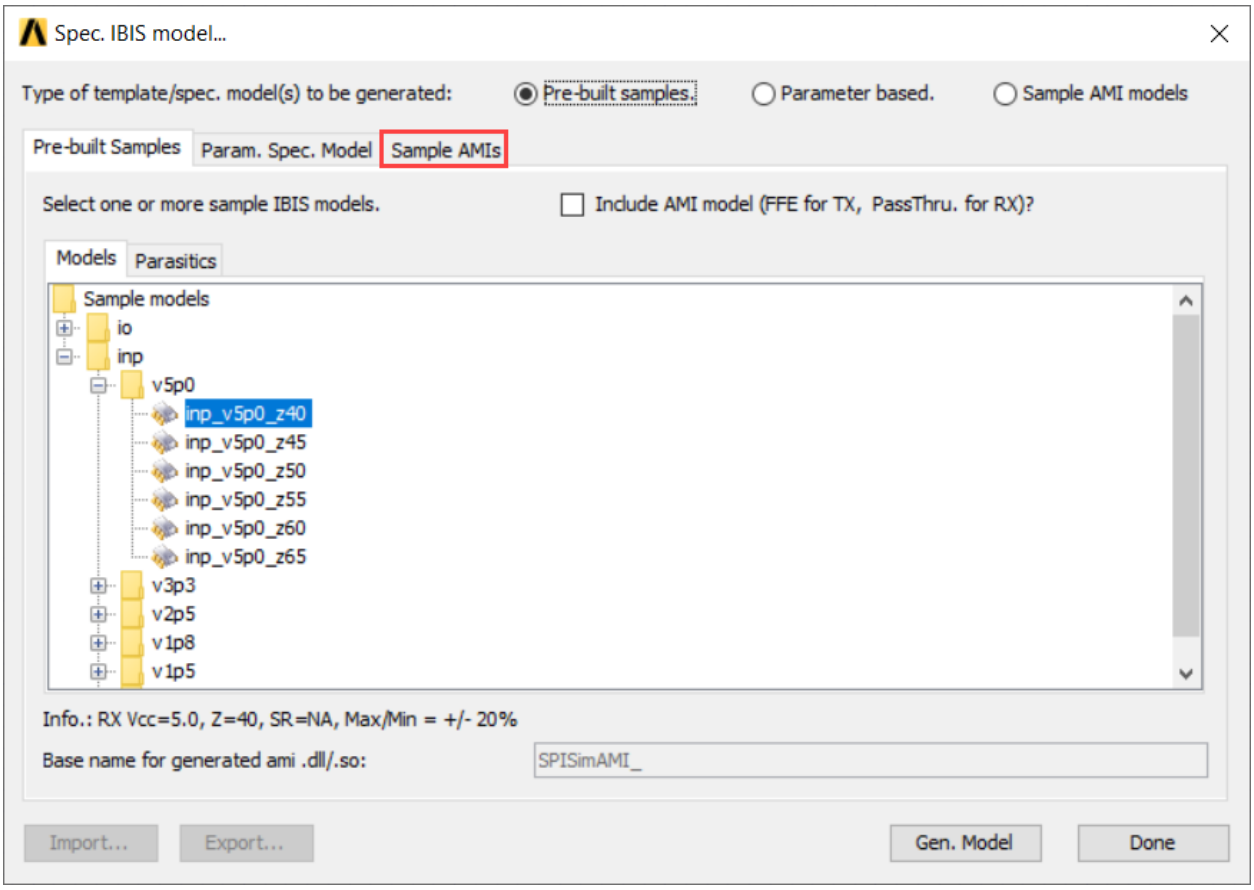
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Select **Models** then **IBIS_Synth** to launch the **Spec. IBIS Model** window.



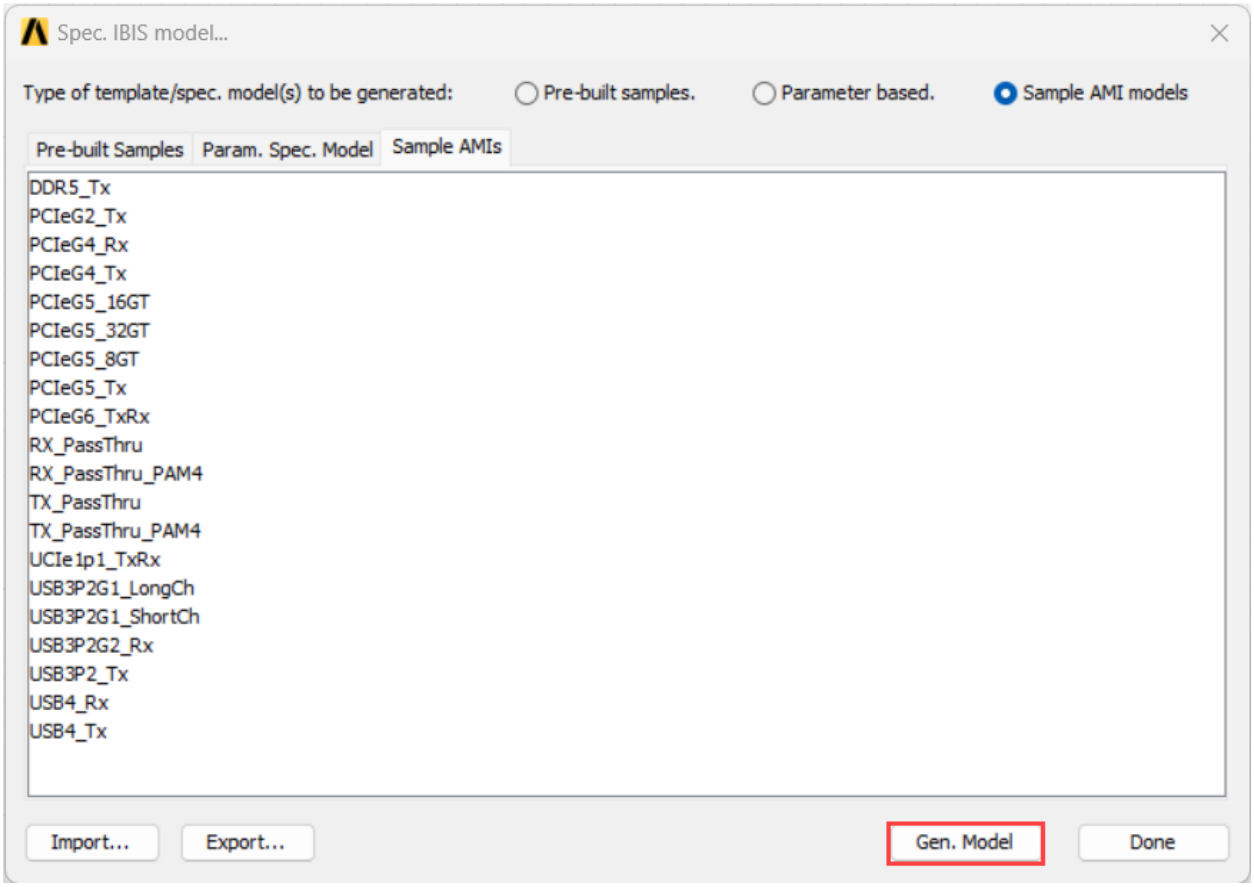
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Select **Sample AMIs**



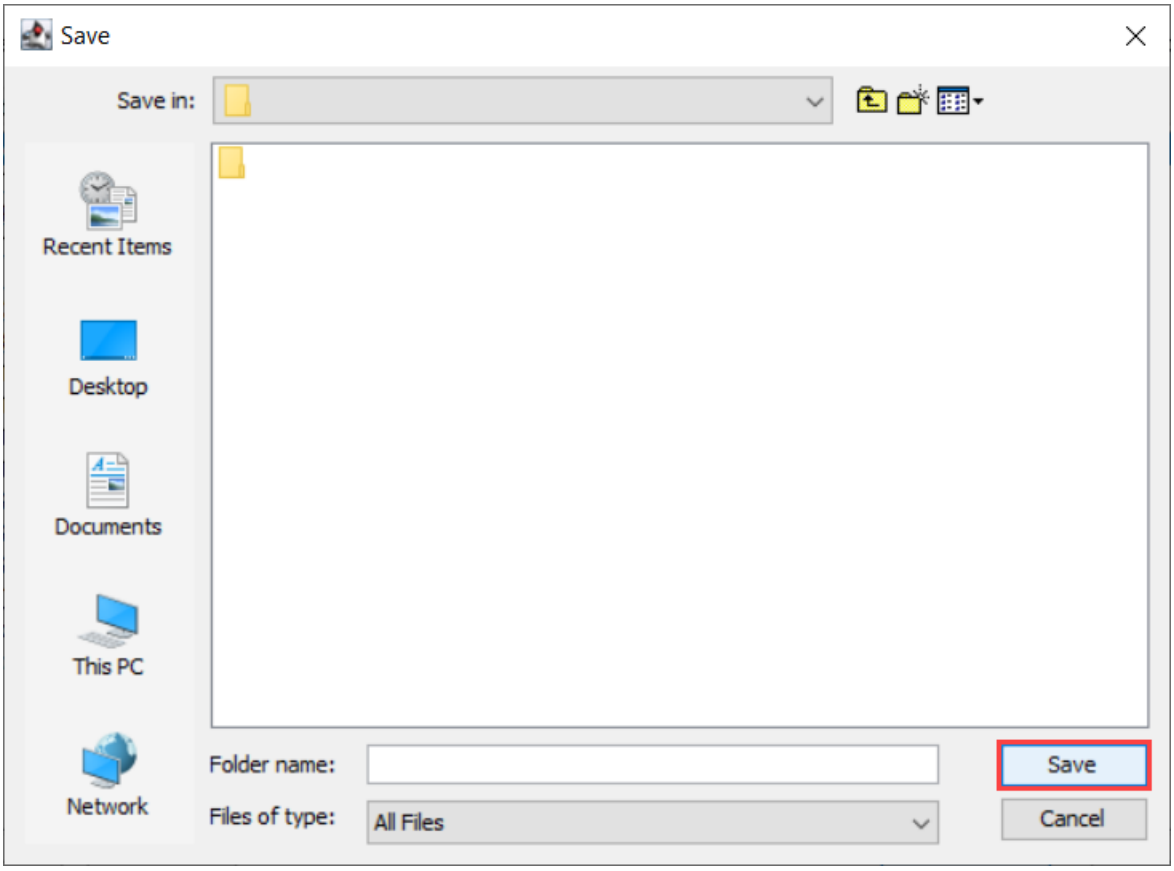
4. Select the model(s) and click Generate Model

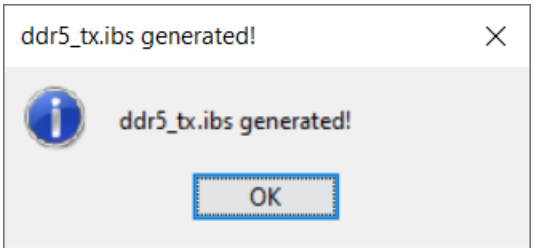
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. Select an output folder and click **Save**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



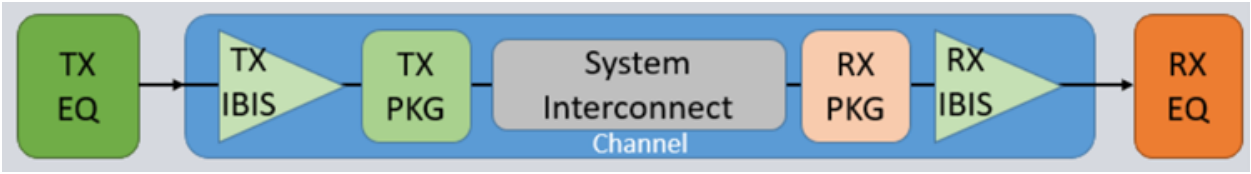


The model will be generated in the specified directory.

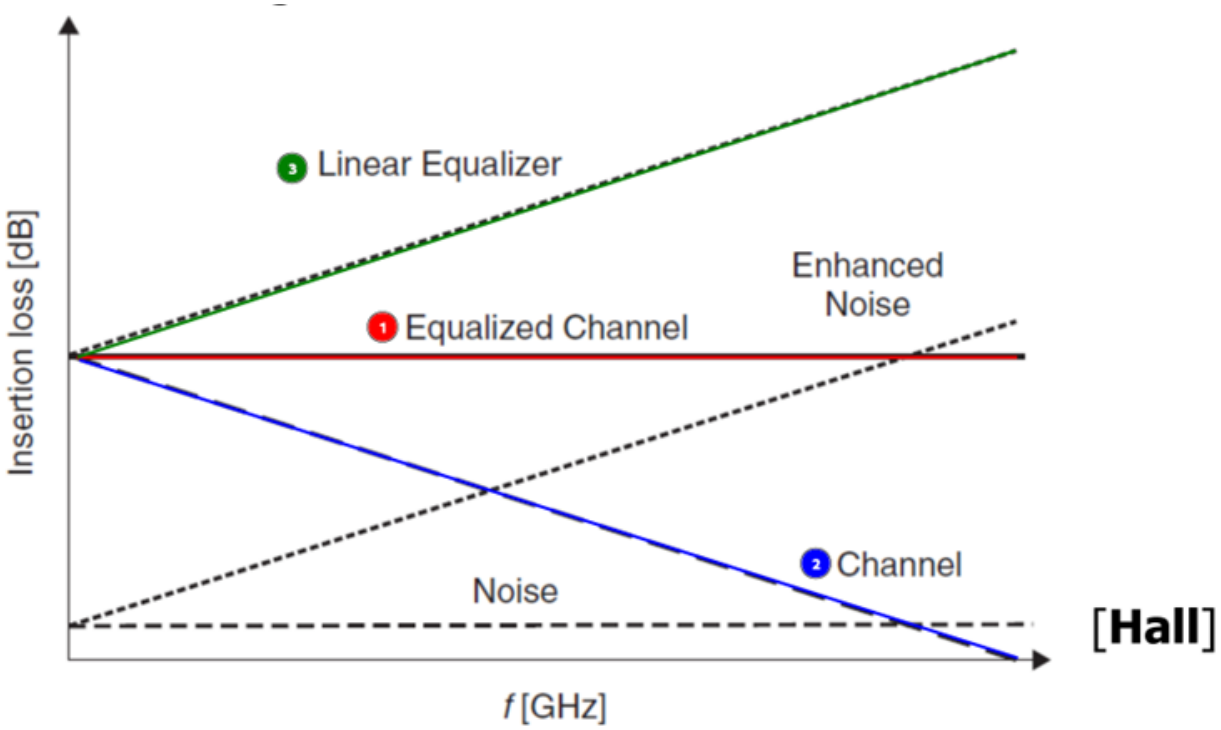
Adaptive CTLE IBIS-AMI Model

Background

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



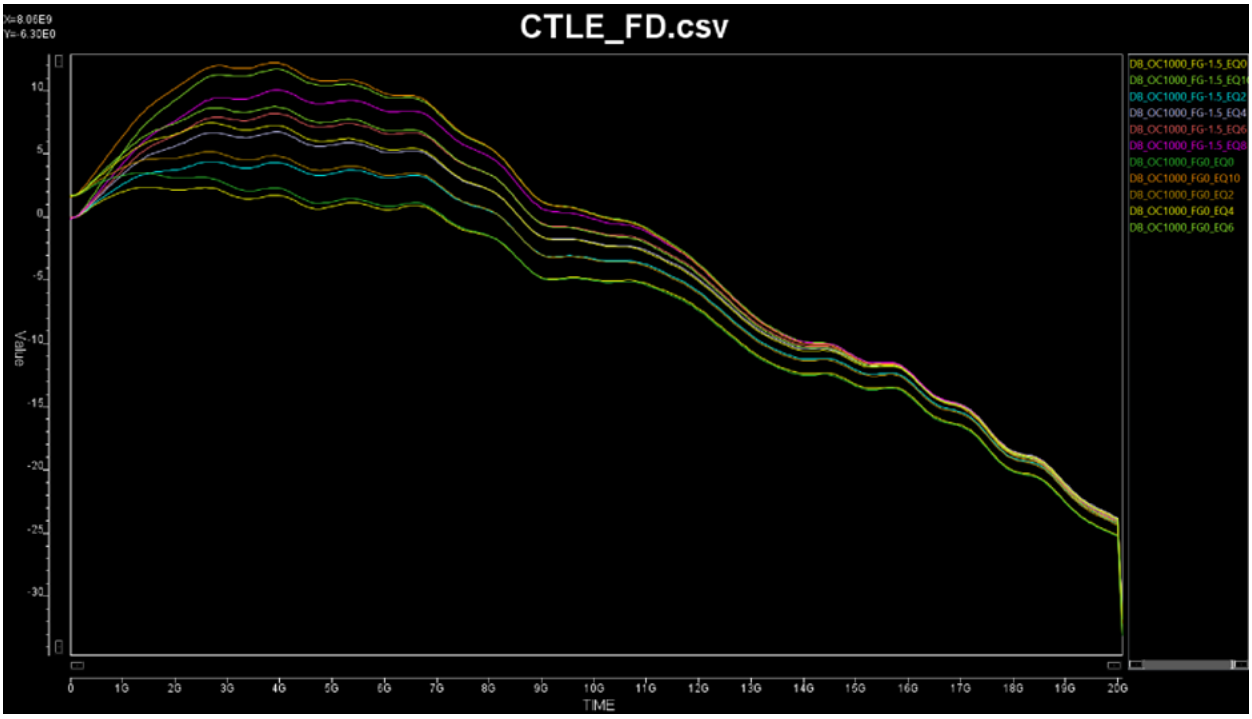
An ideal equalized channel for signal path from input of TXEQ to output of RXEQ is an all pass filter, represented by line 1, in the graph below. In an all pass filter, signals of all frequencies have the same gain, equal to 1, i.e. 0dB, so no signal distortions exist. When signals of different frequencies travel at different speeds and losses down a channel, loss or dispersion will occur resulting in distorted signal bits. This distortion is a common behavior of a channel, represented by the components in the blue box of the flow diagram above, and marked as line 2 in the graph below. To accommodate for this, linear equalizers TXEQ and RXEQ are introduced, with behaviors represented by line 3, below. The goal is that adding behaviors 2 and 3 will results in an overall channel performance similar to line 1, an equalized channel.



REFERENCE: Palermo, Sam. RX Equalization Noise Enhancement. 2023. Digital, ECEN720: High-Speed Links Circuits and Systems Spring 2023. https://people.engr.tamu.edu/spalermo/ecen689/lecture8_ee720_rx_adaptive_eq.pdf

The linear behavior of line 3, above, is an ideal case. In reality, the behavior of CTLE (RXEQ) is better represented by one of the curves below. It's common that a CTLE has many curves to chose from and the user must find a matching one for a given channel so that the overall performance is acceptable.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

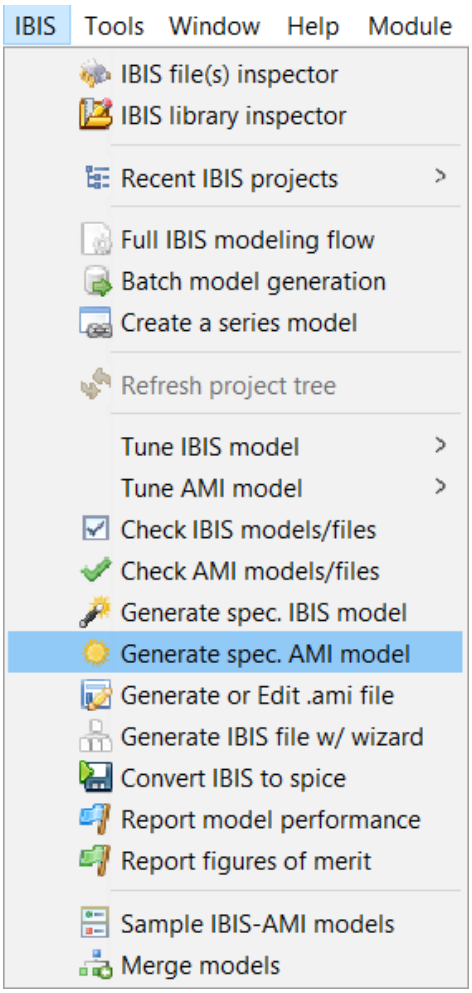


The adaptive CTLE IBIS-AMI feature provides a “self-adapting” capability in the CTLE model to find a good curve among those available to produce good analysis results

Steps

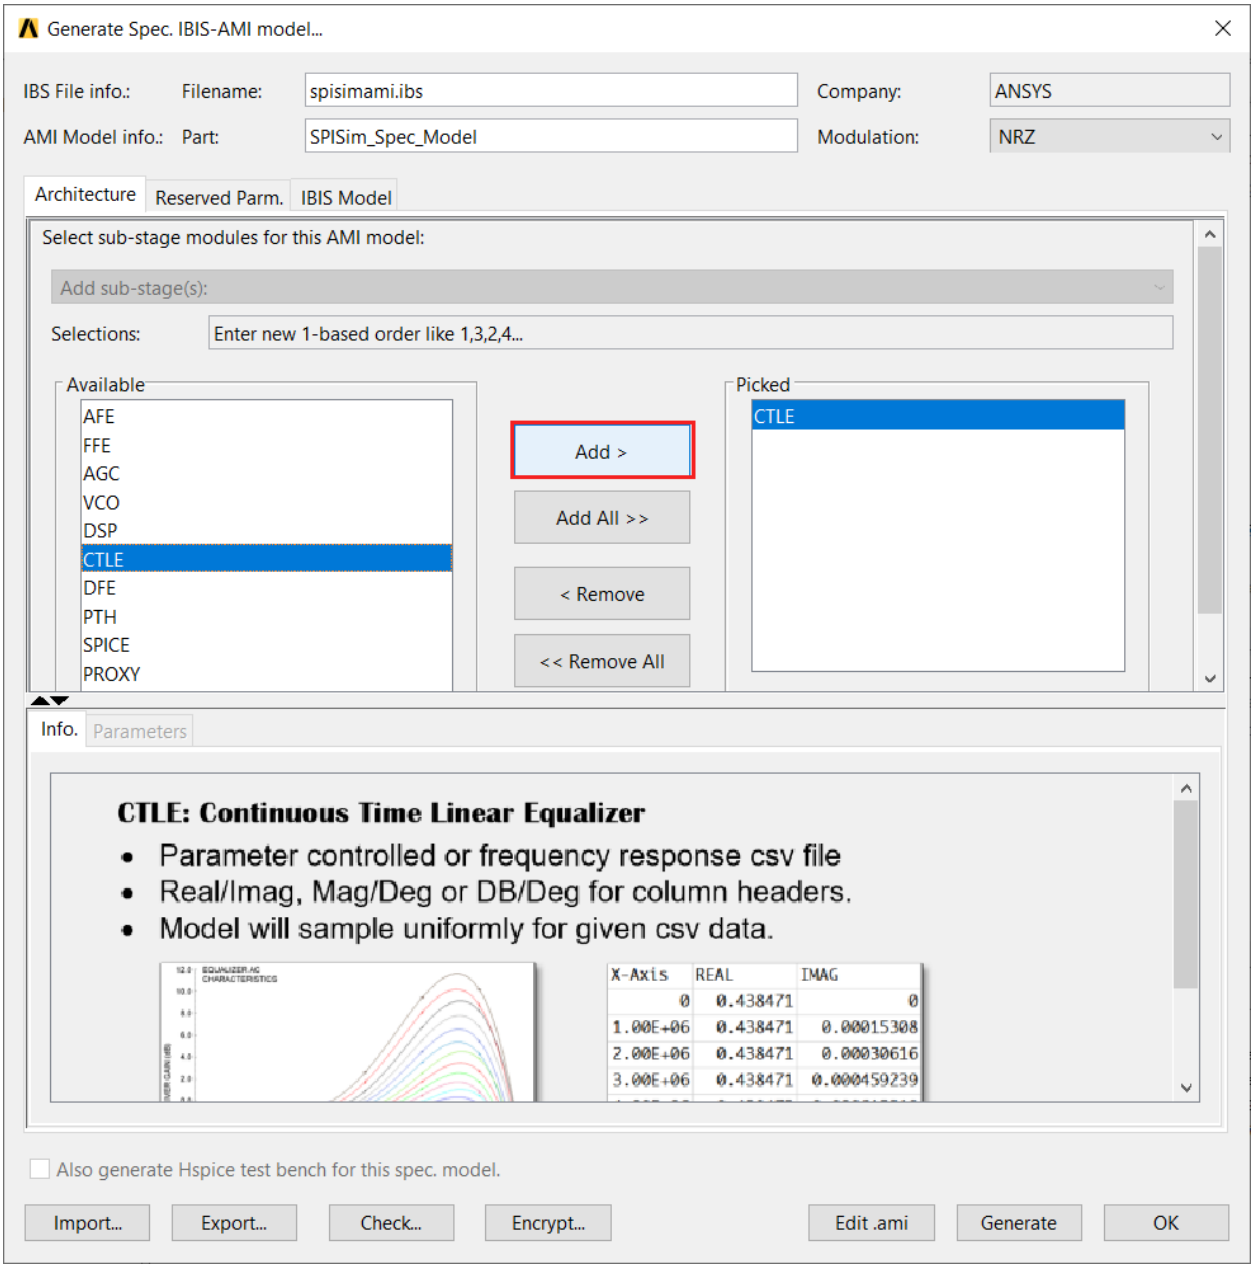
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Launch SPISim, choose IBIS from the top ribbon and select **Generate spec. AMI Model**.



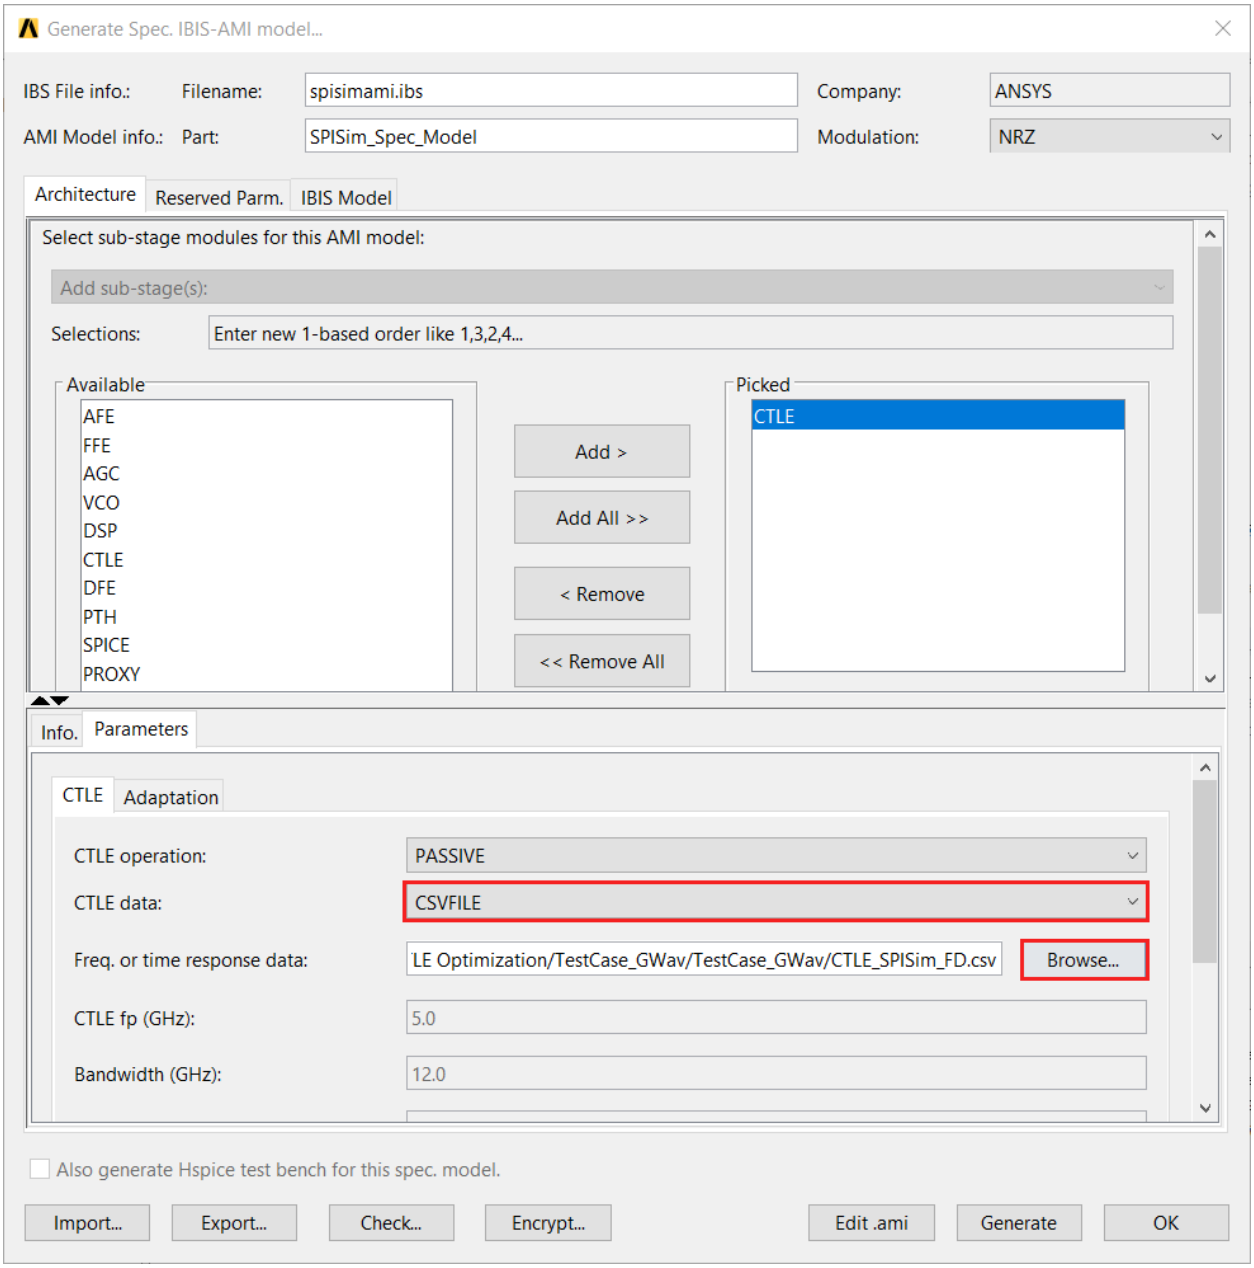
2. Select **CTLE** from the **Available** group box and click **Add**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. From the **CTLE data** drop down menu, select CSVFILE and use the **Browse** button to choose your CSV file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



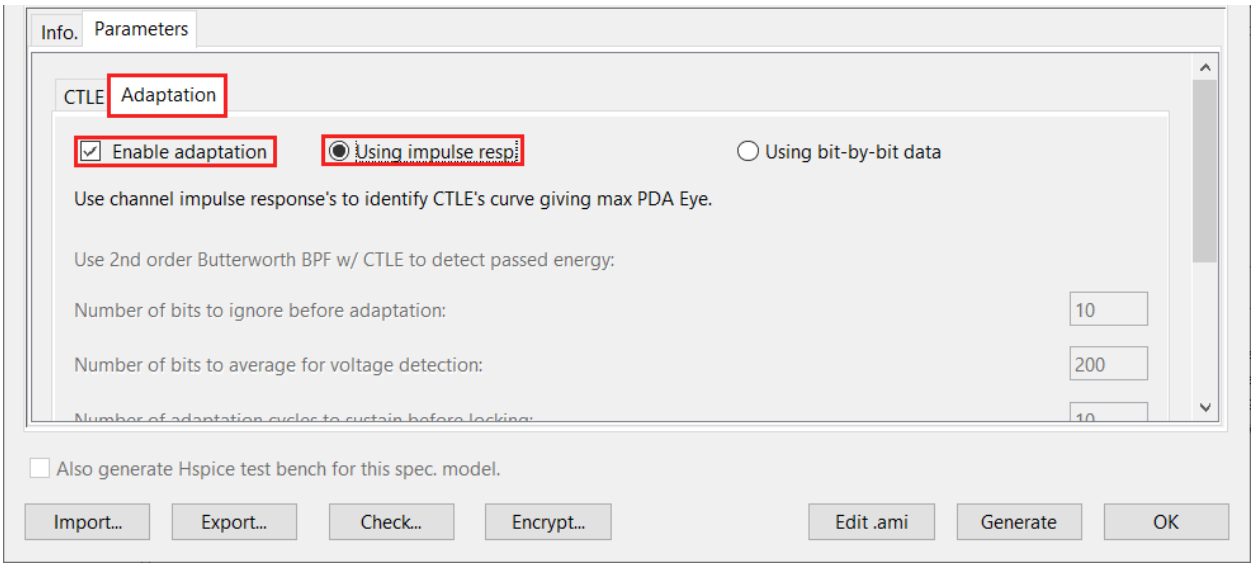
The **Adaptation** tab will be enabled.

4. In the **Adaptation tab**, check Enable Adaptation to choose between **Using impulse response** or **Using bit-by-bit data**.

    a. **Using Impulse Response**: During AmiInit (e.g. Nexxim's VerifEye analysis and AMI analysis), impulse response is input to the model. PDA based approach will be

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

used to calculate eye height. CTLE curve resulting maximum PDA eye-height will be selected for subsequent analysis. All curves will be “scanned” in this approach.



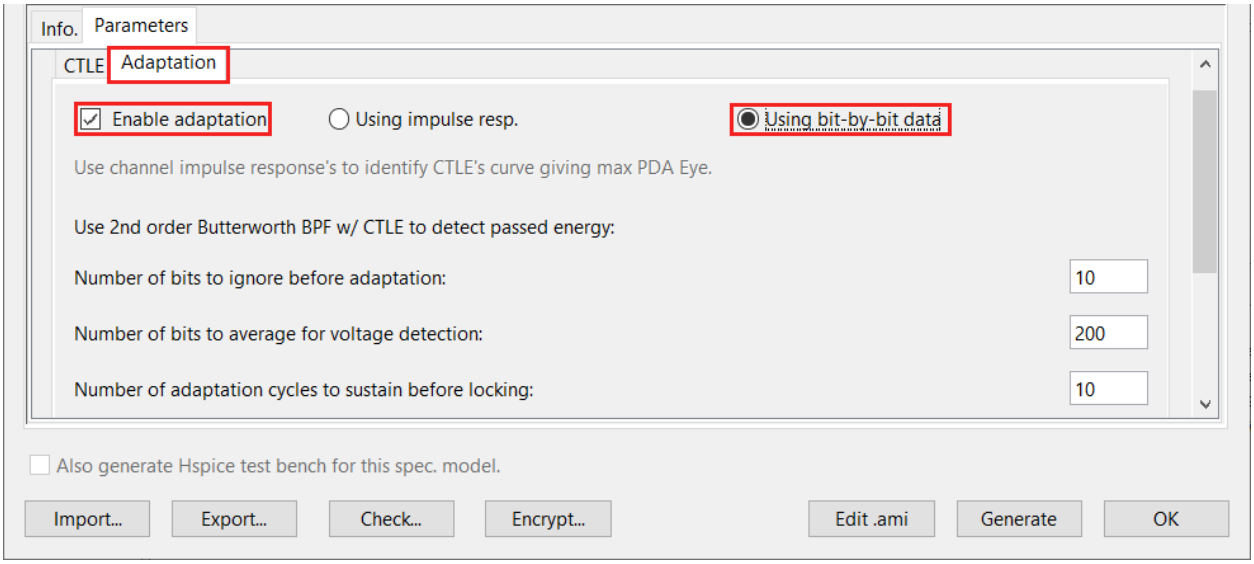
The generated model's .ami file will contain the new corresponding AMI parameter:

```
) | End Reserved_Parameters

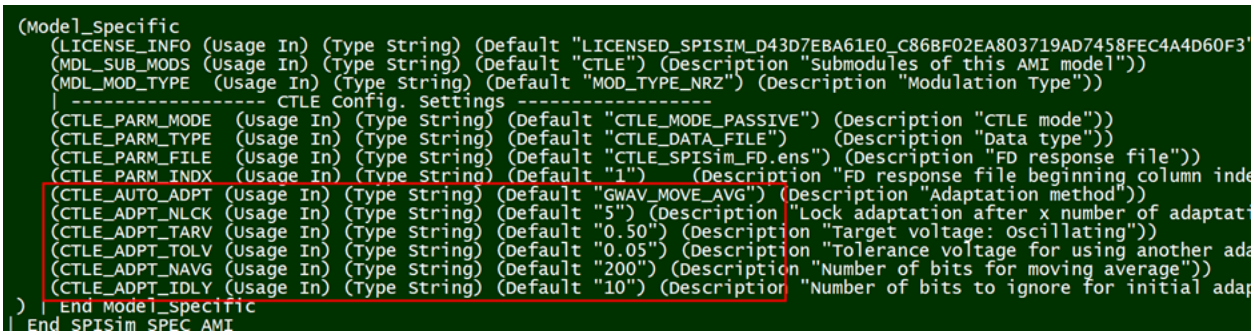
|*****************************************************************************
| Remove or tamper LICENSE_INFO values will cause simulation being aborted!
|*****************************************************************************
(Model_Specific
   (LICENSE_INFO (Usage In) (Type String) (Default "LICENSED_ANSYS_AEDT_E168EFCC0268A84087F7B23B510CB41F")
        | ------------------ MAIN Settings ------------------
   (MDL_SUB_MODS (Usage In) (Type String) (Default "CTLE") (Description "Cascaded stages"))
   | ------------------ CTLE Settings ------------------
   (CTLE_PARM_TYPE (Usage In) (Type String) (Default "CTLE_DATA_FILE") (Description "Data type"))
   (CTLE_PARM_FILE (Usage In) (Type String) (Default "C:/Temp/00_TestPlan/20230831_F822807_Optimization/Te
   (CTLE_PARM_INDX (Usage In) (Type String) (Default "1") (Description "FD response file beginning id"))
   (CTLE_AUTO_ADPT (Usage In) (Type String) (Default "INIT_PDA_EYEH") (Description "Adaptation method"))
```

b. **Using bit-by-bit data**: During getWave (e.g. Nexxim’s AMI analysis), bit-by-bit waveform input will be used for the model. Moving average after band pass filter (BPF) and various CTLE curves will be calculated to find best one giving passing energy around the targeted value.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

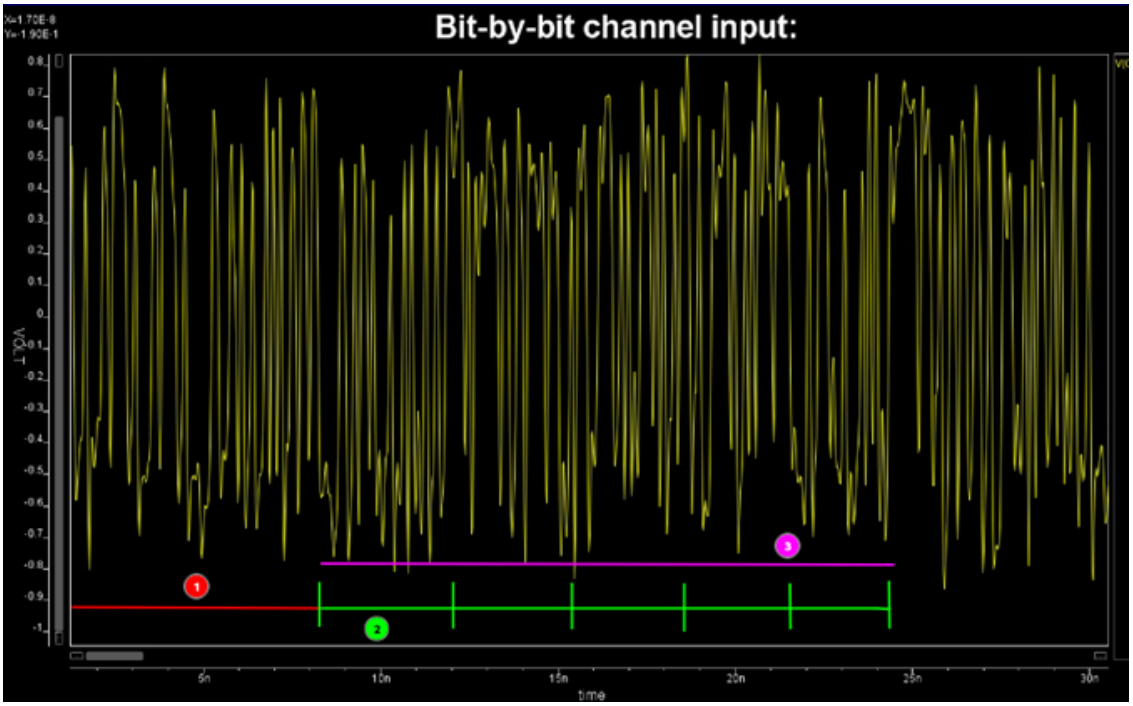


The specified values will also be reflected in the new AMI parameters.



Using Bit-by-Bit Data Parameter Descriptions

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Let the yellow curve above be the bit-by-bit waveform simulator provided for RX AMI models using **GetWave** simulation. Simulator will provide sampling interval **dt** and bit time **UI** to the model. Thus, the number of samples there are in one bit: nSampBit = UI / dt.

i. **Number of bits to ignored**: Marked as 1, red above, this value times nSampBit will be ignored from input data. Data provided for the model to adapt will start from the ones above green lines.

ii. **Number of bits to average**: each average take one chunk of data marked as 2, green, above. At the end of the “chunk”, judgement will be made to see whether a better CTLE curves should be chosen before moving to next “chunk”.

iii. **Number of sustaining cycles**: If the selected curve produces average energy within V+-dV, then this curve will be reused for the next “chunk” of data. It needs to stay within range for this number of cycles/chunks to be declared “locked” and selected, marked as 3, magenta, above

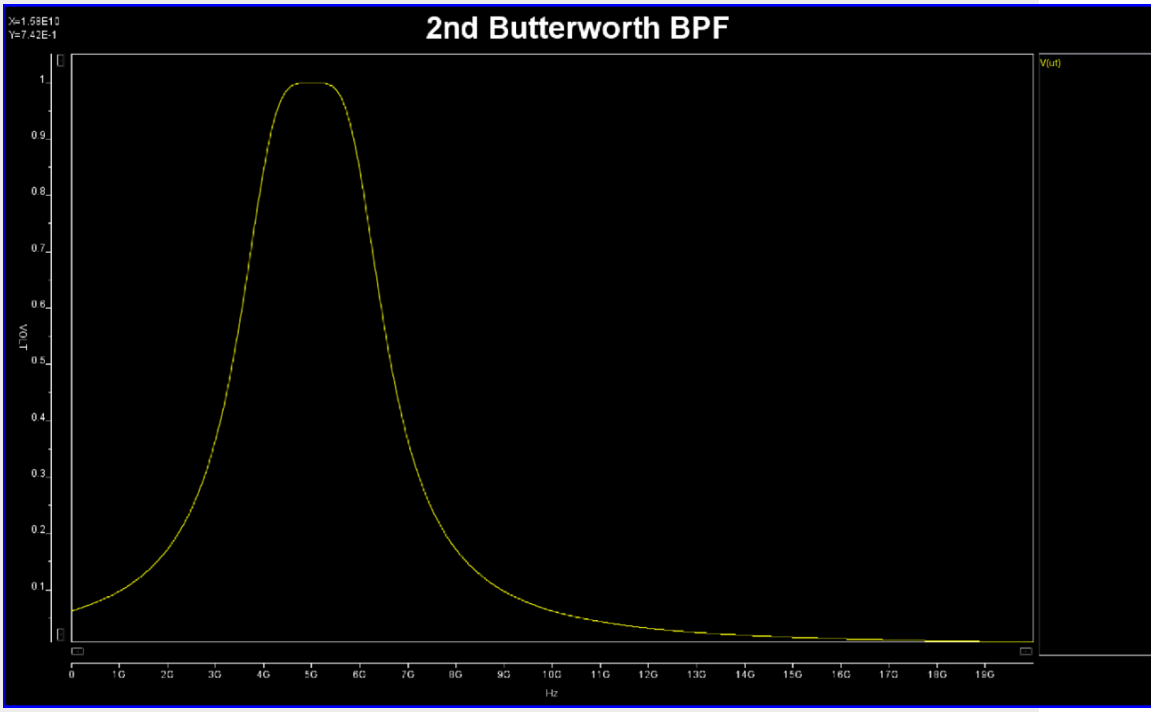
iv. **Target voltage**: V mentioned in (iii).

v. **Tolerance**: dV mentioned in (iii).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: In this BPF/Energy based adapting algorithm, not all curves will be scanned. This is the algorithm used:

1. Based on the UI, a second-order Butterworth BPF will be generated:



2. A single bit passing this BPF will be used as input data. Each curve will be convolved with this input to calculate output energy. The curves are sorted by final value (boost level) from low to high. As only a single bit is used here, this process is very quick.

3. During actual AMI analysis where many bits are provided, CTLE curve of lowest boost level is first used. If the resulting passed average energy is not within the V +- dV range, the selection will move up and down (using next chunk of data) until either adaptation is successful or failed.

4. For the adaptation process to proceed, the input data needs to be least this long: `nSampBit * (num_bit_ignored + num_bits_to_average * num_sustain_cycle)`. The three variables used in the parentheses are parameters defined in (i-iii) mentioned above.

5. All the processes are “non-blocking”. That is, even if the adaptation failed, the model will still use the last best value to continue the AMI analysis. User can see model’s output messages for adaptation details.

5. Select **Generate**. The model will be generated.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim IBIS Support

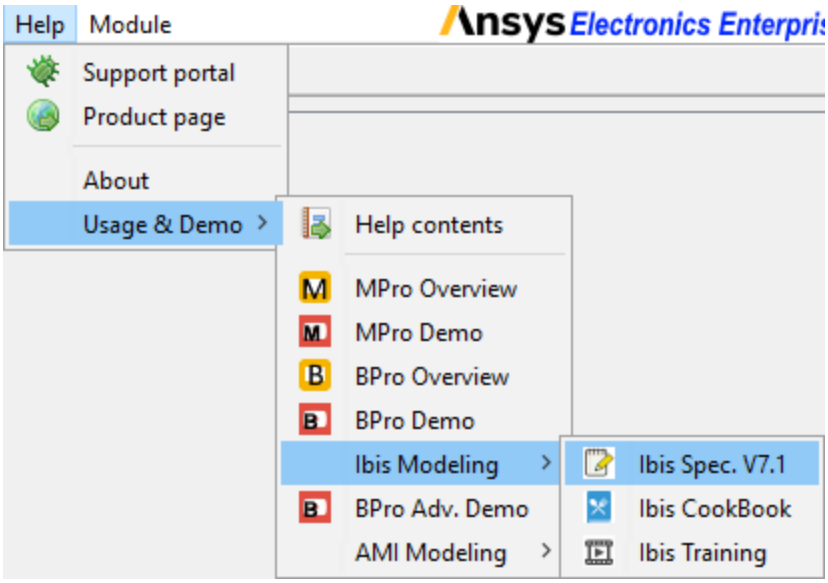
In this Section:

- IBIS Version 7.1
- IBIS Figure of Merit
- IBIS Non-perpetual AMI Expiration

IBIS Version 7.1

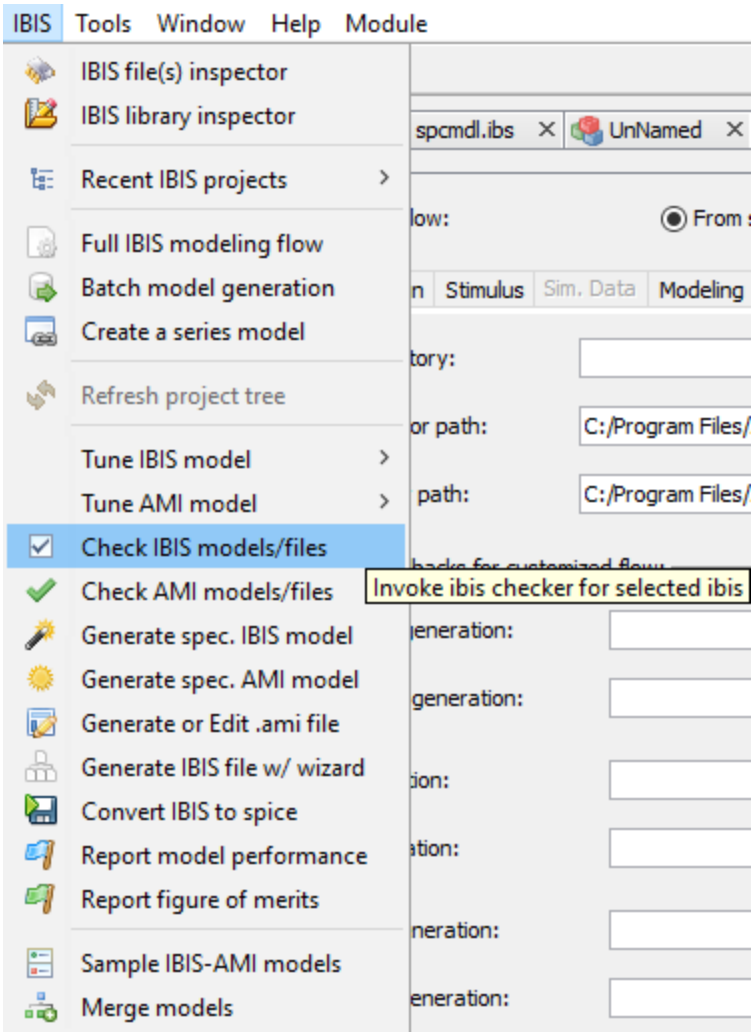
The SPISim internal parser, golden parser, and embedded spec. have been upgraded to the most recent version of IBIS. Refer to the IBIS Version 7.1 specification document for details. To ensure SPISim is running the latest version of IBIS, do one of the following:

- Navigate to **Help** > **Ibis Modeling** and view the **Ibis Spec. V7.1** menu item.

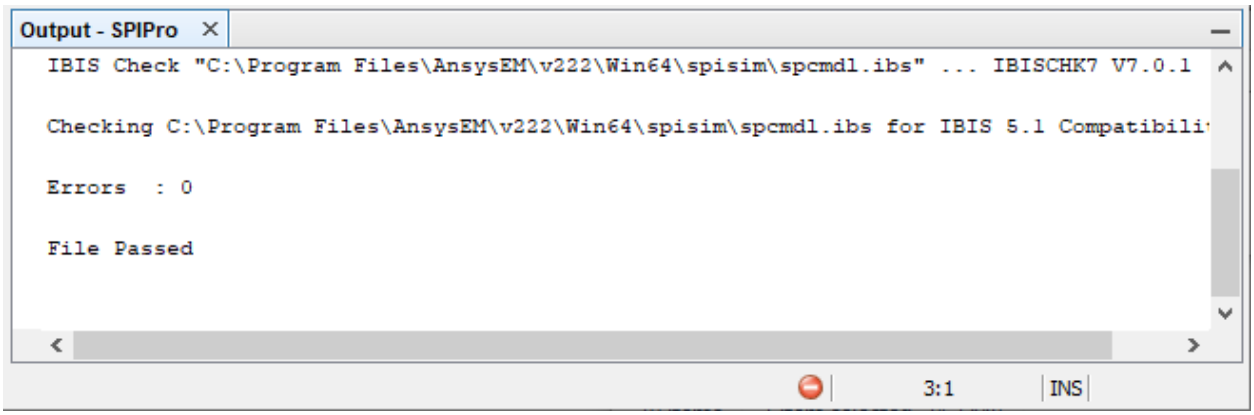


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Test the software by making a relevant request (e.g., **Check IBIS models/files**).



Complete any actions necessary to generate a result and view the **Output - SPIPro** window. The **IBIS Check** line will identify the parser version used during the request.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IBIS Figure of Merits

The Figure of Merits (FOM) report is used to provide a quantitative measure for correlating between transistors design and its IBIS model's performance. Two FOM correlation methods are implemented based on sections 4.3 and 4.4 of the IBIS Accuracy Specification.

FOM1: Average of absolute value of relative errors, defined in IBIS handbook.

$$FOM1 = 100 * \left[1 - \frac{\sum_{i-1}^{N} | Y1_i - Y2_i |}{YW * N}\right]$$

FOM2: Maximum relative error.

$$FOM2 = 100 * \left[\frac{max | Y1_i - Y2_i |}{YW}\right]$$

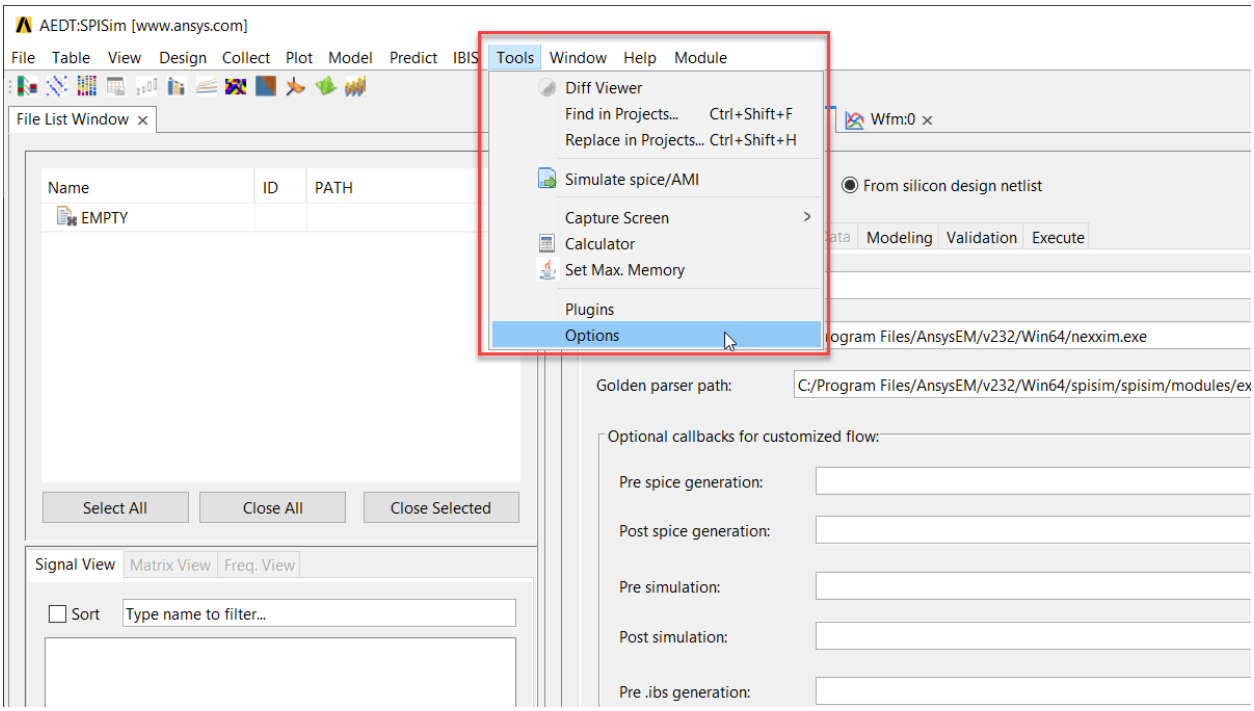
An IBIS model that correlates to the original transistor design will result in approximately equal simulation results from the transistor (Y1) and the IBIS model (Y2). In this case, FOM1 will be high, or approximately 100%, and FOM2 will be low, or approximately 0%.

> **Note:** The Figure of Merits calculation is OFF by default as the added FOM calculation will increase the number of simulations required for modeling.

To configure the FOM option in SPISim:

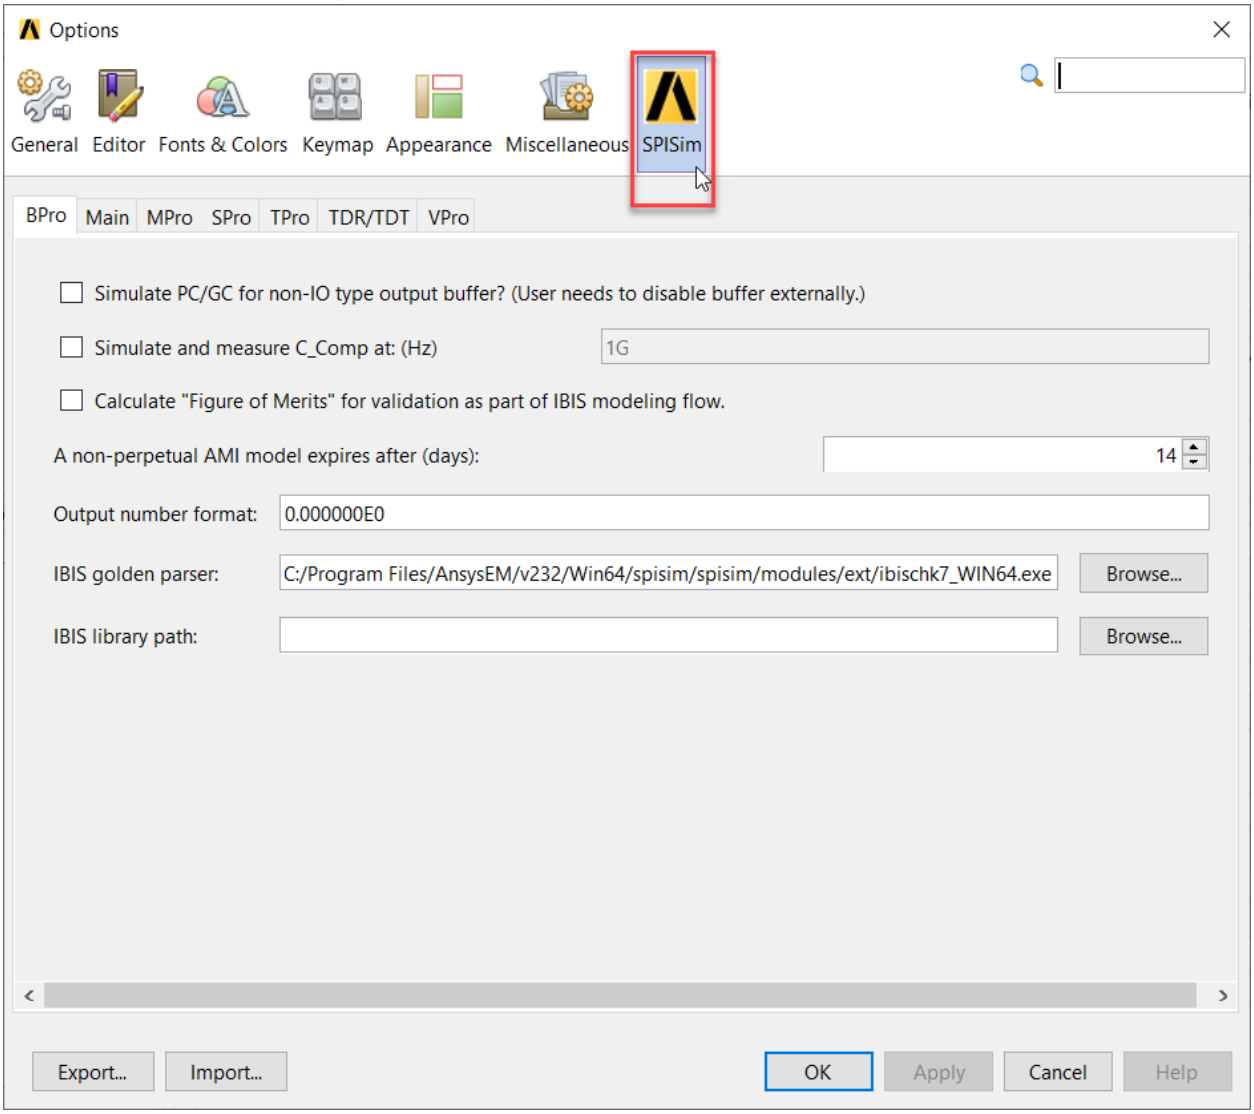
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select the **Tools** menu and click **Options**.



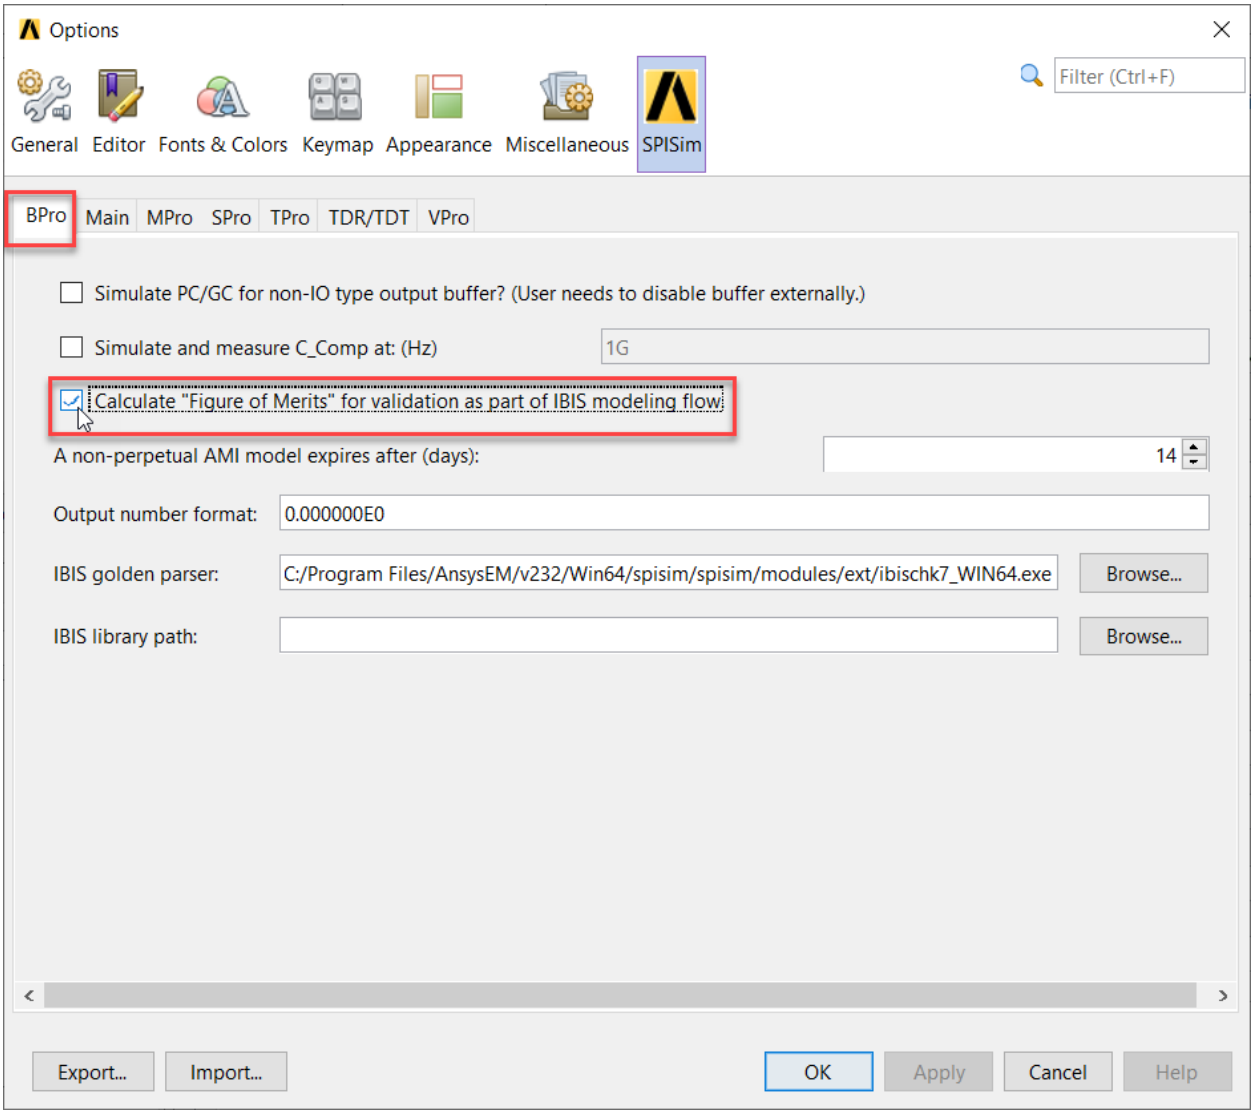
2. Select the **SPISim** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. In the **BPro** tab, select **Calculate "Figure of Merits" for validation as part of IBIS modeling flow.** and select **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



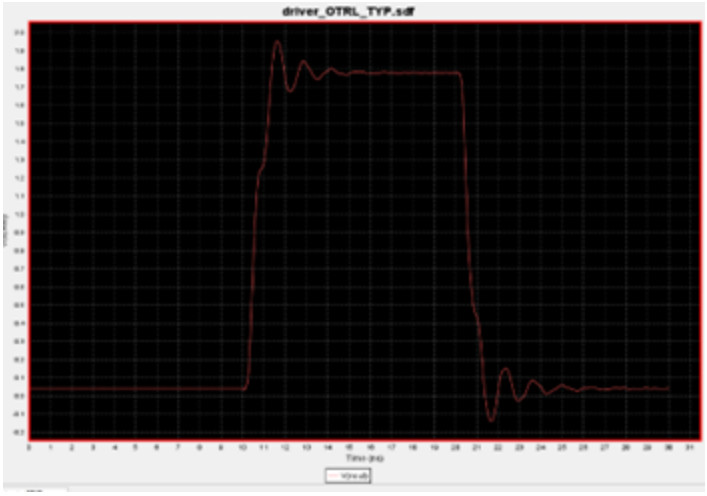
4. In the SPISim IBIS modeling flow **Execute** tab, click through the IBIS model generation flow as normal for Steps 0 - 5. An additional open-ended transmission test load will be created during steps 2, 3, 6, and 7. In step 2 and 3, a transistor buffer connecting to the test load will be generated and simulated together with other regular buffer modeling setup (IVPU, IVPD etc).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

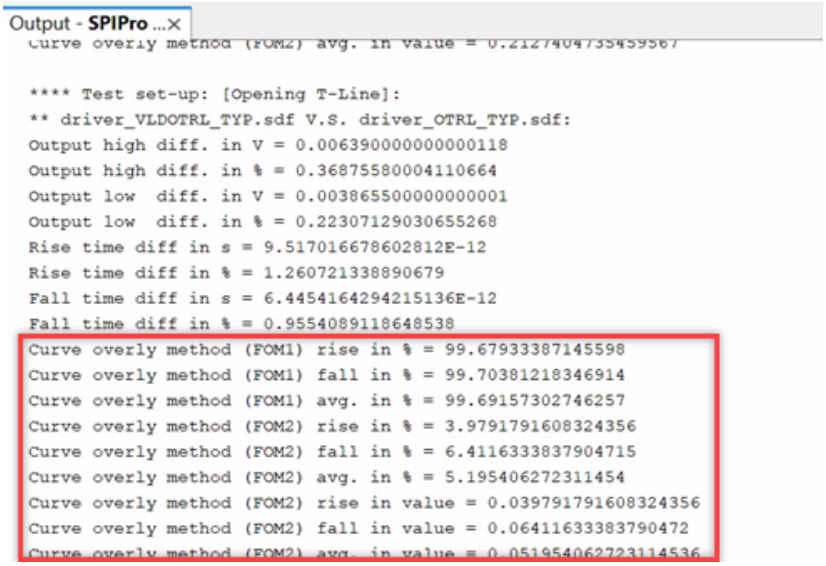
5. Click **Run** in Step 6 of the IBIS model generation flow. The generated IBIS model will be connected to the OTRL load and simulated.

> **Important:** Users should verify the simulated results (either IBIS or transistor) have typical transmission line ringing/reflection effect.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



6. Click **Run** in Step 7 of the modeling flow. The FOM1 and FOM2 results will be printed in the output window.

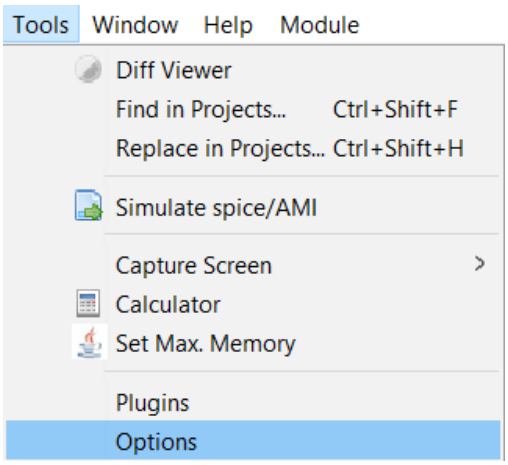


Non-perpetual IBIS-AMI Model Expiration

To specify the number of days before a non-perpetual IBIS-AMI model will expire:

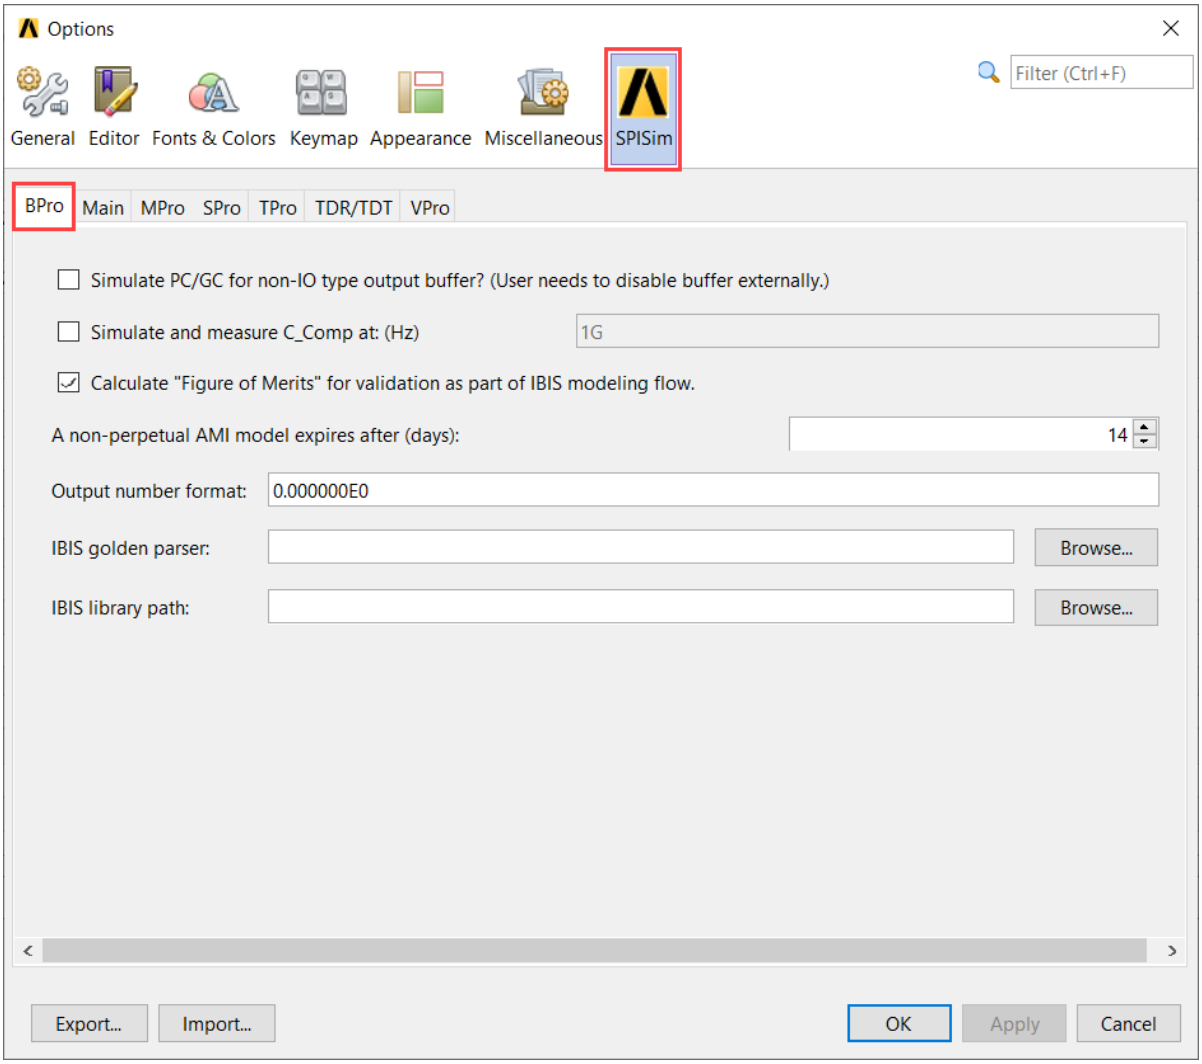
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Navigate to **Tools > Options**



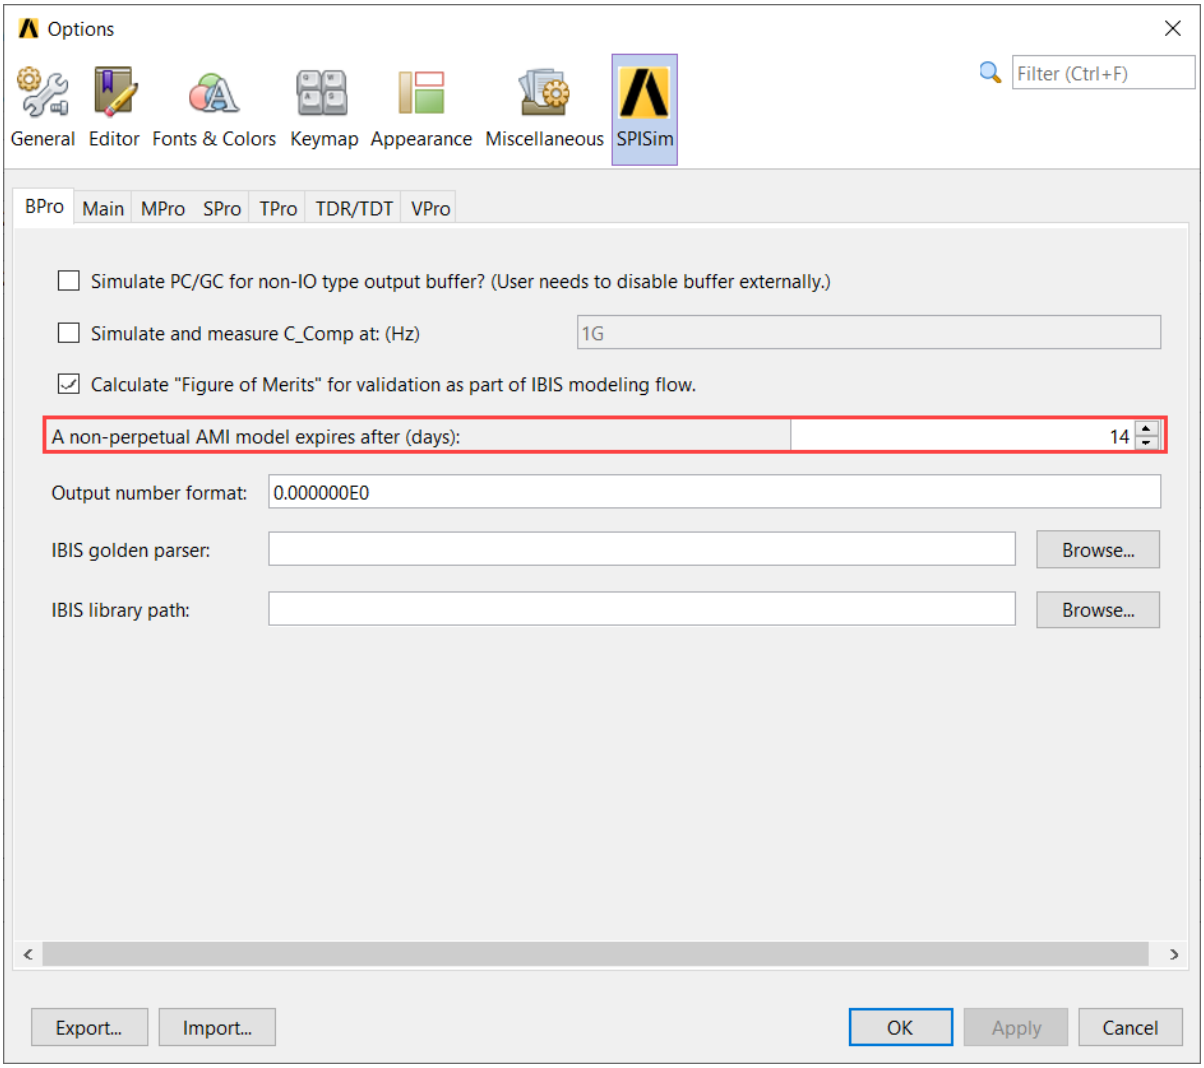
2. Select **SPISim > BPro**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Select the desired number of days before the model expires. Use the arrows or enter a number between 7 and 30.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



IBIS Modeling Flow Batch Mode Support

Batch mode support for IBIS modeling flow fully streamlines the process for multiple model generation.

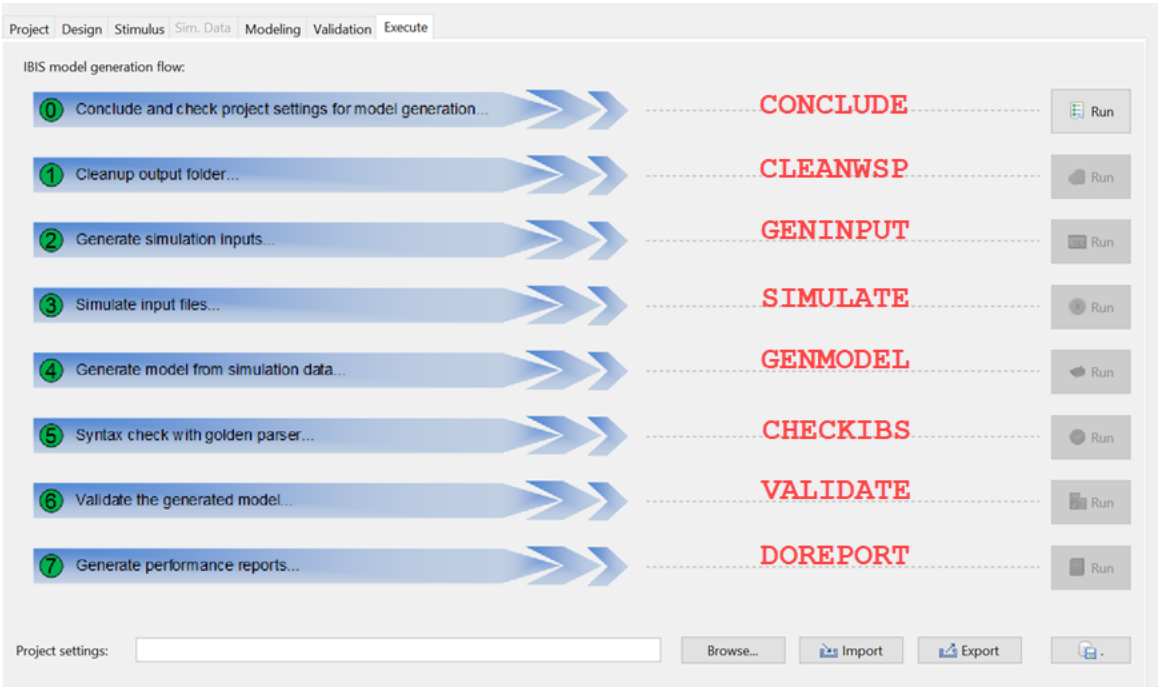
To use the batch model generation tool, a config file is required. The file should contain all the settings necessary for a good set up- that is, the file should be ready to be imported and used to generate a valid IBIS model using the GUI mode.

Each step of the IBIS modeling flow has a corresponding command:

`CONCLUDE, CLEANWSP, GENINPUT, SIMULATE, GENMODEL, CHECKIBS, VALIDATE, DOREPORT.`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

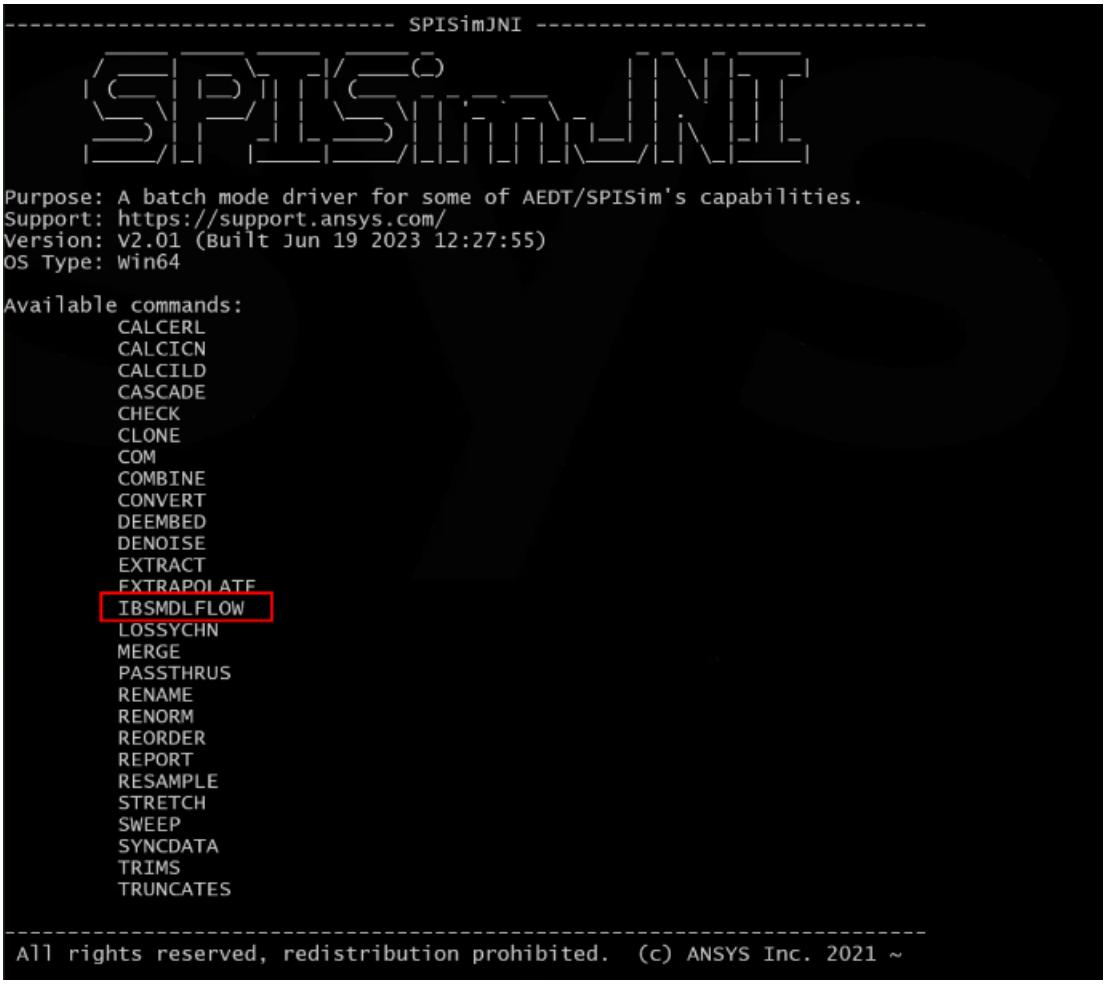
The commands are not case-sensitive and the order is not important when being issued to run batch mode. The commands will automatically be rearranged to the correct execution order internally. Additionally, **CONCLUDE** will always be executed so users can skip issuing this step as well.



The batch mode executable is **SPISimJNI_Win64/Lx64.exe**, which is same as all the other batch mode commands' entry point.

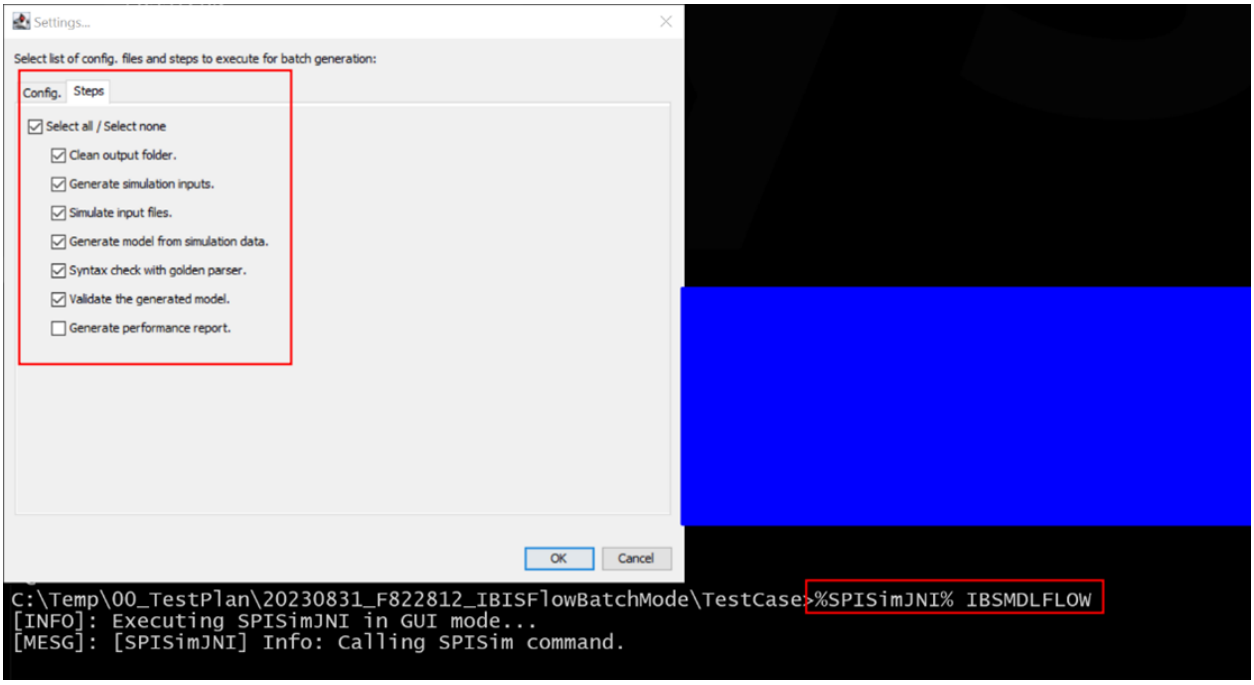
Running the executable will show the list of commands supported, including newly added **IBISMDLFLOW** command:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



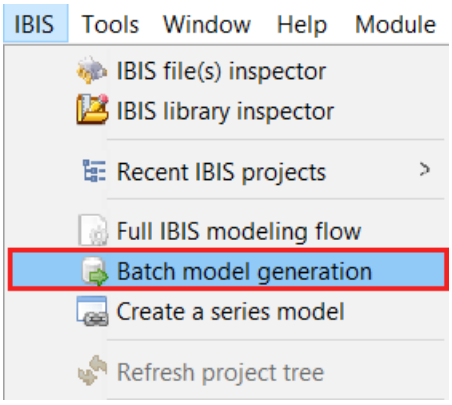
To run batch mode GUI mode, do SPISimJNI_WIN64.exe IBISMDLFLOW:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



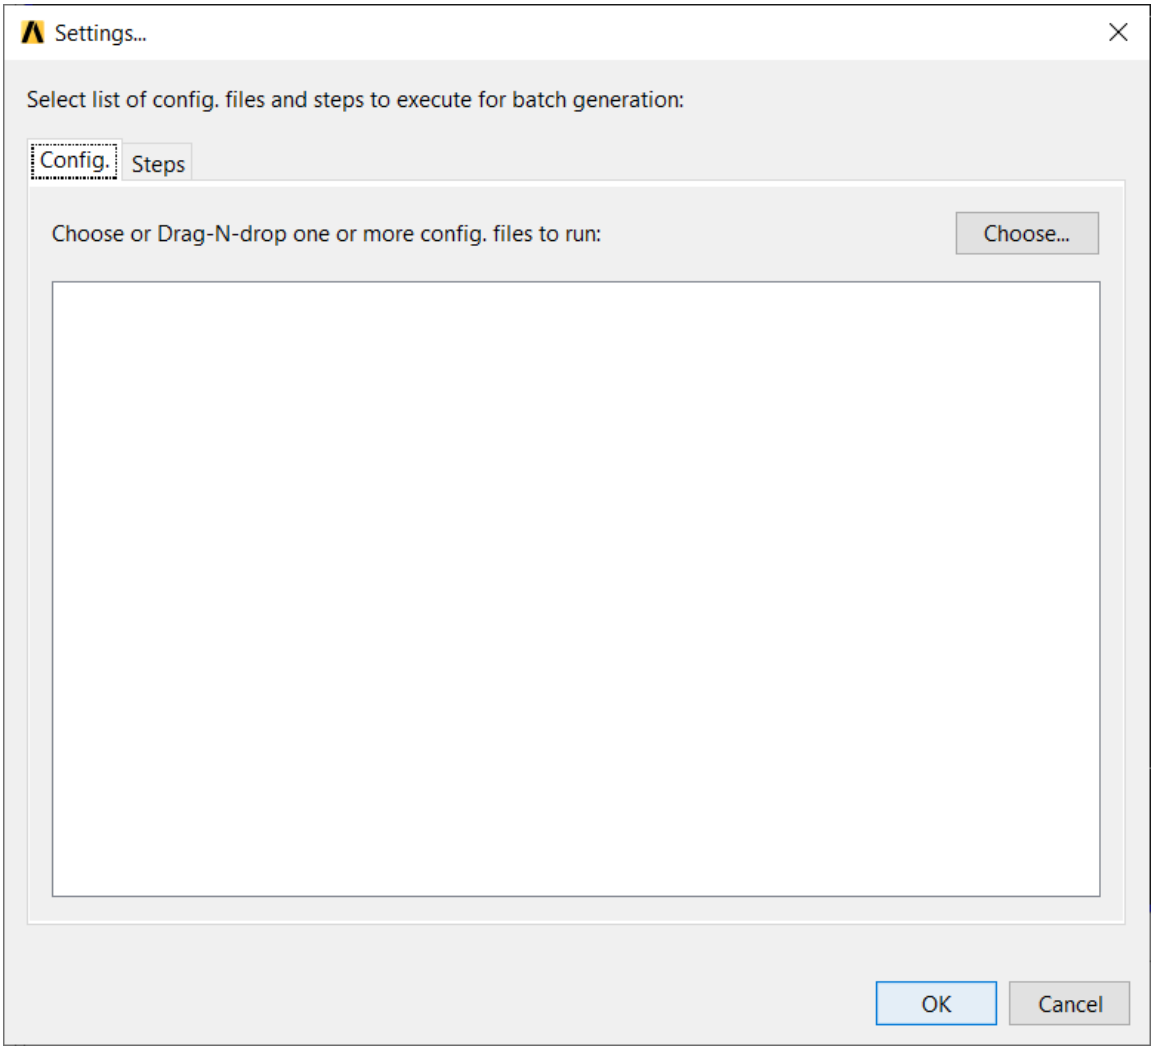
To run batch modeling from the SPISim user interface:

1. Select IBIS > Batch Model Generation



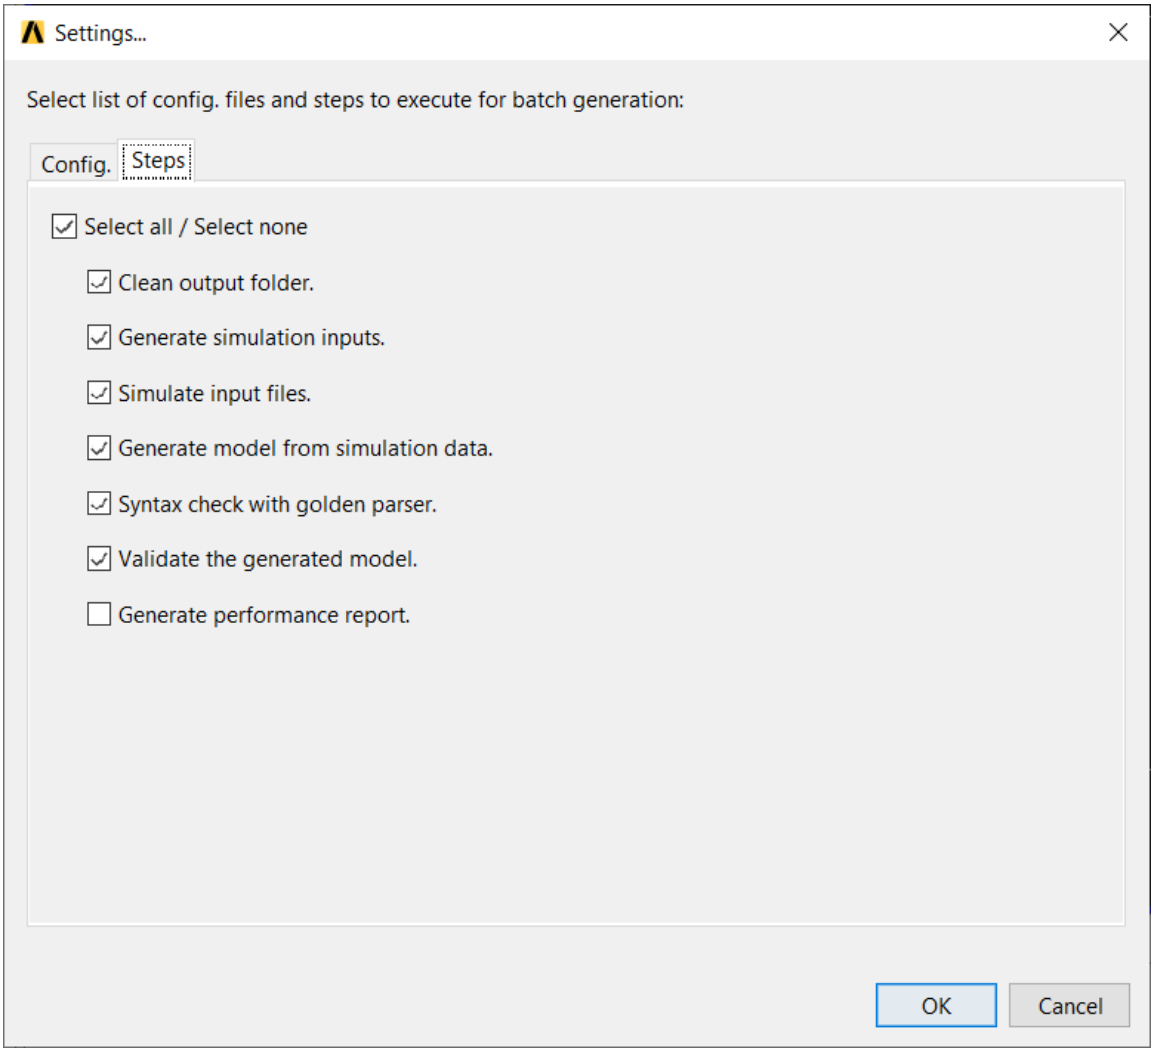
2. Use the **Choose** button, or Drag-N-drop one or more config files to run.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Select the steps to be run and click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For headless mode, the following three command syntaxes are supported:

1. `SPISimJNI_WIN64.exe IBISFLOW -v CFGFILE=XXX.cfg,GENSTEP=ALL`
2. `SPISimJNI_WIN64.exe IBISFLOW -v CFGFILE=XXX.cfg,GENSTEP=UNTIL:SIMULATE`
3. `SPISimJNI_WIN64.exe IBISFLOW -v CFGFILE=XXX.cfg,GENSTEP="CLEANWSP;GENINPUT"`

`GENSTEP` is the parameter name for the steps to be executed.

`ALL` means run the full flow from begin to end.

`UNTIL:XXXX` means run up to and include the `XXXX` step.

`XXXX` is one of the defined commands mentioned above.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The last syntax list various commands to be run separated with semi-column ";" One example of the last syntax's application is that user may choose to run until all inputs are generated, then simulate outside the flow (e.g. using parallel simulation workgroup), then continue the flow to start `GENMODEL` and finish up the modeling process.

SPISim SPro

SPISim SPro provided S-parameter analysis and viewing of waveforms, SPro can generate configurable time-domain and frequency-domain plots.

> **Note:** A full channel operating margin (COM) analysis summary report can now be generated either through **SPISim** (on the **S-Param** menu, select **Generate Report** > **Channel operating margin**) or through **Electronic Desktop** (on the **Circuit** menu, select **Toolkit** > **[Beta] COM**). Refer to **Generate a COM Analysis Report** for details.

See the Online Help for a video on this module.

In this section:

Generate a Compliance Analysis Report

Generate a Compliance Analysis Report Using Only a Non-GUI Batch Command Line

Generate a Compliance Analysis Report Using a Batch Command Line to Invoke the User Interface

Generate a Compliance Analysis Report

SPISim can generate a compliance report for the following standards:

IEEE 802.3 25G AUI C2M	**IEEE 802.3 50GAUI-1 C2M**
IEEE 802.3 25GAUI C2C	**IEEE 802.3 50GAUI-1 C2C**
IEEE 802.3 2G5BASE CR	**IEEE 802.3 50GBASE CR**
OIF CEI 28G CEI-25-LR	**OIF CEI 28G CEI-28G-MR**
OIF CEI 56G CEI-56G-LR-PAM4	**IEEE 100_1000_BaseT1_CMC**
IEEE 100_1000_BaseT1_MDI	**UCIe 1.1 Channel**
MIPI DPHY Channel	**MIPI CPHY Channel**

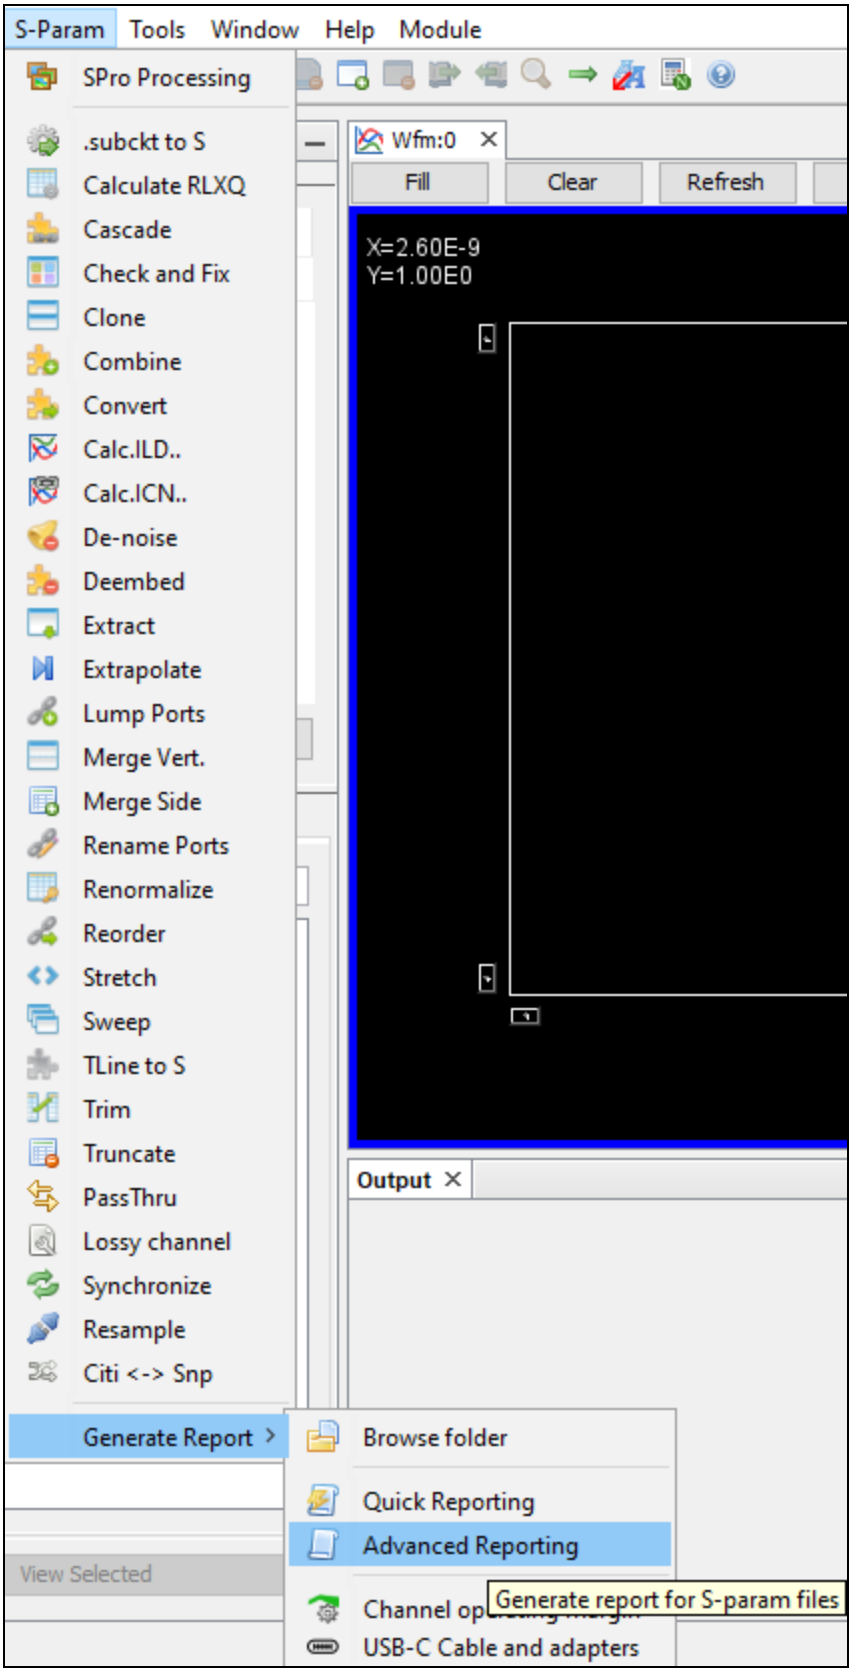
Complete the following steps to create a compliance analysis report.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: A report can also be generated using batch command line. Refer to Generate a Compliance Analysis Report Using Online a Non-GUI Batch Command Line or Generate a Compliance Analysis Report Using a Batch Command Line to Invoke the User Interface for details.

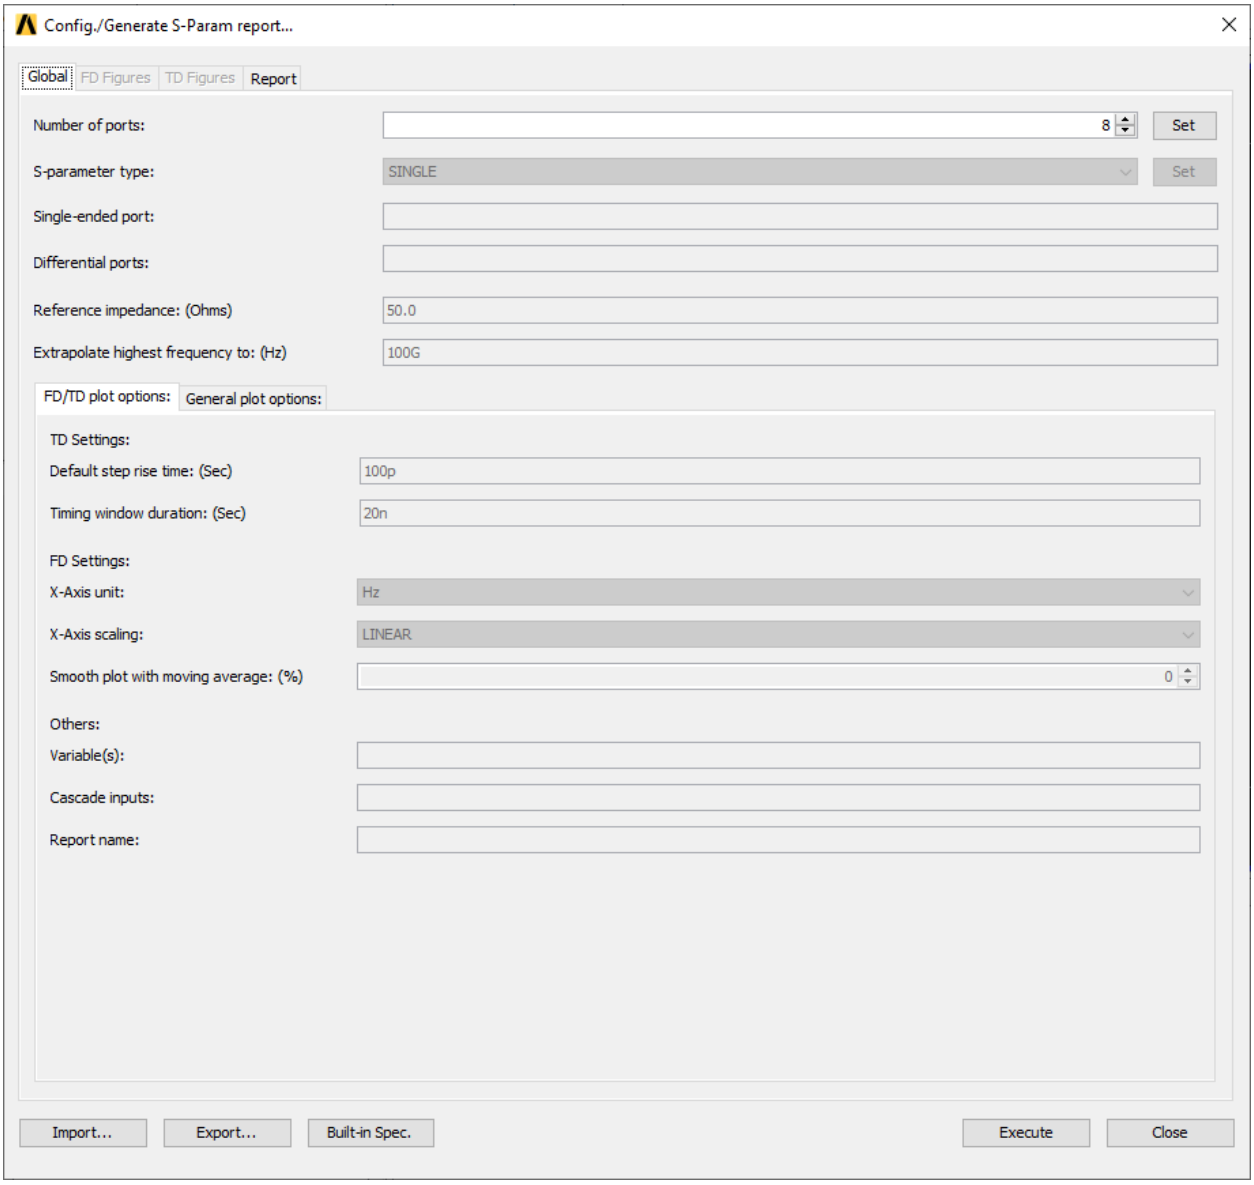
1. From **S-Param**, select **Generate Report** > **Advanced Reporting** to open the **Config./Generate S-Param report...** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Click **Built-in Spec.** to open the **Load built-in spec. template...** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The **Built-in Spec.** option will populate the **Config./Generate S-Param report...** window with the appropriate parameters. If the user selects either an **OIF** or **MIPI CPHY Channel** built-in spec template, follow these additional steps.

From the **Global** tab, select the correct **Number of ports** (i.e., *.s12p* for **OIF**, *.s6p* for **MIPI CPHY Channel**). Then click **Set**.

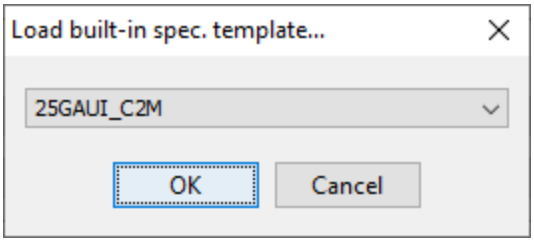
The **OIF** built-in spec templates assume input will be a 12-port file (i.e., *s12p*), with first and third pair for aggressors and second (i.e., central) pair for signal traces. At least four ports are required, or the user will need to import a modified built-in spec. template file (i.e., *.tpl*) to continue processing regardless. With the *.s4p* files arranged in "Even-Odd" mode, it will not be necessary to import a modified *.tpl* file.

The **MIPI CPHY Channel** built-in spec template assumes input will be a 6-port file (i.e., *.s6p*), and individually targets each pair. Users may need to extract one or more *.s4p* files before processing (e.g., AB, from port (1, 2, 4, 5), AC from port (1, 3, 4, 6), or BC from port (2, 3, 5, 6). With the *.s4p* files arranged in "Even-Odd" mode, it will not be necessary to import a modified *.tpl* file.

Choosing **8** (i.e., *.s8p*) ports will not work for **OIF** or **MIPI CPHY Channel** built-in spec templates. A modified *.tpl* file will need to be imported.

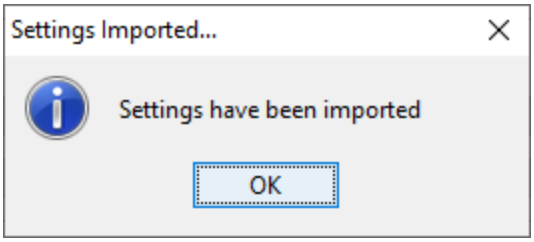
For all advanced template modification, please contact **Ansys Support**.

3. Select a built-in spec template of the appropriate compliance protocol from the drop-down menu. Then click **OK** to close the **Load built-in spec. template...** window and populate the **Config./Generate S-Param report...** window with the template's parameters. When the process completes, a new window appears confirming the import.

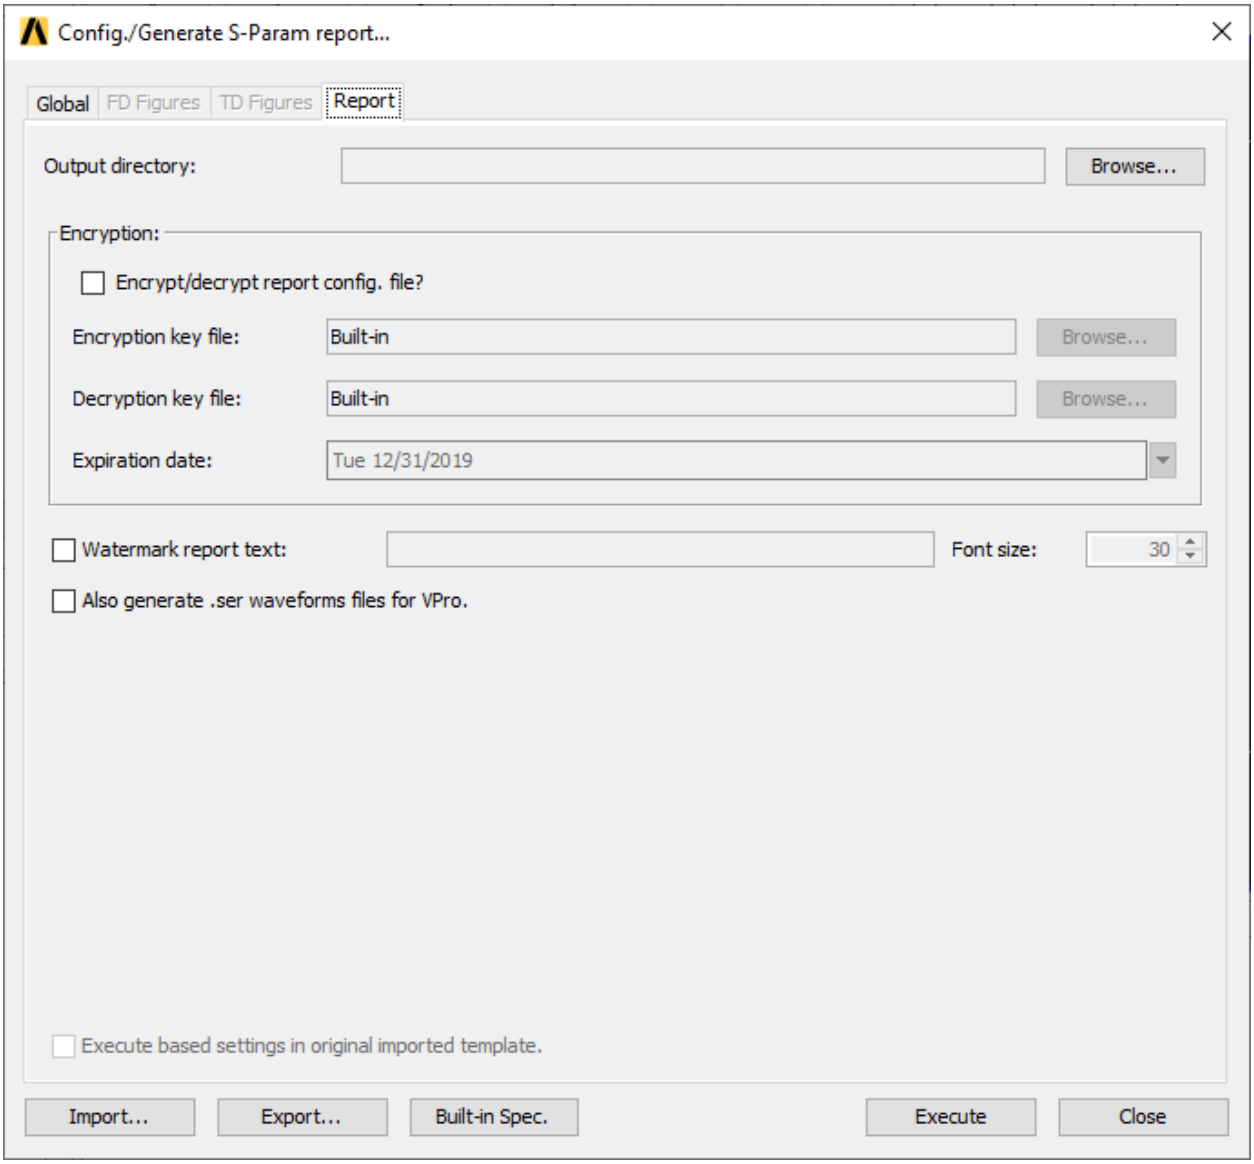


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click **OK**.

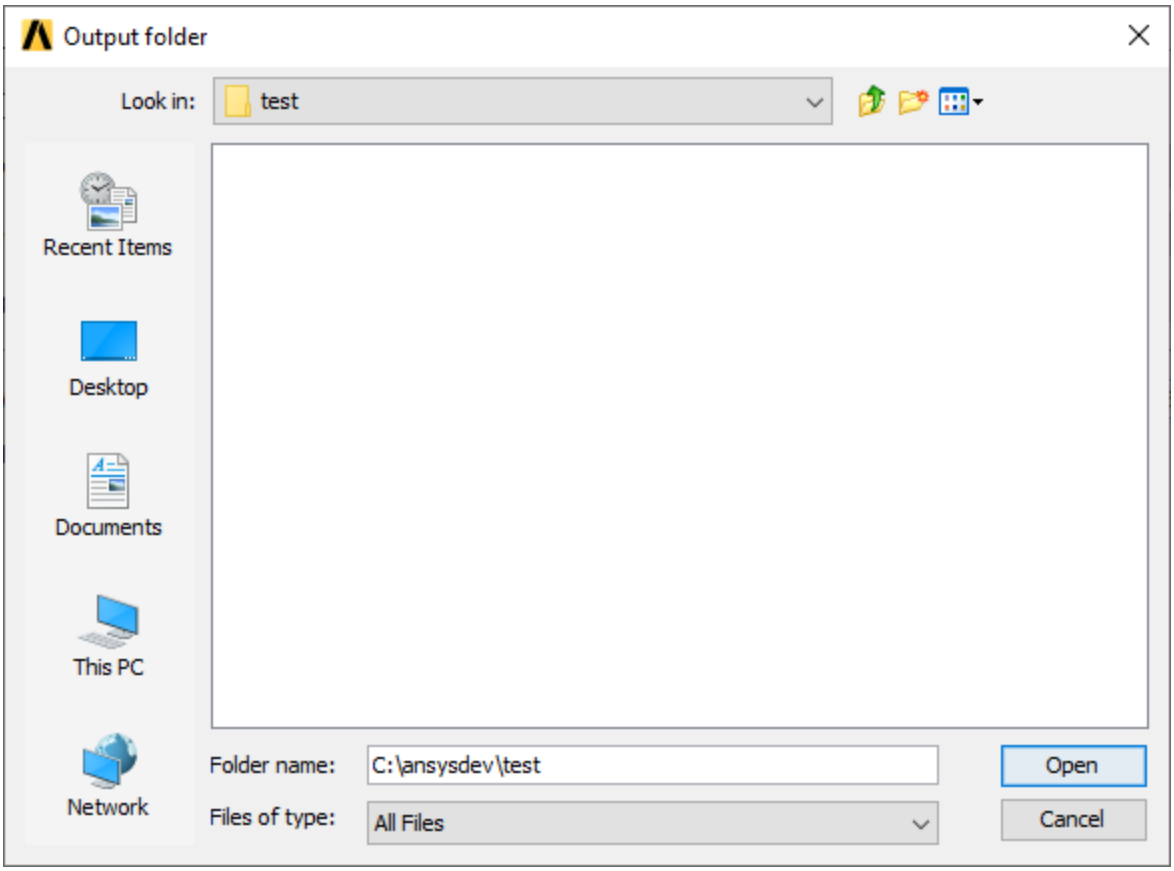


5. Click the **Report** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

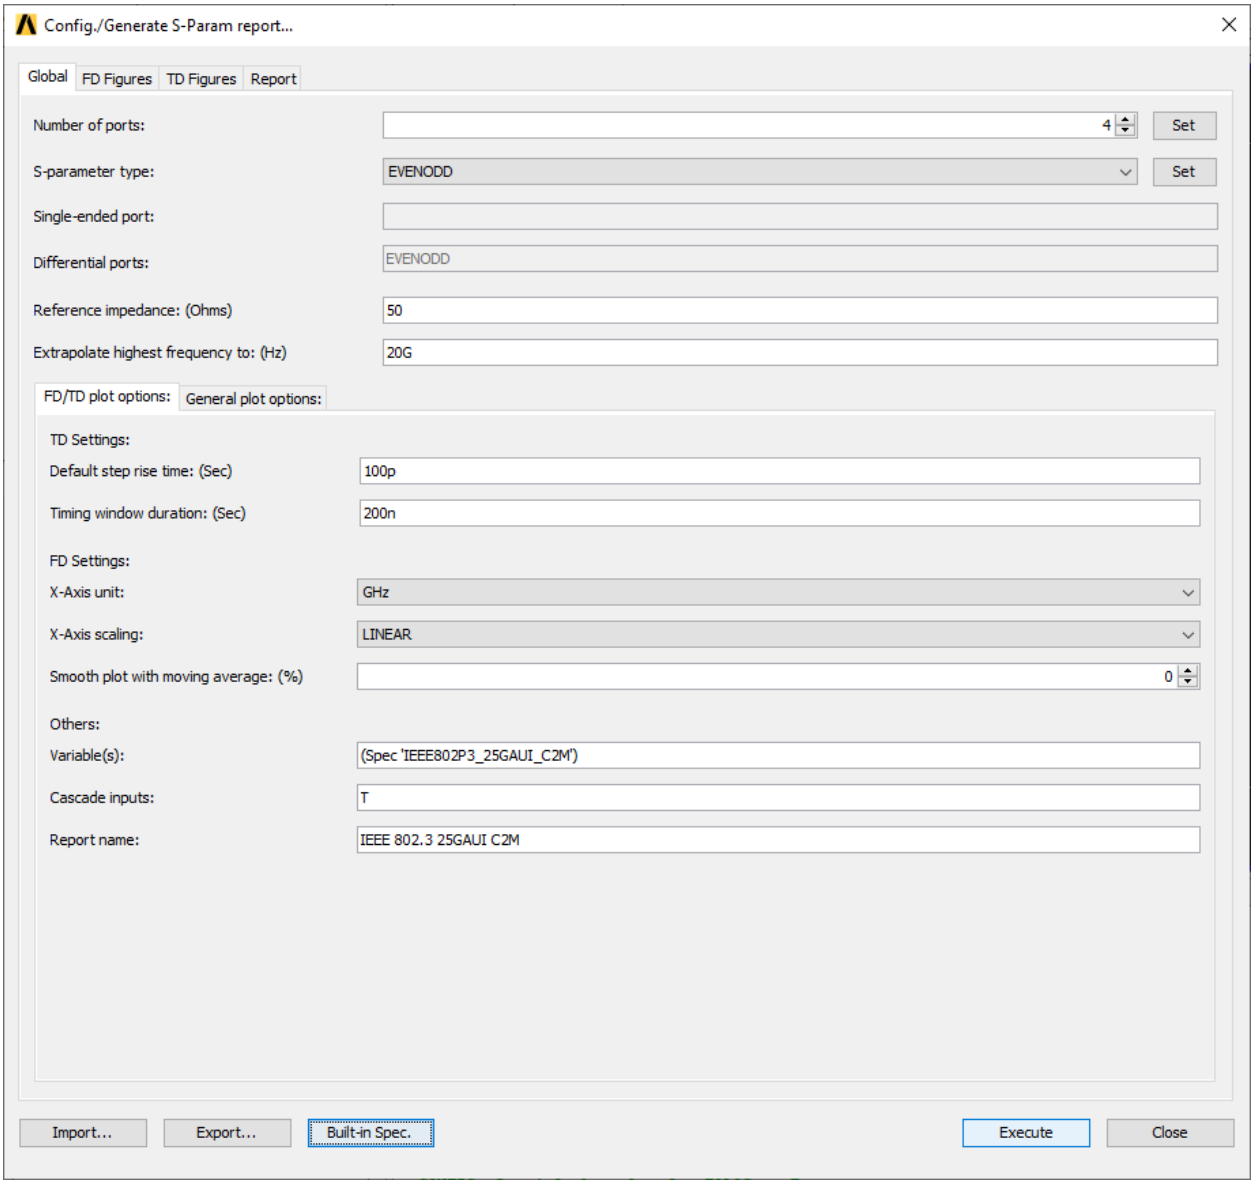
6. Click **Browse...** adjacent to **Output directory** to open an explorer window. Navigate to the appropriate output folder. Then click **Open** to select the folder and close the explorer window.



> **Note:** If no **Output directory** is chosen, the *.snp* file directory will be used as the **Output directory**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

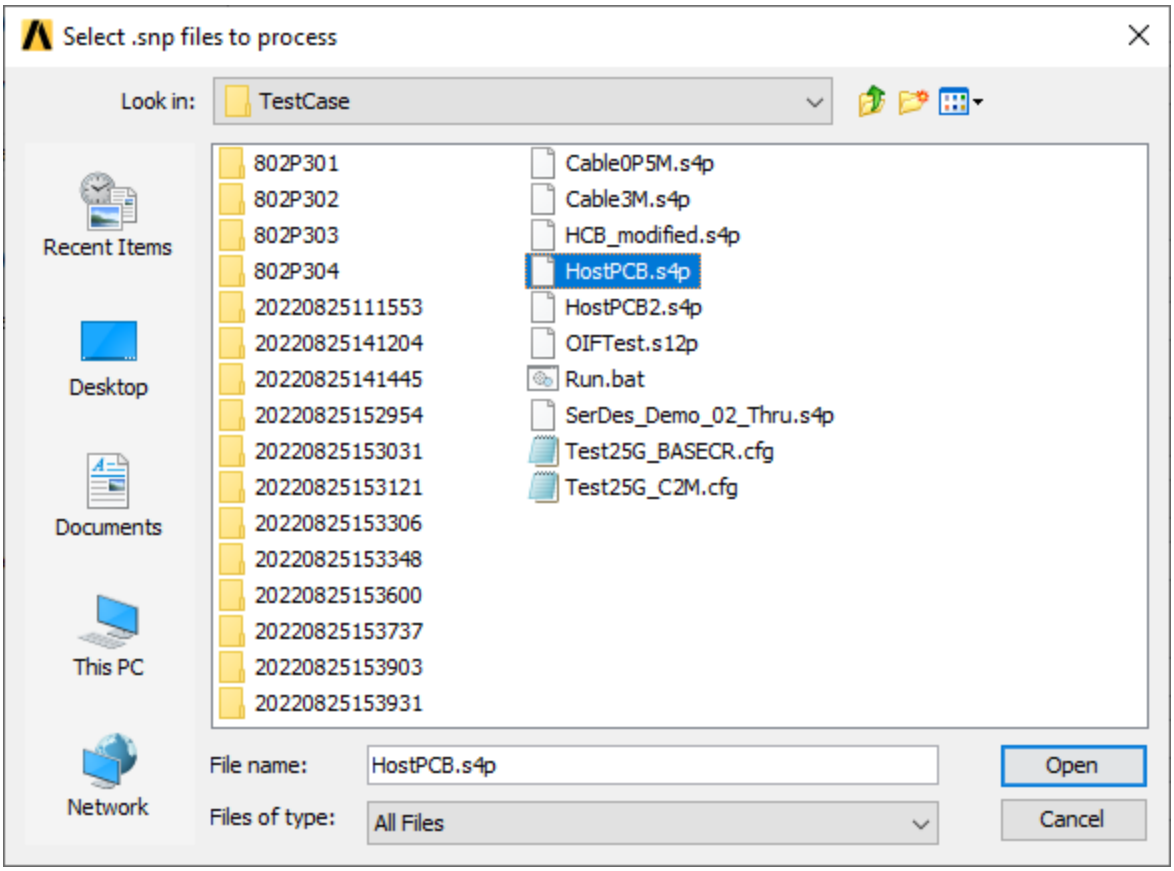
7. Click **Execute**.



8. Depending on the template chosen in step 3., one of four windows will appear:

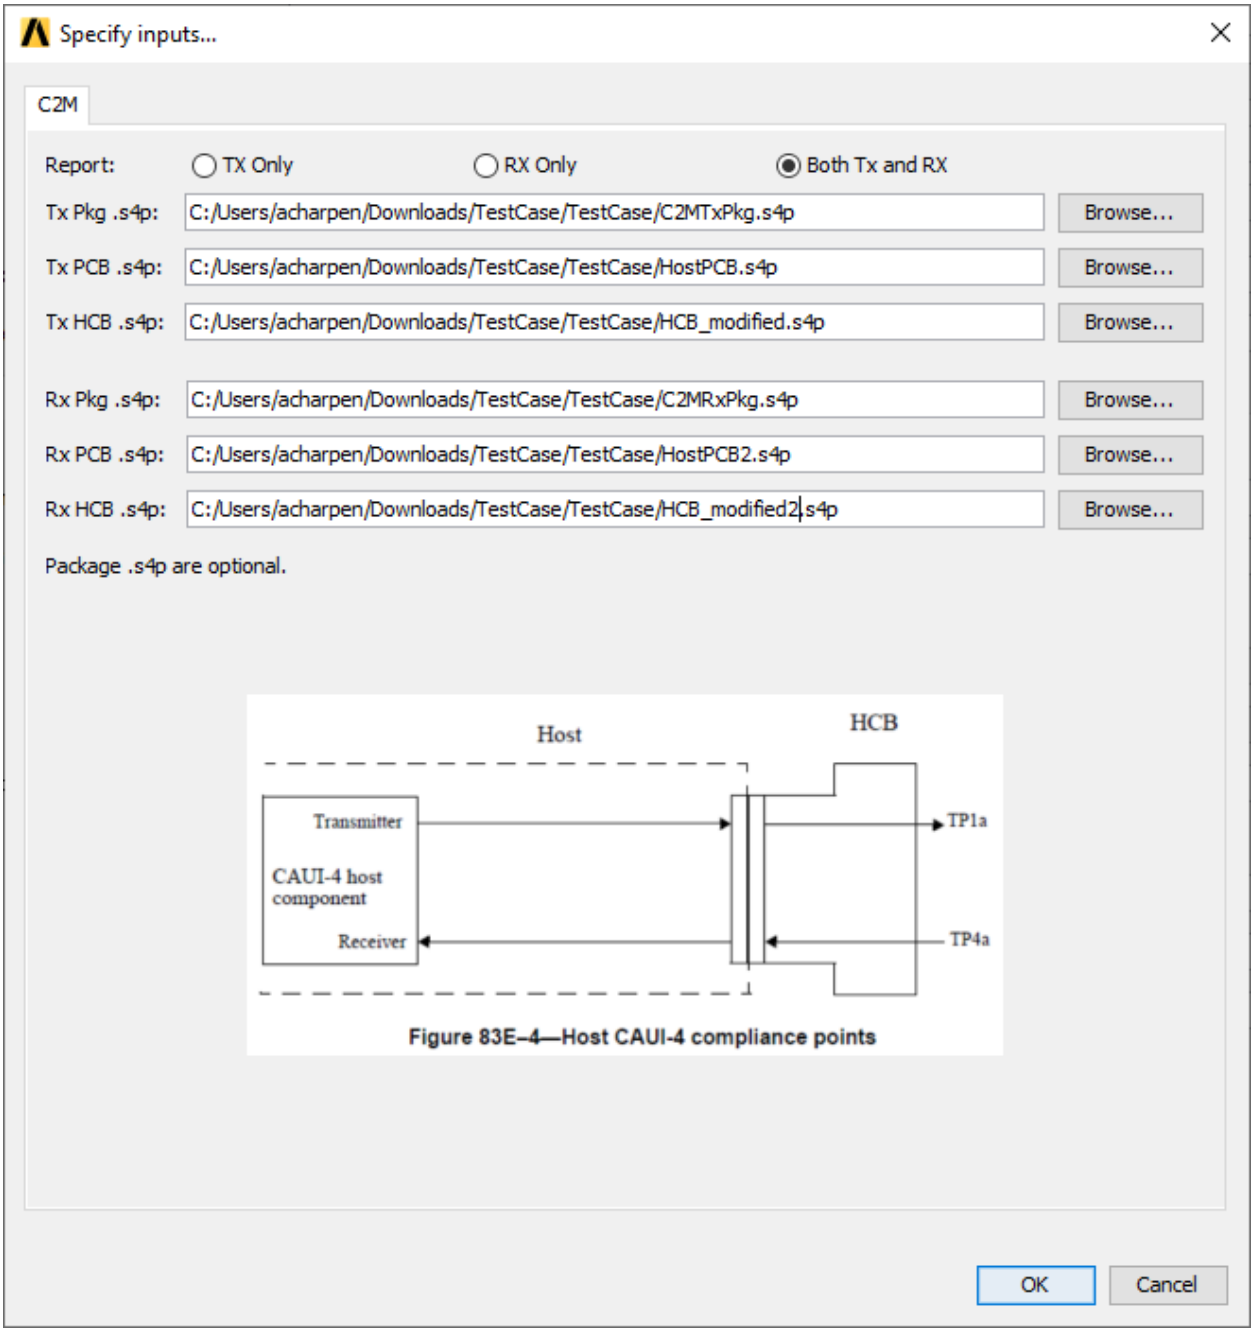
   i. **All OIF, IEEE 802.3 25G/50G C2C, 100BT/1000BT Base-T1 CMC/MDI, MIPI CPHY, and MIPI DPHY built-in spec templates** - an explorer window will appear. Navigate to the appropriate .sn*p* file(s) (e.g., .*s12p*). Select one or more to input, then click **Open** to begin generating a report. Every .sn*p* file will be treated equally and processed in order. The **MIPI DPHY** Channel option requires one or more .s4p file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



ii. **IEEE 802.3 25G/50G C2M built-in spec templates** - a **Specify inputs...** window will appear. Select a **Report** type (i.e., **TX Only**, **RX Only**, or **Both Tx and RX**) to activate and deactivate the appropriate rows. Then use the adjacent **Browse...** buttons in the enabled columns to select the appropriate *.s4p* files (e.g., **Tx Pkg *.s4p***, **Tx PCB *.s4p***, **Tx HCB *.s4p***, **Rx Pkg *.s4p***, **Rx PCB *.s4p***, and/or **Rx HCB *.s4p***). **PCB** and **HCB *.s4p*** files **must** be provided. If no **Pkg *.s4p*** is provided, only **PCB** and **HCB*.s4p*** files will be used to generate a cascaded file and form channel *.s4p*. If a **Pkg *.s4p*** is provided, all three files will be used to process disparate sections of the compliance report. The generated report will only contain data relevant to the **Report** selection made in this window (i.e., **TX Only**, **RX Only**, or **Both Tx and RX**)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



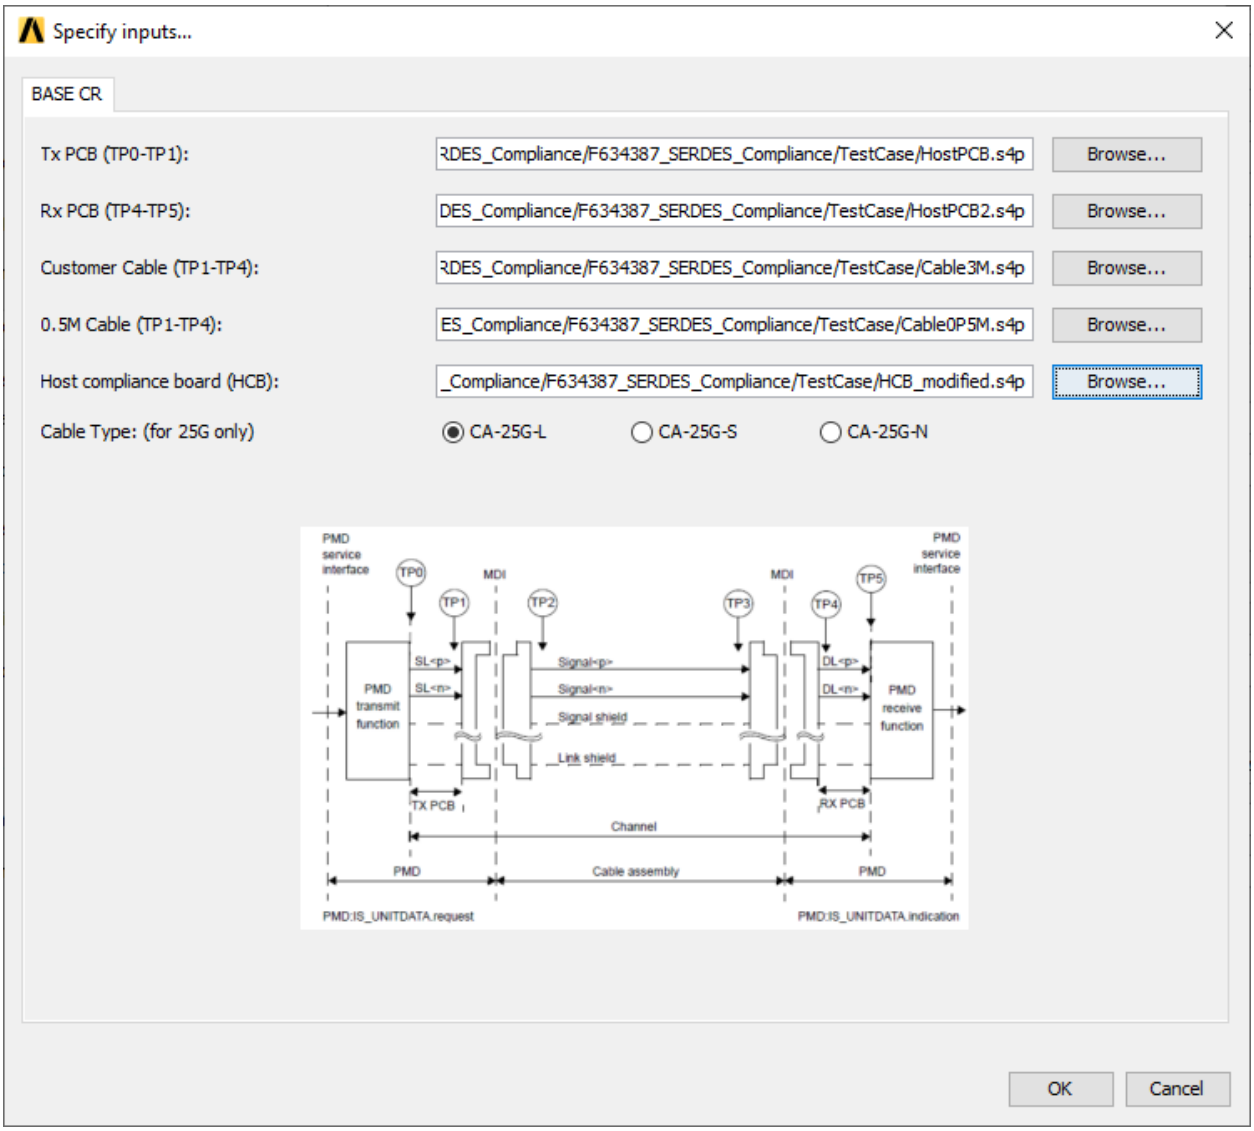
Note:

The **Host TF** *.s4p* file must be valid. If an **HCB** *.s4p* file is unavailable, no cascaded file can be generated and the **Host TF** *.s4p* will be used to process the entire compliance report.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

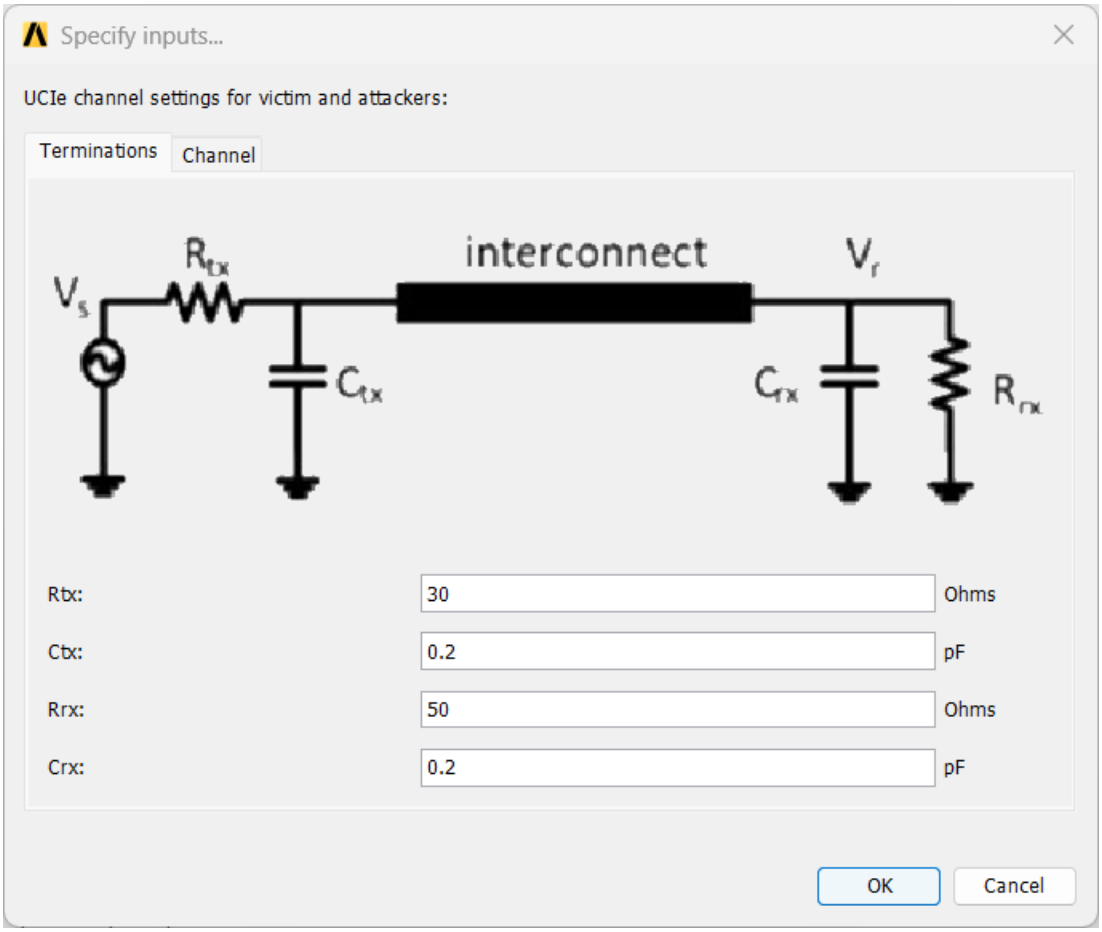
iii. **IEEE 802.3 25G/50G Base CR built-in spec templates** - a **Specify inputs. . ..** window will appear. Use the adjacent **Browse...** buttons to select the appropriate **Tx PCB**, **Rx PCB**, **Customer Cable**, **0.5M Cable**, and **Host compliance board** *.s4p* files. Then select the **Cable Type** (i.e., **CA-25G-L**, **CA-25G-S**, or **CA-25G-N**).

> **Note:**
>
> The order of the inputs becomes important when the compliance report is completed via non-GUI batch command line. Refer to **"Generate a Compliance Analysis Report" on page 16-54**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

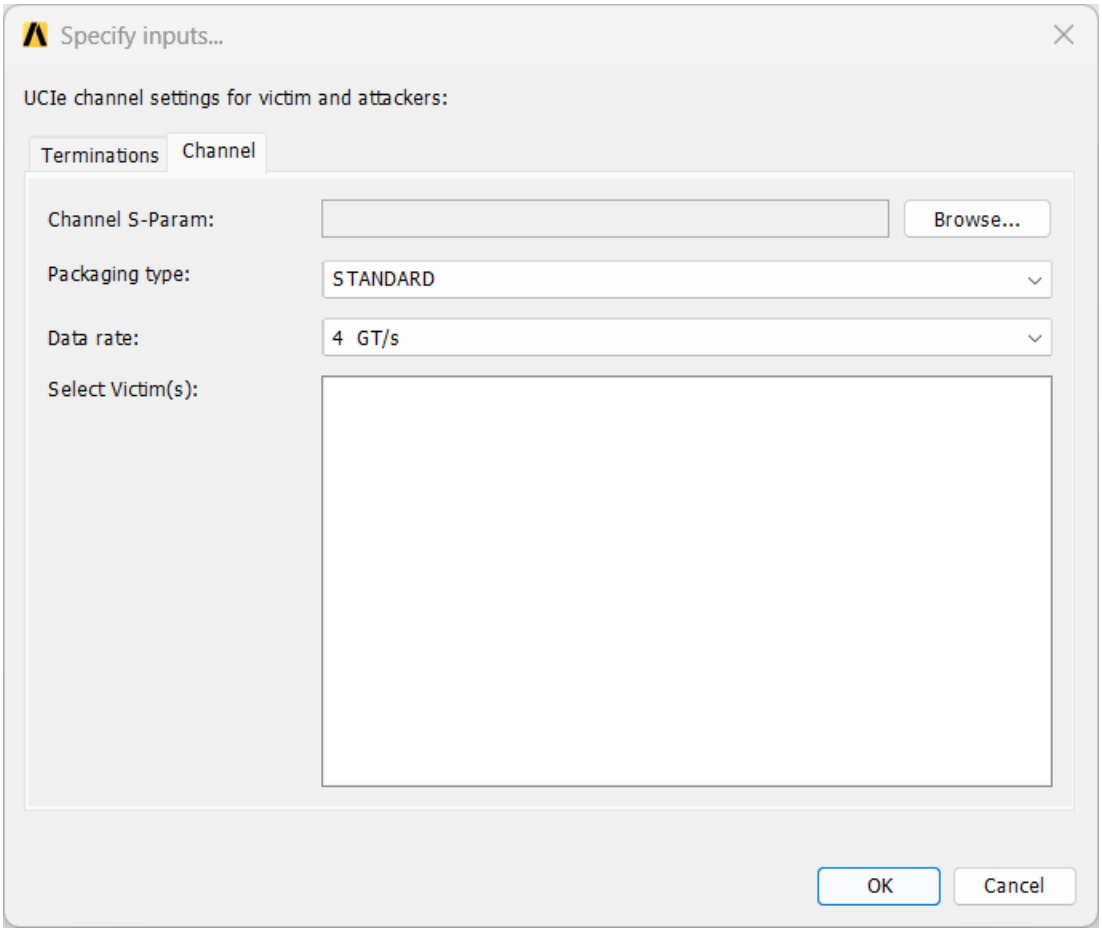
iv. **UCIe 1.1 Channel**- a **Specify Inputs...** window a will appear. Use the **Termination** tab to specify the R/C values on the Tx and Rx sides.



Use the **Channel** tab to specify the *.snp* file path and select the package type (standard or advanced), the data rate, and the Rx ports to be analyzed.

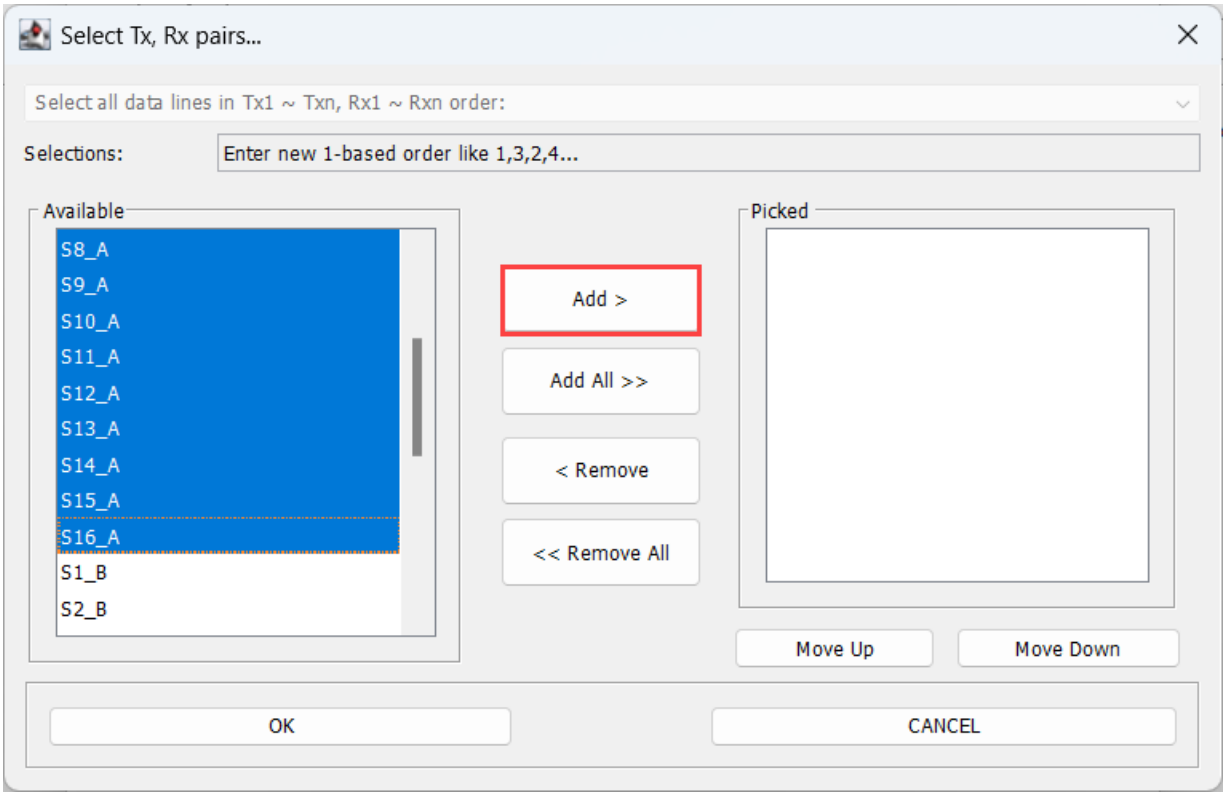
> **Note:** One or more Rx ports must be specified or the report will not be generated.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



After selecting the Channel S-Param file, a dialog to specify Tx, Rx pairs will pop up. From the **Available** group box, select all Tx ports first and add them to the **Picked** group box on the right, then select all Rx ports and add them to the **Picked** group box; SPISim will consider the first half of the list of ports in the **Picked** group box as Tx and the second half as Rx. Note, the i-th Tx and i-th Rx ports must be on the same channel.

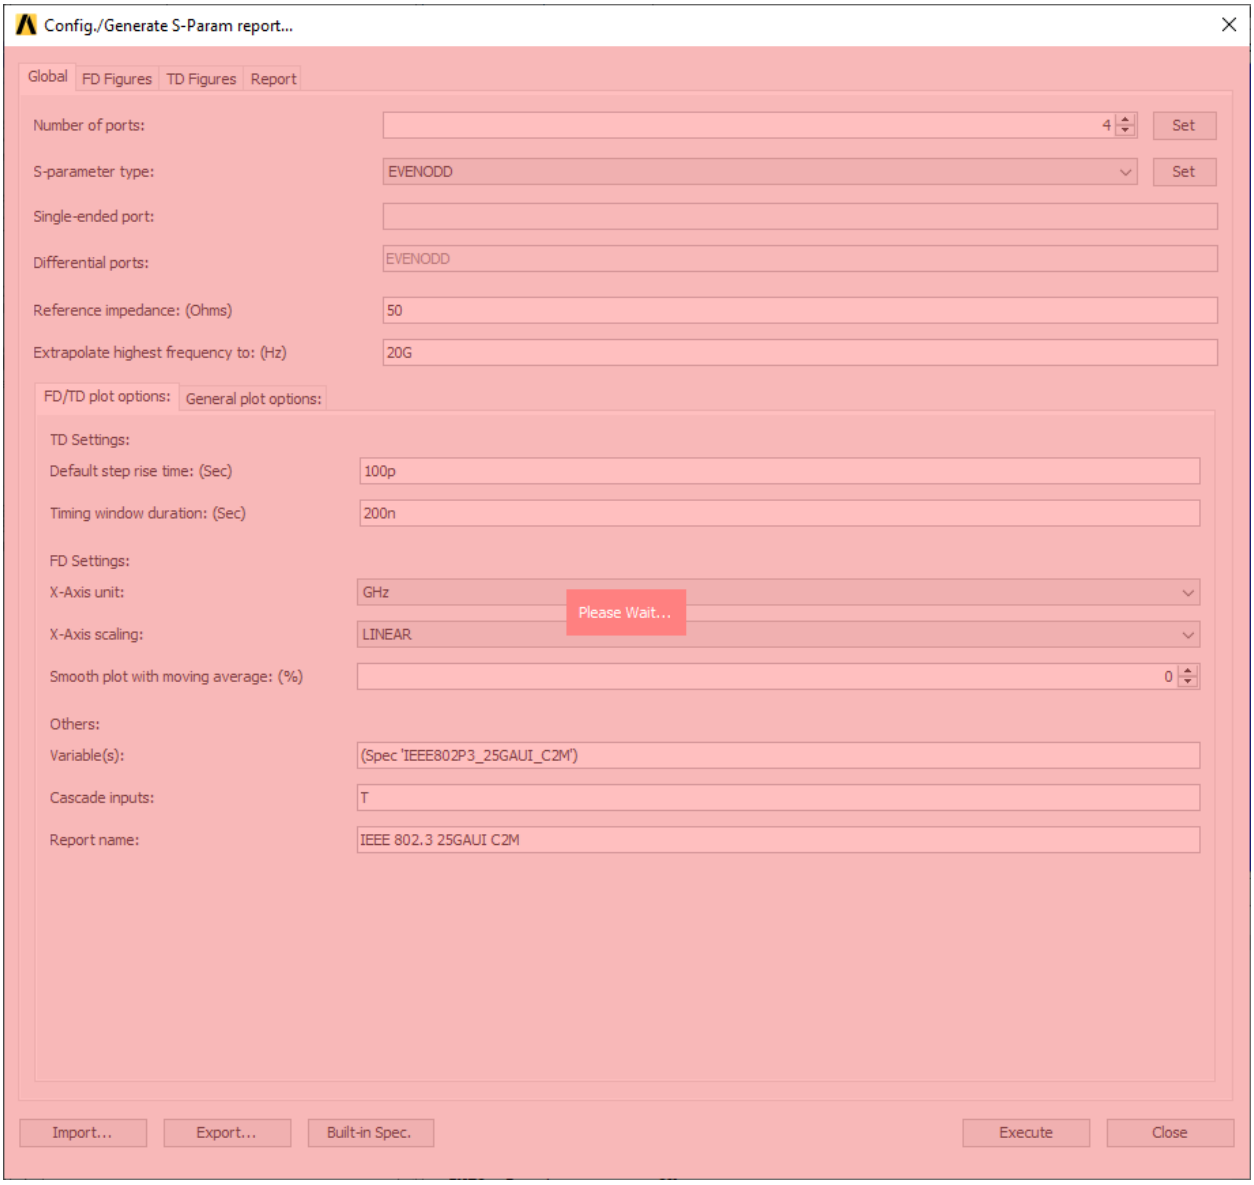
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



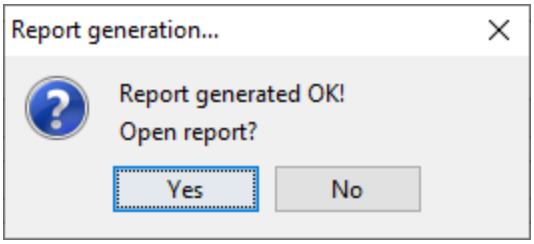
By default, all the Rx ports will be selected for default calculation target in the UCIe dialog. They can be deselected to skip their VTF_LOSS calculation.

9. Click **Open** or **OK**, depending on the window that opened in step 8, to close the window and begin calculation.
10. The **Config./Generate S-Param report...** window will turn red and the words **Please Wait...** will appear momentarily.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



11. When the report is ready, a **Report generation...** window appears.

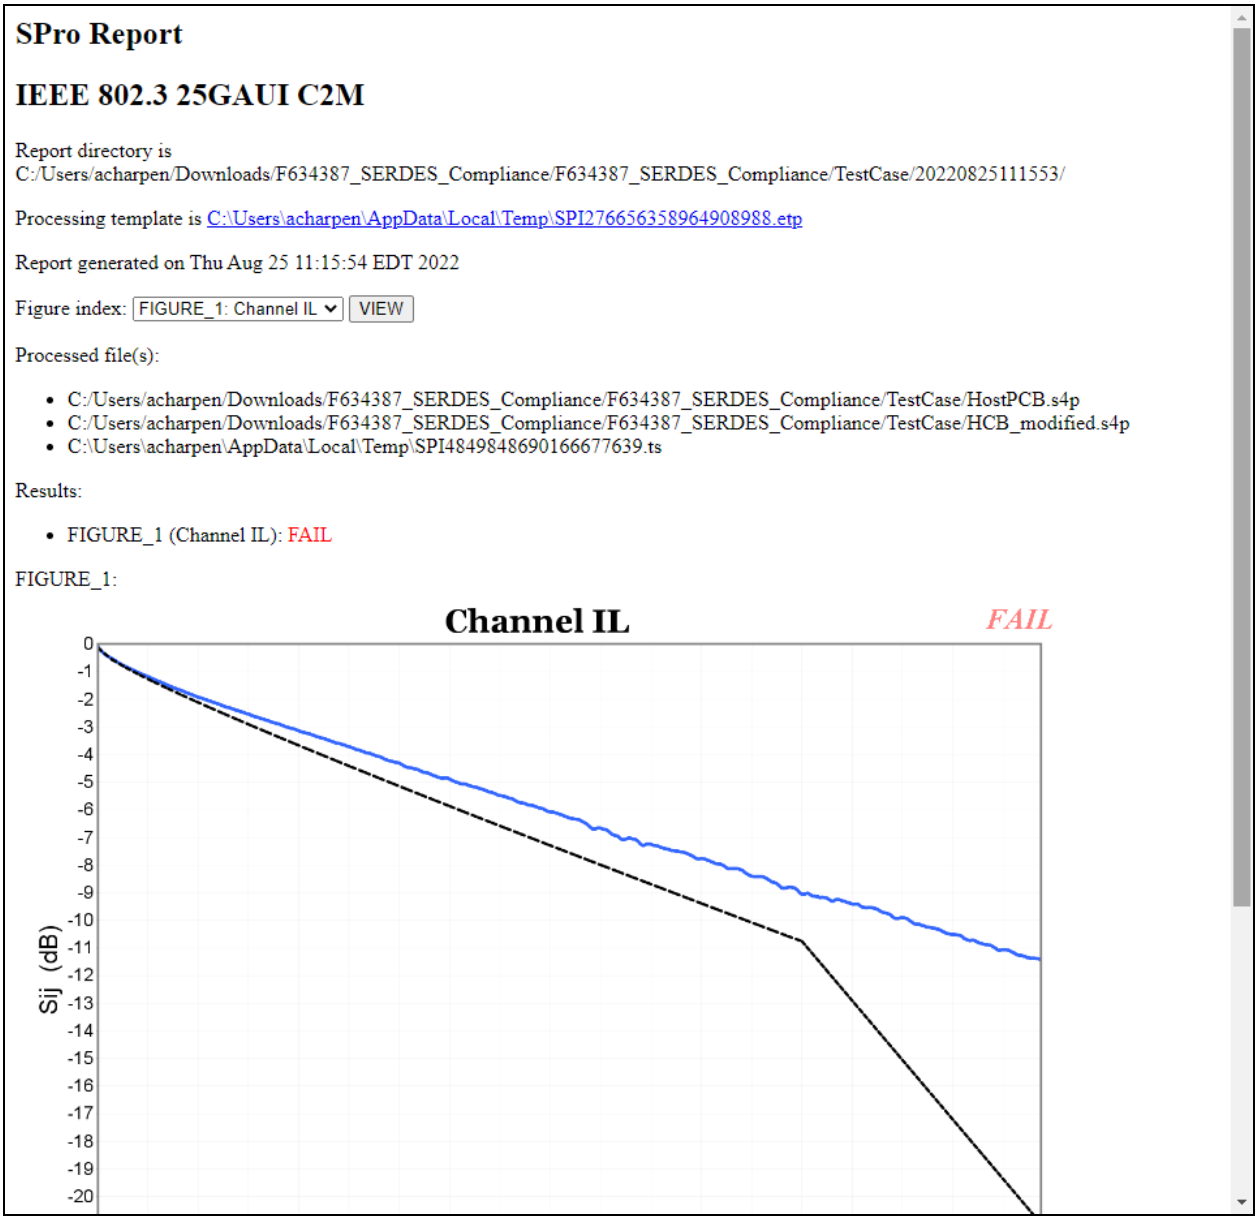


Click **Yes** to open the report in the system's default browser. The second line in the report

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

heading states the compliance protocol that was tested. The report contents will vary depending on the chosen template and the number of input files.

The MIPI DPHY Channel report will provide plots for speeds <= 1.5 GHz, and above 1.5 GHz, choose the appropriate plot for the data.



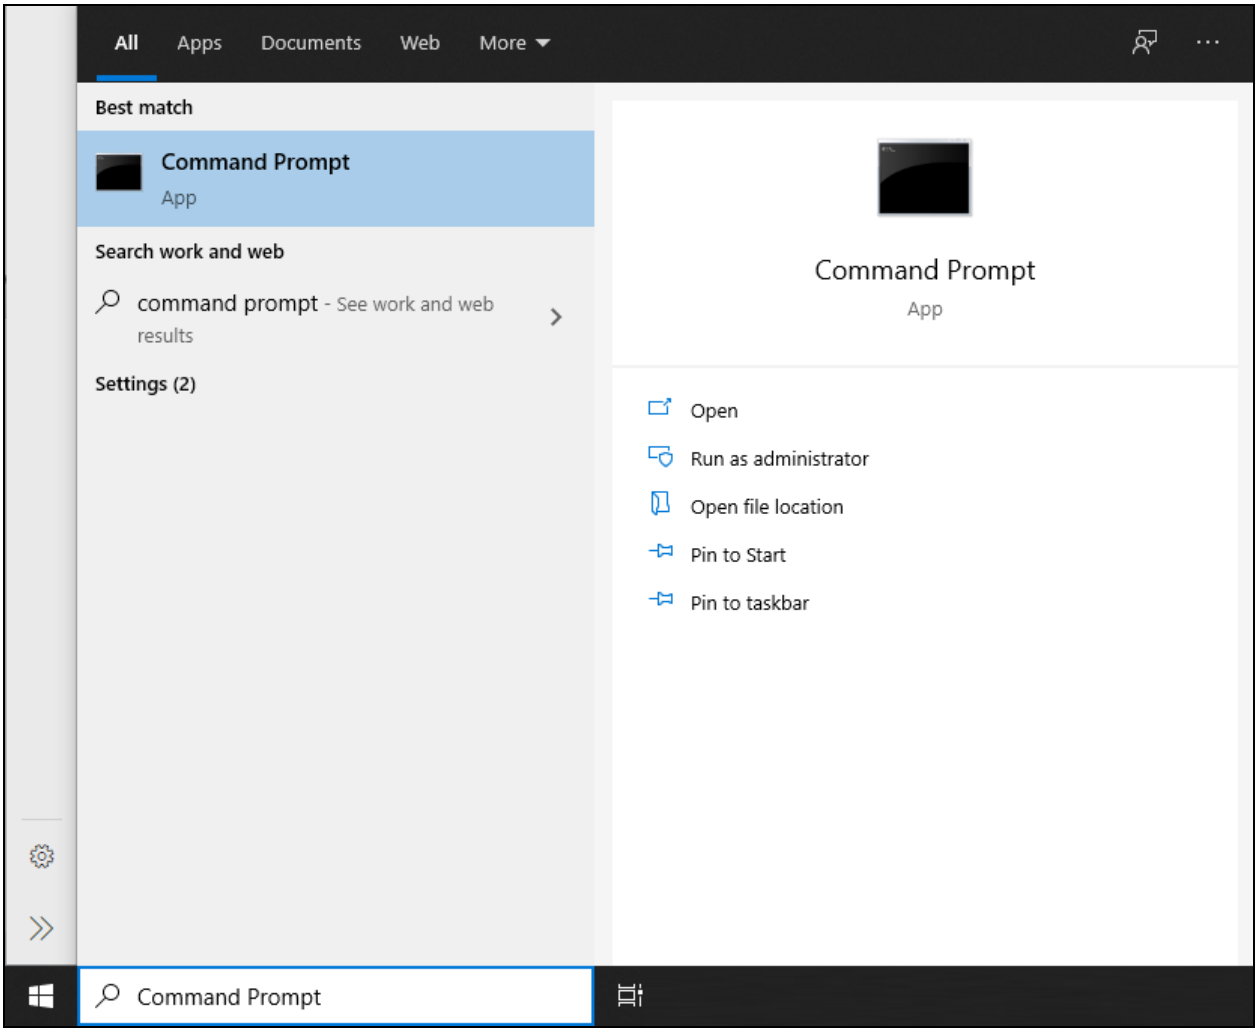
12. The **Config./Generate S-Param report...** window remains open beneath the browser window. To generate a report with different specs, simply repeat steps 2-10.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Generate a Compliance Analysis Report Using Only a Non-GUI Batch Command Line

Complete the following steps to run a compliance analysis report using only a non-GUI batch command line.

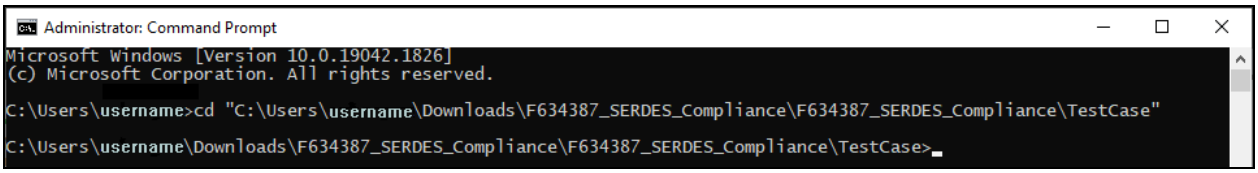
1. Run a command prompt (e.g., in a Windows environment, type *Command Prompt* into the **Search Bar** and press **Enter** to open a **Command Prompt** window).



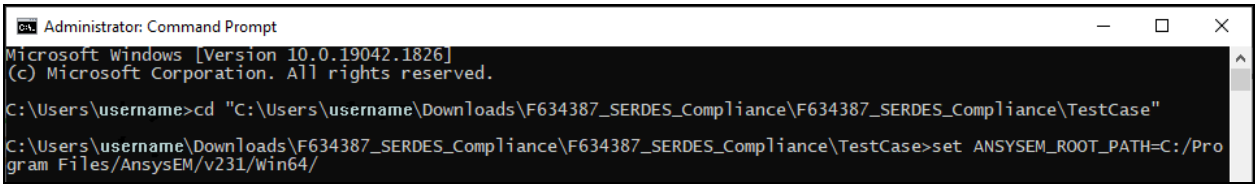
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: The following example assumes **Electronics Desktop** is installed in the default directory in a Windows operating system environment. Structure the command appropriately for a different directory, path, and/or operating system, as necessary. Do **not** move the ***SPISimJNI_WIN64.exe*** executable file. The executable file relies on the relative path to the **Electronics Desktop** installation folder.

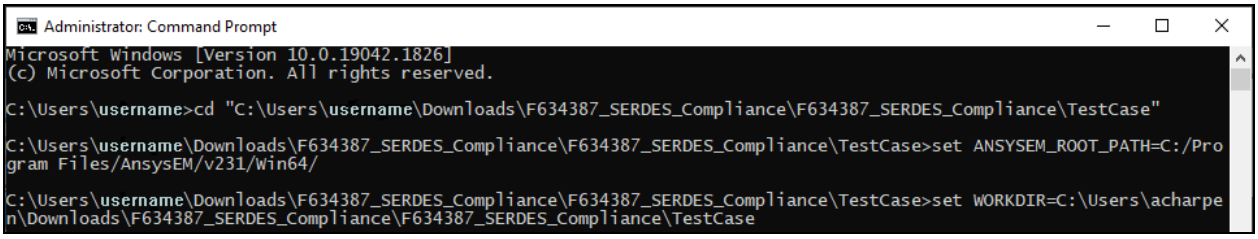
2. Change the current directory by entering the following command: `cd "[The direct path to the appropriate .sNp file(s).]"`. Then press **Enter**.



3. Set the Ansys installation root directory by entering the following command: `set ANSYSEM_ROOT_PATH="C:\Program Files\ANSYS Inc\v252\AnsysEM\"`. Then press **Enter**.



4. Set the report output directory by entering the following command: `set WORKDIR=[The direct path to an appropriate directory where a report will be output.]`. Then press **Enter**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: Depending on the type of compliance analysis report requested, adhere to the following additional instructions.

All OIF built-in spec templates - assume a *.s12p* file is used (first and third pair for aggressors, second pair for signal) in even-odd ordering scheme.

IEEE 802.3 25G/50G C2M built-in spec templates - specify up six input files. If six input files are not used, the missing inputs should be indicated by `NA` or `THRU`.

IEEE 802.3 25G/50G Base CR built-in spec templates - specify one of three cable types (i.e., `CBTLTYPE`): `CA_25G_L`, `CA_25G_S`, `CA_25G_N`.

```
"%ANSYSEM_ROOT_PATH%spisim/spisim/modules/ext/SPISimJNI_Win64.exe"
REPORT --inp %WORKDIR%/HostPCB.s4p,%WORKDIR%/HostPCB2.s4p,%WORKDIR
%/Cable3M.s4p,%WORKDIR%/Cable0P5M.s4p,%WORKDIR%/HCB_modified.s4p
--val BUILTIN=25GBASE_CR,OUTPATH=%WORKDIR%/802P304,CBLTYPE=CA_25G_L
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Batch Mode

Users can input several .*sN*p files for analysis (i.e., batch mode).

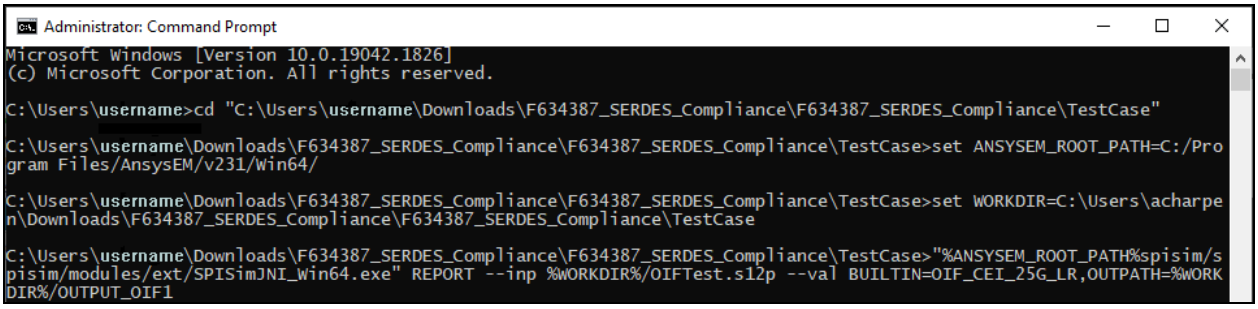
```
"%ANSYSEM_ROOT_PATH%spisim/spisim/modules/ext/SPISimJNI_Win64.exe"
REPORT --inp %WORKDIR%/OIFTest.s12p --val BUILTIN=OIF,OUTPATH=
%WORKDIR%/OUTPUT_OIF0
"%ANSYSEM_ROOT_PATH%spisim/spisim/modules/ext/SPISimJNI_Win64.exe"
REPORT --inp %WORKDIR%/OIFTest.s12p --val
BUILTIN=OIF_CEI_25G_LR,OUTPATH=%WORKDIR%/OUTPUT_OIF1
"%ANSYSEM_ROOT_PATH%spisim/spisim/modules/ext/SPISimJNI_Win64.exe"
REPORT --inp %WORKDIR%/OIFTest.s12p --val
BUILTIN=OIF_CEI_28G_MR,OUTPATH=%WORKDIR%/OUTPUT_OIF2
"%ANSYSEM_ROOT_PATH%spisim/spisim/modules/ext/SPISimJNI_Win64.exe"
REPORT --inp %WORKDIR%/OIFTest.s12p --val
BUILTIN=OIF_CEI_56G_LR_PAM4,OUTPATH=%WORKDIR%/OUTPUT_OIF3
```

When creating batch analysis reports of certain types, adhere to the following additional instructions.

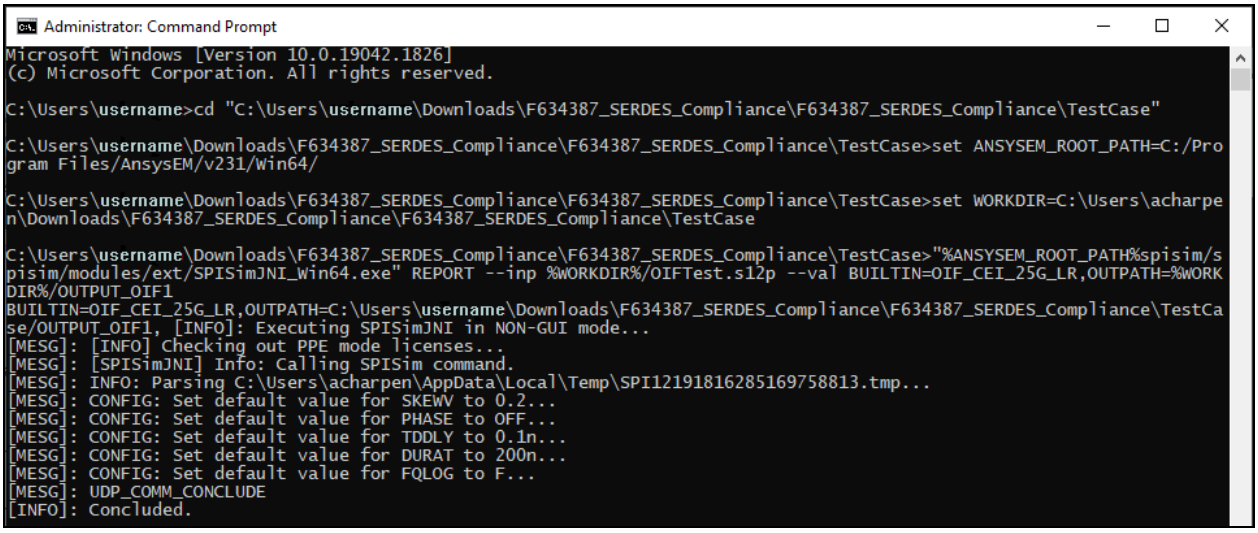
- **IEEE 802.3 25G/50G C2M built-in spec templates** - input two *.s4p* files, ordered as follows:
  0: TP0-TP1 (PCB)
  1: TP1-TP2 (HCB)
- **IEEE 802.3 25G/50G Base CR built-in spec templates** - input up to five *s4p*files, ordered as follows:
  0: TP0-TP1 (Tx PCB)
  1: TP4-TP5 (Rx PCB)
  2: TP1-TP4 (Customer Cable)
  3: TP1-TP4 (0.5M Cable)
  4: TP1-TP2 (HCB)

5. Order a compliance analysis using a built-in spec template. by entering the following command: `"%ANSYSEM_ROOT_PATH%spisim/SPISim/modules/ext/SPISimJNI_Win64.exe" REPORT --inp %WORKDIR%/[Name and extension of the .sNp file to analyze (e.g., OIFTest.s12p).] --val BUILTIN=[The template to use for analysis (e.g., OIF_CEI_25G_LR)],OUTPATH=%WORKDIR%/OUTPUT_OIF1`. Then press **Enter**.

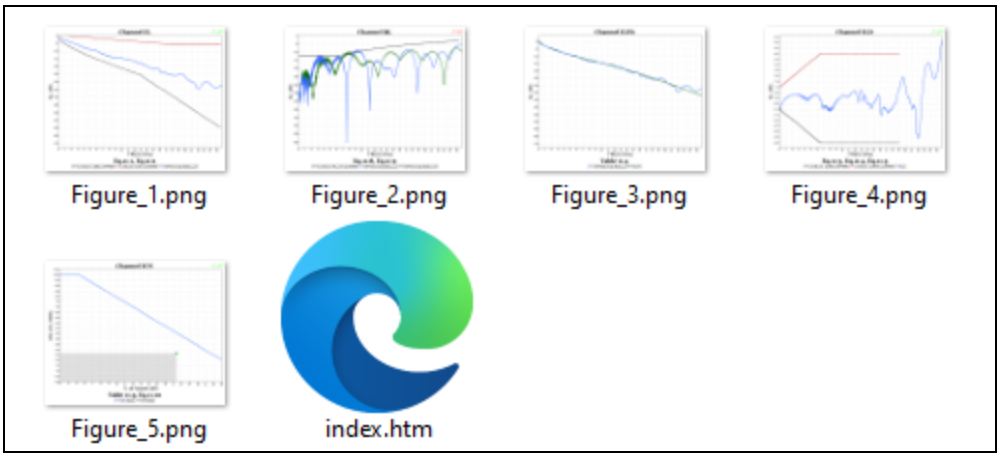
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



SPISim analyzes the input file using the chosen template's parameters.

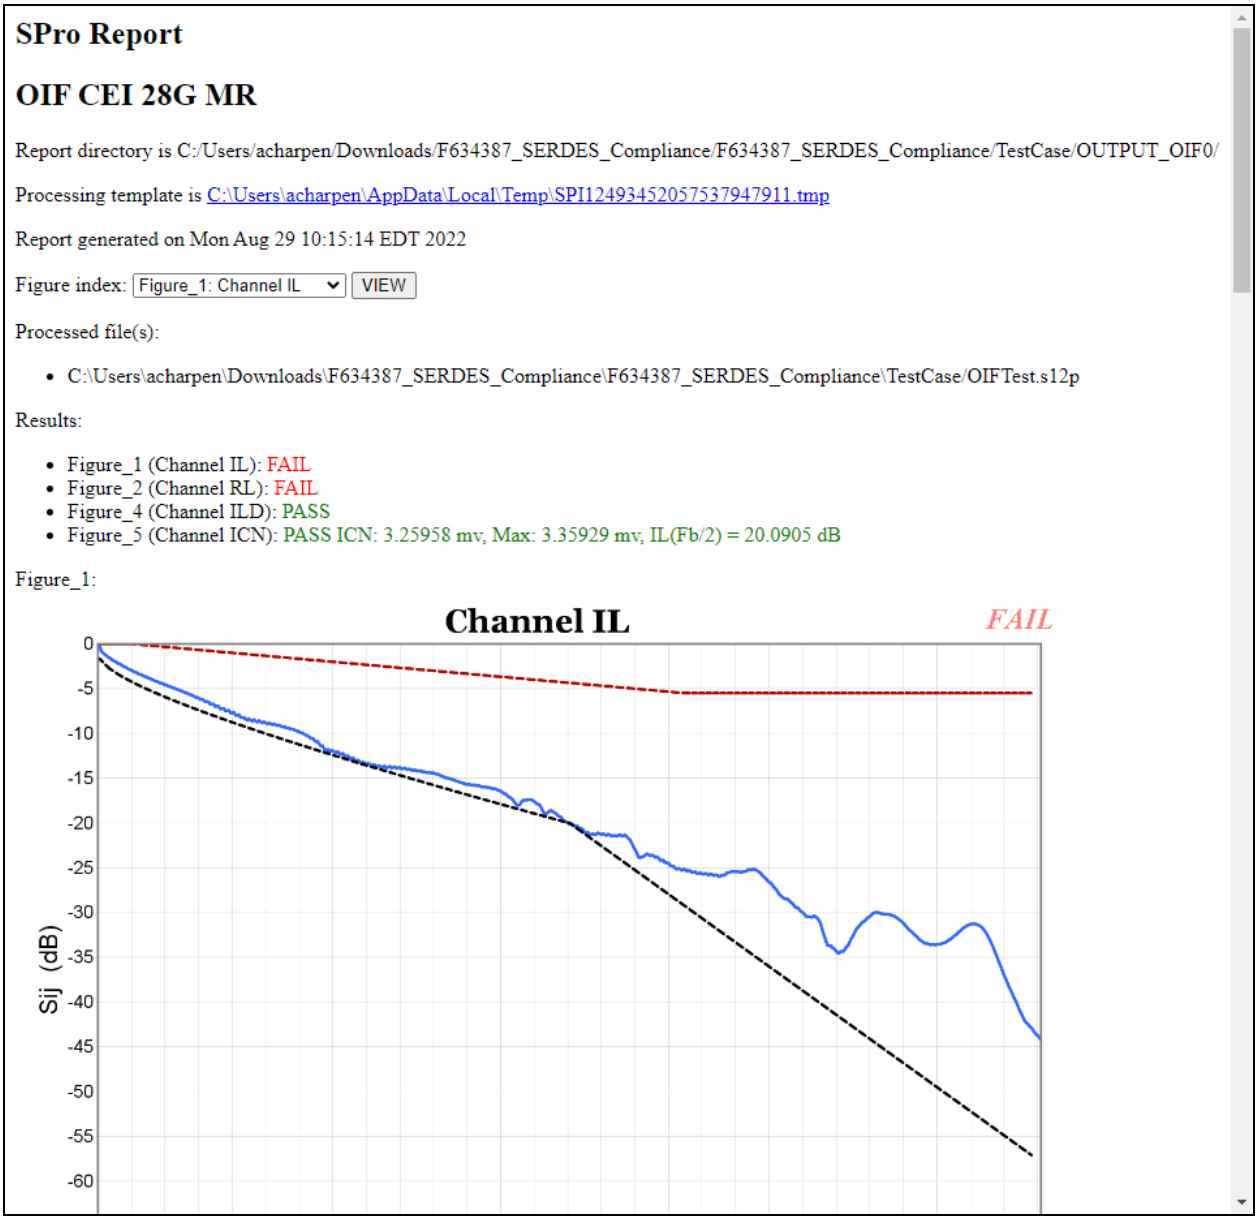


SPISim outputs the report as *.png* files and an *.htm* file in the directory chosen in step 4.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Open the report in the system's default browser. The second line in the report heading states the compliance protocol that was tested. The report contents will vary depending on the chosen built-in spec template and the number of input files.



The analysis can be further customized by changing the configuration settings (e.g., exporting a custom *.cfg* file and editing it in a text editor) or adding further parameters via the command line. If necessary, enter the following command for a complete list of supported commands, then press **Enter**: `"C:\Program Files\ANSYS Inc\v252\AnsysEM\spisim\SPISim\modules\ext\SPISimJNI_WIN64.exe" --list`.

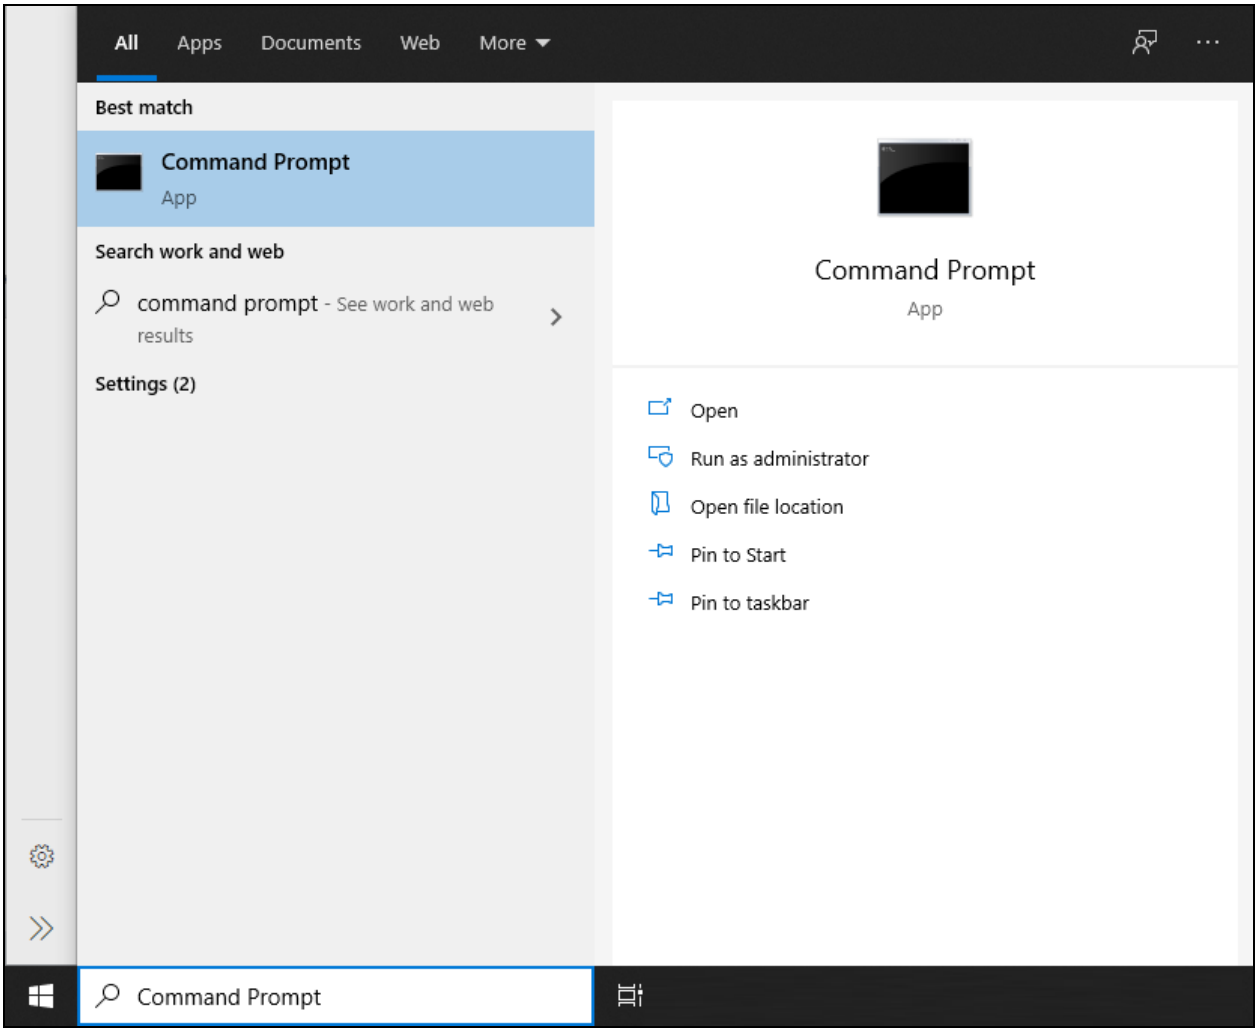
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Generate a Compliance Analysis Report Using a Batch Command Line to Invoke the User Interface

Complete the following steps to run a compliance analysis report using a batch command line to open the **SPISim** user interface.

1. Run a command prompt (e.g., in a Windows environment, type *Command Prompt* into the **Search Bar** and press **Enter** to open a **Command Prompt** window).

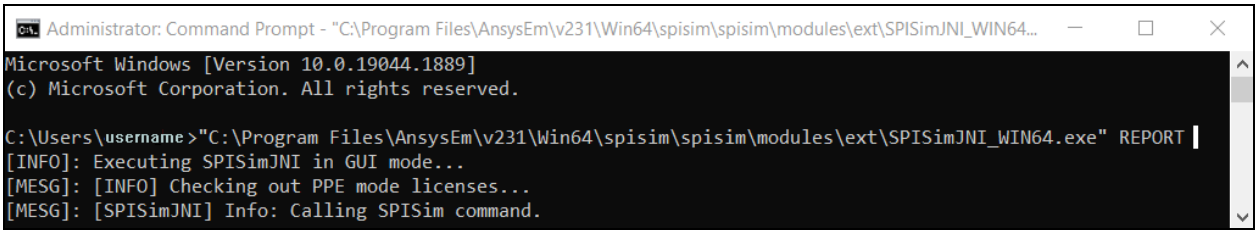
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



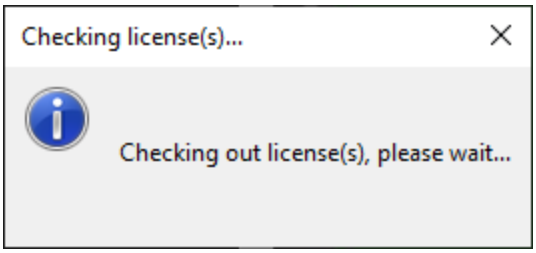
Note: The following example assumes **Electronics Desktop** is installed in the default directory in a Windows operating system environment. Structure the command appropriately for a different directory, path, and/or operating system, as necessary. Do **not** move the ***SPISimJNI_WIN64.exe*** executable file. The executable file relies on the relative path to the **Electronics Desktop** installation folder.

2. From the **Command Prompt** window, enter the following command, then press **Enter**:
   ```
   "C:\Program Files\ANSYS Inc\v252\AnsysEM\spisim\SPISim\modules\ext\SPISimJNI_WIN64.exe" REPORT
   ```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

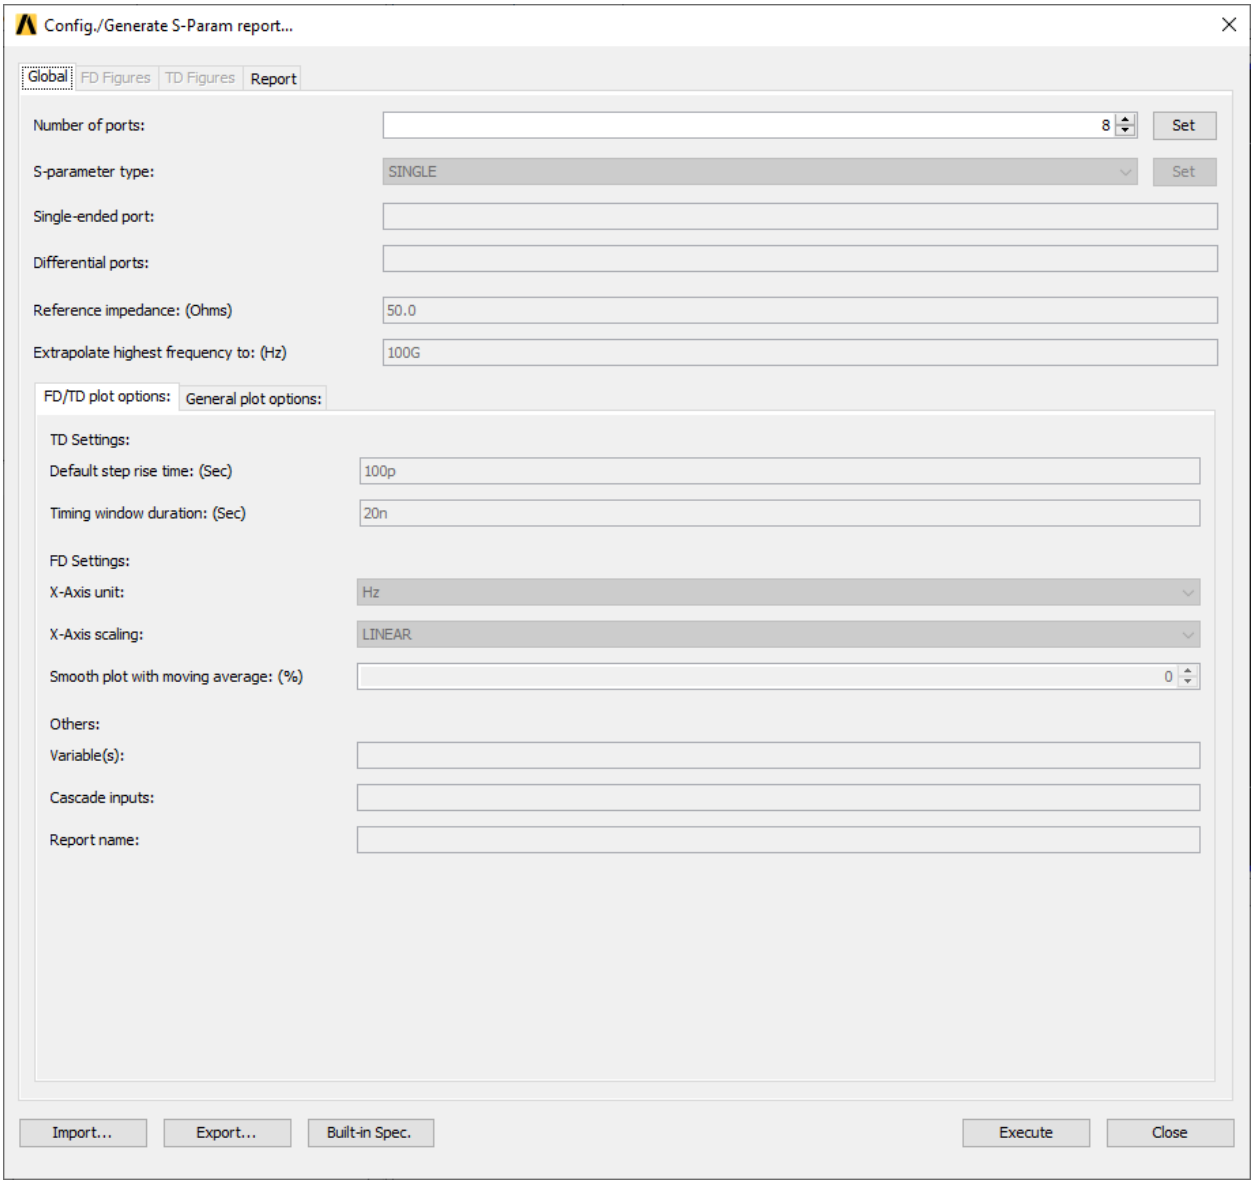


A **Checking License(s) ...** window opens.



Once the software license is verified, the **Config./Generate S-Param report...** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Complete steps 2-12 in Generate a Compliance Analysis Report.

Calculate TDR Via Command Line

> **Note:** The following assumes **Electronics Desktop** is installed in the default directory in a Windows operating system environment. Structure the command appropriately for a different directory, path, and/or operating system, as necessary. Do **not** move the ***SPISimJNI_WIN64.exe*** executable file. The executable file relies on the relative path to the **Electronics Desktop** installation folder.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The API function for calculating TDR implements the settings found in the SPISim GUI TDR Settings dialog. The dialog is located in the **Tools> Options> SPISim >TDR/TDT** menu.

Settings:

- Pulse width (ps)
- Pulse rise time (ps)
- TD window duration (ps)
- Signal voltage high (Volt)
- Initial delay (ps)
- Trimming Tolerance (mv)

When the Calc. TDR dialog is launched from the command prompt, two additional settings are available:

- 0-based i,j of Sij(s)
- TDR Calc type: TD Impulse, TD Pulse, TD Step, TDR Step (DP), TDR Step (SE)

For an initial batch mode run, it's recommended to launch the API's GUI mode to configure the parameters then export the settings to a configuration file.

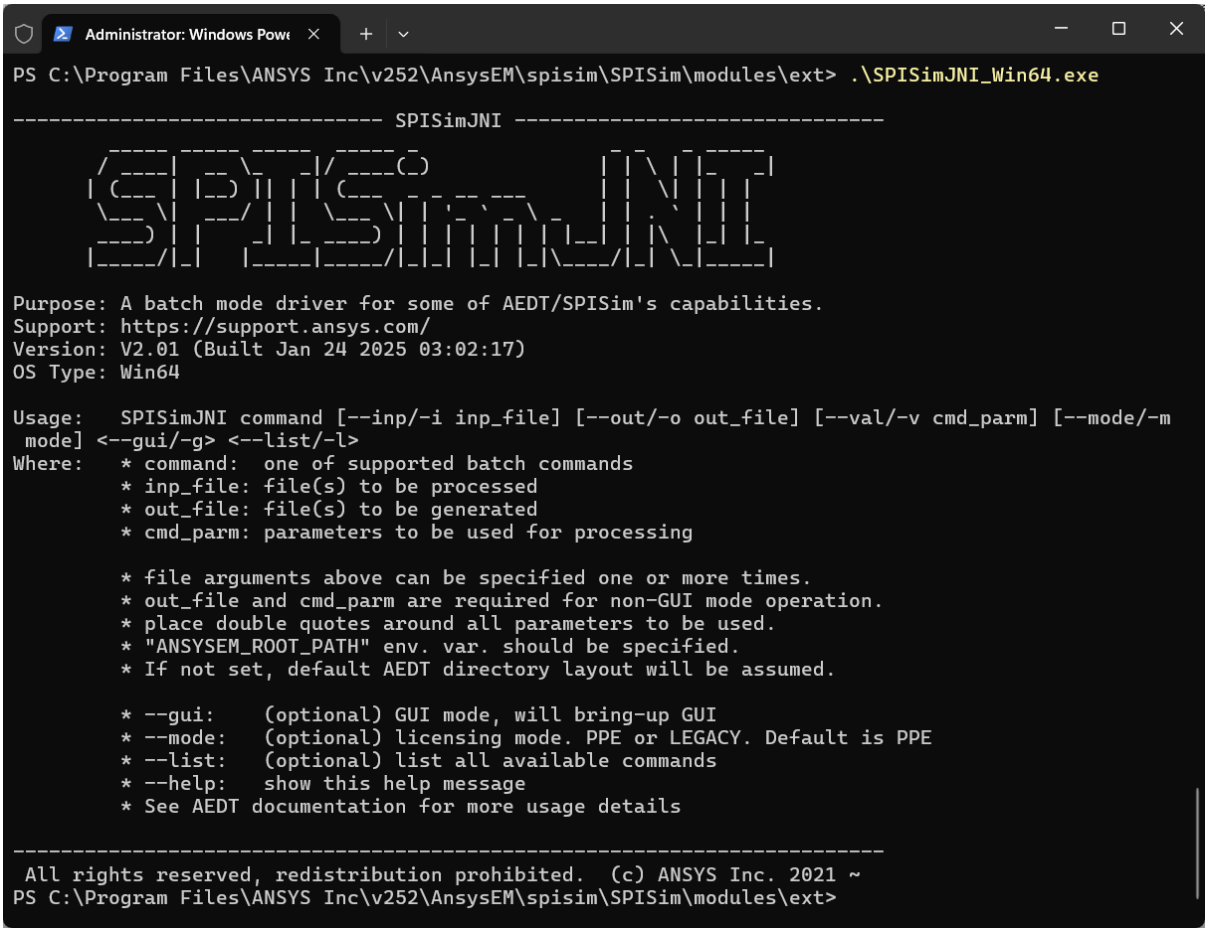
Creating a Configuration File and Calculating TDR using the Command Line

> **Note:** For differential pairs, the s-parameters must be provided in differential form. The tool will not convert single-ended s-parameters to differential form. Additionally, TDR SE and TDR DP are for reflectometry so the specified trace(s) must be of the return loss type, meaning i=j for the specified Sij. (S11, S22, S33, etc).

To create a configuration file:

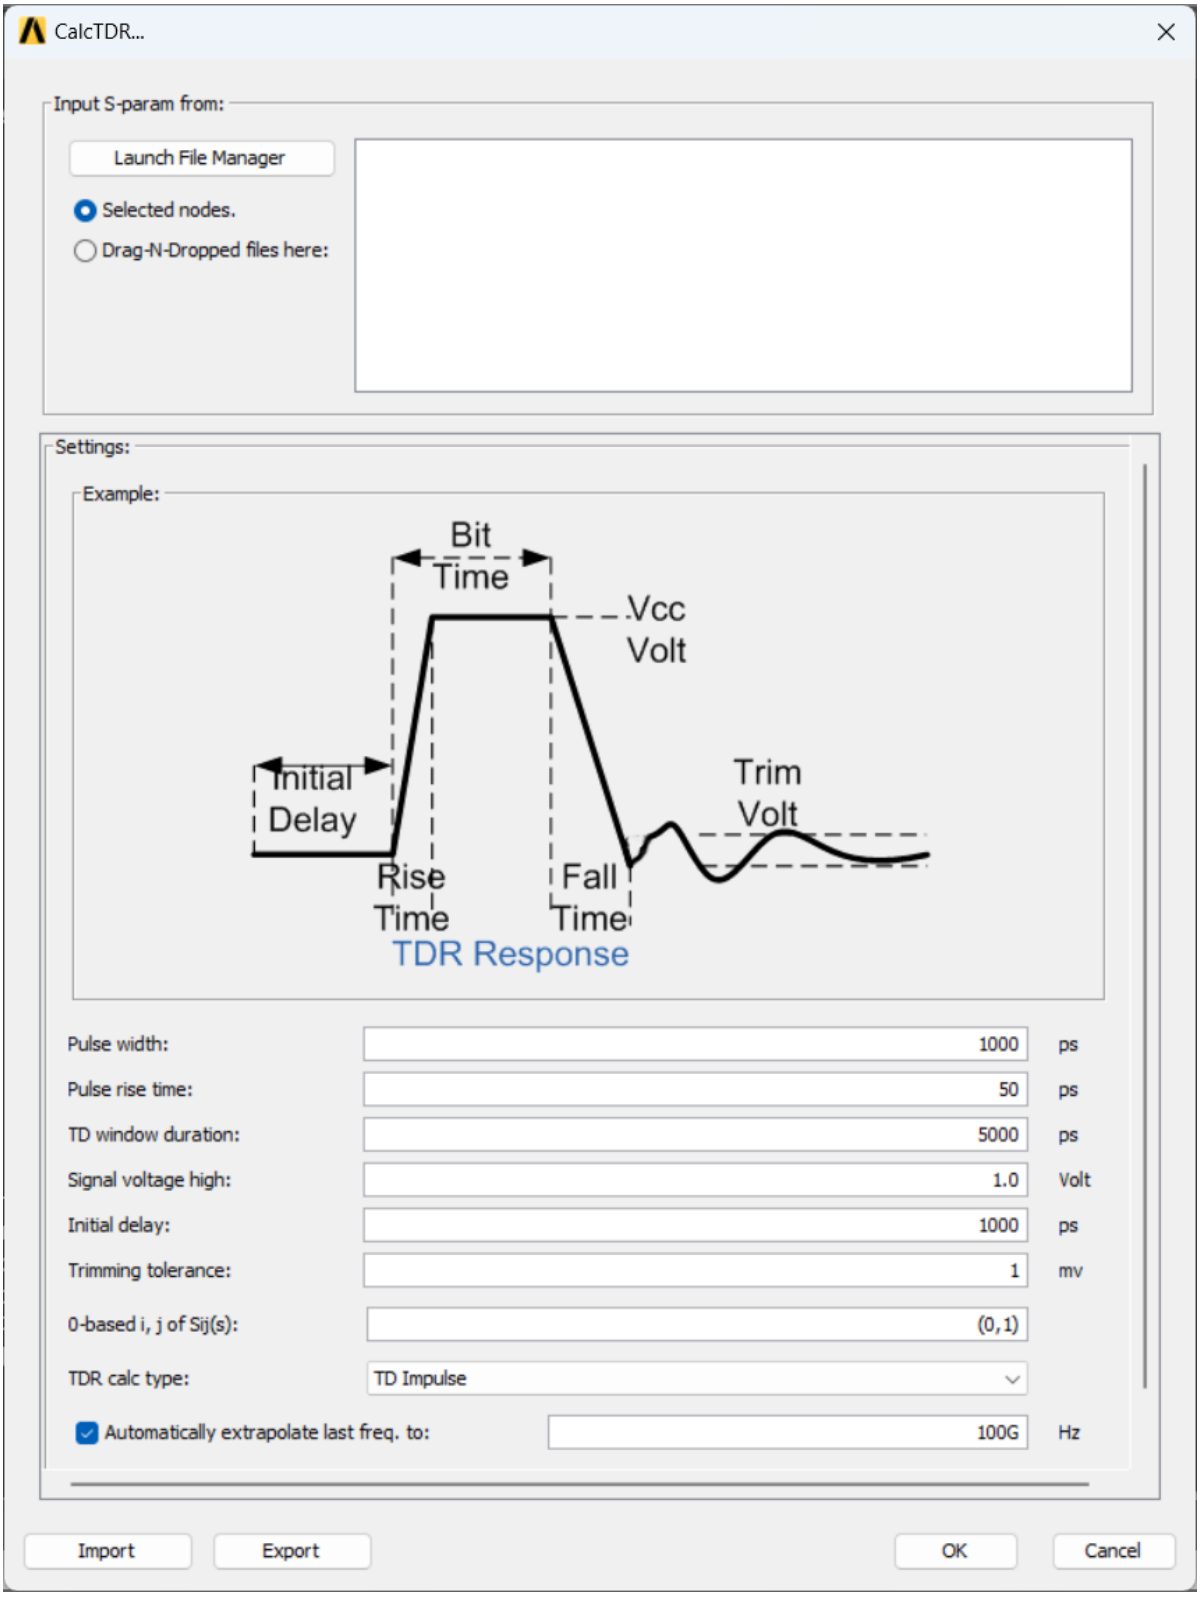
1. Launch the command prompt.
2. In your current AnsysEM installation path, navigate to the \spisim\SPISim\modules\ext directory. Launch the executable file `SPISimJNI_Win64.exe` to view the usage notes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Alternatively, type and enter `SPISimJNI_Win64.exe CALCTDR` in the command prompt to launch the **Calc TDR** dialog without viewing the API usage notes.

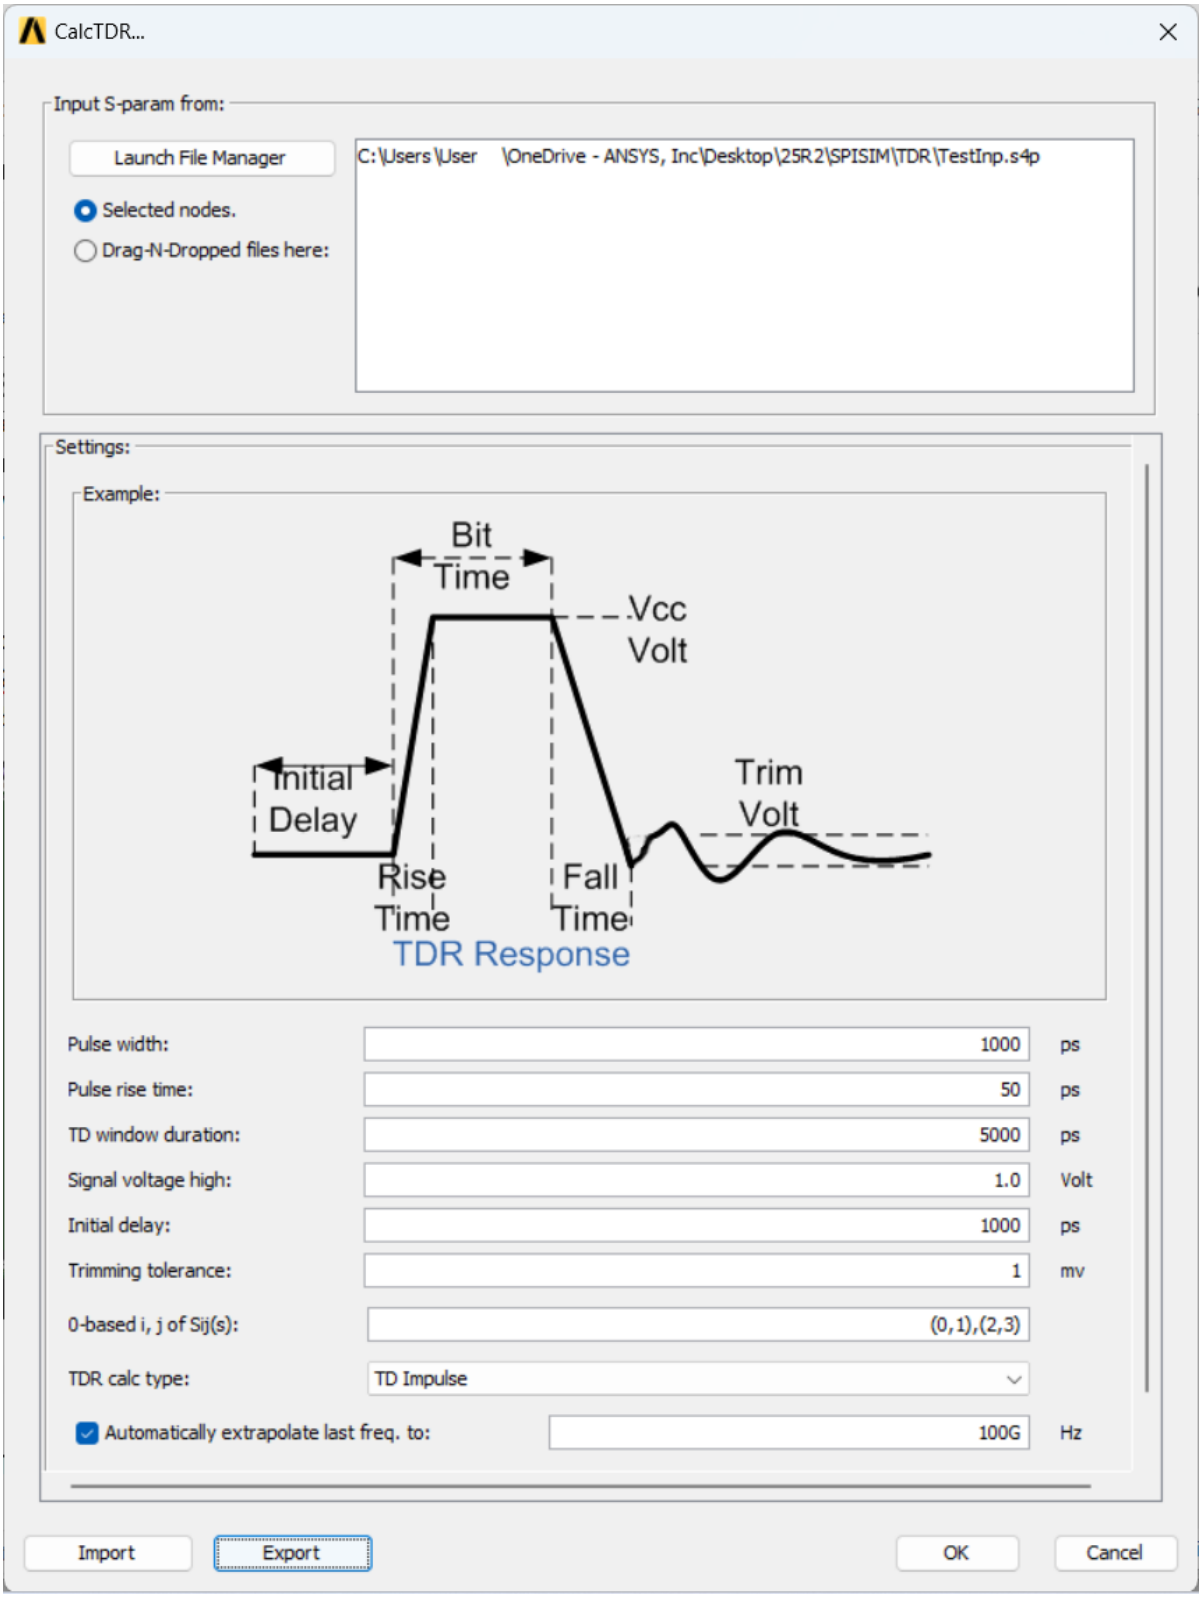
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Select the desired .s4p files using the **Input S-Param from** group box. Drag and drop the files into the file list box, or select **Launch File Manager** to navigate to and select files.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

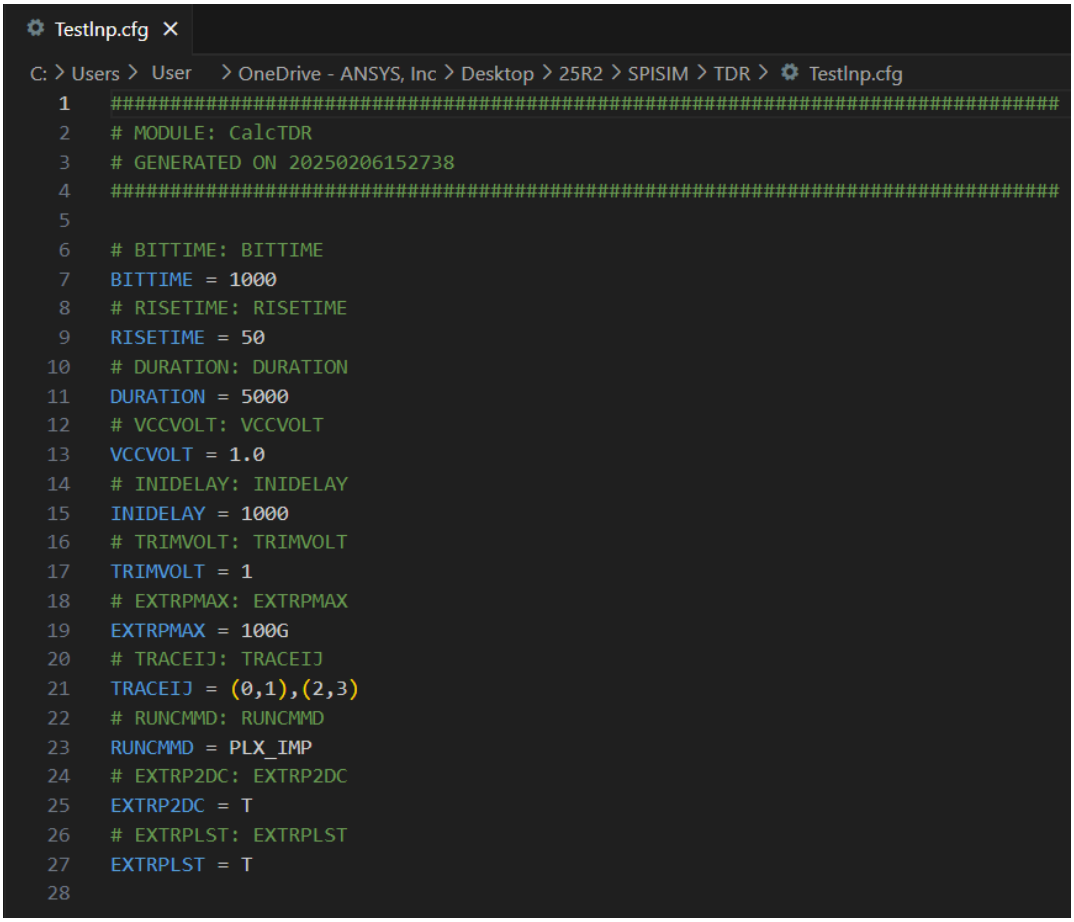
4. Adjust the settings as desired.

   For the **0-based i,j of Sij(s)** setting, enter the sets as comma separated sets.

   For **TDR calc type** setting, use the drop down menu to select the desired calculation type.

5. Click **Export** and choose the appropriate directory to save the configuration file.

6. Optional. Open the configuration file to view the settings.



The settings in the configuration file correspond to the adjustable settings in the GUI.

`BITTIME`: Pulse width (ps)

`RISETIME`: Pulse rise time (ps)

`DURATION`: TD window duration (ps)

`VCCVOLT`: Signal voltage high (Volt)

`INIDELAY`: Initial delay (ps)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TRIMVOLT: Trimming Tolerance (mv)

EXTRPMAX: Extrapolation max field box

TRACEIJ: 0-based i,j of Sij(s)

RUNCMMD: TDR Calc type:

i. PLX_IMP:TD Impulse

ii. PLX_PLS:TD Pulse

iii. PLX_STP: TD Step

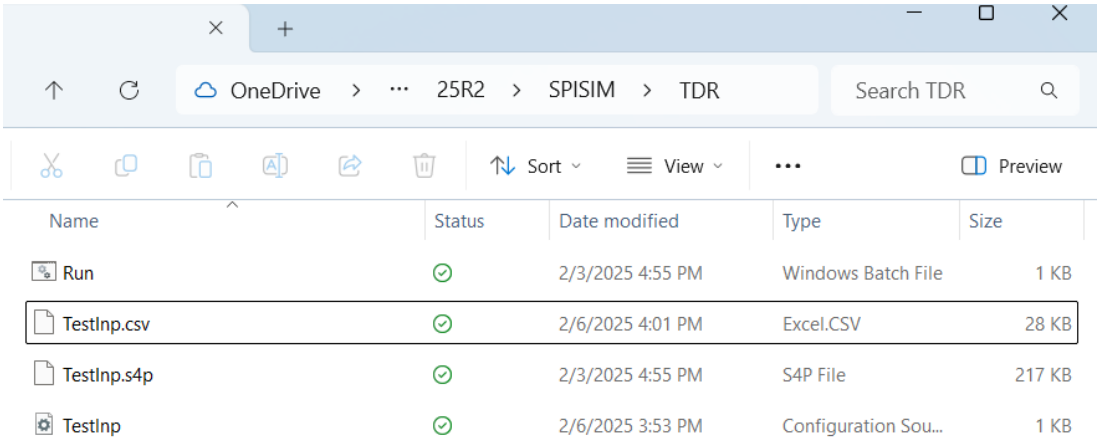
iv. TDR_DP: TDR Step (DP)

v. TDR_SE: TDR Step (SE)

EXTRP2DC: Automatically expand data to DC

EXTRPLST: Automatically extrapolate last freq. to EXTRPMAX

7. In the **Calc TDR** dialog, click **OK** to generate .csv file(s) in the directory of the selected .s4p file(s). The file(s) contain traces of all the specified Sij(s).



8. The resulting .csv file(s) can be plotted in SPISim.

Check and Fix Quality Report

SPro offers the capability to check and fix various S-param qualities:

- Even-Odd mode and asymptomatic behaviors
- Passivity in S (value <= 1.0)

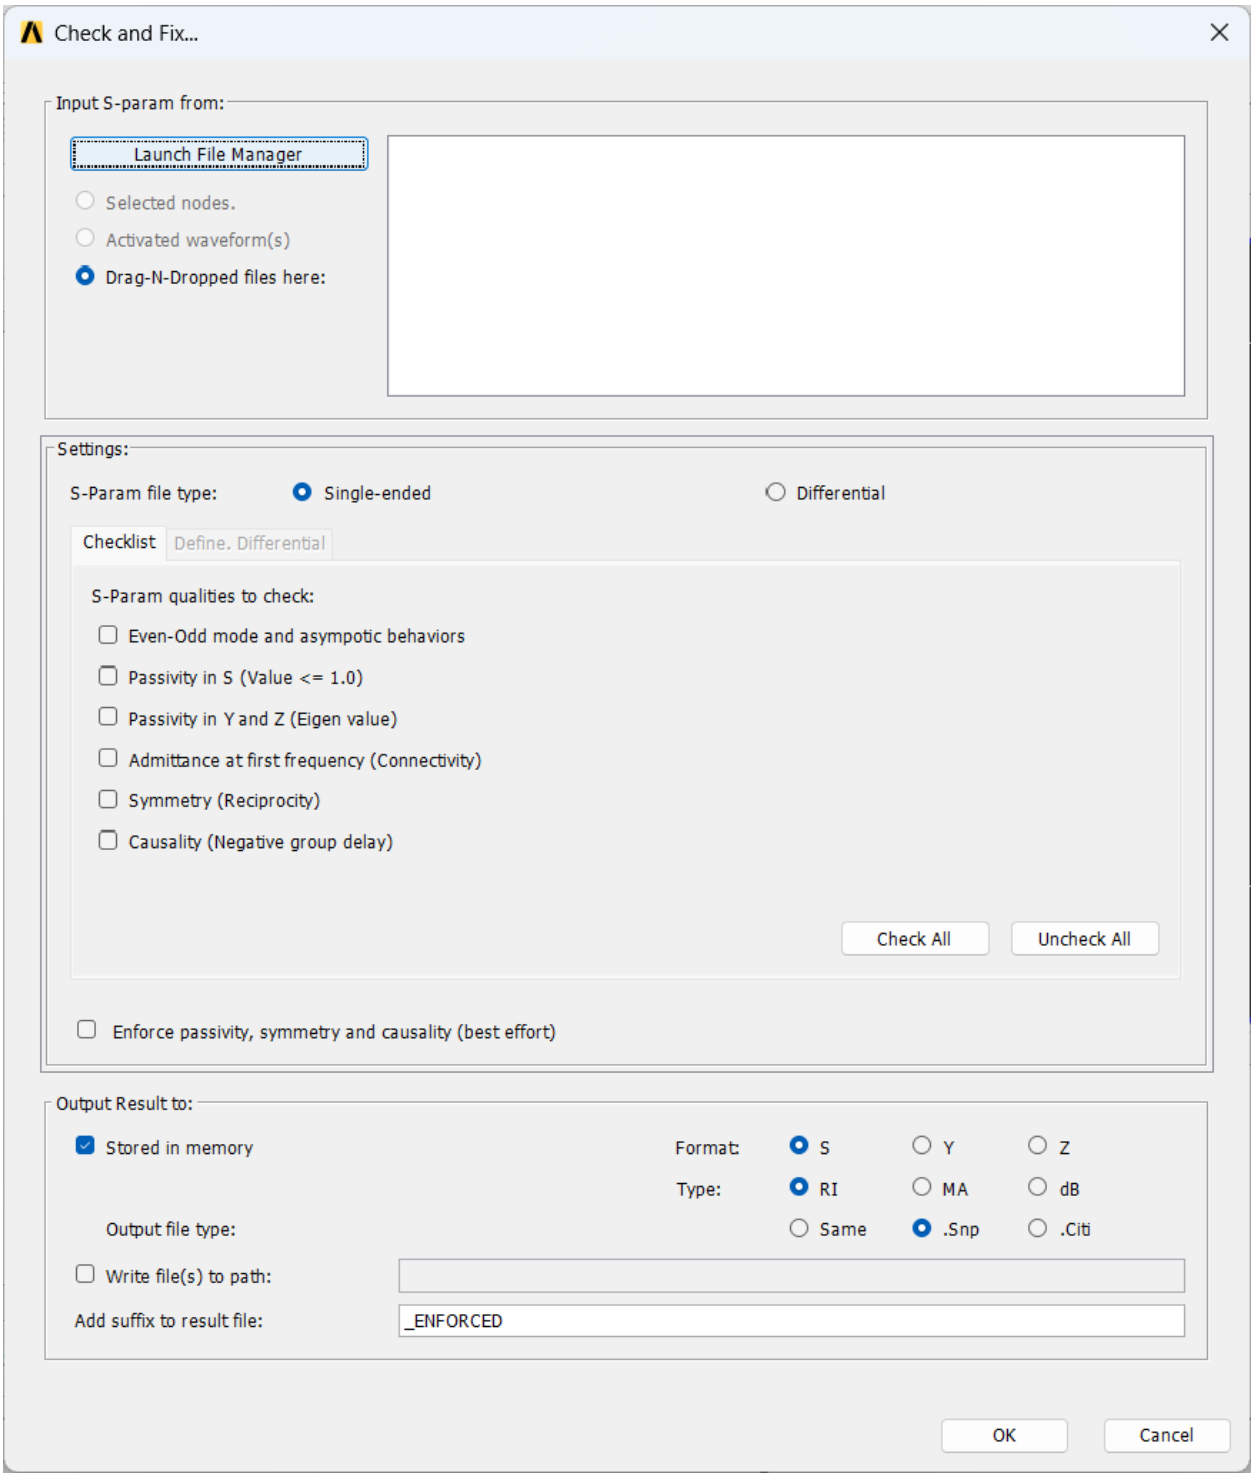
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Passivity in Y and Z (Eigen value)
- Admittance at first frequency (Connectivity)
- Symmetry (Reciprocity)
- Causality (Negative group delay)

Create a Report

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Launch the dialog. From the main ribbon select **S-Param**, and click **Check and Fix**.

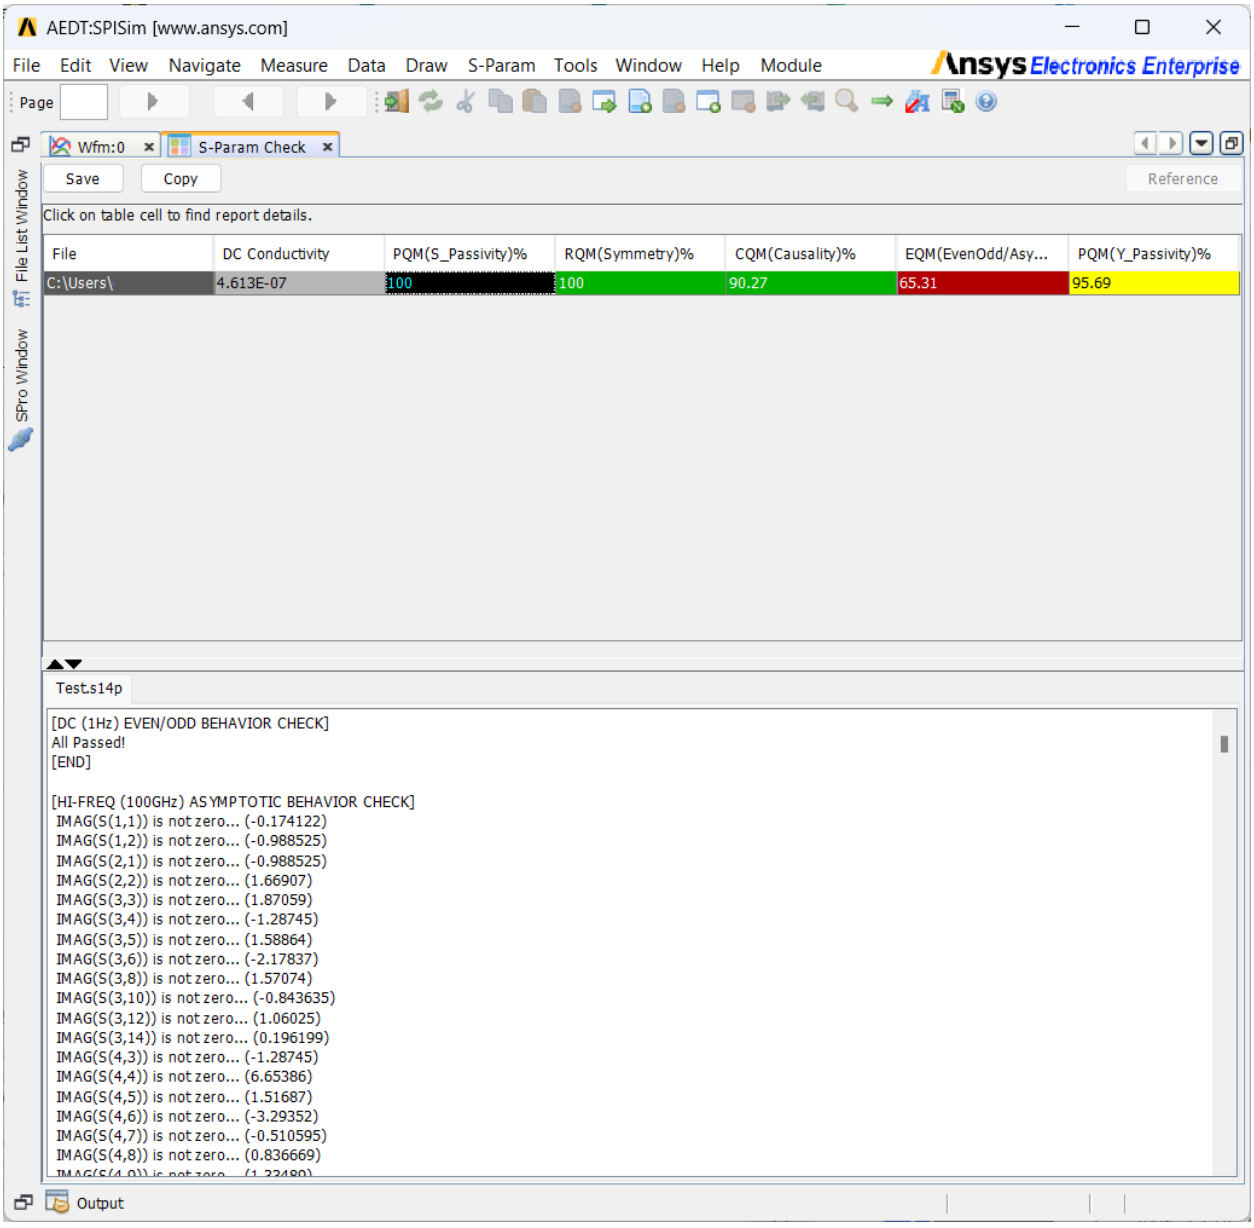


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Select the S-param file(s) by dragging-and-dropping files into the white field box, or alternatively, click **Launch File Manager** to browse and select files.
3. Select the S-param file type, either single-ended or differential, and select the qualities to check.
4. Choose the output settings including format, type, file type, and any suffix desired for the file names.
5. Click **OK**.

The report will be generated and saved to the specified output directory.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Create a Report via Command Line

Alternatively, the quality report can be created via command line. To create a report via the command line, use the following arguments:

```
"SPISimJNI_Win64.exe PATH" CHECK --inp "S-Param FILE PATH" --val
"EVENODD=TRUE,SPASSIVE=TRUE,YPASSIVE=TRUE,SYMMETRIC=TRUE,DCCOND=TRUE,
CAUSAL=TRUE" --out "Output FILE PATH"
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The arguments correspond to the settings available in the **Settings** group box, seen in the **Check and Fix** dialog box of Step 1. When set to true, the arguments indicate check for:

`EVENODD` - Even-odd mode and asymptotic behaviors

`SPASSIVE` - Passivity in S (value <= 1.0)

`YPASSIVE` - Passivity in Y and Z (eigen value)

`SYMMETRIC` - Symmetry (reciprocity)

`DCCOND` - Admittance at first frequency (connectivity)

`CAUSAL` - Causality (negative group delay)

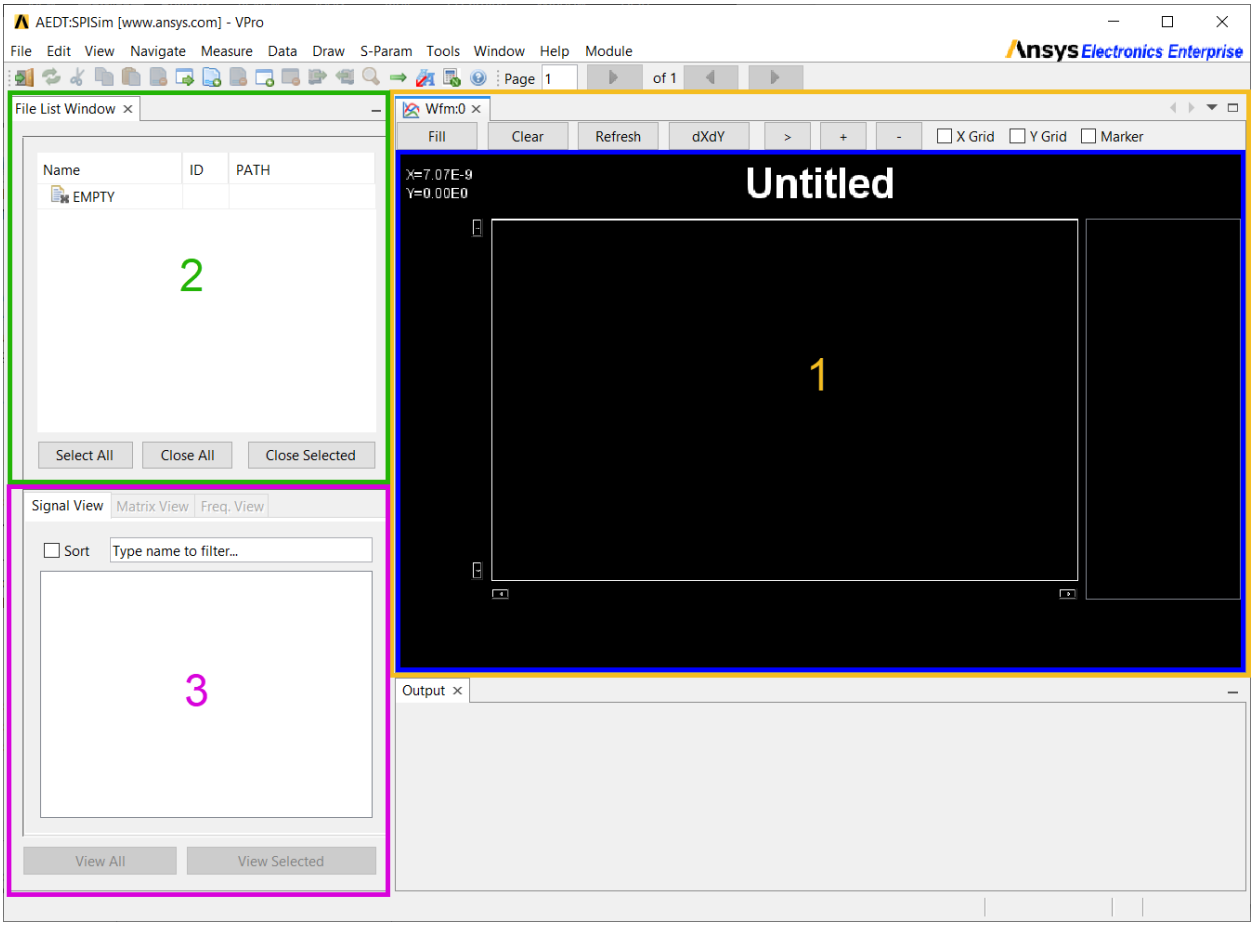
SPISim assumes single ended .snp files are used. To specify differential mode, before running the check, add either `MIXMODE=INCREMENTAL` or `MIXMODE=EVENODD` as part of the `VAL` arguments above.

SPISim VPro Overview

SPISim VPro allows its users to view and analyze waveforms in both time and frequency domains. VPro offers signal integrity focused measurements, data markers, waveform calculated, and script processing.

Waveform Viewing Interface and Navigation

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



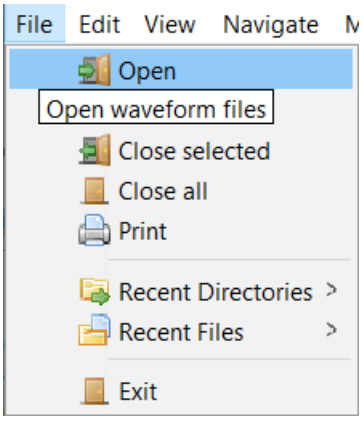
1. Waveform viewing window- open more waveform viewer windows with **Ctrl+t** or click **Window> Waveform Tab**
2. File List Window- main file index.
3. Probe and Signal Index - the probe and signal index window will automatically populate according to the selected file type. It contains different views: **Signal View**, **Matrix View**, and **Freq. View**. The available views are dependent on the file type selected.

Open Waveform Files:

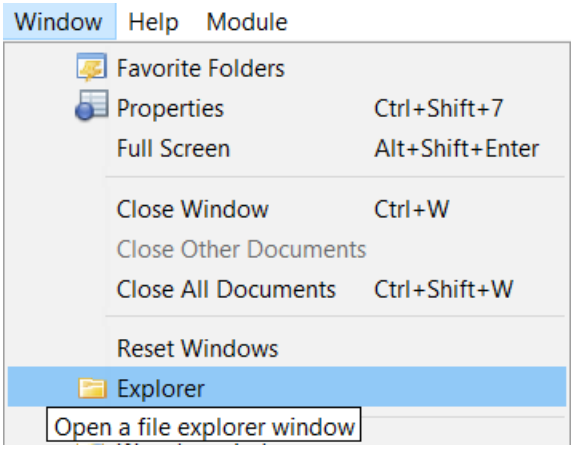
To open a waveform, use any of the following four methods:

1. From the main ribbon, click **File> Open**, navigate to the folder containing the files. Select the files to open. Different file types will automatically be placed in separate file folders in the **File List Window**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

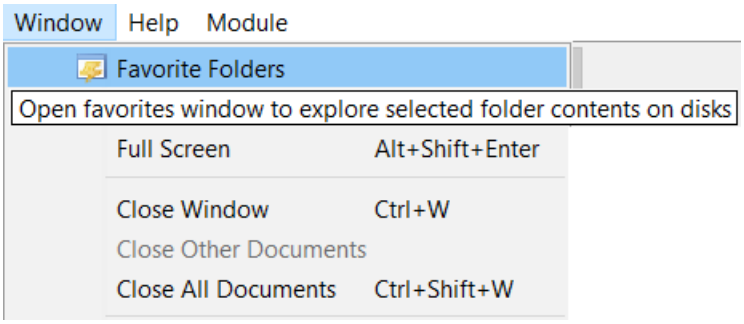


2. Use the operating system's **File Explorer** and drag-and-drop selected files into the **VPro File List Window**.
3. From the main ribbon, select **Window>Explorer** to open VPro's file browser. Check the **Waveform Only** box to view only the waveform files within a folder. Alternatively, in the VPro file explorer, click the **Launch File Manager** button to open the operating system's **File Explorer**, then drag-and-drop selected file to the **File List Window**.

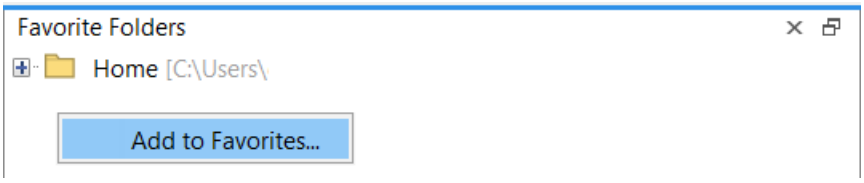


4. Use the **Favorites Folder**. From the main ribbon, select **Window> Favorites Folder** to open the **Favorites Folder**.

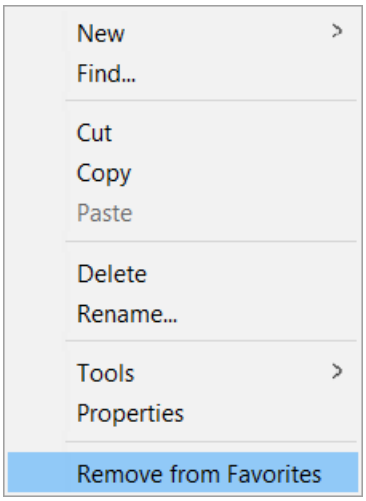
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Right-click > Add to Favorites to open the application explorer and select the folder which contains the waveform data. The folders added to the **Favorites Folder** will remain listed through all sessions until it is removed from Favorites.



To remove the folder from Favorites, **right-click** the folder, select **Remove from Favorites**.



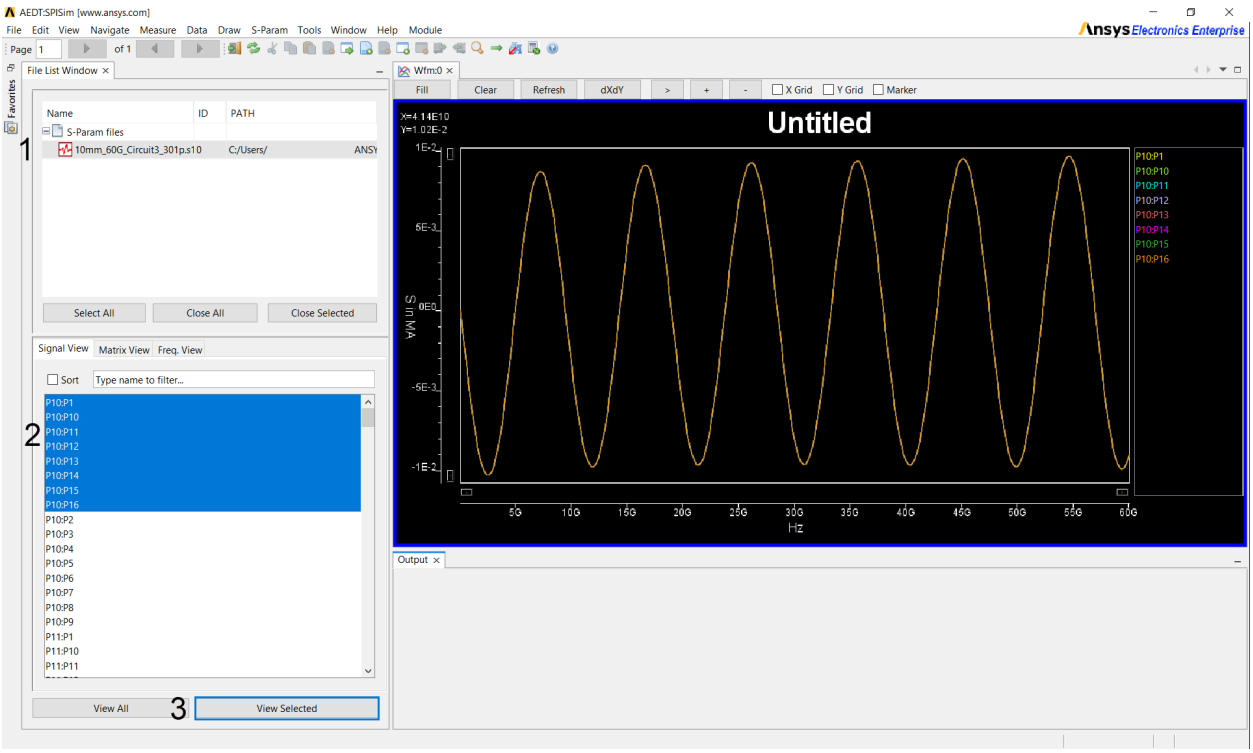
> **Important:** If **Delete** is selected, the data will be removed from the disc.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim VPro Waveform Viewer

Viewing A Waveform

1. Select a waveform file from the **File List Window** to populate the probe.
2. Select the probe of interest.
3. Click the **View Selected** button.

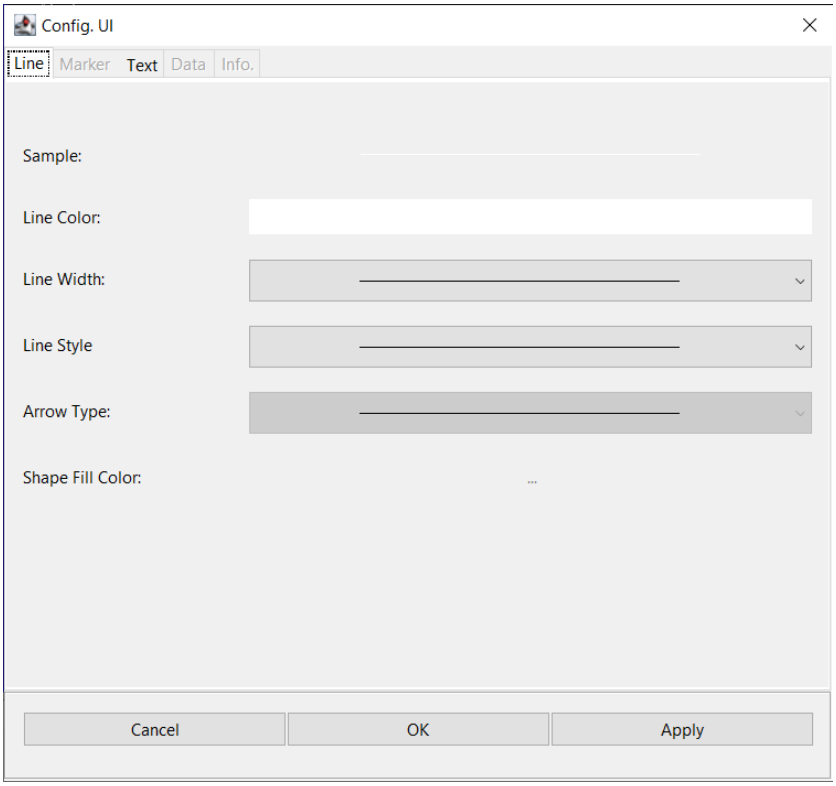


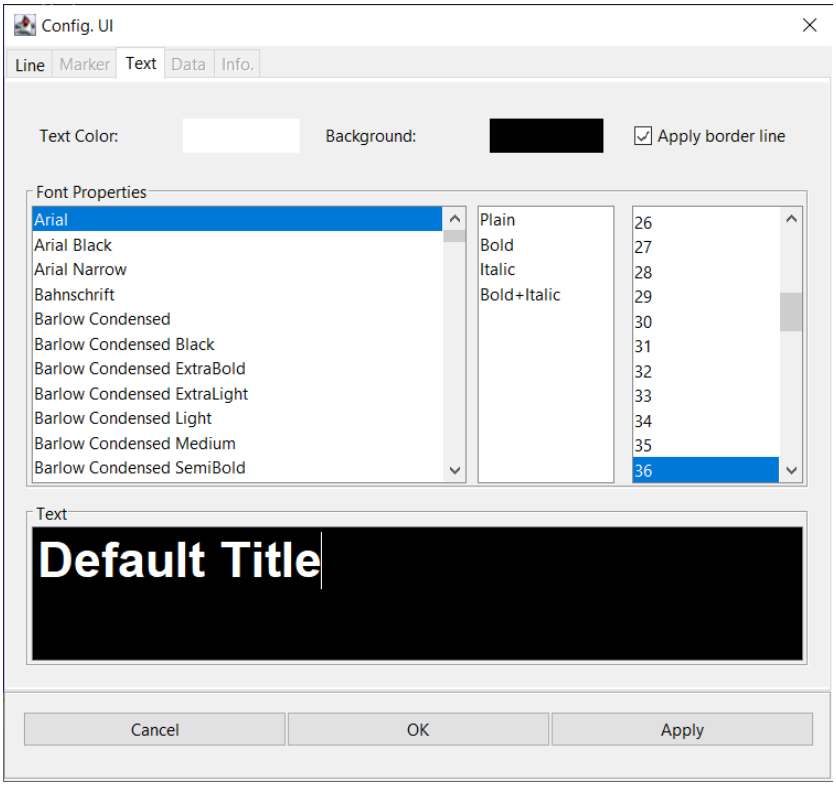
Alternatively, drag-and-drop the selected probes into the waveform viewer pane.

Customize the Waveform Pane

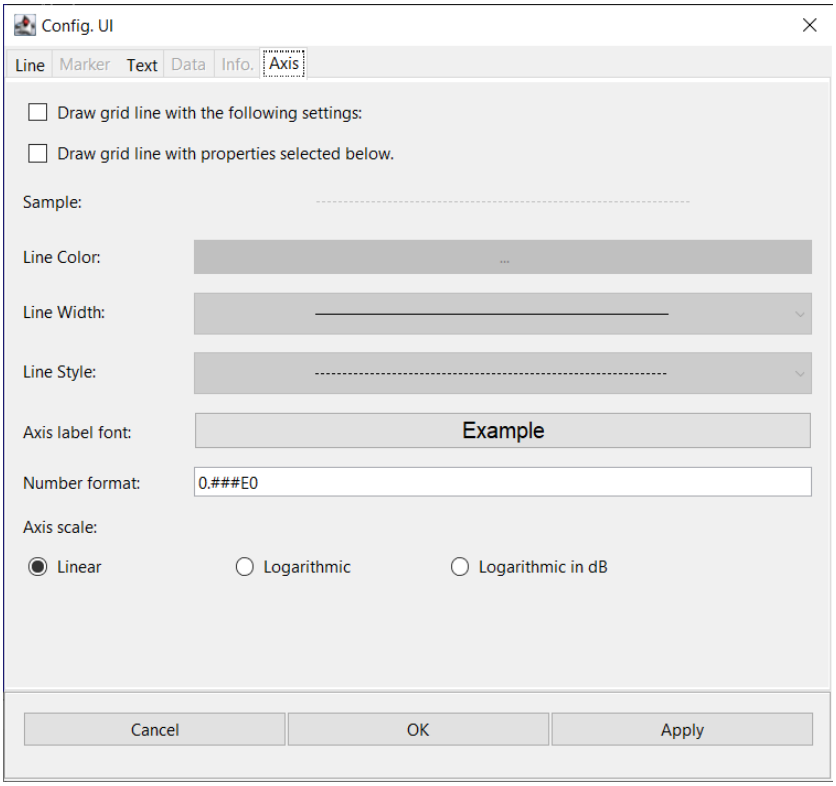
Right-click on the default title, axis, or curve to open the **Config UI** dialog. It will display the related adjustable settings.

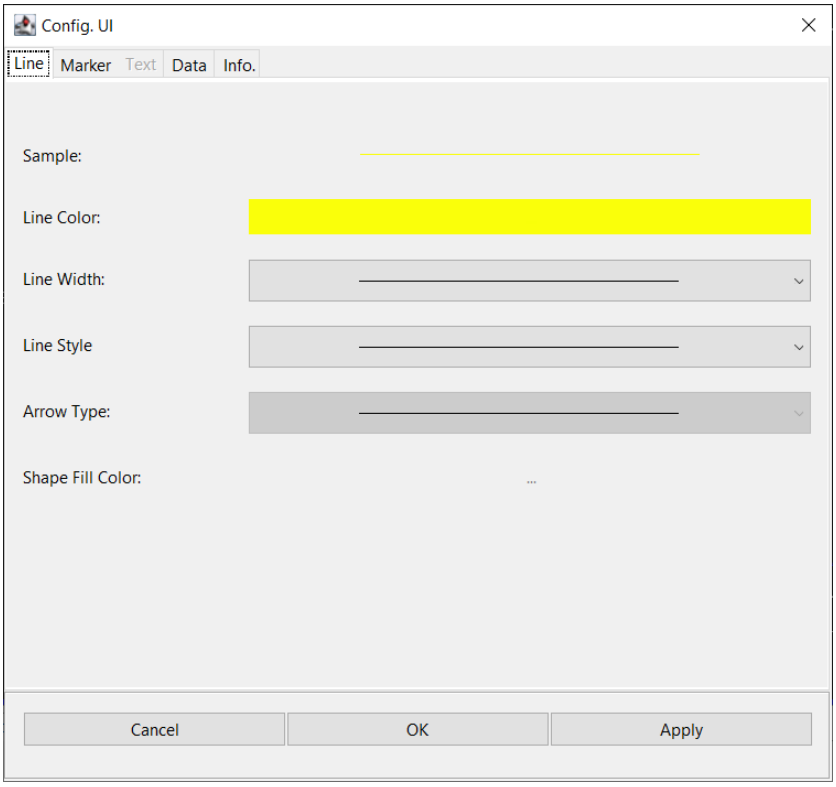
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

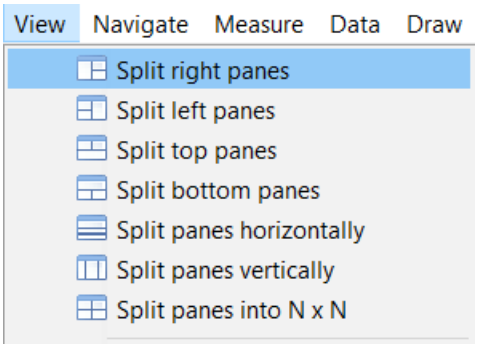




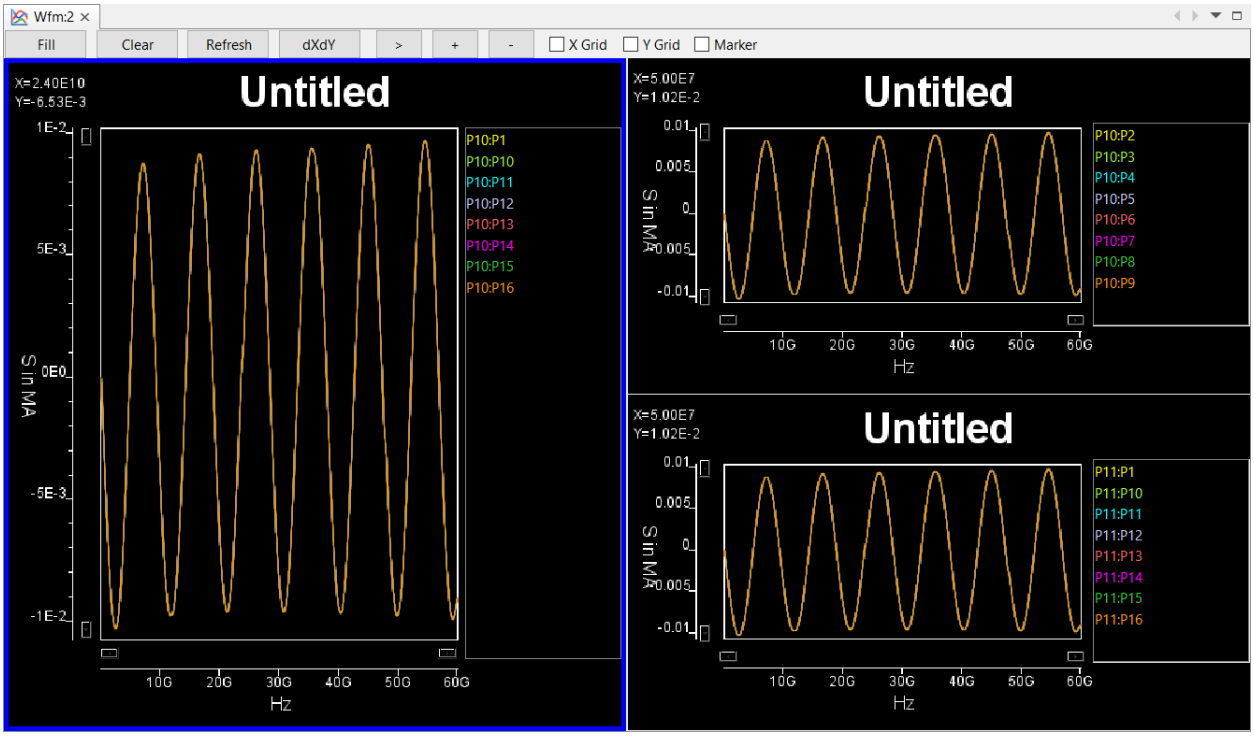
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Synchronize Panes

View multiple panes in a single tab at the same time. From the main ribbon, click **View** to see the pane viewing options.



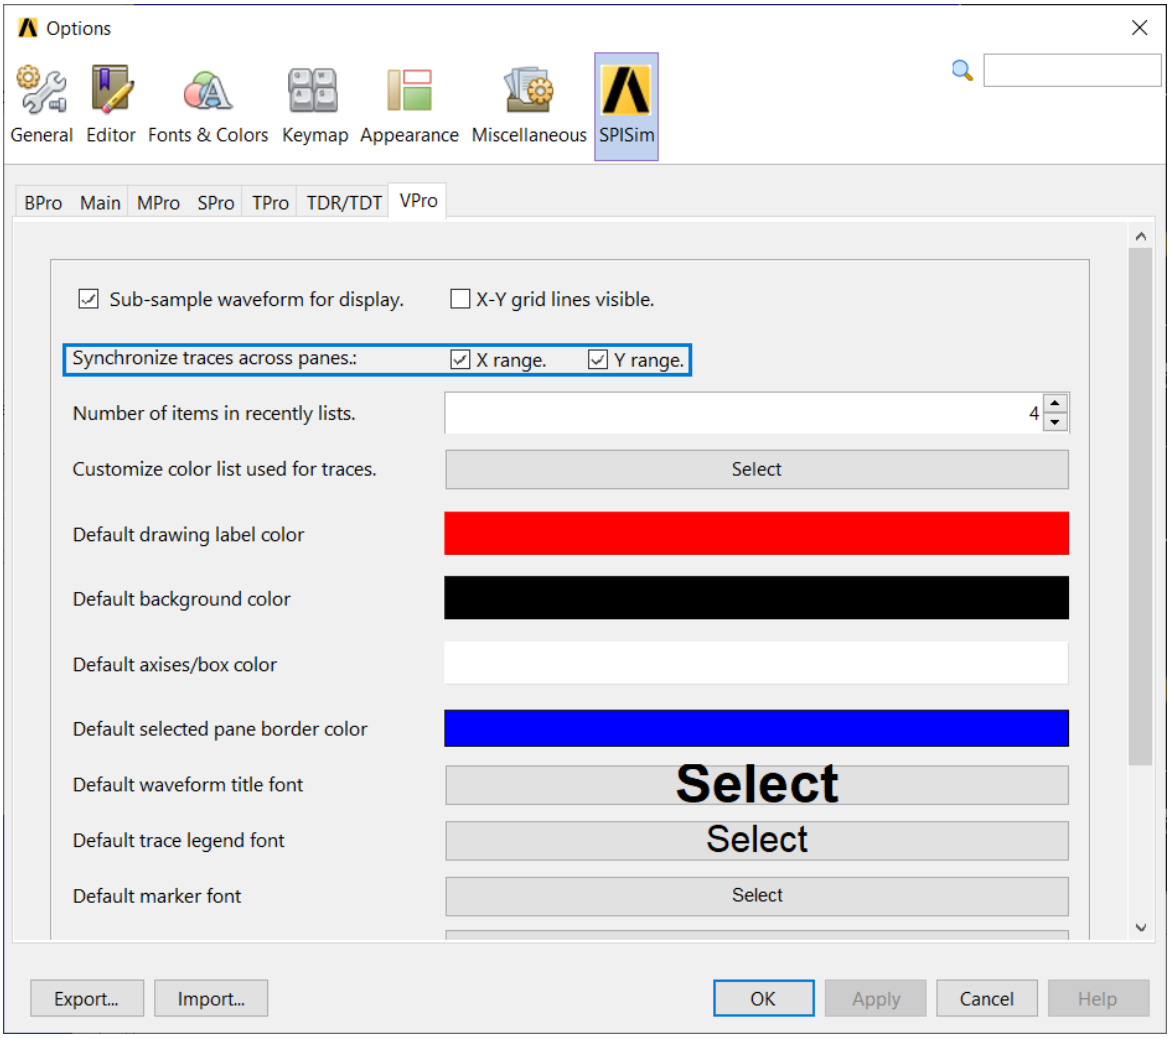
The current working pane will be highlighted in blue.



Synchronize trace across different panes. For example, if you zoom-in on one waveform pane, all other synchronized panes will be zoomed-in. Click **Tools>Options** then **VPro** to see synchronization X and Y options.

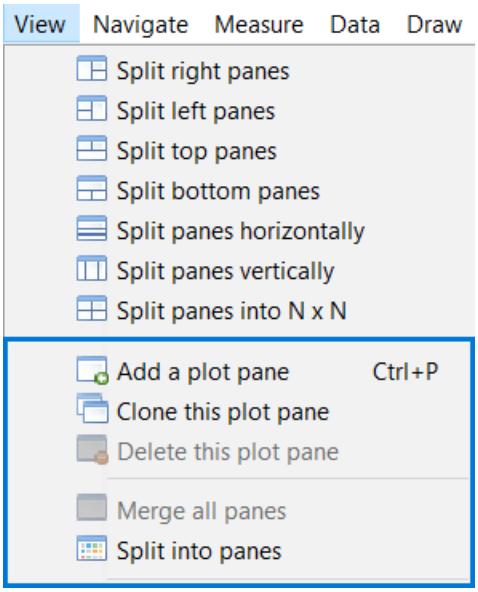
Data can be dragged and dropped between panes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Additional Pane Options

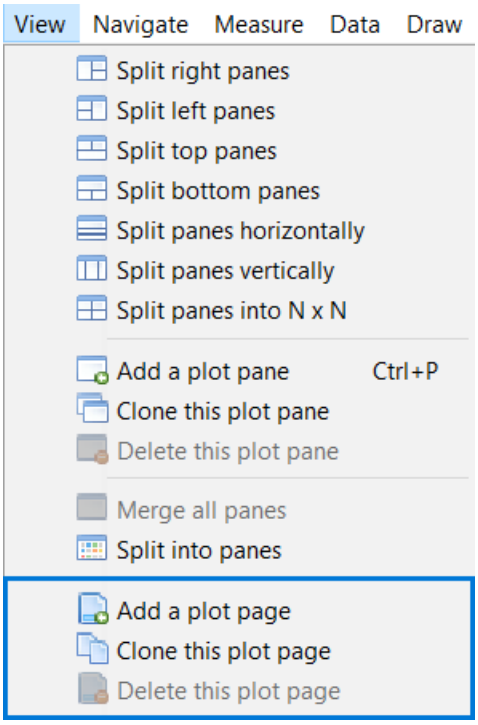
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



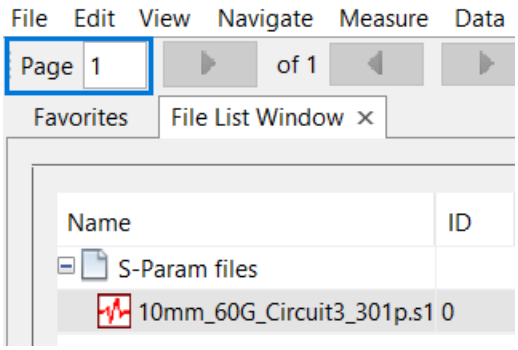
Option	Description
Add plot pane	Adds a plot pane in the current working tab.
Clone the plot pane	Using the signal from current working pane, opens a new pane with the same data.
Delete this plot pane	Closes the current working pane.
Merge all panes	Merges the data in the open panes and displays them in a single pane.
Split into panes	Splits the signal into different panes.

Pages

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



A tab can also contain multiple pages. The additional pages may not be immediately visible but underneath the displayed panes. Use the **Page** option to toggle between the pages.



Comparing Waveforms

Select the desired waveform files in the **File List Window**.

In the **Signal View Window**, only the common signal from the selected waveforms will be displayed.

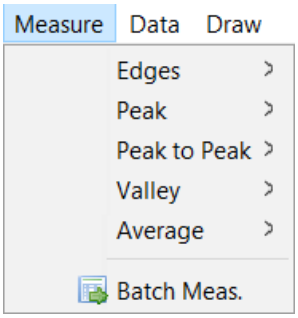
Select the signal to view. The common signal from all the waveforms will be displayed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

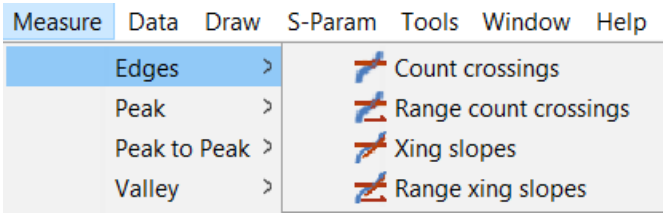
SPISim VPro Measurements

Measurements

From the main ribbon, select **Measure** to view the available calculations.

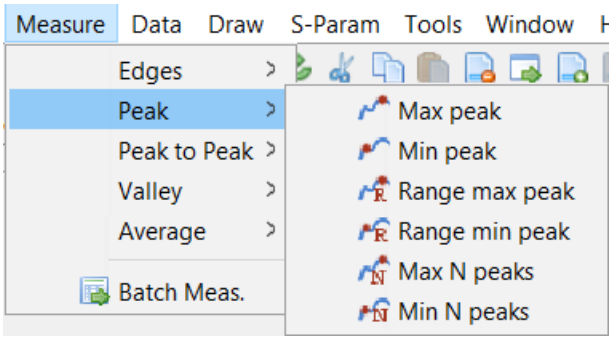


Edges



- Count Crossings- detect selected rise or fall (or both) crossings.
- Range count crossings- detect rise or fall crossings in a selected range.
- Xing slopes- calculate rise or fall slopes at crossings.
- Range xing slopes- calculate crossing slops in selected range.

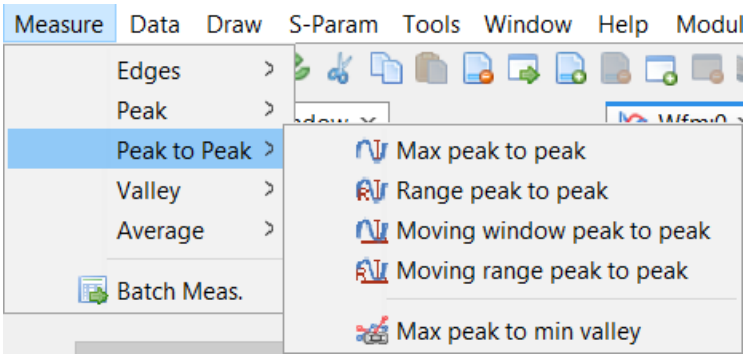
Peak



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

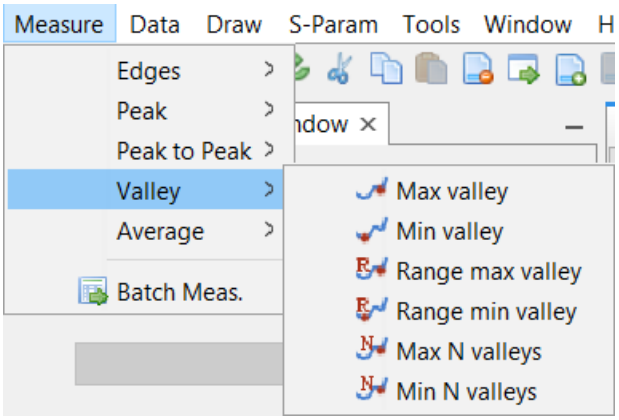
- Max peak- identify the maximum peak.
- Min peak- identify the minimum peak.
- Range max peak- identify the maximum peak within a given range.
- Range min peak- identify the minimum peak within a given range.
- Max N peaks- identify N number of maximum peaks.
- Min N peaks- identify N number of minimum peaks.

Peak to Peak



- Max peak to peak - mark peak to peak value.
- Range peak to peak - mark peak to peak in a selected range.
- Moving window peak to peak - report sliding window based peak to peak.
- Moving rage peak to peak - select range to do sliding window peak to peak.
- Max peak to min valley - peak to peak based with slope consideration.

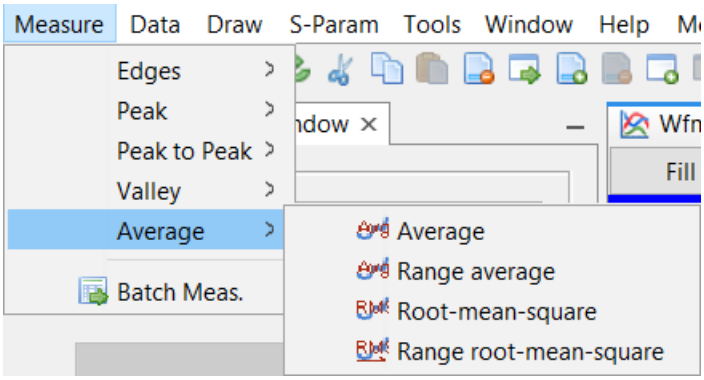
Valley



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

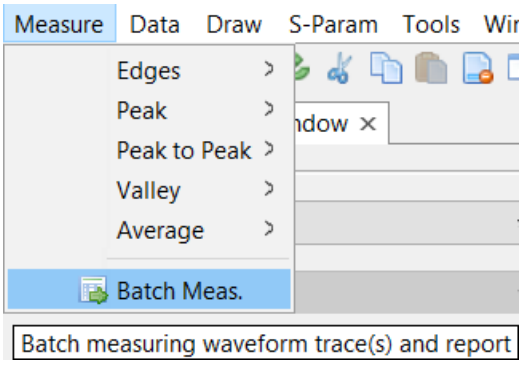
- Max valley - identify max valley.
- Min valley - identify min valley.
- Range max valley - identify max valley within a selected range.
- Range min valley - identify min valley within a selected range.
- Max N valleys - identify N number of max valleys.
- Min N valleys - identify N number of min valleys.

Average



- Average - report average value of selected traces.
- Range average - report average value in selected range.
- Root-mean-square - report RMS value of selected traces.
- Range root-mean-square - report RMS value of traces in a selected range.

Batch Measure



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Launches the **Batch Measurement and Report** window. Provides batch measurements for waveform traces and reports as a csv file.

This function works in two modes:

1. Measure all traces within one waveform file, or
2. Measure common probes across different waveform file.

Add one or more measurements at specified time point/ranges with "," as the delimiter.

Select cells and apply with same value using the **Set Cells** button.

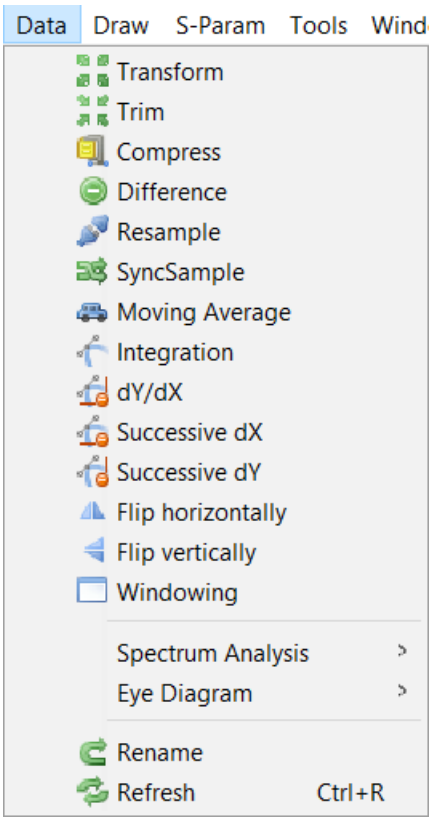
Remove unwanted measurements using "-" button.

Settings may be exported for later use.

SPISim VPro Data

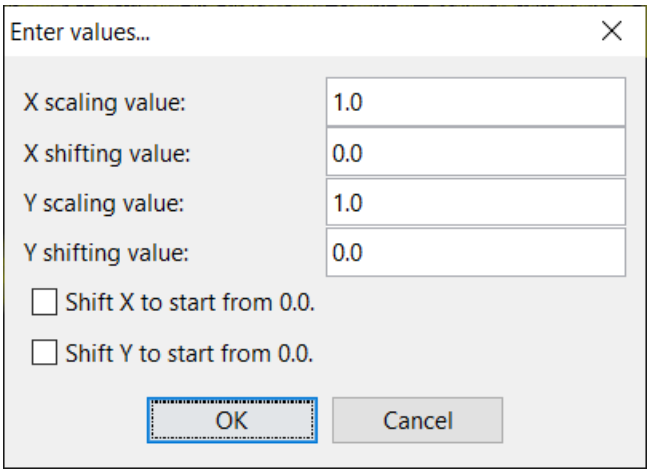
Data Processing

From the main ribbon, select **Data** to view the available options.

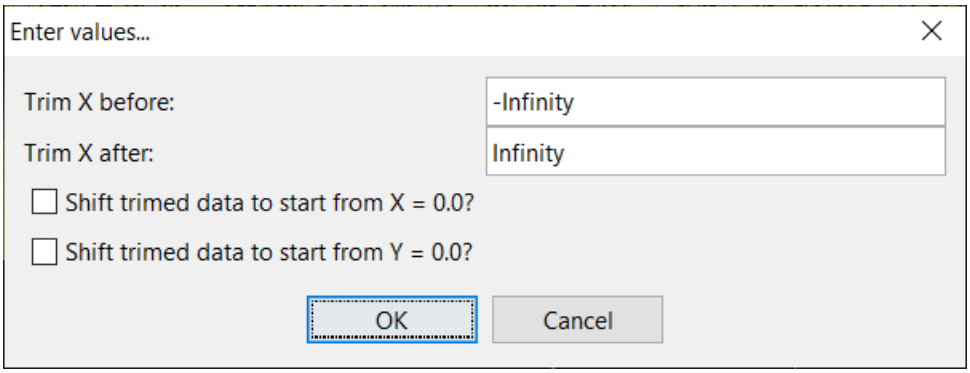


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

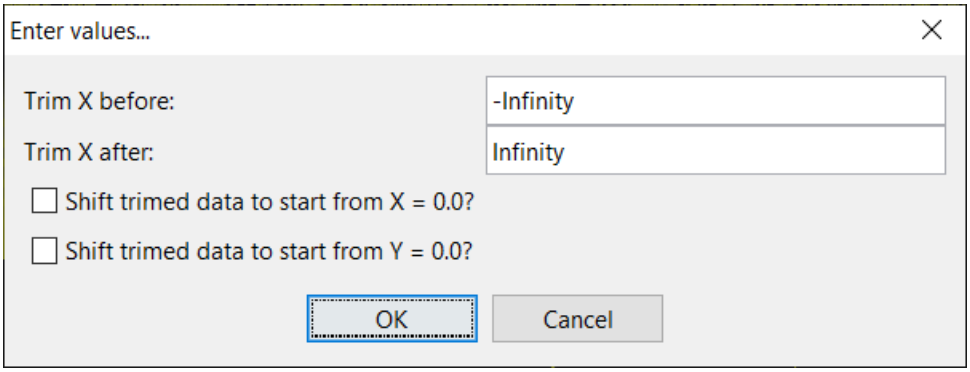
Transform: Scale/Shift selected traces.



Trim: Trim selected traces.

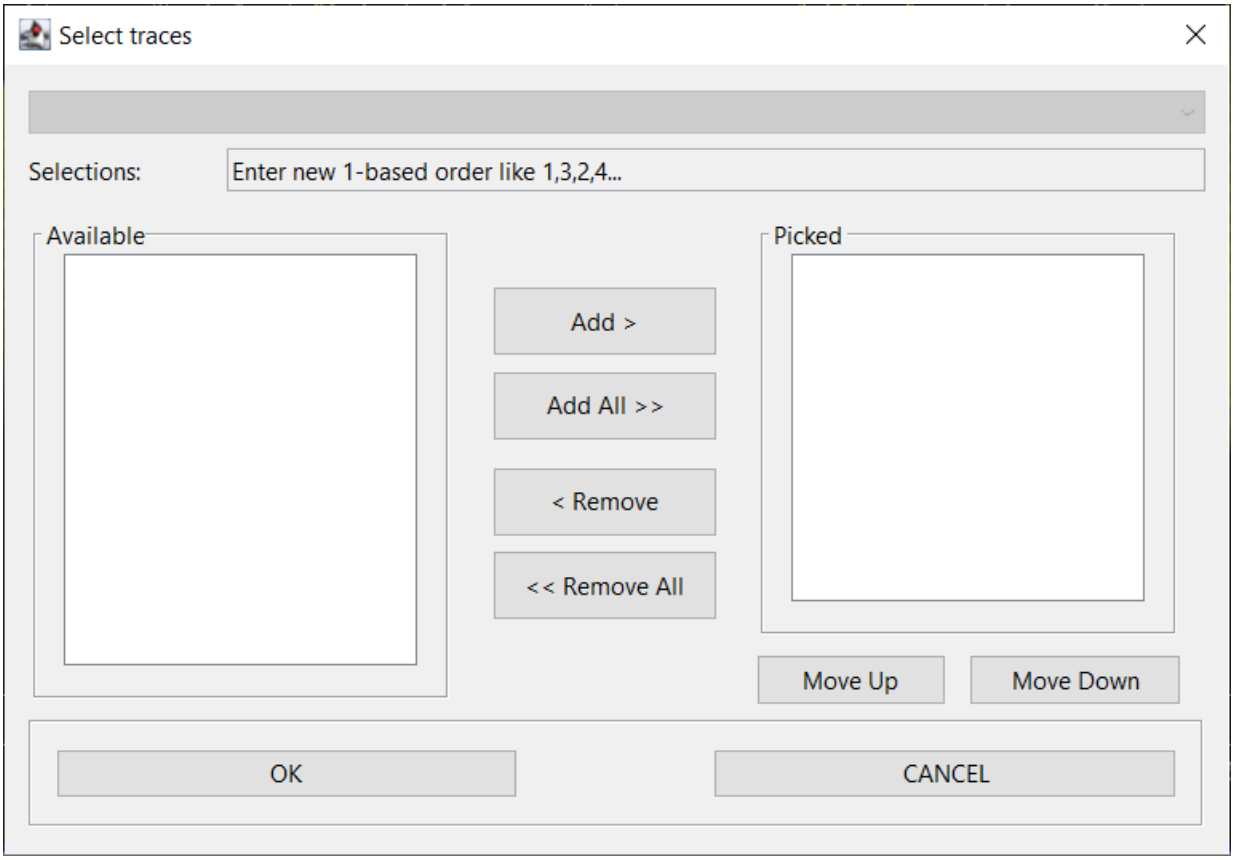


Compress: Compress data points of selected traces.



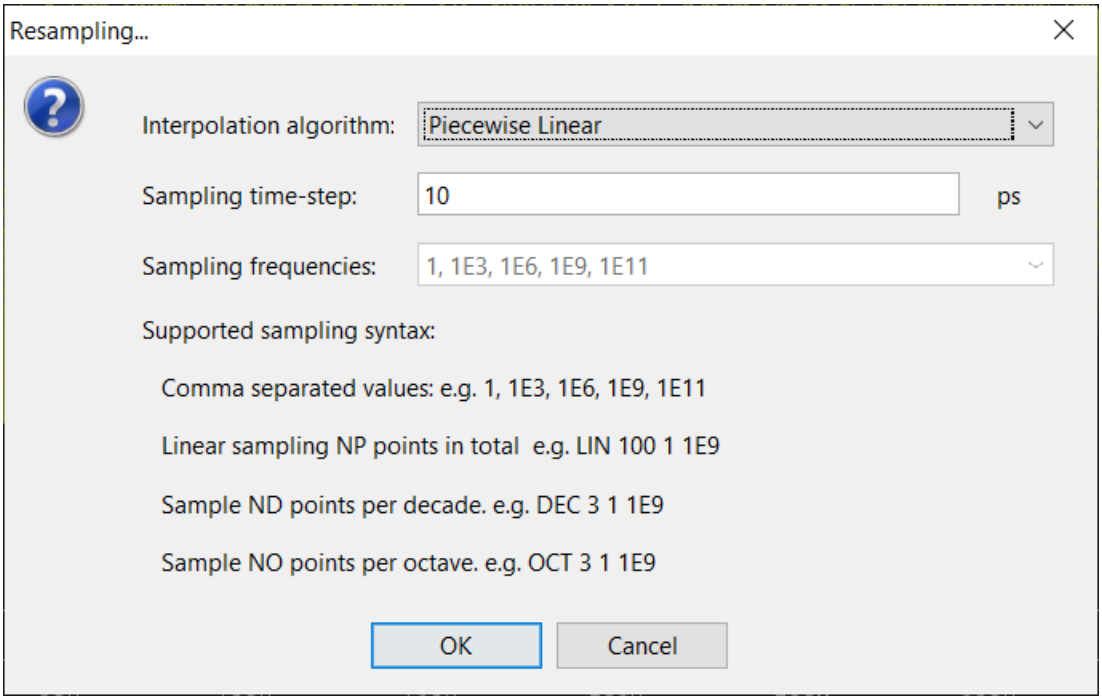
Difference: Select traces to do difference comparison.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

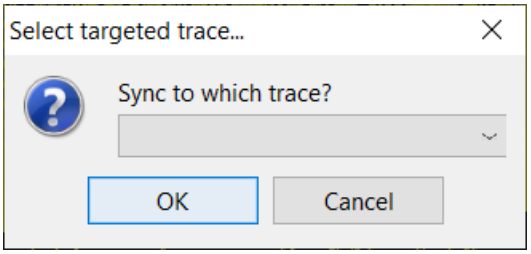


Resample: Resample data for selected traces.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



SyncSample: Synchronize sampling points of selected traces.



Moving Average: Calculate moving average to smooth data.

Integration: Do integration for selected traces.

dY/dX: Calculate dY/dX for selected traces.

Successive dX: Calculate successive dX for traces.

Successive dY: Calculate successive dY for traces.

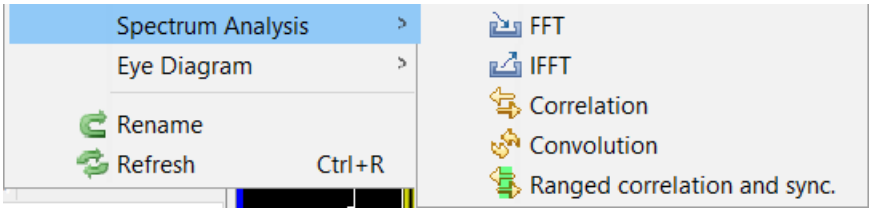
Flip horizontally: Flip trace between left and right.

Flip vertically: Flip trace between top and bottom.

Windowing: Windowing functions available for frequency domain.

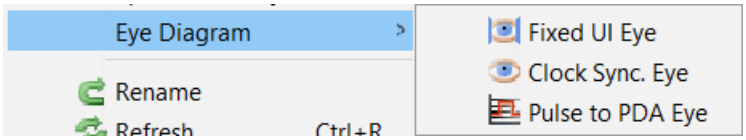
Spectrum Analysis:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **FFT**: Perform fast Fourier transform.
- **IFFT**: Perform Inverse fast Fourier transform.
- **Correlation**: Calculate cros correlations between traces.
- **Convolution**: Convolve selected traces.
- **Ranged correlation and sync**.:Calculate correlation within selected range.

Eye Diagram:



- **Fixed UI Eye**: Do fixed UI eye plot.
- **Clock Sync Eye**: Do clock synchronous eye plot.
- **Pulse to PDA Eye**: Do peak distortion analysis (worst case) eye plot.

Rename: Rename trace label.

Refresh: Reread original data from disk.

Calculating Effective Return Loss

Follow the instructions on the following pages to calculate the effective return loss (ERL) of *.sNp* files on the **SPISim: VPro Analysis Module**.

" Calculating ERL From the SPISim User Interface" on the next page

"Creating an ERL Configuration File" on page 16-131

" Importing an ERL Configuration File" on page 16-132

"Overriding ERL Configuration File Parameters" on page 16-147

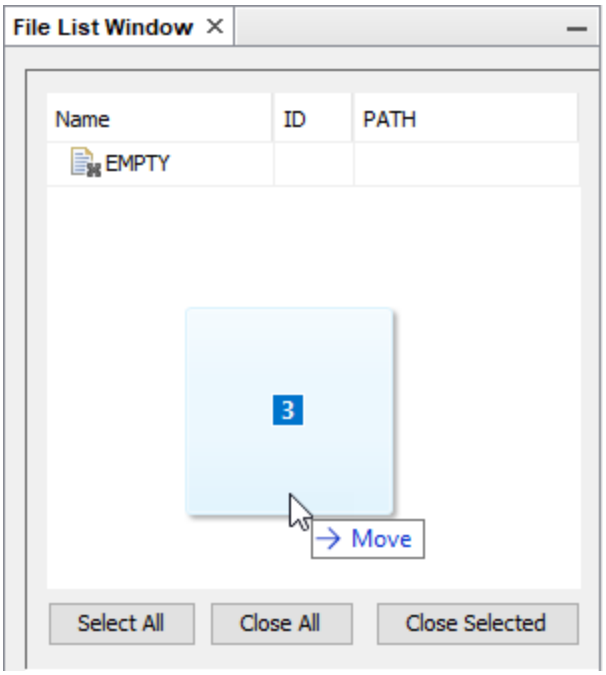
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

"Generate an ERL Calculation Report with a User Defined Solution" on page 16-150

Calculating ERL From the SPISim User Interface

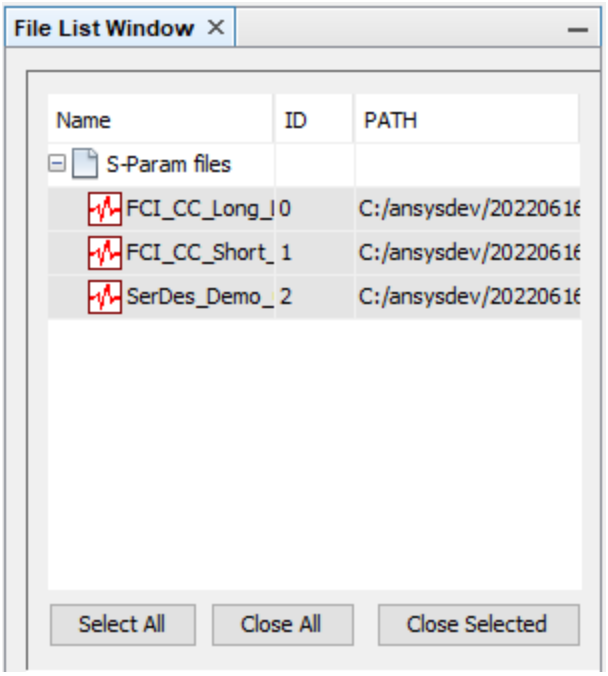
Follow these steps to calculate the effective return loss (ERL) of one or several *.s4p* files.

1. **Drag**+**drop** the relevant *.s4p* file(s) into the **File List Window** to populate the **Signal**, **Matrix**, and **Freq. View** tabs.



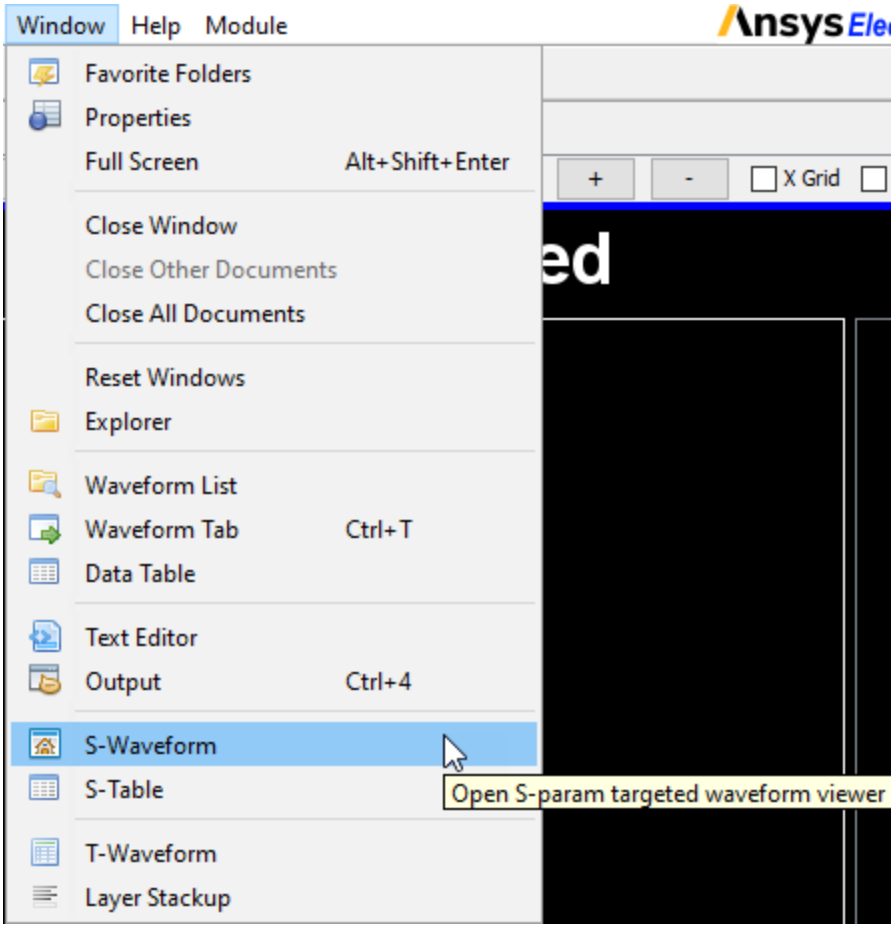
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **File List Window**, click **Select All**.



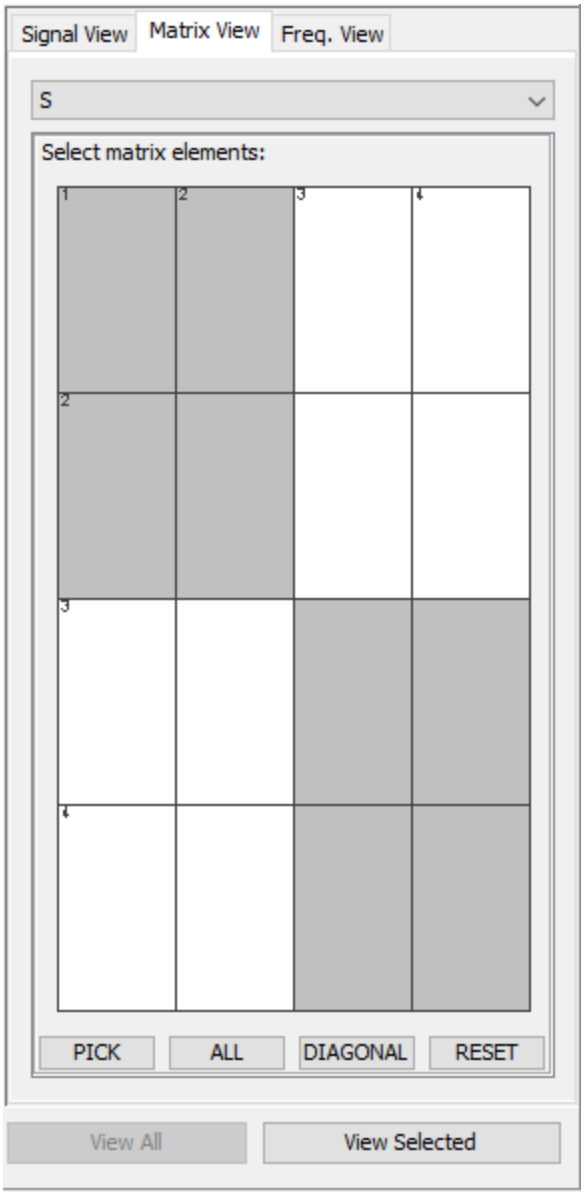
3. If necessary, navigate to **Window** > **S-Waveform** to open an S-waveform output view tab (i.e., **S-Wfm:1** in step 5).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



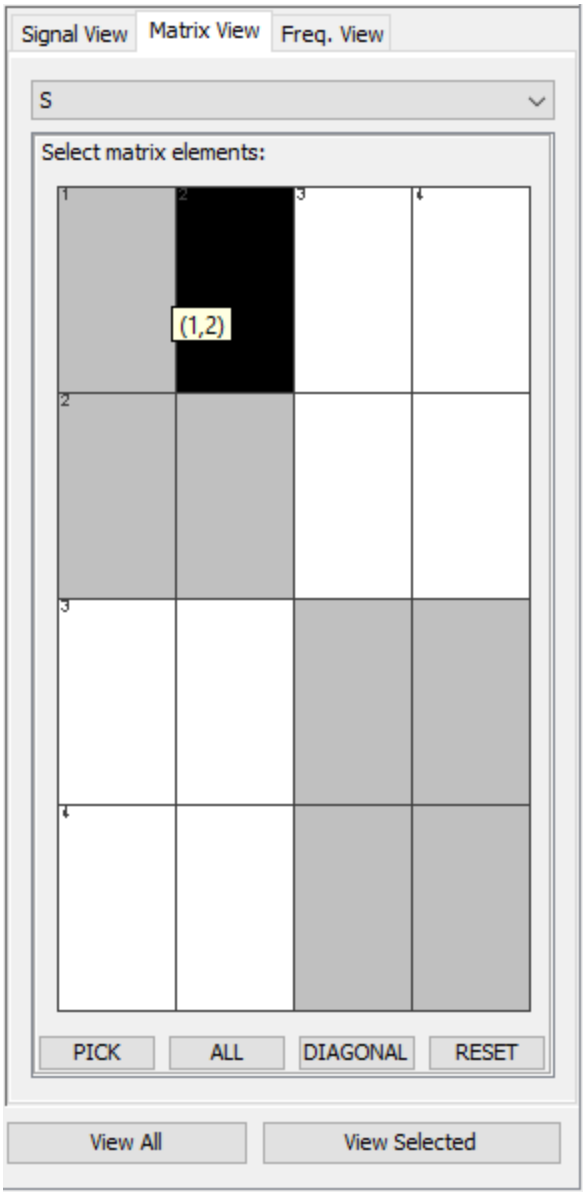
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Navigate to the **Matrix View** tab.



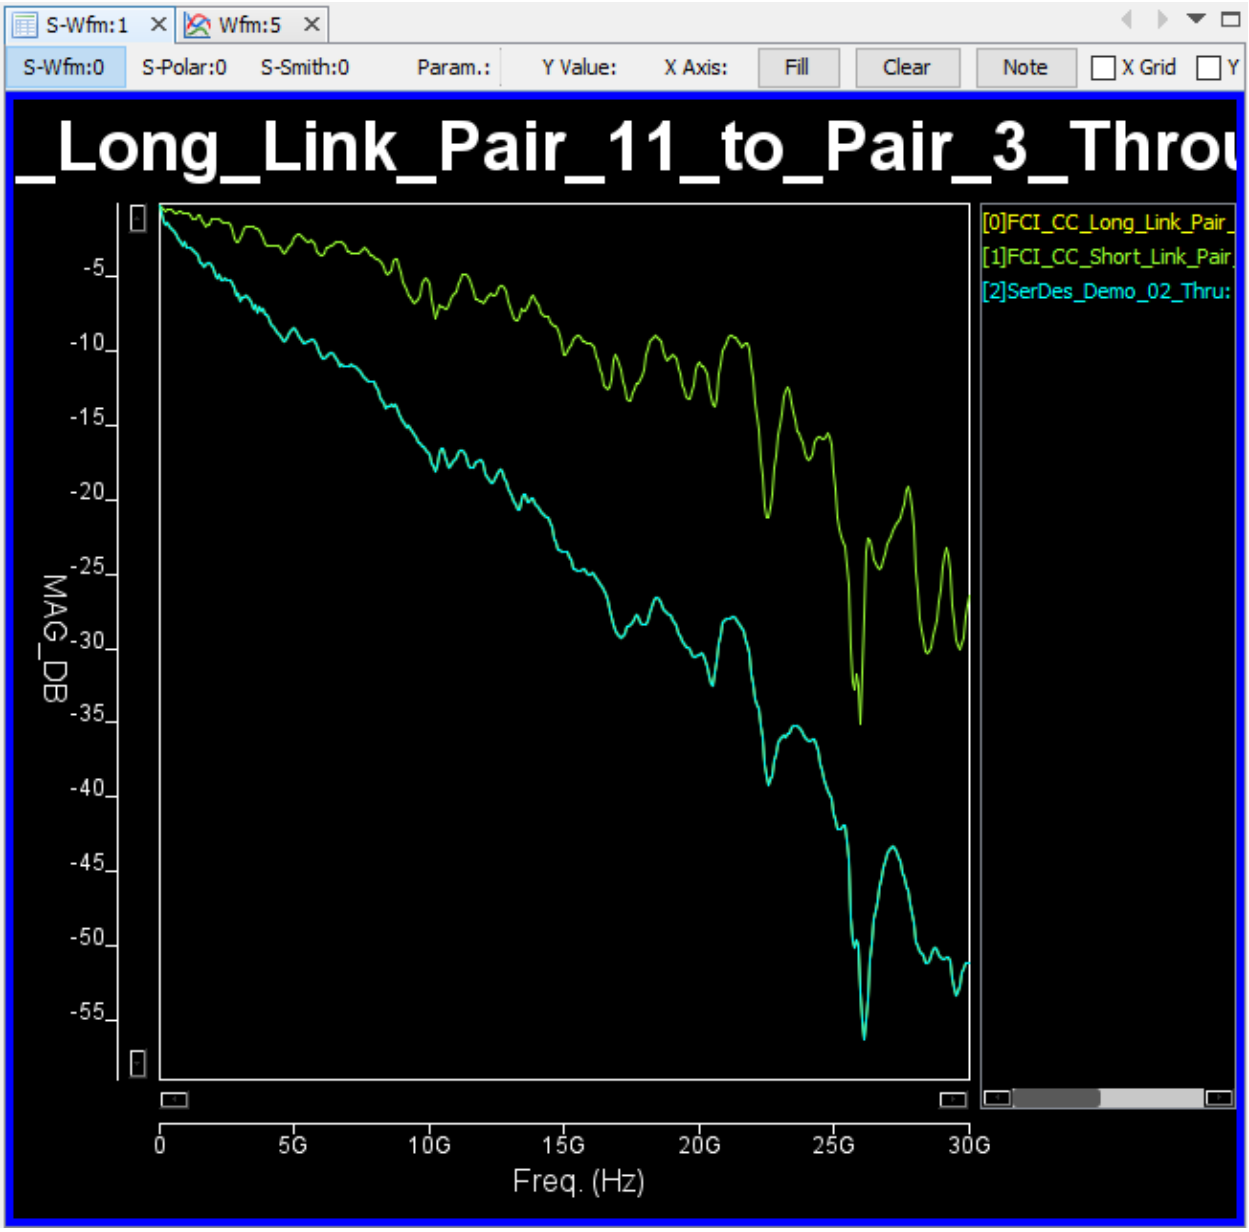
To verify port order, select a port (i.e., a rectangle in the matrix). Each rectangle is assigned a matrix coordinate, indicating the port it represents (e.g., according to both the X,Y coordinate grid and the pop-up **Tool Tip**, the selected rectangle in the following screenshot is port 1,2).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



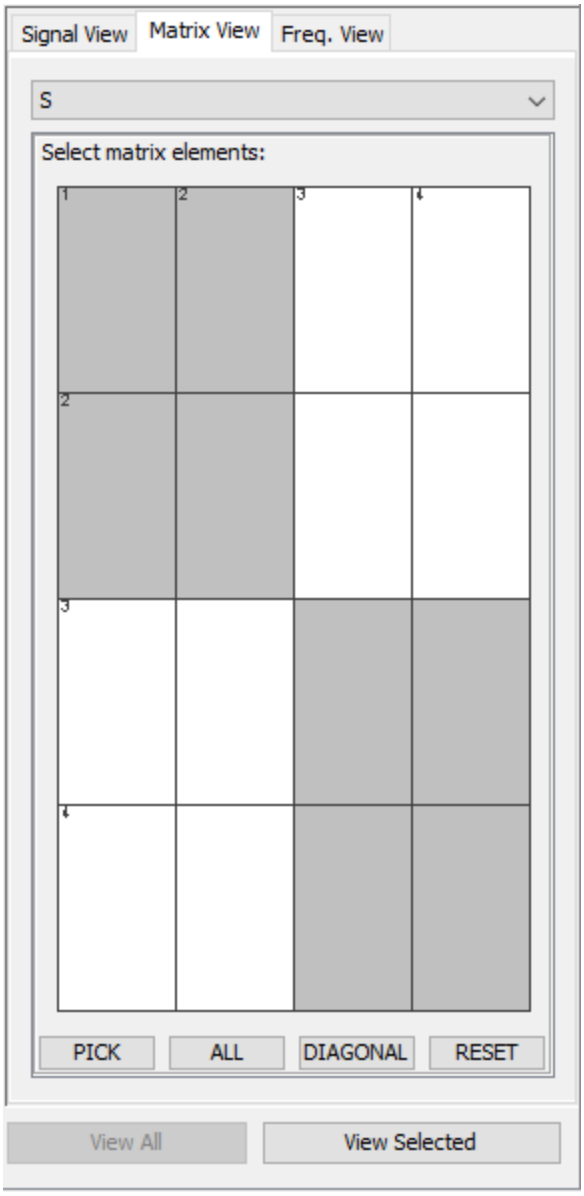
5. Click **View Selected** to view the selected port in the waveform view window (i.e., **S-Wfm:1**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



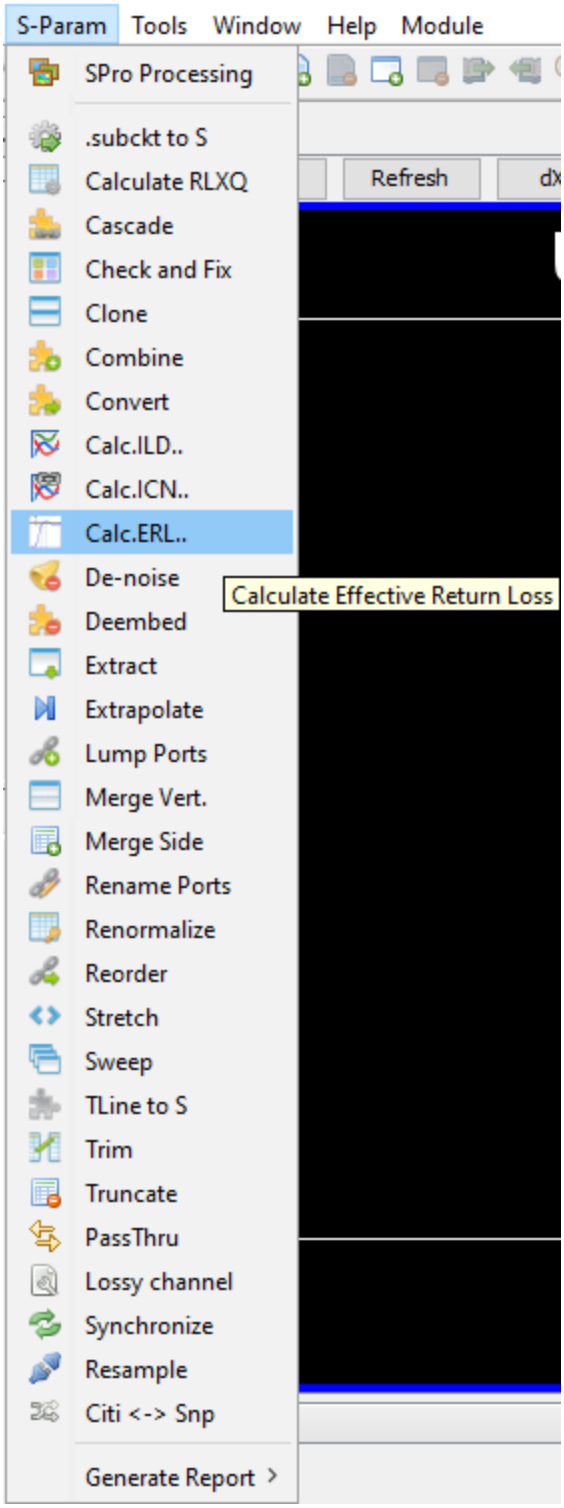
6. Once the port order is identified, select **RESET** on the **Matrix View** tab, to clear the selection.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

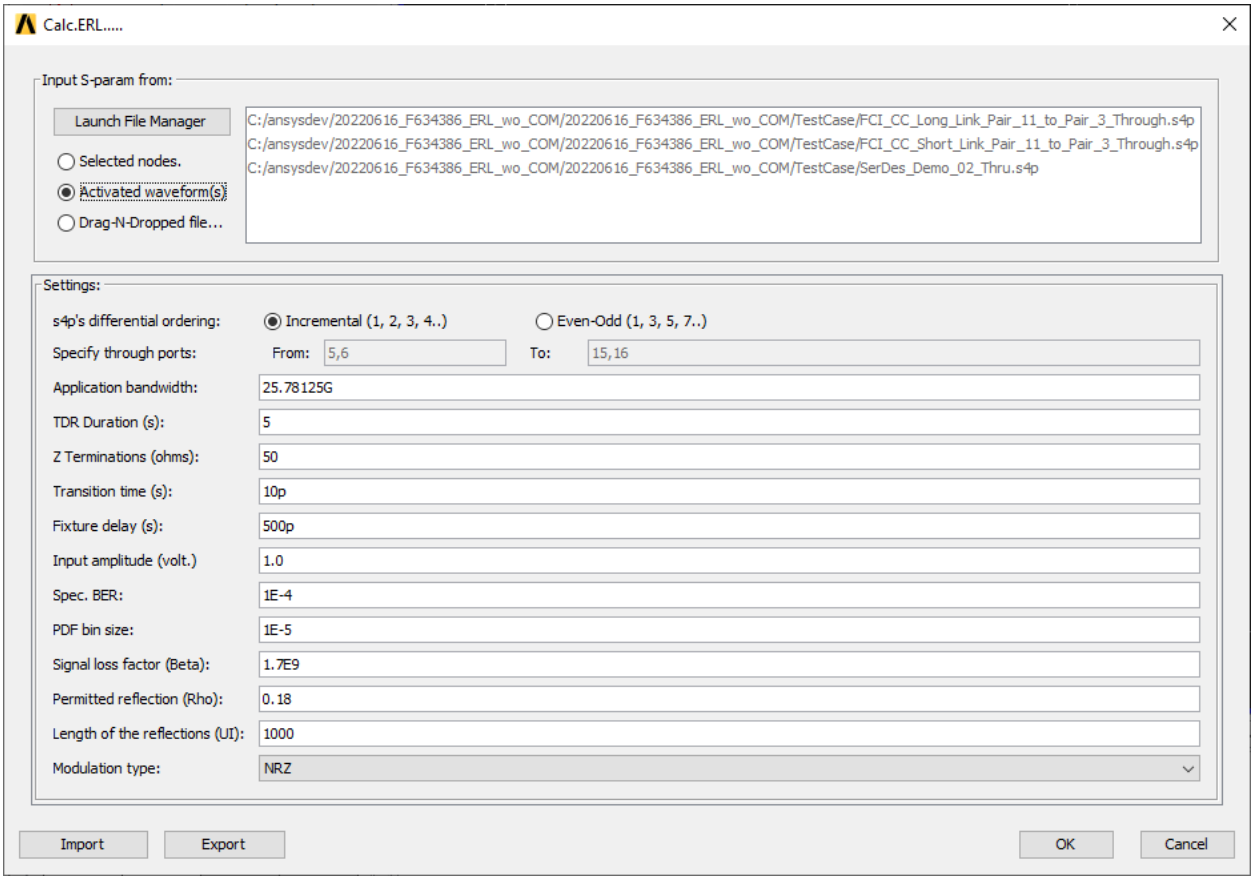
From **S-Param**, select **Calc.Erl..** to open the **Calc.ERL.....** window.



The **Input S-param from** group box is pre-populated with the *.s4p* files that were dropped

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

in the **File List Window** in step 1.



7. From the **Settings** group box, select **Even-Odd (1, 3, 5, 7..)** from **s4p's differential ordering**. Then make any other appropriate changes. The **Settings** group box also contains the following configurable parameters:

   Application bandwidth: inverse of one unit interval (UI)

   TDR Duration (s): length time domain reflectometry (TDR) data should be applied, in seconds

   Z Terminations (ohms): termination (Z11 and Z22) when TDR is calculated

   Transition time (s): how fast input pulse transitions from 0 to Vcc voltage (Tr)

   Fixture delay (s): lapse between when input starts transition from 0 to Vcc voltage (Tfx)

   Input amplitude (volt.): Vcc volt of step input

   Spec. BER: threshold at which ERL is calculated

   PDF bin size: superimposed value (i.e., quantized number of bins)

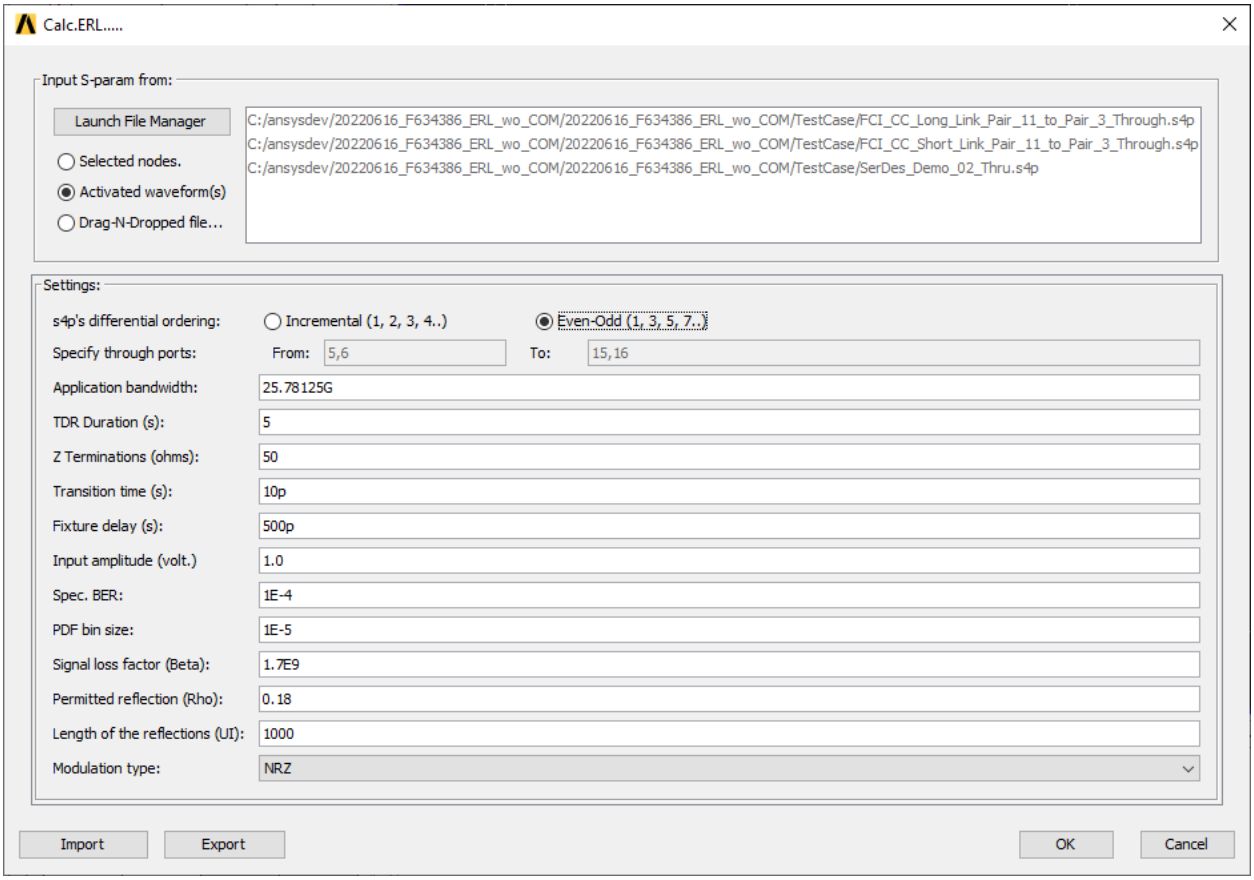
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Signal loss factor (Beta): exponent by which the signal loses strength as it propagates

Permitted reflection (Rho): reflective coefficient

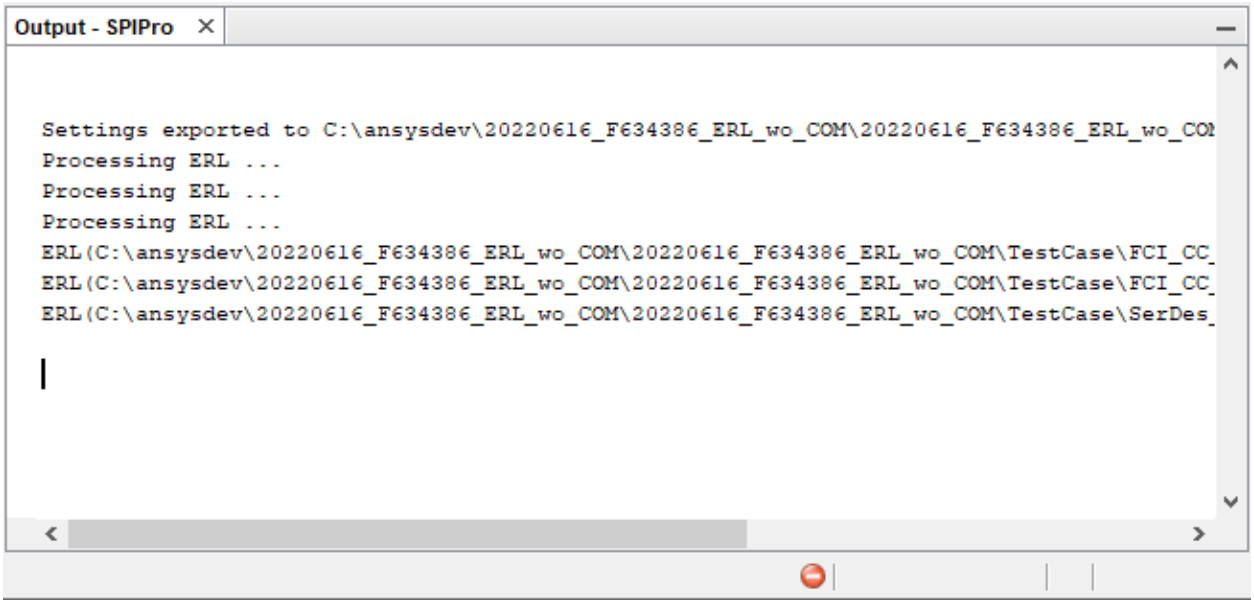
Length of the reflections (UI): number of unit intervals used to calculate ERL

Modulation type: signal modulation type (NRZ or PAM4)

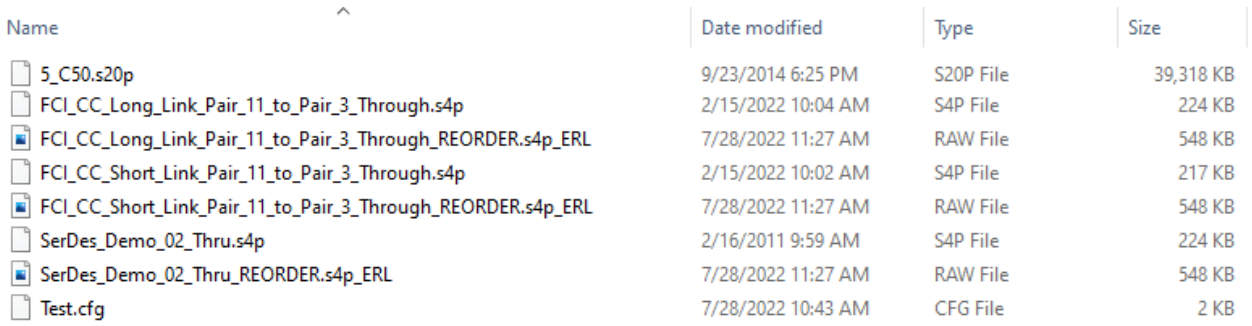


8. Click **OK** to close the **Calc.ERL.....** window and begin ERL calculation. View the process and result in the **Output - SPIPro** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

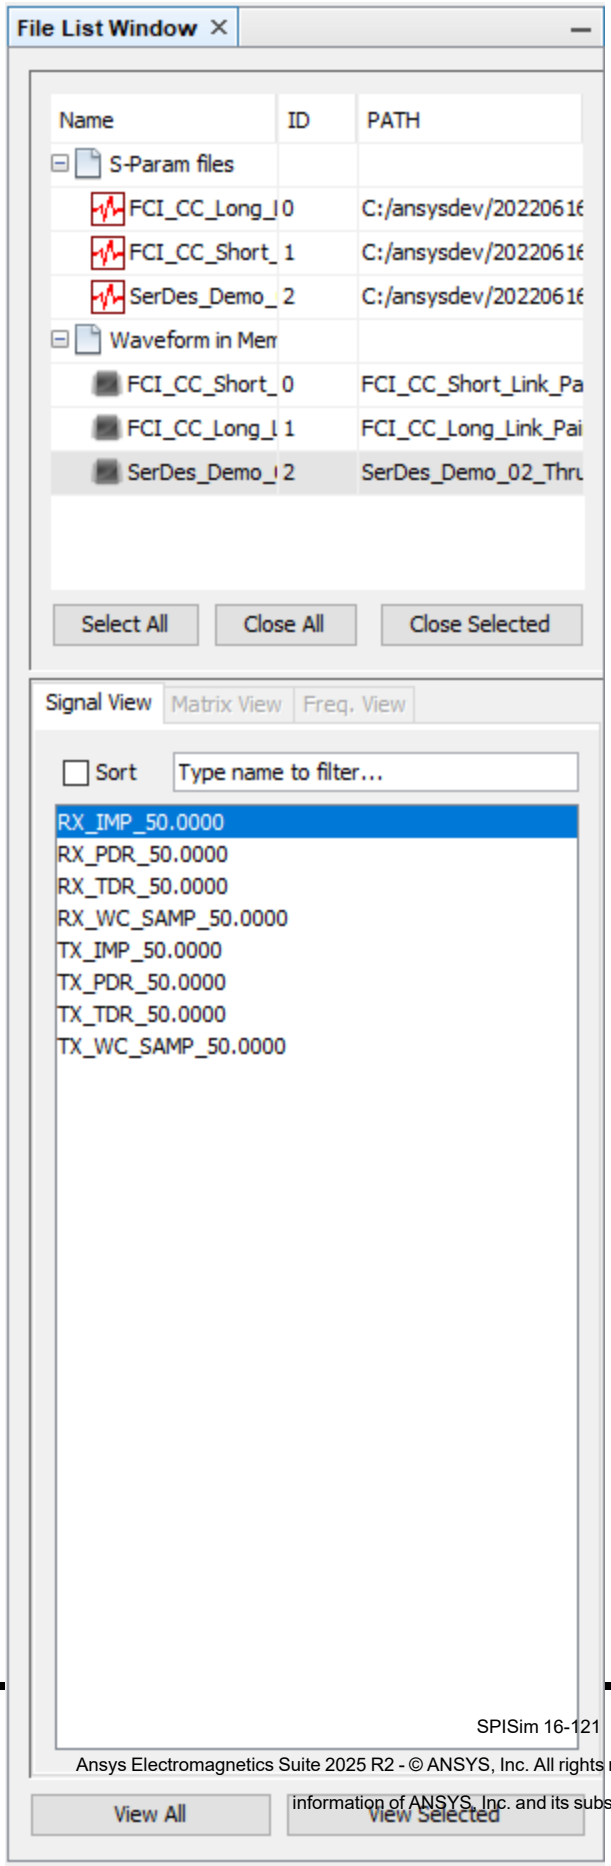


When the process is finished, new *.RAW* waveform files appear in the directory from which the original *.s4p* files were dragged.



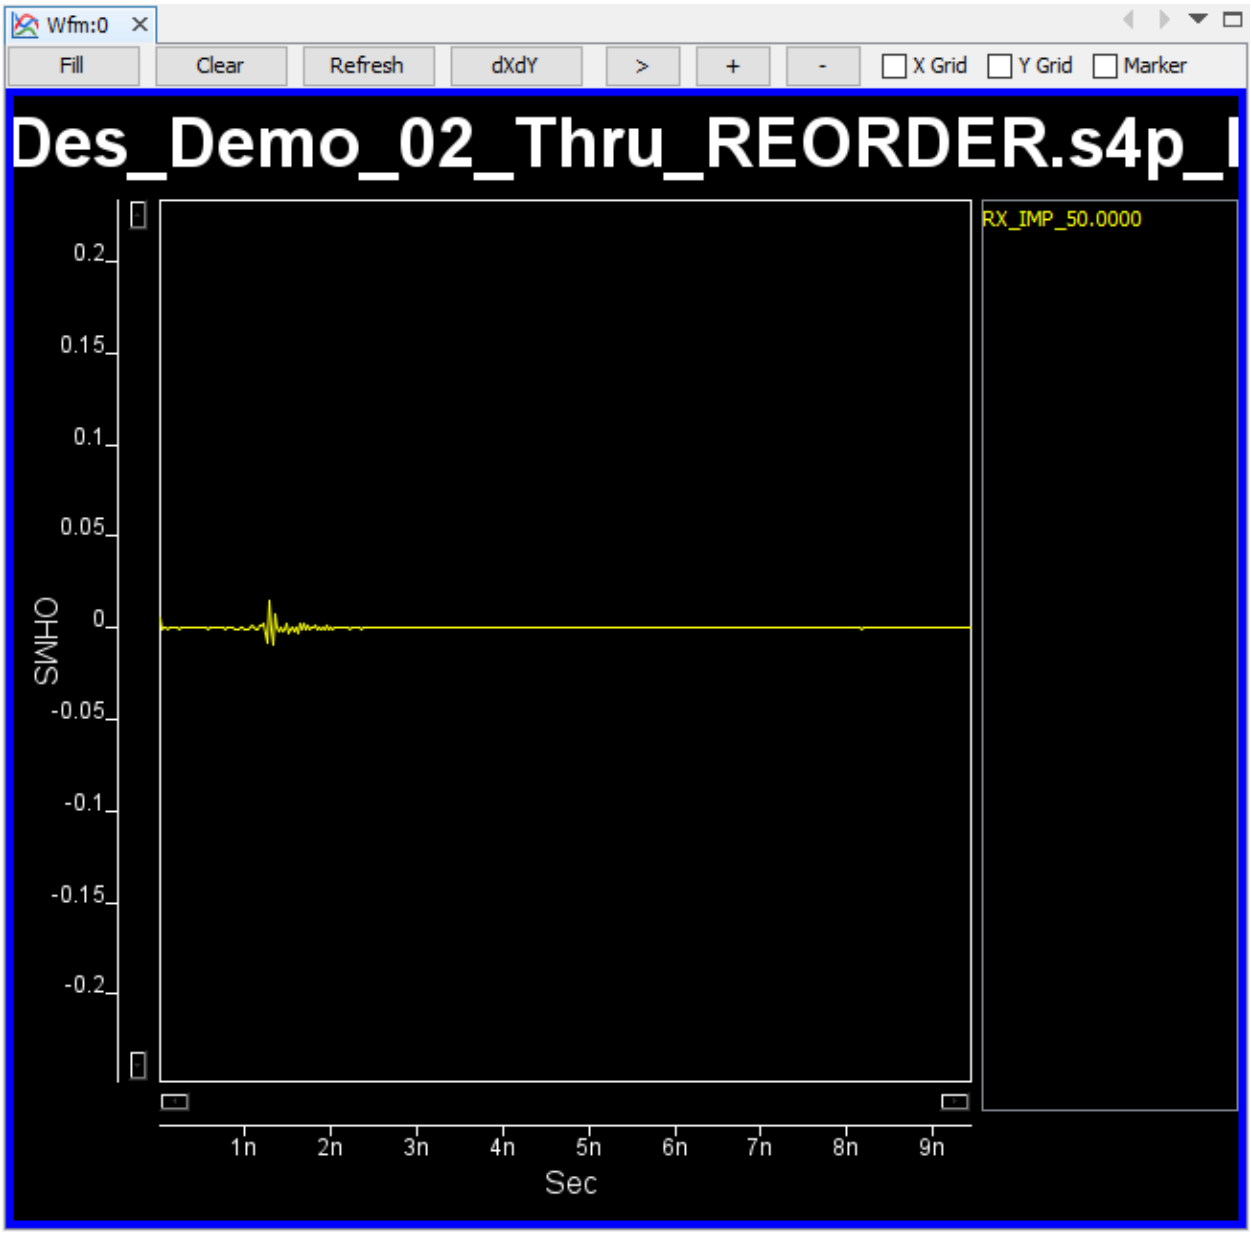
The **File List Window** and **View** tabs populate with relevant information (.e.g., the **Signal View** window is now populated with Pulse Time Domain Reflectometry (PTDR) waveforms).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



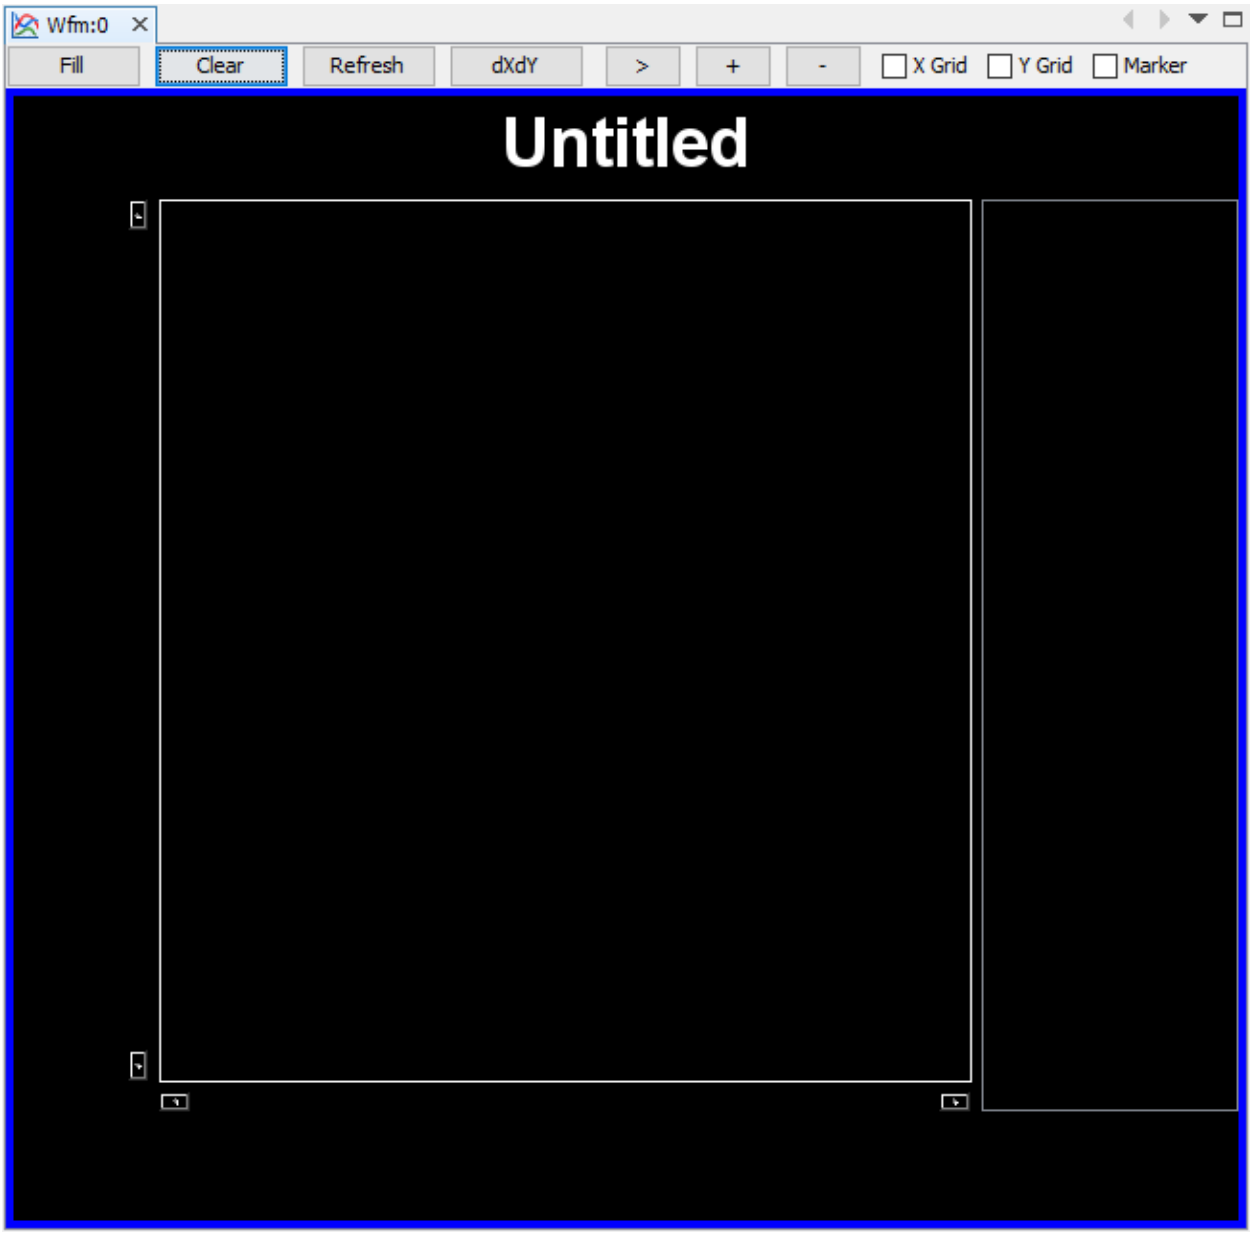
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9. Select a PTDR waveform on the **Signal View** tab. Then click **View Selected** to view the PTDR waveform in the waveform view window (i.e., **Wfm:0**).



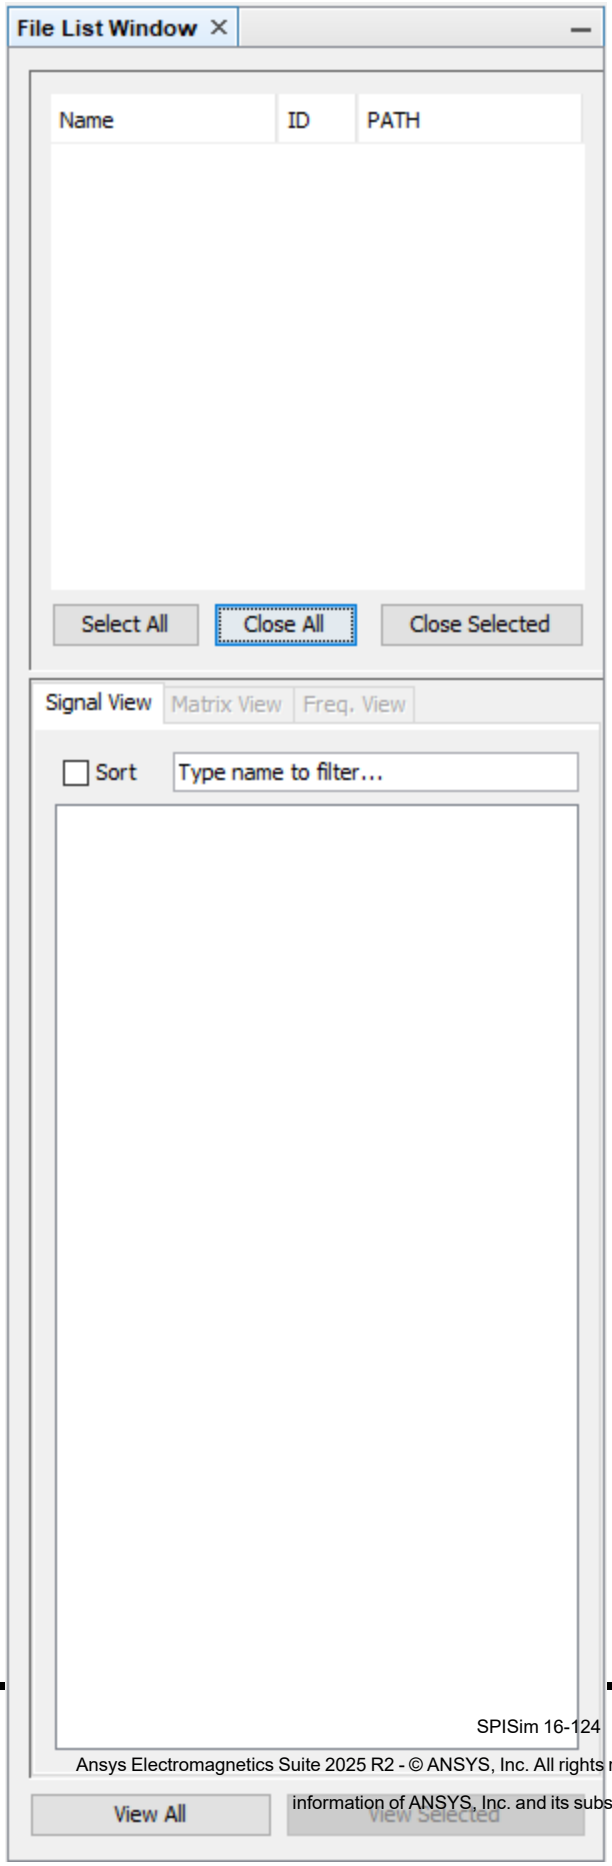
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

10. Click **Clear** to stop viewing the waveform.



11. From the **File List Window**, click **Close All** to clear the *.s4p* files and waveforms on the **File List Window** and the supplemental data on the **View** tabs.

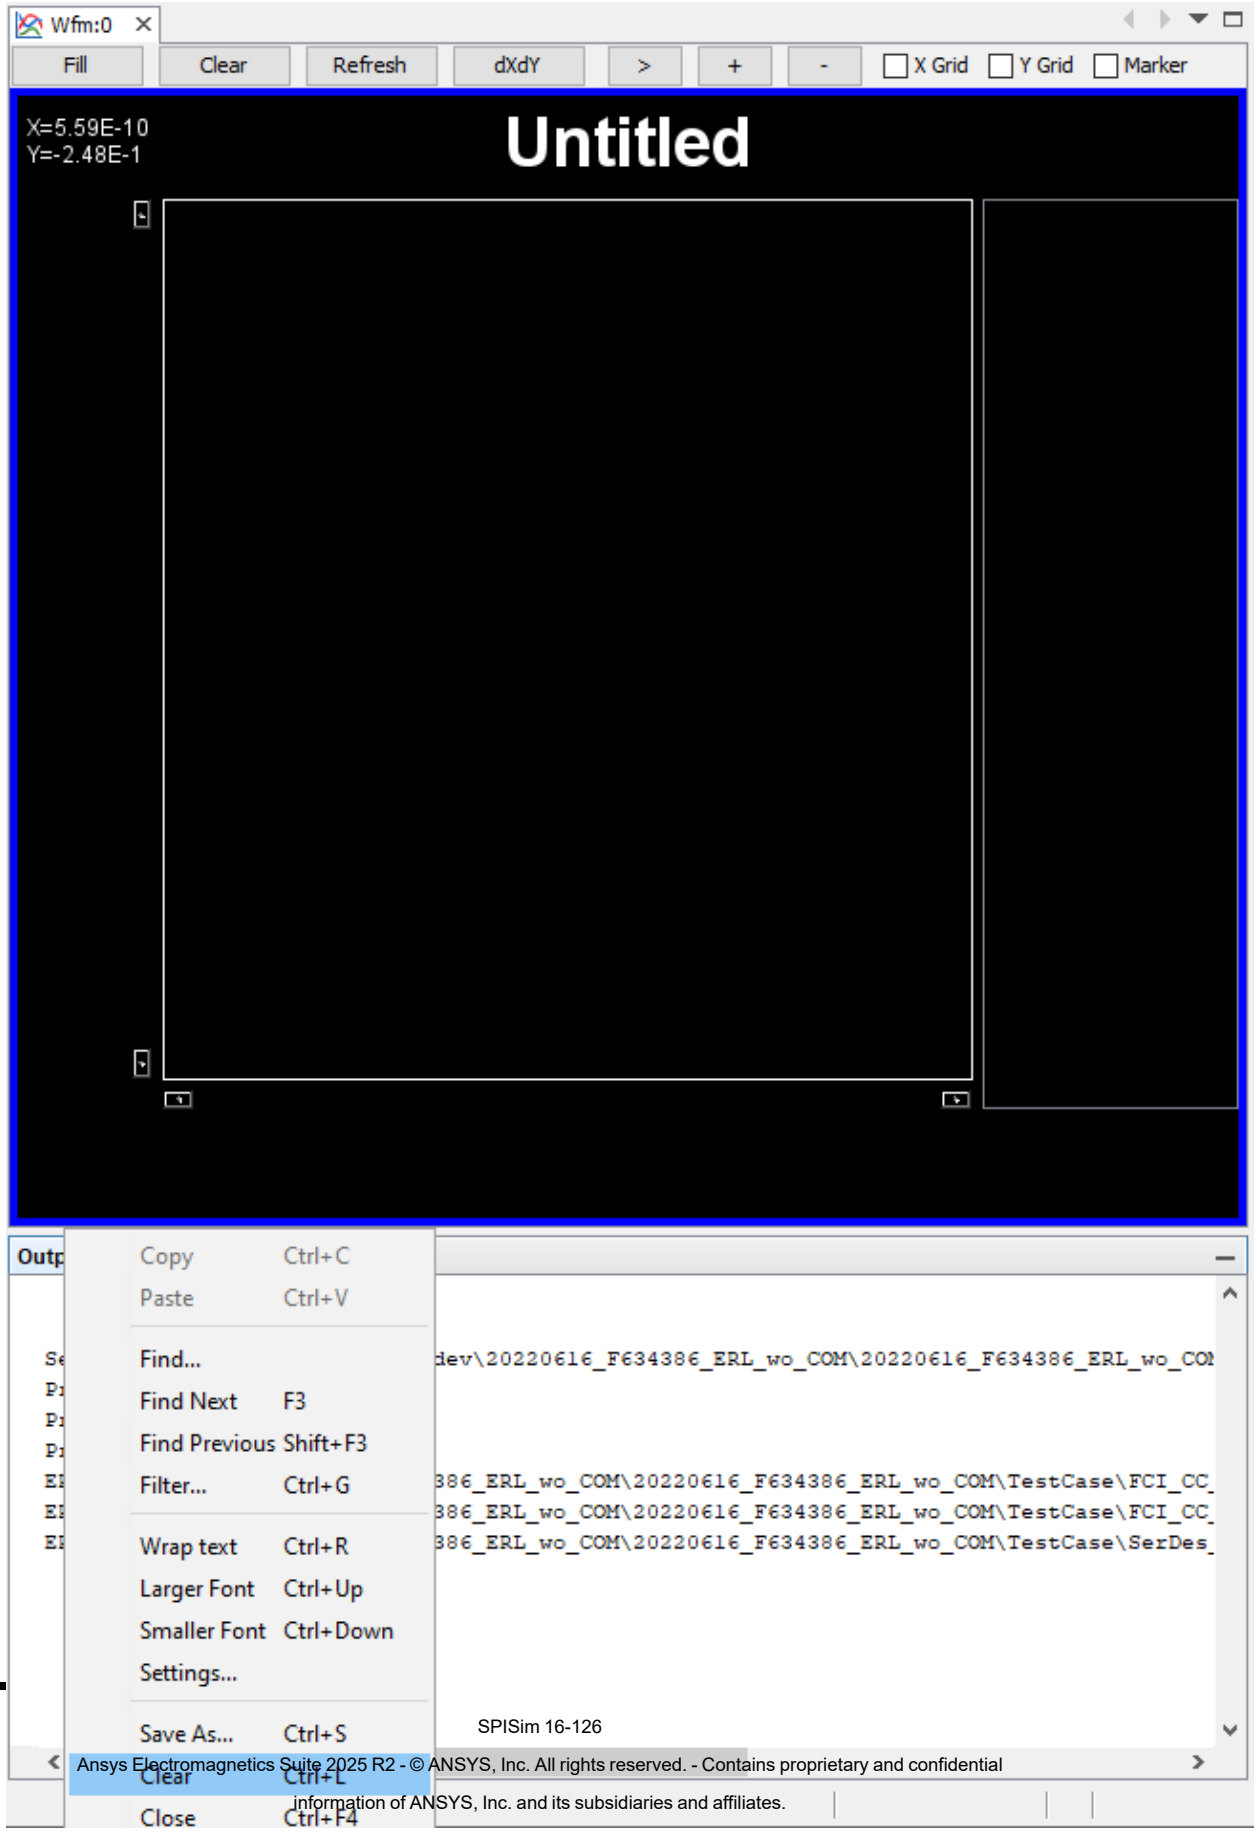
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

12. To clear the contents of the **Output** window, right-click within the window and select **Clear**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



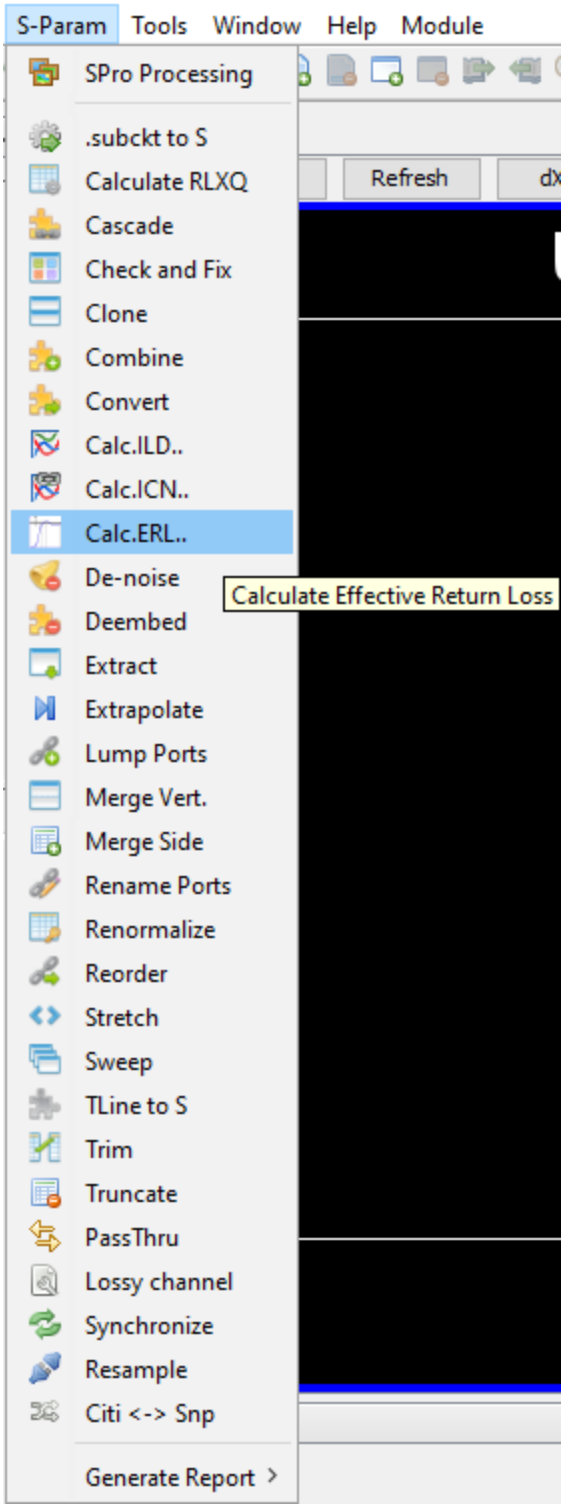
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Calculating ERL of Non-.*S*4*P* .*SNP* Files

Follow these steps to calculate the ERL of .*sNp* files of any other variant, where ***N*** is not equal to **4**.

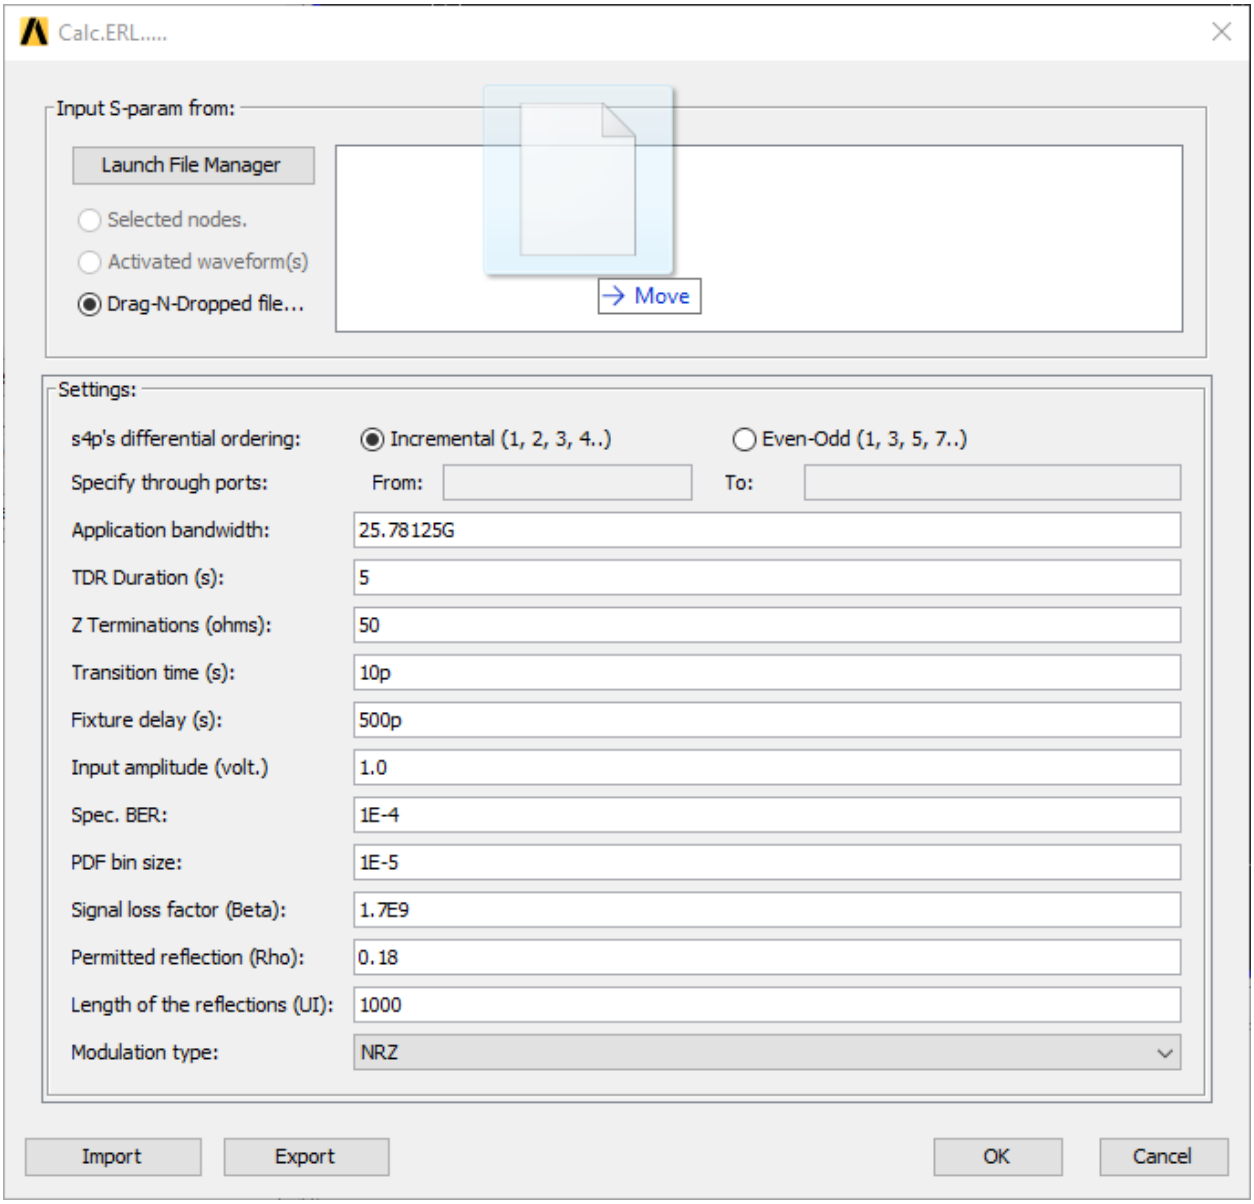
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Navigate to **S-Param** > **Calc.Erl..** to open the **Calc.ERL.....** window.



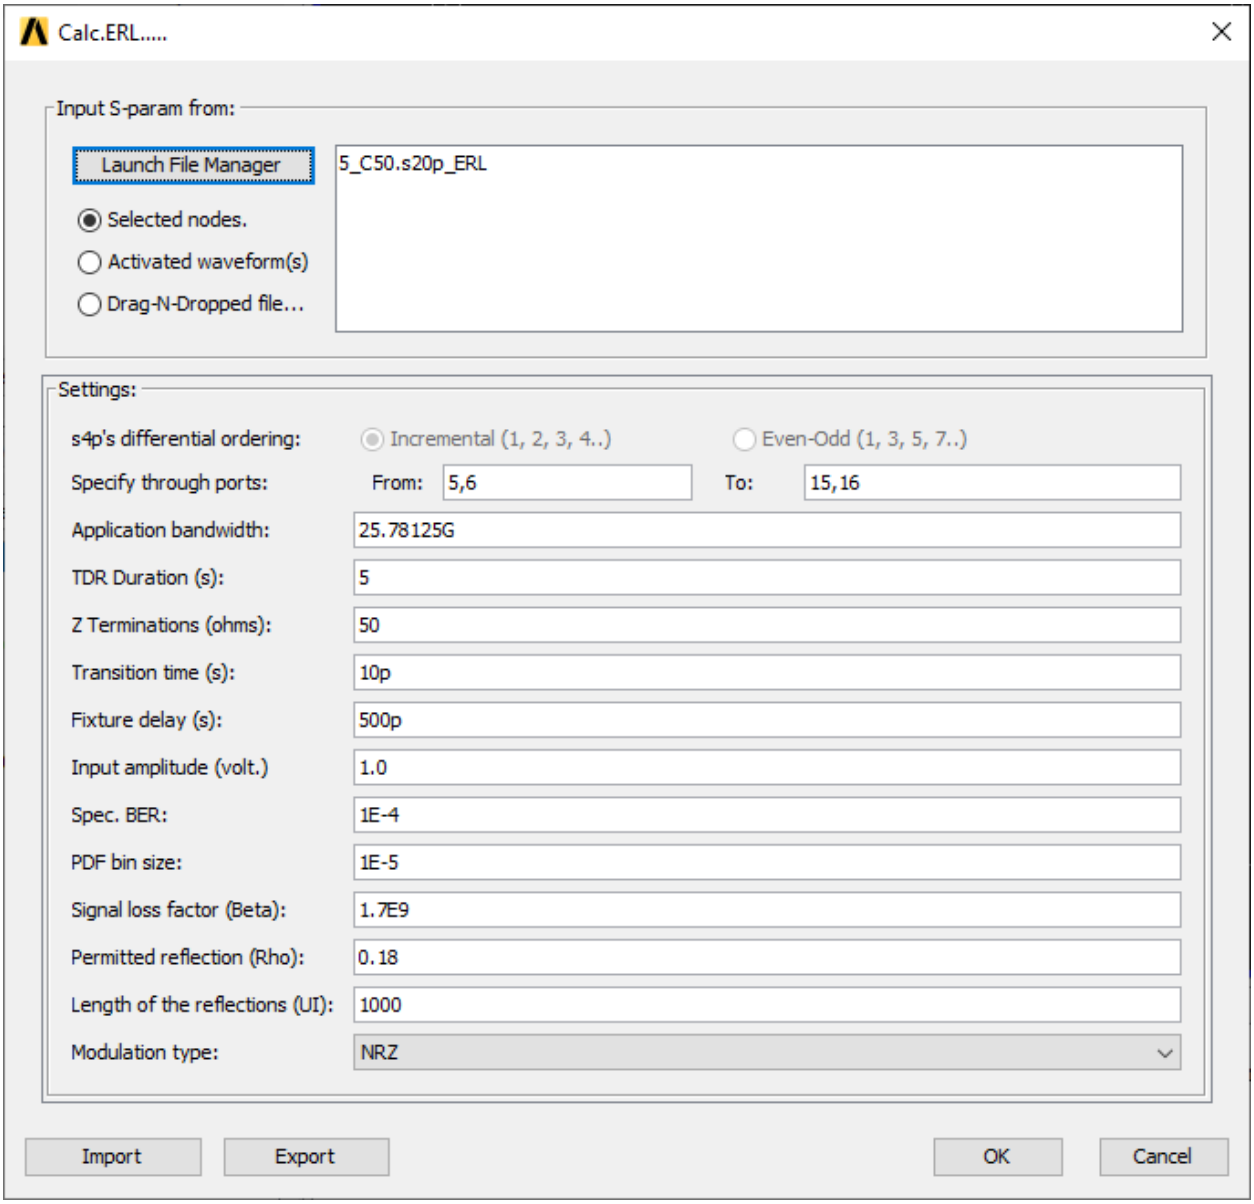
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. **Drag+drop** the relevant file(s) (e.g., ***s20p***) into the **Input S-param from** group box. Multiple .*s*N*p* files can be input, as long as they are of the same *N* value.



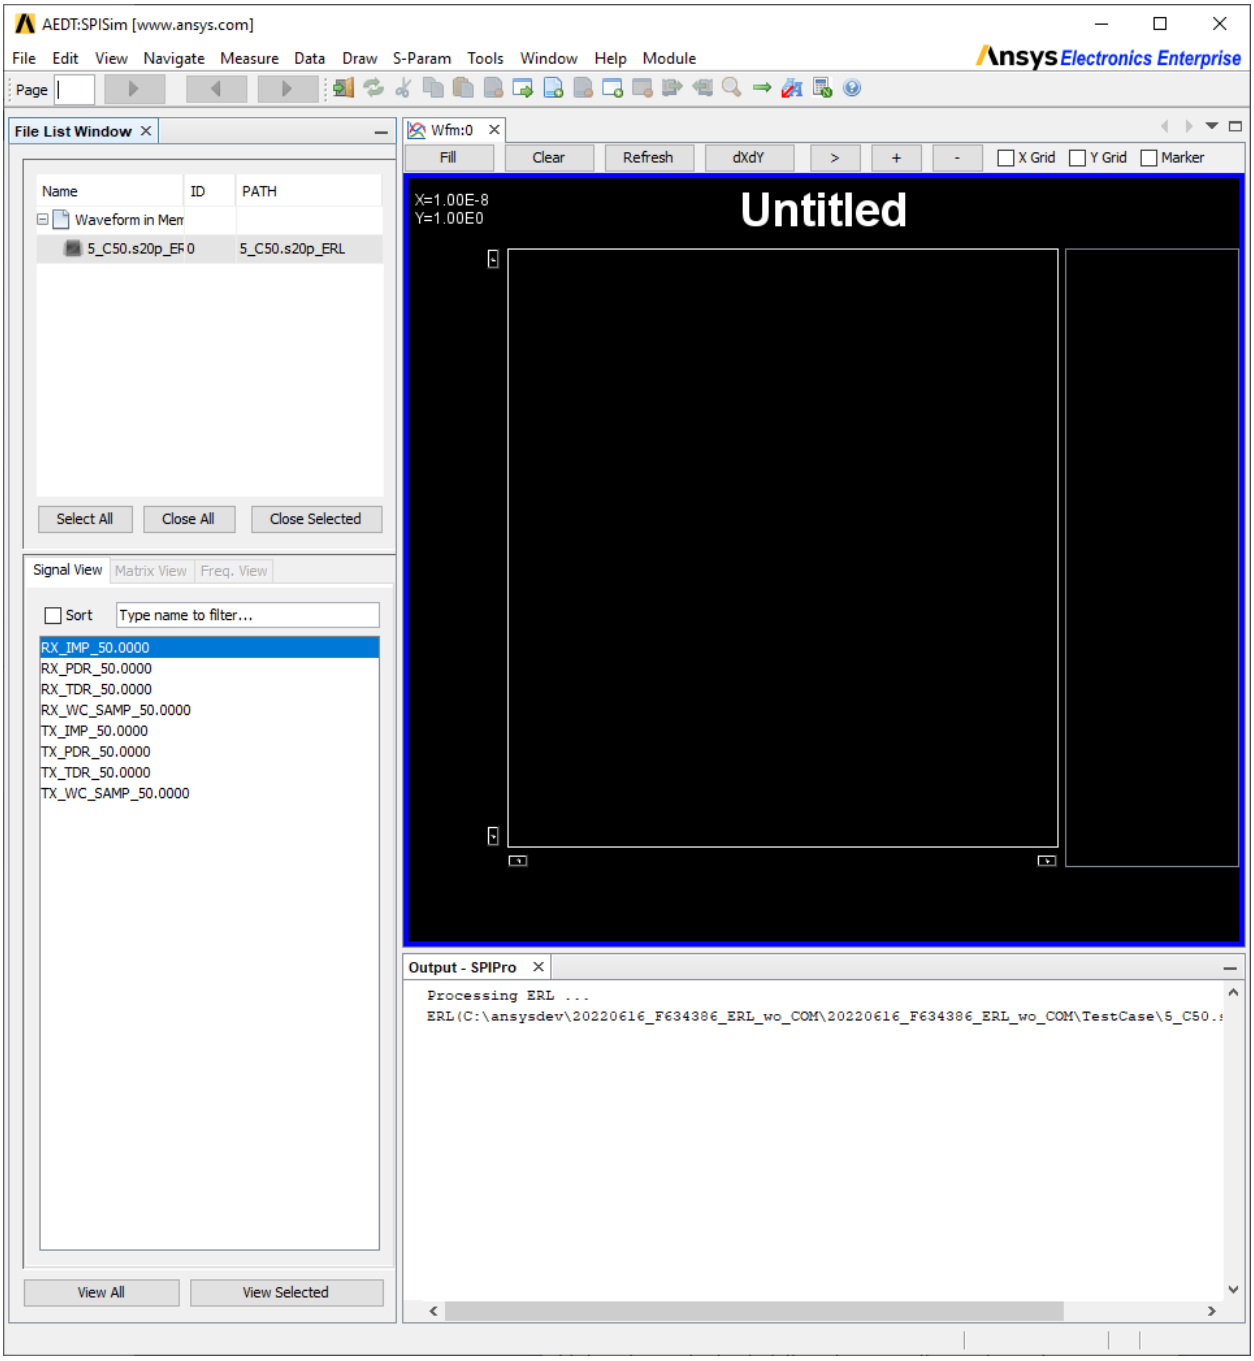
3. If necessary, enter two differential inputs (i.e., in the **From** field) and two outputs (i.e., in the **To** field).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Click **OK** to close the **Calc.ERL.....** window and begin ERL calculation. View the process and see the result in **SPISim**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

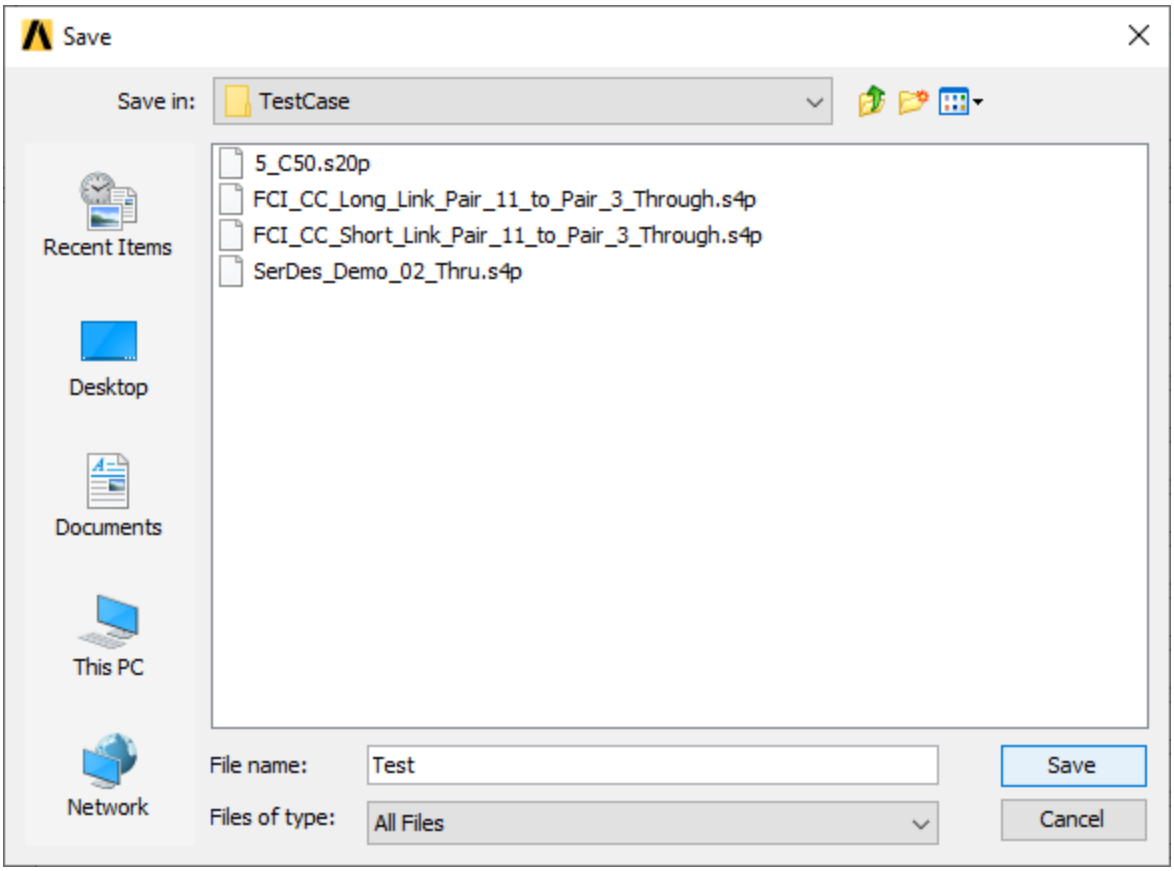


Creating an ERL Configuration File

Complete the following steps to create (i.e., **Export**) a *.cfg* (i.e., configuration) file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. After populating **SPISim** with the appropriate *.s4p* files and making any necessary changes in the **Calc.ERL.....** window > **Settings** group box (i.e., complete steps 1-7 in " Calculating ERL From the SPISim User Interface" on page 16-110), click **Export** to open an explorer window.
2. Navigate to the appropriate directory.
3. Enter a **File name** for the *.cfg* file (i.e., **Test**).
4. Click **Save** to close the explorer window.



Importing an ERL Configuration File

Follow the instructions on the following pages to import an ERL configuration file using three methods.

"Importing an ERL Configuration File From the SPISIM User Interface" on the facing page

"Importing an ERL Configuration File Using a Batch Command Line to Invoke the User Interface" on page 16-138

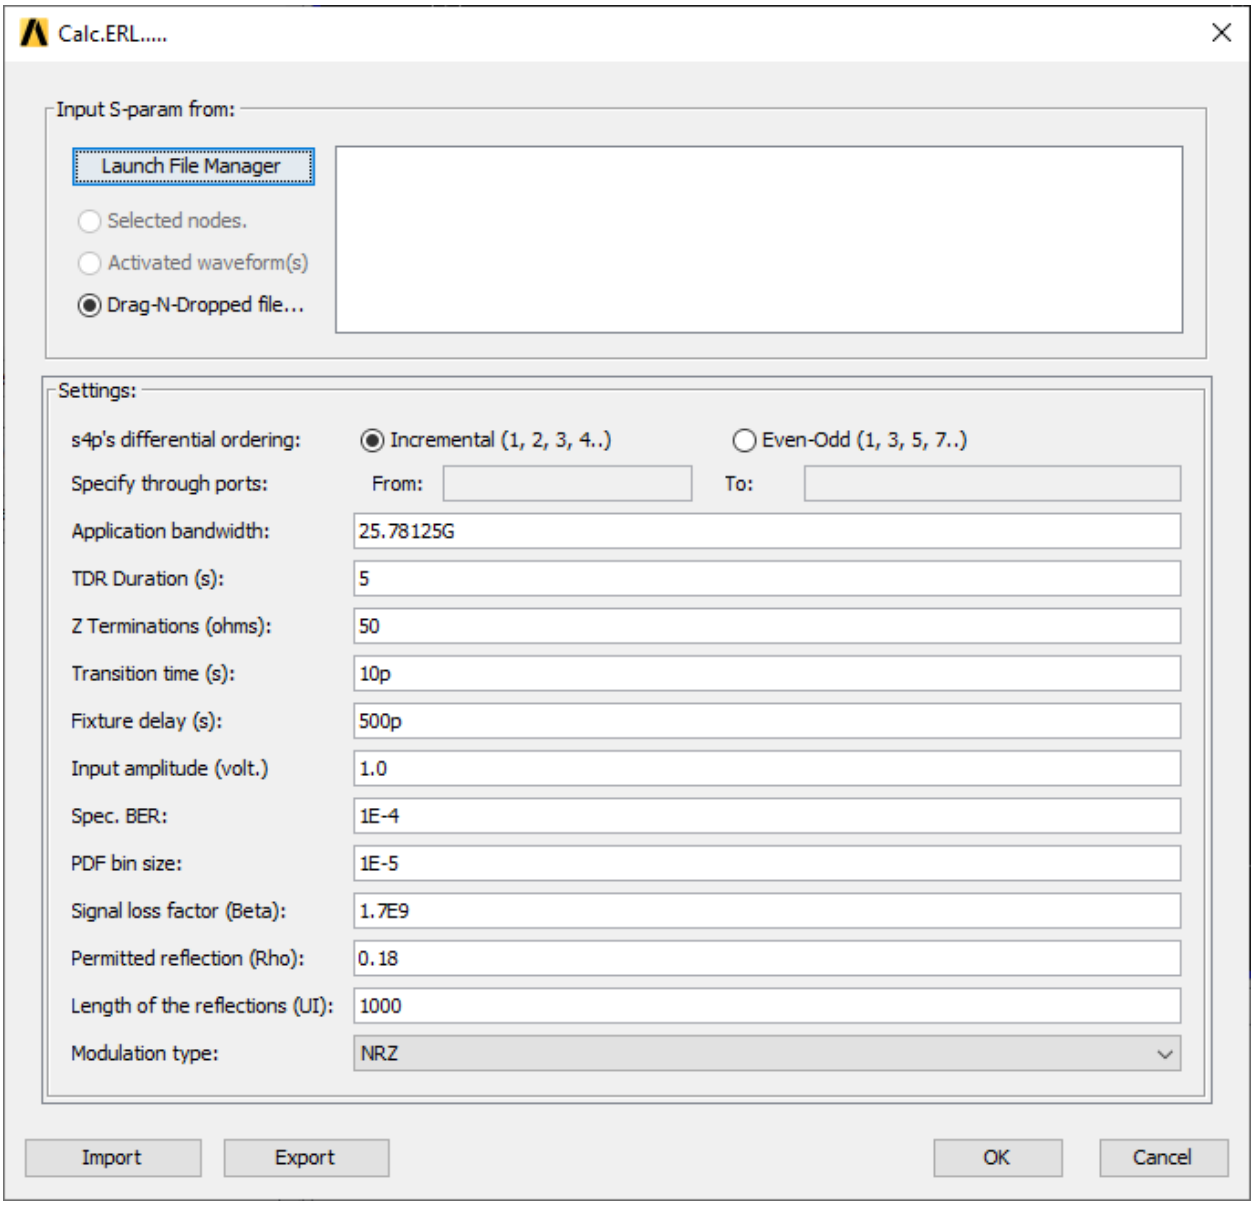
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

"Importing an ERL Configuration File Using Only a Non-GUI Batch Command Line" on page 16-144

Importing an ERL Configuration File From the SPISIM User Interface

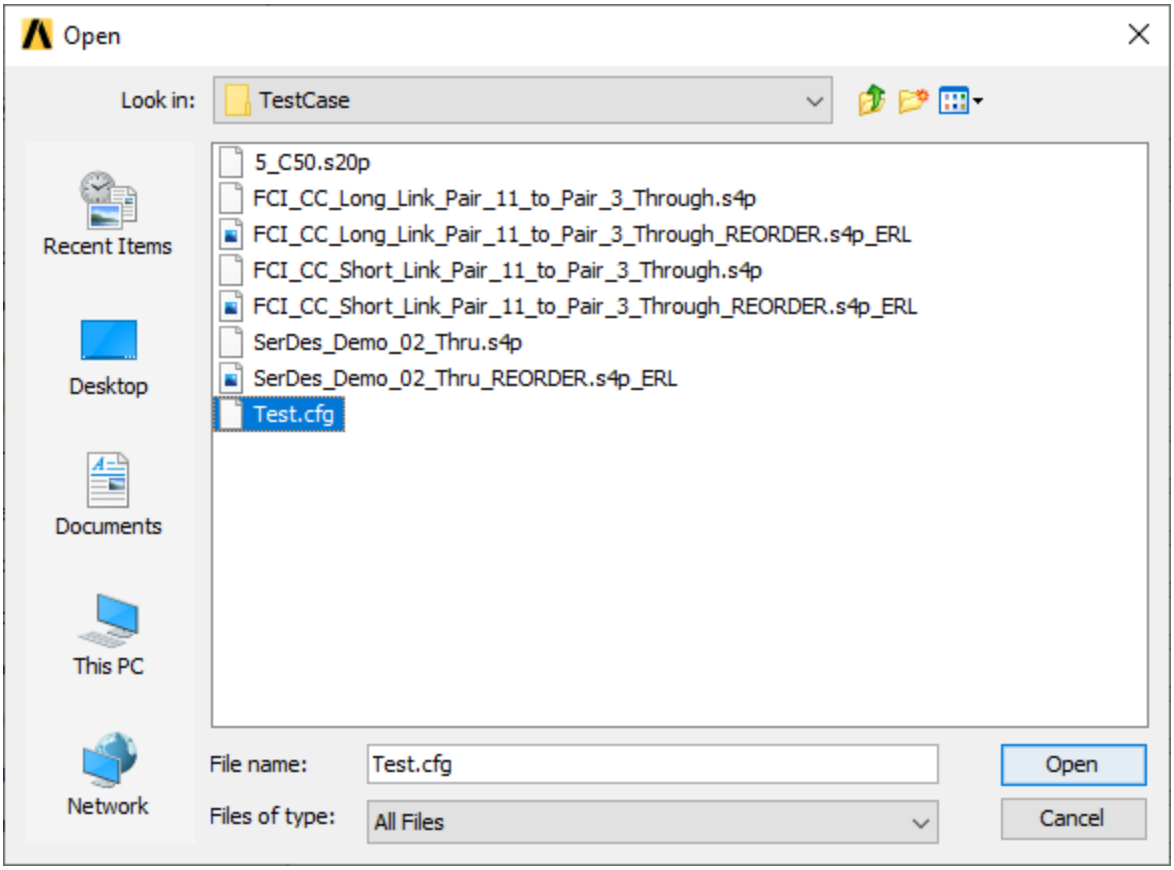
Complete the following steps to **Import** a *.cfg* file using the **SPISim** user interface, or refer to "Importing an ERL Configuration File Using a Batch Command Line to Invoke the User Interface" on page 16-138 or "Importing an ERL Configuration File Using Only a Non-GUI Batch Command Line" on page 16-144 for alternative methods.

1. From the **Calc.ERL.....** window, click **Import** to open an explorer window.



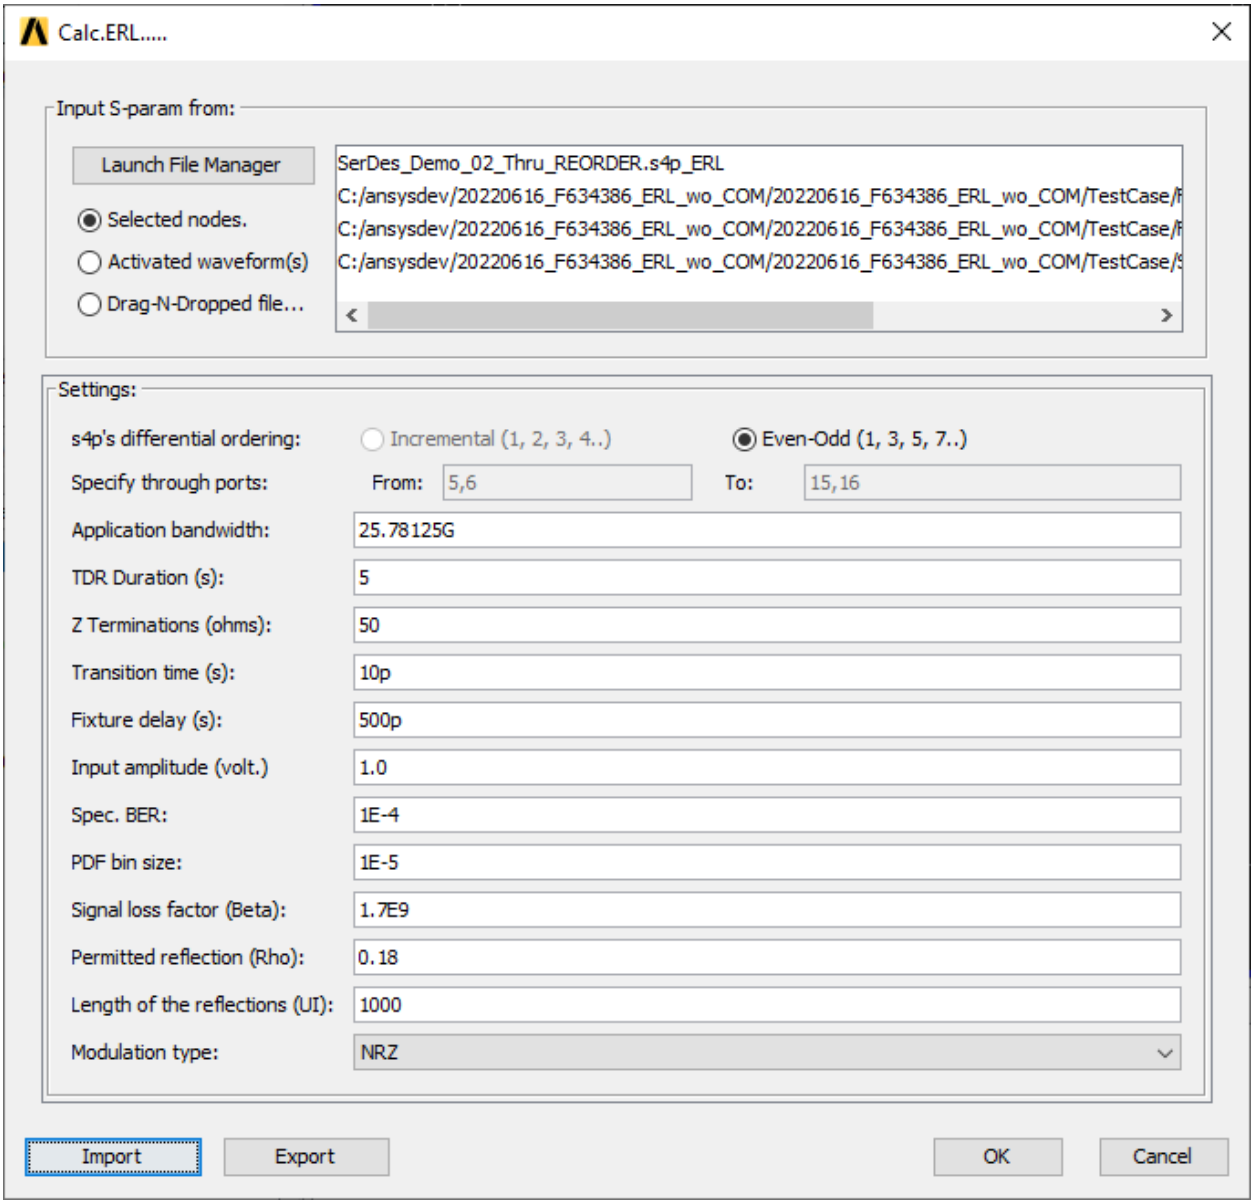
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Navigate to the appropriate directory and select a *.cfg* file (i.e., **Test.*cfg***).
3. Click **Open** to close the explorer window.



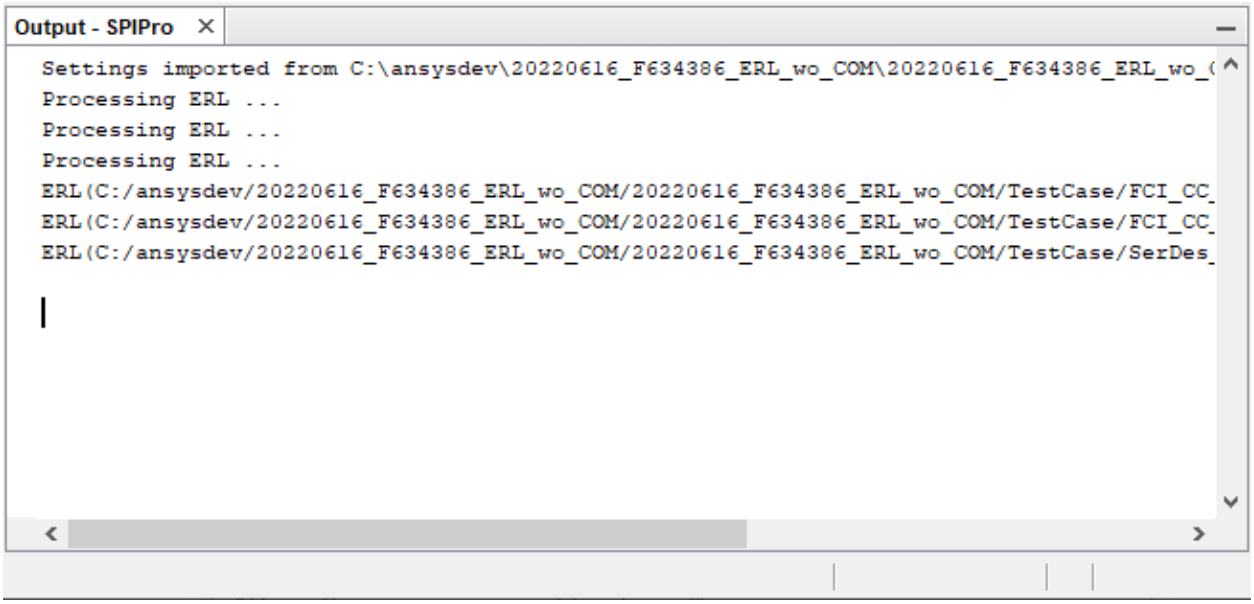
4. Make any necessary changes in the **Settings** group box. Refer to step 7 in Calculating ERL From the SPISim User Interface.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

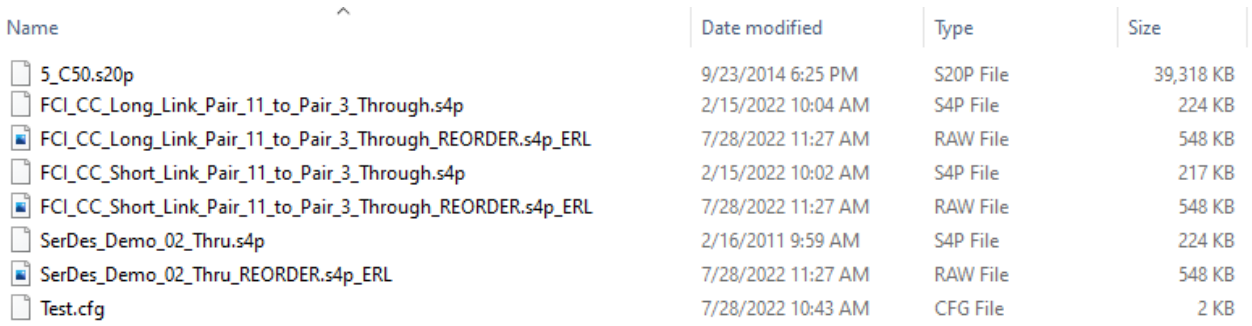


5. Click **OK** to close the **Calc.ERL.....** window and begin ERL calculation. View the process and result in the **Output - SPIPro** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

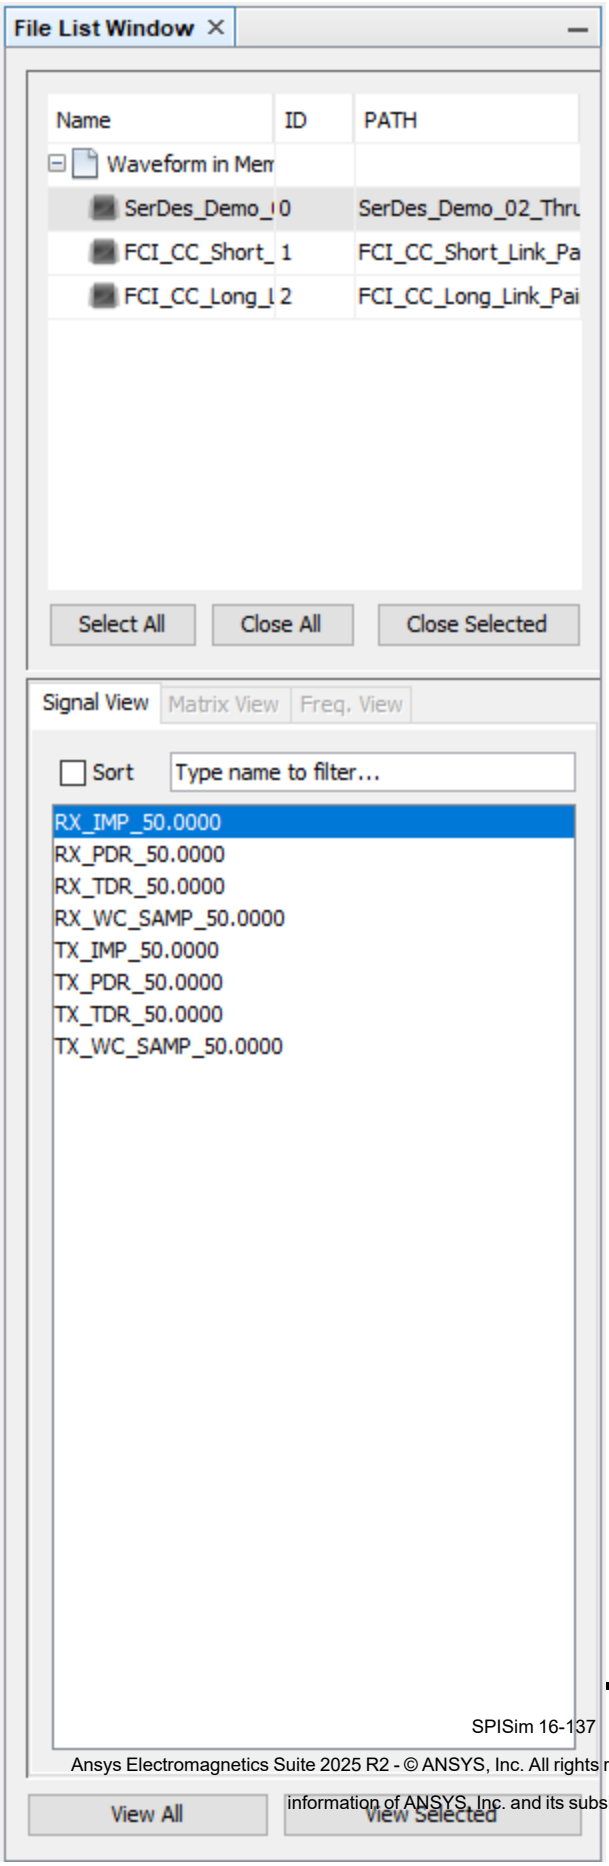


When the process is finished, new *.RAW* waveform files appear in the directory from which the original *.s4p* files were dragged.



The **View** tabs populates with relevant information (.e.g., the **File List Window** is now populated with a waveform created for each *.s4p* file, which were identified by the configuration file).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

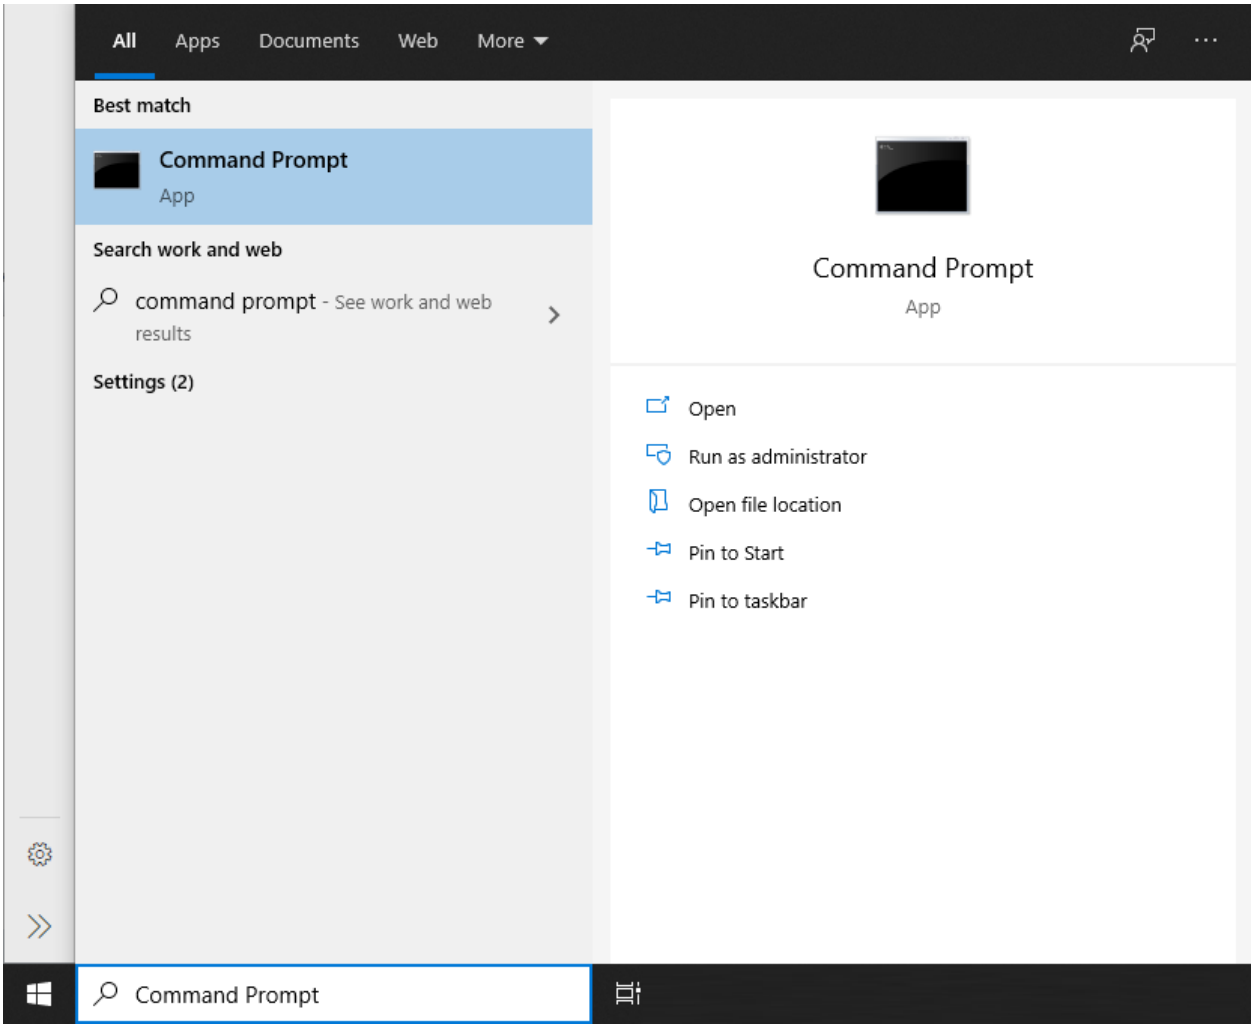


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Importing an ERL Configuration File Using a Batch Command Line to Invoke the User Interface

Complete the following steps to **Import** a *.cfg* file using a batch command line to open the **SPISim** user interface.

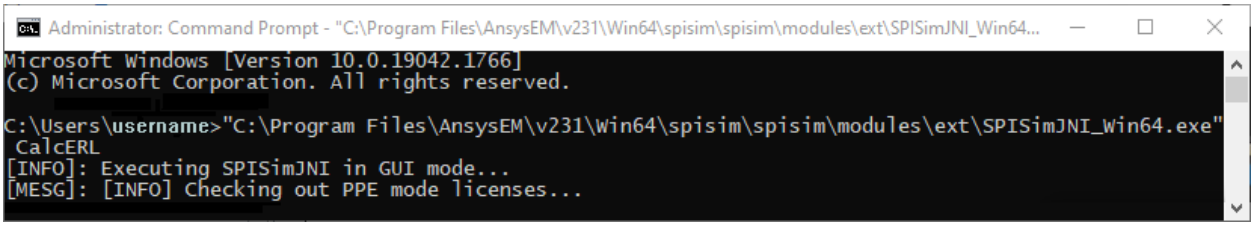
1. Run a command prompt (e.g., in a Windows environment, type *Command Prompt* into the **Search Bar** and press **Enter** to open a **Command Prompt** window).



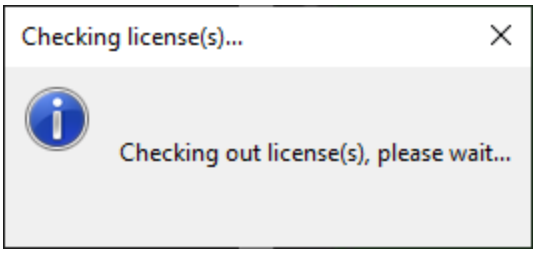
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** The following example assumes **Electronics Desktop** is installed in the default directory in a Windows operating system environment. Structure the command appropriately for a different directory, path, and/or operating system, as necessary. Do **not** move the ***SPISimJNI_WIN64.exe*** executable file. The executable file relies on the relative path to the **Electronics Desktop** installation folder.

2. From the **Command Prompt** window, enter the following command, then press **Enter**:
   `"C:\Program Files\ANSYS Inc\v252\AnsysEM\spisim\SPISim\modules\ext\SPISimJNI_WIN64.exe" CalcERL`

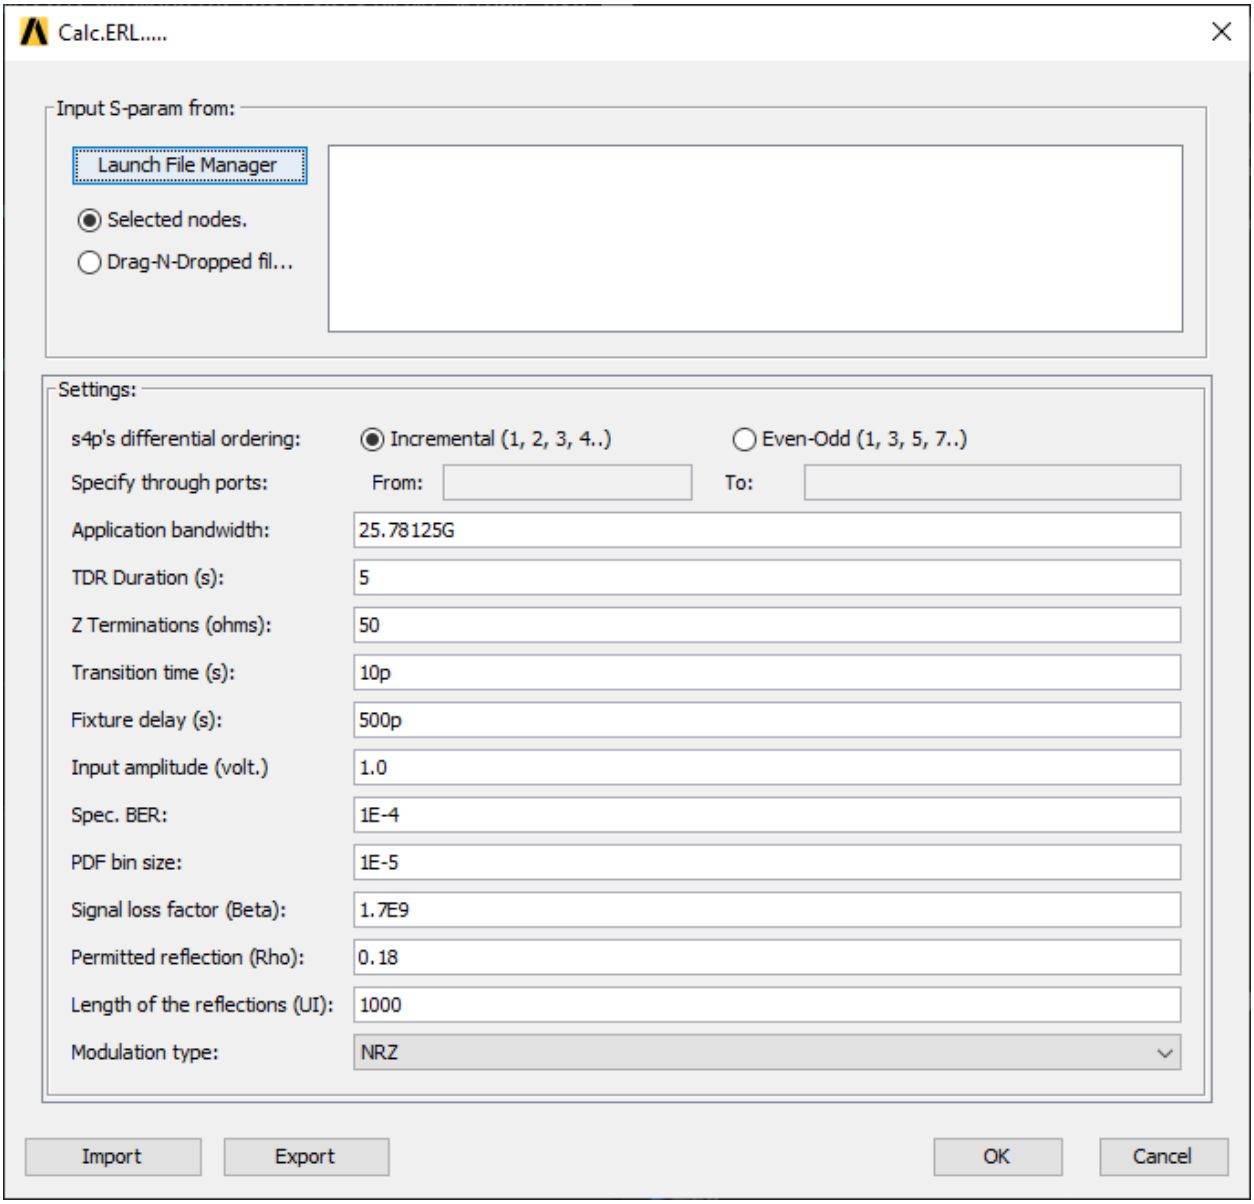


A **Checking License(s) ...** window opens.



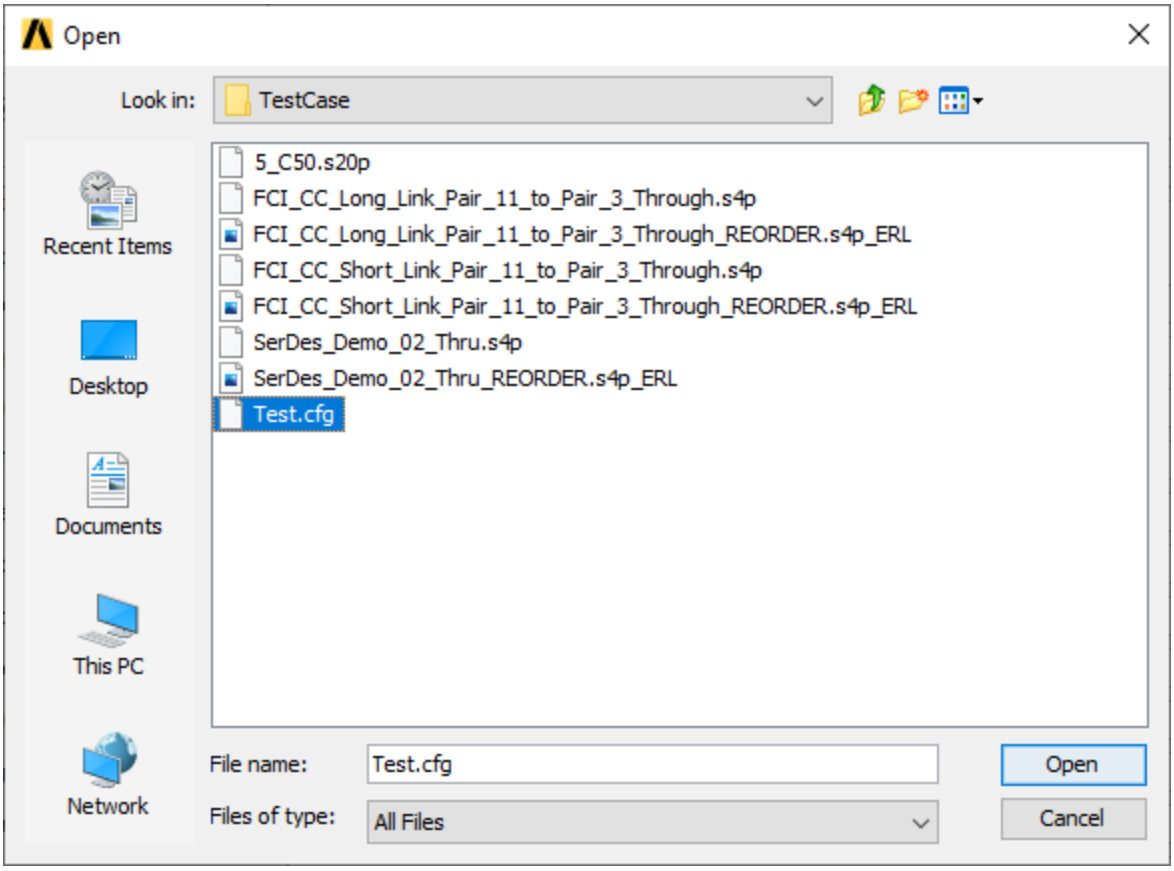
Once the software license is verified, the **Calc.ERL.....** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



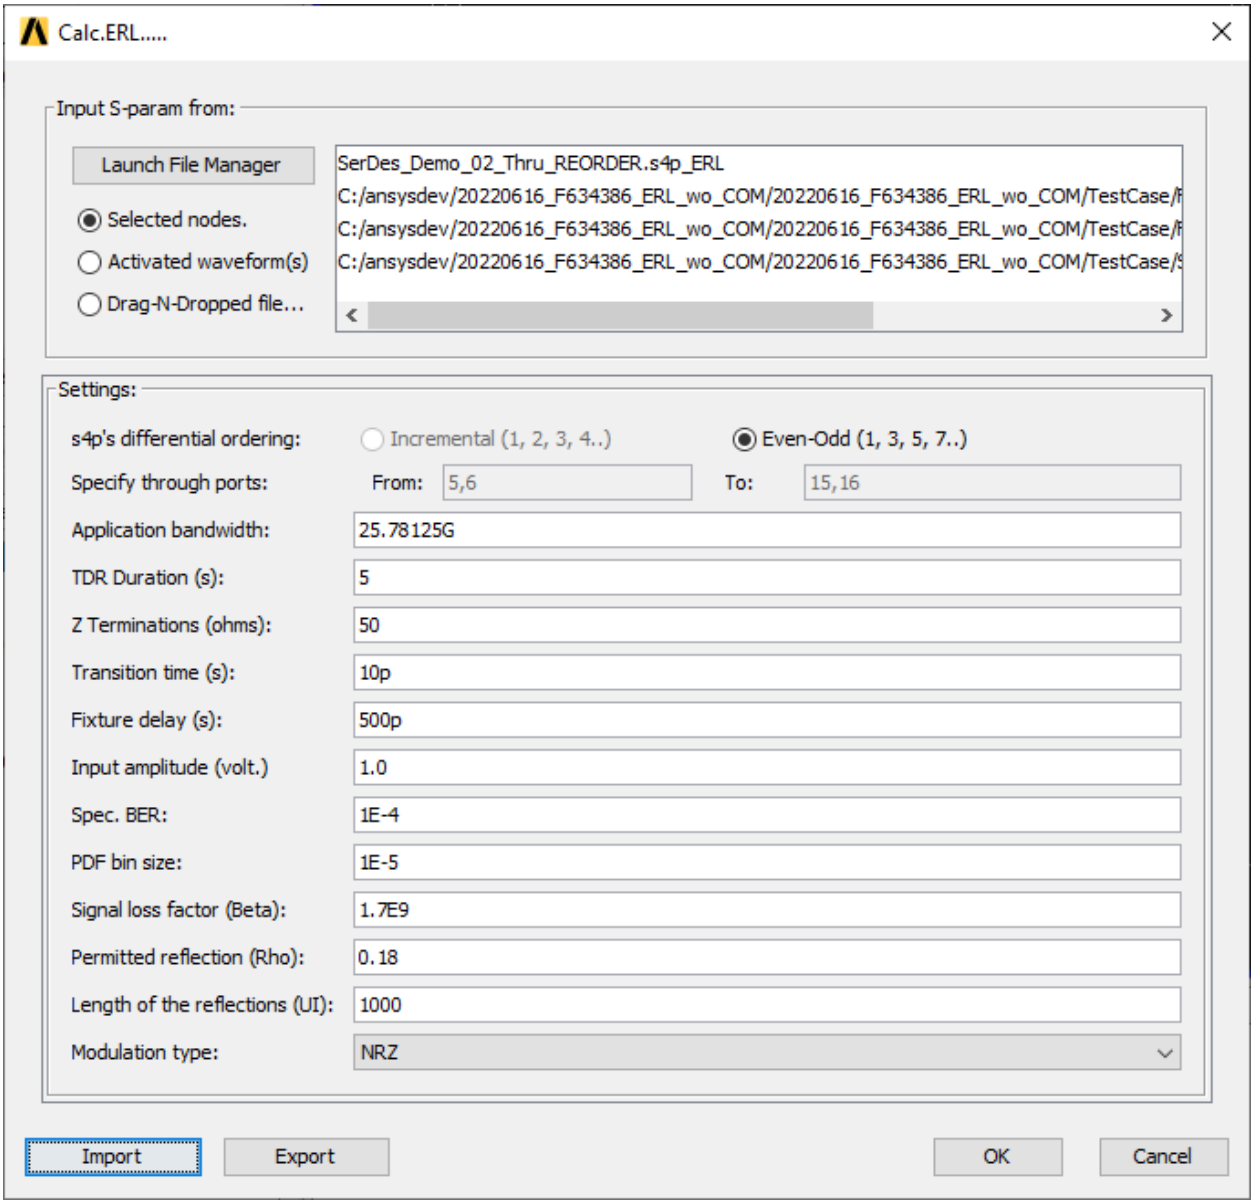
3. From the **Calc.ERL.....** window, click **Import** to open an explorer window.
4. Navigate to the appropriate directory and select a *.cfg* file (i.e., **Test.*cfg***).
5. Click **Open** to close the explorer window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



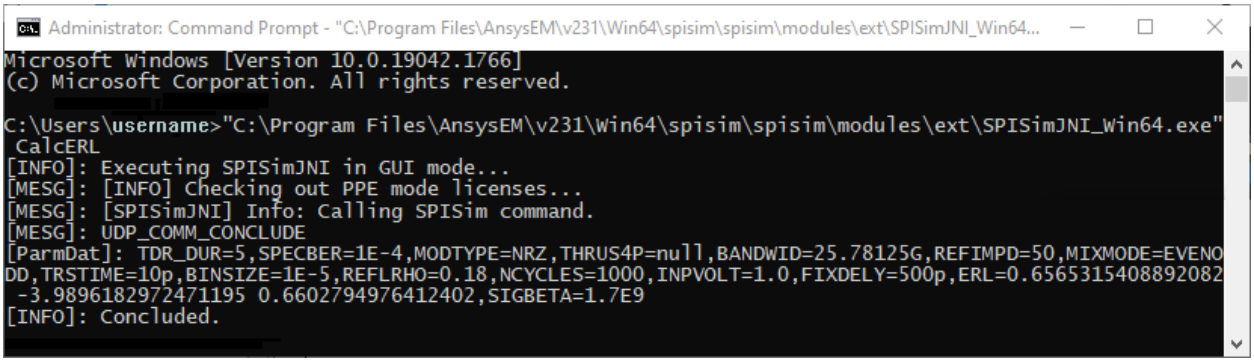
6. Make any necessary changes in the **Settings** group box. Refer to step 7 in Calculating ERL From the SPISim User Interface.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

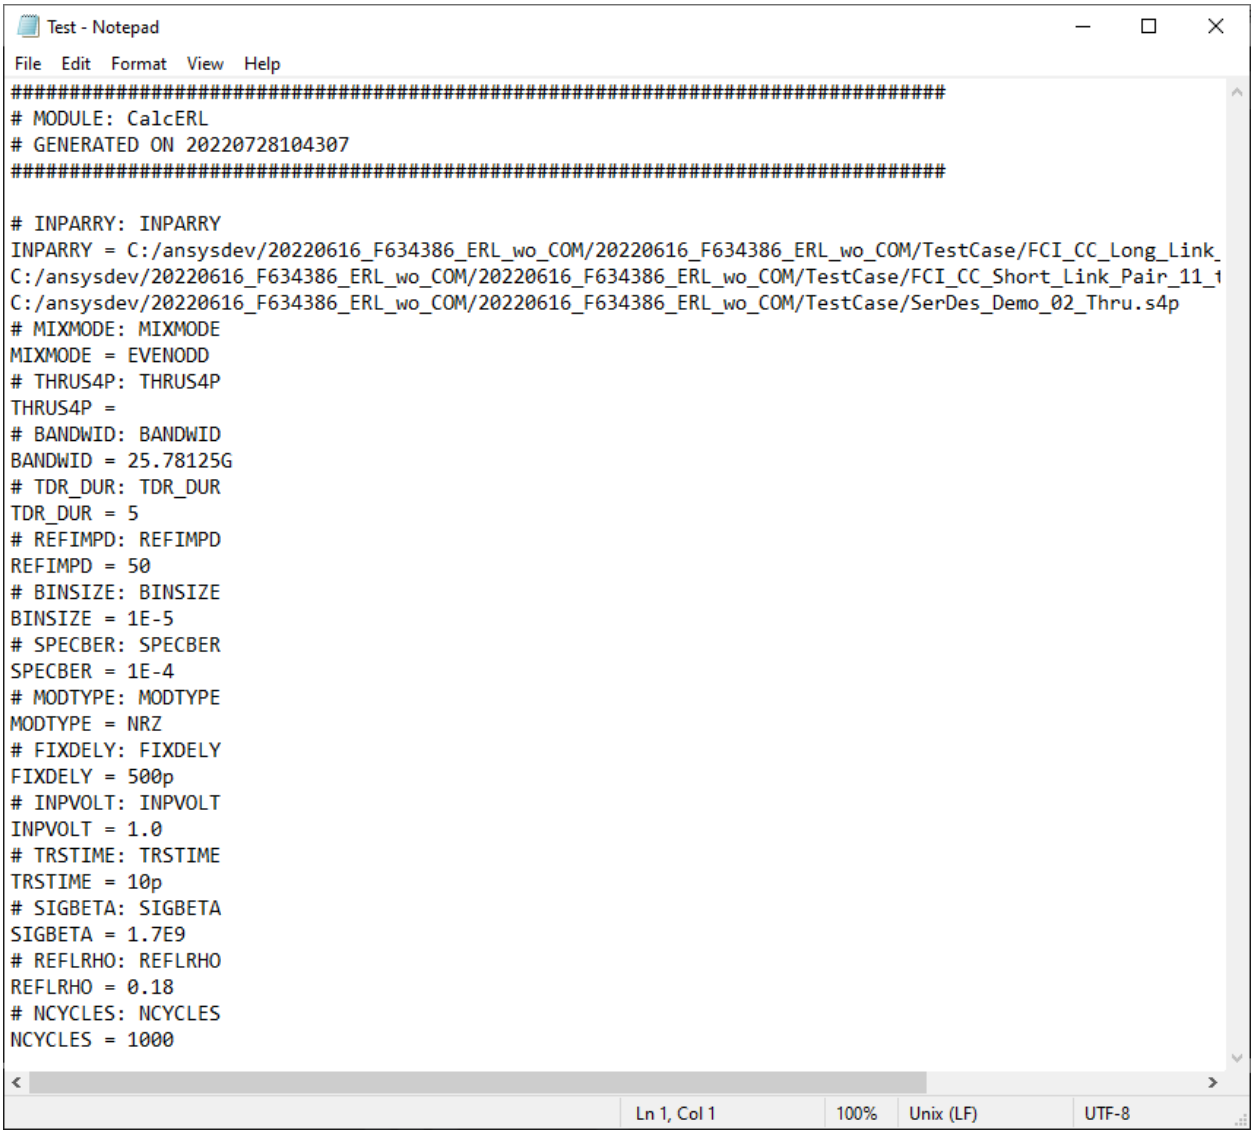


7. Click **OK** to close the **Calc.ERL.....** window and begin ERL calculation. View the process and result in the **Command Prompt** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

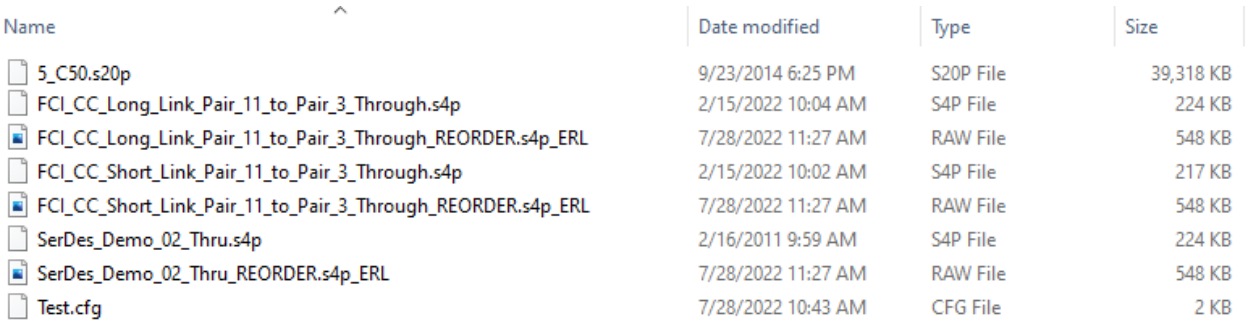


In this example, three sets of results are output. The *.cfg* file, which is viewable in any text reader, calls three *.s4p* files.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the process is finished, new *.RAW* waveform files appear in the directory from which the *.s4p* files were called.



Name	Date modified	Type	Size
5_C50.s20p	9/23/2014 6:25 PM	S20P File	39,318 KB
FCI_CC_Long_Link_Pair_11_to_Pair_3_Through.s4p	2/15/2022 10:04 AM	S4P File	224 KB

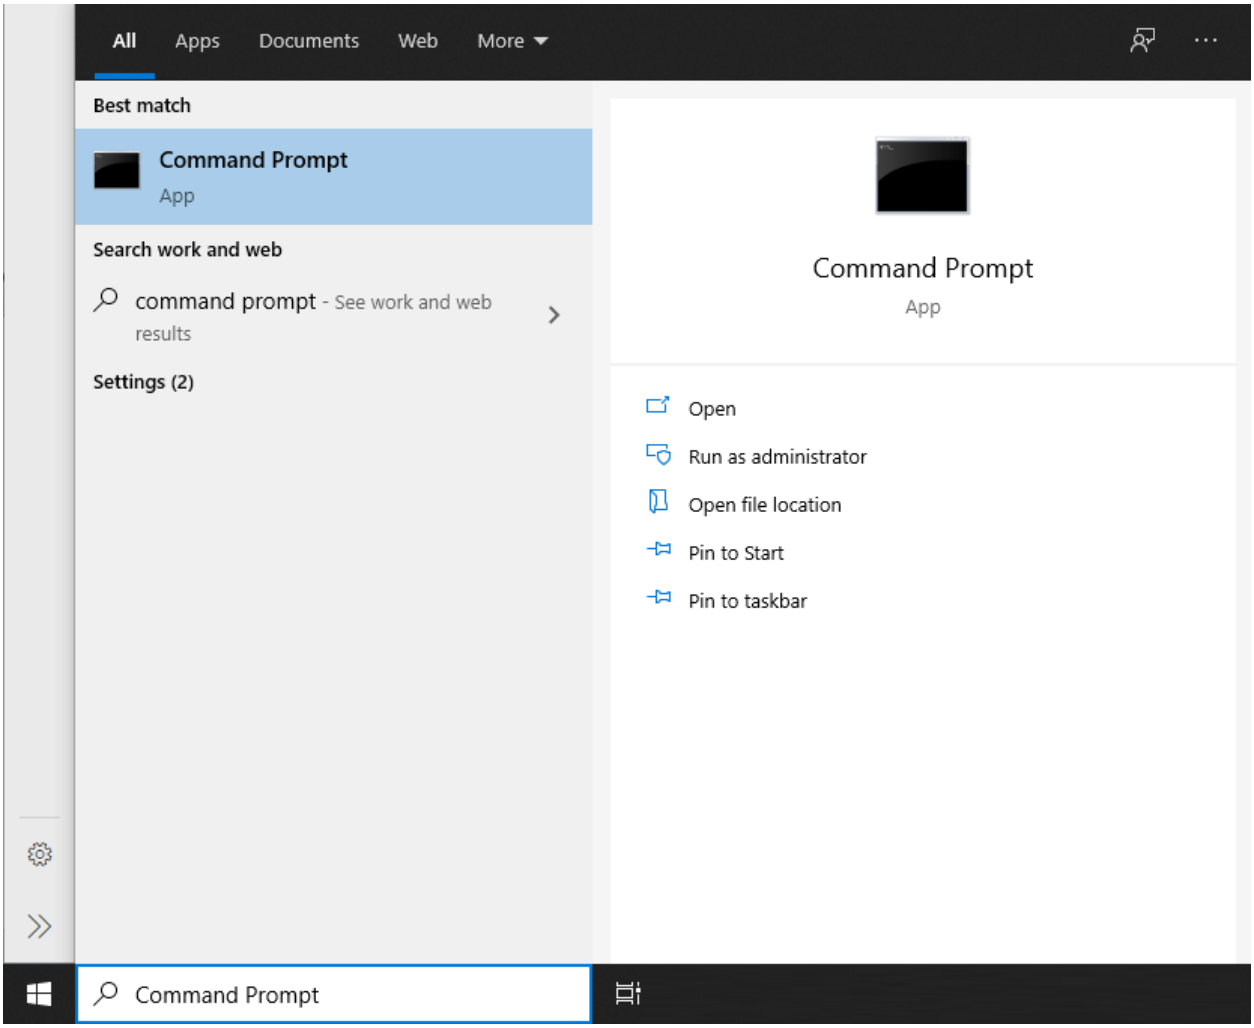
Test.cfg	7/28/2022 10:43 AM	CFG File	2 KB

Importing an ERL Configuration File Using Only a Non-GUI Batch Command Line

Complete the following steps to **Import** a *.cfg* file using only a non-GUI (NG) batch command line.

1. Run a command prompt (e.g., in a Windows environment, type *Command Prompt* into the **Search Bar** and press **Enter** to open a **Command Prompt** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

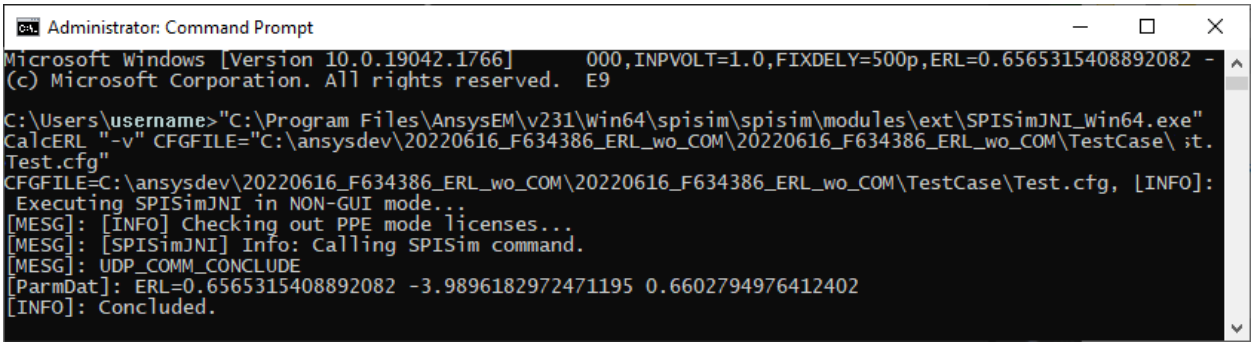


Note: The following example assumes **Electronics Desktop** is installed in the default directory in a Windows operating system environment. Structure the command appropriately for a different directory, path, and/or operating system, as necessary. Do **not** move the ***SPISimJNI_WIN64.exe*** executable file. The executable file relies on the relative path to the **Electronics Desktop** installation folder.

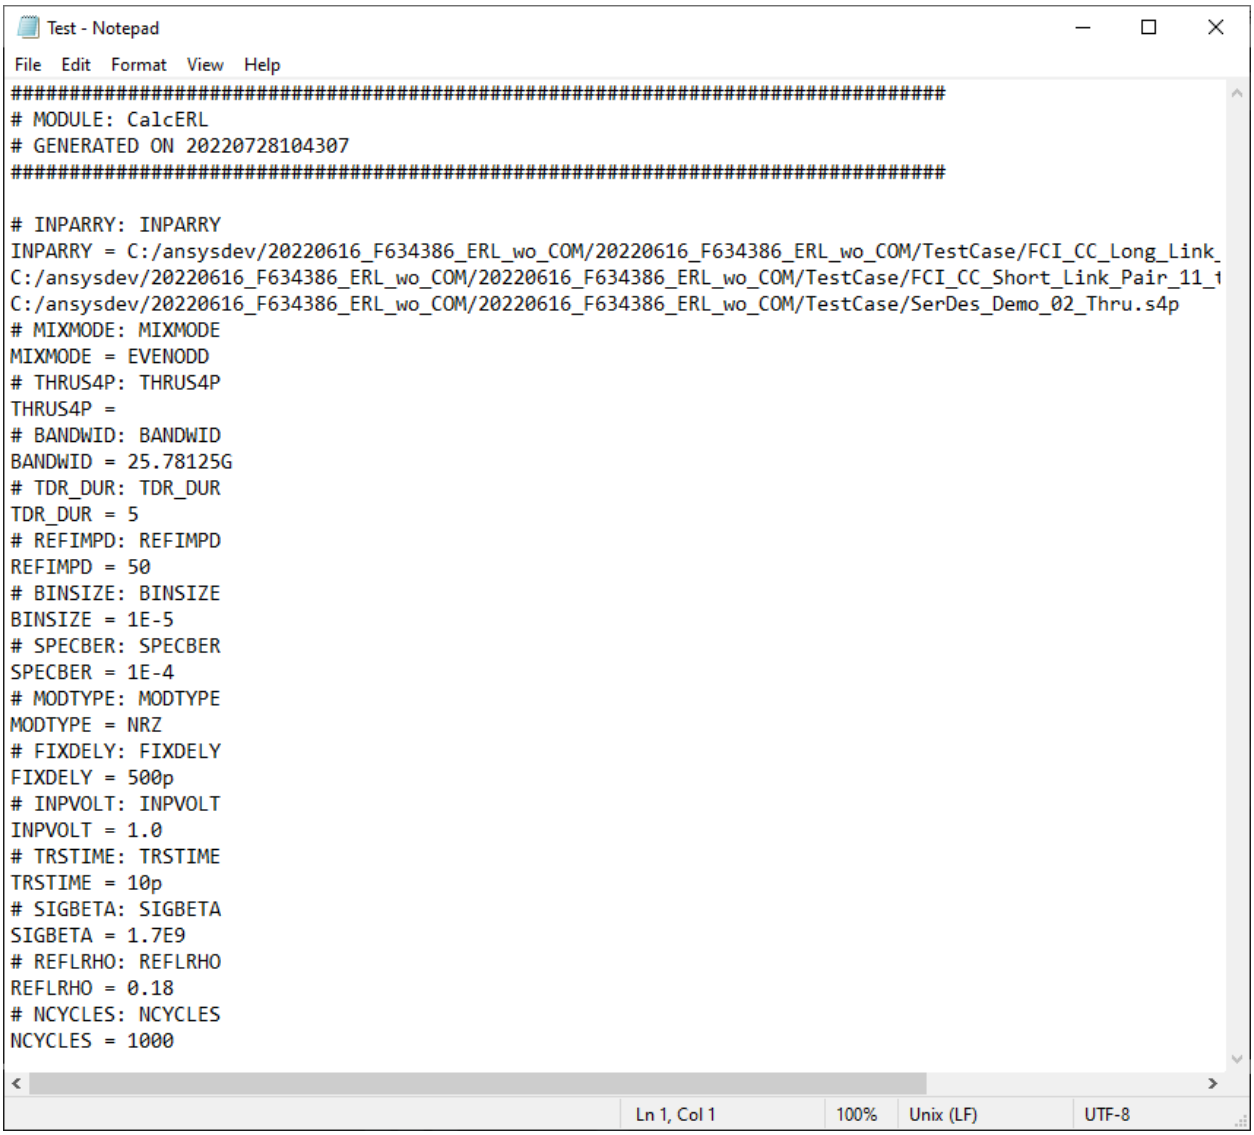
2. From the **Command Prompt** window, enter the following command, then press **Enter**:

```
"C:\Program Files\ANSYS Inc\v252\AnsysEM\spisim\SPISim\modules\ext\SPISimJNI_WIN64.exe" CalcERL "-v" "CFGFILE="[The direct path to the .cfg file.]"
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

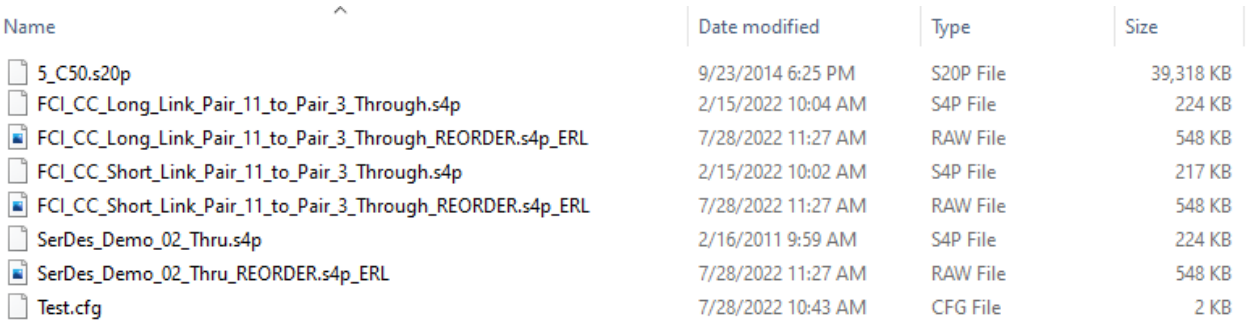


SPISim checks software licenses, calculates ERL, and then outputs the result. In this example, three sets of results are output. The *.cfg* file, which is viewable in any text reader, calls three *.s4p* files.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the process is finished, new *.RAW* waveform files appear in the directory from which the *.s4p* files were called.



Name	Date modified	Type	Size
5_C50.s20p	9/23/2014 6:25 PM	S20P File	39,318 KB

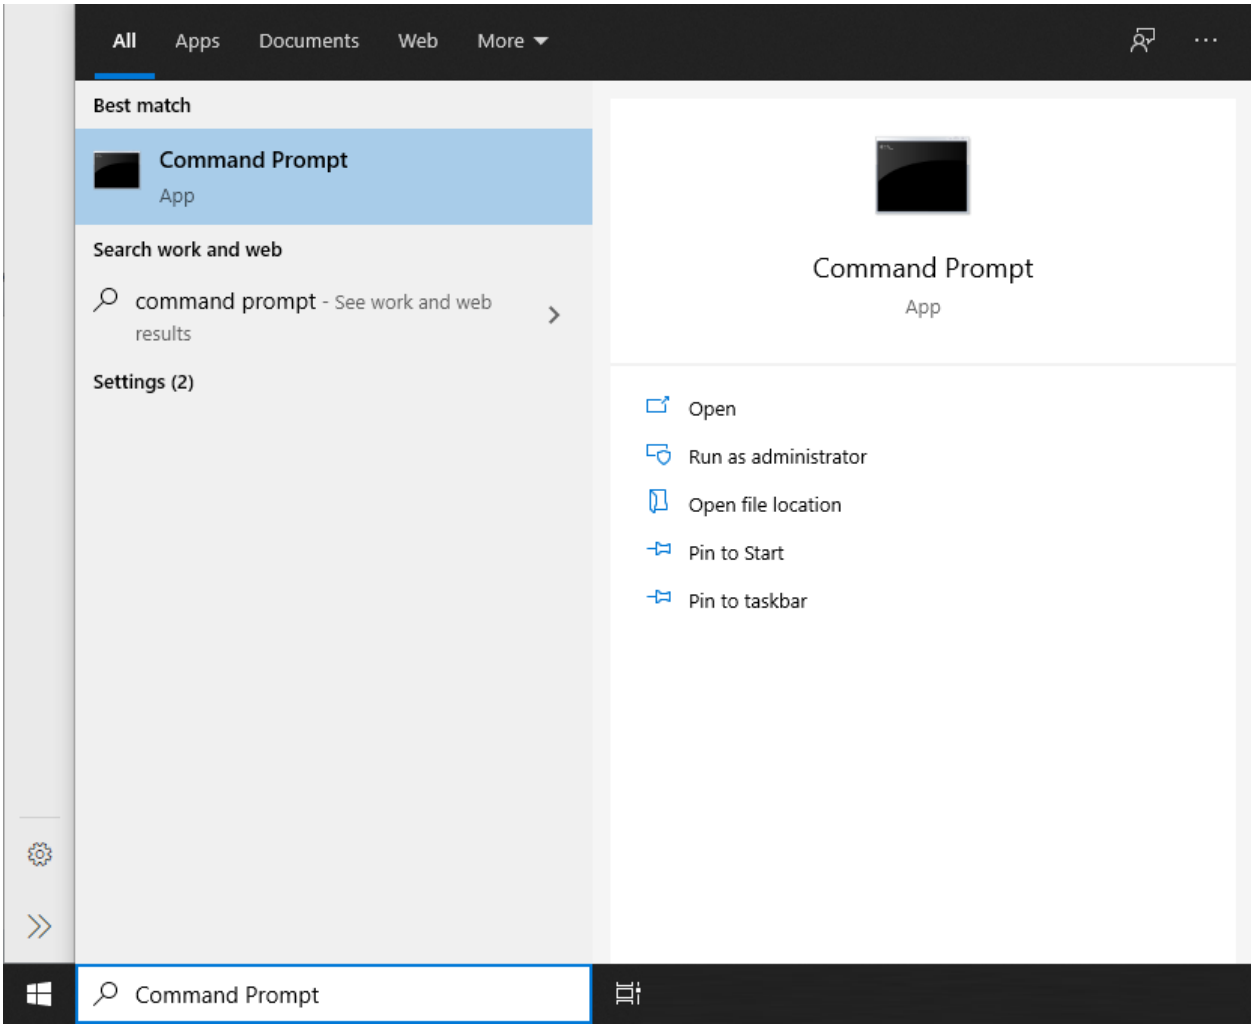
\

Overriding ERL Configuration File Parameters

Complete the following steps to override parameter values, substitute input files, or remove input files from ERL calculation conducted via a configuration file from a command line.

1. Run a command prompt (e.g., in a Windows environment, type *Command Prompt* into the **Search Bar** and press **Enter** to open a **Command Prompt** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

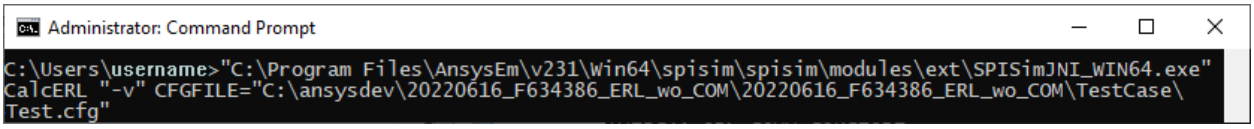


> **Note:** The following example assumes **Electronics Desktop** is installed in the default directory in a Windows operating system environment. Structure the command appropriately for a different directory, path, and/or operating system, as necessary. Do **not** move the ***SPISimJNI_WIN64.exe*** executable file. The executable file relies on the relative path to the **Electronics Desktop** installation folder.

1. From a **Command Prompt** window, enter the following command, but do **not** press **Enter**: `"C:\Program Files\ANSYS Inc\v252\AnsysEM\spisim\SPISim\modules\ext\SPISimJNI_WIN64.exe"`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
CalcERL "-v" "CFGFILE="[The direct path to the .cfg file.]"
```



2. To override a configuration file, enter any combination of the following as a suffix (i.e., after the last quotation mark in step 1), then press Enter to run ERL calculation exactly as described in "Importing an ERL Configuration File Using Only a Non-GUI Batch Command Line" on page 16-144.

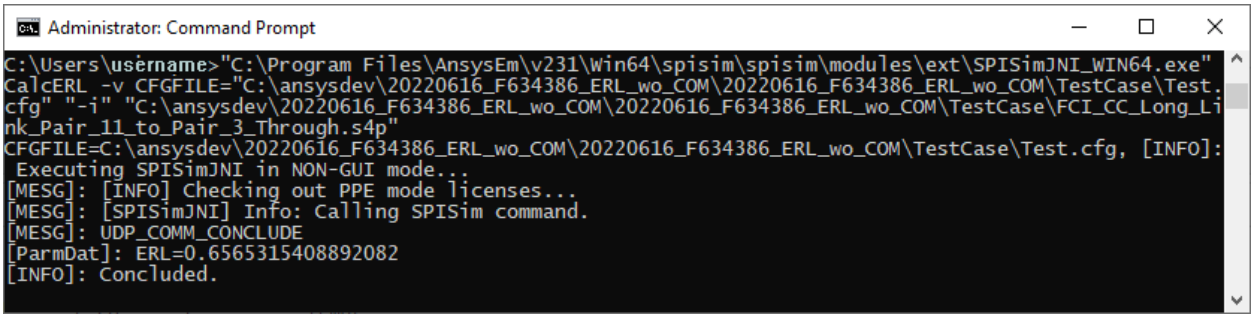
   - Enter `"-v"`, then a variable, and a new value (e.g., enter `"-v" "MIXMODE=INCREMENTAL"` to override EvenOdd mix).

   - Enter `"-v"`, then any number of variables, and new values, separated by commas (e.g., enter `"-v" "MIXMODE=INCREMENTAL,NCYCLES=100"` to override EvenOdd mix and N Cycles).

   - Enter `-i` and the direct path to a *.sNp* or *.ts* file to override the input file(s) in the configuration file and calculate the override file instead (e.g., enter `"-i" "C:\ansysdev\20220616_F634386_ERL_wo_COM\20220616_F634386_ERL_wo_COM\TestCase\FCI_CC_Long_link_Pair_11_to_Pair_3_`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

`Through.s4p"` to override the input file(s) referred to the *.cfg* file).

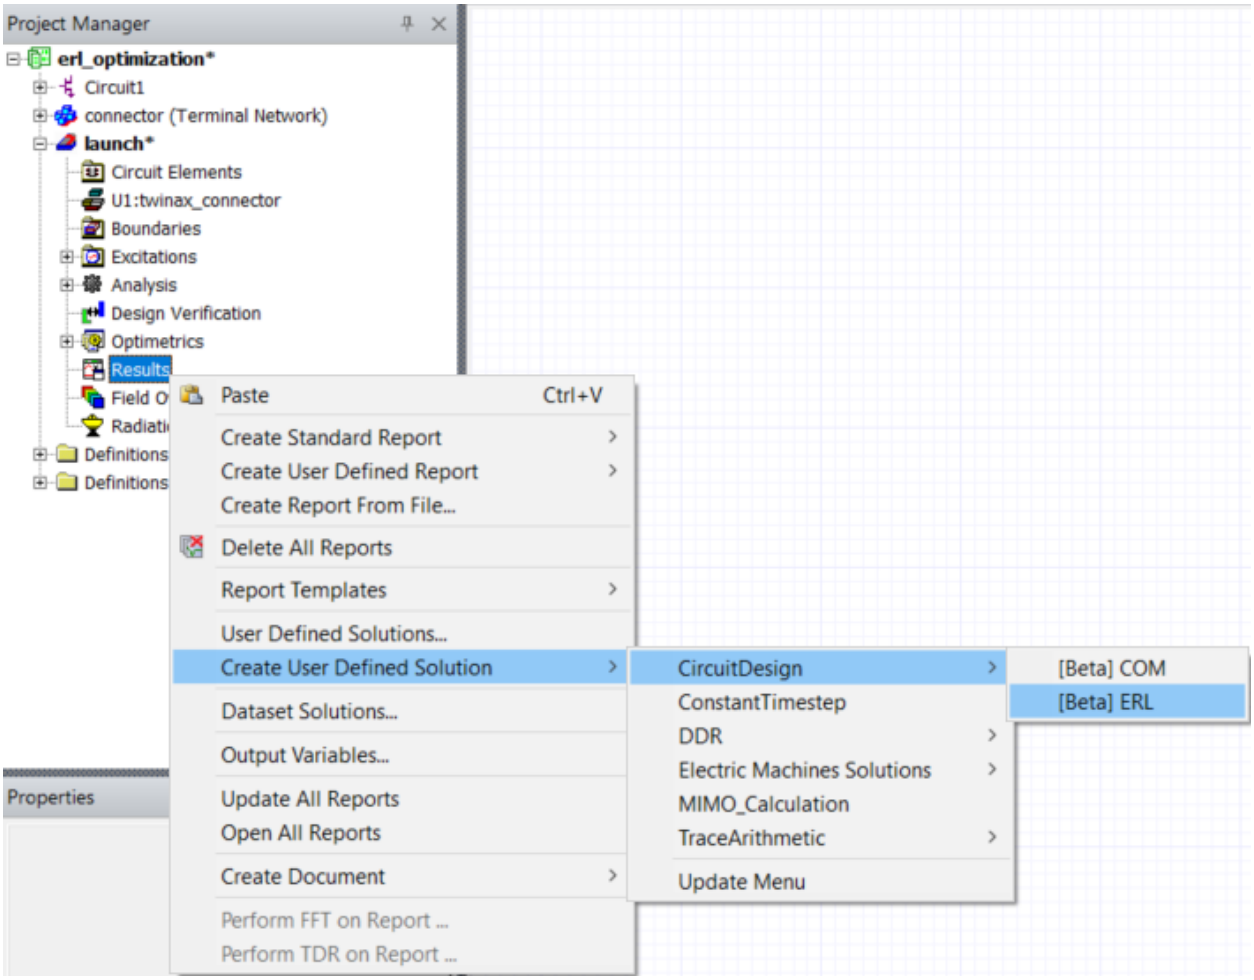


Generate an ERL Calculation Report with a User Defined Solution

Follow these steps to create a user defined solution (UDS) and calculate the effective return loss (ERL) from within **Electronics Desktop** > **HFSS 3D Layout** environment.

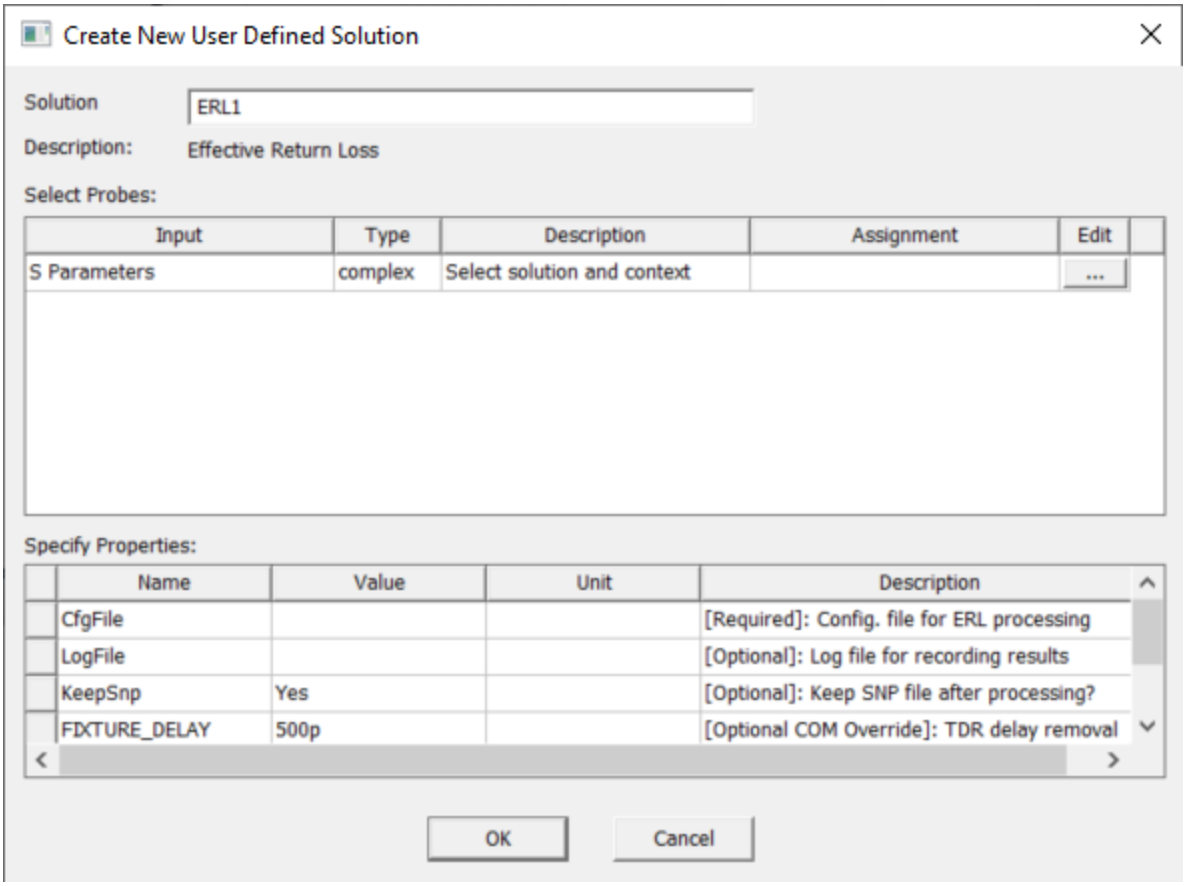
1. From the **Project Manager** window, expand the **Project Tree** > [*active design folder*]. Then right-click **Results** and select **Create User Defined Solution** > **CircuitDesign** > **[Beta] ERL** to open the **Create New User Defined Solution** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



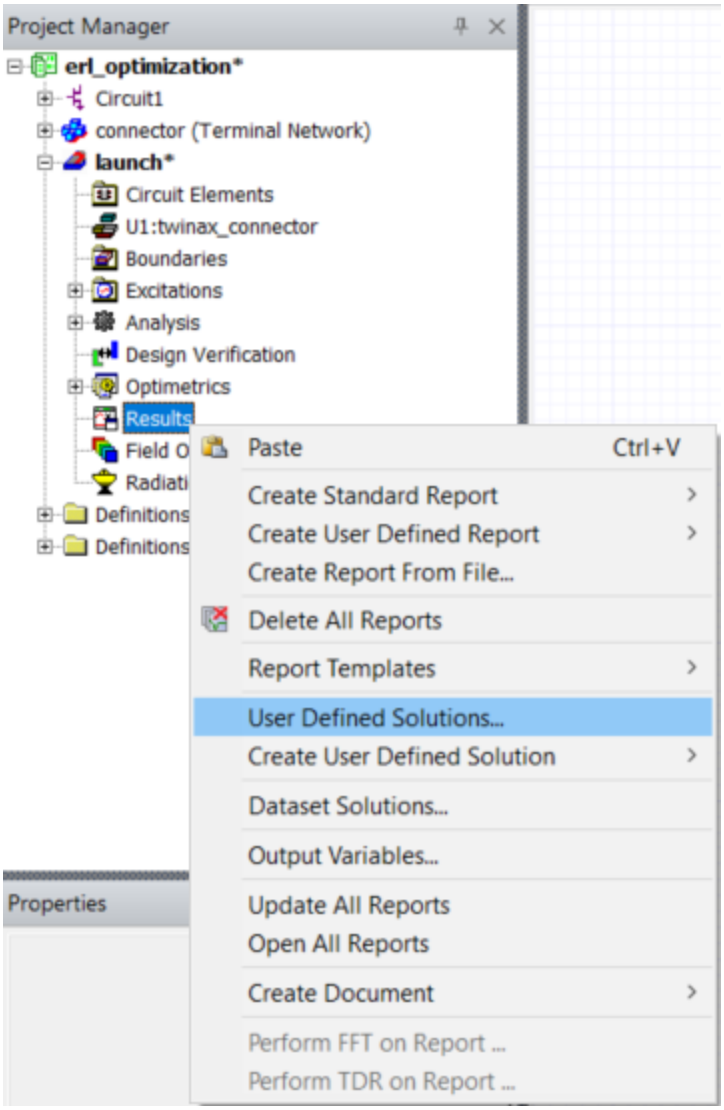
2. Click **OK** to create a new user-defined solution with default settings while simultaneously closing the **Create New User Defined Solution** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



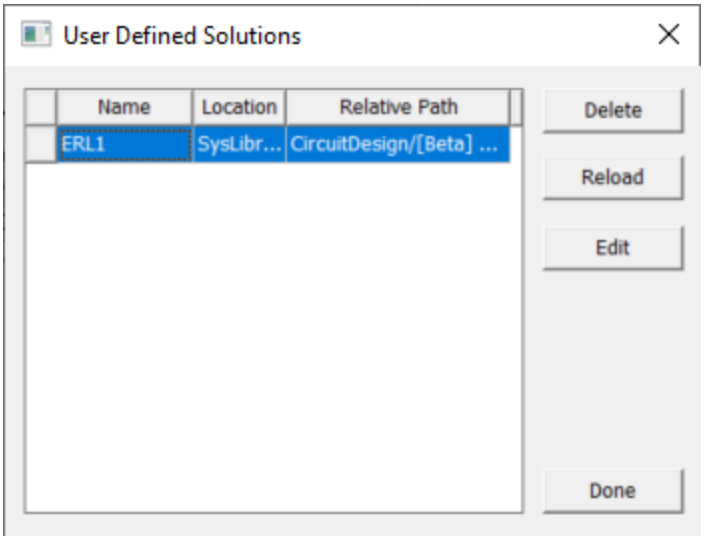
3. From the **Project Manager** window, right-click **Results** and select **User Defined Solutions...** to open the **User Defined Solutions** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

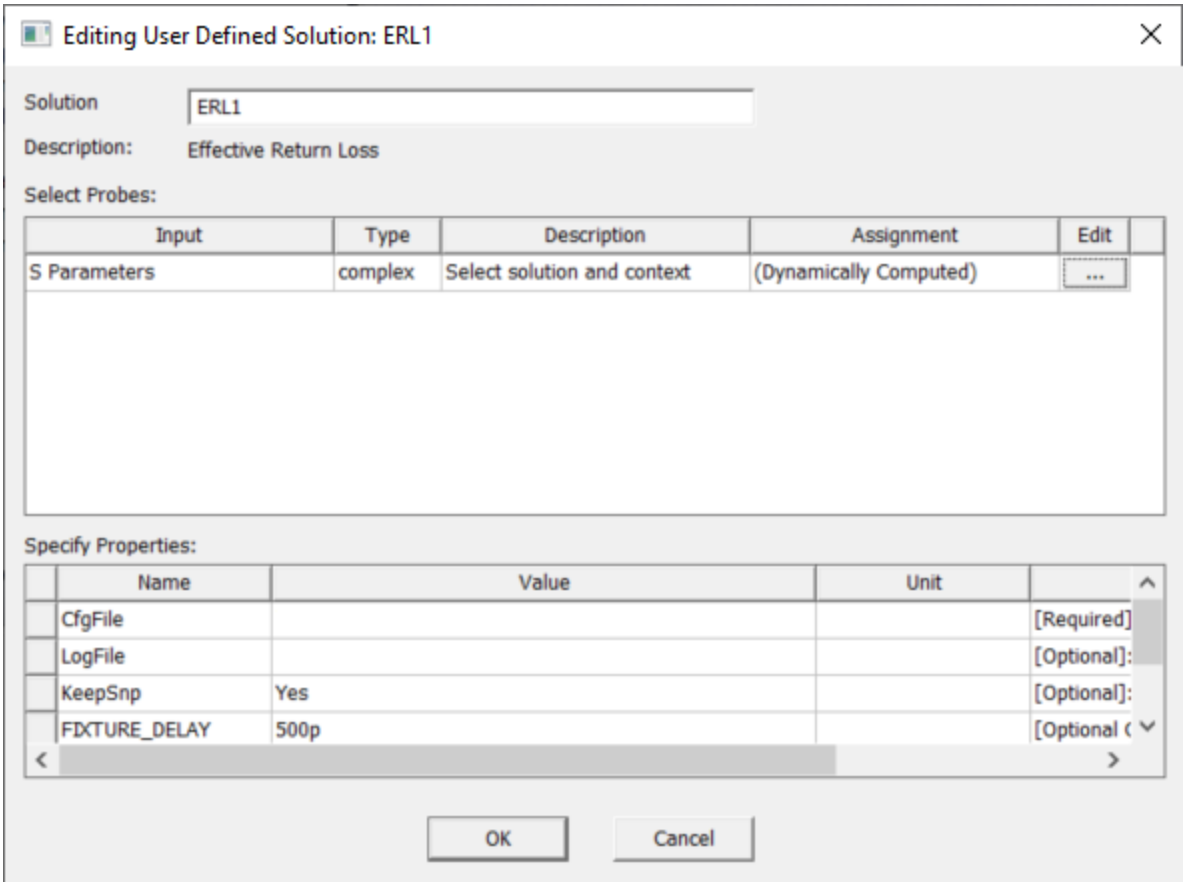


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Select the new solution on the list (e.g., **ERL1**).



5. Click **Edit** to open the **Editing User Defined Solution** window.



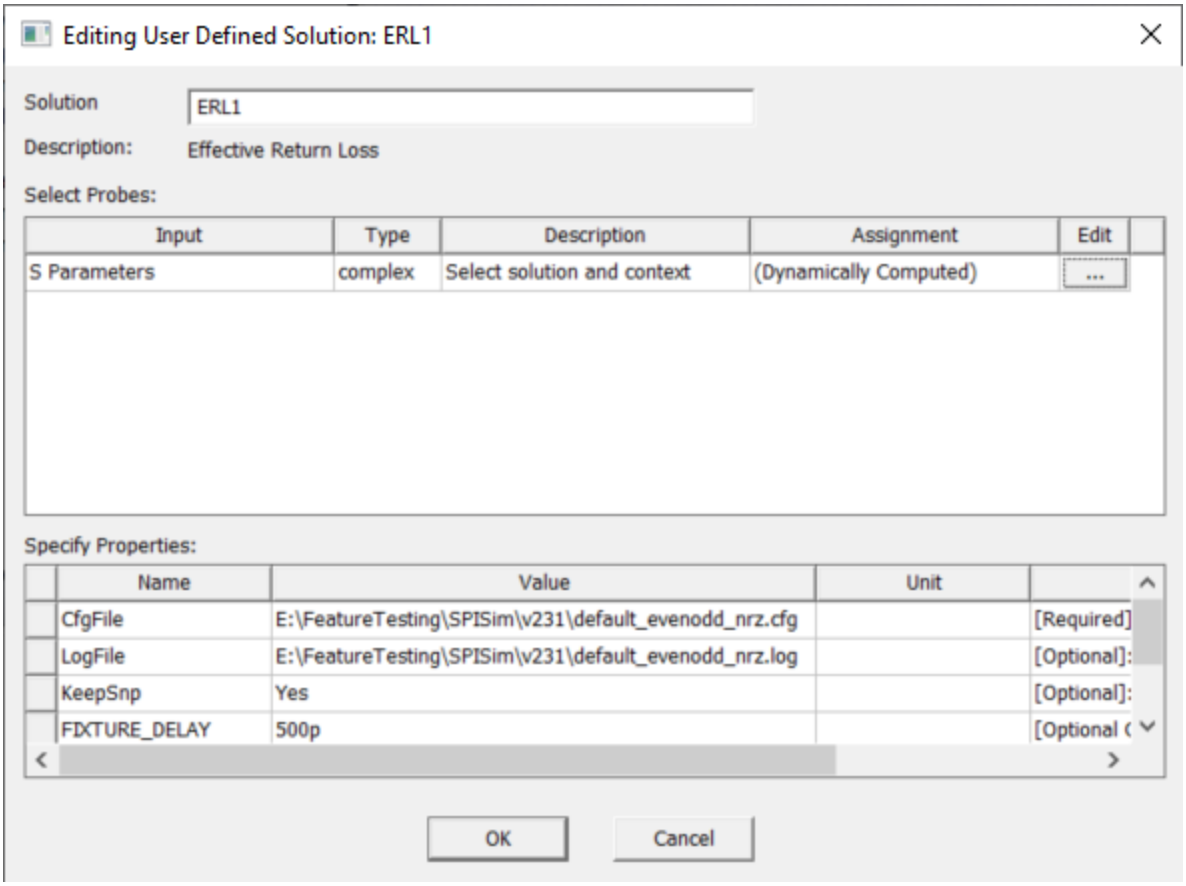
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. In the **Specify Properties** table, make the following changes:

- Enter the path to the relevant *.cfg* file (e.g., **E:\FeatureTesting\SPISim\v252\default_evenodd_nrz.cfg**) in the **CfgFile Value** field.

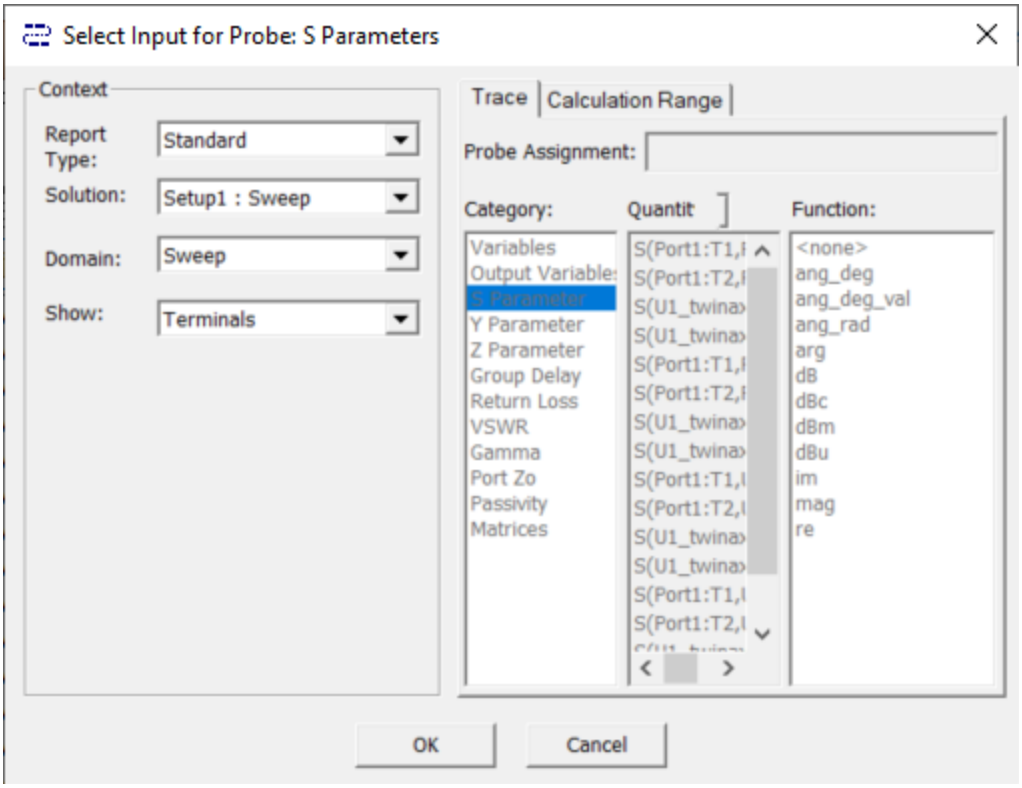
> **Note:** The path can include spaces but can **not** include commas or other punctuation.

- If appropriate, enter the path to a *.log* file (e.g., **E:\FeatureTesting\SPISim\v252\default_evenodd_nrz.log**) in the **LogFile Value** field.



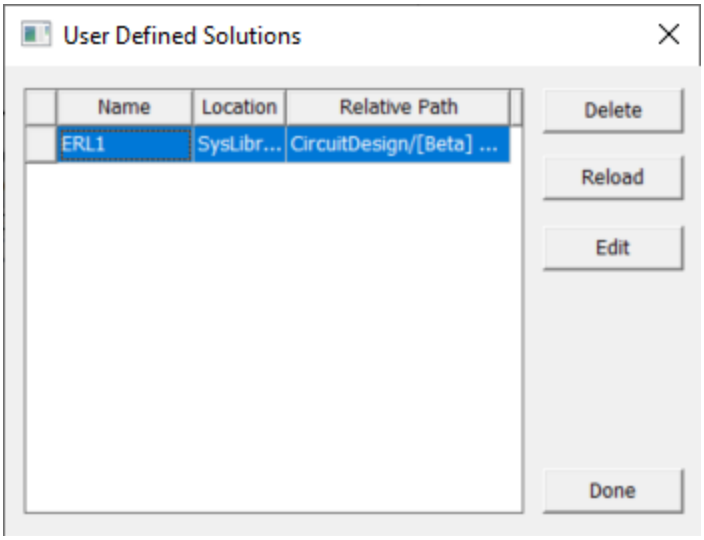
7. From the **Select Probes** table, click **...** in the **Edit** column to open the **Select Input for Probe: S Parameters** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



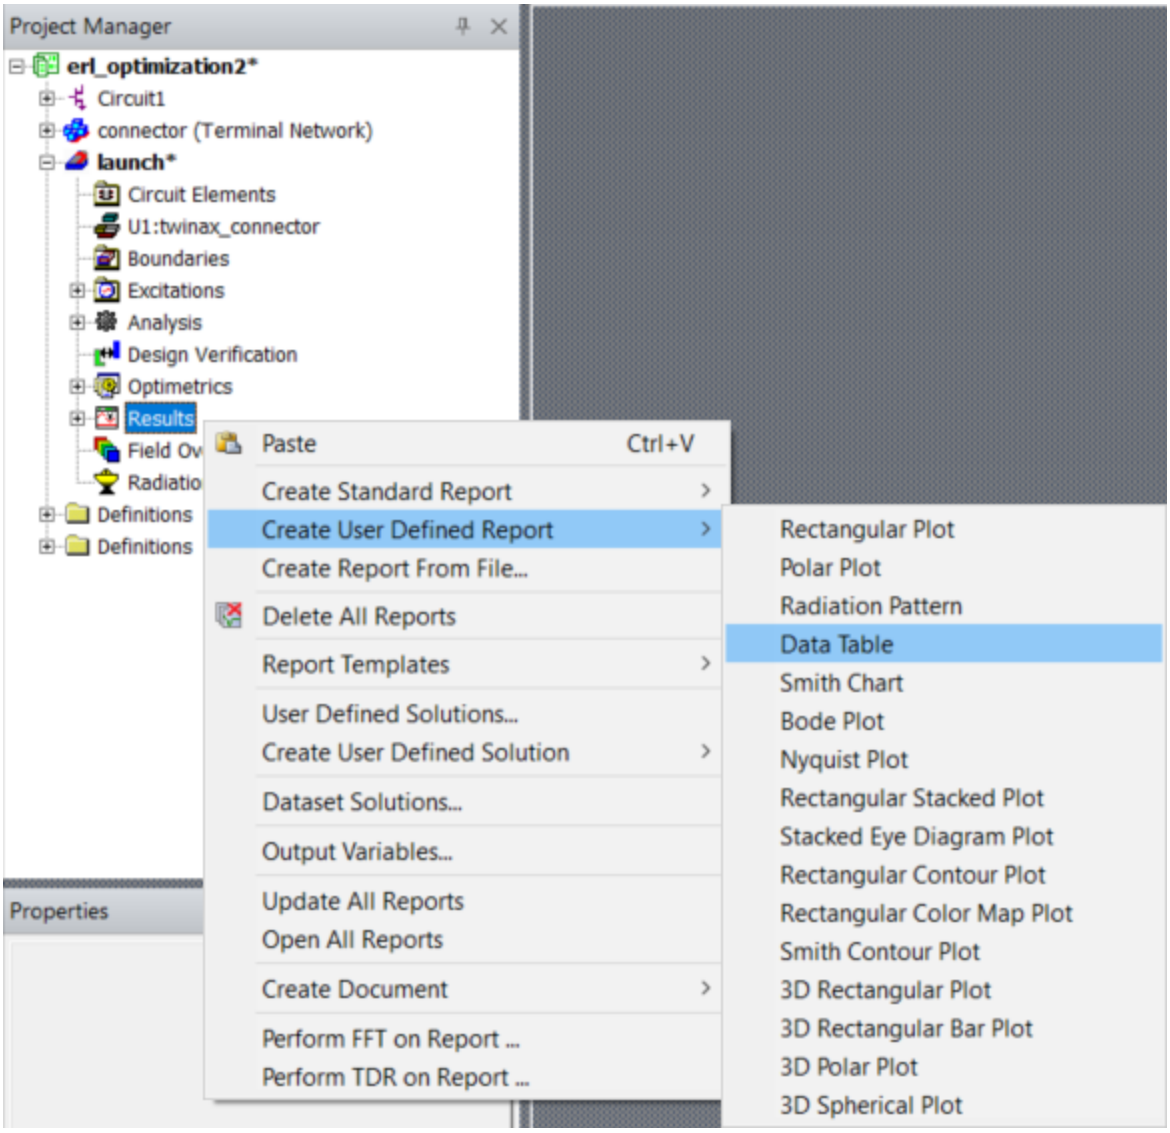
8. Ensure that **Terminals** is selected on the **Context** group box > **Show** drop-down menu.
9. Make any additional changes, as appropriate. Then click **OK** to close the **Select Input for Probe: S Parameters** window.
10. Click **OK** to close the **Editing User Defined Solution** window.
11. Ensure the new solution (e.g., **ERL1**) is still highlighted in the **User Defined Solutions** window. Then click **Reload**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



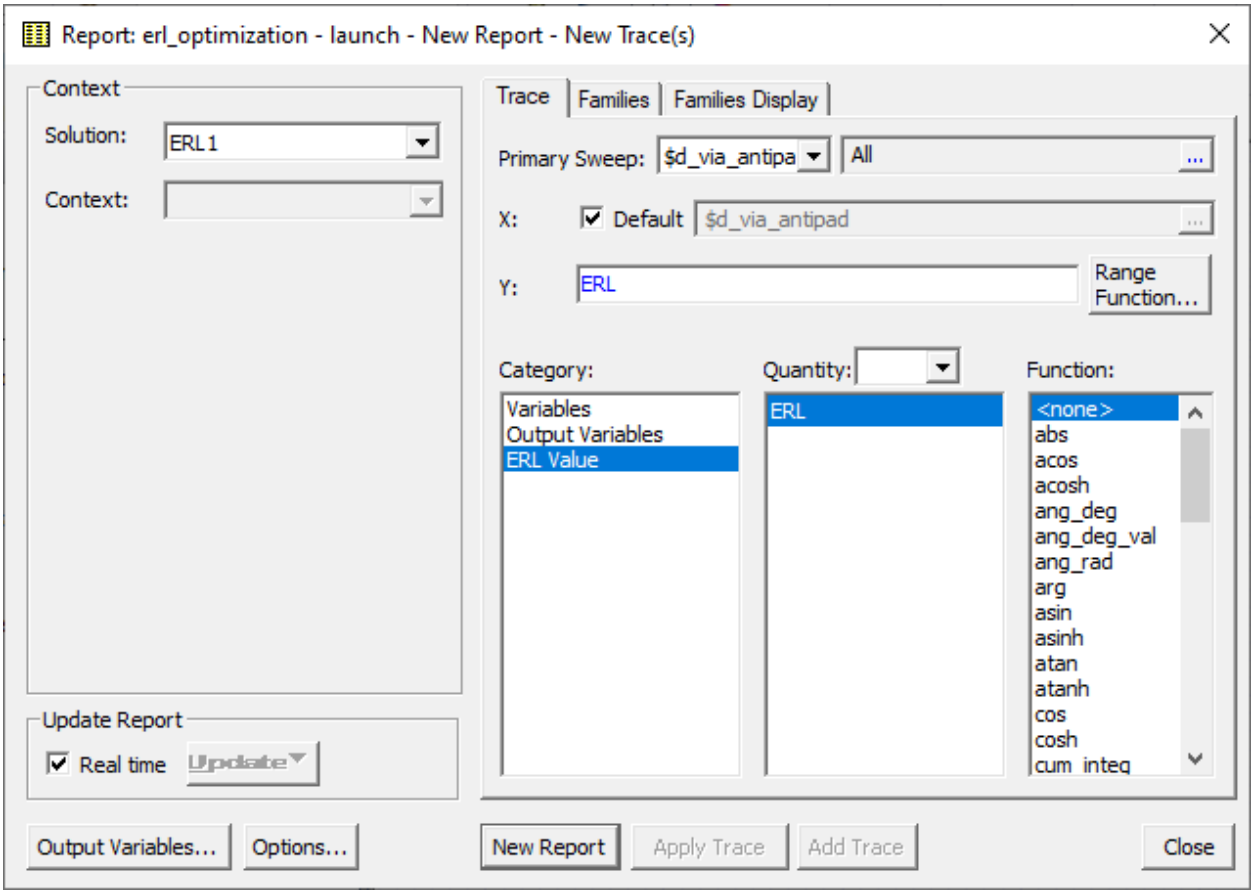
12. Click **Done** to close the **User Defined Solutions** window.
13. From the **Project Manager** window, right-click **Results** and select **Create User Defined Report** > **Data Table** to open a **Report** window to the **Trace** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



14. From the **Report** window, ensure the following settings are selected:
    - From the **Context** group box, the appropriate **ERL** solution is selected on the **Solution** drop-down menu (i.e., **ERL1**).
    - From the **Trace** tab, **ERL Value** is selected on the **Category** list.
    - **ERL** is selected on the **Quantity** list.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



15. Click **New Report** and the report appears.

	$d_via_antipad [mm]	ERL ERL1 $trace_out_width='0.1793657929mm'	ERL ERL1 $trace_out_width='0.1793663276mm'	ERL ERL1 $trace_out_width='0.3mm'	ERL ERL1 $trace_out_width...

Channel Operating Margin Analysis

Follow the instructions on the following pages to generate Channel Operating Margin (COM) analysis reports through various methods.

" Generating a COM Analysis Report From the SPISim User Interface " below

Generating a COM Analysis Report From the SPISim User Interface - Settings Tab

" Generating a COM Analysis Report Using a Non-GUI Batch Command Line" on page 16-172

" Generating a COM Analysis Report Using IBIS-Based Transition Data" on page 16-176

"COM Analysis Report Summary" on page 16-188

COM Analysis Keywords Reference Tables

COM Analysis Built-in Specs

" UDO/UDS-Based COM/ERL Calculations for HFSS-Based Solutions" on page 16-270

Generating a COM Analysis Report From the SPISim User Interface

Channel operating margin (COM) analysis generates a *.csv* report file and binary waveform plots from analyzed data in a streamlined format. **Electronic Desktop 2025 R1** support COM keywords up to V3.7.

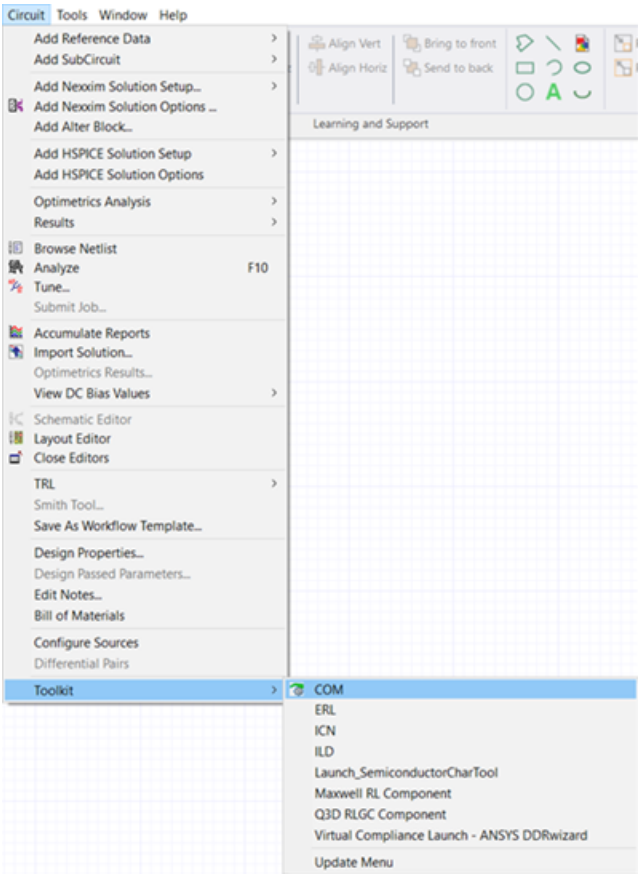
A COM analysis report can also be generated outside of the SPISim User Interface. Refer to " Generating a COM Analysis Report Using a Non-GUI Batch Command Line" on page 16-172 and " UDO/UDS-Based COM/ERL Calculations for HFSS-Based Solutions" on page 16-270 for details.

To begin the process of generating a COM analysis report via the SPISim User Interface, complete the following steps to open the **Config. and generate COM report ...** window. Alternatively, refer to the animated demonstration following these instructions.

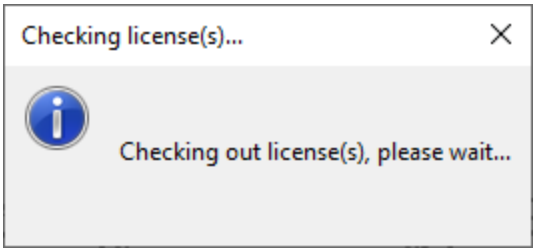
From Electronics Desktop

From the **Circuit** menu, select **Toolkit** > **COM**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



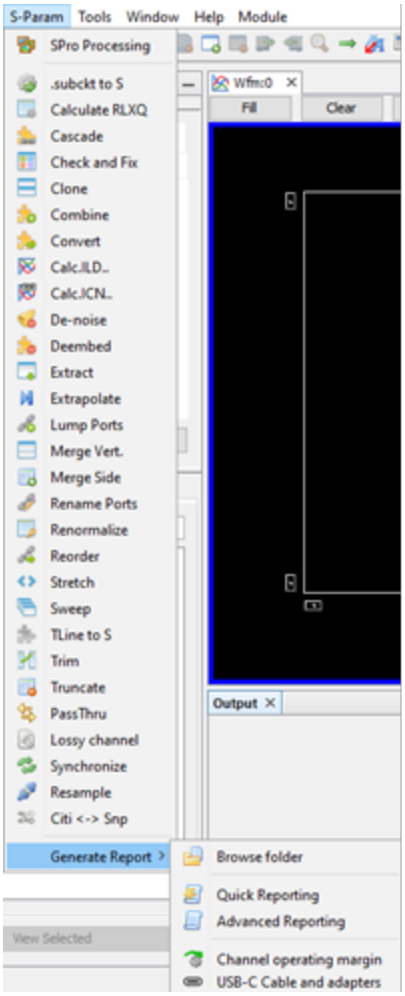
Before the **Config. and generate COM report ...** window opens, a **Checking License(s) ...** window opens.



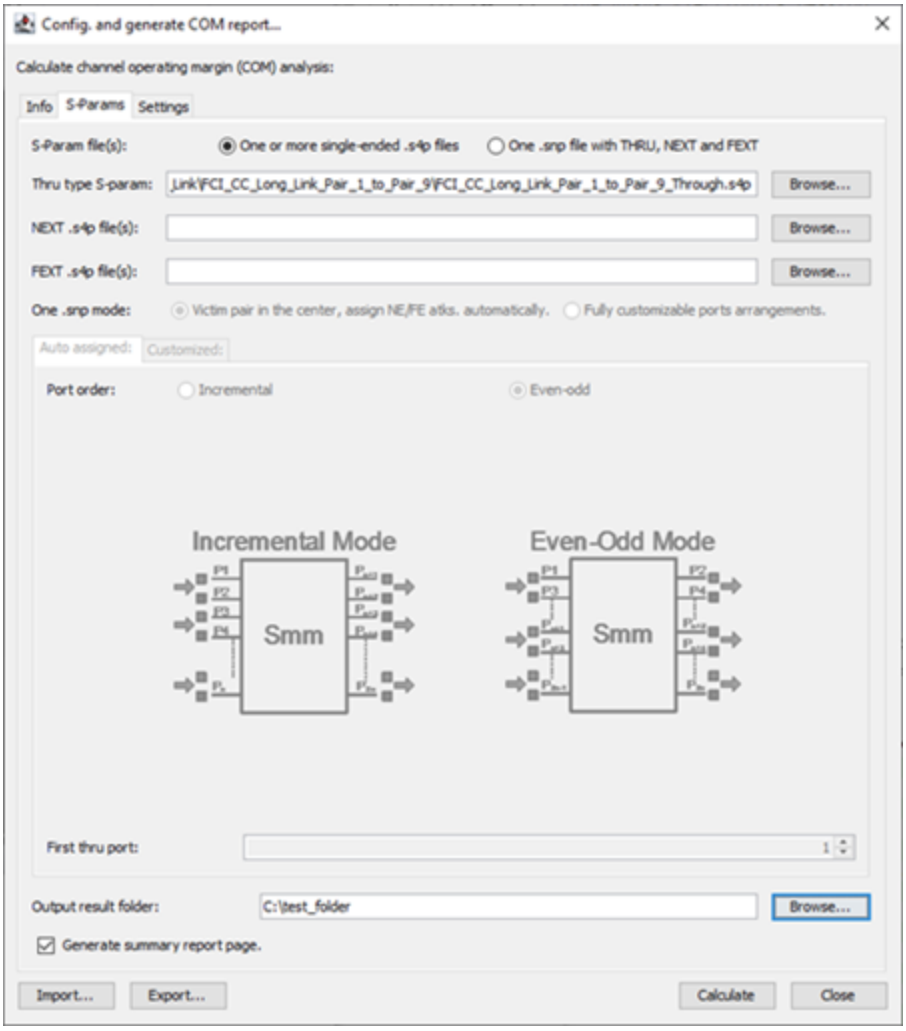
From SPISim

From the **S-Param** menu, select **Generate Report** > **Channel operating margin** to open the **Config. and generate COM report ...** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Follow the steps below to configure and then generate a COM analysis report.

1. Click the **Browse ...** button in line with the **Thru type S-param** field to open an explorer window.
2. Navigate to and choose an *.sNp* file to include it in the COM analysis report. Then click **Open**.
3. Click the **Browse ...** button in line with the **Output result folder** field to open an explorer window. Choose a location to save the COM analysis report output files, which includes *.raw*, *.csv*, and *.png* files that remain accessible to the user outside of the context of the COM analysis report.
4. Click **Open**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Before continuing, ensure that the **Generate summary report page.** check box, beneath the **Output result folder** field, is checked (checked by default).

6. Click the **Settings** tab to view the current configuration of the analyzed data.

OP_IO_CTRL	TABLE_93A1	TABLE_93A3	TABLE_9212

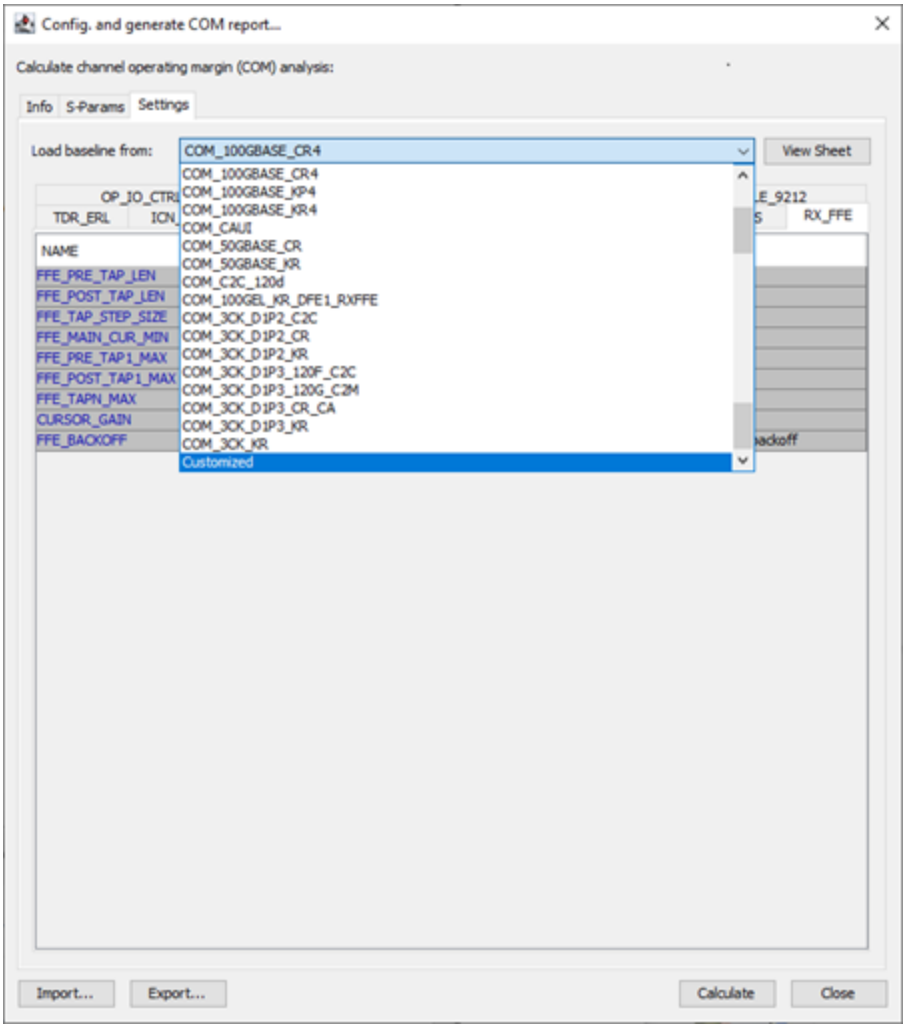
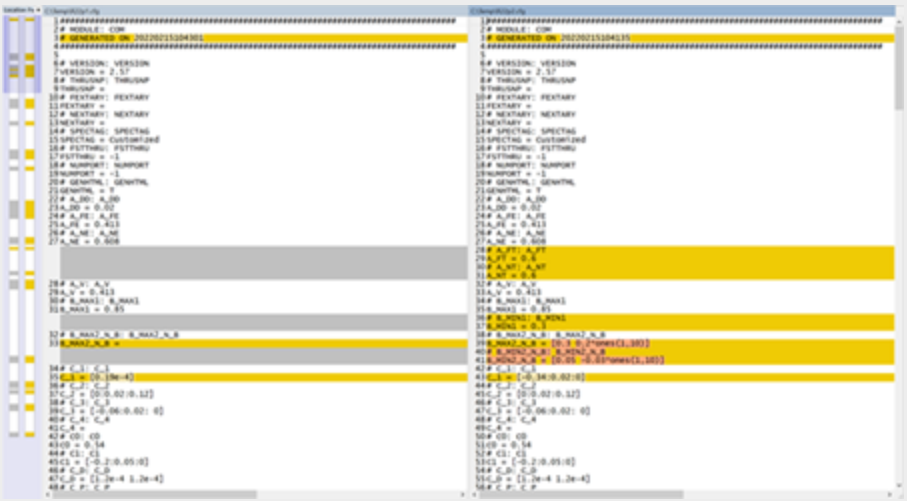
If necessary, choose another baseline configuration on the **Spec** drop-down menu, or select **Customized** to make individual changes to each field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



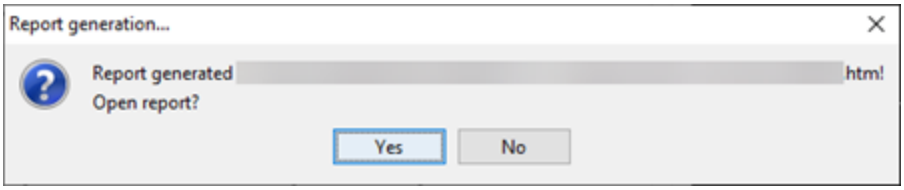
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: The configurable settings are extensive, see Generate A COM Analysis Report - Settings Tab. If the user is upgrading from a previous version of *Electronic Desktop*, and currently has both versions installed, they can **Export** their configuration settings (e.g., *.cfg* file) from both versions and compare them. New parameters will be clearly visible in this side by side perspective. While **Electronic Desktop** supports COM keywords up to V3.70, not all keywords will be defined. Undefined keywords will function at their default values.



For more information, refer to the IEEE 802 LAN/MAN Standards Committee website and the IEEE P802.3ck 100 Gb/s, 200 Gb/s, and 400 Gb/s Electrical Interfaces Task Force Home Page.

7. Click **Calculate** and the output folder selected in **Step 3** populates with .raw (i.e., Berkley spice), *.csv*, and *.png* files.
8. When the report is ready, a **Report generation ...** window appears. Click **Yes** to open the COM analysis report in the system's default browser.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Continue to COM Analysis Report Summary

> **Note:** New features have been added to SPISim that are not mentioned in the following video tutorial. Relevant features, such as the number of configurable parameters, their locations within the Settings tab, and the expanded subtabs available, are documented in the prior instructions.

Excluded Experimental Flags

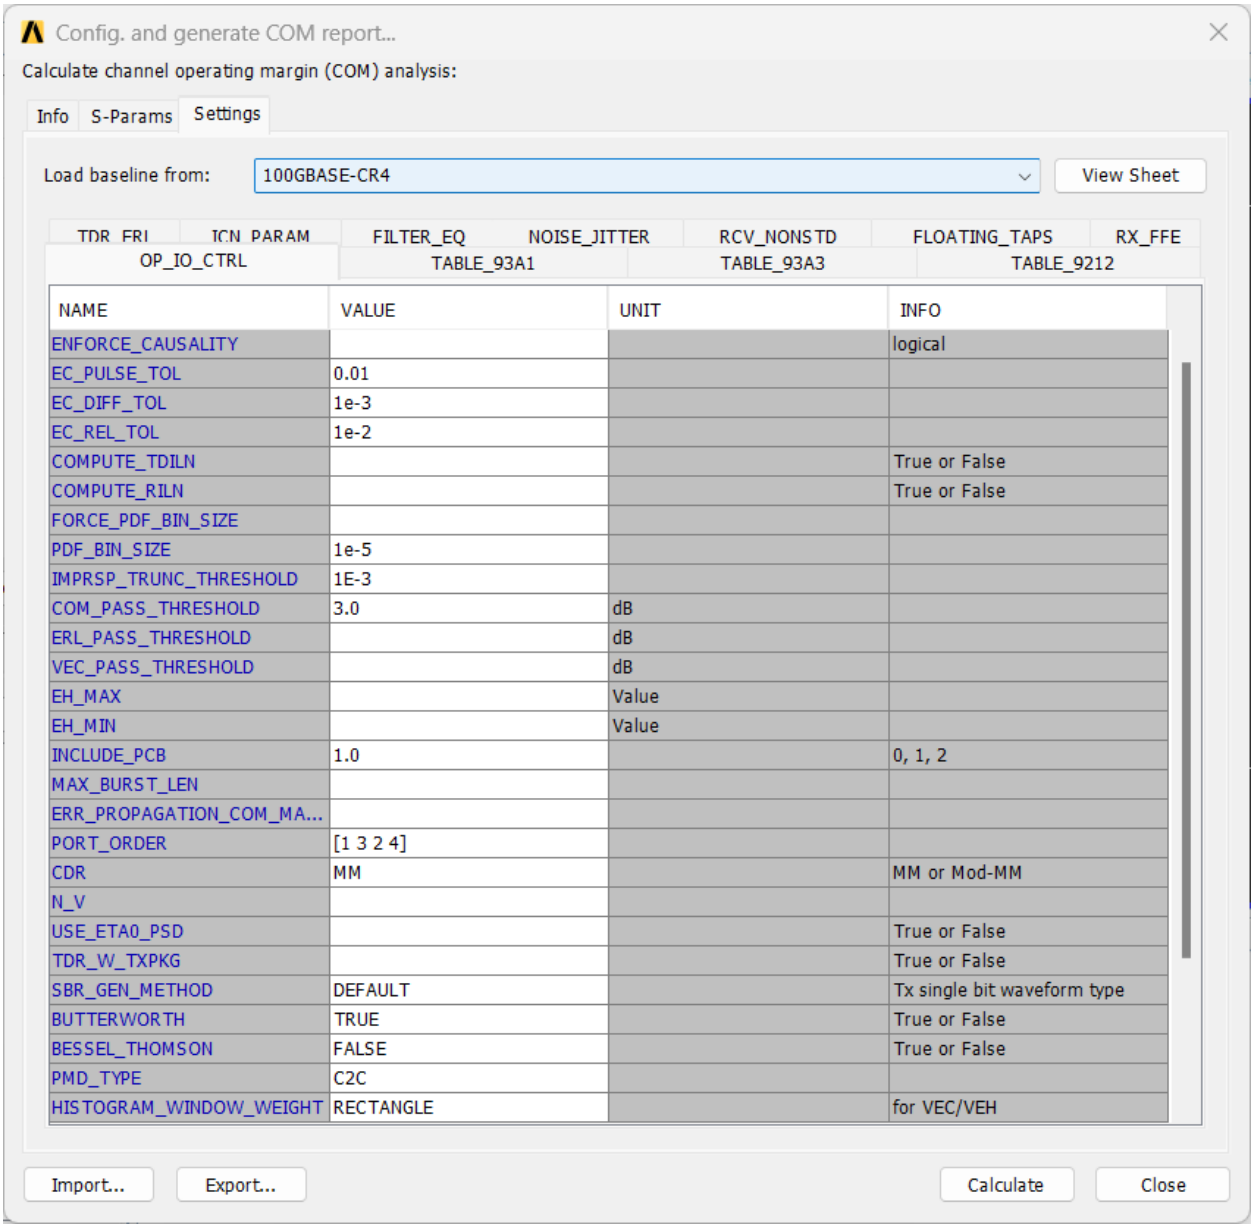
> **Important:** Experimental flags excluded from COM keywords are: TDMODE, Save_TD.

Generating a COM Analysis Report From the SPISim User Interface - Settings Tab

Channel operating margin (COM) analysis generates a *.csv* report file and binary waveform plots from analyzed data in a streamlined format. **Electronic Desktop 2025 R1** supports COM keywords up to V3.7.

Click the **Settings** tab to view the current configuration of the analyzed data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For an exhaustive list of the parameters, descriptions, and usage notes, refer to the COM Analysis Keywords reference page.

The settings are divided in eleven subtabs:

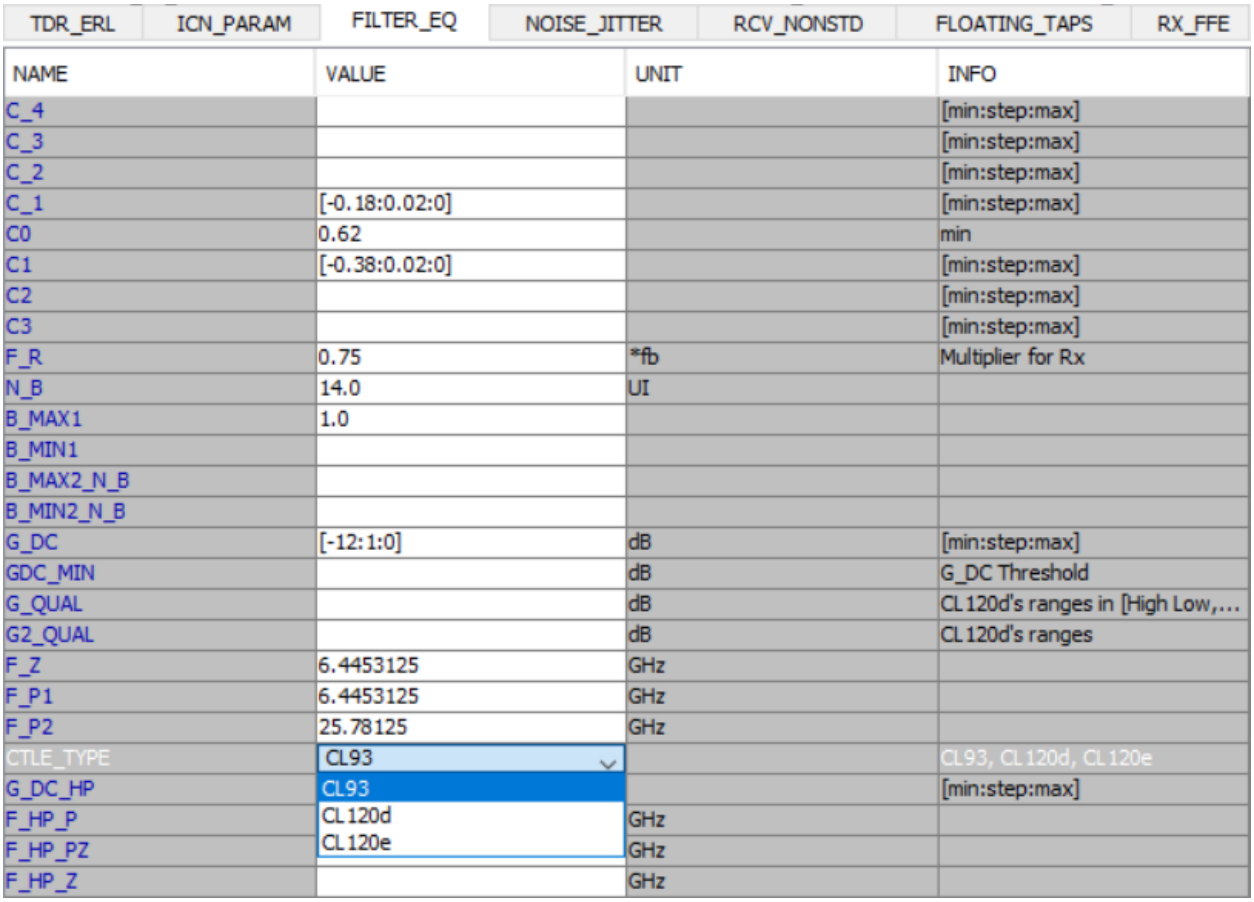
TDR_ ERL	ICN_ PARAM	FILTER_ EQ	NOISE_ JITTER	RCV_ NONSTD	FLOATING_ TAPS	RX_ FFE

OP_IO_TRL	TABLE_93A1	TABLE_93A3	TABLE_9212

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Beside each parameter **NAME** is a configurable **Value** field, **UNIT** field (if applicable) and useful **INFO** field. These parameters include:

- **C_4** and **C_3** TXFFE taps and **CTLE_TYPE** (on the *FILTER_EQ* subtab). **CTLE_TYPE** includes three choices on the **VALUE** field drop-down menu (i.e., **CL93**, **CL120d**, and **CL120e**)



- **FFE_BackOff** (on the *RX_FFE* subtab) compels RxFEE post taps to decrement up to the increment assigned in the **FFE_BackOff Value** field, and to scan for FFE settings based on DFE probes. The best resolution will be used as the tap selection for COM calculation (default is 4, i.e., deactivated). The *RX_FFE* subtab also includes parameters to optimize the pulse before DFE (i.e., **FFE_PRE_TAP_LEN** and **FFE_POST_TAP_LEN**, configurable pre and post taps for RxFFe). The subsequent parameters provide incremental and thresholds to qualify solutions (e.g., **FFE_TAP_STEP_SIZE**, **FFE_MAIN_CUR_MIN**, etcetera).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: For more information, refer to the IEEE 802 LAN/MAN Standards Committee COM 2.51 with rxFFE Updates presentation files.

OP_IO_CTRL		TABLE_93A1		TABLE_93A3	TABLE_9212

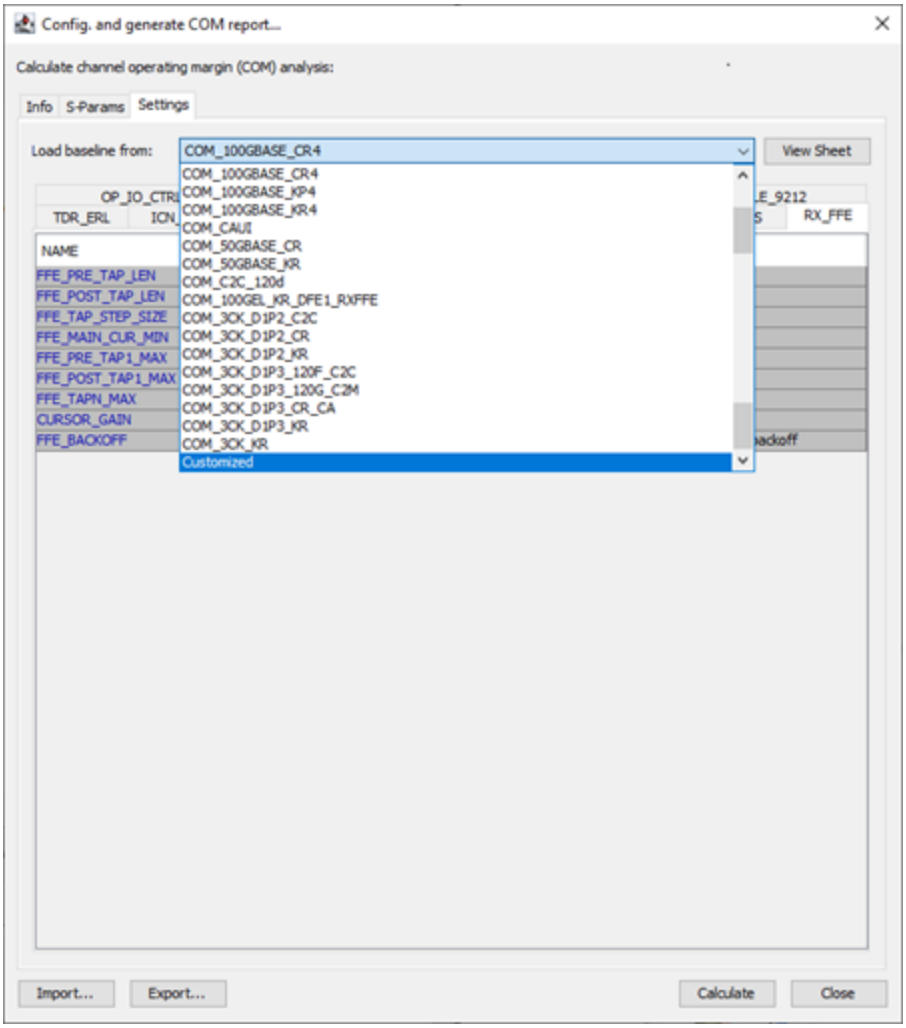
FFE_POST_TAP_LEN		UI	
FFE_TAP_STEP_SIZE	0		
FFE_MAIN_CUR_MIN	0.7		
FFE_PRE_TAP1_MAX	0.7		
FFE_POST_TAP1_MAX	0.7		
FFE_TAPN_MAX	0.7		
CURSOR_GAIN		dB	
FFE_BACKOFF	4		No. of taps to backoff

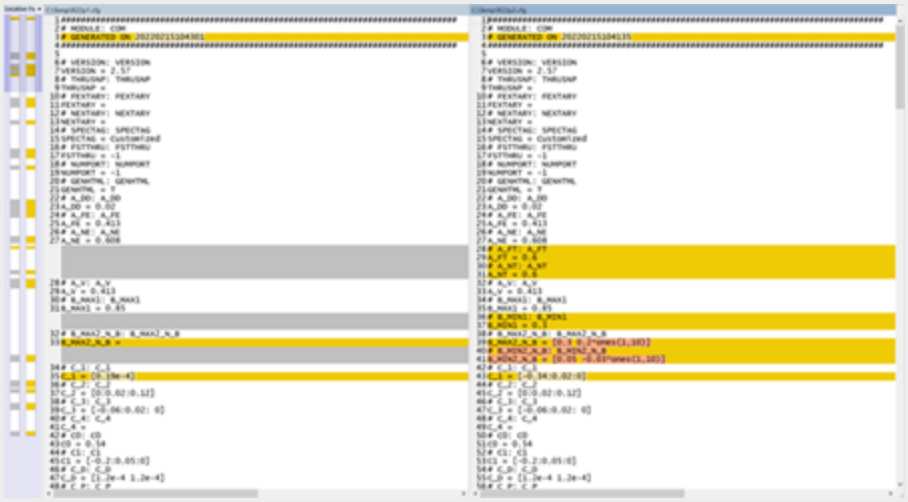
Note: There are various options for baseline configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: The configurable settings are extensive. If the user is upgrading from a previous version of *Electronic Desktop*, and currently has both versions installed, they can **Export** their configuration settings (e.g., *.cfg* file) from both versions and compare them. New parameters will be clearly visible in this side by side perspective. While **Electronic Desktop** supports COM keywords up to V3.7, not all keywords will be defined. Undefined keywords will function at their default values.



For more information, refer to the IEEE 802 LAN/MAN Standards Committee website and the IEEE P802.3ck 100 Gb/s, 200 Gb/s, and 400 Gb/s Electrical Interfaces Task Force Home Page.

AEDT/SPISim's COM analysis flow has been upgraded to match IEEE's reference implementation V3.7 (with some of experimental flags excluded).

Excluded Experimental Flags

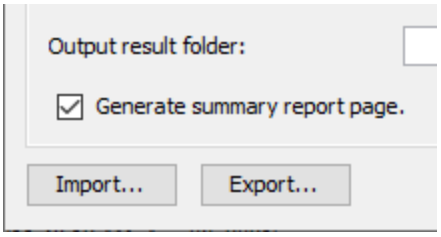
Important: Experimental flags excluded from COM keywords are: TDMODE, Save_TD.

Generating a COM Analysis Report Using a Non-GUI Batch Command Line

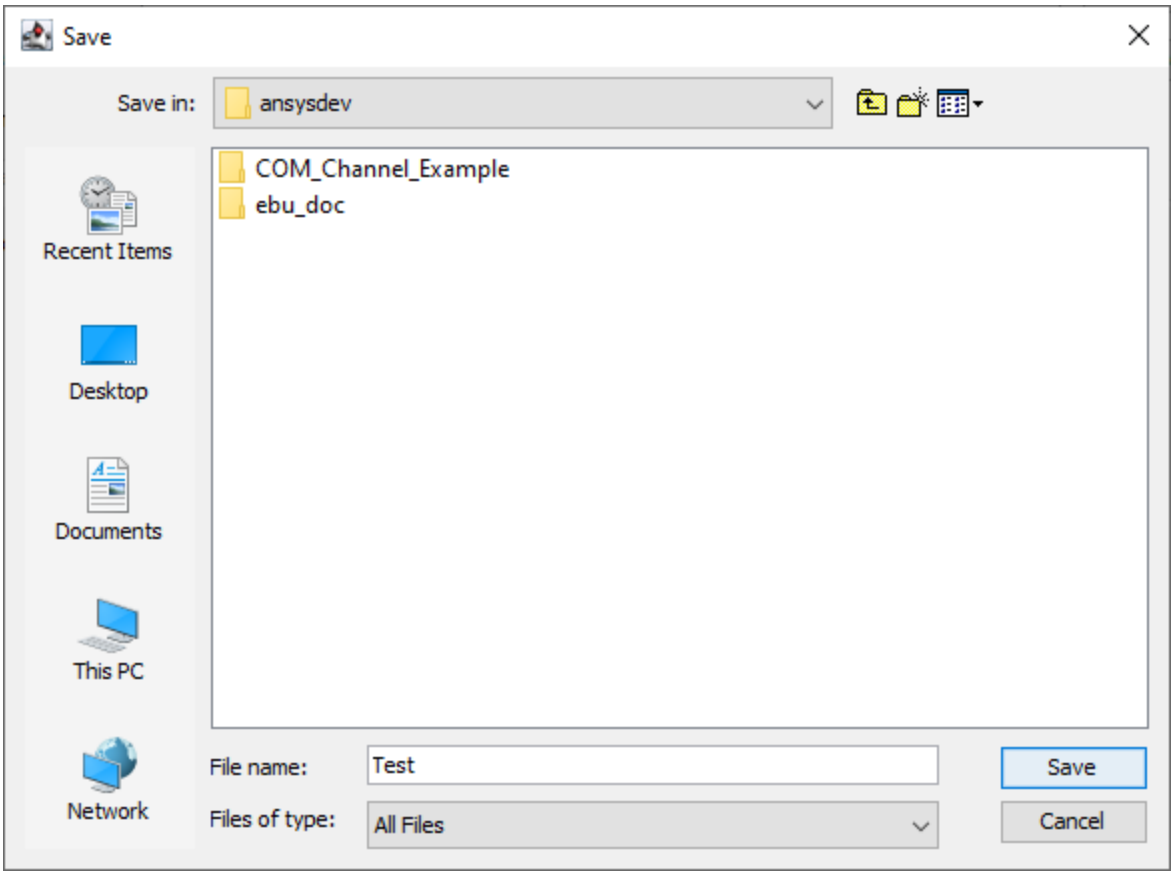
Generate a COM analysis report in a non-GUI (NG) batch command line by completing the following steps.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Launch the COM analysis report GUI interface. Refer to the first section of " Generating a COM Analysis Report From the SPISim User Interface " on page 16-160 for details.
2. Complete steps 1-6 in the " Generating a COM Analysis Report From the SPISim User Interface " on page 16-160 section to configure a COM analysis report.
3. From the **Config. and generate COM report ...** window, select **Export...** to open an explorer window.



4. Choose and enter a name in the **File name** field. Then use the **Save in** drop-down menu or the navigable explorer field to choose a location to save the *.cfg* file.

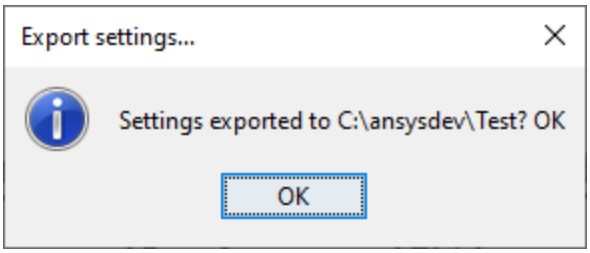


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Click **Save** to close the explorer window and open the **Export settings...** confirmation window.

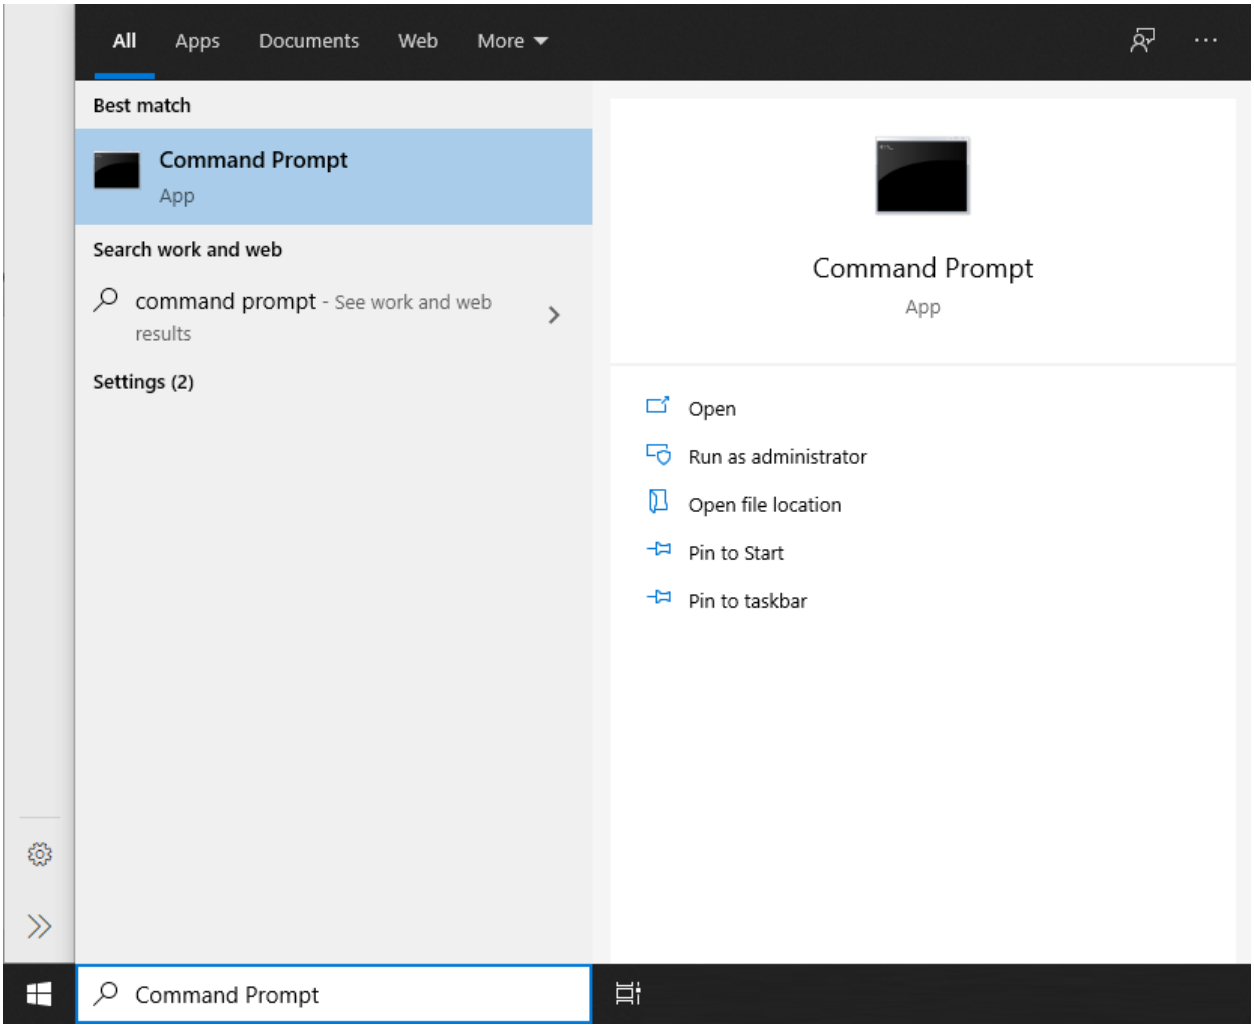
> **Note:** The *.cfg* file contains configuration settings in plain text format. These settings can be edited, if necessary.

6. Click **OK**



7. Run a command prompt (e.g., in a Windows environment, type *Command Prompt* into the **Search Bar** and press **Enter** to open a **Command Prompt** window.

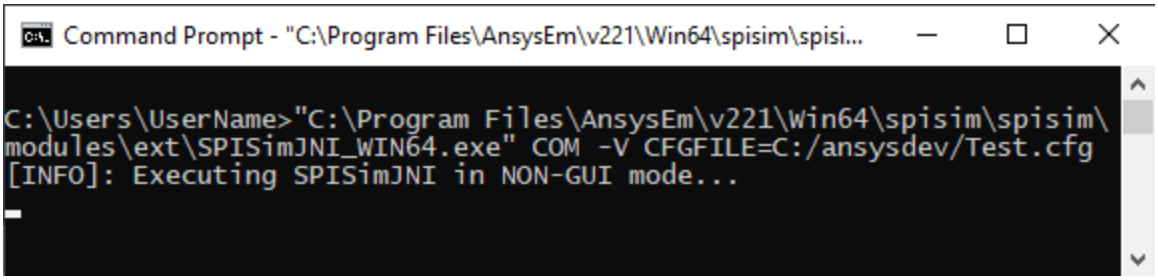
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note: The following example assumes **Electronics Desktop** is installed in the default directory in a Windows operating system environment. Structure the command appropriately for a different directory, path, and/or operating system, as necessary. Do **not** move the ***SPISimJNI_WIN64.exe*** executable file. The executable file relies on the relative path to the **Electronics Desktop** installation folder.

8. From the window, enter the following command, then press **Enter** to execute the COM analysis report in NG mode: `"C:\Program Files\ANSYS Inc\v252\AnsysEM\spisim\SPISim\modules\ext\SPISimJNI_WIN64.exe" COM -v CFGFILE=[`path to .cfg file`]`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



> **Note:** The *.cfg* file contains configuration settings in plain text format. These settings can be edited, if necessary.

The command prompt generates a COM analysis report in standard output (stdout), and generates the same *.htm*, *.raw*, *.csv*, and *.png* files that are created in a standard GUI report. The files are saved in the **Output result folder:** (selected on the **Config. and generate COM report ...** window in "Complete steps 1-6 in the " Generating a COM Analysis Report From the SPISim User Interface " on page 16-160 section to configure a COM analysis report." on page 16-173).

Generating a COM Analysis Report Using IBIS-Based Transition Data

Channel operating margin (COM) analysis generates a *.csv* report file and binary waveform plots from analyzed data in a streamlined format. While AMI configuration data (e.g., Tx and Rx package data) can be entered manually, follow the steps in this section to generate a COM analysis report using data parsed from an IBIS file and then easily selected from drop-down menus.

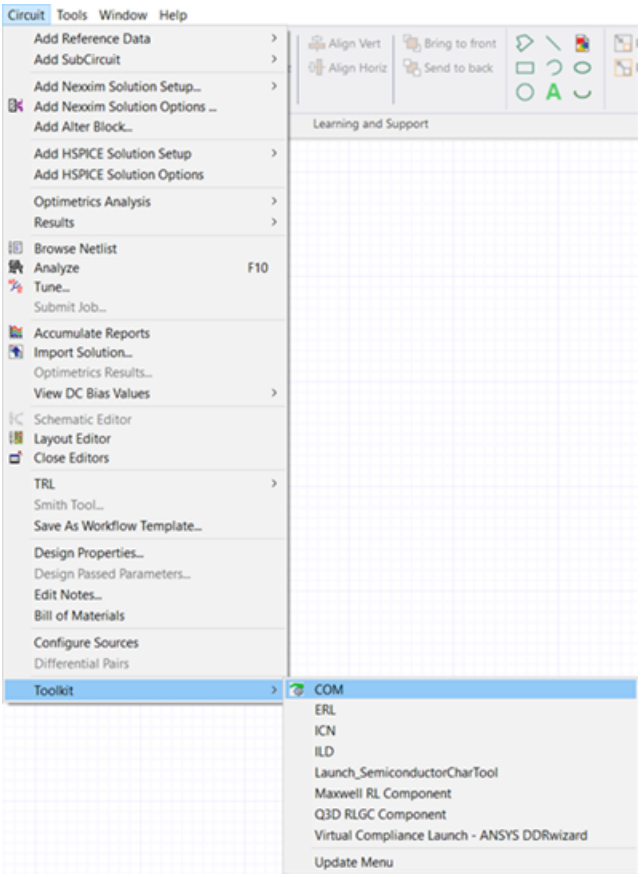
> **Note:** A COM analysis report can also be generated in other ways. If the user is familiar with the process, the pertinent differences begin at **step 8**. Refer to " Generating a COM Analysis Report From the SPISim User Interface " on page 16-160.

Complete the following steps to open the **Config. and generate COM report ...** window.

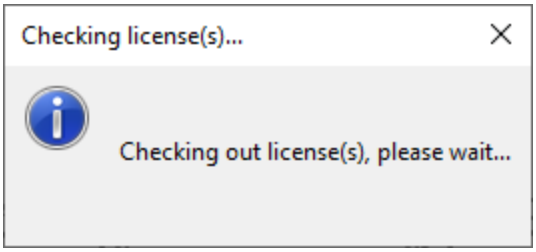
From Electronics Desktop

From the **Circuit** menu, select **Toolkit** > **COM**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



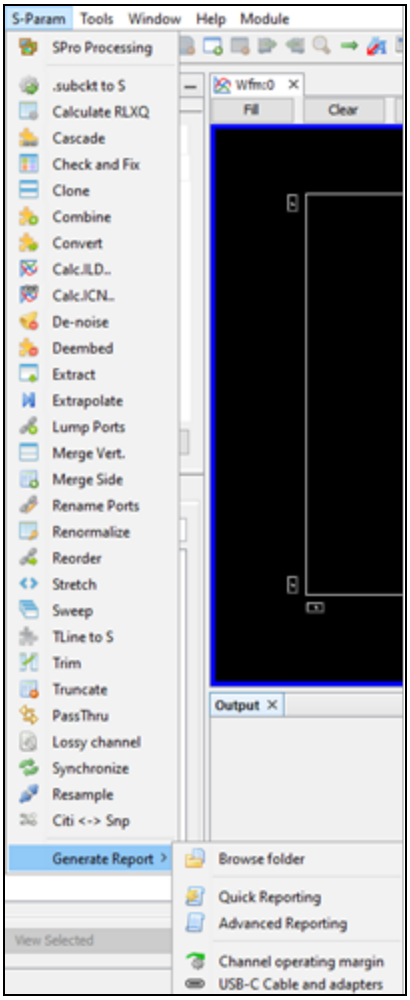
Before the **Config. and generate COM report ...** window opens, a **Checking License(s) ...** window opens.



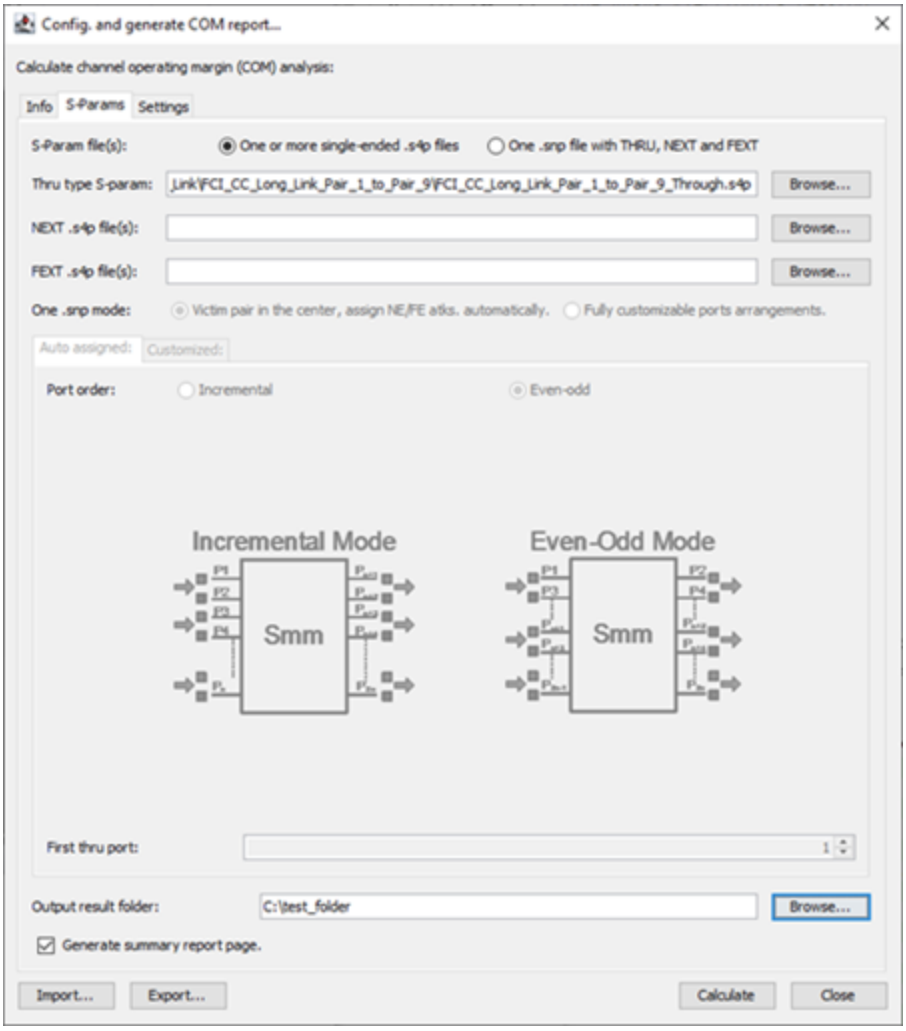
From SPISim

From the **S-Param** menu, select **Generate Report** > **Channel operating margin** to open the **Config. and generate COM report ...** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

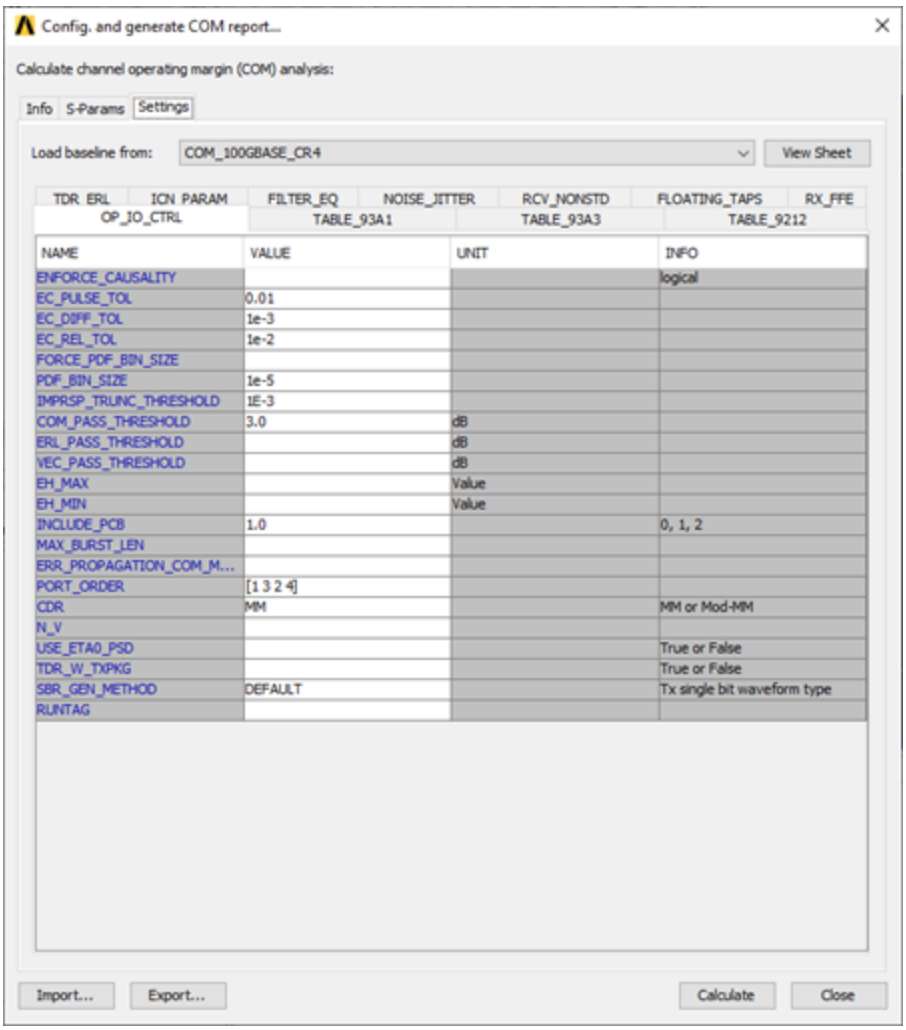


Follow the steps below to configure and then generate a COM analysis report.

1. Click the **Browse ...** button in line with the **Thru type S-param** field to open an explorer window.
2. Navigate to and choose an *.sNp* file to include it in the COM analysis report. Then click **Open**.
3. Click the **Browse ...** button in line with the **Output result folder** field to open an explorer window. Choose a location to save the COM analysis report output files, which includes *.raw*, *.csv*, and *.png* files that remain accessible to the user outside of the context of the COM analysis report.
4. Click **Open**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Before continuing, ensure that the **Generate summary report page.** check box, beneath the **Output result folder** field, is checked (checked by default).
6. Click the **Settings** tab to view the analyzed data's current configuration.

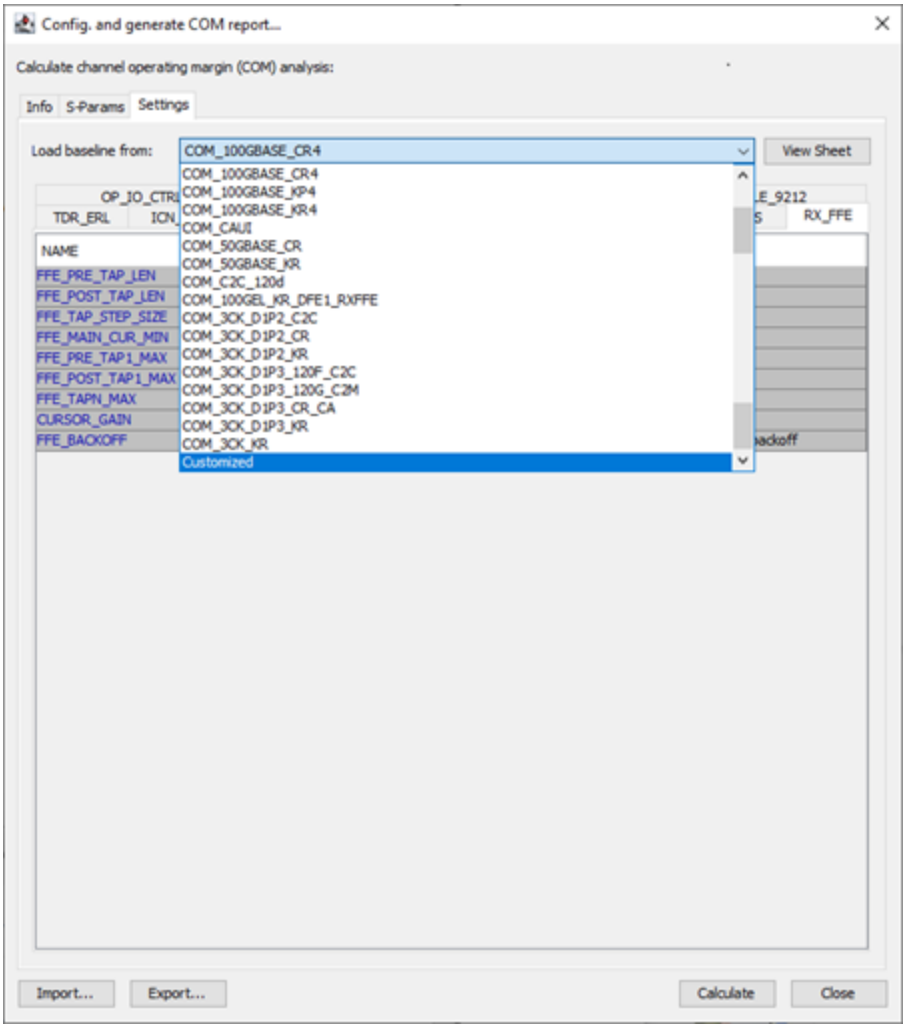


The settings are divided in eleven subtabs (i.e., **TDR_ERL**, **ICN_PARAM**, **FILTER_EQ**, **NOISE_JITTER**, **RCV_NONSTD**, **FLOATING_TAPS**, **RX_FFE**, **OP_IO_CTRL**, **TABLE_93A1**, **TABLE_93A3**, and **TABLE_9212**). Beside each parameter **NAME** is a configurable field, **UNIT** field (if applicable) and useful **INFO** field.

> **Note:** For more information, refer to the IEEE 802 LAN/MAN Standards Committee COM 2.51 with rxFFE Updates presentation files.

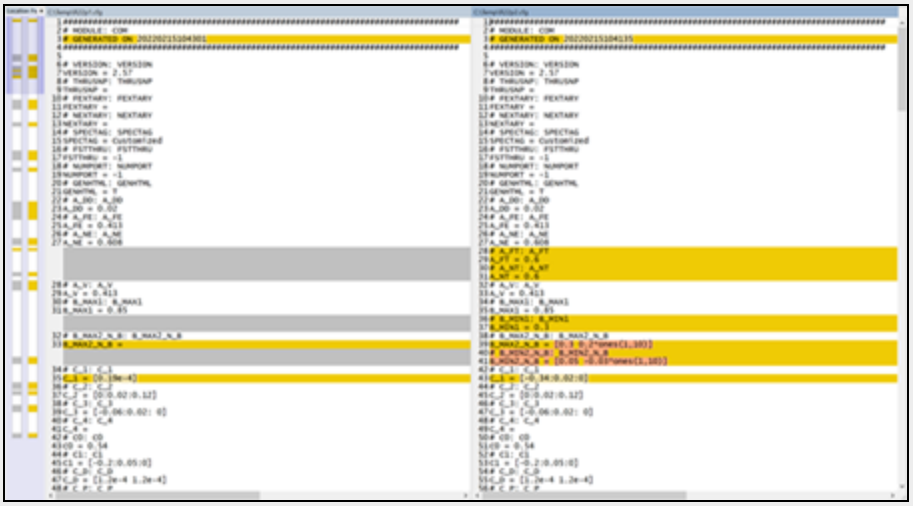
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. If necessary, choose another baseline configuration on the **Spec** drop-down menu, or select **Customized** to make individual changes to each field.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: The configurable settings are extensive. If the user is upgrading from a previous version of *Electronic Desktop*, and currently has both versions installed, they can **Export** their configuration settings (e.g., *.cfg* file) from both versions and compare them. New parameters will be obviously represented in this side by side perspective. While **Electronic Desktop** supports COM keywords up to V3.7, not all keywords will be defined. Undefined keywords will function at their default values.

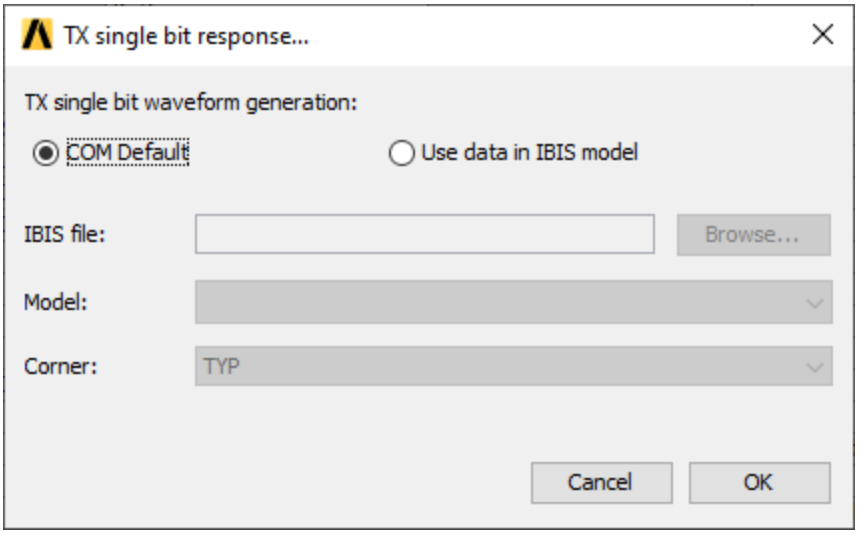


For more information, refer to the IEEE 802 LAN/MAN Standards Committee website and the IEEE P802.3ck 100 Gb/s, 200 Gb/s, and 400 Gb/s Electrical Interfaces Task Force Home Page.

8. Navigate to the **OP_IO_CTRL** subtab. Then click the field adjacent to **SBR_GEN_METHOD** to reveal the **...** button.

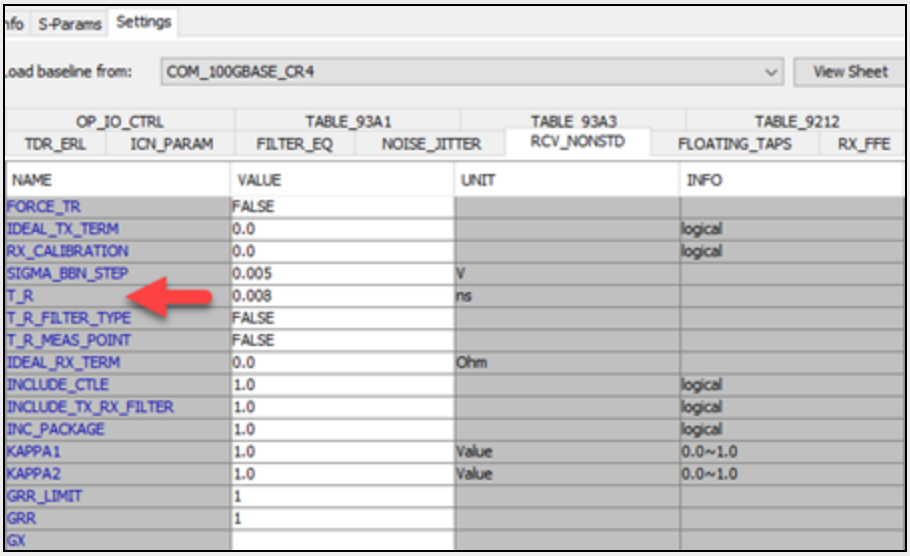
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9. Click the **...** button to open the **TX single bit response...** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: If **COM Default** is selected, the user must enter Tx/Rx IBIS data (e.g., Tx and Rx package data, and amplitude) manually.
First, navigate to the **RCV_NONSTD** subtab to enter Tx/Rx values in the **T_R** field.



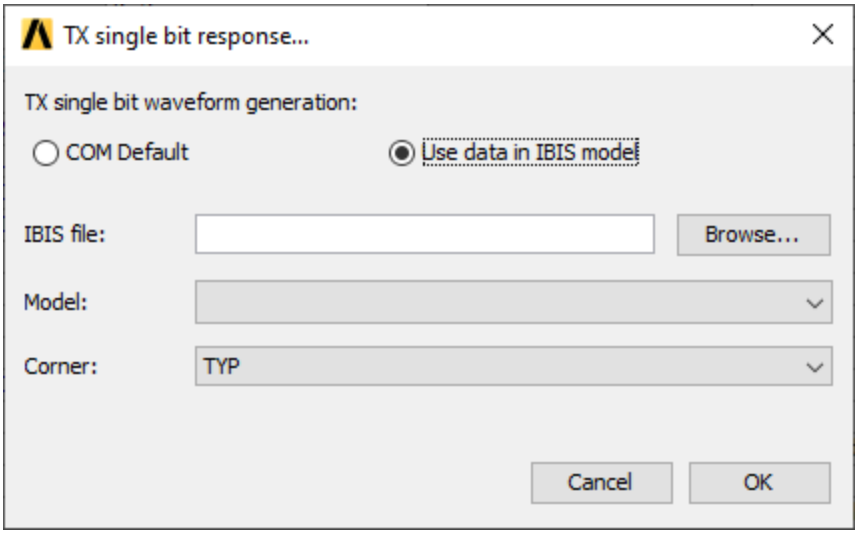
NAME	VALUE	UNIT	INFO
FORCE_TR	FALSE		
IDEAL_TX_TERM	0.0		logical
RX_CALIBRATION	0.0		logical
SIGMA_BBN_STEP	0.005	V	
T_R	0.008	ns	
T_R_FILTER_TYPE	FALSE		
T_R_MEAS_POINT	FALSE		
IDEAL_RX_TERM	0.0	Ohm	
INCLUDE_CTLE	1.0		logical
INCLUDE_TX_RX_FILTER	1.0		logical
INC_PACKAGE	1.0		logical
KAPPA1	1.0	Value	0.0~1.0
KAPPA2	1.0	Value	0.0~1.0
GRR_LIMIT	1		
GRR	1		
GX			

Then navigate to the **TABLE_93A1** subtab to enter amplitude values in the **A_V** field.

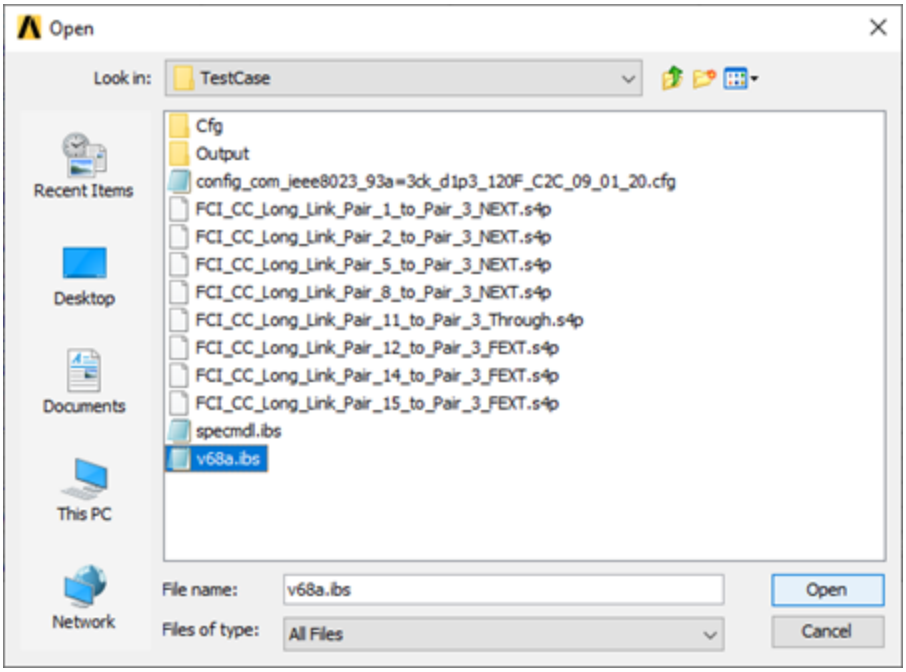
NAME	VALUE	UNIT	INFO
A_FE	0.4	V	tdr selected
A_NE	0.6	V	tdr selected
A_V	0.4	V	tdr selected
C_D	[2.5e-4 2.5e-4]	nF	[TX RX]
C_P	[1.8e-4 1.8e-4]	nF	[TX RX]
C_V	0.0	nF	[TX RX]
L_S		nH	[TX RX]
C_B		nF	[TX RX]
LOCAL_SEARCH			Local search range if > 0
DELTA_F	0.005	GHz	
DER_0	1.0E-5		
F_B	25.78125	GBd	
F_MIN	0.05	GHz	
F_V	4.0	*fb	Multiplier for Tx
L	2.0		PAM4=4, NRZ=2
M	32.0		
N_BX	14.0	UI	# DFE Taps for ERL
N_B_STEP			Normalized
R_0	50.0	Ohm	
R_D	[55 55]	Ohm	[TX RX] or selected
Z_PFEXT	[12 30]	mm	[test cases]
Z_PNEXT	[12 12]	mm	[test cases]
Z_PRX	[12 30]	mm	[test cases]
Z_PSELECT	[1 2]		[test cases to run]
Z_PTX	[12 30]	mm	[test cases]

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

10. To use an IBIS file (i.e., **.ibs* file) to create a COM analysis report, select the appropriate **TX single bit waveform generation** option (i.e., **Use data in IBIS model**).



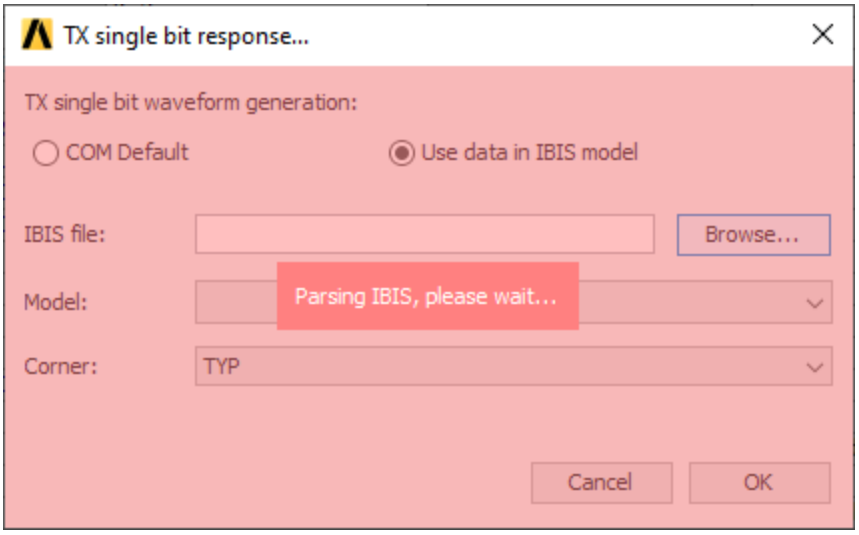
11. Click **Browse...** to open an explorer window. Then navigate to and select the appropriate IBIS file (e.g., **v68a.ibs**).



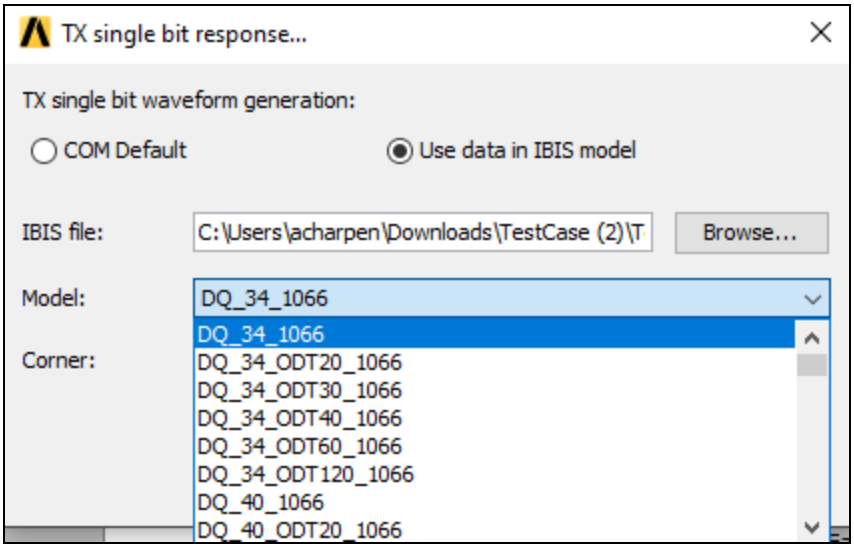
12. Click **Open** to close the explorer window and return to the **TX single bit waveform generation** window. **SPISim** immediately parses the selected IBIS file, scales based on the IBIS model's voltage range and the amplitude specified in the **A_V** field. The updated

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

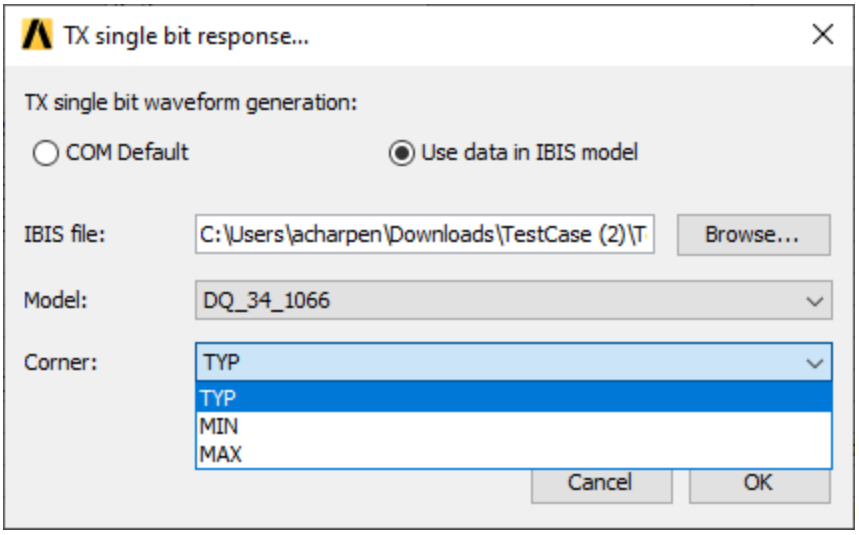
value is used in the final report calculation and present in the **Output** window as **IBIS Tr Time**. Depending on the size of the IBIS file, the **TX single bit waveform generation** window may be momentarily inaccessible. In that case, the following message may appear.



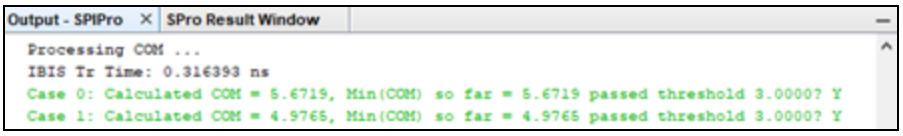
13. Once the IBIS file is parsed, select the appropriate **Model** and **Corner** from the adjacent drop-down menus.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



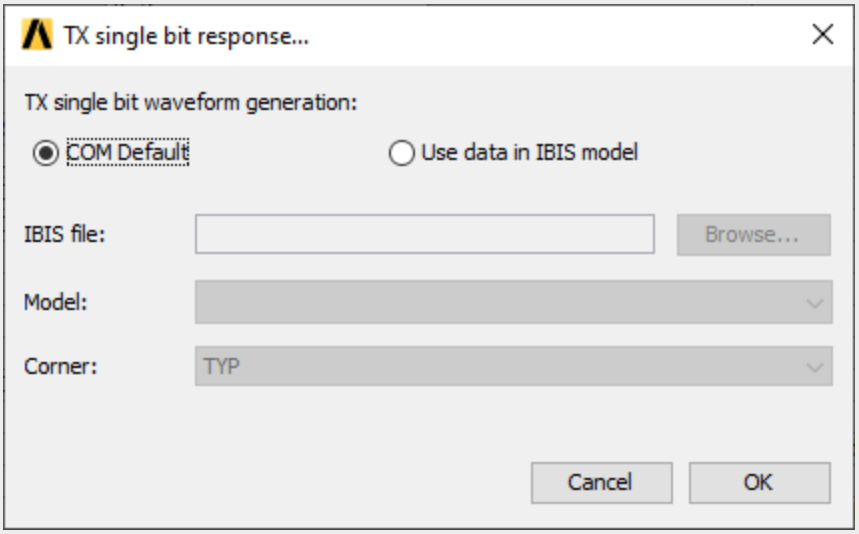
14. Click **OK** to return to the **Config. and generate COM report ...** window.
15. Click **Calculate** and the output folder selected in **Step 3** populates with .raw (i.e., Berkley spice), .csv, and .png files. The **Output - SPIPro** window will display relevant data, including the **IBIS Tr Time** (e.g., **0.316393 ns**).



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

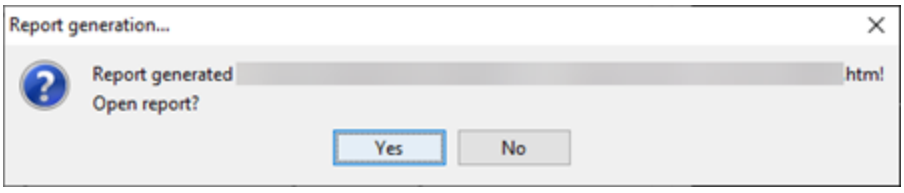
Note: To test the data reported in the method described in this section, enter the **IBIS Tr Time** value in the **Config. and generate COM report ...** > **Settings** tab > **RCV_NONSTD** subtab > **T_R** field.

Then set the **OP_IO_CTRL** > **SBR_GEN_METHOD** > **TX single bit response...** window > **TX single bit waveform generation** option to **Default**.



Click **OK** to close the **TX single bit response...** window, and then click **Calculate**. The resulting data should match.

16. When the report is ready, a **Report generation ...** window appears. Click **Yes** to open the COM analysis report in the system's default browser.

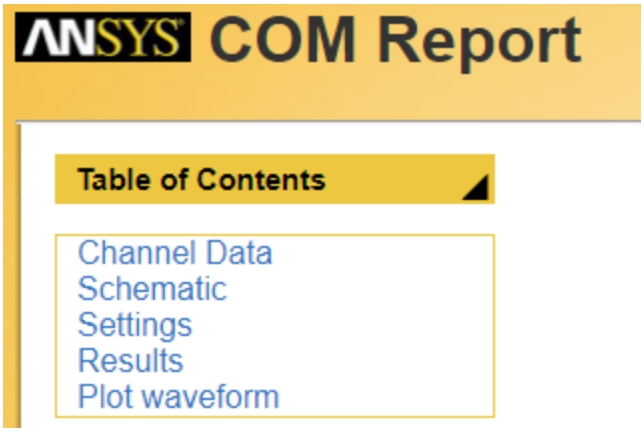


Continue to COM Analysis Report Summary

COM Analysis Report Summary

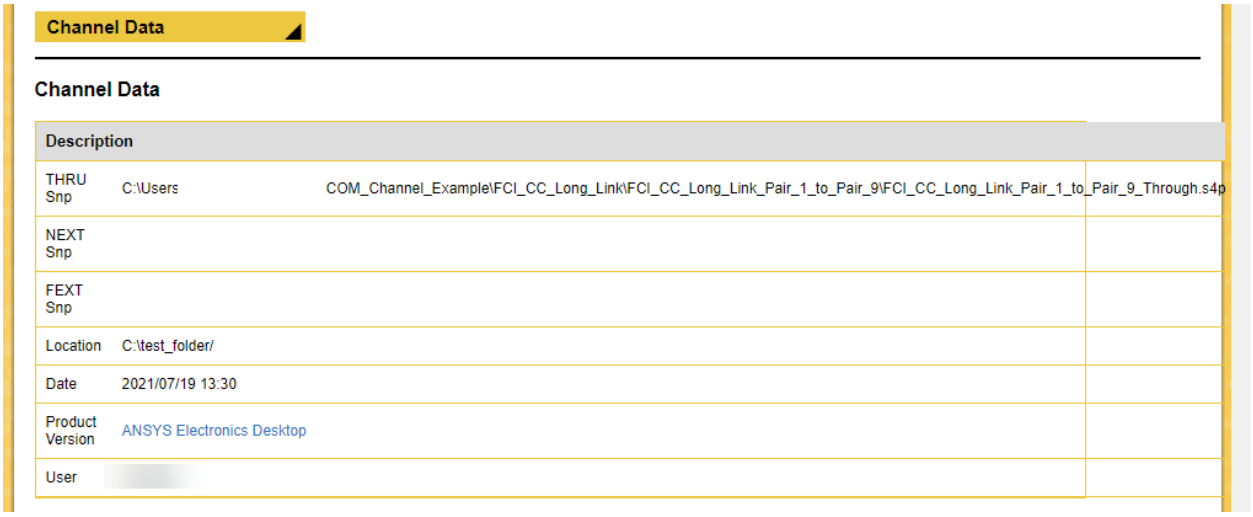
The COM Analysis Report is organized into a single window, navigable by a Table of Contents (TOC).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The TOC contains the following subsections.

Channel Data – Contains statistics about the report, including the location of the raw file(s) used to generate the report, the output location, date of generation, version of Electronic Desktop/SPISim software used to generate the report, and the user responsible for generating the report.



Schematic: – A *.png* of the schematic used to produce the original analysis, upon which the COM analysis report is based. Click the *.png* file to open the image at full resolution.

> **Note:** The schematic *.png*, as well as other *.pngs*, *.raw*, and *.csv* files created during generation of the COM Analysis Report remain accessible in the Output folder.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Schematic:

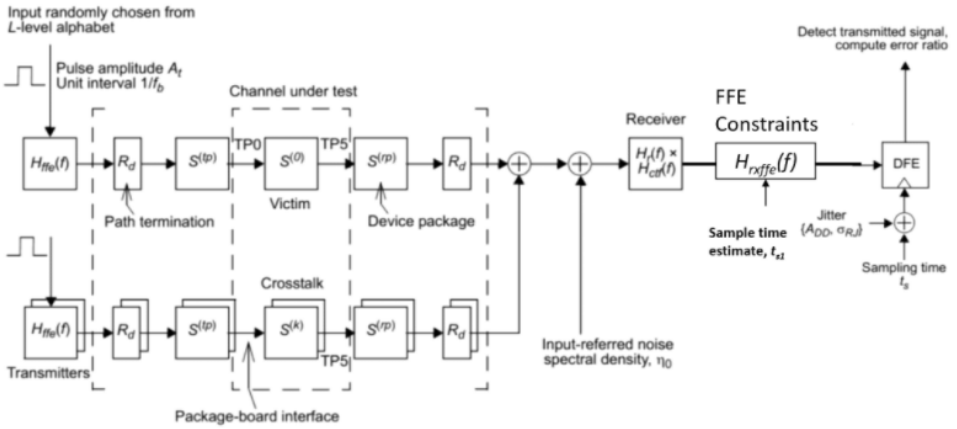


Figure 93A–1—COM reference model

Settings – Shows extensive tables of the parameters and settings used to generate the COM analysis report.

> **Note:** The tables mirror the settings accepted or chosen by the user on the **Config. and generate COM report ...** window **Settings** tab and the number of tabs differs from report to report.

Settings

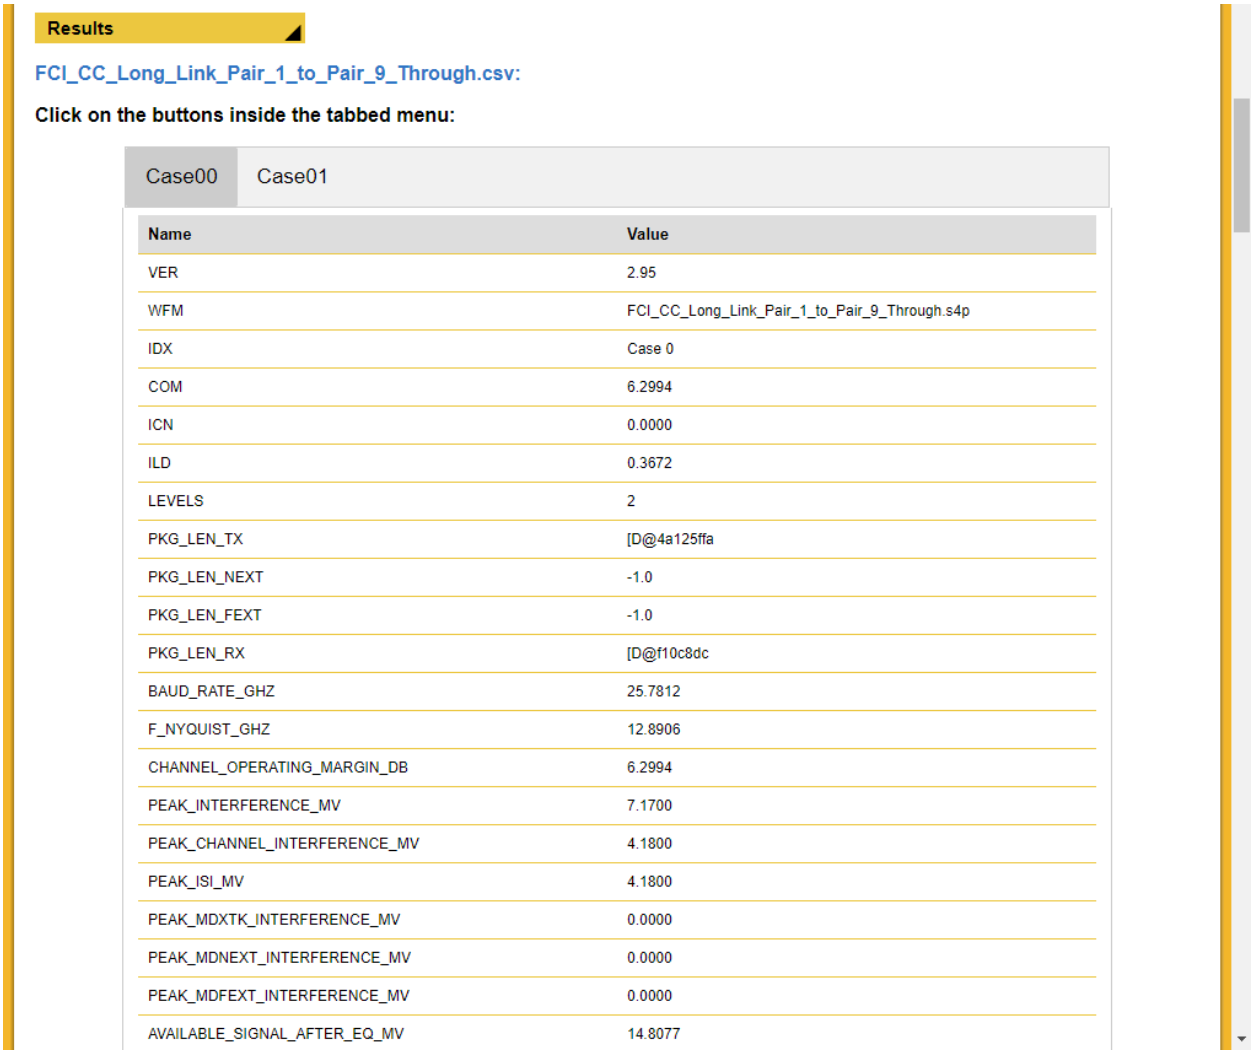
Click on the buttons inside the tabbed menu :

OP_IO_CTRL | TABLE_93A1 | TABLE_93A2 | TABLE_92A2 | RCV_NONSTD | RX_FFE

Results – Contains three subsections:

- A hyperlink to a .csv file.
- Multiple tables with the measured analysis results (the exact number of tabs is determined at the **Config. and generate COM report ...** > Settings tab). The results mirror the contents of the *.csv* file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Name	Value
VER	2.95

COM Analysis Keywords Reference Tables

OP_IO_CTRL

OP_IO_CTRL

SPISim Keyword	Description and Notes
ENFORCE_CAUSALITY	Default is 0. Not recommended to use.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
EC_PULSE_TOL	Tolerance parameter for causality. Hard enforcement, 0.05, Soft enforcement, .01.
EC_DIFF_TOL	Difference Tolerance parameter for causality. Hard enforcement, 1e-4,Soft enforcement, 1e-3.
EC_REL_TOL	Difference Tolerance parameter for causality, Hard enforcement, 1e-4,Soft enforcement, 1e-3
COMPUTE_TDILN	Figure of merit metric. Time Domain Insertion Loss Noise (TDILN). When comparing to existing ILN, which is in the frequency domain, TDILN fits the IL in the complex domain then

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	does TDR (time domain reflectometer) to find the noise compared to the original data's TDR.
COMPUTE_RILN	Reflective Insertion Loss Noise. Calculated when there is no terminal reflection. ILN only considers the channel itself.
FORCE_PDF_BIN_SIZE	Do not use.
PDF_BIN_SIZE	Do not use.
IMPRSP_TRUNC_THRESHOLD	Zero padding threshold in fraction of IR peak for the impulse response. Effectively controls the length of time for the PR. Larger values decrease run time and accuracy. Default is 1e-3.
COM_PASS_THRESHOLD	The pass/fail threshold for COM in dB.
ERL_PASS_THRESHOLD	The pass fail

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	threshold for ERL in dB.
VEC_PASS_THRESHOLD	The pass fail threshold for VEC in dB; only used when PMD_type is C2M.
EH_MAX	Used when PMD_type is C2M and is not really computed per spec.
EH_MIN	Used when PMD_type is C2M.
INCLUDE_PCB	Used to add a PCB, one each side of the passed s-parameters.
MAX_BURST_LEN	Used to calculate burst error rate (not normally used).
ERR_PROPAGATION_COM_MARGIN	Use to calculate error propagation (not normally used).
PORT_ORDER	S parameter port order [tx+ tx- rx+ rx-].
CDR	CDR method, default is 'MM' (Mueller-Muller).
N_V	Number of UI used to

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	compute Vf.
USE_ETA0_PSD	Used eta_0 PSD equation for sigma_n. Default is 0. Do not use.
TDR_W_TXPKG	Adds tx package for TDR, PTDR, and ERL. Default is 0.
SBR_GEN_METHOD	Pulse generation method: use IBIS's slew rate or filtered rectangular pause.
BUTTERWORTH	Enable Butterworth filter for TDR, PTDR, and ERL.
BESSEL_THOMSON	Enable Bessel Thomson filter for COM.
PMD_TYPE	The type of Physical Media Dependent (PMD) segment. Options are either C2C (chip-to-chip) or C2M (chip-to-module).
HISTOGRAM_WINDOW_WEIGHT	%Weighting for VEC and VEO for histogram

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	processing. Type are Gaussian, Dual Rayleigh, Triangle, and Rectangle (default)
OPTIMIZE_LOOP_SPEED_UP	If set to 0 (or default) normal looping, If set to 1 loop speedup by slightly reducing PD Fbin and FIR_ threshold for optimize looping only
SIGMA_R	sigma_r for 0.3ck Gaussian histogram window. Units are UI. Preferred usage.
MIN_VEO_TEST	Used when PMD_type is C2M. This allows EH to go below EH_min. If set to zero, it is ignored.
TDECQ	Transmitter dispersion eye closure quaternary. While in NRZ the corresponding transmitter

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	dispersion penalty (TDP) is determined by directly measuring the bit error rate (BER), for TDECQ the symbol error rate (SER) is measured indirectly.
SNR_TxWC0	Compute SNR taking the main tap's value into account.
RUNTAG	This string is appended to the beginning of the result files.

TABLE_93A1

TABLE_93A1

SPISim Keyword	Description and Notes
A_FE	FEXT aggressor differential peak source output voltage (half of peak to peak).
A_NE	NEXT aggressor differential peak source

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	output voltage (half of peak to peak).
A_V	Victim differential peak source output voltage (half of peak to peak).
C_D	C_d in nF (single sided). Supports ladder structure. [Tx Rx]
C_P	C_p in nF (single sided).
C_V	C_v in nF (via cap)(single sided).
L_S	L_s in nH (single sided). Supports ladder structure [Tx Rx]
C_B	C_b in nF (single sided).
LOCAL_SEARCH	Decreases COM compute time. Setting to 2 seems ok, if 0 search is full grid.
DELTA_F	Frequency step.
DER_0	Target detector error ratio.
F_B	Baud (Signaling) rate

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	in Gbaud.
F_MIN	Minimum required frequency start for s parameters.
F_V	For FOM_ILD: Transition rate cut off frequency for ICN/ILD calc in terms of fb.
L	Number of symbols levels (PAM-4 is 4, NRZ is 2).
M	Samples per UI.
N_BX	Used for ERL to compensate for a number of UI associated with the DFE.
N_B_STEP	Discretization of DFE. 0 disables and is not normally used.
R_0	Reference impedance.
R_D	Die source termination resistance (single sided).
Z_PFEXT	List of FEXT transmitter package trace lengths in mm, one per case.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
Z_PNEXT	List of NEXT transmitter package trace lengths in mm, one per case.
Z_PRX	List of FEXT receiver package trace lengths in mm, one per case.
Z_PSELECT	List of package length indexes used to run COM.
Z_PTX	List of victim transmitter package trace lengths in mm, one per case.
SAMPLES_FOR_C2M	Finer sampling in terms of samples per UI for c2m histogram analysis.
T_O	Do not use. Superceded with T_O but is the internal values that is used.
AC_CM_RMS	AC_CM_RMS is the CM BBN AWGN RMS at COM source point. Default is 0. Adds common mode noise source to

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	the COM signal path for the through channel.
ACCM_MAX_FREQ	F max for integrating ACCM voltage in Hz. Default is fb.

TABLE_93A3

TABLE_93A3

SPISim Keyword	Description and Notes
PACKAGE_TL_GAMMA0_A1_A2	Fitting parameters for package model per unit length. First element is in 1/mm and affects DC loss of package model . Second element is in ns1/2/mm and affects loss proportional to sqrt(f). Third element is in ns/mm and affects loss proportional to f.
PACKAGE_TL_TAU	Package model transmission line delay

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	ns/mm.
PACKAGE_Z_C	Package model transmission line characteristic impedance [Tx , Rx].

TABLE_9212

TABLE_9212

SPISim Keyword	Description and Notes
BOARD_TL_GAMMA0_A1_A2	Fitting parameters for package model per unit length. First element is in 1/mm and affects DC loss of package model . Second element is in ns1/2/mm and affects loss proportional to sqrt(f). Third element is in ns/mm and affects loss proportional to f.
BOARD_TL_TAU	Board model transmission line delay ns/mm.
BOARD_Z_C	Board model

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	transmission line characteristic impedance [Tx , Rx].
Z_BPFEXT	Fext Assessor transmitter board trace lengths in mm.
Z_BPNEXT	Next Assessor transmitter board trace lengths in mm.
Z_BPRX	Victim receiver board trace lengths in mm.
Z_BPTX	Victim transmitter board trace lengths in mm.
CB0	If include PCB is set to 1, near device single ended capacitance C0 in nF is added.
CB1	If include PCB is set to 1, connector side single ended capacitance C1 in nF is added.

TDR_ERL

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

TDR_ERL

SPISim Keyword	Description and Notes
ERL	Enables ERL. Needs TDR to be set as well.
Z_T	Single sided source termination reference resistance for TDR and ERL.
ERL_ONLY	Compute ERL only.
N	Duration time in UI which is used for ERL (PTDR).
TR_TDR	Gaussian shaped transition time for TDR source in ns.
TDR_DURATION	Only used if N*UI is longer than the TDR duration time. Default is 5 times the raw s-parameter transit time.
BT_ORDER	Bessel function order.
TUKEY_WINDOW	Required for ERL. Set to 1. Default is 0.
BETA_X	(For ERL) use default 0.
RHO_X	(For ERL) use default 0.618.
AUTO_TFX	Mostly used for

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	device ERL. If sent to 1 the fixture tfx will be estimated.
FIXTURE_DELAY_TIME	Fixture delay time (for ERL).
FIXTURE_BUILTIN_DELAY	Built-in fixture delay.

ICN_PARAM

ICN_PARAM

SPISim Keyword	Description and Notes
F_F	For ICN: Fext transition rate cut off frequency for ICN calc in terms of fb.
F_N	For ICN: Next transition rate cut off frequency for ICN calc in terms of fb.
F_1	Start frequency for ICN and ILD calculations in GHz.
F_2	Frequency in GHz for integration computation of ICN or FOM_Ild in GHz.
A_FT	FEXT

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	aggressor amplitude for ICN. Defaults to A_fe if not specified.
A_NT	NEXT aggressor amplitude for ICN. Defaults to A_ne if not specified.

FILTER_EQ

FILTER_EQ

SPISim Keyword	Description and Notes
C_4	TX equalizer pre cursor tap -4.
C_3	TX equalizer pre cursor tap -3.
C_2	TX equalizer pre cursor tap -2.
C_1	TX equalizer pre cursor tap -1.
C0	TX equalizer cursor minimum value (actual value is calculated as 1-sum(abs(tap)), Grid seat ignored for

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	when C(0) is below this value.
C1	TX equalizer post cursor tap 1.
C2	TX equalizer post cursor tap 2.
C3	TX equalizer post cursor tap 3.
F_R	Reference receiver filter in COM and in ICN/FOM_ILD calcs in terms of fb.
N_B	Decision feedback fixed equalizer (DFE) length.
B_MAX1	DFE negative magnitude limit. If not specified it defaults to -bmax.
B_MIN1	DFE negative magnitude limit. If not specified it defaults to -bmax.
B_MAX2_N_B	DFE magnitude limit for second coefficient and on (ignored if Nb<2). Can be a regular expression.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
B_MIN2_N_B	DFE negative magnitude limit; if not specified it defaults to -b_max(2..N_b).
G_DC	AC-DC gain list.
GDC_MIN	Max ACDC gain, if 0 ignore.
G_QUAL	G_Qual are the dB ranges of g_DC (g DC)which correspond tog_DC_HP (g DC2).
G2_QUAL	G2_Qual limit values of g_DC_HP (g DC2) which corresponds to ranges of g_DC g DC specified with G_QUAL.
F_Z	CTLE zero in GHz.
F_P1	CTLE pole 1 in GHz.
F_P2	CTLE pole 2 in GHz.
CTLE_TYPE	Sets the CTLE type, default as poles and zeros (i.e. not a list of poles as in 120e). Choices are CL93, CL120d, and CL120e

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
G_DC_HP	CTF AC-DC gain list (GDC2).
F_HP_P	CFT pole fp2 is in GHz. Normally a list for 120e. Not normally used otherwise.
F_HP_PZ	CFT pole pole zero pair in GHz for low frequency CTF.
F_HP_Z	CFT pole pole zero pair in GHz for low frequency CTF.

NOISE_JITTER

NOISE_JITTER

SPISim Keyword	Description and Notes
SIGMA_RJ	rms of random jitter.
A_DD	Normalized peak dual-Dirac noise, this is half of the total bound uncorrelated jitter (BUJ) in UI.
ETA_0	One-sided noise spectral density (V^2/GHz).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	Input referred noise at TP5.
SNR_TX	Transmitter SNDR noise in dB.
R_LM	Ratio of level separation mismatch. Relevant when not PAM-2 (NRZ).

RCV_NONSTD

RCV_NONSTD

SPISim Keyword	Description and Notes
FORCE_TR	Included for earlier version support but should be set to 1.
IDEAL_TX_TERM	Not supported, instead, set Zp ,Cd, and Cp parameters to zero and Zp to 1
RX_CALIBRATION	Turn on RX_ Calibration loop.
SIGMA_BBN_STEP	BBN step for Rx Calibration in volts. Defaults is 0.5e-3.
T_R	20% to 80%

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	transition time used for the Gaussian shaped source.
T_R_FILTER_TYPE	Included for earlier version support. Not recommended to use.
T_R_MEAS_POINT	Included for earlier version support. Not recommended to use.
IDEAL_RX_TERM	IDEAL_RX_ TERM not supported, instead, set Zp, Cd, and Cp parameters to zero and Zp to 1
INCLUDE_CTLE	Do not use.
INCLUDE_TX_RX_FILTER	Do not use.
INC_PACKAGE	Warning: INC_ PACKAGE=0 not fully supported, instead, set Zp,Cd, and Cp parameters to zero and Zp to 1.
KAPPA1	If set 0, reflection at tp0 are omitted from COM.
KAPPA2	If set 0, reflection at tp5

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	are omitted from COM.
GRR_LIMIT	Either do not use or set to 1 (for ERL).
GRR	Either do no use or set to 1 (for ERL).
GX	ERL parameter param.Grr; This is used in the COM code.

FLOATING_TAPS

FLOATING_TAPS

SPISim Keyword	Description and Notes
N_BG	Number of group of floating tap. Used as a switch, 0 means no float.
N_BF	Number of taps in group.
N_F	UI span for floating taps. Replaced by N_bmax.
BMAXG	Max DFE value for floating taps.
B_FLOAT_RSS_MAX	Floating DFE tap start for RSS floating tap limit.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
N_TAIL_START	Start range for max RSS limit for DFE taps.

RX_FFE

RX_FFE

SPISim Keyword	Description and Notes
FFE_PRE_TAP_LEN	Rx FFE pre cursor tap length.
FFE_POST_TAP_LEN	Rx FFE post cursor tap length.
FFE_TAP_STEP_SIZE	Rx FFE tap step size.
FFE_MAIN_CUR_MIN	Rx FFE main cursor miminum.
FFE_PRE_TAP1_MAX	Rx FFE pre cursor tap1 limit.
FFE_POST_TAP1_MAX	Rx FFE post cursor tap1 limit.
FFE_TAPN_MAX	Rx FFE precursor tap N limit.
CURSOR_GAIN	Only FFE and not supported.
FFE_BACKOFF	See if better zero forced solution is better by backing off the number

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Keyword	Description and Notes
	specified FFE taps one at a time.

The COM analysis keywords can also be referenced at https://www.ieee802.org/3/ck/public/tools/index.html.

UDO/UDS-Based COM/ERL Calculations for HFSS-Based Solutions

Generate an User-Defined Output (UDO)-based COM analysis report by completing the steps in the following subsections.

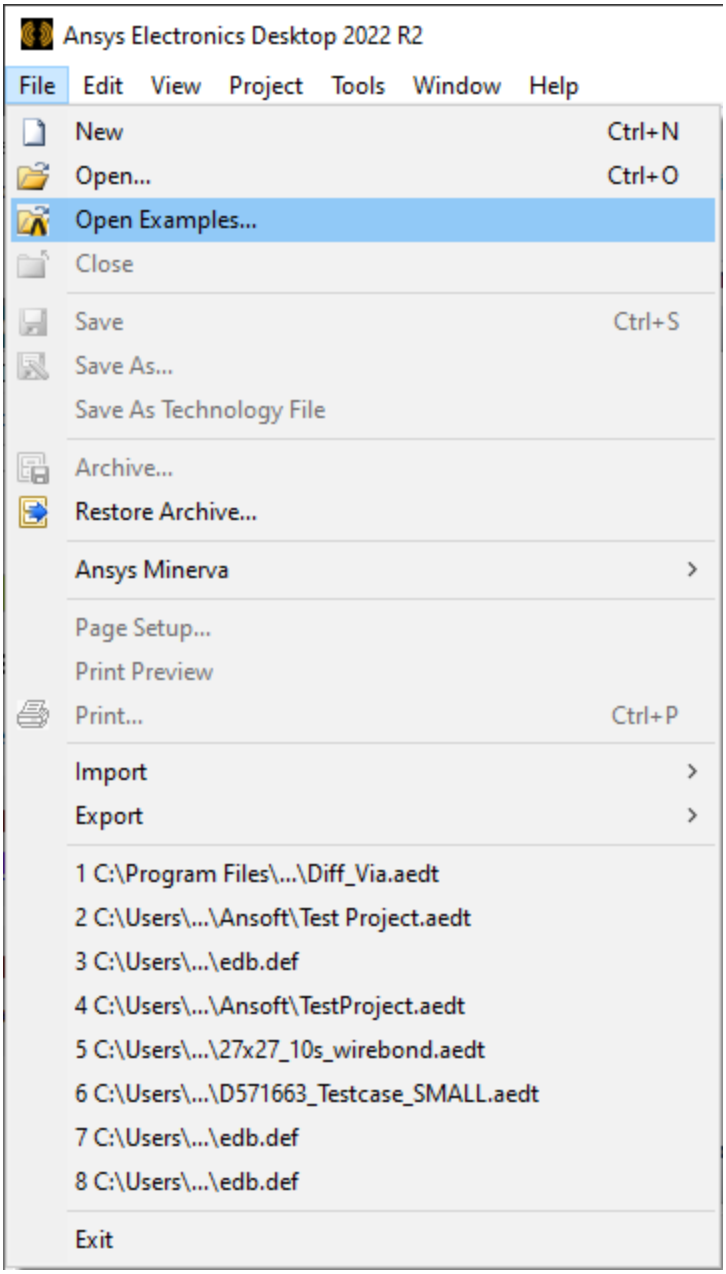
> **Note:** A COM analysis report can also be generated in other ways. Refer to " Generating a COM Analysis Report From the SPISim User Interface " on page 16-160 and " Generating a COM Analysis Report Using a Non-GUI Batch Command Line" on page 16-172 for details.

Open the Example Project

1. Open the example project **Diff_Via.aedt** by doing one of the following:

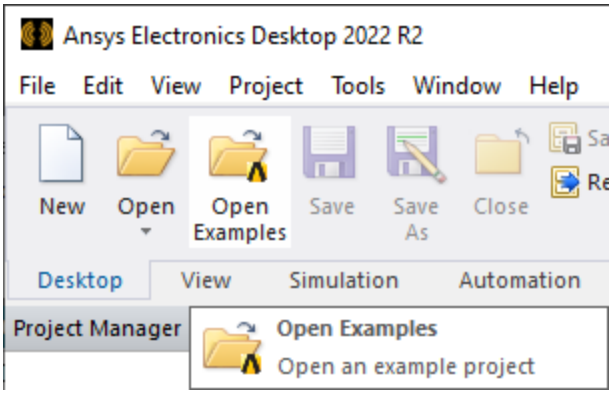
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From **File**, select **Open Examples**.

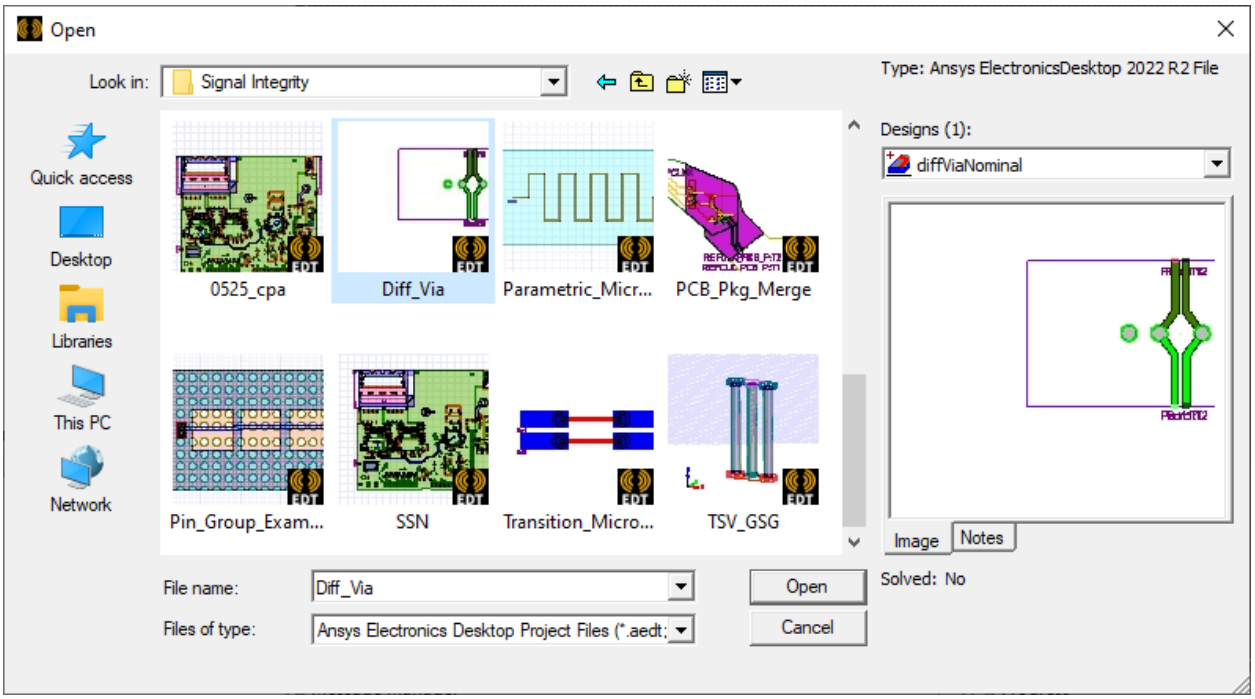


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Desktop** ribbon, click **Open Examples**.



2. From the explorer window that opens, navigate to **HFSS 3D Layout** > **Signal Integrity** and either double-click **Diff_Via.aedt** or click **Diff_Via.aedt** and then click **Open**.

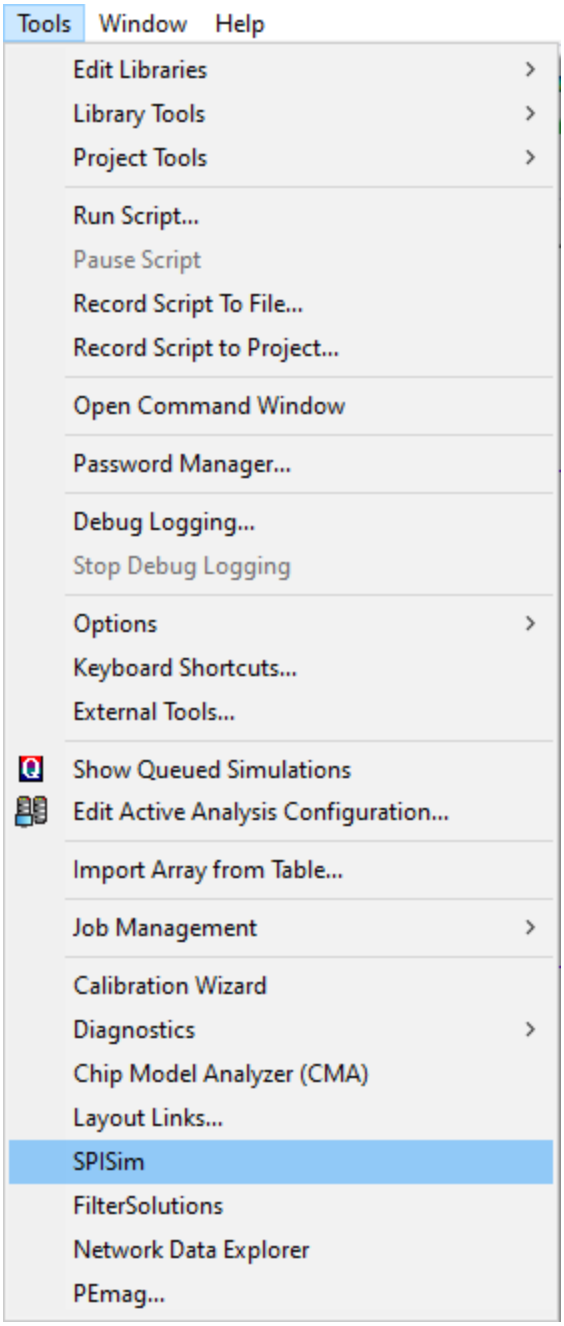


3. If necessary, navigate to an appropriate directory and save the project.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create a Configuration File in SPISim

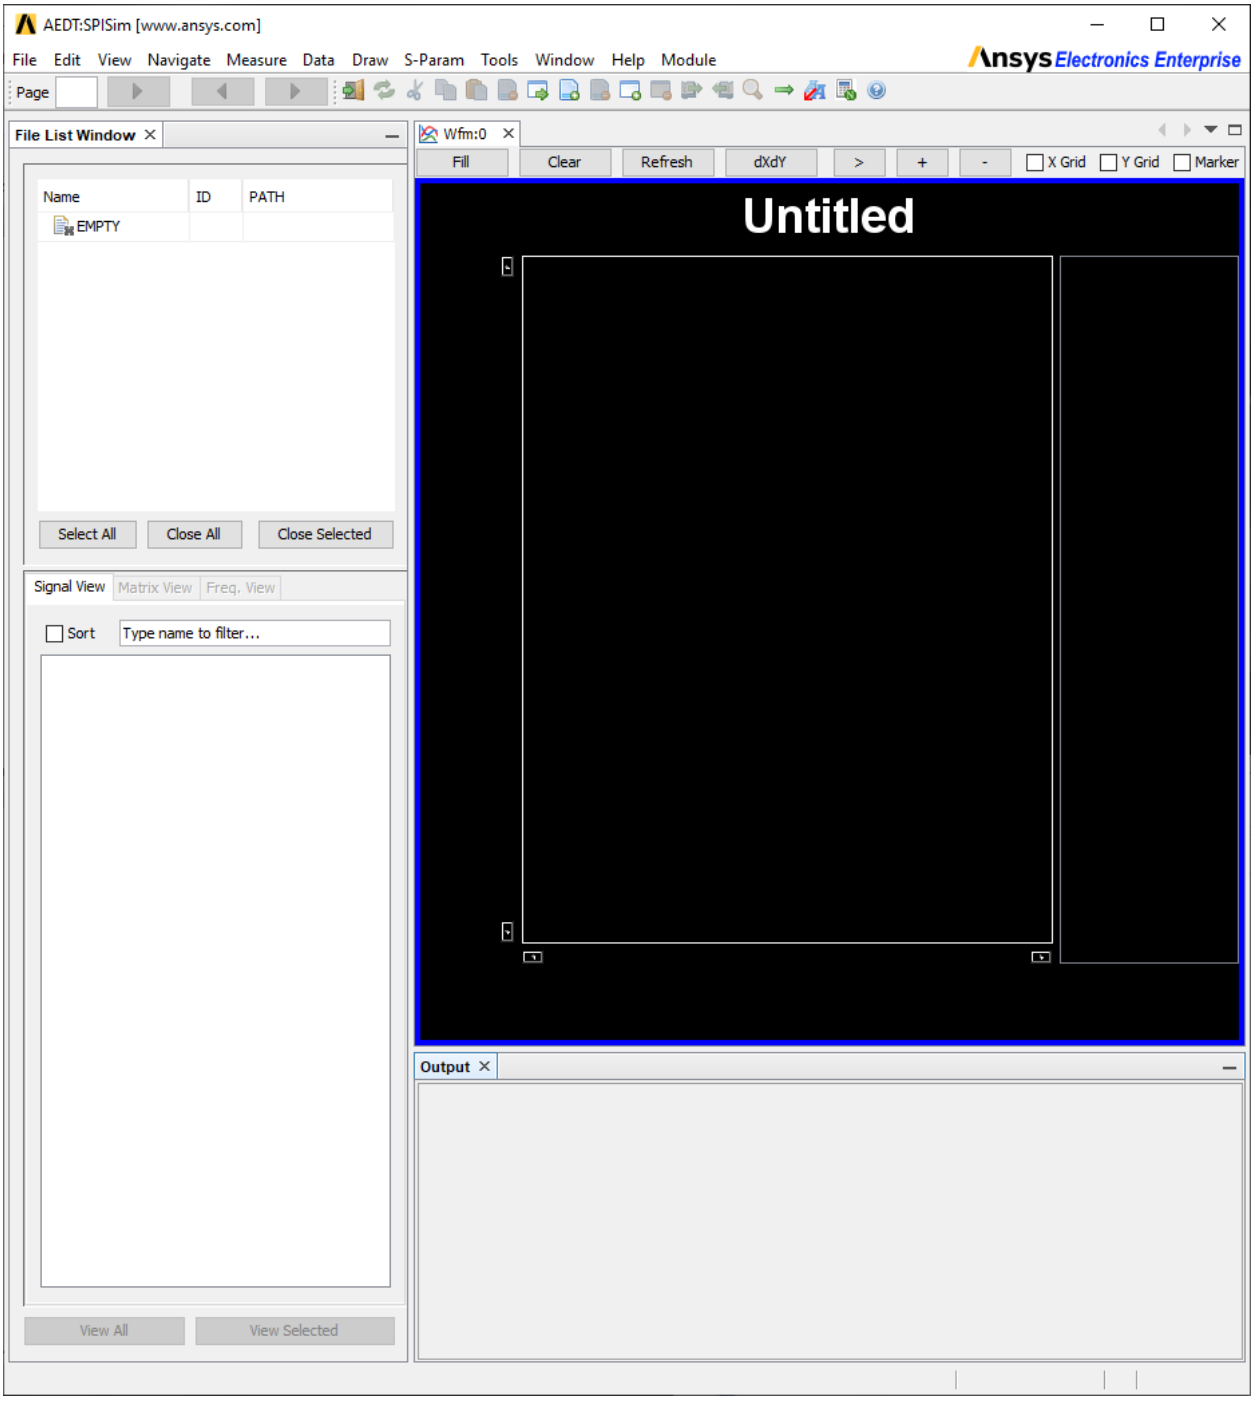
1. From **Tools**, select **SPISim**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

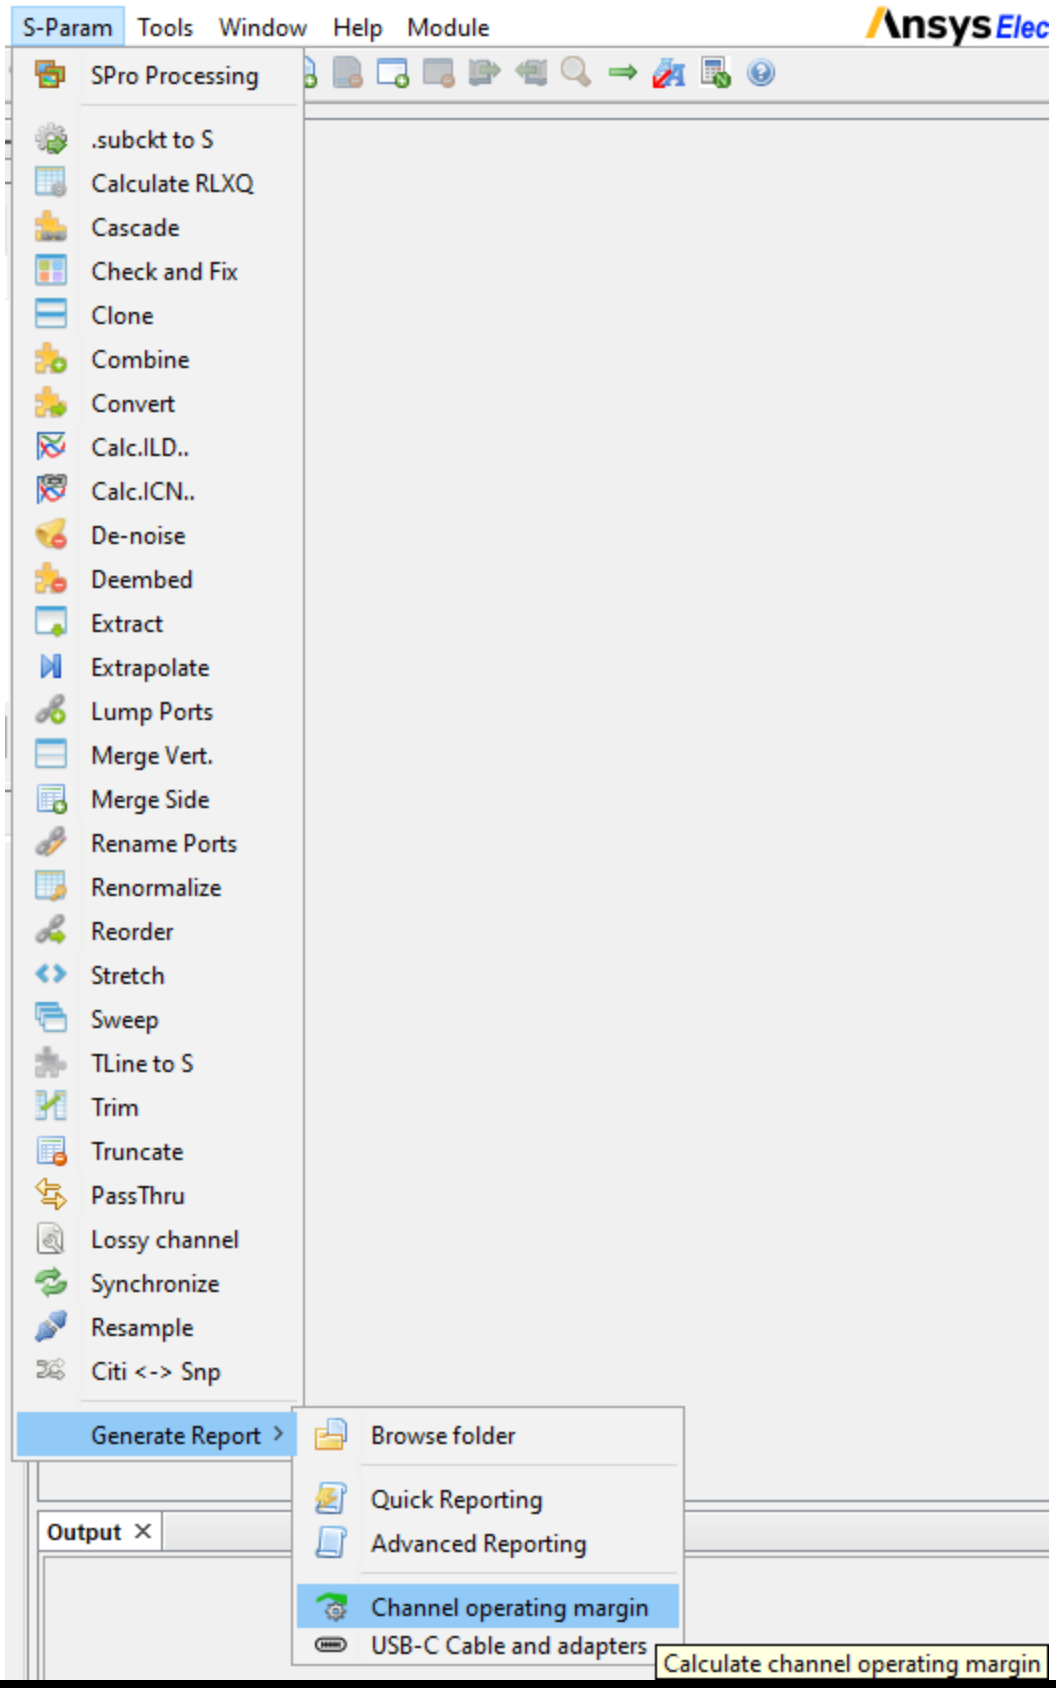
2. Wait for **SPISim** to load.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

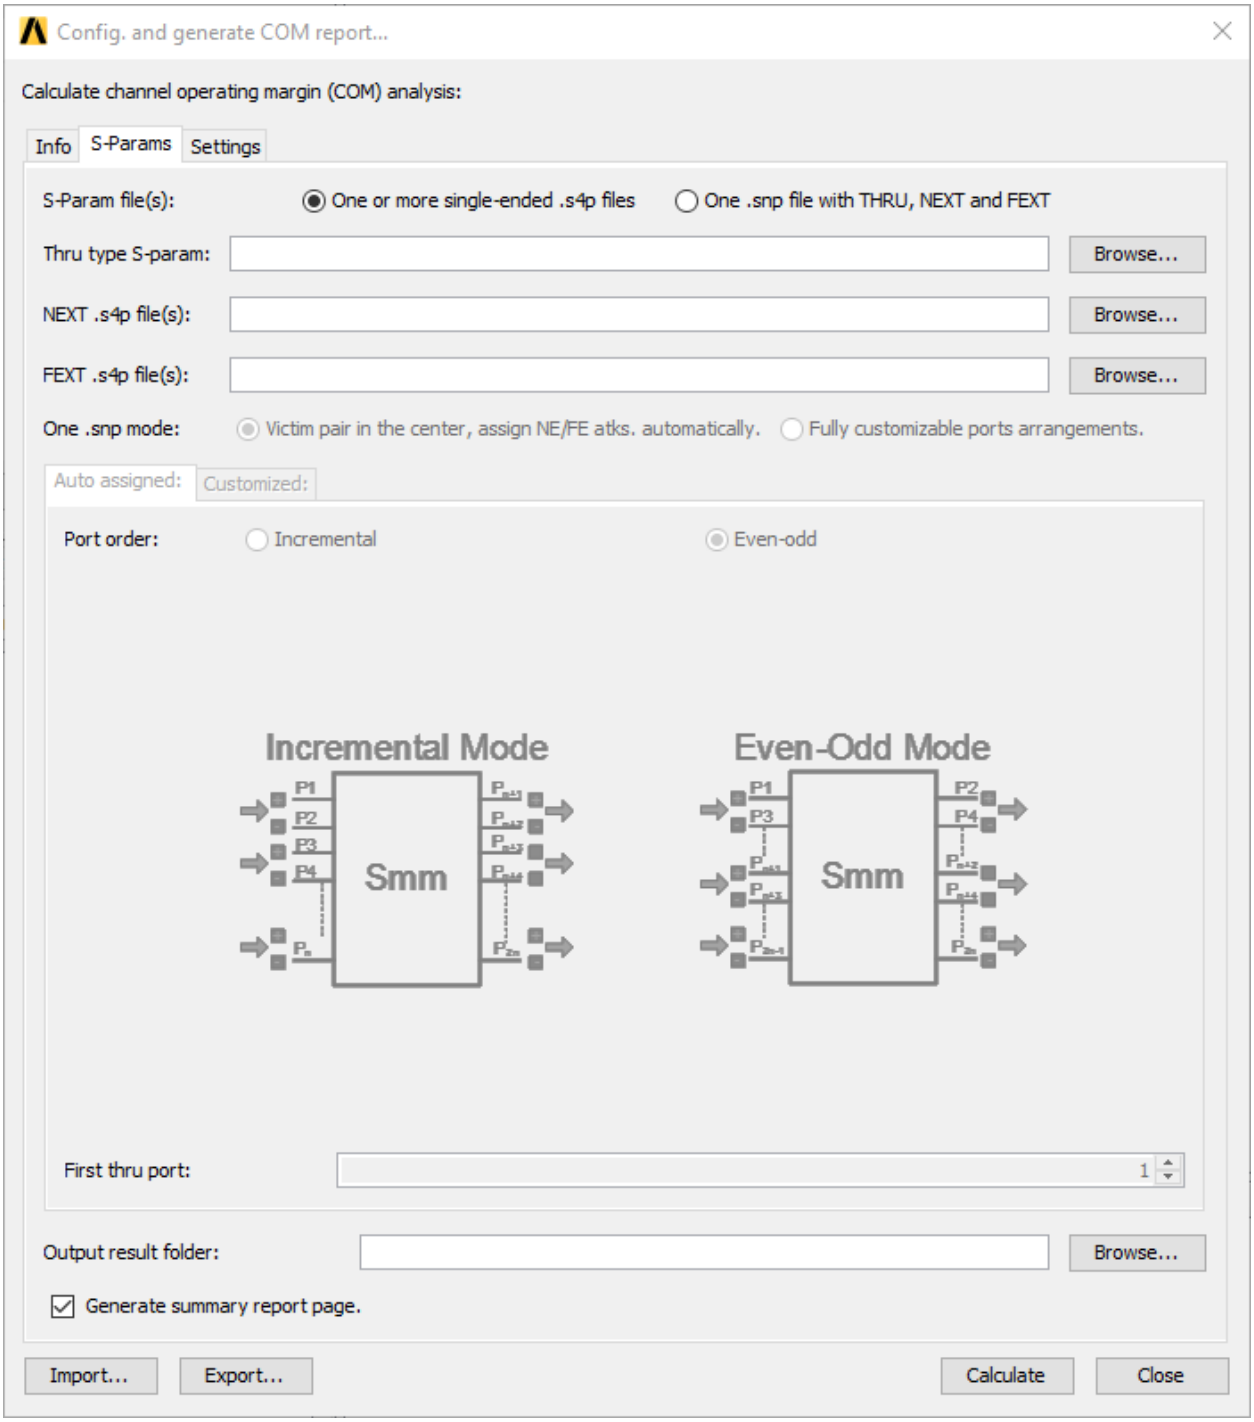


3. From **SPISim**, select **S-Param** > **Generate Report** > **Channel operating margin** to open the **Config. and generate COM report...** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



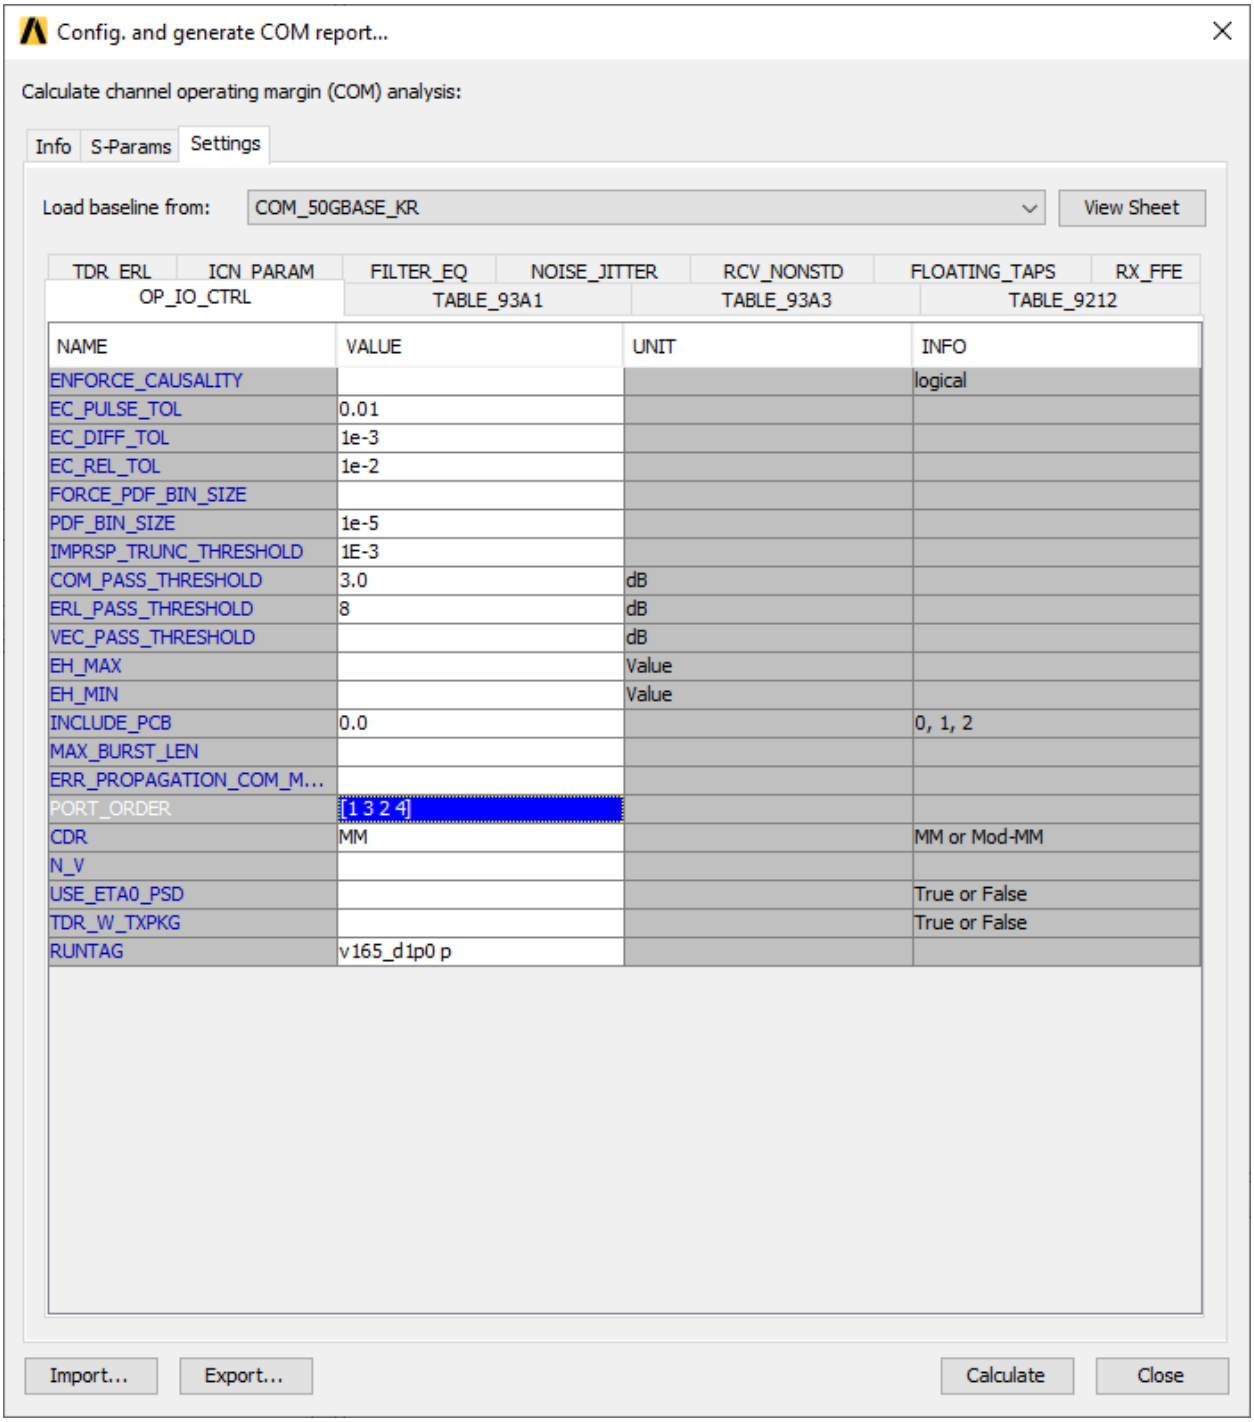
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Navigate to the **Settings** tab. Then do the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

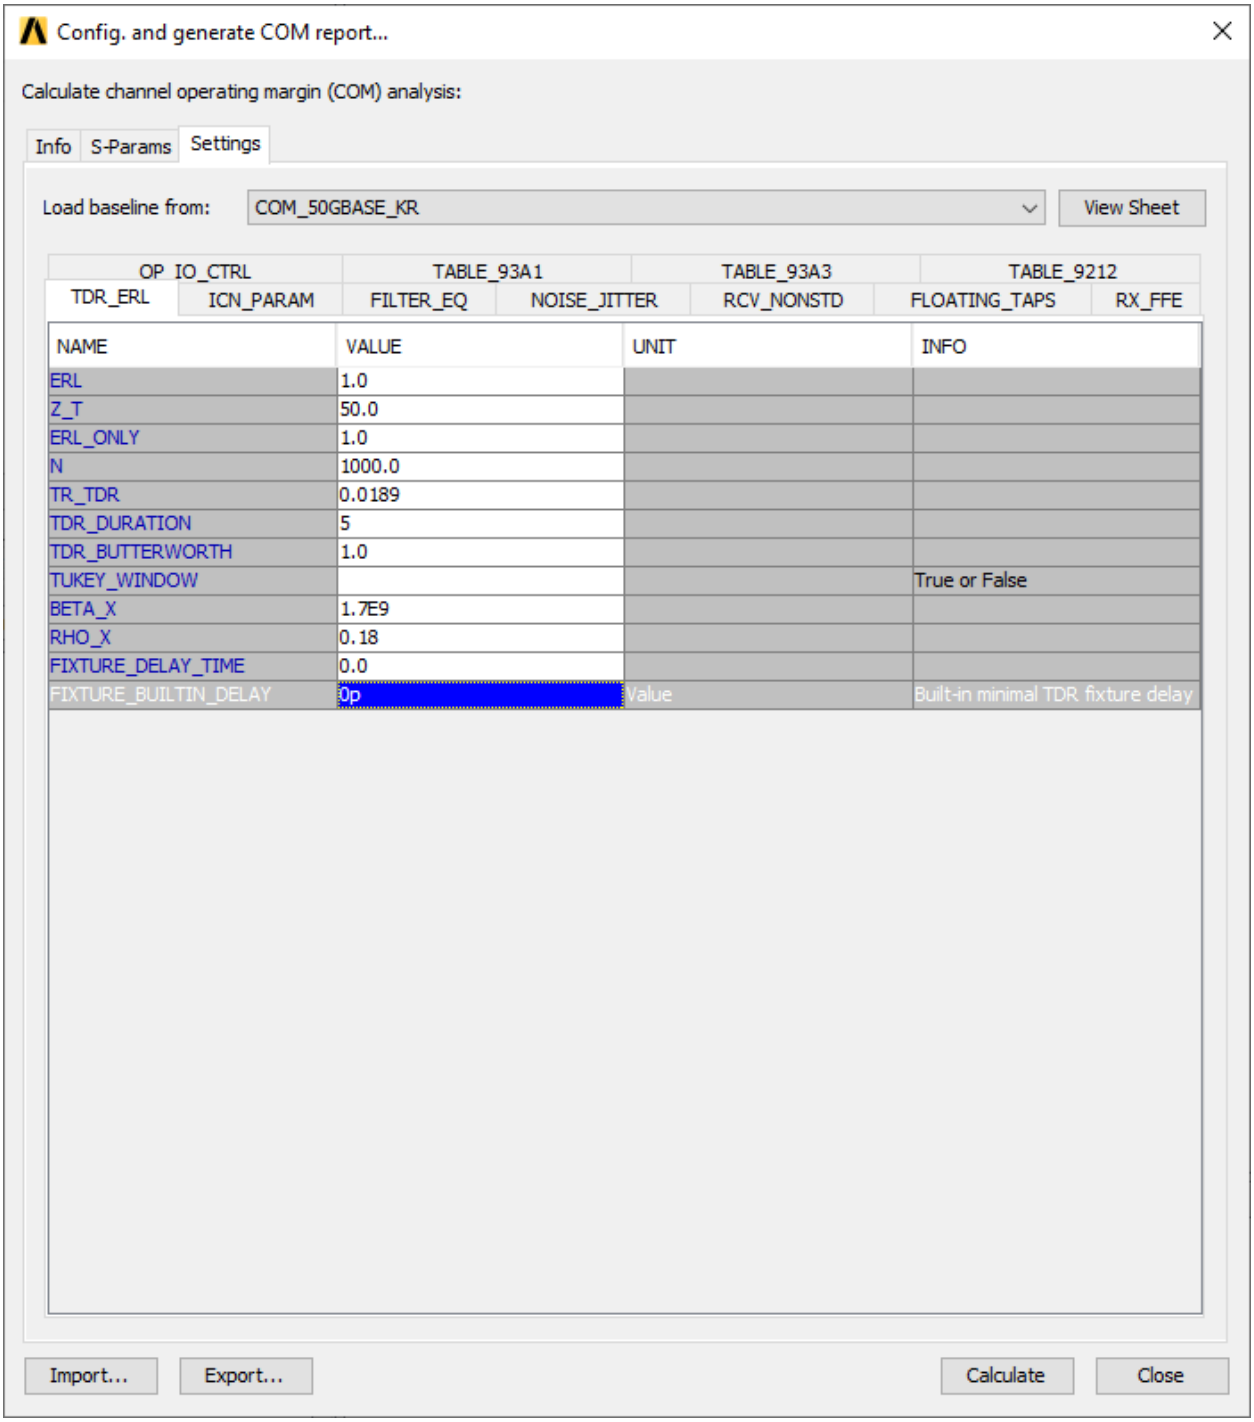
- From the **Load baseline from** drop-down menu, select **COM_50GBASE_KR**.
- From the **OP_IO_CTRL** subtab, type **[1 2 3 4]** in the **PORT_ORDER VALUE** field.



5. Navigate to the **TDR_ERL** subtab and make the following changes:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

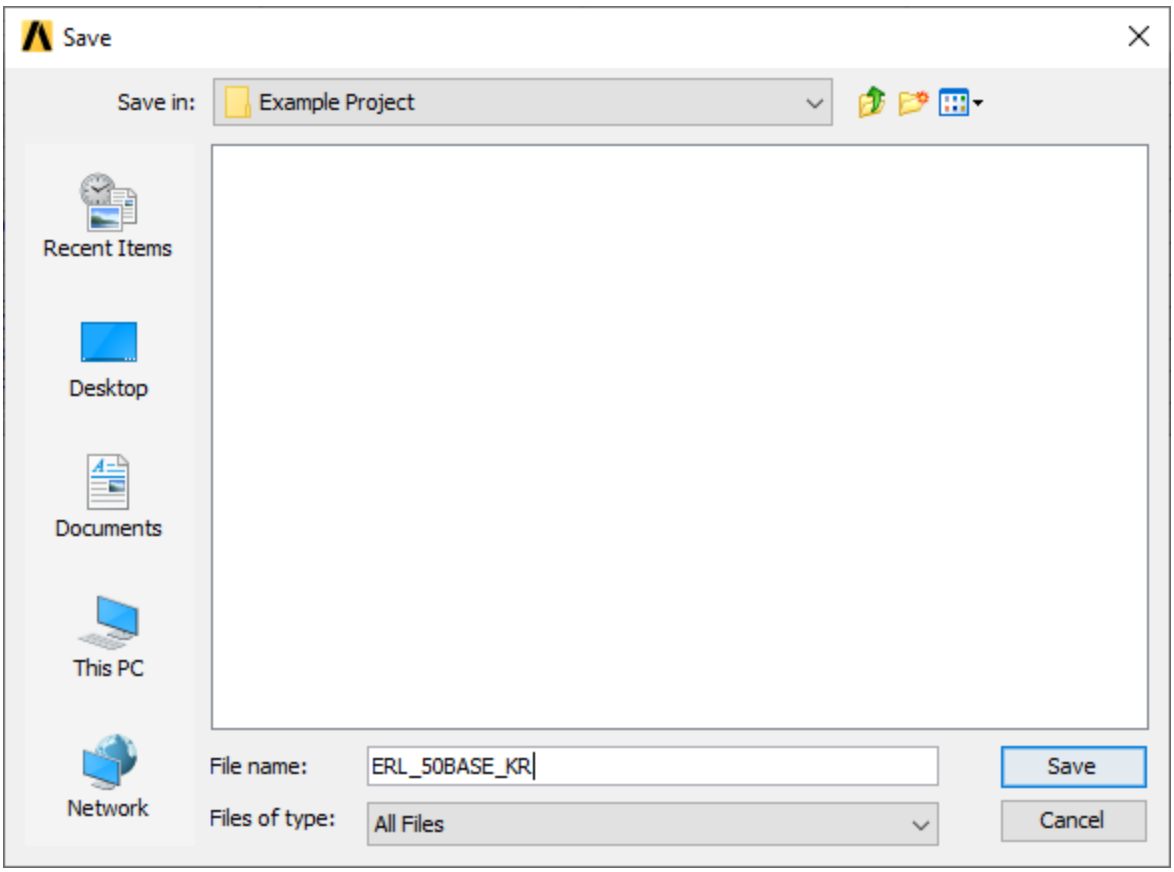
- Enter **1.0** in the **ERL_ONLY Value** field.
- Enter **0p** in the **FIXTURE_BUILTIN_DELAY Value** field.



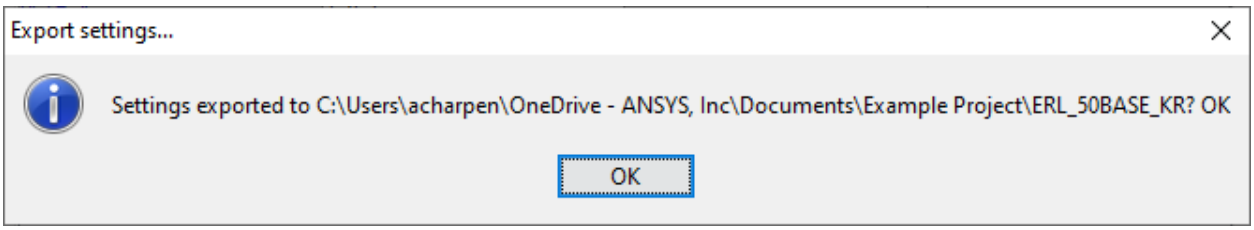
6. Click **Export...** to open an explorer window. Then do the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Navigate to an appropriate directory to save the configuration file (*.*cfg*).
- Enter an appropriate **File Name** (e.g., **ERL_50BASE_KR.cfg**).



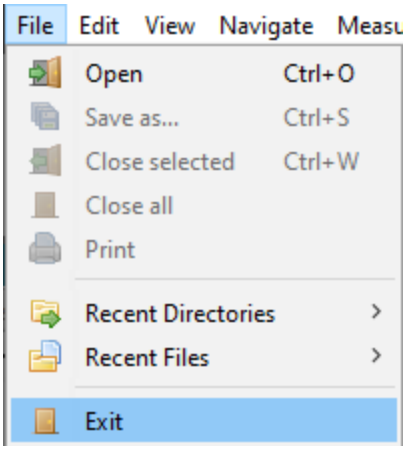
7. Click **Save** to close the explorer window and simultaneously open an **Export settings...** window.



8. Click **OK** to close the Export Settings window.
9. Click **Close** to close the **Config. and generate COM report...** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

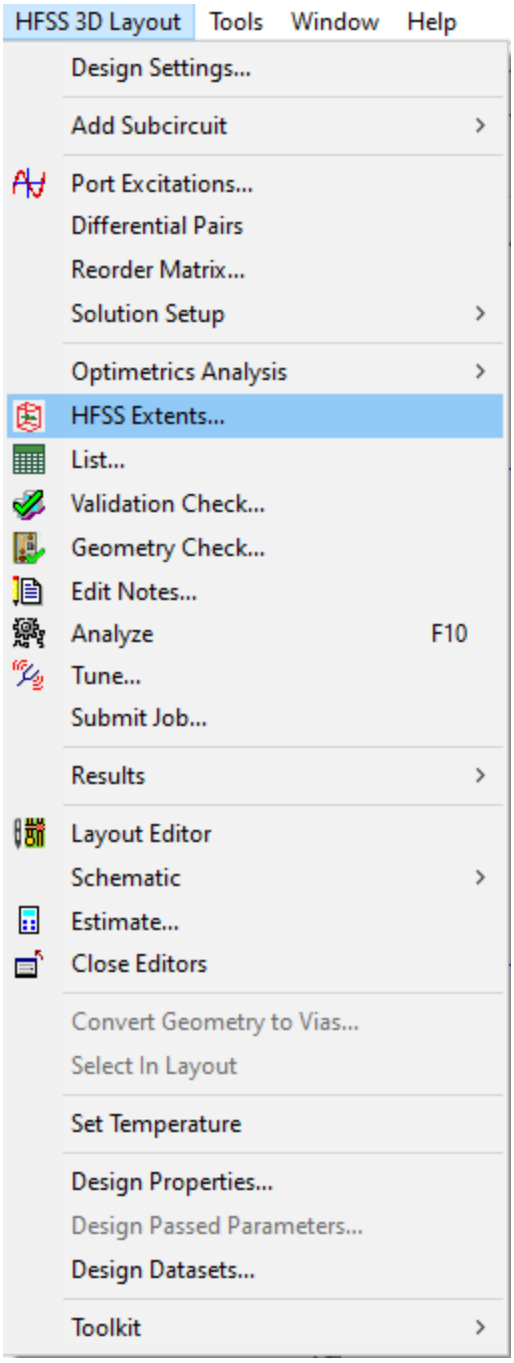
10. From **File**, select **Exit** to close **SPISim**.



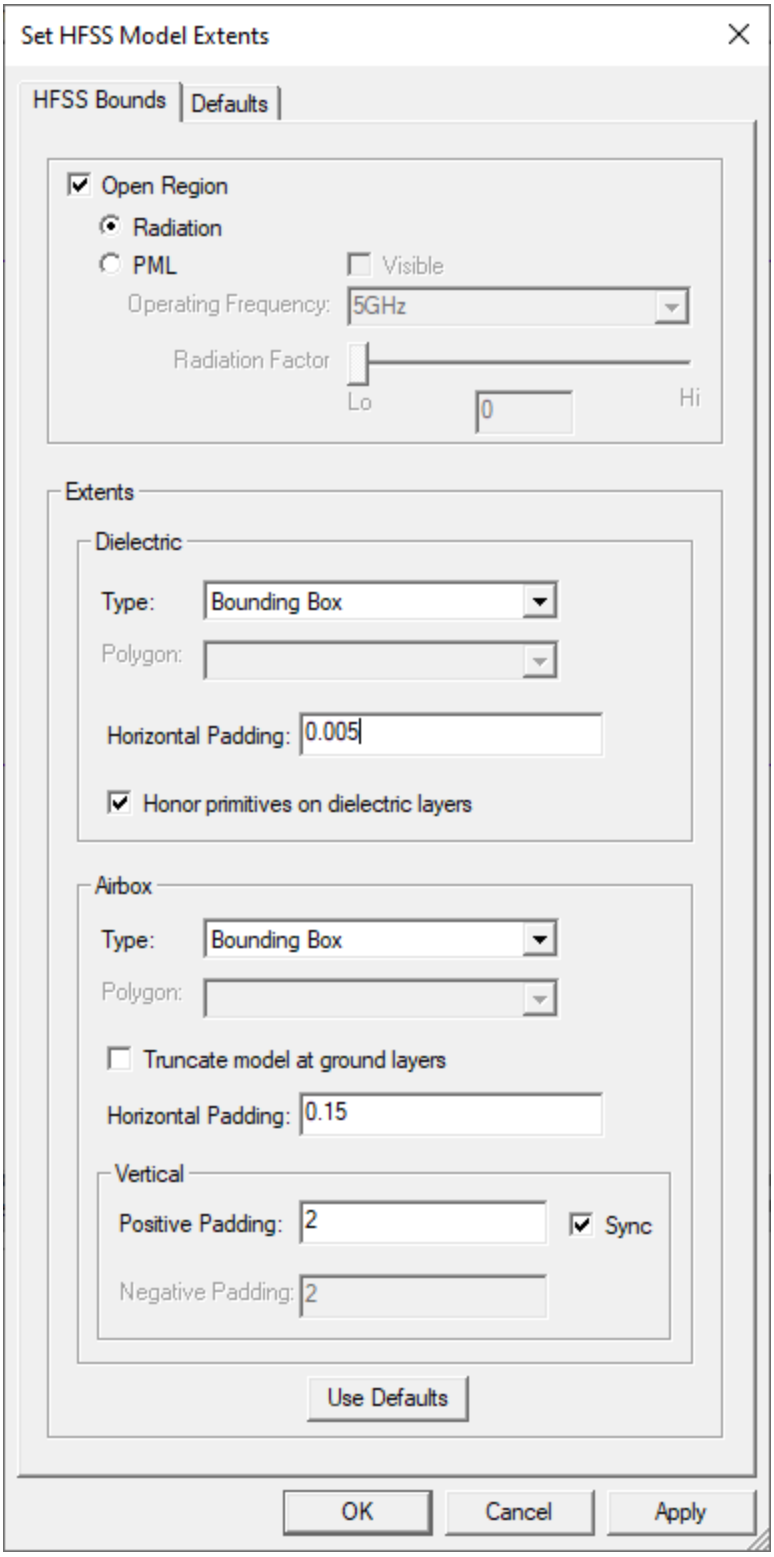
Set Up an HFSS Solution

1. From **Electronics Desktop**, select **HFSS 3D Layout** > **HFSS Extents...** to open the **Set HFSS Model Extents** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



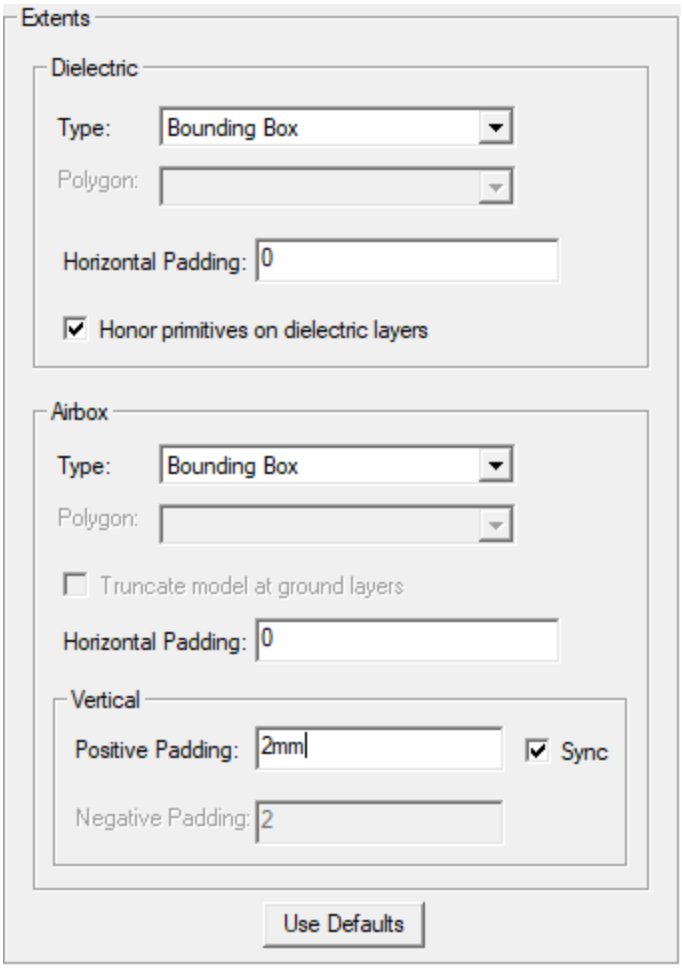
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Extents** group box, do the following:

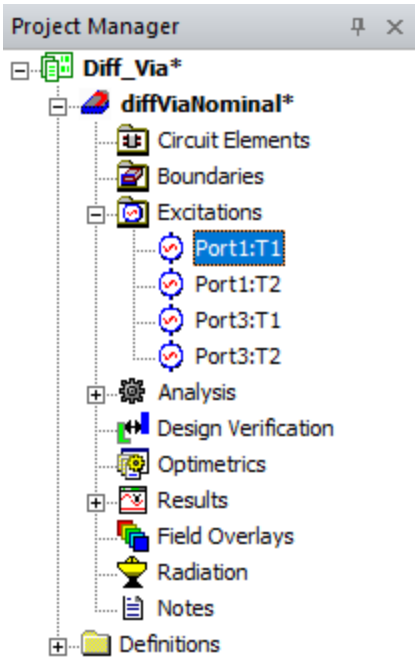
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- In the *Dielectric* subgroup, enter **0** in the **Horizontal Padding** field.
- In the *Airbox* subgroup, enter **0** in the **Horizontal Padding** field.
- In the *Airbox* subgroup, enter **2mm** in the **Positive Padding** field.

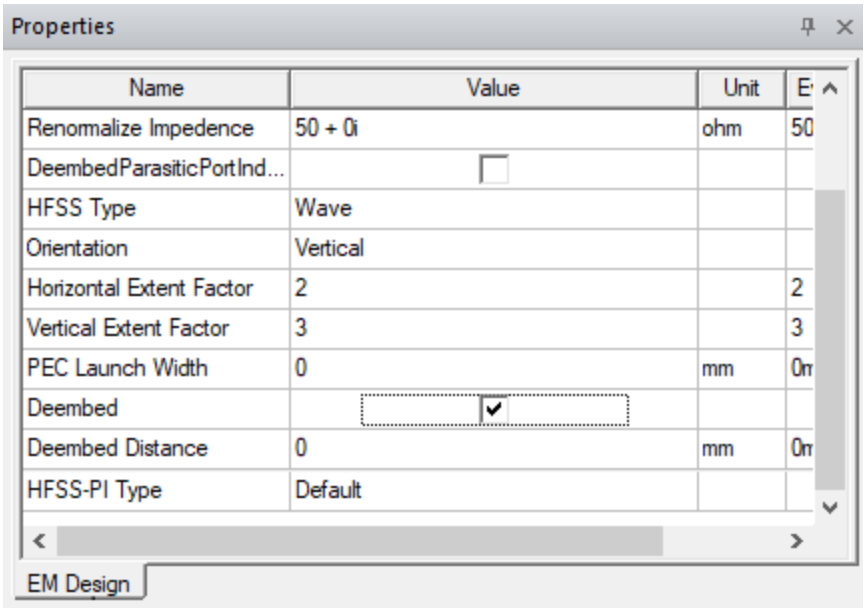


3. Click **Apply** to save the configuration. Then click **OK** to close the **Set HFSS Model Extents** window.
4. From the **Project Manager** window, expand the **Project Tree** > [*active design folder*] > **Excitations**. Then click **Port1:T1**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



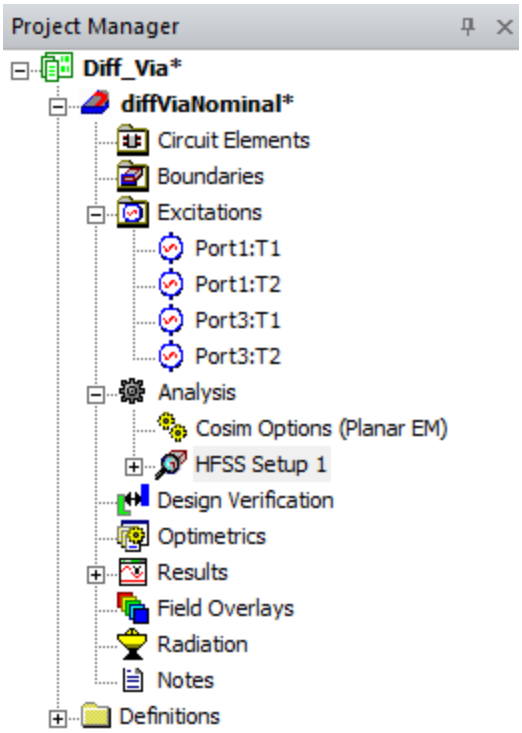
5. From the **Properties** window, type **0** in the **PEC Launch Width Value** field. Then press **Enter**.



6. Repeat steps **4-5** for **Port3:T1**.

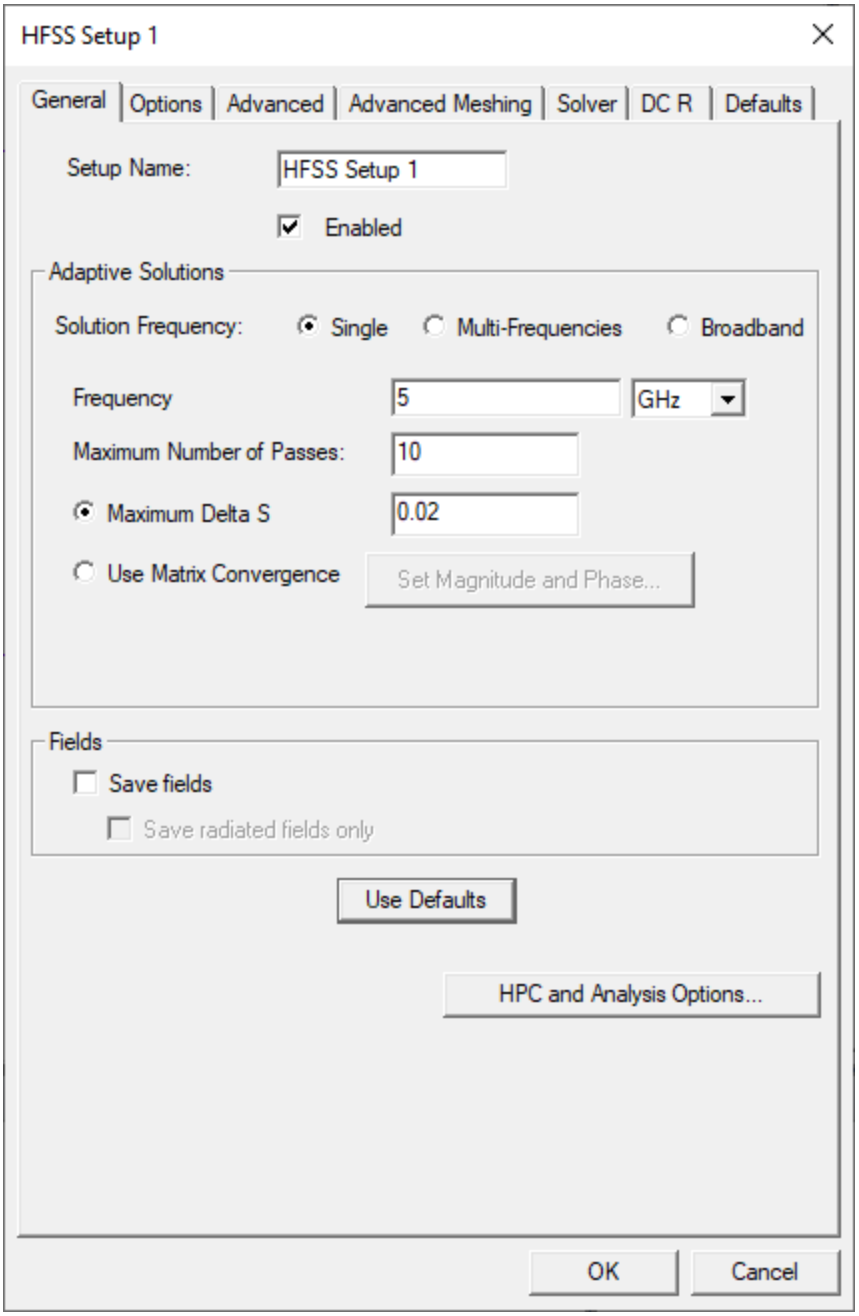
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. From the **Project Manager** window, expand **Analysis**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

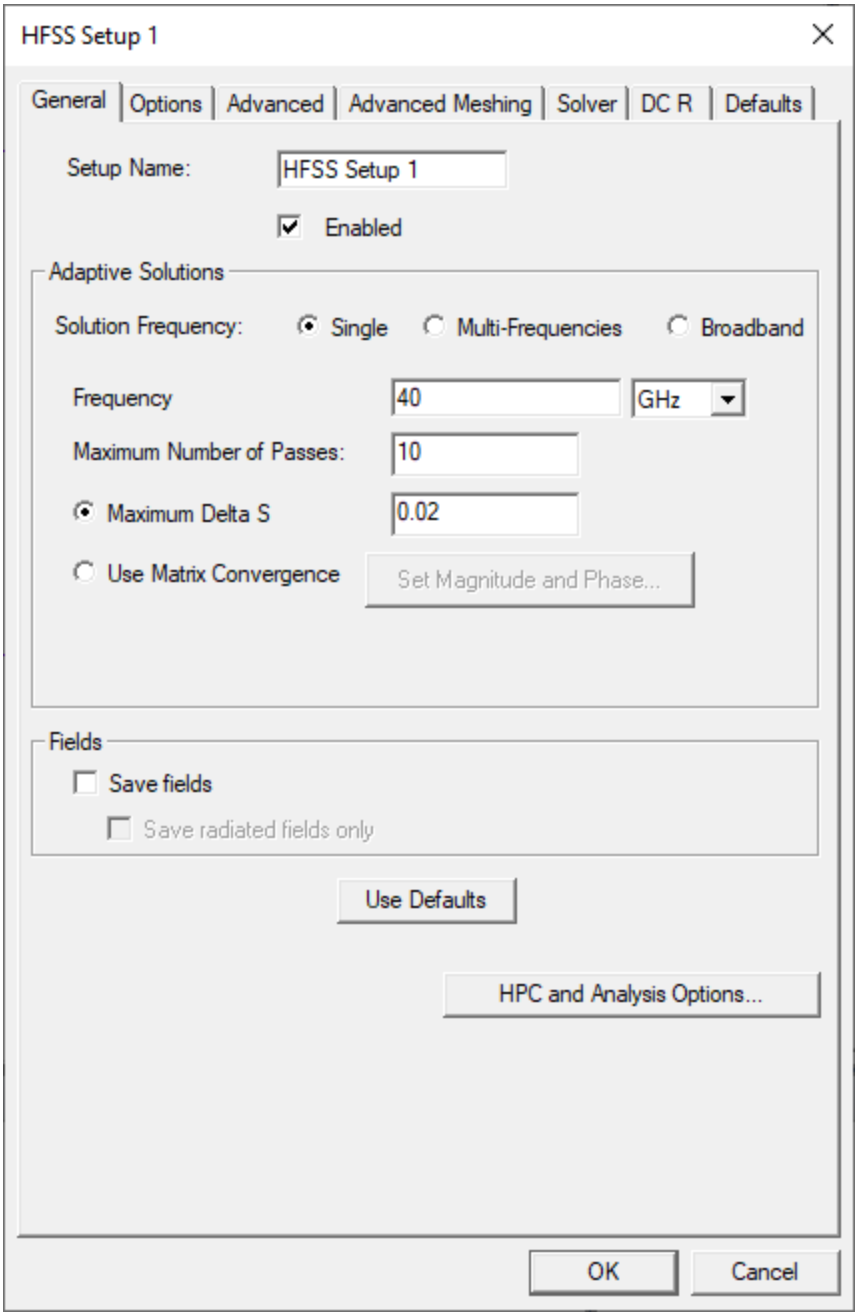
8. Double-click **HFSS Setup 1** to open the **HFSS Setup 1** window.



9. From the **HFSS Setup 1** window, make the following changes:

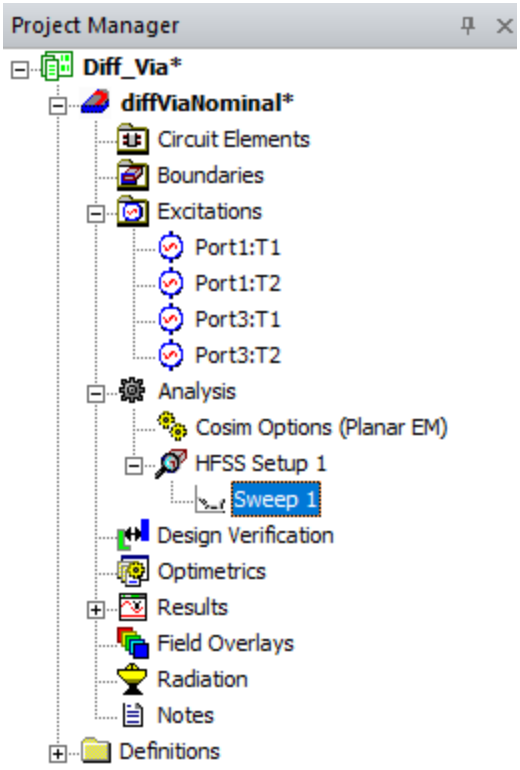
- From the **Adaptive Solutions** group box, enter **40** in the **Frequency** field.
- If necessary, enter **10** in the **Maximum Number of Passes** field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



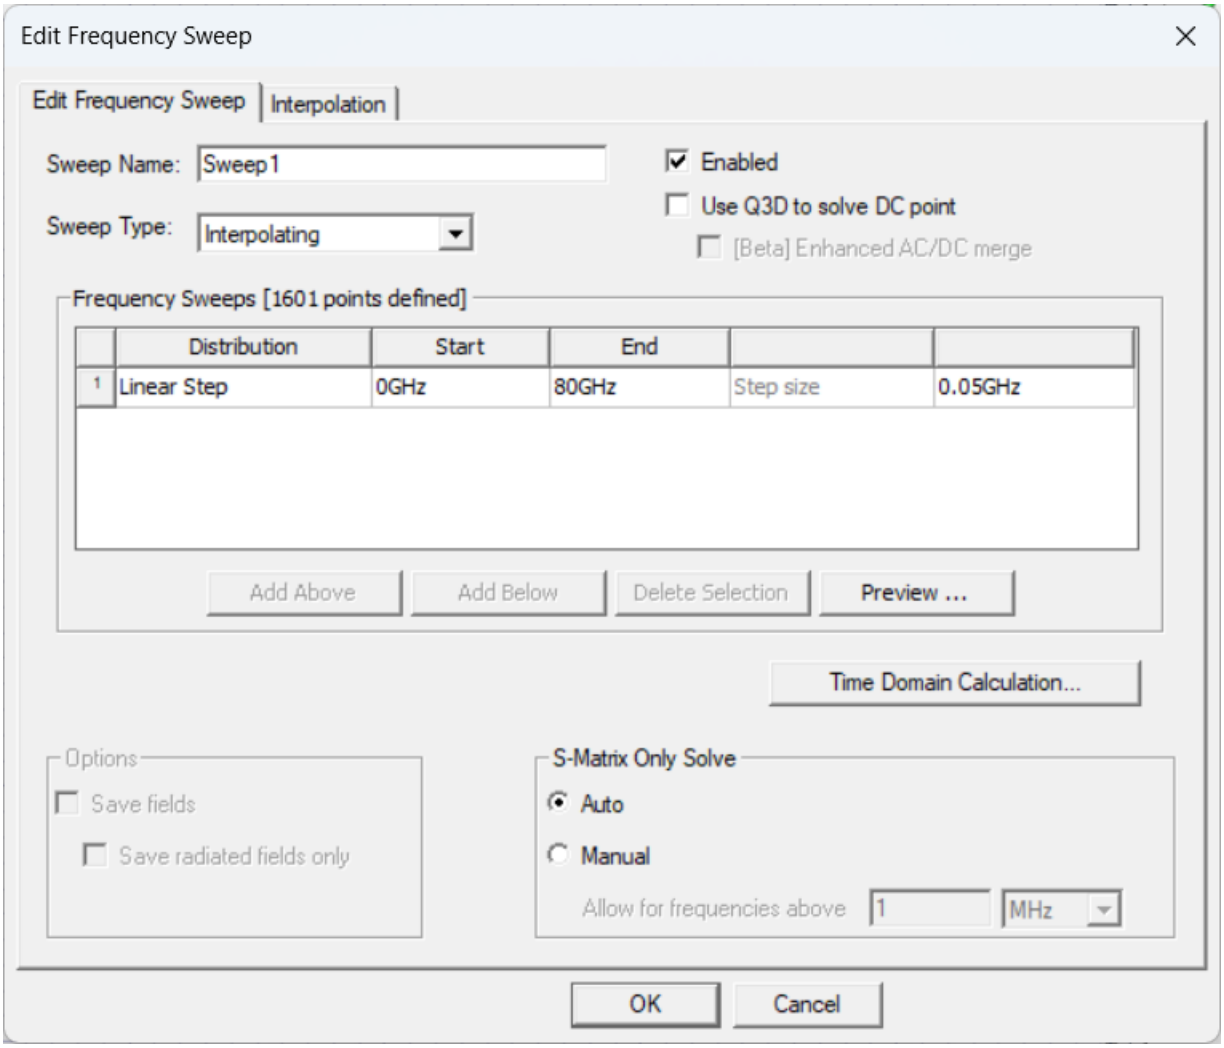
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

10. Click **OK** to close the **HFSS Setup 1** window.
11. From the **Project Manager** window, expand **HFSS Setup 1**.



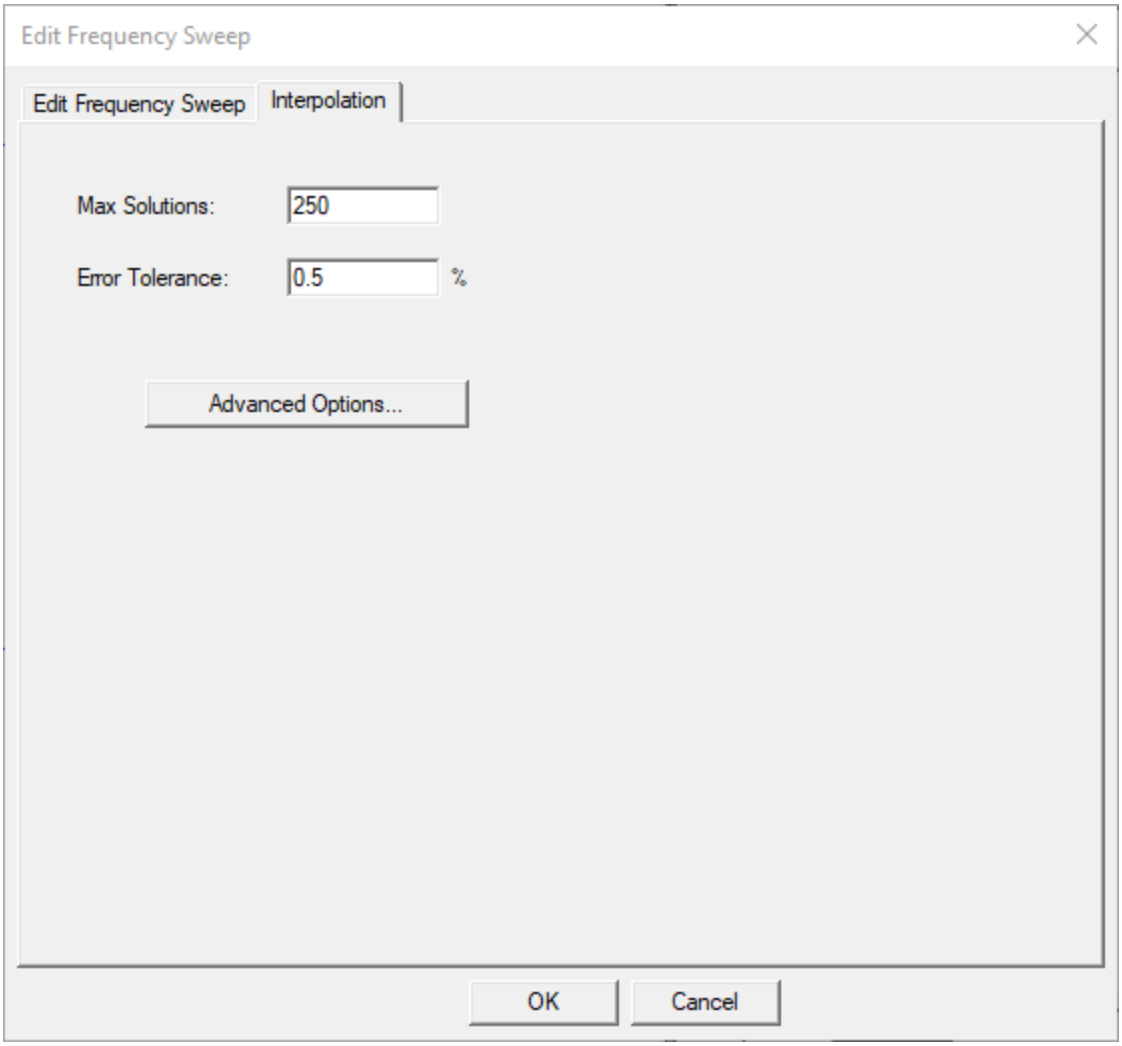
12. Double-click **Sweep 1** to open the **Edit Frequency Sweep** window. Then type **80GHz** in the **Frequency Sweeps** table > **Linear Step** > **End** column and press **Enter**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



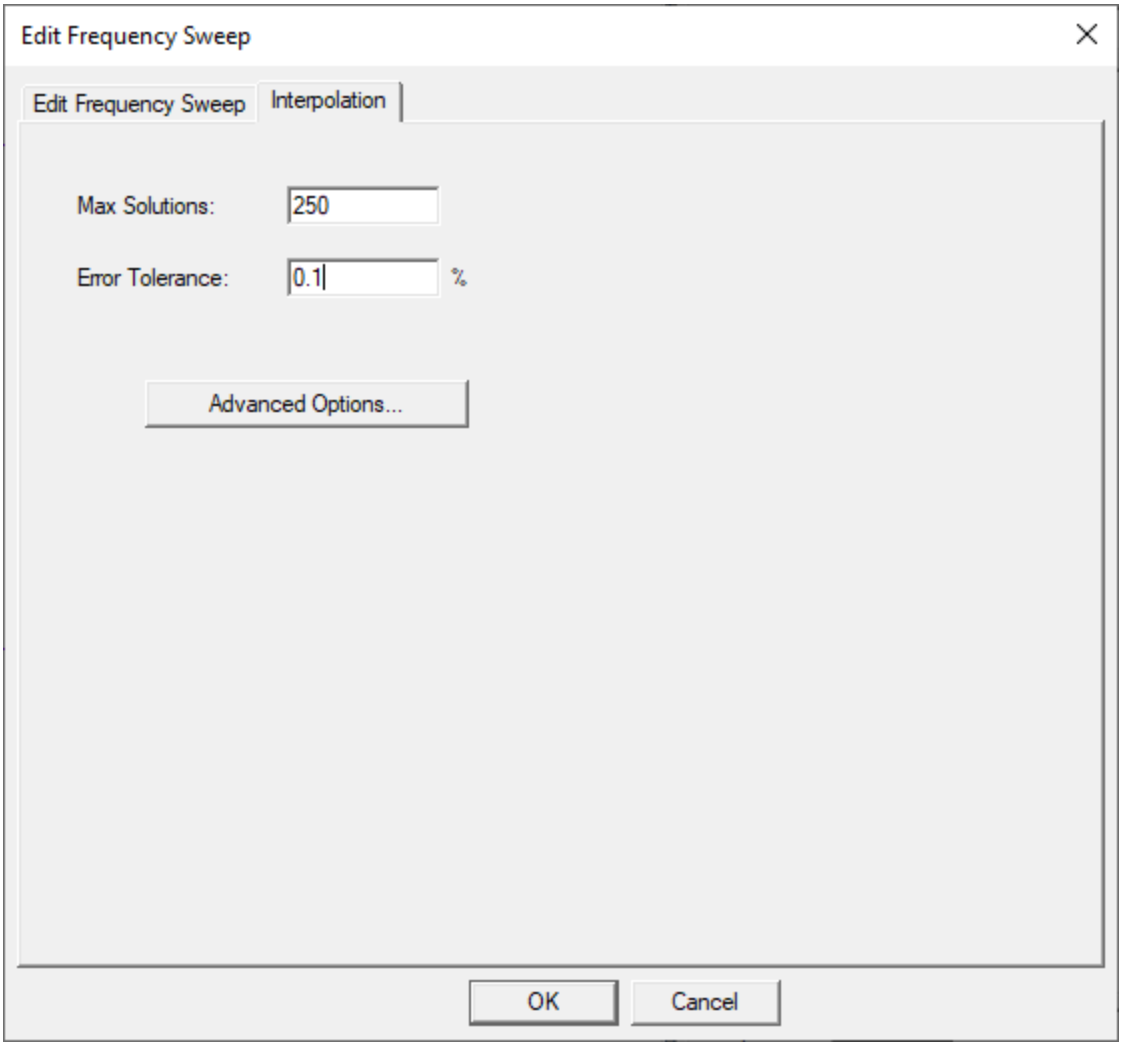
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

13. Navigate to the **Interpolation** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

14. Enter **0.1** in the **Error Tolerance** field.



15. Click **OK** to close the **Edit Frequency Sweep** window.

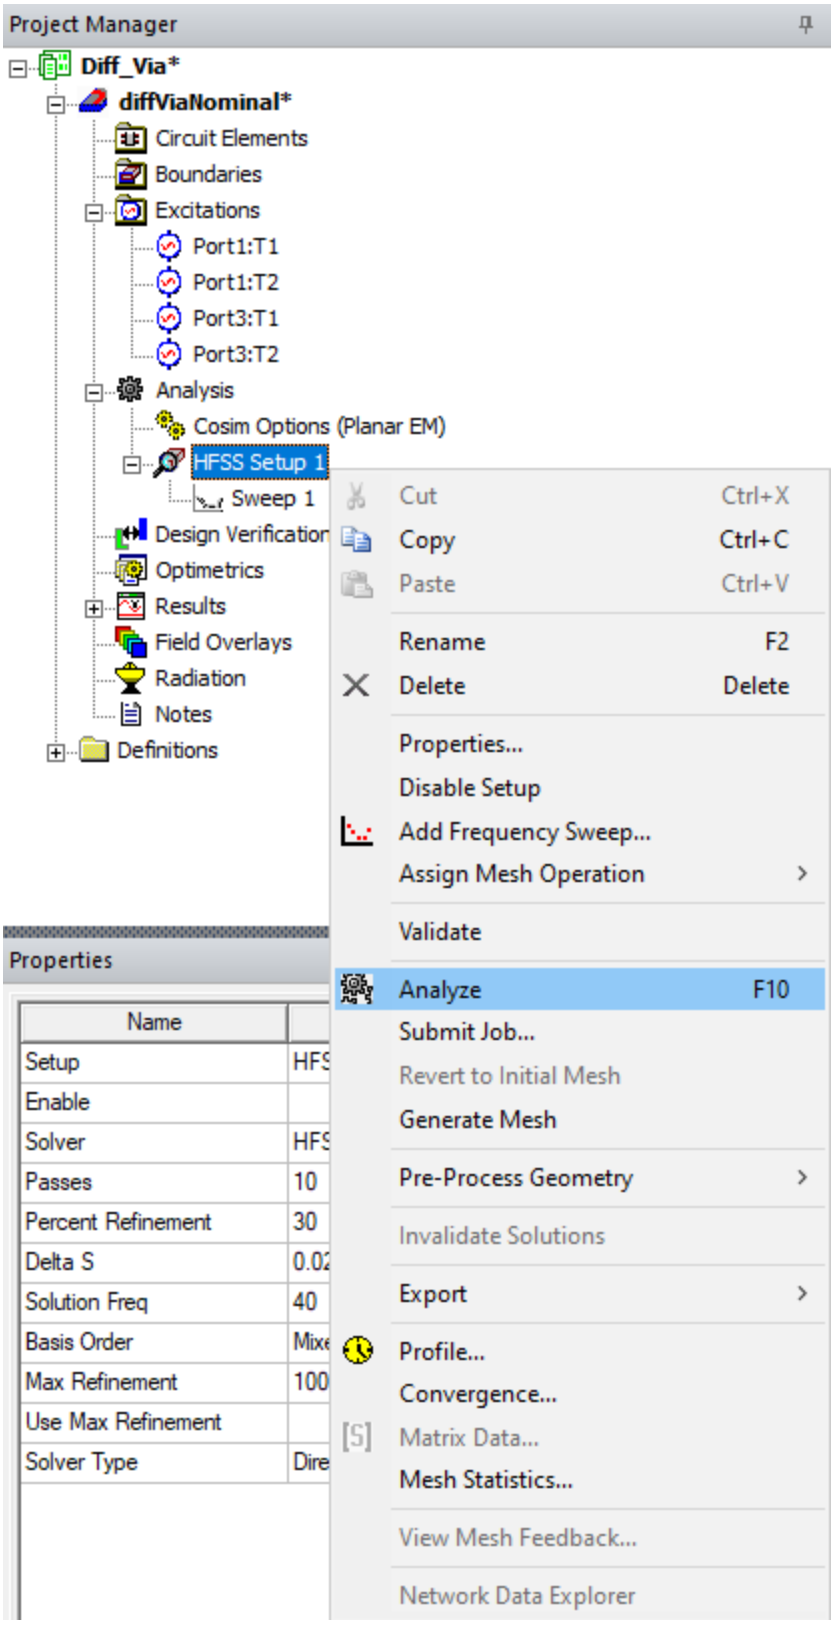
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Analyze the Solution, Then Create a Plot and Report

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

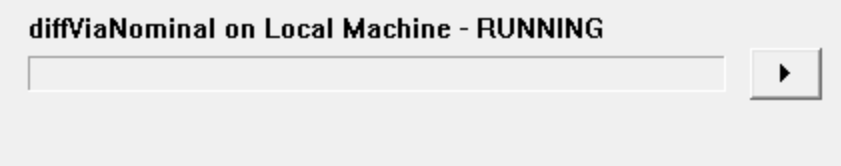
1. From the **Project Manager** window, right-click **HFSS Setup 1** and select **Analyze**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

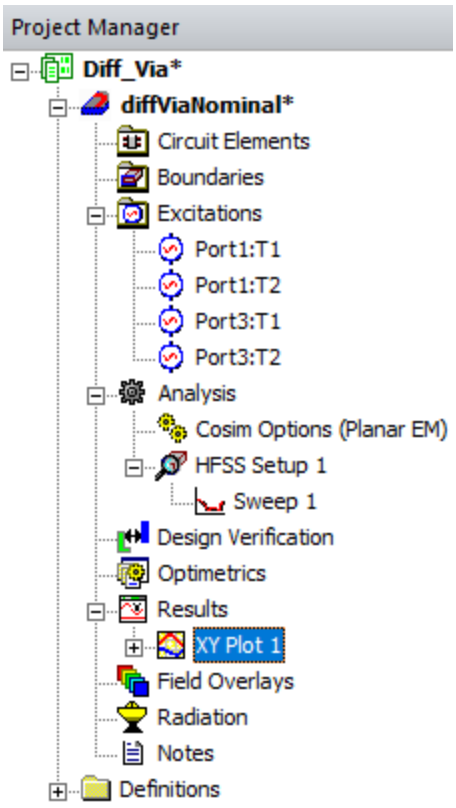


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Wait for the solution to complete.

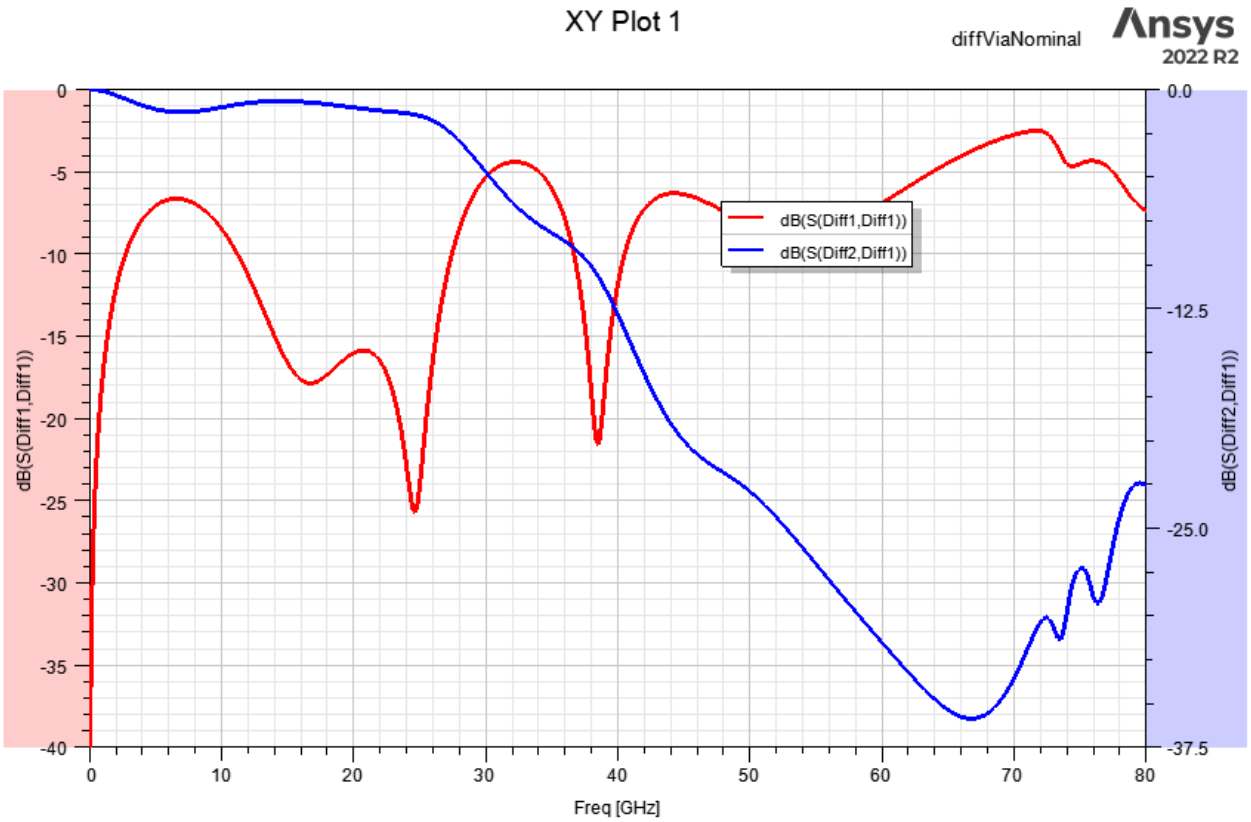


3. From the **Project Manager** window, expand **Results**.



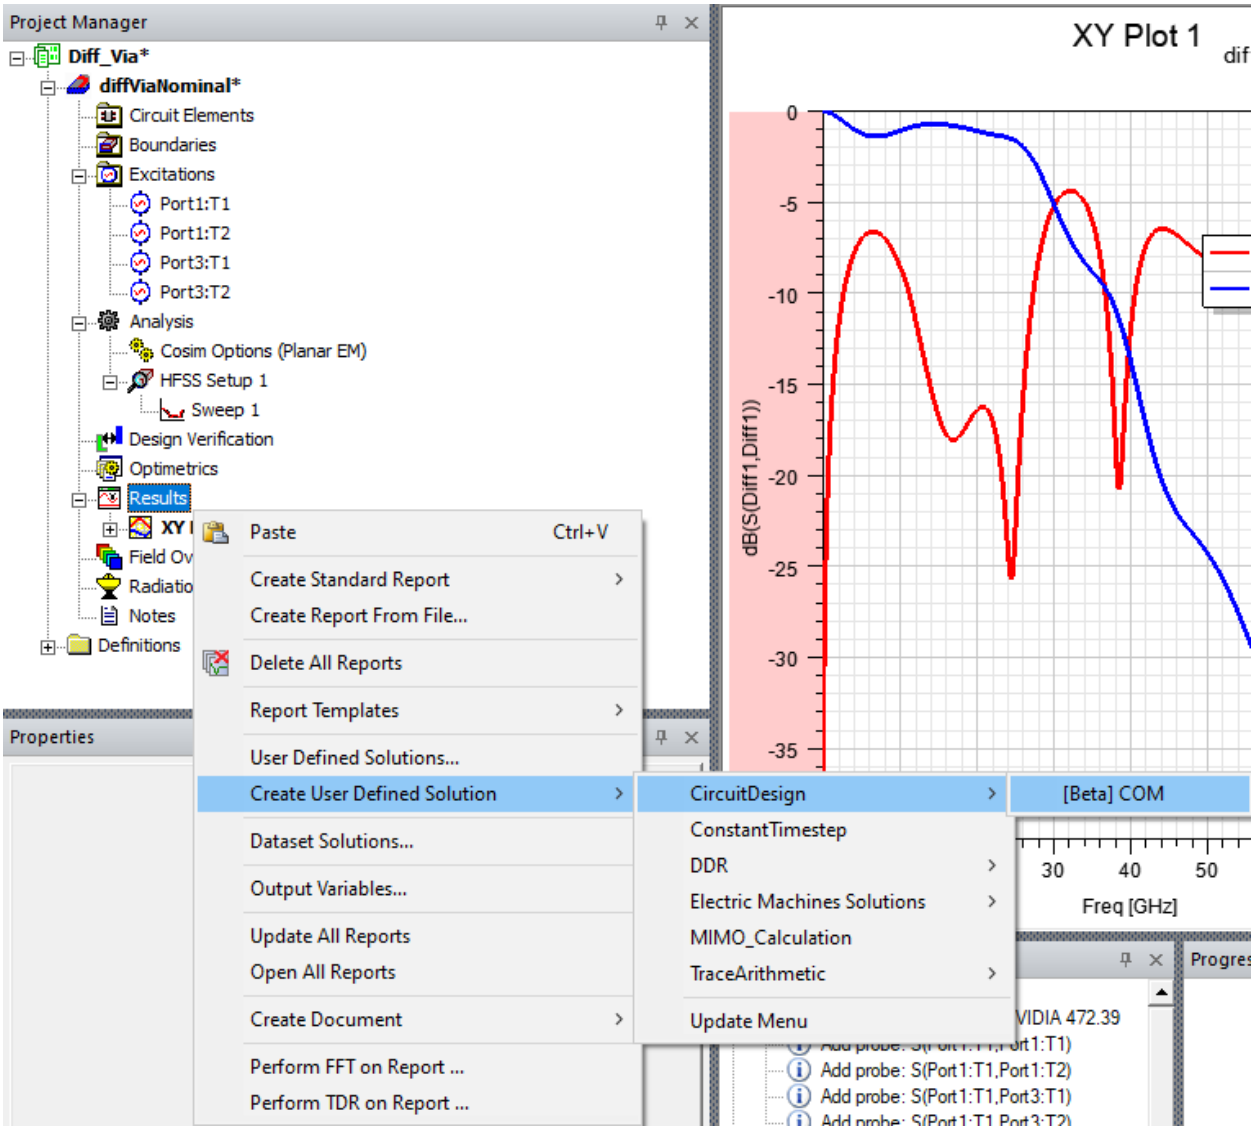
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Double-click **XY Plot 1** to view the differential insertion and return loss plot.

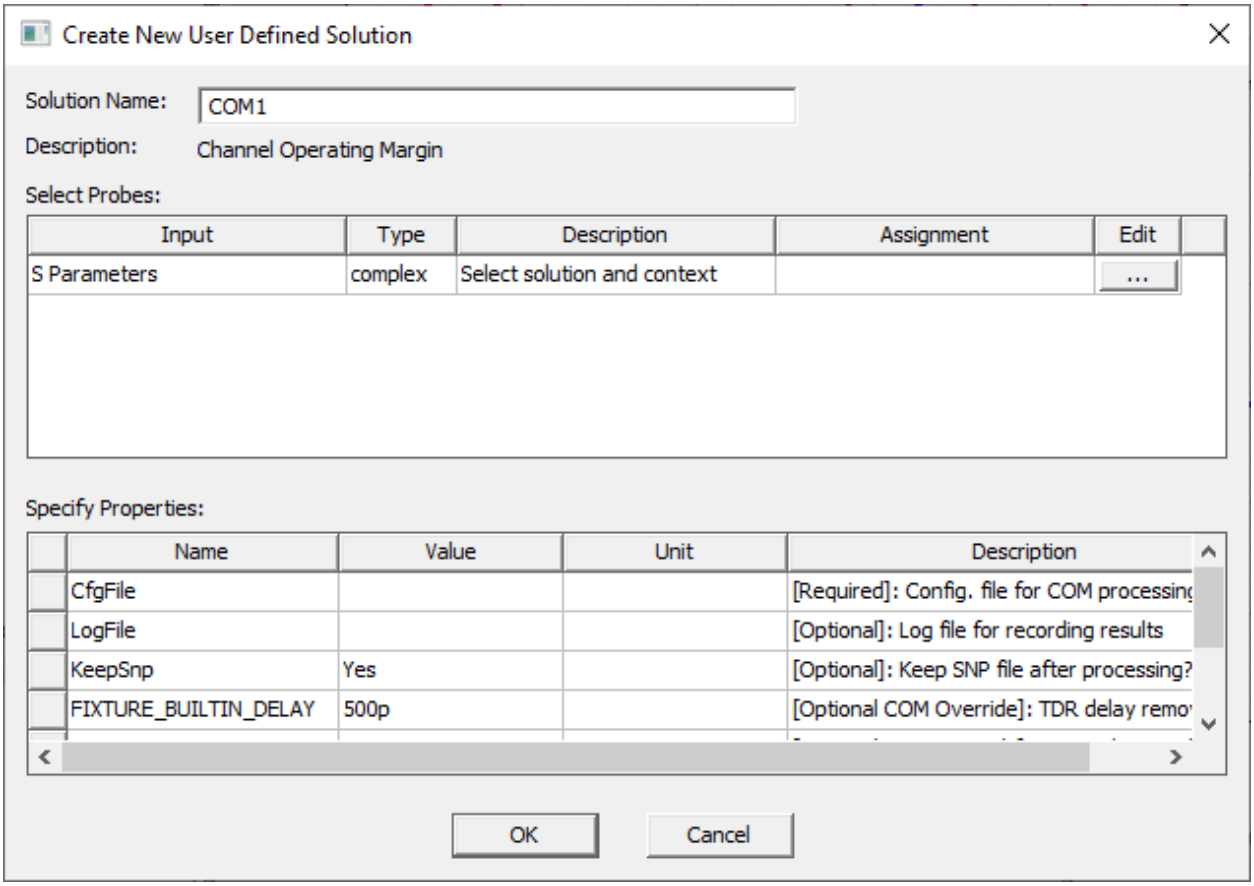


5. From the **Project Manager** window, right click **Results** and select **Create User-Defined Solution** > **CircuitDesign** > **[Beta] COM** to open the **Create New User-Defined Solution** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

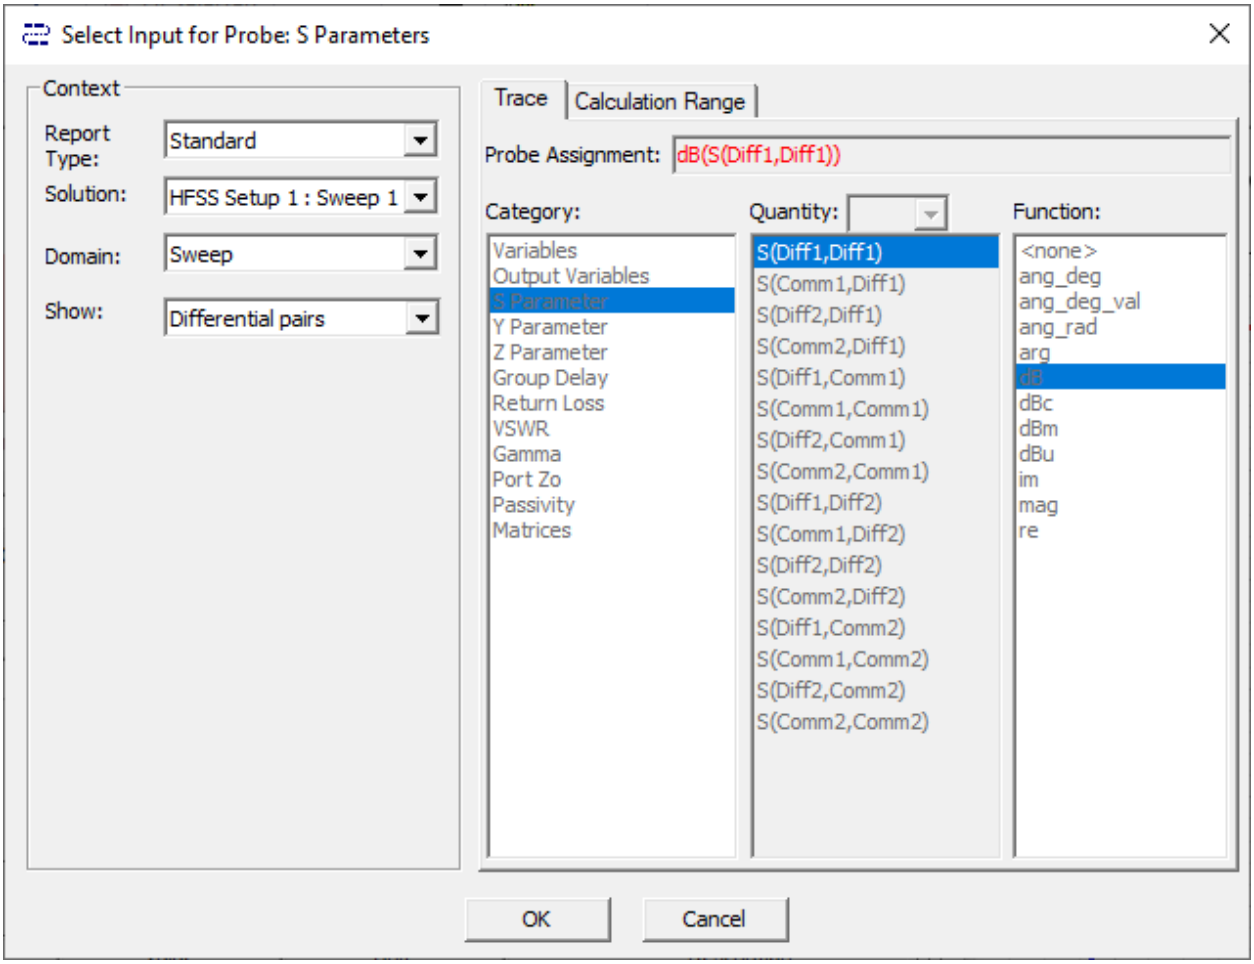


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



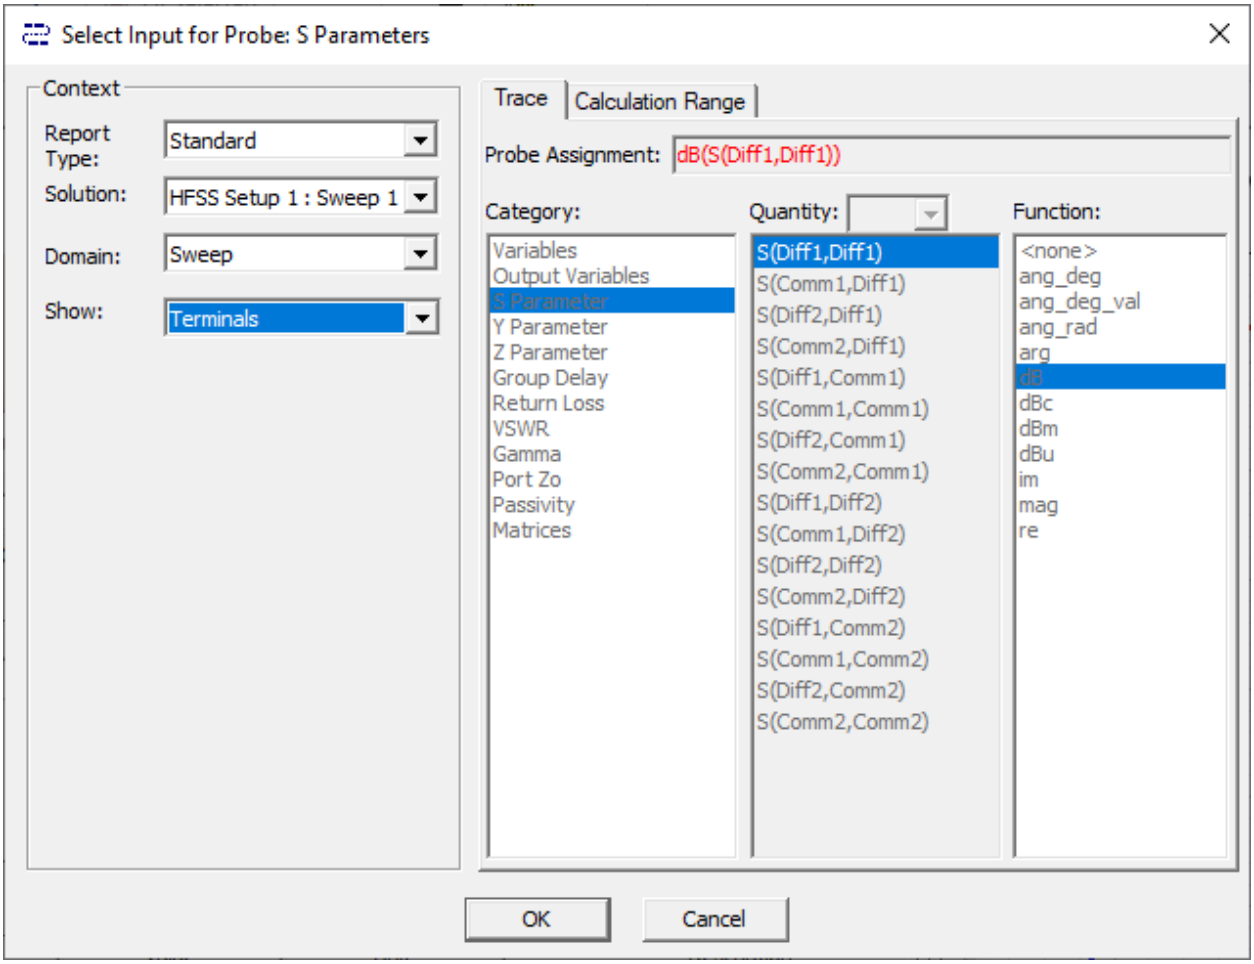
6. From the **Select Probes** table > **S-Parameters** row, click **...** to open the **Select Input for Probe** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



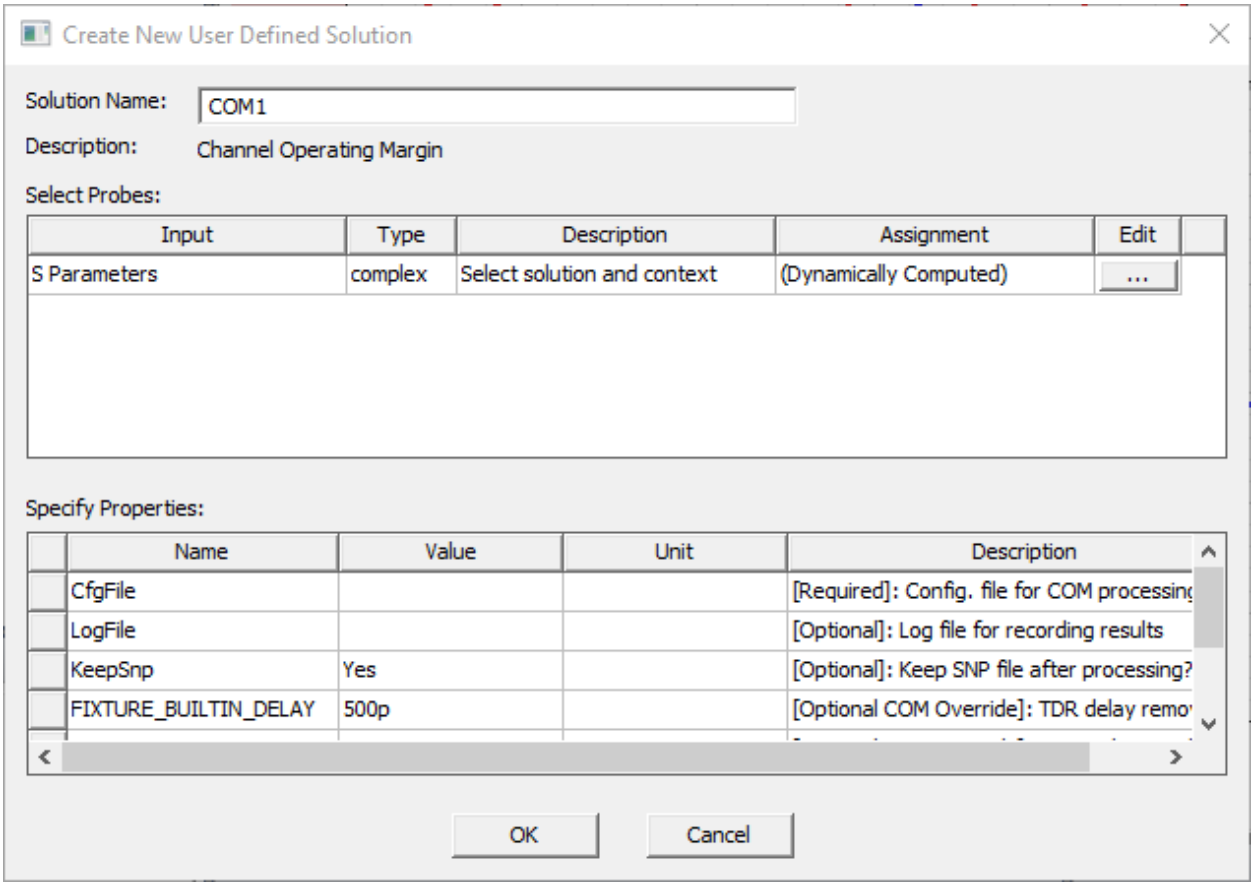
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. In the **Context** group box, select **Terminals** on the **Show** drop-down menu.



8. Click **OK** to close the **Select Input for Probe** window and return to the **Create New User-Defined Solution** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



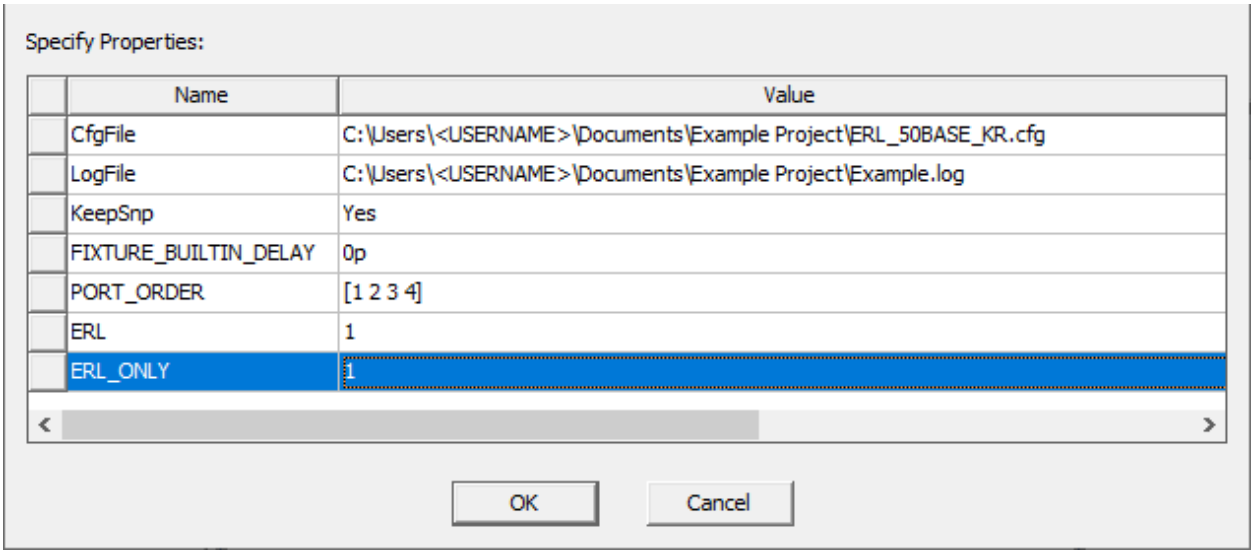
9. In the **Specify Properties** table, make the following changes.

- Enter the path to the configuration file exported in **"Create a Configuration File in SPISim" on page 16-273** (e.g., **C:\Users\<USERNAME>\Documents\Example Project\ERL_50BASE_KR.cfg**) in the **CfgFile Value** field.

> **Note:** The path can include spaces but can **not** include commas or other punctuation.

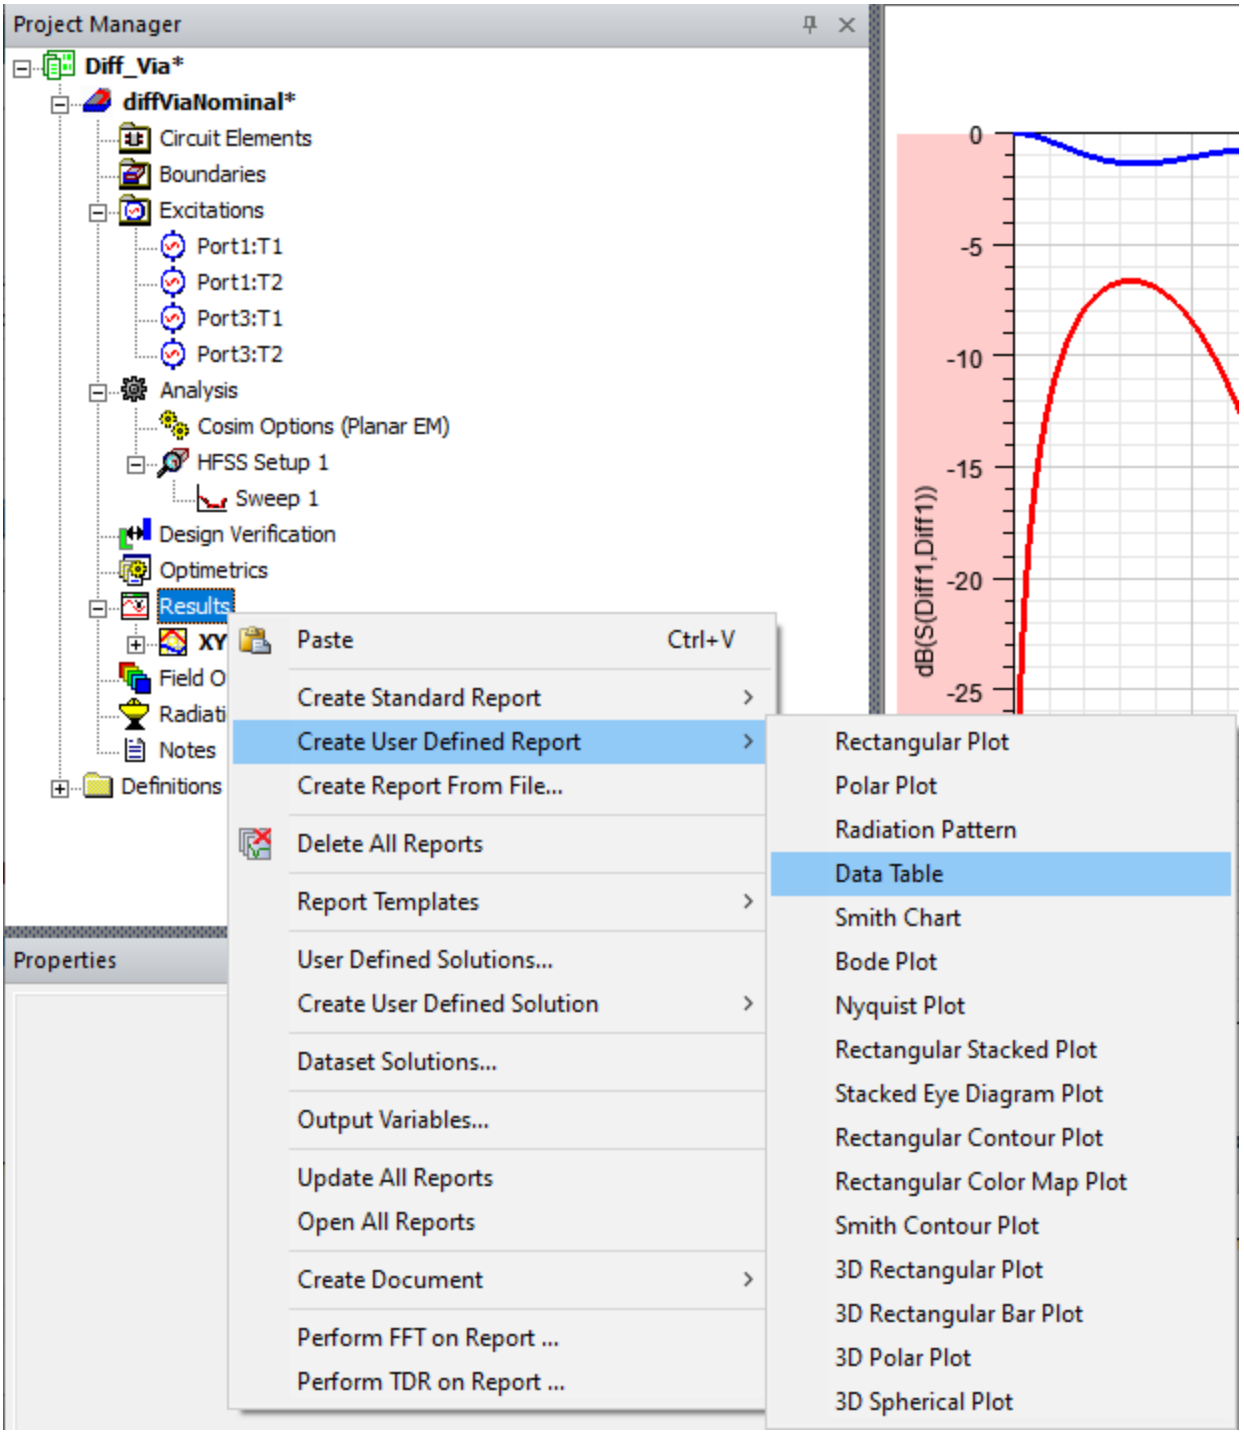
- If appropriate, enter the path to a log file in the **LogFile Value** field (e.g., **C:\Users\<USERNAME>\Documents\Example Project\Example.log**).
- Enter **0p** in the **FIXTURE_BUILTIN_DELAY Value** field.
- Select **[1 2 3 4]** on the drop-down menu in the **PORT_ORDER Value** field.
- Select **1** on the drop-down menu in the **ERL Value** field.
- Select **1** on the drop-down menu in the **ERL_ONLY Value** field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

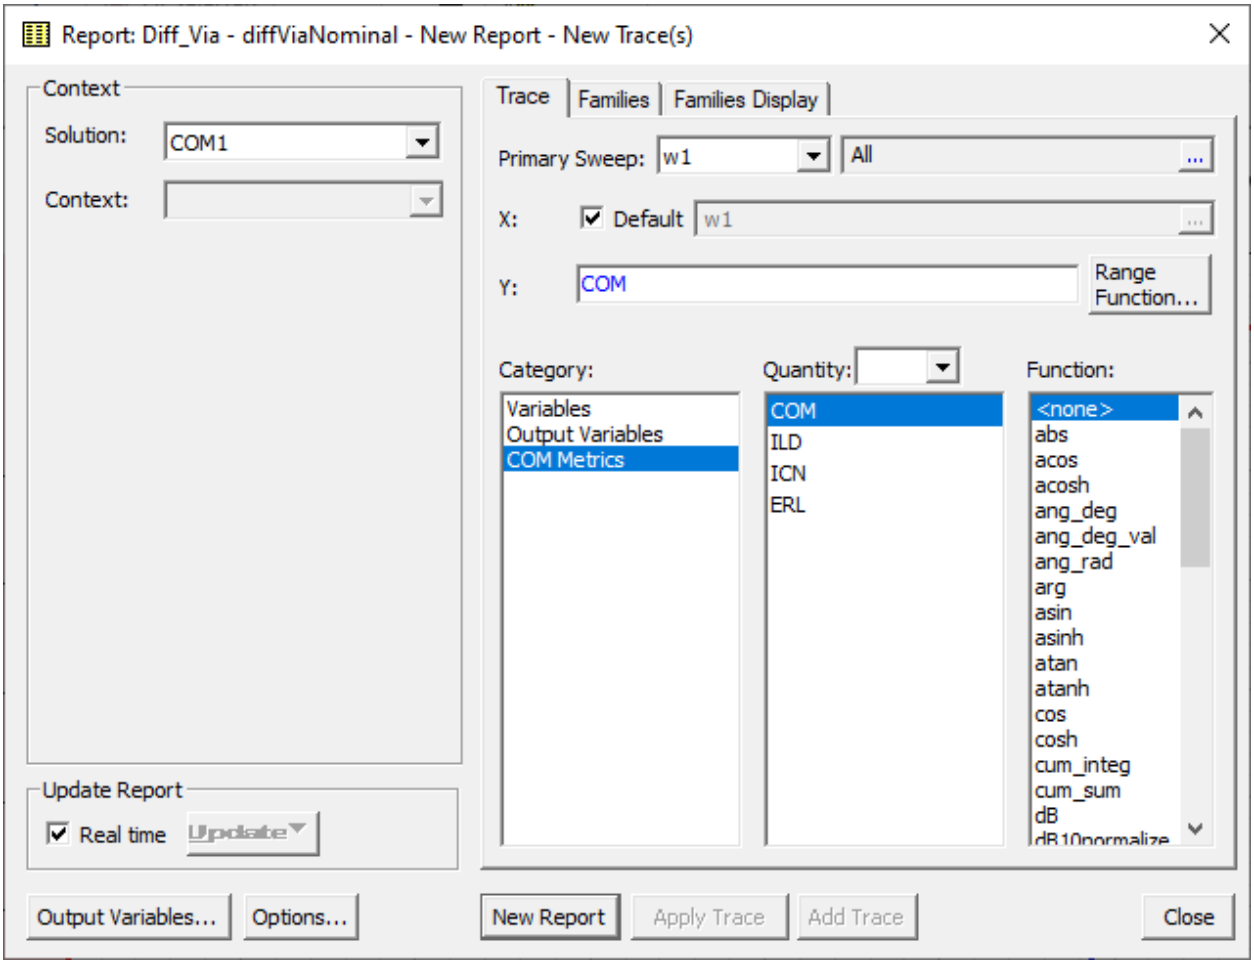


10. Click **OK** to close the **Create New User-Defined Solution** window.
11. From the **Project Manager** window, right-click **Results** and select **Create User-Defined Report** > **Data Table** to open the **Report** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

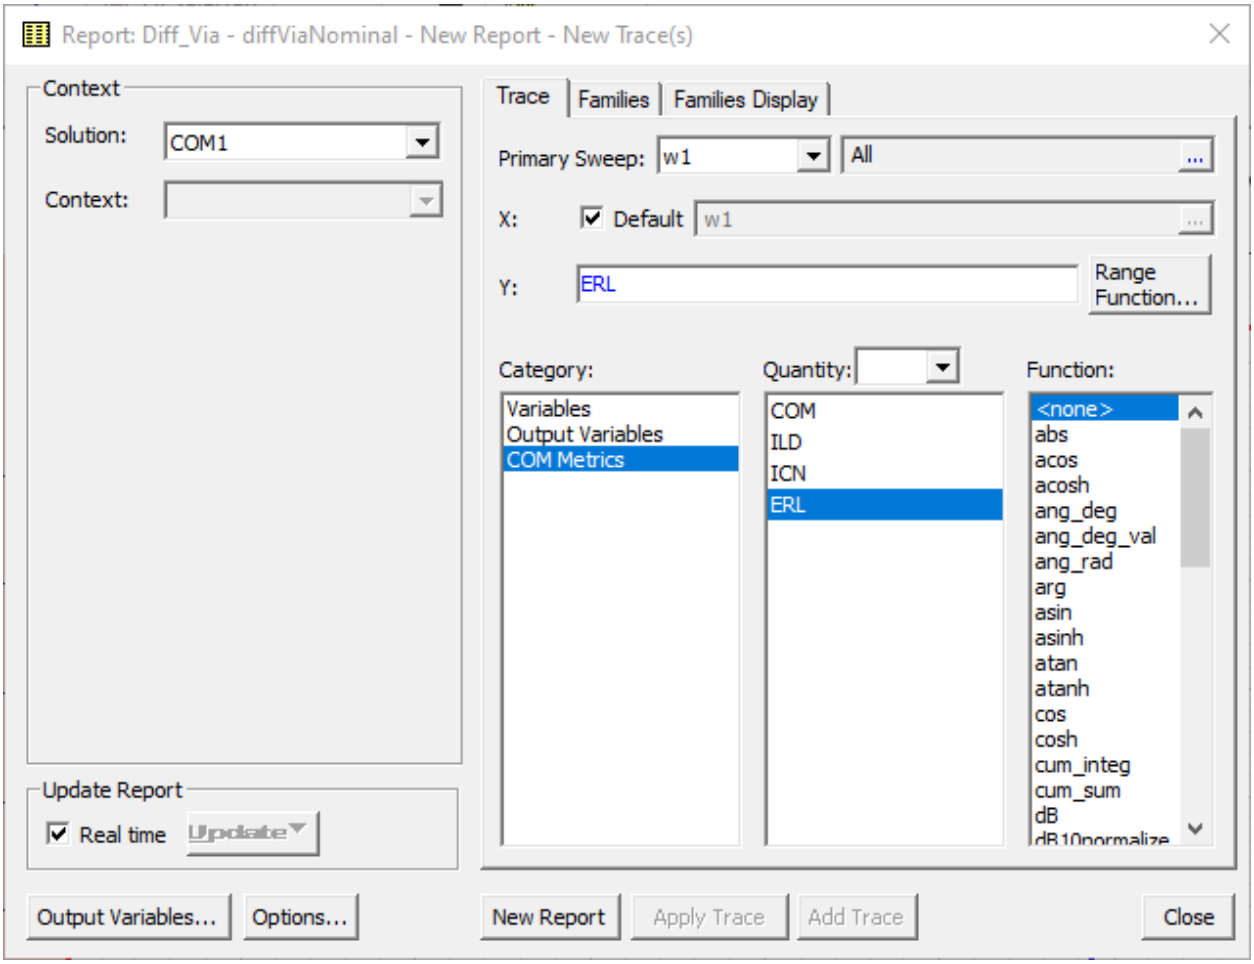


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

12. From the **Report** window, select **ERL** on the **Quantity** list.



13. Click **New Report** to begin the ERL calculation. The **Close** button will be temporarily unavailable until ERL calculation is complete.

14. Click **Close** to close the **Report** window and view the **Data Table 1** report. The report is accessible from **Electronics Desktop View** tab and from expanding the **Project Manager** window > **Data Table 1**.

	w1 [um]	ERL COM1
1	199.500000	27.013300

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

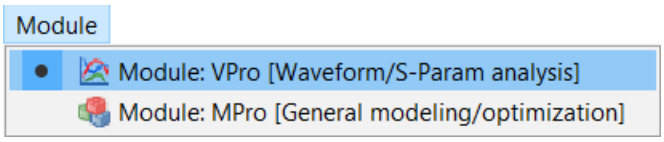
The procedure is complete.

Calculating Integrated Crosstalk Noise

> **Note: NEW in 23.2 Release:** calculation method **PCIe5 ccICN** added. This option enables calculating ccICN for given s-param files according to PCIe5 spec, (see step 5).

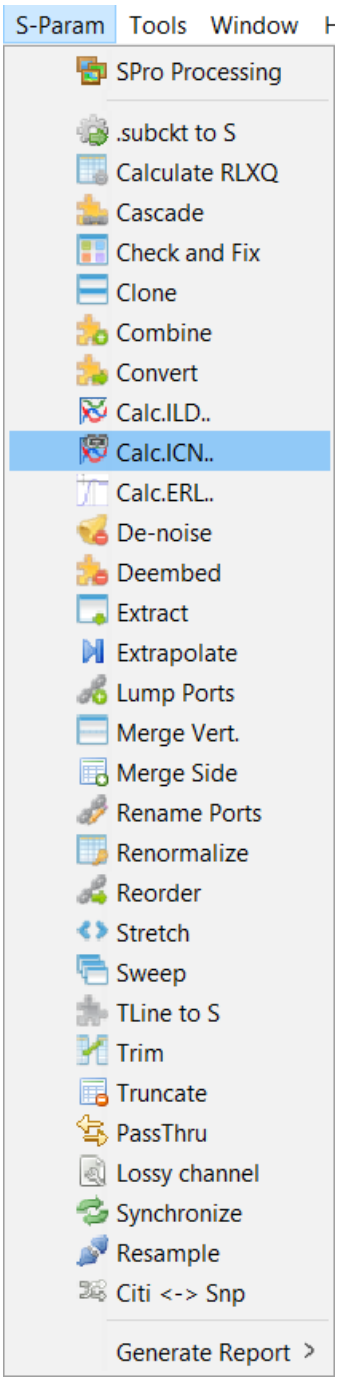
To launch the Calc. ICN window:

1. Select **Module: VPro [Waveform/ S-Param analysis]** from the **Module** menu.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the S. Param menu, select Calc. ICN.

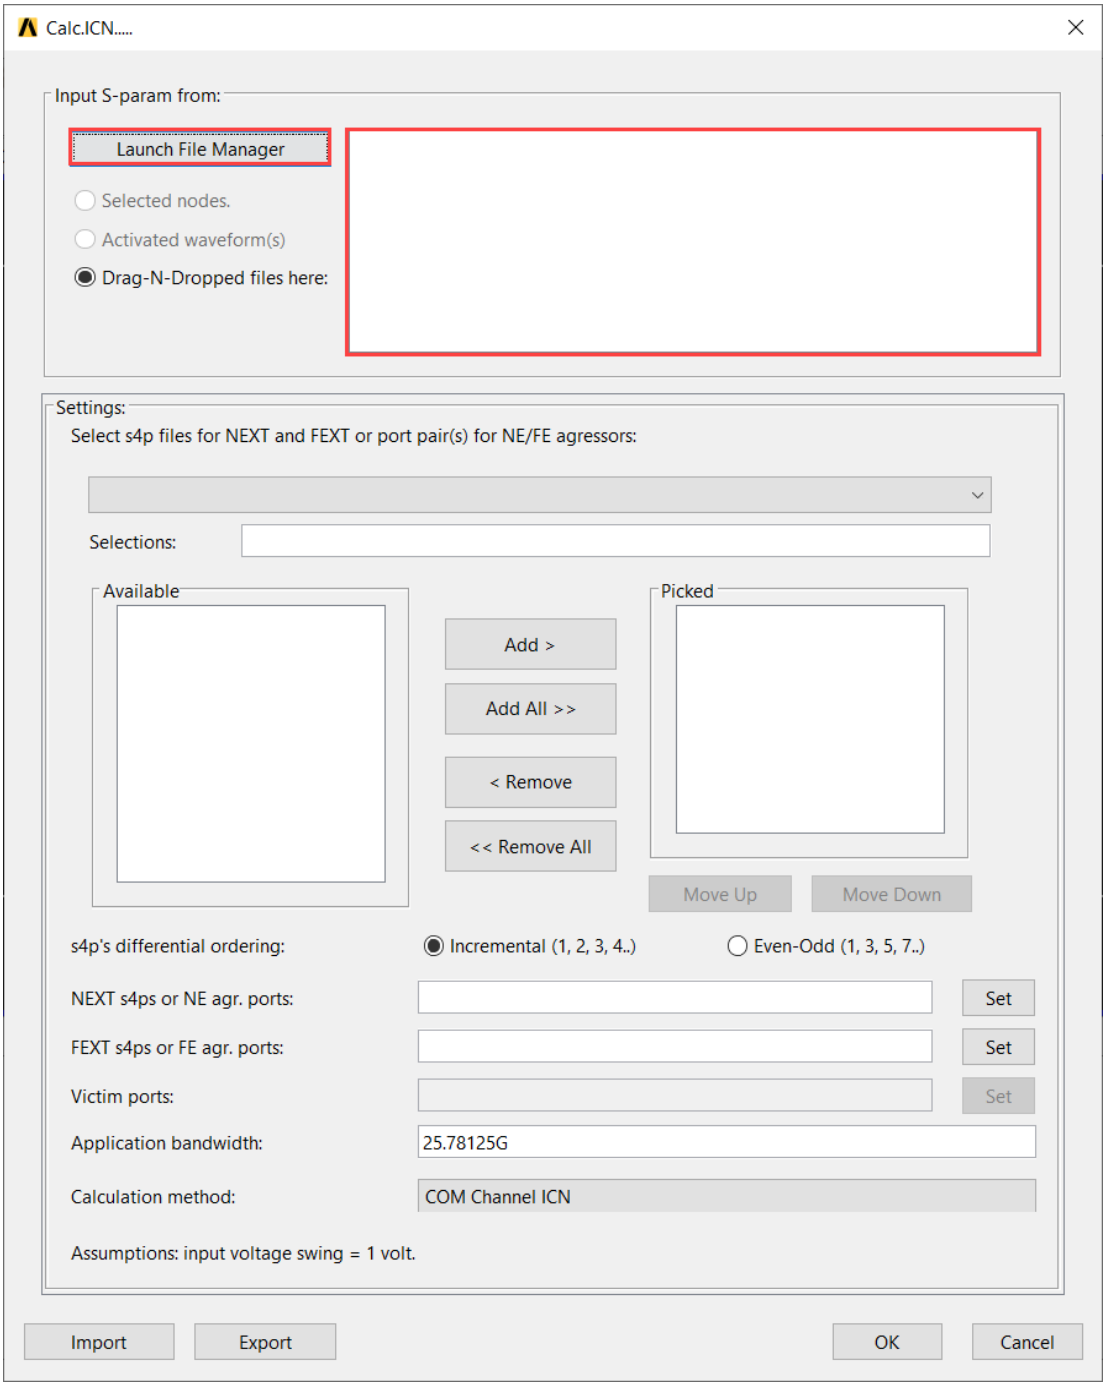


To use the Calc. ICN feature:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Choose the S. parameter files by selecting **Launch File Manage**r or by dragging and dropping the files into the box.

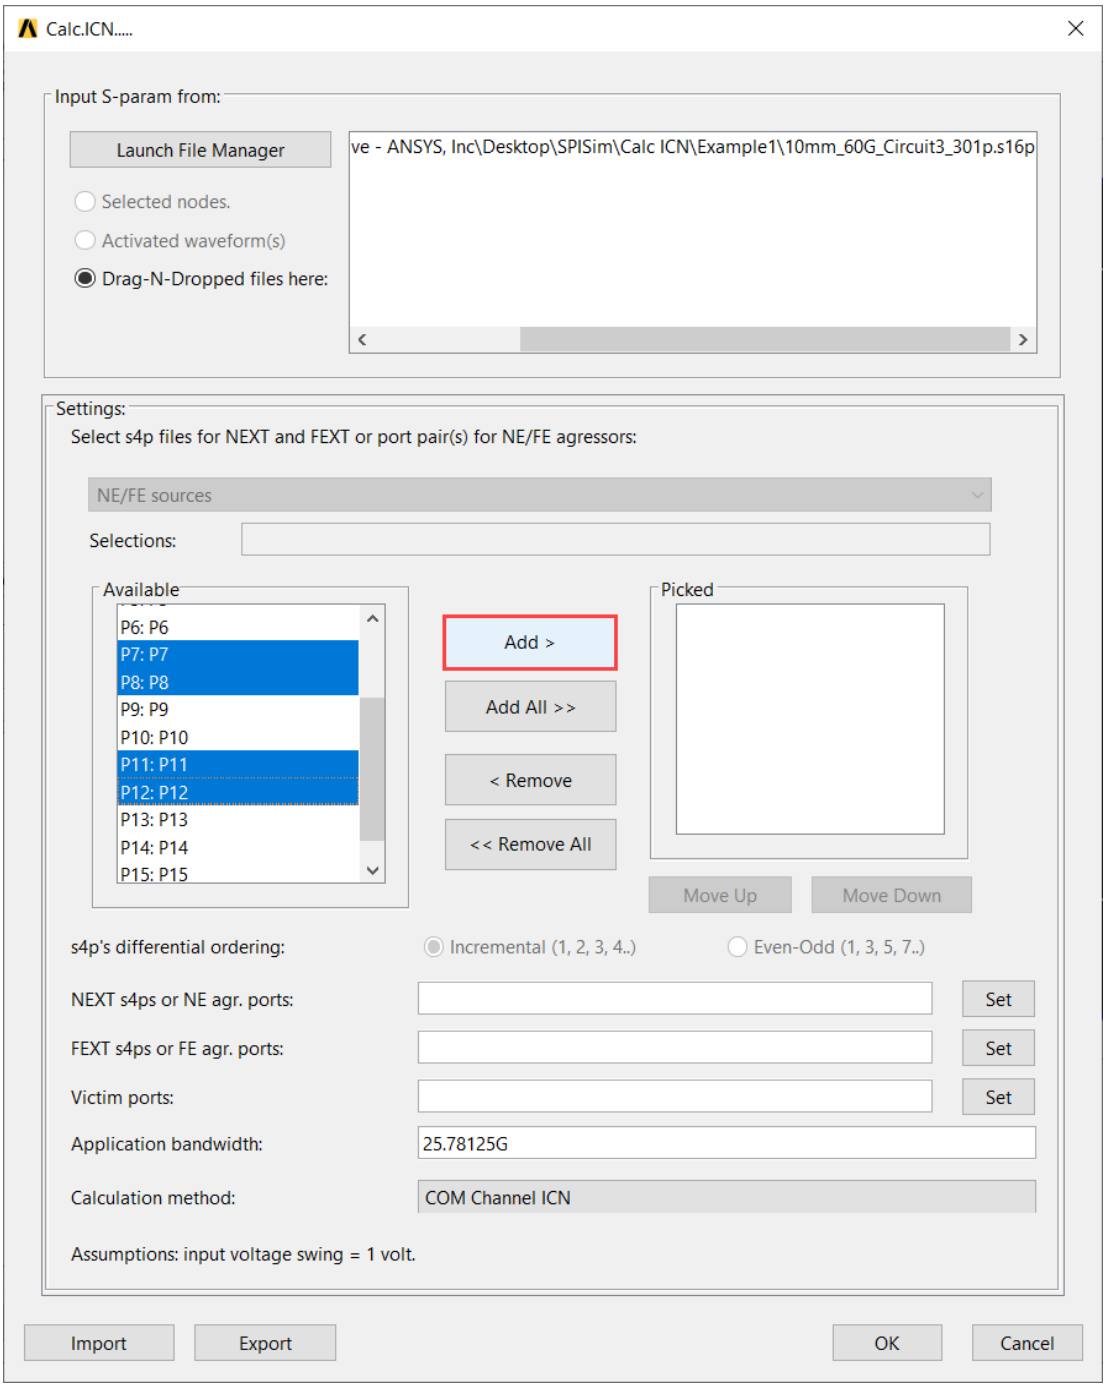
   The **Available** group box will be populated with the selected files.



2. Select **NEXT s4ps or NE agr. ports**:

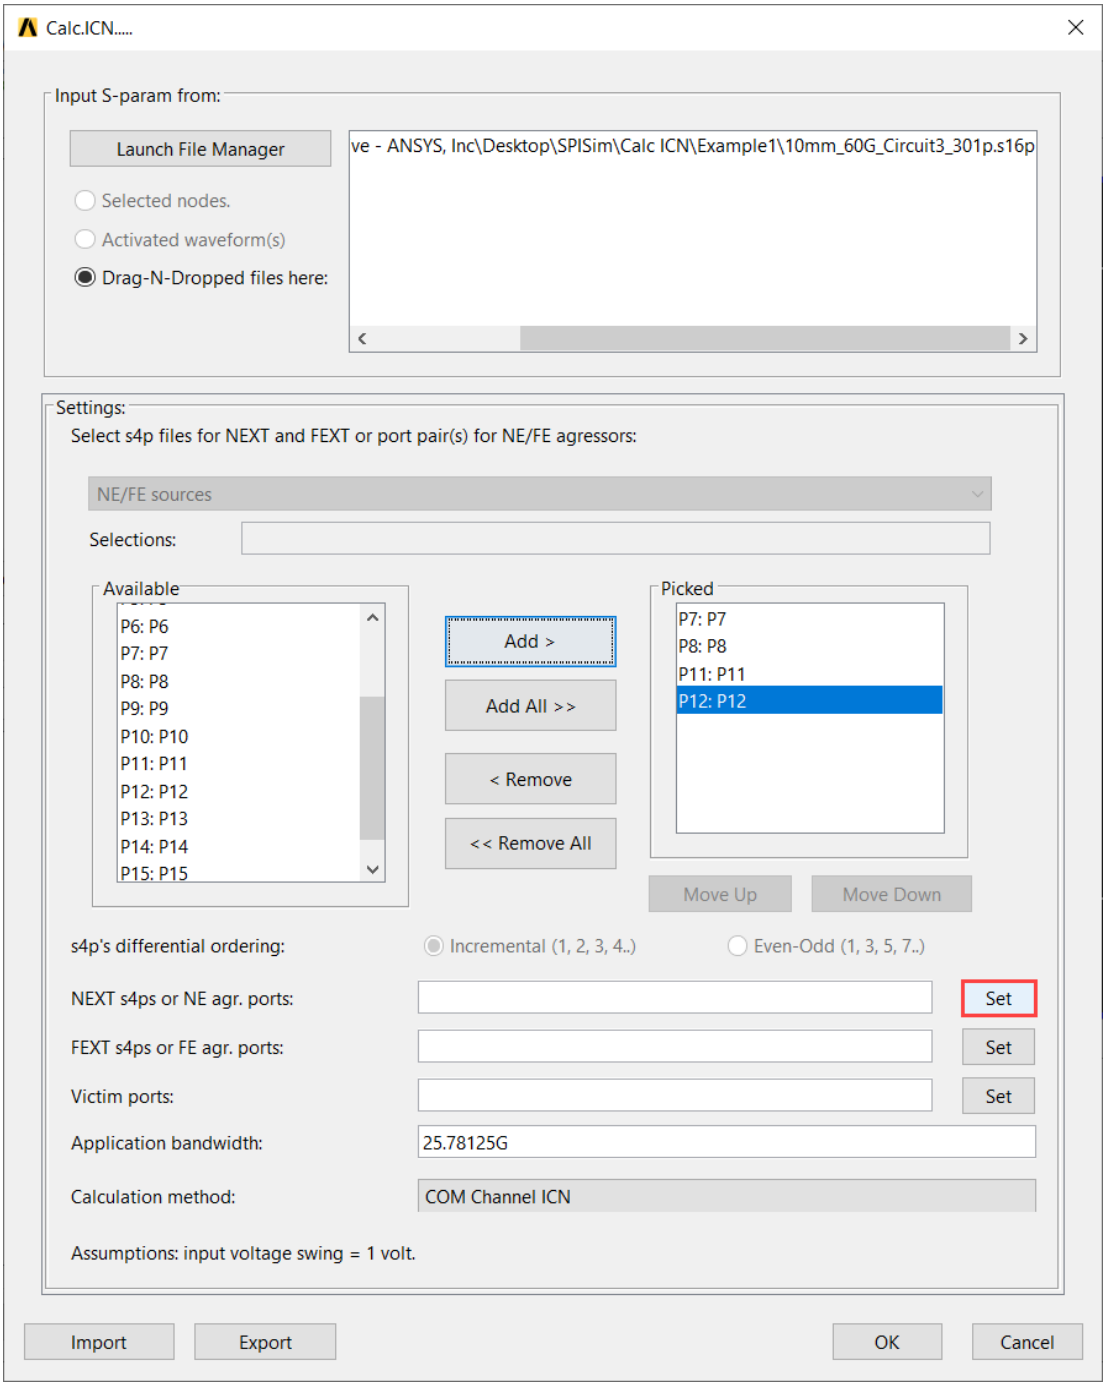
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

i. Select from the **Available** group box and click **Add >**



ii. The selections will be populated in **Picked**. Click **Set.**

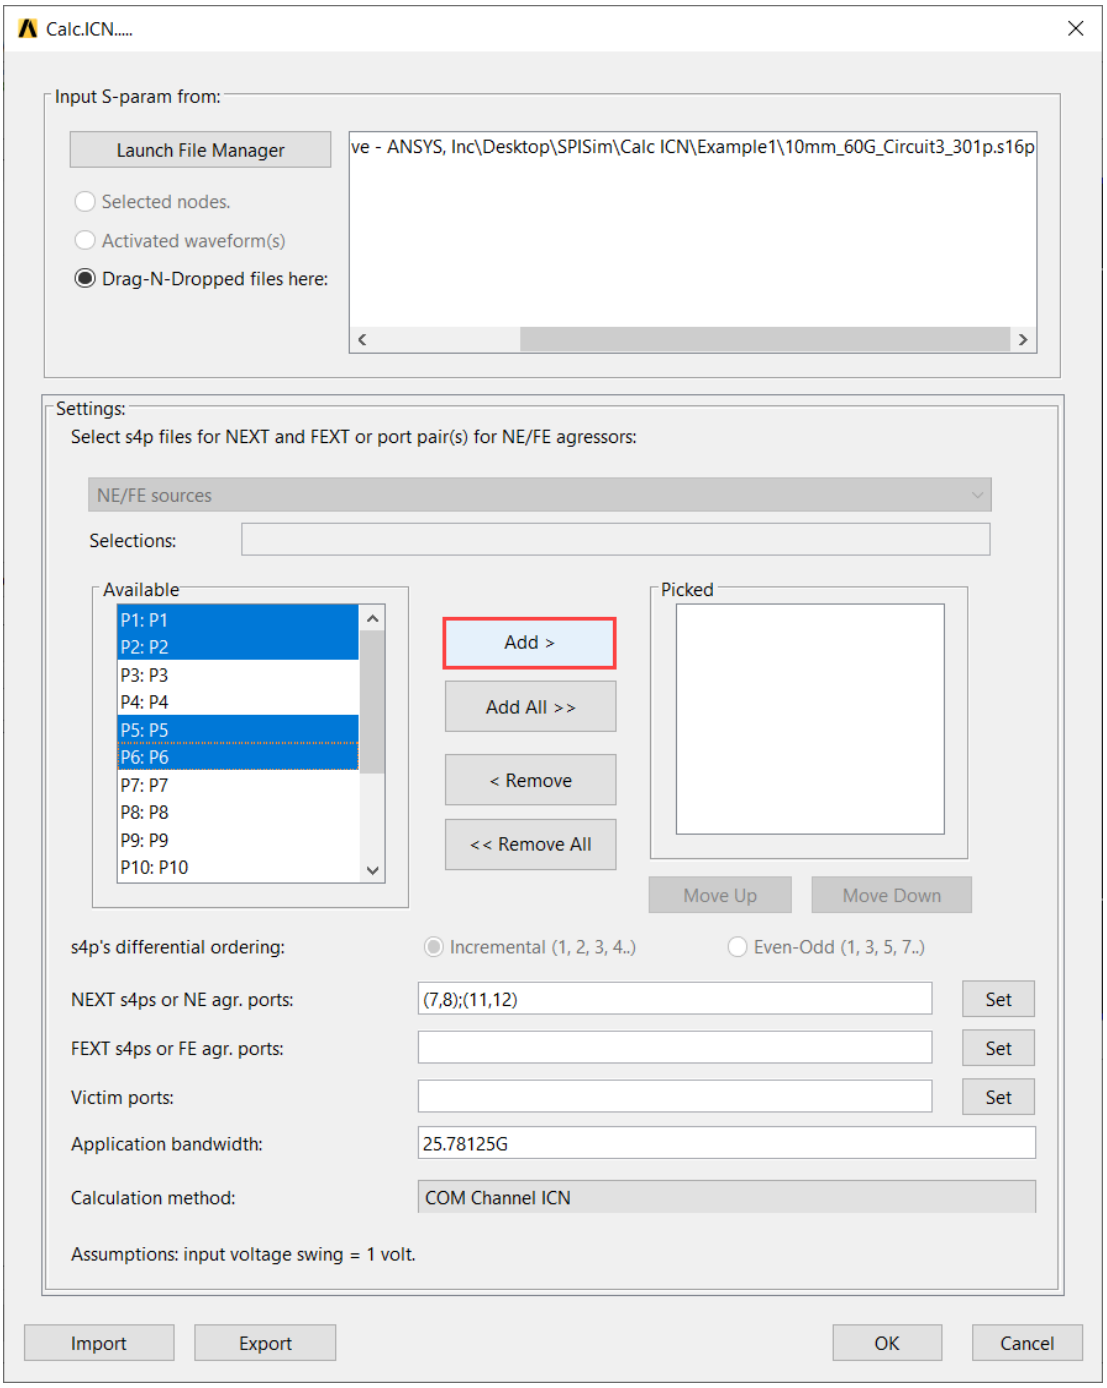
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Select **FEXT s4ps or FE agr. ports**:

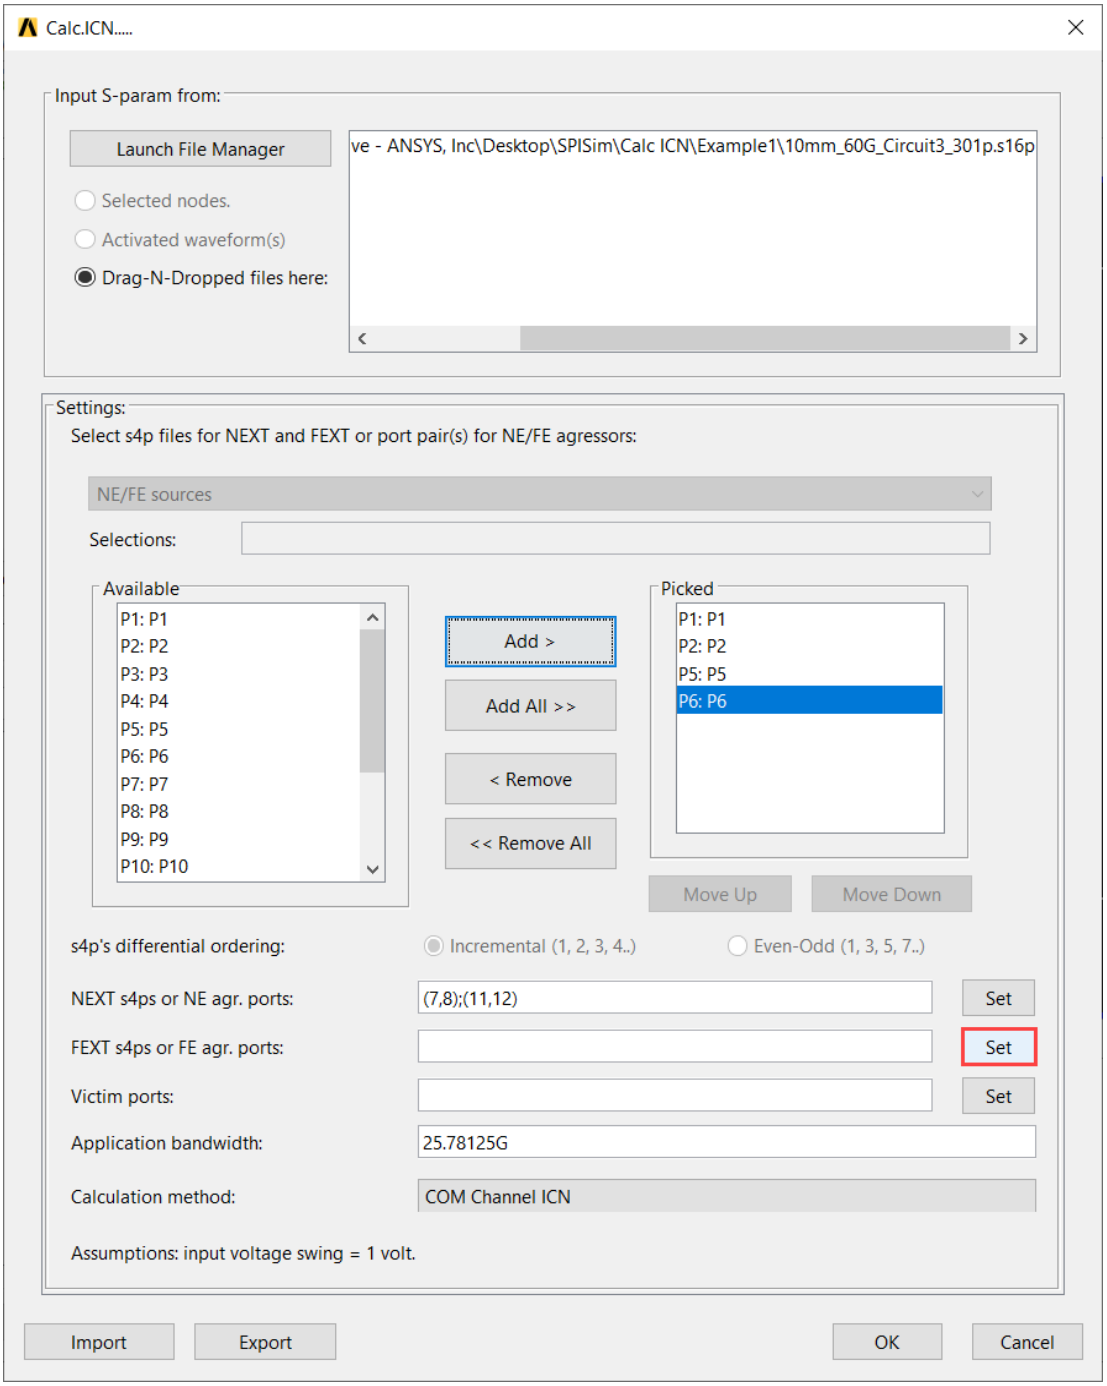
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

i. Select from the **Available** group box and click **Add >**



ii. The selections will be populated in **Picked**. Click **Set**

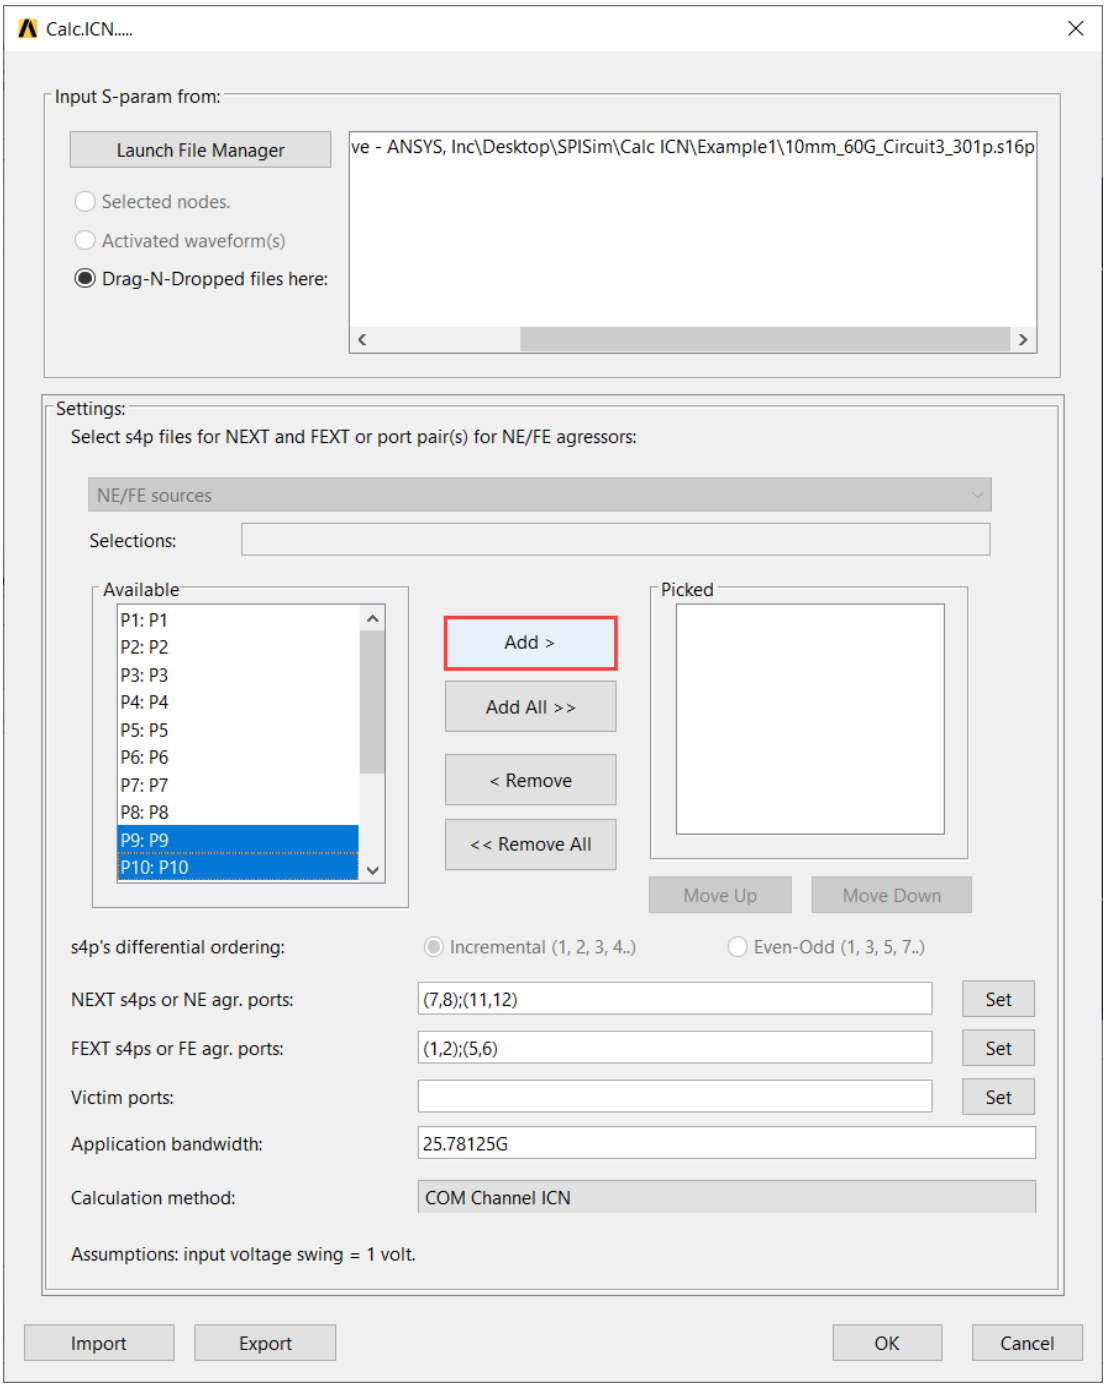
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Select **Victim ports**:

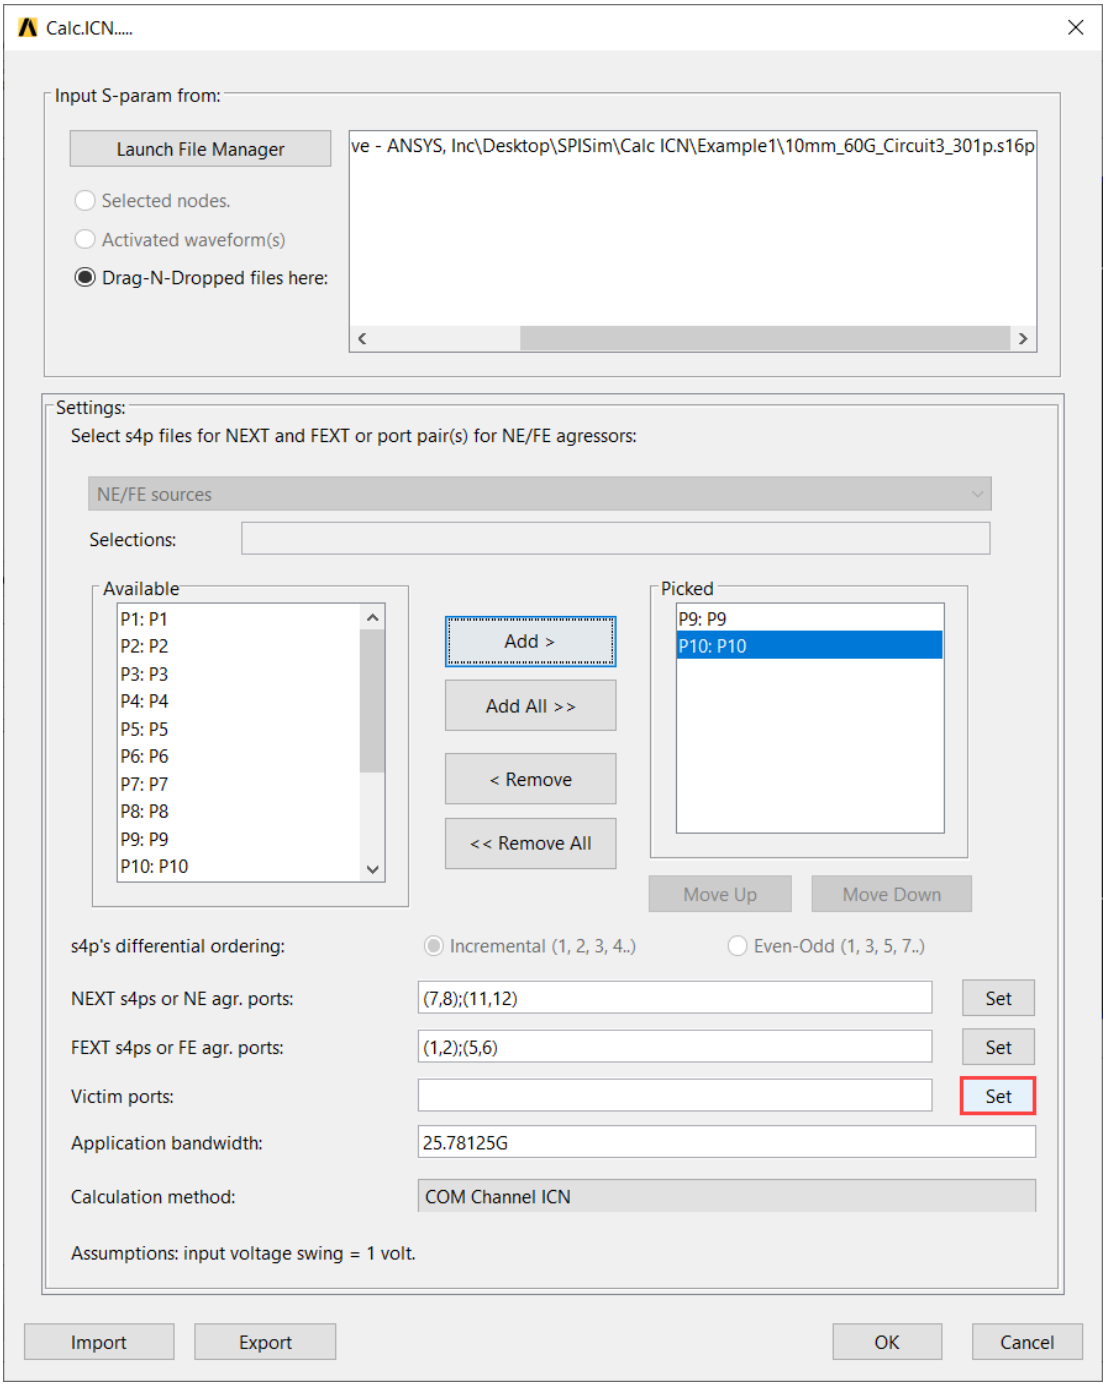
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

i. Select the ports from the **Available** group box and click **Add >**



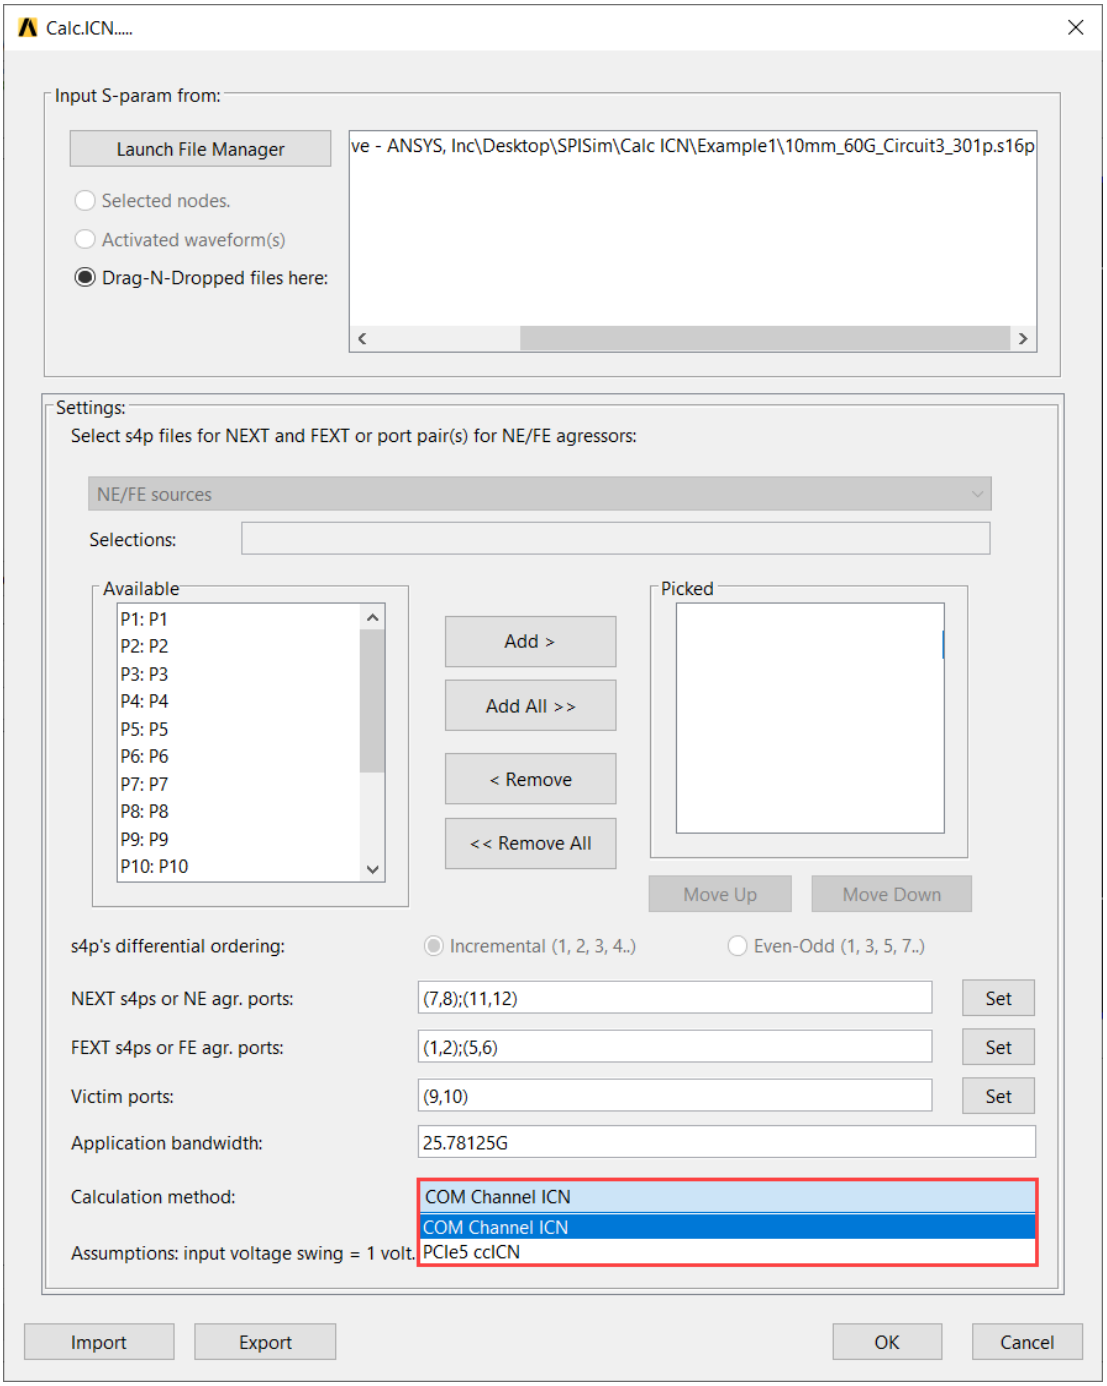
ii. The selections will be populated in **Picked**. Click **Set**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. Choose a calculation method from **COM Channel ICN** or **PCIe5 ccICN**

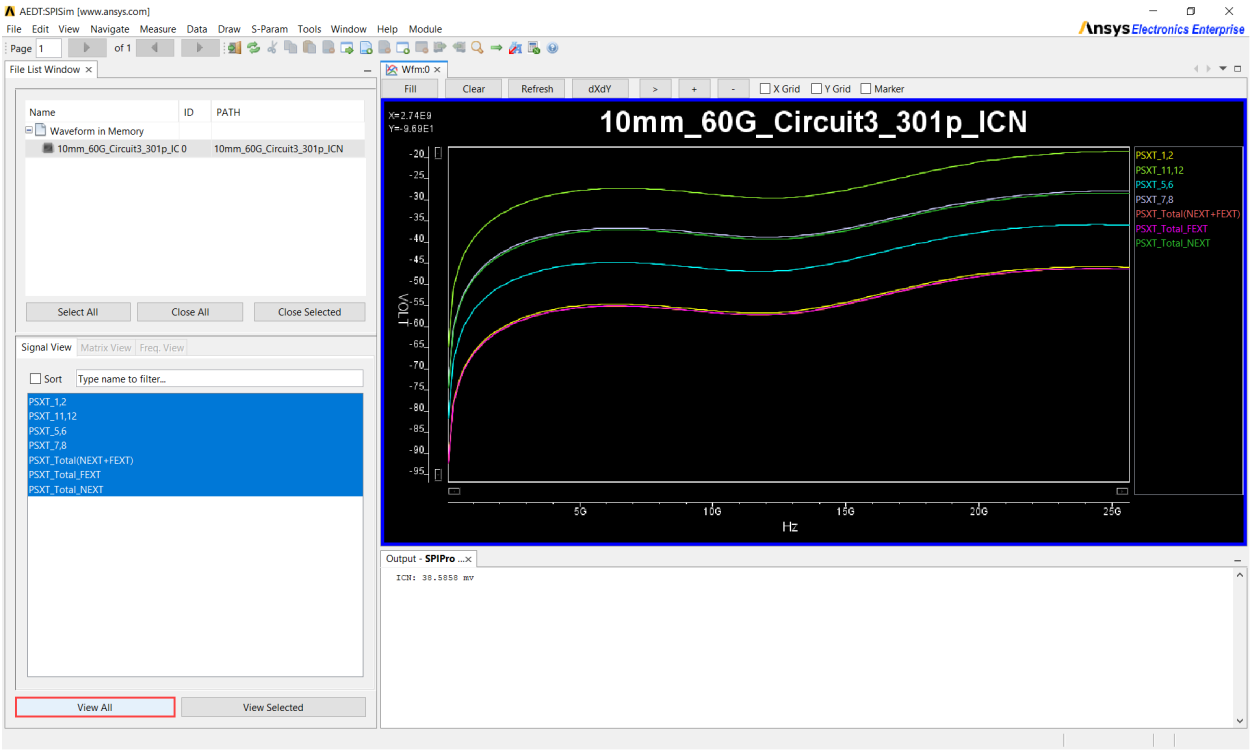
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



6. Select **OK**to close the window.

Select **View All** in the SPISim **VPro Signal View** group box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

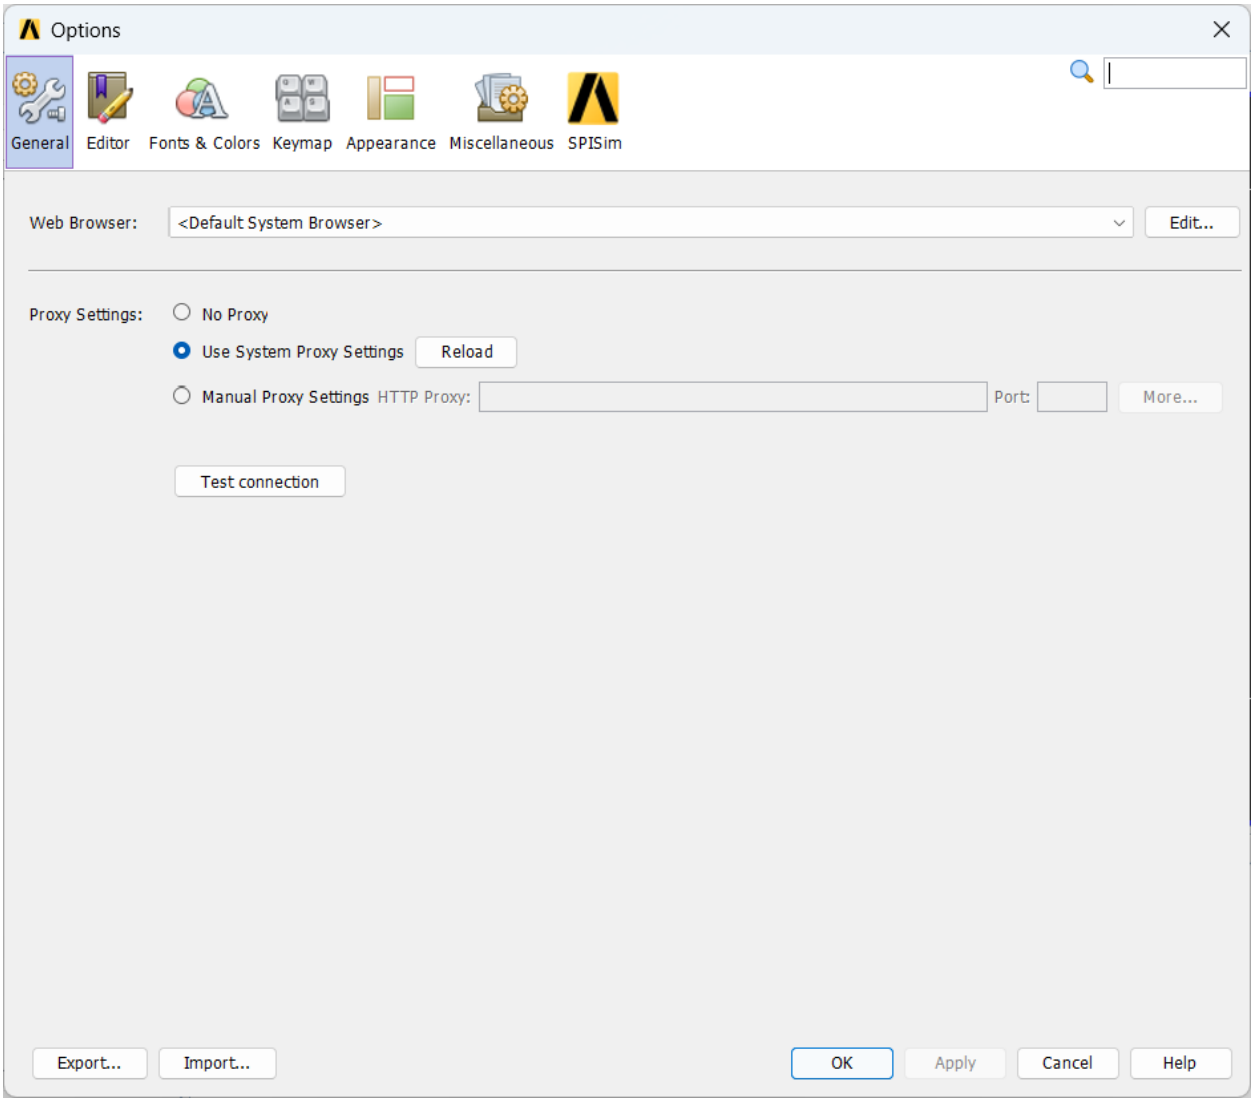


Note: To specify PCIe5 CCICN in batch command, add the following setting as part of the config settings: ICNCALC=PCIE_CCICN

The default is COM_CHNICN

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPISim Options



The SPISim Options dialog contains 7 tabs:

General - contains options for web browser and proxy settings.

Editor - contains options for autosave, language servers, general, folding, formatting, code completion, code templates, hints, highlighting, macros, on save, and go to.

Fonts & Colors - contains options for profile, syntax, highlighting, annotations, and diff.

Keymap - contains keymap options

Appearance - contains options for document tabs, windows, look and feel, and flatlaf.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Miscellaneous - contains options for diff, files, janitor, output, and terminal.

SPISim- contains options for BPro, Main, MPro, SPro, TPro, TDR/TDT, VPro.

17 - FilterSolutions

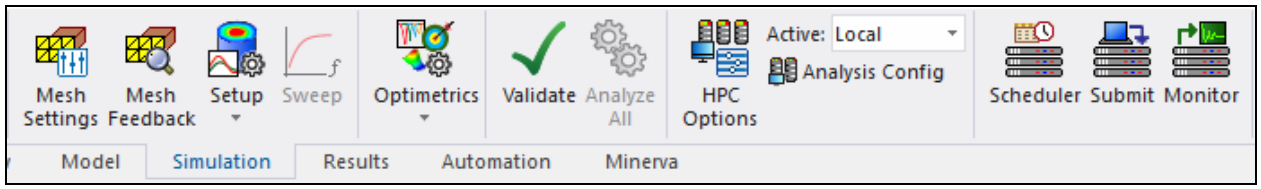
Ansys FilterSolutions allows you to design frequency filters using specifications. This stand-alone application simplifies filter design. With it, custom-design a filter and import the resulting components into Circuit. FilterSolutions is available through **Electronics Desktop**. It is launched from the **Electronics Desktop**. In the menu bar, click **Tools** > **FilterSolutions**. Refer to the Welcome to FilterSolutions Help for more details.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

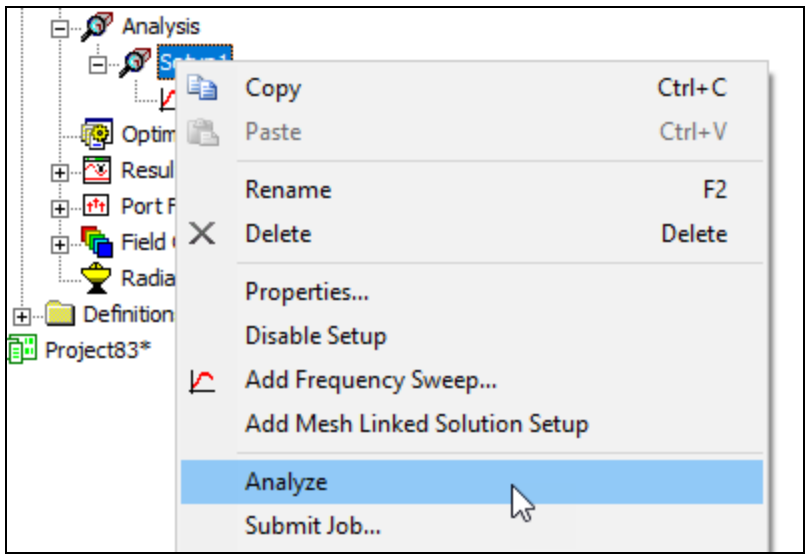
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

18 - Running Simulations

After you specify how Ansys Electronics Desktop is to compute the solution, you need to begin the solution process. You can access the **Analyze** commands for a specific setup by right-clicking on a solution or sweep in the **Project** tree and selecting from the shortcut menu, you by selecting the **Analyze All** from the solver menu, or the **Analyze All** icon on the **Simulation** tab of the ribbon.

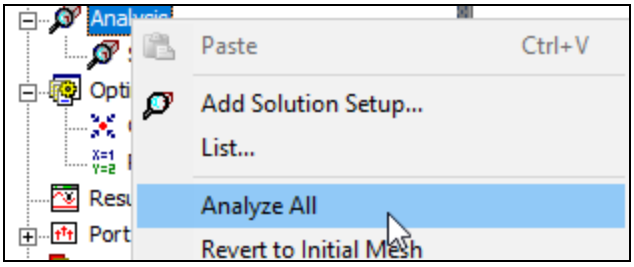


In general, the **Analyze** command on the shortcut menu applies to the selected setup and associated sweeps, if any, or to a selected sweep. To use this command, right-click on a setup or sweep in the Project Manager and click the command on the context menu.



The **Analyze All** command applies to all, and sweeps at or below the level invoked in the Project Manager. To use this command, either click **Circuit**> **Analyze All** or right-click the **Analysis** icon in the *Project Manager* and select **Analyze All**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



What do you want to do?

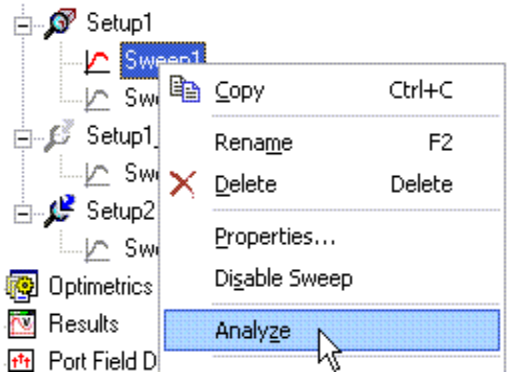
- Local Analysis
- Solve a single setup with or without sweeps (when applicable)
- Solve a specific sweep
- Enable a queue so that multiple simulations can run sequentially as resources become available.
- Run more than one simulation, whether multiple setups, or multiple sweeps under a single setup, or setups with dependencies.
- Enable or Disable one or more solution setups or sweeps.
- Submit Job to RSM or HPC Scheduler
- Monitor queued simulations
- Monitor the solution process
- Change a solution priority for system resources
- Abort an analysis
- Re-solve after modifying a design
- Re-solve after Ansys Workbench Feedback

Solving a Single Setup or Sweep

To run a single setup or sweep:

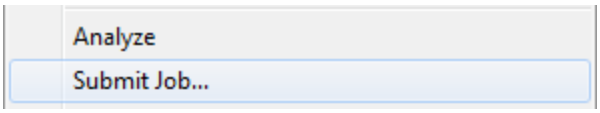
1. Select a solution setup or sweep in the Project Manager.
2. Right-click and select **Analyze** from the shortcut menu. The graphic shows a single sweep selected for analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The 3D field solution is computed inside the structure for a solution. For a select sweep, it is computed for the sweep variables.

When you right-click a Setup, rather than a Sweep, the shortcut menu also includes the **Submit Job...** command.



For more information on the **Submit Job...** command see, Distributed Analysis and High Performance Computing (HPC) Integration.

To run more than one analysis at a time, follow the same procedure while a simulation is running. If you have enabled queuing, the next solution setup will be solved when the previous solution is complete.

> **Note:**
>
> If a linked dependency in the setup is already simulating (for example, due to setup links to the same external source for a near or far field wave, or a magnetic bias), Ansys Electronics Desktop will not allow another dependent simulation to start until the first use of the source has completed.

Running More than One Simulation

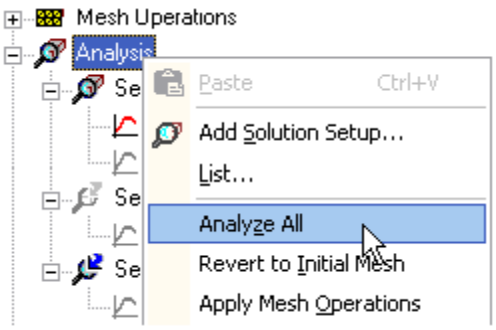
To solve every enabled solution setup in a design:

1. In the project tree, under the design you want to solve, select **Analysis**.
2. Click **Circuit**> **Analyze All**.

Each enabled solution setup is solved in the order it appears in the Project Manager.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The example here shows an analysis invoked from the Project Manager shortcut menu with three setups: one disabled, two enabled. The first setup has one sweep enabled, and one disabled (shaded icon). The second setup is disabled, and the third is enabled, with a disabled sweep.



Note:

The **General** tab for the Setup includes an **Enabled** check box. By default, this is checked. Clearing the **Enabled** check box excludes a setup from running

Note:

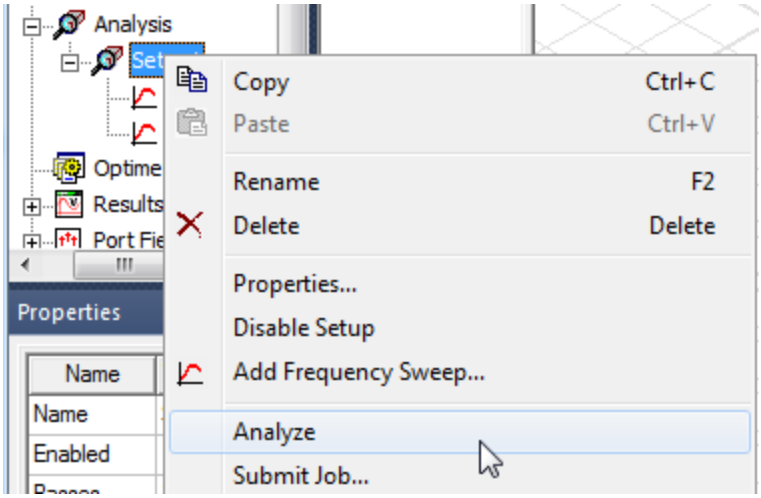
You can simulate all designs in a project by clicking **Project** > **Analyze All**.

To solve *two or more sweeps or two or more parametric analyses under a setup*:

1. In the project tree, under the design you want to solve, right-click **the setup** icon that includes the sweeps of interest.
2. Click **Analyze** on the shortcut menu.

   Each solution sweep under that setup is solved in the order it appears in the Project Manager, using the available machines. The following example shows a setup with two enabled sweeps.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Monitoring Queued Simulations

If you have multiple setups for a design and have selected **Analyze All**, the simulations can be queued until there is a machine available. You enable queuing in the HPC and Analysis Options: Options tab. If queuing is enabled, and you run multiple setups, they are solved in the order that they appear in the Project Manager. You can prioritize setups by changing their order in the queue.

1. To view the solution queue, click **Tools** > **Show Queued Simulations**.

   This displays a dialog box showing all the simulations and their current status. You can select and remove any simulation from the queue.

   You can also select any setup and use the **Move up** and **Move down** buttons to prioritize them.

2. To remove a simulation from the queue, select the simulation and click **Remove from Queue**.

   This removes the selected simulation from the queue.

Monitoring the Solution Process

While a simulation is running, you can monitor the solution's progress in the **Progress** window. The progress bar shows the relative progress of the simulation.

To view the *Solutions* window:

1. Right-click the solution **Setup** in the Project Manager.

   A shortcut menu appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Select **Convergence**, **Solutions**, **MatrixData**, **Mesh Statistics**, or **Profile** from the shortcut menu.

   The *Solutions* window appears with the corresponding tab selected and the current data displayed.

For "out of core" problems, quite different amounts of memory may be used for factorization and for solution. So if the amount for factorization is displayed under the progress bar and the amount used is calculated for the profile at the end of the solution, they may be quite different numbers.

To view the solution status:

- Right-click **Analysis** in the Project Manager and choose **Browse Solutions** from the shortcut menu.

  The *Solutions* dialog box appears with the **Browse** tab selected. It displays data about the number of valid passes completed (when adaptive solutions are applicable). It contains a tree structure showing the solutions listed according to Setup, Solution, and Variation. A table lists the setup, the solution, the sweep variable (when applicable), and the state of the solution.

- You can use the **Properties** button to display a dialog box that lets you change the way the Setup, Solution, and Variation are listed in the tree structure of the *Solutions* dialog box.
- You can delete one or more solutions by selecting from the table and clicking **Delete**. Click on a solution to select it, and use Ctrl+click to select multiple solutions, or Shift+click to select a range of solutions. You can also select all solutions using the **Select All** button.

  > **Note:**
  >
  > If a license is lost, the software waits for the license to be regained, checking every 2 minutes or until you abort.

- The **Statistics** tab of the *Solutions* dialog box displays path information as well as format, number of files, and size.

Changing a Solution Priority for System Resources

You can modify the priority of Ansys Electronics Desktop simulations so that system resources are allocated to other computer processes before the solver. If you reduce the priority of Ansys Electronics Desktop simulations, your other software tools will respond as they normally would, but Ansys Electronics Desktop simulations may take longer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> The Windows Task Manager does not indicate a reduced priority for the Ansys Electronics Desktop solvers. It only lists the priority of the engine manager, which appears normal, not the actual engine. The actual engine is in a separate thread, whose priority is not visible in the Windows Task Manager.

To change the priority of simulations for the system's resources:

1. While a solution is running, right-click the **Progress** window, and click **Change Priority** on the shortcut menu.
   - To affect priority for future simulation runs, click **Tools** > **Options** > **HPC and Analysis** and click the **Options** tab of the resulting dialog box.
2. From the **Change Priority** menu (or the **Default Process Priority** drop-down menu), select one of the following priorities:

Highest	
Above Normal	
Normal	Default
Below Normal	
Lowest Priority	

3. Click **OK**.

Related Topics

Monitoring Queued Simulations

Aborting an Analysis

To end the solution before the currently running process is complete:

- Right-click in the **Progress** window and click **Abort**.

  The solver ends the analysis immediately. The data for the currently running adaptive pass, frequency point, time step, or variation is lost. Previously completed solutions may or may not be retained (depending on what process was interrupted by the Abort command). If you want to ensure that the results of all completed solutions are saved, use *Clean Stop* instead of *Abort*.

To abort the solution after the currently running process is complete:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Right-click the **Progress** window and click **Clean Stop** on the shortcut menu.

  The analysis ends after the currently running adaptive pass, frequency point, time step, or variation has been solved. Solutions completed before the stop request are retained.

If you request a clean stop during the third adaptive pass, the solution for the third pass will be available once the third pass has finished solving, but the fourth pass will not run.

Ansys EM Application as an LSF Job

If you have an Ansys EM application running as an LSF job, you can use the command "bkill -s SIGTERM *jobid*" to terminate that application. Here *jobid* is the LSF job id. The response will be "Job <jobid> is being signaled." The response is the same whether the job is actually being signaled or not.

In cases where the SIGTERM parameter is ignored, the command kills the LSF job, but does not clean the lock files, and other files may not be in a consistent state. See http://www.vital-it.ch/support/LSF/programmer/advanced.html for a detailed description under *Signal Handling in Windows*.

Linux

For Linux, you can use TERM commands. Sigterm handling is done in Desktop library. You can abort a running batchsolve by sending a TERM signal to hfss.exe.

Re-solving after Modifying a Design

In some cases, if you modify a design after generating a solution, the solution in memory will no longer match the design. In such cases you receive a warning message that "Solutions have been invalidated. Undo to recover."

To generate a new solution after modifying a design, follow the procedure for running a simulation.

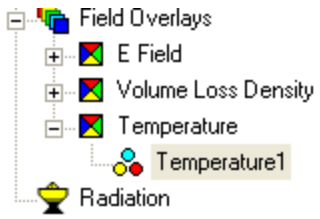
Also see Re-Solving with Ansys Workbench Thermal Feedback.

Re-solving after Ansys Workbench Thermal Feedback

With the Enable Feedback box in Setting the Temperature of Objects dialog box is checked, you can manage analysis with feedback in Ansys Workbench. After solving an HFSS or Q3D Extractor or Maxwell design, after performing the corresponding linked thermal analysis in Ansys Workbench, you can receive a temperature distribution back from the thermal solution. Ansys Workbench will write the feedback files directly to the Project Solution directory.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

After an analysis that includes thermal feedback from Ansys Workbench, you can see temperature changes expressed in Temperature field overlays (both visually in the overlay and in the color key) as well as in the Solution data.



In the **Solution** data Profile tab you will see a new entry for Maximum Delta T, for the change in temperature from the previous simulation. The solver calculates delta in the first iteration by comparing the temperature distribution output from thermal with the initial temperature setting in HFSS/Maxwell/Q3D. Subsequent simulation iterations provide a number for the temperature delta.

Solver MCS4	00:00:00	00:00:00	31.4 M	Disk = 0 KBytes, matrix size 3468 , matrix bandwidth
Field Recovery	00:00:00	00:00:00	31.4 M	Disk = 310 KBytes, 2 excitations
				Maximum Delta T = 7.0685

This simulation feedback loop from Ansys Electronics Desktop to Ansys Workbench and back can continue until you decide that Temperature delta reported in the Solution Report low and stable for the designs.

Running EMI Scanner in HFSS 3D Layout (General Mode Only)

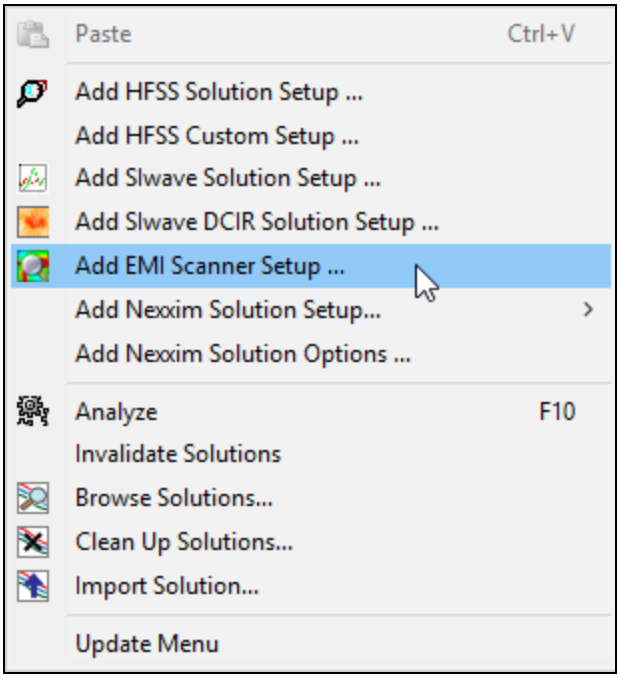
Ansys EMI Scanner identifies design issues that might result in electromagnetic interference problems during operation. Such problems can stem from a compromised power delivery network or from improperly shielded signal nets. This feature, which is based on geometric rule checks, scans complete layouts quickly and can be used to identify subsections of the design requiring more rigorous analysis using the Ansys SIwave™ or Ansys HFSS™ finite element-based solvers.

To set up EMI scanner:

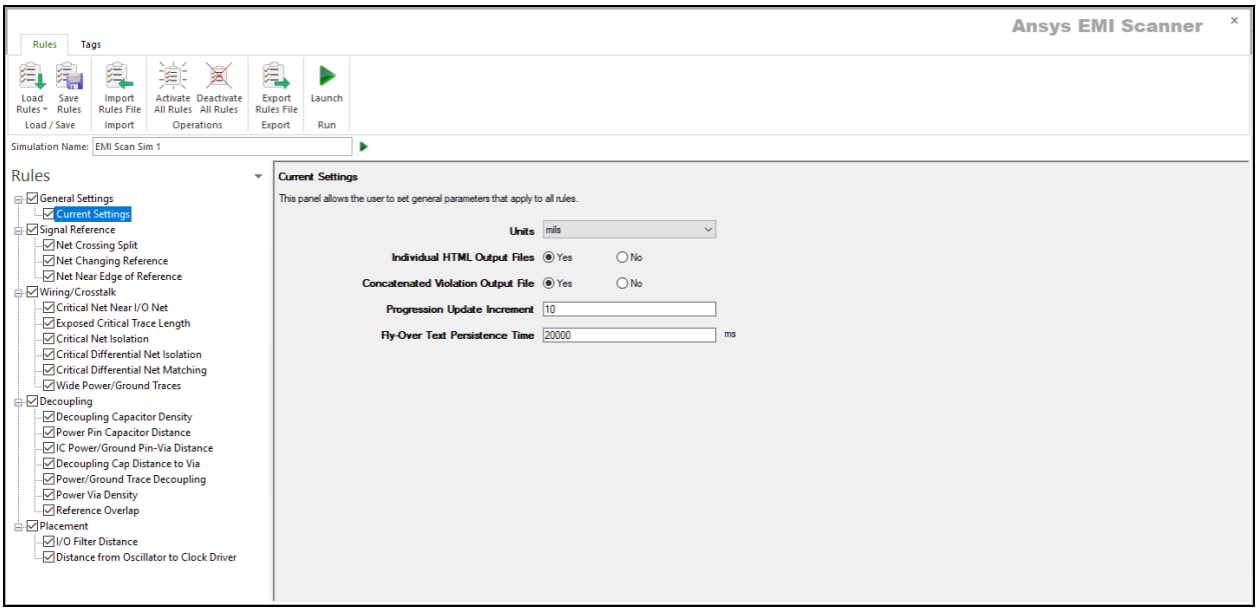
1. From the **Simulation** tab, click **EMI**, or

   From the **Project Manager** window, right-click **Analysis** and select **Add EMI Scanner Setup**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Project Manager** window, double-click **EMI Setup**. to open the **Ansys EMI Scanner** window, on the **Rules** tab.



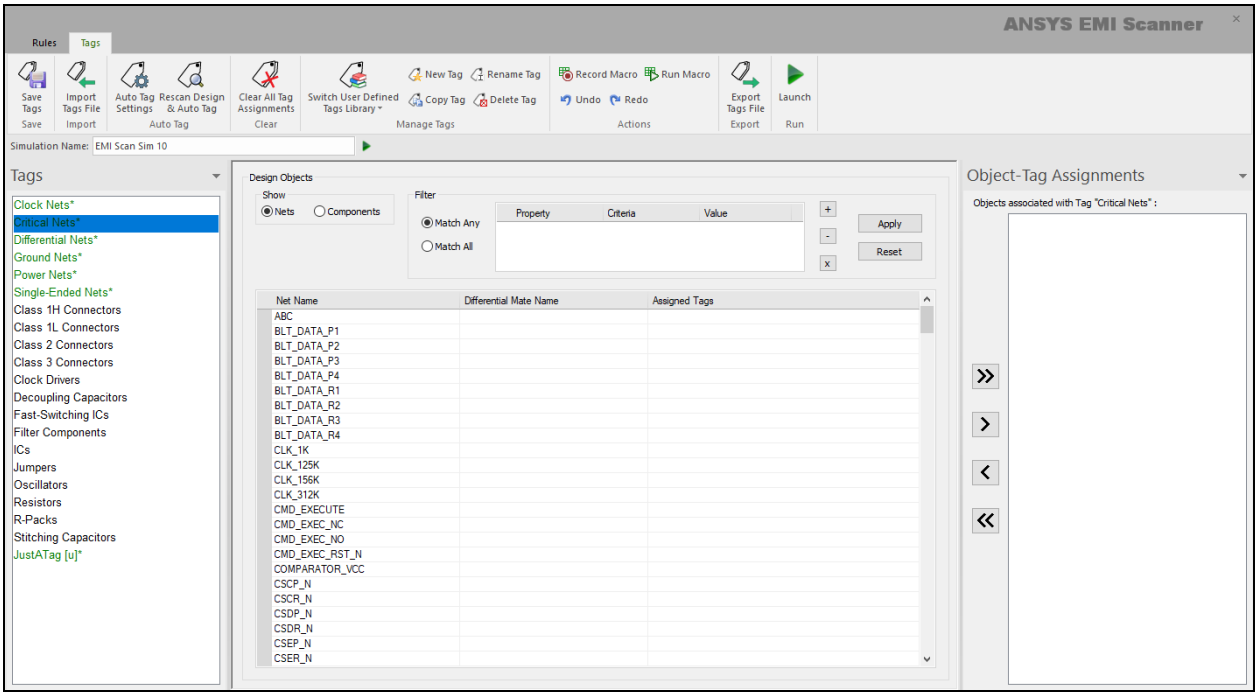
If selected, click the **Simulation Name** field to rename the scan.

3. Set rules, as selected.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Select the **Tags** tab.

   The **Tags** tab displays.

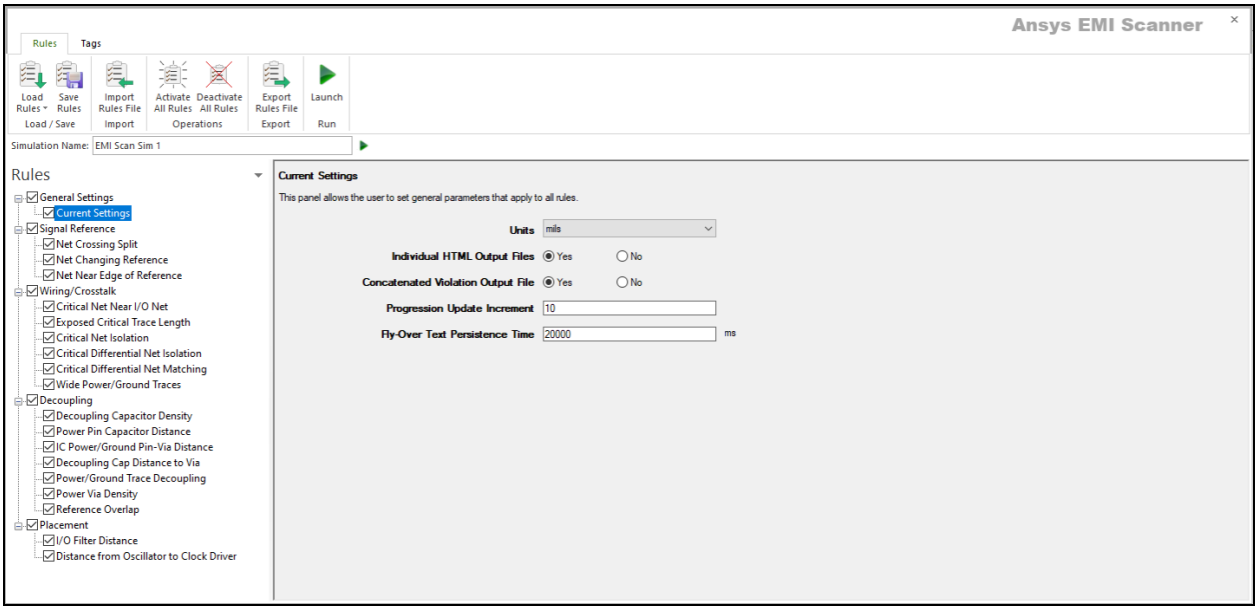


5. Assign tags, as selected.
6. Click **Launch**.

   The **Progress** window updates to show EMI Scanner progress. Simulation Status messages are logged in the **Message Manager**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Setting Rules in EMI Scanner



The EMI Scanner **Rules** tab contains the following buttons:

- **Load Rules** – allows you to select from a series of pre-defined rule sets to load into the Rules pane:
  - **Default EM Rules Profile** – contains the basic rule set for analyzing electromagnetic interference.
  - **Default SI Rules Profile** – contains the basic rule set for analyzing signal integrity.
  - **Default EM+SI Rules Profile** – contains all rules from both the Default EM Rules Profile and the Default SI Rules Profile.
  - **Default Rules Profile (0 - 100MHz)** – contains the recommended rule set for frequencies ranging from 0 - 100MHz.
  - **Default Rules Profile (100MHz - 500MHz)** – contains the recommended rule set for frequencies ranging from 100 - 500MHz.
  - **Default Rules Profile (500MHz - 1000MHz)** – contains the recommended rule set for frequencies ranging from 500 - 1000MHz.
  - **Default Rules Profile (1GHz+)** – contains the recommended rule set for frequencies 1GHz and above.
- **Save Rules** – applies changes to the rule profile.
- **Import Rules File** – allows you to import rules via an XML file.
- **Activate All Rules** – selects all check boxes in the Rules pane.
- **Deactivate All Rules** – deselects all check boxes in the Rules pane.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Export Rules File** – allows you to export the current rule settings in XML format.
- **Launch** – begins the EMI scan.

To set rules for an EMI Scan:

1. Click the **Load Rules** drop-down menu to select a pre-defined rules profile, or click **Import Rules File**.

   The **Rules** pane updates to show all applicable rules for the selected profile.

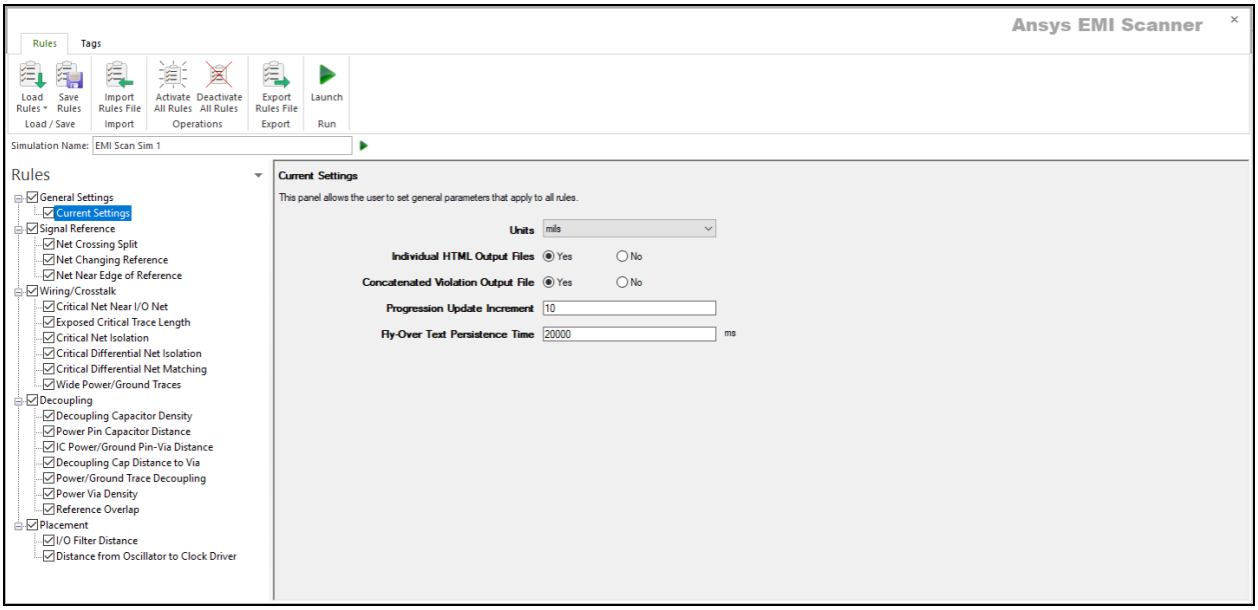
2. From the **Rules** pane, use the check boxes to activate and deactivate rules, as appropriate. Also **Activate All Rules** or **Deactivate All Rules**.
3. Change the General Settings and settings for Signal Reference, Wiring/Crosstalk, Decoupling, Placement, Net Integrity, Via Integrity, and Power Integrity rules, as appropriate.

Applying EMI Scanner General Settings

To change EMI Scanner General Settings:

1. Launch EMI Scanner.

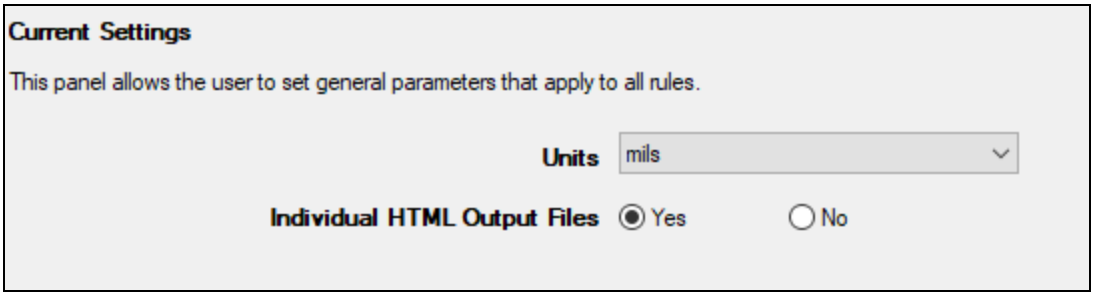
   The **EMI Scanner** window opens, on the **Rules** tab.



2. The **Current Settings** display by default. If they do not, in the Rules pane, select **General Settings** > **Current Settings**.

   The **Current Settings** display.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



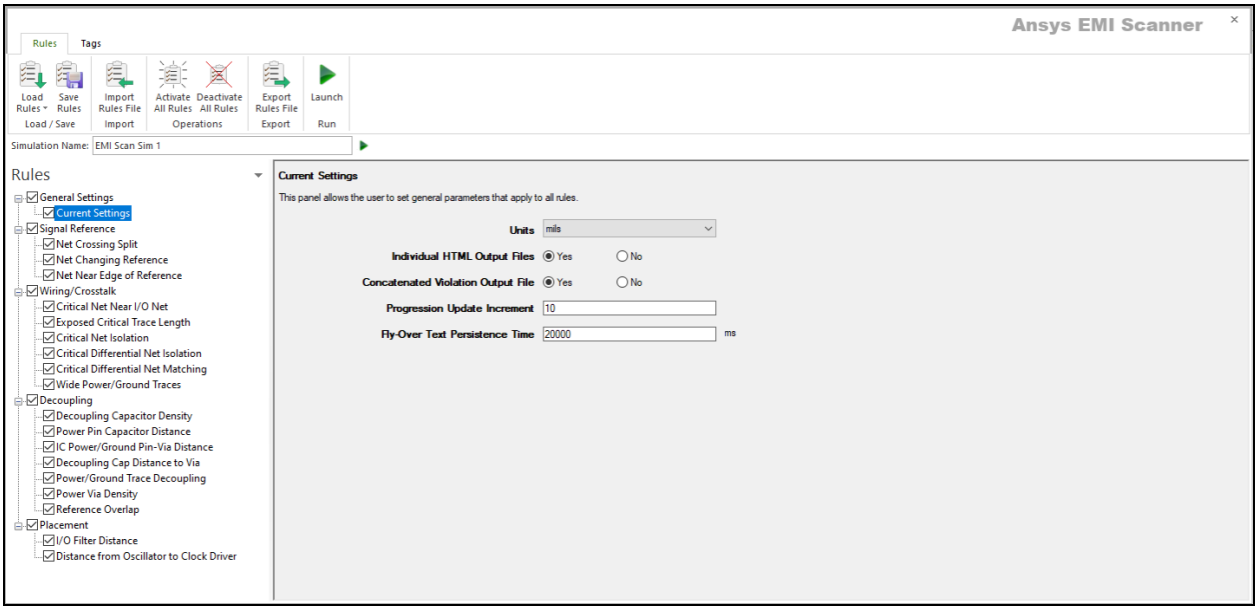
3. From this screen, set the following:
   - **Units** – selects the unit in which other rules are measured.
   - **Individual HTML Output Files** – selects whether to export EMI Scanner results as one large, combined HTML file or as individual HTML files. See Exporting EMI Scanner Results.
4. Rules are automatically saved for the current EMI scan. To save them for a future scan, click **Save Rules**.

Applying Signal Reference Rules

To change EMI Scanner Signal Reference rules:

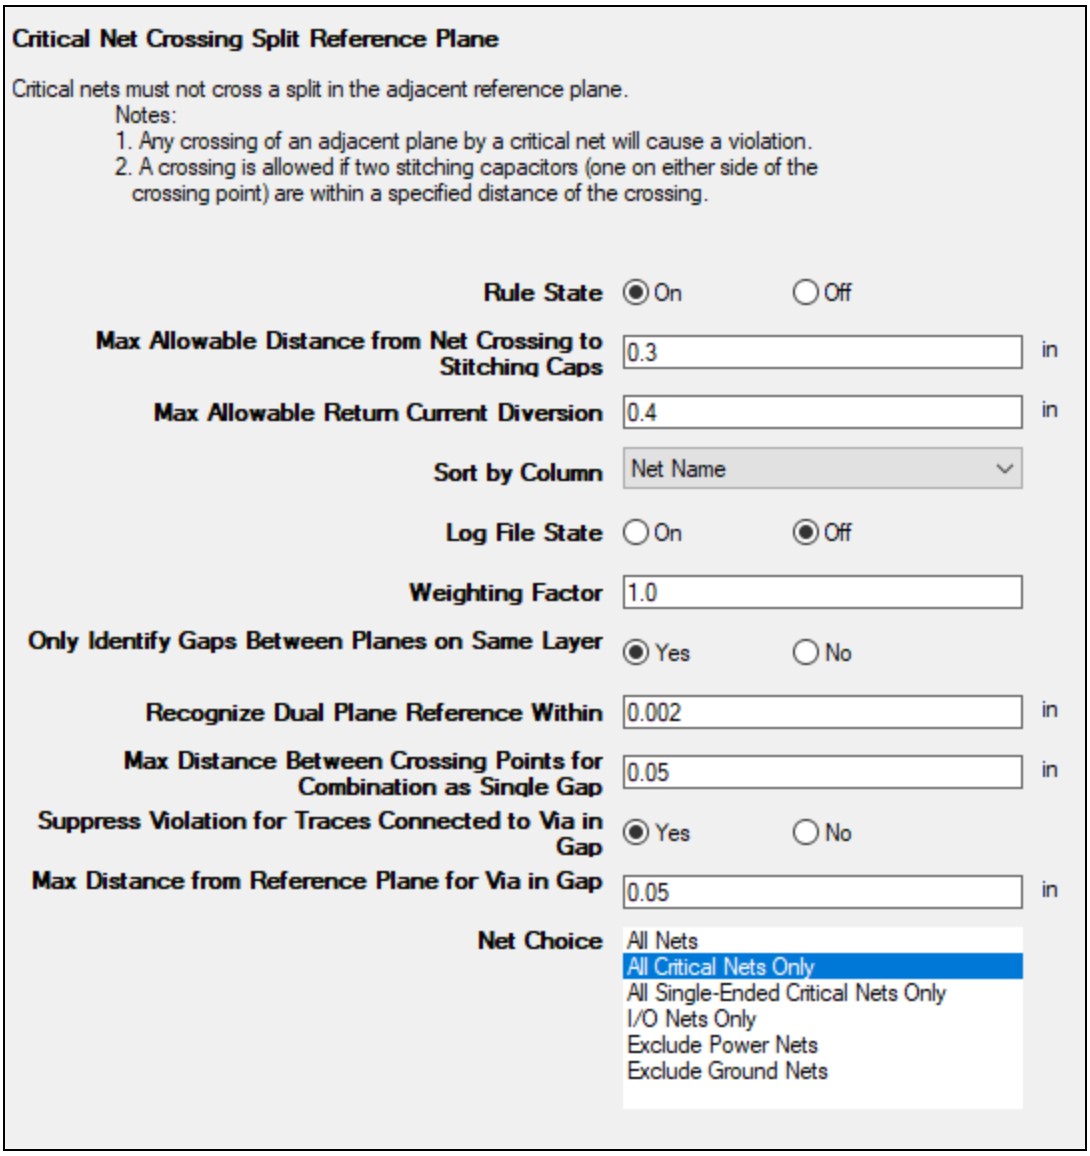
1. Launch EMI Scanner.

   The **EMI Scanner** window opens, on the **Rules** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **Rules** pane, select one of the three subcategories under **Signal Reference**:
   - **Net Crossing Split** – displays **Critical Net Crossing Split Reference Plane** rule configuration.



This rule states that critical nets must not cross a split in the adjacent reference plane. A cross is allowed only if two stitching capacitors are within a specified distance of the crossing.

From here, set the following:

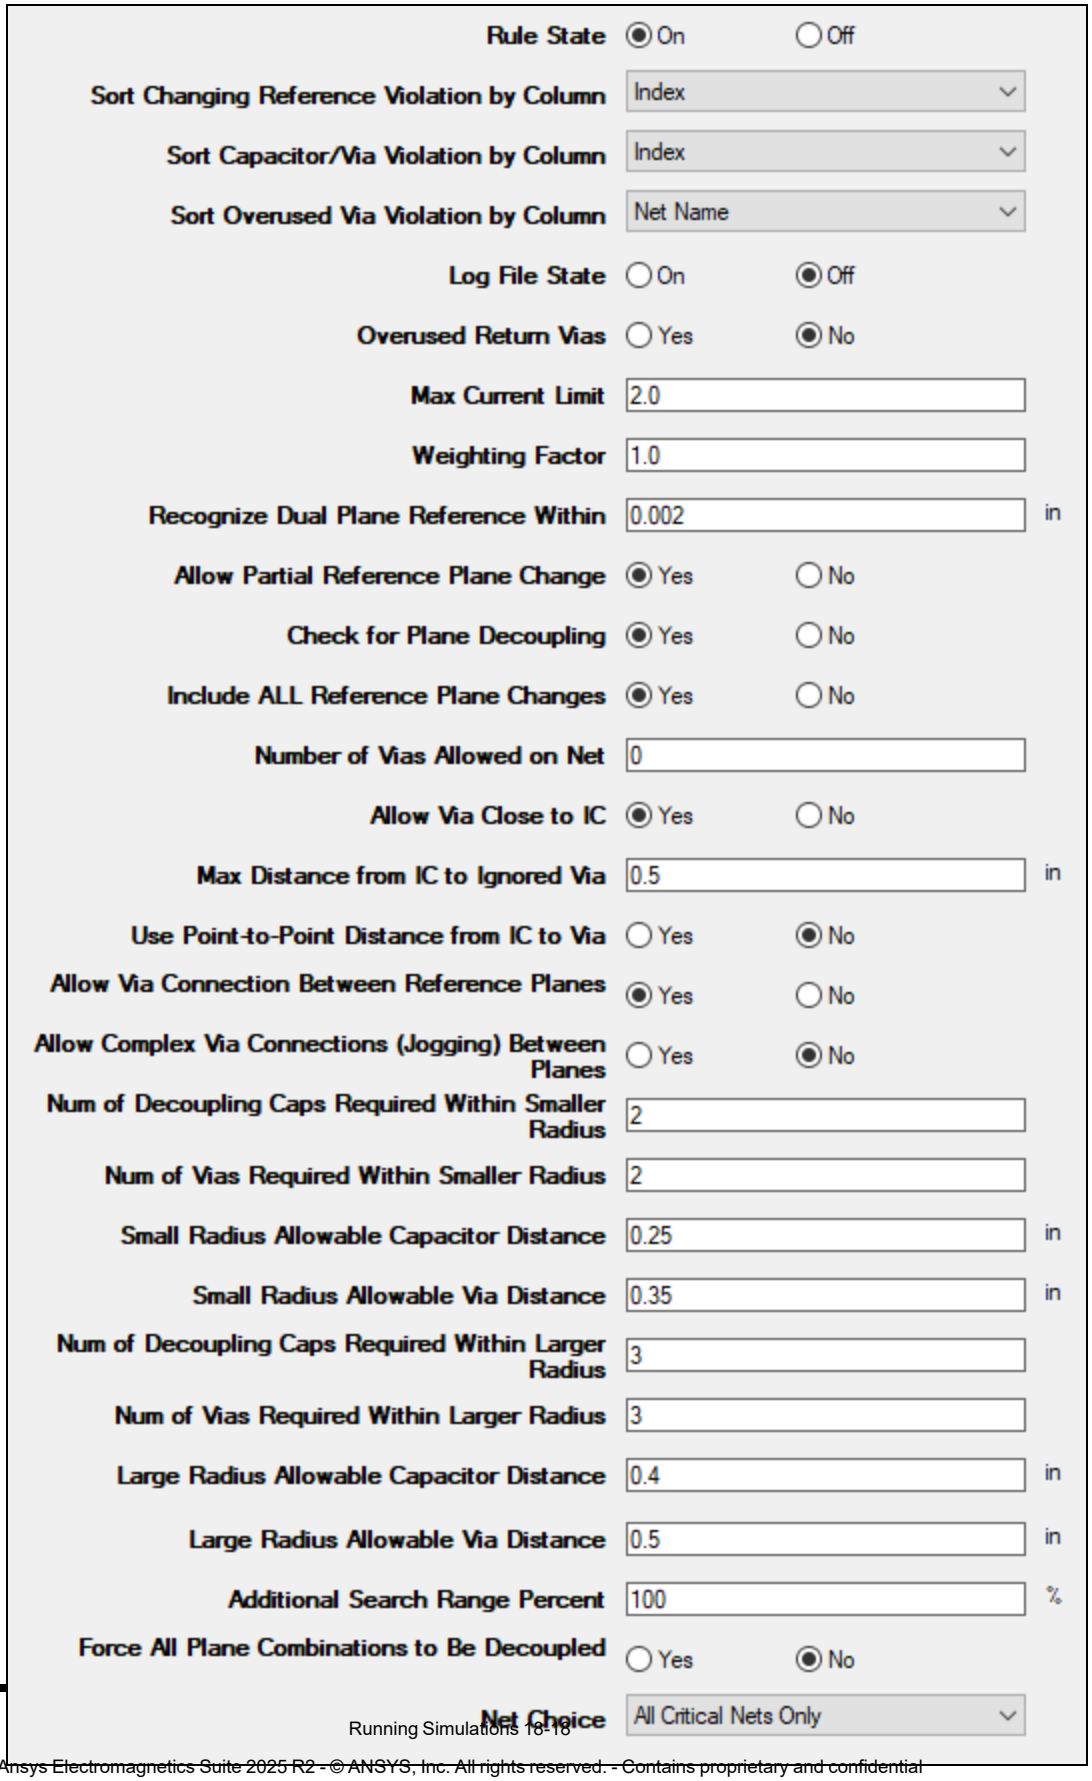
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Rule State** – toggles Net Crossing Split rules on or off.
- **Max Allowable Distance from Net Crossing to Stitching Caps** – sets the maximum distance on the point where the net crosses a split in its reference plane. Two stitching capacitors must be found within this distance.
- **Max Allowable Return Current Diversion** – sets the maximum distance for a return current diversion. If a signal's return current can divert itself around the gap in the reference plane, the total distance of the diversion must be less than this value.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Only Identify Gaps Between Planes on Same Layer** – determines whether gaps are only between planes on the same layer or not. When the rule tries to pair up nearby plane boundary crossing points and identify gaps, this parameter enables or disables a check for layer commonality.
- **Recognize Dual Plane Reference Within** – instructs EMI Scanner to consider both planes as a reference when checking for gap crossing when the distance difference to each plane is less than the specified distance. This allows recognition of both planes as references for strip line traces when the trace is offset on the exact center by a small amount (normally for manufacturing reasons).
- **Max Distance Between Crossing Points for Combination as a Single Gap** – sets the maximum distance for combining crossing points into a single violation (e.g., the entrance and exit of a gap between planes). Too large a value can cause the algorithm to pair up unrelated crossing points, and too small a value can prevent crossing points from being paired up, resulting in more violations. It is recommended to set the value to a reasonable distance based on the board design technology being used (e.g., slightly larger than the typical plane separation within a layer).
- **Suppress Violation for Traces Connected to Via in Gap** – determines whether to ignore trace crossing split/gap when connected to a via within that gap.
- **Max Distance from Reference Plane for Via in Gap** – sets the maximum distance for which via violations within a gap are suppressed. If the trace extends greater than this distance on the edge of the reference plane to the via, its violation are not suppressed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

    - **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.
- **Net Changing Reference** – displays **Critical Net Changing Reference Plane** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This rule states that critical nets must not change reference planes.

Note:

1. Any change in the reference plane for a critical net causes a violation.
2. Reference plane changing is allowed if two decoupling capacitors (or vias if the planes share the same net name) are within a specified radial distance on the signal via where the signal changes reference planes.
3. Reference plane changing is allowed if three decoupling capacitors (or vias if the planes share the same net name) are within a specified radial distance on the signal via where the signal changes reference planes.
4. Reference plane changing can be ignored when the initial via is within a specified distance from its IC pin (transmit or receive).

From here, set the following:

- **Rule State** – toggles Net Changing Reference rules on or off.
- **Sort Changing Reference Violation by Column** – specifies the column by which Changing Reference Violation results are sorted.
- **Sort Capacitor/Via Violation by Column** – specifies the column by which Capacitor/Via Violation results are sorted.
- **Sort Overused Via Violation by Column** – specifies the column by which Overused Via Violation results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Overused Return Vias** – determines whether EMI Scanner checks for overused return vias.
- **Max Current Limit** – specifies the maximum number of signal currents that a via should carry. Use in conjunction with **Overused Return Vias**.
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Recognize Dual Plane Reference Within** – instructs EMI Scanner to consider both planes as a reference when checking for gap crossing when the distance difference to each plane is less than the specified distance. This allows recognition of both planes as references for strip line traces when the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

trace is offset on the exact center by a small amount (normally for manufacturing reasons).

- **Allow Partial Reference Plane Change** – instructs EMI Scanner to ignore a violation if one of the two reference planes remains a reference plane on both sides of the via transition.
- **Check for Plane Decoupling** – instructs EMI Scanner to ignore a violation if a decoupling capacitor exists between the two reference planes (entering reference plane and leaving reference plane) and is within a specified distance of the signal via.
- **Include ALL Reference Plane Changes** – instructs EMI Scanner whether to display all reference plane changes. When there are two associated reference planes for the entry to the via, and two different associated reference planes for the trace leaving the via, selecting 'yes' shows two violations for this transition. If 'no' is selected and a decoupling capacitor exists between one of the entering reference planes and one of the leaving reference planes (in the specified distance), no violation are reported, even though the two other reference planes do not have any connection.
- **Number of Vias Allowed on Net** – specifies the number of via reference plane changes that are allowed on critical nets. If no vias are selected except the 'escape' via close to the IC, set this parameter to zero, and set **Allow Via Close to IC** to 'yes'.
- **Allow Via Close to IC** – determines whether to ignore vias that are close to the IC and are required to get a trace on the surface to an inner layer.
- **Max Distance from IC to Ignored Via** – specifies the maximum distance between IC and via at which vias is ignored.
- **Use Point-to-Point Distance from IC to Via** – if 'yes' is selected, the actual trace path length is NOT calculated. This option allows EMI Scanner to check rules faster, but violations may be ignored incorrectly.
- **Allow Via Connection Between Reference Planes** – allows a via to connect reference planes (to provide return current path) when the two reference planes share the same net name.
- **Allow Complex Via Connections (Jogging) Between Planes** – allows a set of vias (e.g., 'blind' vias that do not extend through all layers) to connect with reference planes (to provide return current path) when the two reference planes share a net name. This advanced checking requires extra processing time because all vias found in the larger via radius are considered as potential paths.
- **Num of Decoupling Caps Required Within Smaller Radius** – when **Allow Partial Reference Plane Change** is selected, a return current path (when a critical net changes reference planes) may be provided with either capacitors

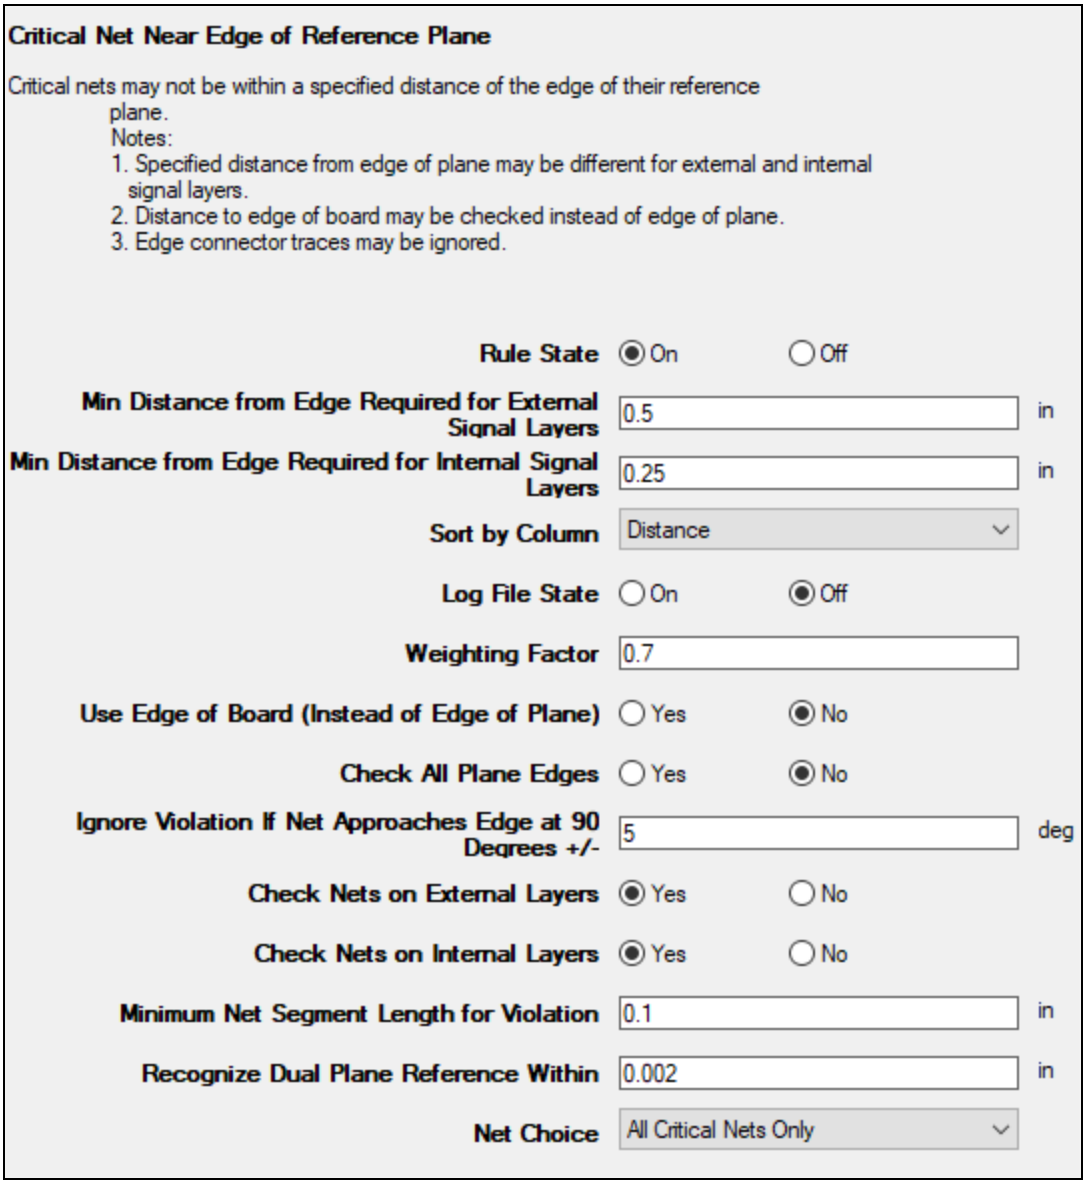
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

or vias. This setting specifies the number of capacitors required in the smaller radius.

- **Num of Vias Required Within Smaller Radius** – when **Allow Partial Reference Plane Change** is selected, a return current path (when a critical net changes reference planes) may be provided with either capacitors or vias. This setting specifies the number of vias required in the smaller radius. A via between planes is a lower impedance/inductance connection than a decoupling capacitor, so you may want to specify a different setting.
- **Small Radius Allowable Capacitor Distance** – specifies the smaller radius used with the **Num of Decoupling Caps Required Within Smaller Radius** setting.
- **Small Radius Allowable Via Distance** – specifies the smaller radius used with the **Num of Vias Required Within Smaller Radius** setting.
- **Num of Decoupling Caps Required Within Larger Radius** – if a smaller radius is not specified, this allows specification of a larger radius for a larger number of decoupling capacitors.
- **Num of Vias Required Within Larger Radius** – if a smaller radius is not specified, this allows specification of a larger radius for a larger number of vias. A via between planes is a lower impedance/inductance connection then a decoupling capacitor, so you may want to specify a different setting.
- **Large Radius Allowable Capacitor Distance** – specifies the larger radius used with the **Num of Decoupling Caps Required Within Larger Radius** setting.
- **Large Radius Allowable Via Distance** – specifies the larger radius used with the **Num of Vias Required Within Larger Radius** setting.
- **Additional Search Range Percent** – specifies an additional search range beyond the larger radius for additional capacitors (e.g., if the larger radius is set to 500mils and the Additional Search Range Percent is 100%, EMI Scanner reports capacitors within 1000mils when a violation occurs).
- **Force All Plane Combinations to Be Decoupled** – determines whether to decouple all reference plane combinations. See Technical Note.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Net Near Edge of Reference** – displays **Critical Net Near Edge of Reference Plane** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This rule states that critical nets must not be within a specified distance of the edge of their reference plane.

From here, set the following:

- **Rule State** – toggles Net Near Edge of Reference rules on or off.
- **Min Distance from Edge Required for External Signal Layers** – specifies the minimum distance that must exist between the edge of the reference plane and a critical signal net when the net is on an external layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Min Distance from Edge Required for Internal Signal Layers** – specifies the minimum distance that must exist between the edge of the reference plane and a critical signal net when the net is on an internal layer.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Use Edge of Board (Instead of Edge of Plane)** – allows you to check distance from critical nets to the edge of the board instead of the edge of the reference plane. This can be useful if the board is only partially complete and all reference planes are not yet completed.
- **Check All Plane Edges** – checks the distance from nets to any edge of their reference plane, rather than limiting the check to reference plane edges near the edge of the board
- **Ignore Violation If Net Approaches Edge at 90 Degrees +/-** – EMI scanner ignores edge connectors that approach the edge of the reference plane or board at a 90 degree angle, tolerating approaches slightly off a perfect 90 degrees.
- **Check Nets on External Layers** – specifies whether nets on external layers should be checked.
- **Check Nets on Internal Layers** – specifies whether nets on internal layers should be checked.
- **Minimum Net Segment Length for Violation** – specifies the minimum net segment length before EMI Scanner reports a violation if the net is in the specified distance on the edge of the reference plane or board.
- **Recognize Dual Plane Reference Within** – instructs EMI Scanner to consider both planes as a reference when checking for traces too close to the edge of the reference planes when the distance difference to each plane is less than the specified distance. This allows recognition of both planes as references for strip line traces when the trace is offset on the exact center by a small amount (normally for manufacturing reasons).
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

3. Rules are automatically saved for the current EMI scan. To save them for a future scan, click **Save Rules**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

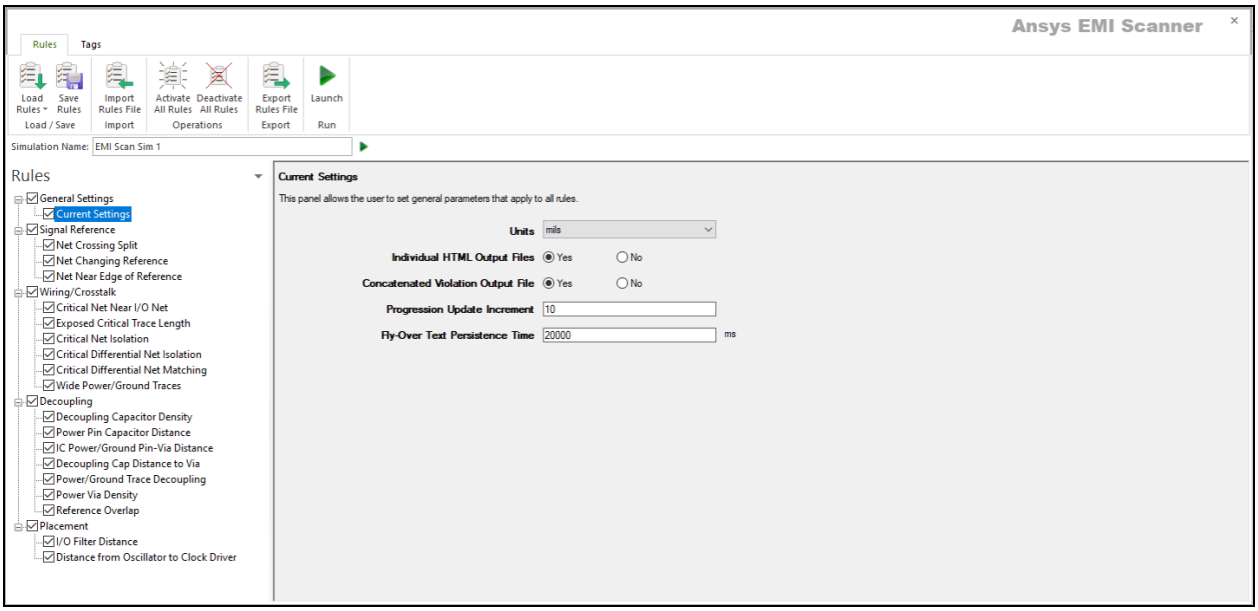
- You can display a description of a rule parameter at any time as with the cursor over it.
- Units of measure are set in General Settings.

Applying Wiring/Crosstalk Rules

To change EMI Scanner Wiring/Crosstalk rules:

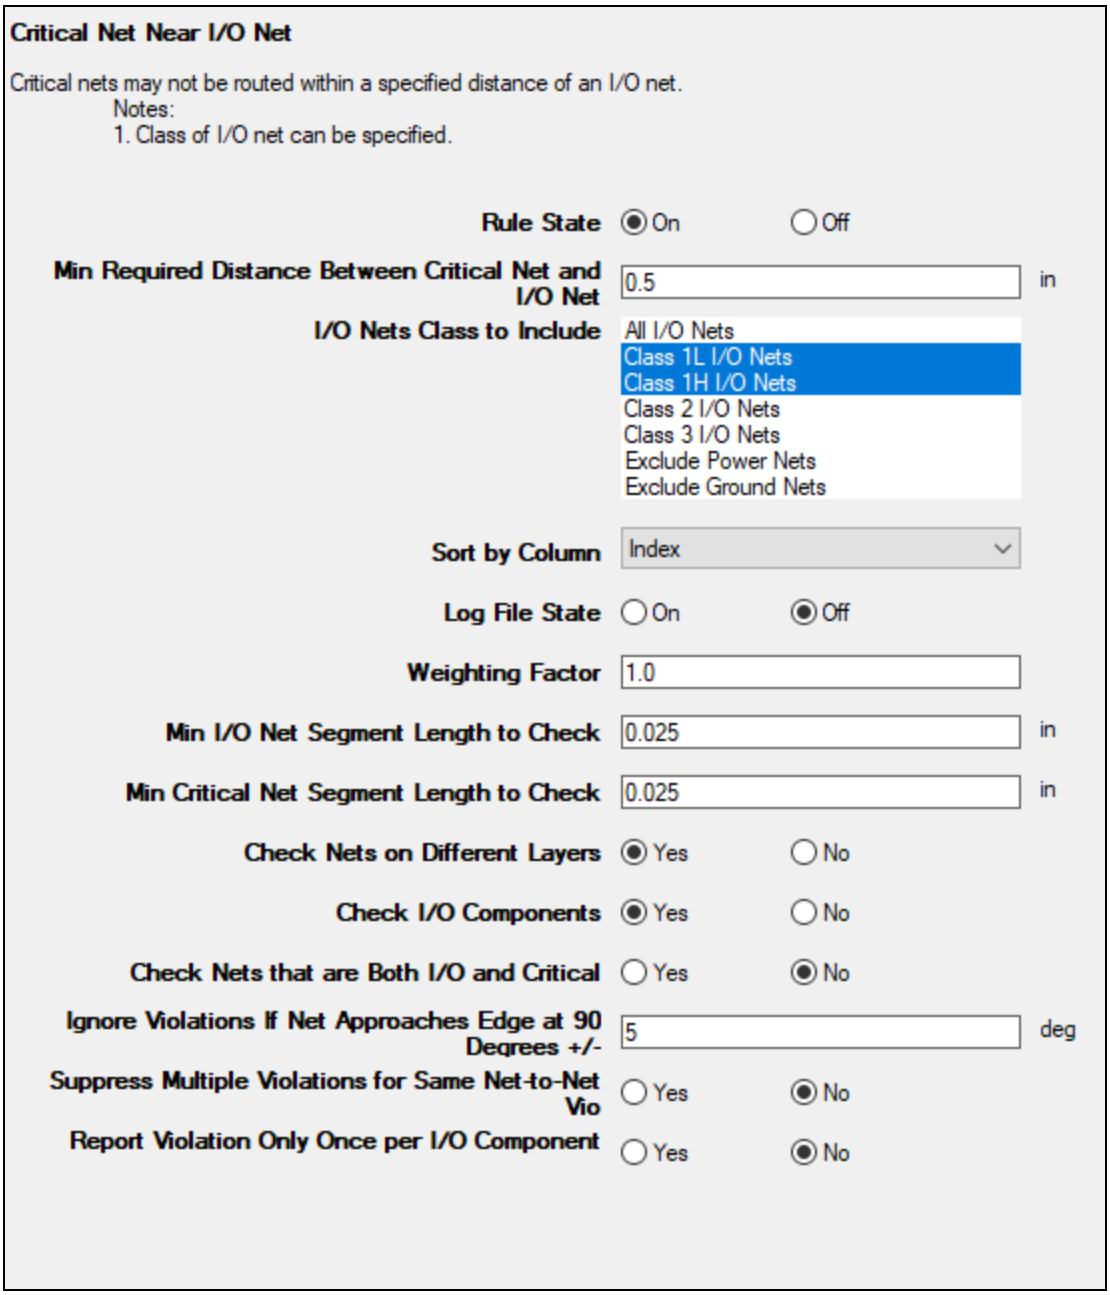
1. Launch EMI Scanner.

   The **EMI Scanner** window opens, on the **Rules** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **Rules** pane, select one of the six subcategories under **Wiring/Crosstalk**:
   - **Critical Net Near I/O Net** – displays **Critical Net Near I/O Net** rule configuration.



This rule states that critical nets may not be routed within a specified distance from an I/O net.

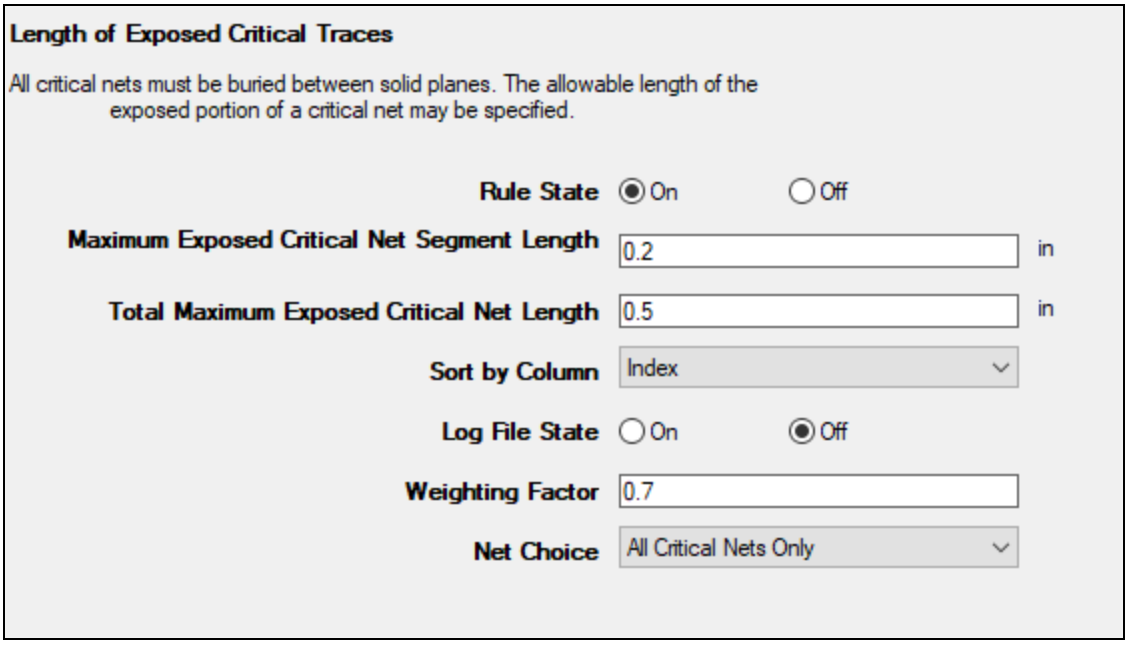
From here, set the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Rule State** – toggles Critical Net Near I/O Net rules on or off.
- **Min Required Distance Between Critical Net and I/O Net** – specifies the minimum distance between all critical nets and all I/O nets.
- **I/O Nets Class to Include** – specifies the type(s) of I/O Nets to include. Select one, or **Ctrl**+click to select multiple types. See Technical Note.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Min I/O Net Segment Length to Check** – specifies the smallest I/O net segment length to check for violations. EMI Scanner ignores All I/O net segments smaller than this length.
- **Min Critical Net Segment Length to Check** – specifies the smallest critical net segment length to check for violations. EMI Scanner ignores all critical net segments smaller than this length.
- **Check Nets on Different Layers** – determines whether to check the distance between I/O nets and critical nets when these nets are on different layers and between the same pair of planes.
- **Check I/O Components** – determines whether any I/O component that is in the specified distance from a critical net causes a violation.
- **Check Nets that are Both I/O and Critical** – determines whether nets labeled as both critical and I/O should be checked for distance from other I/O nets.
- **Ignore Violations If Net Approaches Edge at 90 Degrees +/-** – EMI scanner ignores edge connectors that approach the edge of the reference plane or board at a 90 degree angle, tolerating approaches slightly off a perfect 90 degrees.
- **Suppress Multiple Violations for Same Net-to-Net Ratio** – determines whether to suppress multiple violation reporting when multiple segments on a critical net infringe on the same I/O net.
- **Report Violation Only Once per I/O Component** – reduces run time by checking only for violations between critical nets and I/O components when no other violation has been found for an I/O component.

- **Exposed Critical Trace Length** – displays **Length of Exposed Critical Traces** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



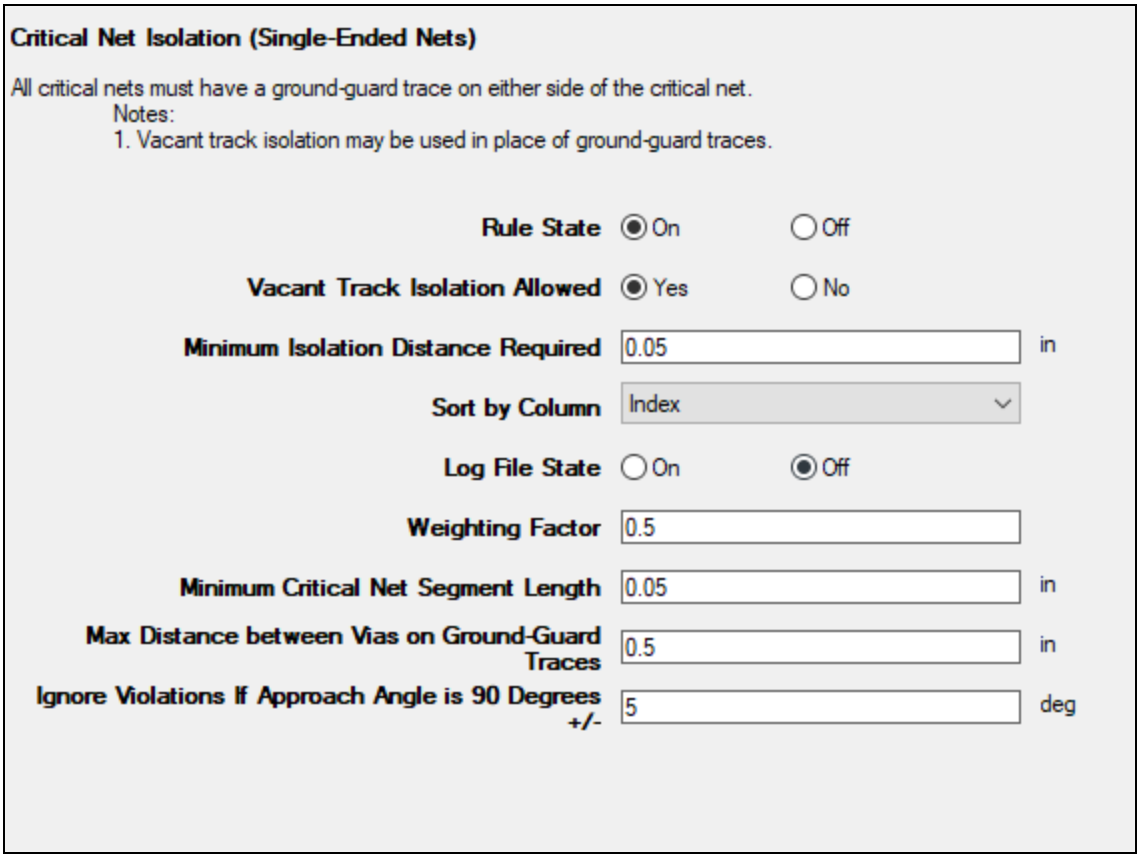
This rule states that all critical nets must be buried between solid planes.

From here, set the following:

- **Rule State** – toggles Exposed Critical Trace Length rules on or off.
- **Maximum Exposed Critical Net Segment Length** – specifies the maximum critical net segment length allowed on external (exposed) layers.
- **Total Maximum Exposed Critical Net Length** – specifies the total maximum critical net length allowed on external (exposed) layers (e.g., multiple segments on a critical net may be exposed, but short enough not to cause a violation individually).
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Critical Net Isolation** – displays **Critical Net Isolation (Single-Ended Nets)** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This rule states that all critical nets must have empty tracks or a "ground-guard" trace on either side of the critical net.

From here, set the following:

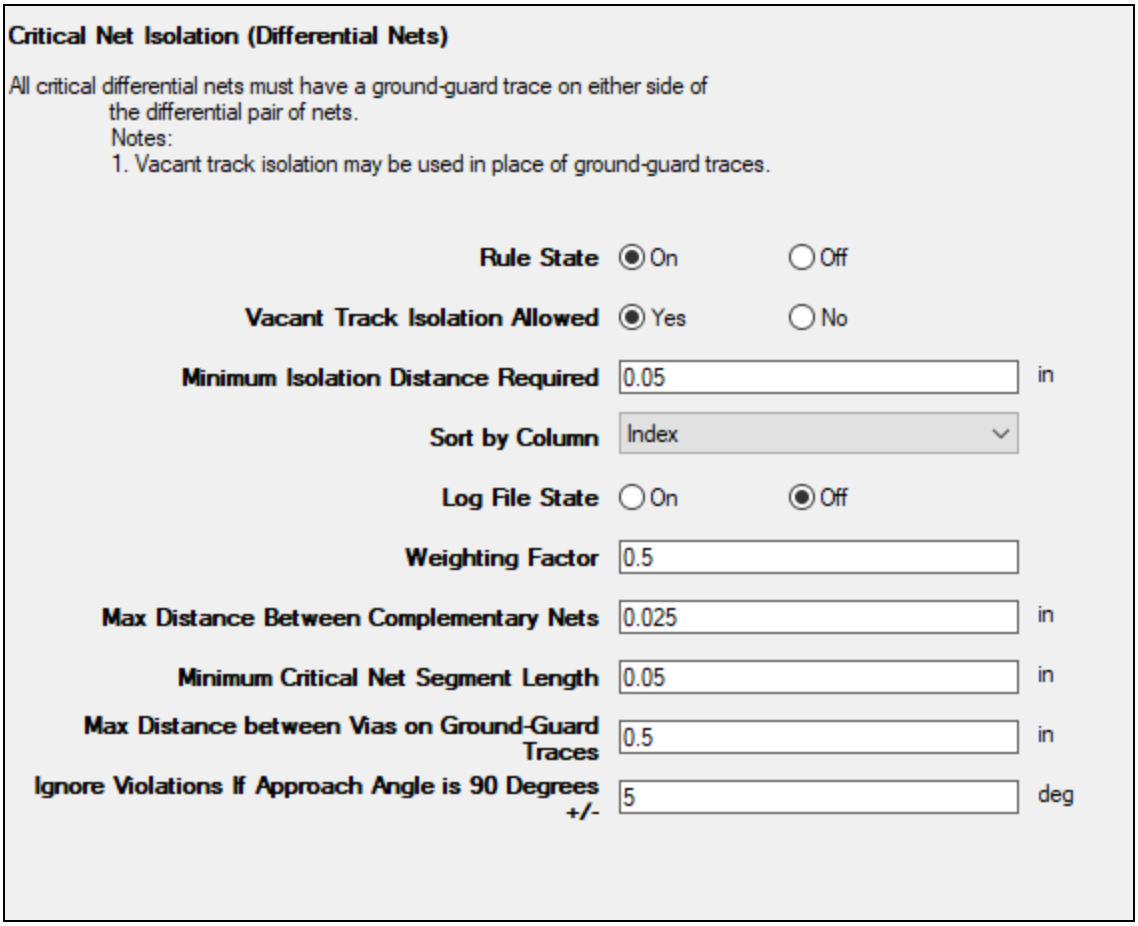
- **Rule State** – toggles Critical Net Isolation rules on or off.
- **Vacant Track Isolation Allowed** – specifies whether vacant tracks (empty space) may be used in place of ground-guard traces.
- **Minimum Isolation Distance Required** – selects the minimum edge-to-edge distance required between critical nets and all other nets before EMI Scanner reports a violation. Used in coordination with **Vacant Track Isolation Allowed**.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

- **Minimum Critical Net Segment Length** – specifies the minimum critical net segment length before EMI Scanner reports a violation. Segments shorter than this length is ignored.
- **Max Distance Between Vias on Ground-Guard Traces** – specifies the maximum distance between vias on ground-guard traces.
- **Ignore Violations If Approach Angle is 90 Degrees +/-** – EMI scanner ignores edge connectors that approach the edge of the reference plane or board at a 90 degree angle, tolerating approaches slightly off a perfect 90 degrees.

- **Critical Differential Net Isolation** – displays **Critical Net Isolation (Differential Nets)** rule configuration.



This rule states that all differential critical nets must have empty tracks or a "ground-guard" trace on either side of the differential pair.

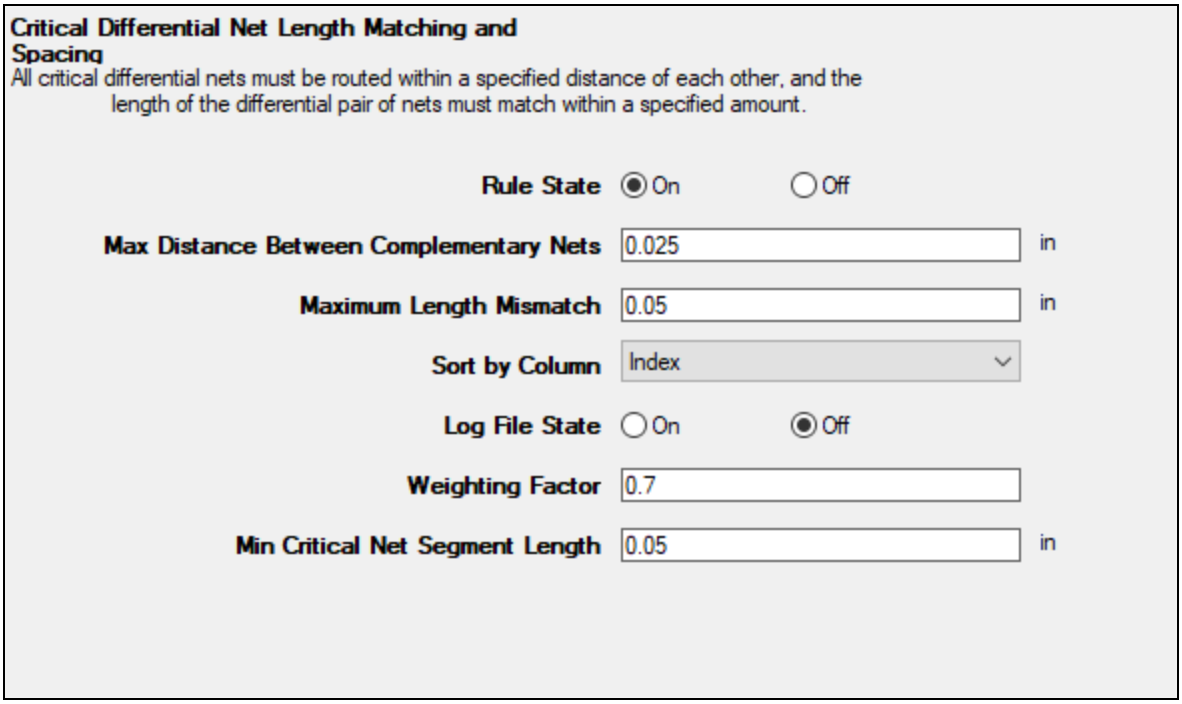
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

From here, set the following:

- **Rule State** – toggles Critical Differential Net Isolation rules on or off.
- **Vacant Track Isolation Allowed** – determines whether vacant tracks (empty space) may be used in place of ground-guard traces.
- **Minimum Isolation Distance Required** – when **Vacant Track Isolation Allowed** is selected, this setting determines the minimum edge-to-edge distance required between critical nets and all other nets before EMI Scanner reports a violation.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Max Distance Between Complementary Nets** – sets the maximum spacing between a pair of critical nets (creating a critical differential pair).
- **Minimum Critical Net Segment Length** – allows you to ignore short critical net segments by specifying the minimum critical net segment length before EMI Scanner reports a violation.
- **Max Distance between Vias on Ground-Guard Traces** – specifies the maximum distance between vias on ground-guard traces.
- **Ignore Violations If Approach Angle is 90 Degrees +/-** – EMI scanner ignores edge connectors that approach the edge of the reference plane or board at a 90 degree angle, tolerating approaches slightly off a perfect 90 degrees.

- **Critical Differential Net Matching** – displays **Critical Differential Net Length Matching and Spacing** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



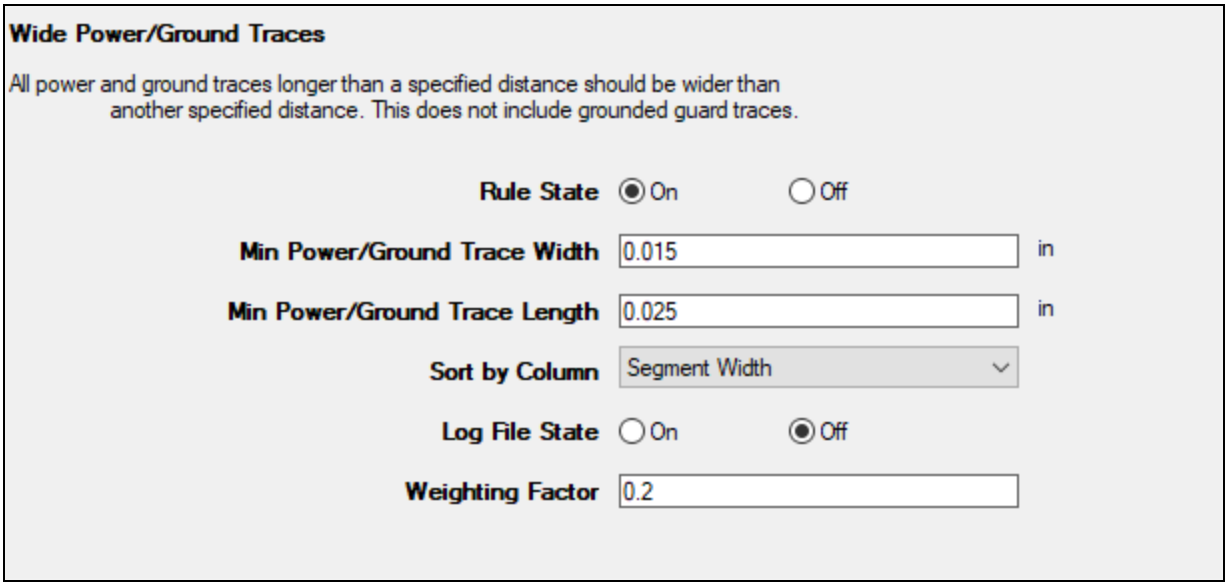
This rule states that all critical nets must be routed within a specified distance of each other, and the length of the differential pair must match within a specified amount.

From here, set the following:

- **Rule State** – toggles Critical Differential Net Matching rules on or off.
- **Max Distance Between Complementary Nets** – sets the maximum spacing between a pair of critical nets (creating a critical differential pair).
- **Maximum Length Mismatch** – specifies the maximum difference in length between a critical differential pair of nets.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Min Critical Net Segment Length** – allows you to ignore short critical net segments by specifying the minimum critical net segment length before EMI Scanner reports a violation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Wide Power/Ground Traces** – displays **Wide Power/Ground Traces** rule configuration.



This rule states that all power and ground traces longer than a specified distance must be wider than a specified amount.

From here, set the following:

- **Rule State** – toggles Wide Power/Ground Traces rules on or off.
- **Min Power/Ground Trace Width** – sets a minimum width limit for all power/ground traces (except grounded guard traces).
- **Min Power/Ground Trace Length** – specifies the smallest trace length to check for violations. EMI Scanner ignores traces smaller than this length.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

3. Rules are automatically saved for the current EMI scan. To save them for a future scan, click **Save Rules**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

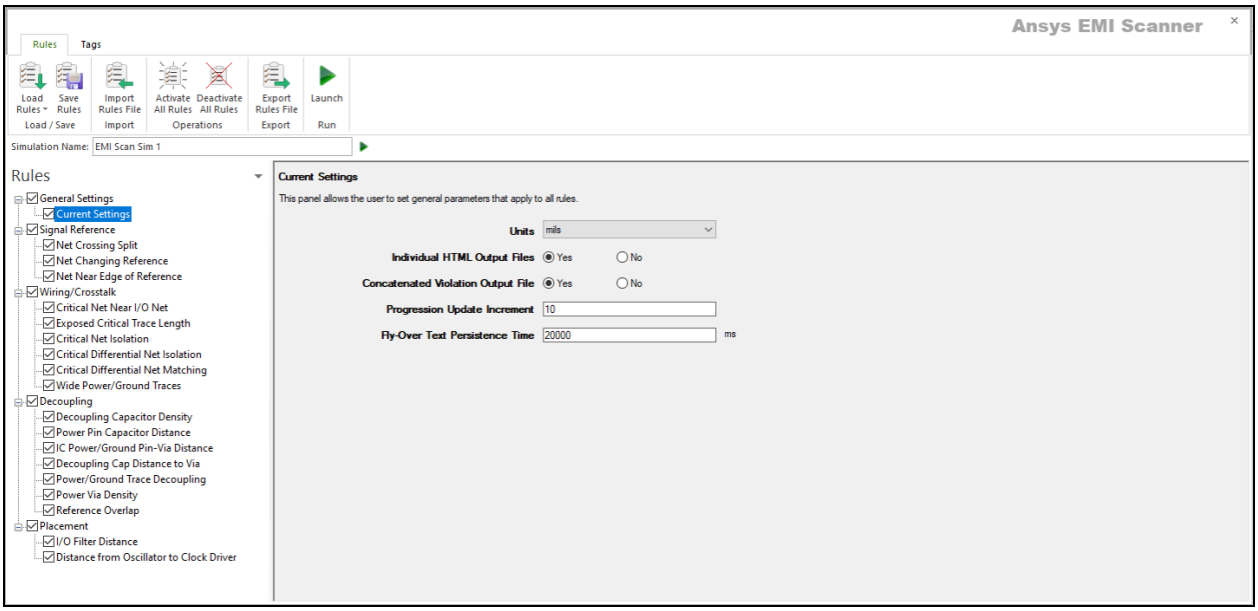
- You can display a description of a rule parameter at any time as with the cursor over it.
- Units of measure are set in General Settings.

Applying Decoupling Rules

To change EMI Scanner Decoupling rules:

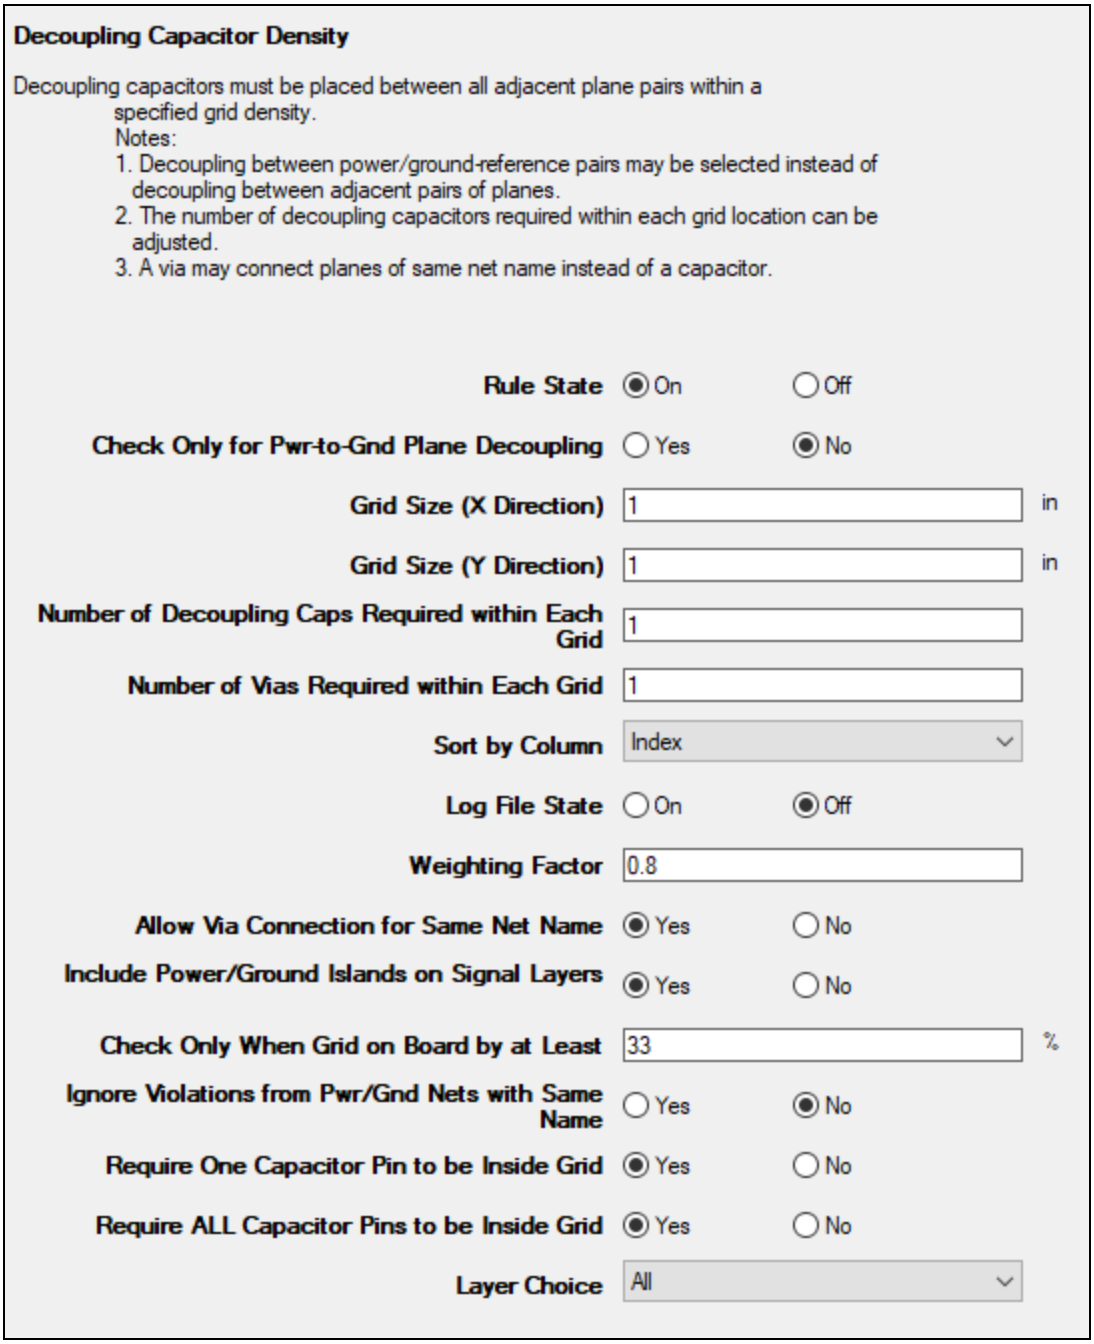
1. Launch EMI Scanner.

   The **EMI Scanner** window opens, on the **Rules** tab.



2. From the Rules pane, select one of the six subcategories under **Decoupling**:
   - **Decoupling Capacitor Density** – displays **Decoupling Capacitor Density** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This rule states that decoupling capacitors must be placed between all adjacent plane pairs within a specified grid density.

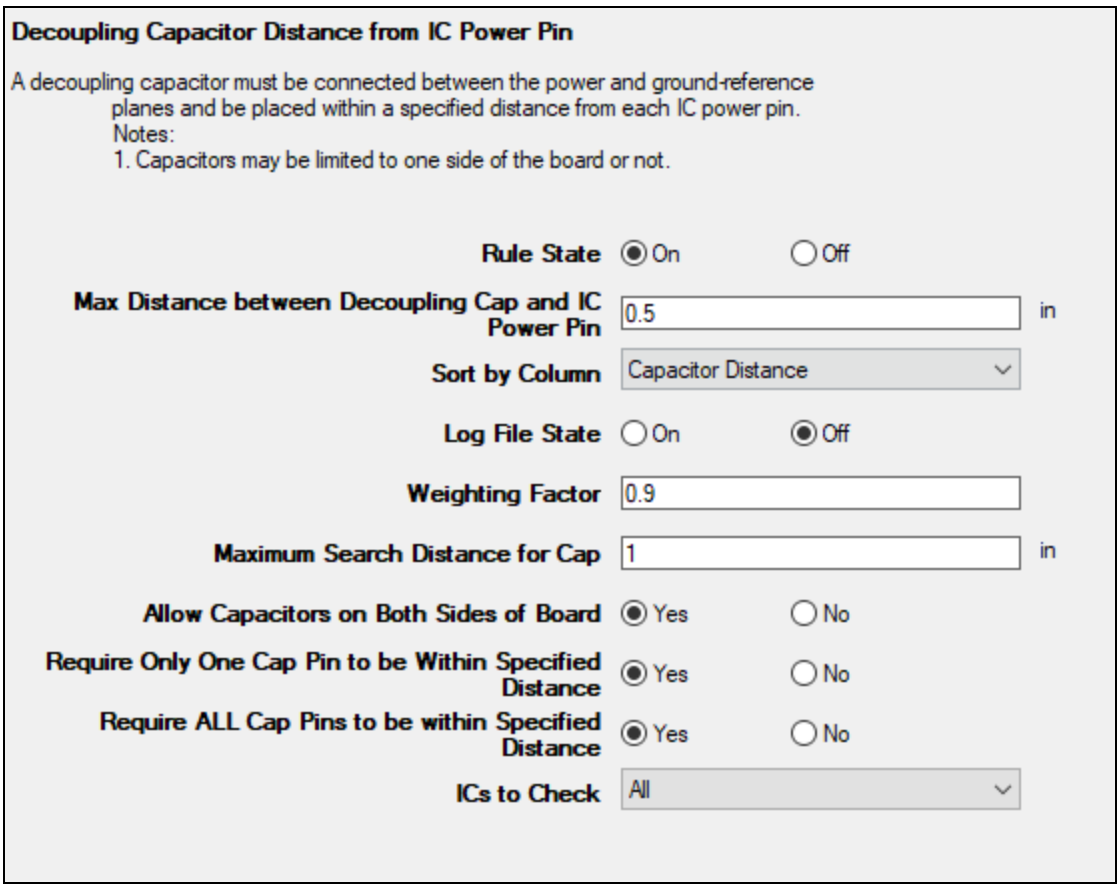
From here, set the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Rule State** – toggles Decoupling Capacitor Density rules on or off.
- **Check Only for Pwr-to-Gnd Plane Decoupling** – sets whether to ignore plane-to-plane decoupling and check only for decoupling capacitors between power and ground planes.
- **Grid Size (X Direction)** – specifies the size of the grid used to check for decoupling capacitors. Used in conjunction with **Grid Size (Y Direction)**.
- **Grid Size (Y Direction)** – specifies the size of the grid used to check for decoupling capacitors. Used in conjunction with **Grid Size (X Direction)**.
- **Number of Decoupling Caps Required within Each Grid** – specifies the number of decoupling capacitors connecting between planes that are required within each grid location.
- **Number of Vias Required within Each Grid** – specifies the number of vias connecting between planes that are required within each grid location. You must select **Allow Via Connection for Same Net Name** to use this option.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Allow Via Connection for Same Net Name** – determines whether EMI Scanner allows a via in place of a decoupling capacitor when the two planes are the same net name.
- **Include Power/Ground Islands on Signal Layers** – specifies whether to check for decoupling on power/ground islands.
- **Check Only When Grid on Board by at Least** – specifies the percentage of a grid that must be on the board in order for it to be checked.
- **Ignore Violations from Pwr/Gnd Nets with Same Name** – determines that only one plane of a given name is checked for violations (e.g., if two planes are "gnd" and a violation occurs between gnd and another layer, only one violation is reported).
- **Require One Capacitor Pin to be Inside Grid** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.
- **Require ALL Capacitor Pins to be Inside Grid** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.
- **Layer Choice** – specifies the layers to include in this rule analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Power Pin Capacitor Distance** – displays **Decoupling Capacitor Distance from IC Power Pin** rule configuration.



This rule states that a decoupling capacitor must be connected between the power and ground-reference planes and be placed within a specified distance of each IC power pin.

From here, set the following:

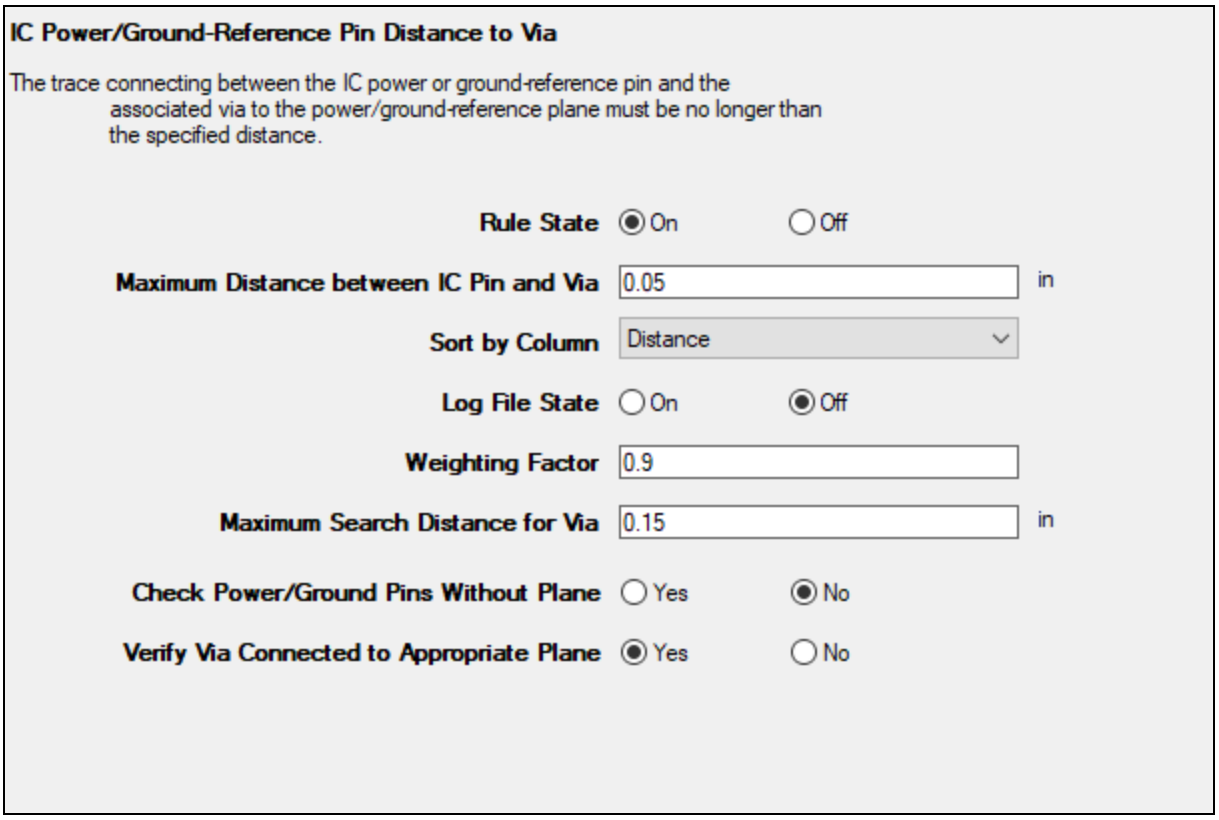
- **Rule State** – toggles Power Pin Capacitor Distance rules on or off.
- **Max Distance between Decoupling Cap and IC Power Pin** – specifies the maximum distance between an IC power pin and its decoupling capacitor.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

- **Maximum Search Distance for Cap** – specifies a maximum search distance for a capacitor. A larger search box increases the chances of EMI Scanner finding capacitors, but can slow processing time.
- **Allow Capacitors on Both Sides of Board** – specifies whether to include capacitors on both sides of the board.
- **Require Only One Cap Pin to be Within Specified Distance** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.
- **Require ALL Cap Pins to be within Specified Distance** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.
- **ICs to Check** – selects the types of components to include in this rule analysis.

- **IC Power/Ground Pin-Via Distance** – displays **IC Power/Ground-Reference Pin Distance to Via** rule configuration.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

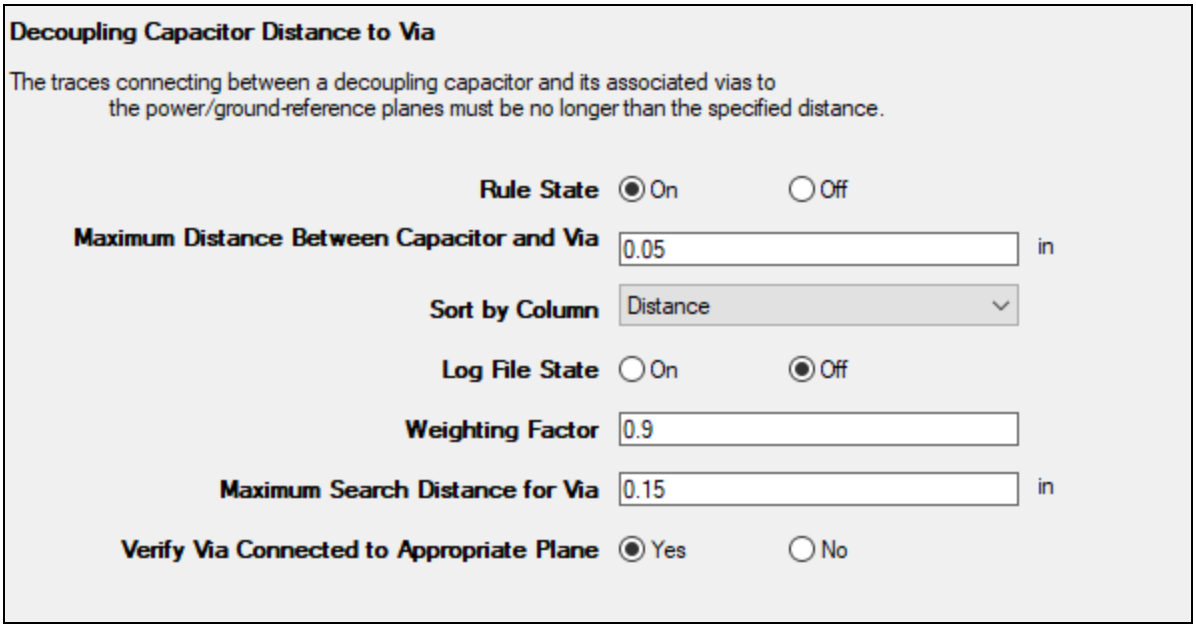
This rule states the trace connecting the IC power/ground reference pin to its associated via to the power/ground-reference plane must be no longer than a specified distance.

From here, set the following:

- **Rule State** – toggles IC Power/Ground Pin-Via Distance rules on or off.
- **Maximum Distance between IC Pin and Via** – specifies the maximum distance between the center of the IC power or ground-reference pin and the center of the via to the power or ground-reference plane.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Maximum Search Distance for Via** – specifies a maximum search distance for a via when a violation is found. This allows you to spot vias that are barely outside the original requirement and therefore not serious violations.
- **Check Power/Ground Pins Without Plane** – checks the distance between the IC power/ground pin and its via when the power/ground plane has not been completed yet.
- **Verify Via Connected to Appropriate Plane** – selecting 'no' speeds up EMI Scanner by not verifying the via connects to the selected plane (shape).

- **Decoupling Cap Distance to Via** – displays **Decoupling Capacitor Distance to Via** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



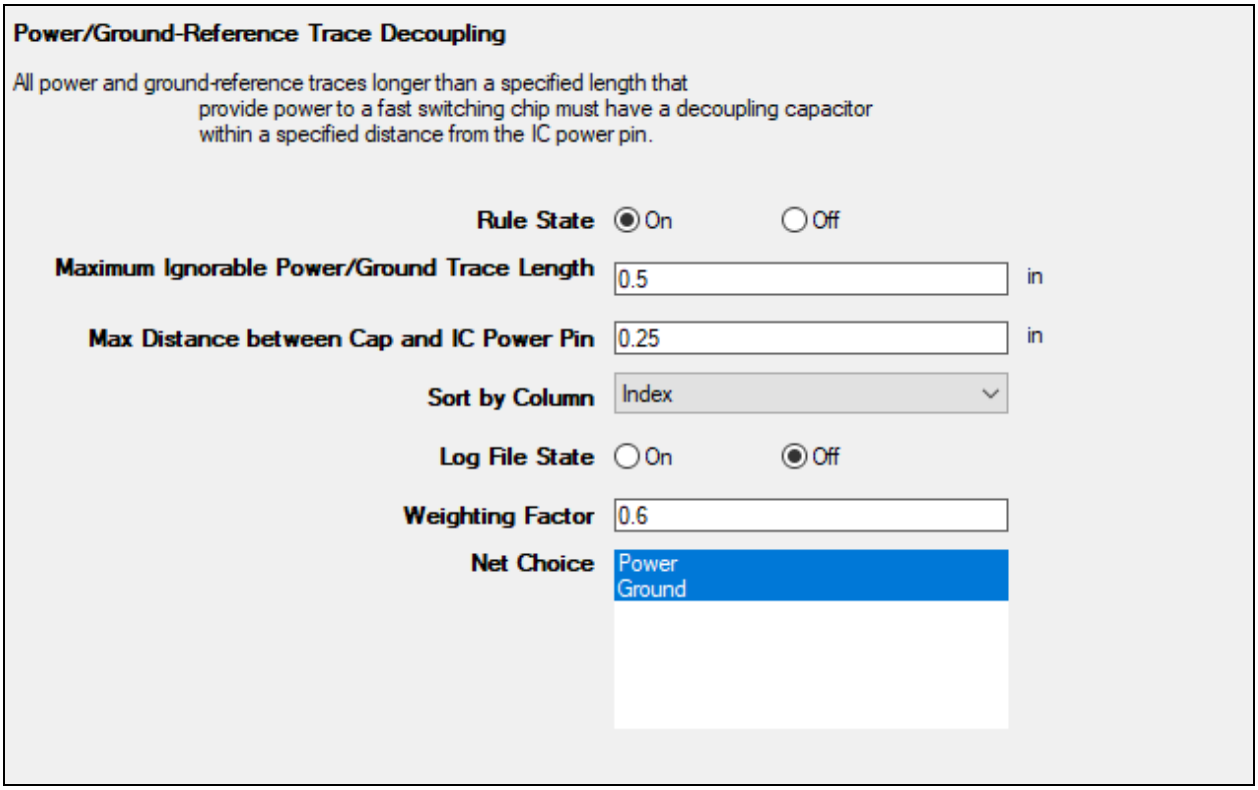
This rule states the trace connecting a decoupling capacitor to its associated via to the power/ground-reference plane must be no longer than the specified distance.

From here, set the following:

- **Rule State** – toggles Decoupling Cap Distance to Via rules on or off.
- **Maximum Distance Between Capacitor and Via** – specifies the maximum distance between the capacitor pin and the via to the power or ground-reference plane.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Maximum Search Distance for Via** – specifies a maximum search distance for a via when a violation is found. This allows you to spot vias that are barely outside the original requirement and therefore not serious violations.
- **Verify Via Connected to Appropriate Plane** – selecting 'no' speeds up EMI Scanner by not verifying the via connects to the selected plane (shape).

- **Power/Ground Trace Decoupling** – displays **Power/Ground-Reference Trace Decoupling** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This rule states that all power and ground-reference traces longer than a specified length must have a decoupling capacitor within a specified distance of the IC power pin.

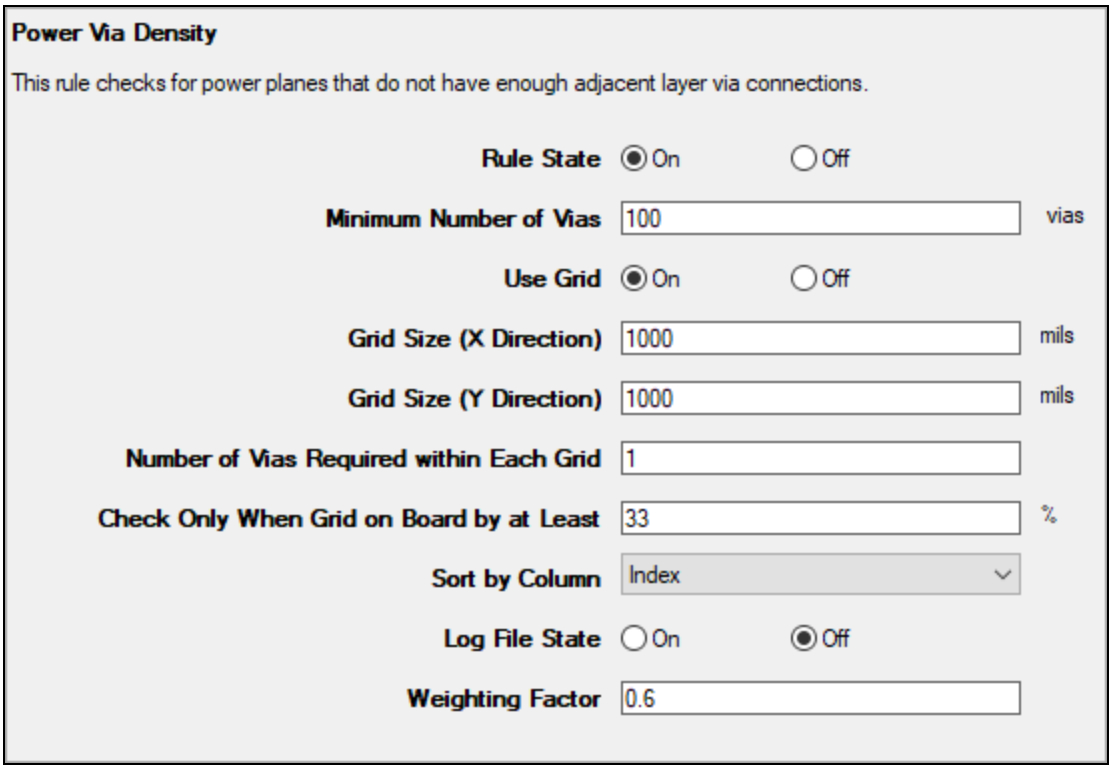
From here, set the following:

- **Rule State** – toggles Power/Ground Trace Decoupling rules on or off.
- **Maximum Ignorable Power/Ground Trace Length** – specifies the maximum power/ground trace length that may be ignored. All traces longer than this length must meet this rule's requirement.
- **Max Distance between Cap and IC Power Pin** – specifies the maximum distance between the capacitor pin and the power or ground-reference pin.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See: Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Power/Via Density** – displays **Power Via Density** rule configuration.



This rule checks for power planes that do not have enough adjacent layer via connections.

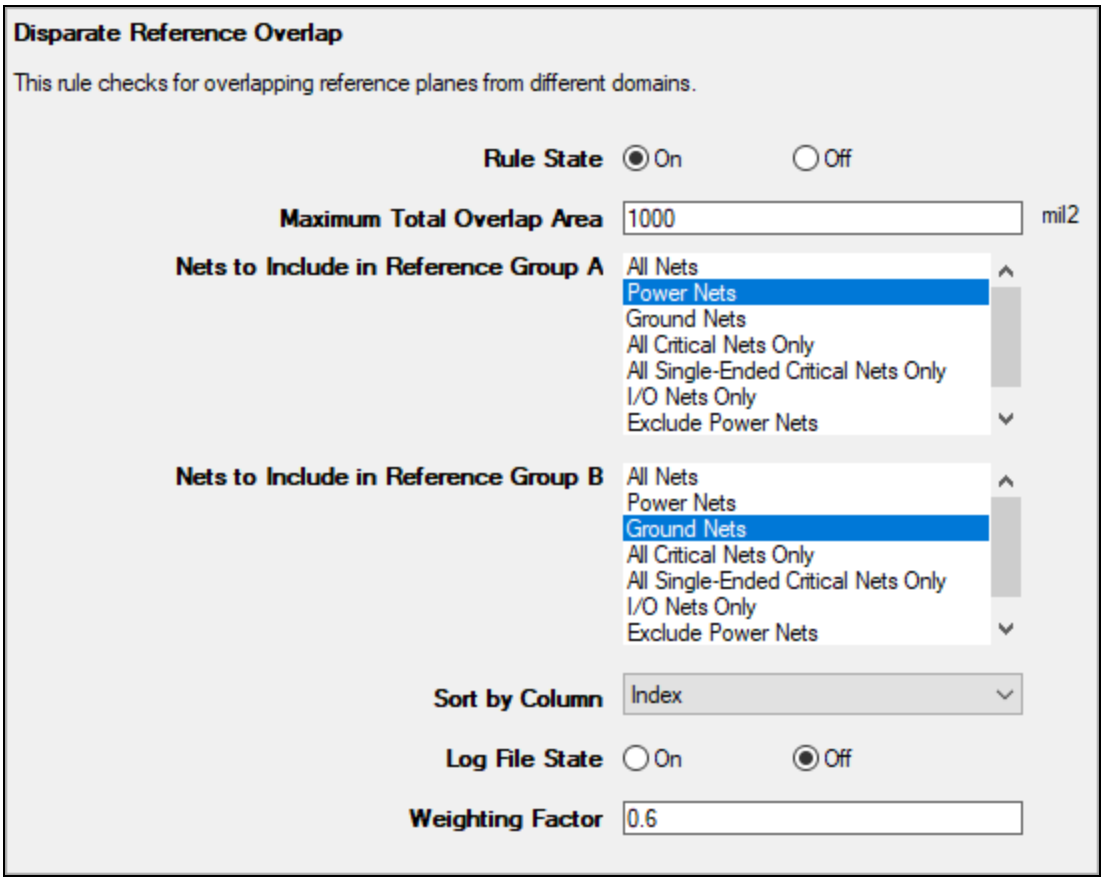
From here, you can set the following:

- **Rule State** – toggles Power Via Density rules on or off.
- **Minimum Number of Vias** – sets the minimum number of vias required to connect adjacent power planes.
- **Use Grid** – toggles the use of a grid on or off.
- **Grid Size (X Direction/Y Direction)** – when Use Grid is enabled, these fields specify the size of the grid.
- **Number of Vias Required within Each Grid** – when Use Grid is enabled, specifies the number of vias required within each grid.
- **Check Only When Grid on Board by at Least** – specifies the percentage of the grid that must be on the board for analysis to occur.
- **Sort by Column** – specifies the column by which results are sorted.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See: Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

- **Reference Overlap** – displays **Disparate Reference Overlap** rule configuration.



The Disparate Reference Overlap rule checks for overlapping reference planes from different domains.

From here, you can set the following:

- **Rule State** – toggles Disparate Reference Overlap on or off.
- **Maximum Total Overlap Area** – specifies the maximum overlap area that is acceptable. Overlap over this maximum will report a violation.
- **Nets to Include in Reference Group A** – selects a net type.
- **Nets to Include in Reference Group B** – selects a net type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See: Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

>

3. Rules are automatically saved for the current EMI scan. To save them for a future scan, click **Save Rules**.

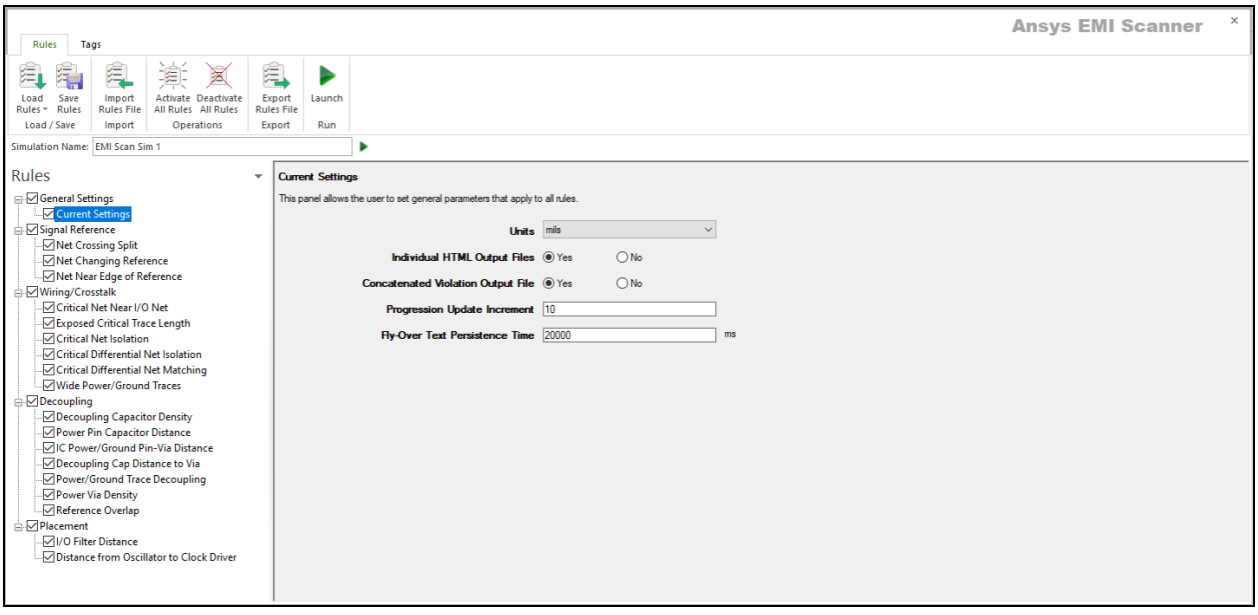
> **Note:**
>
> - You can display a description of a rule parameter as with the cursor over it.
> - Units of measure are set in General Settings.

Applying Placement Rules

To change EMI Scanner Placement rules:

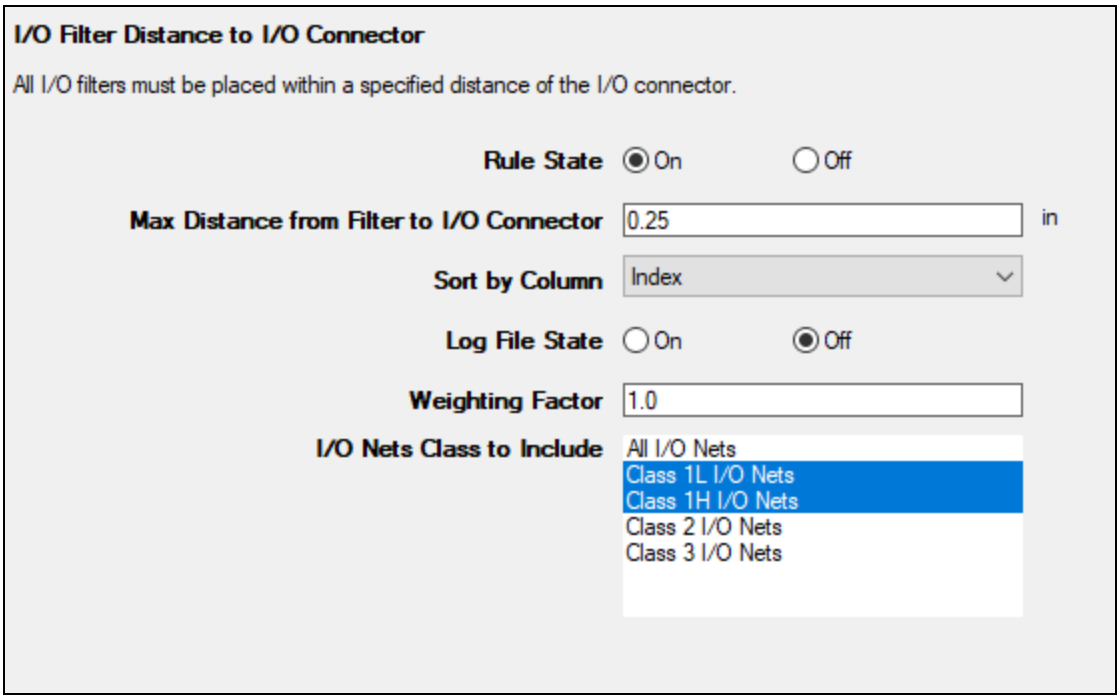
1. Launch EMI Scanner.

   The **EMI Scanner** window opens, on the **Rules** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the Rules pane, select one of the two subcategories under **Placement**:
    - **I/O Filter Distance** – displays the **I/O Filter Distance to I/O Connector** rule configuration.



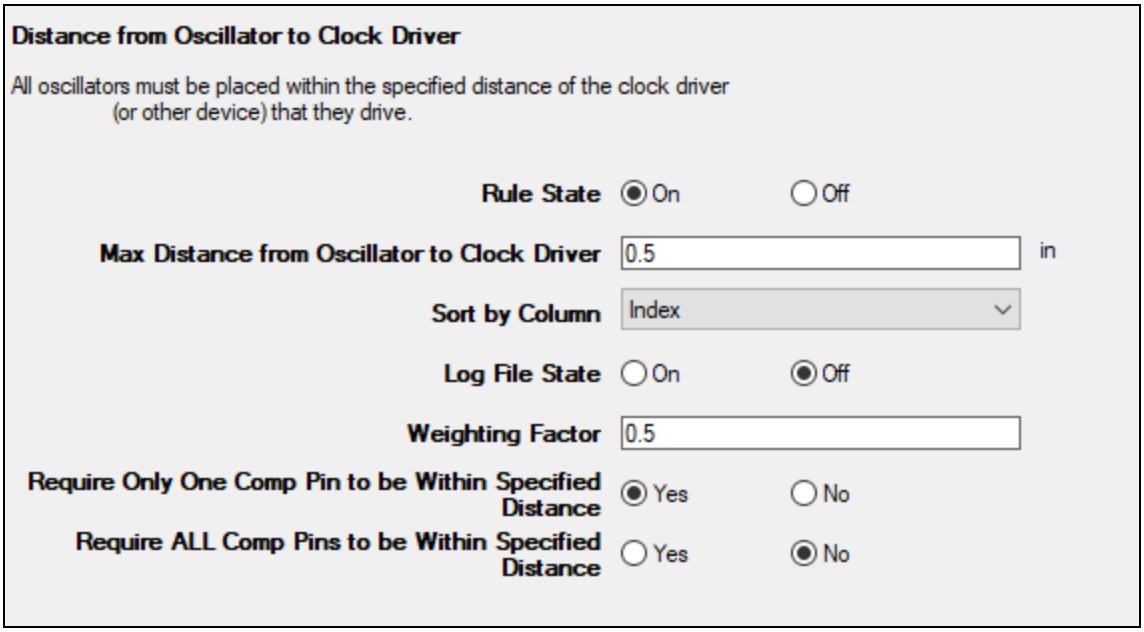
This rule states that all I/O filters must be placed within a specified distance of the I/O connector.

From here, set the following:

- **Rule State** – toggles I/O Filter Distance rules on or off.
- **Max Distance from Filter to I/O Connector** – specifies the maximum distance a filter may be placed on the I/O connector.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **I/O Nets to Include** – specifies the type(s) of I/O Nets to include. Select one, or **Ctrl**+click to select multiple types. See Technical Note.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Distance from Oscillator to Clock Driver** – displays the **Distance from Oscillator to Clock Driver** rule configuration.



This rule states that all oscillators must be placed within a specified distance on the clock driver or other device they drive.

From here, set the following:

- **Rule State** – toggles Distance from Oscillator to Clock Driver rules on or off.
- **Max Distance from Oscillator to Clock Driver** – specifies the distance within which all oscillators must be placed of the clock driver (or other device) they drive.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Require Only One Comp Pin to be Within Specified Distance** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Require ALL Comp Pins to be Within Specified Distance** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.

3. Rules are automatically saved for the current EMI scan. To save them for a future scan, click **Save Rules**.

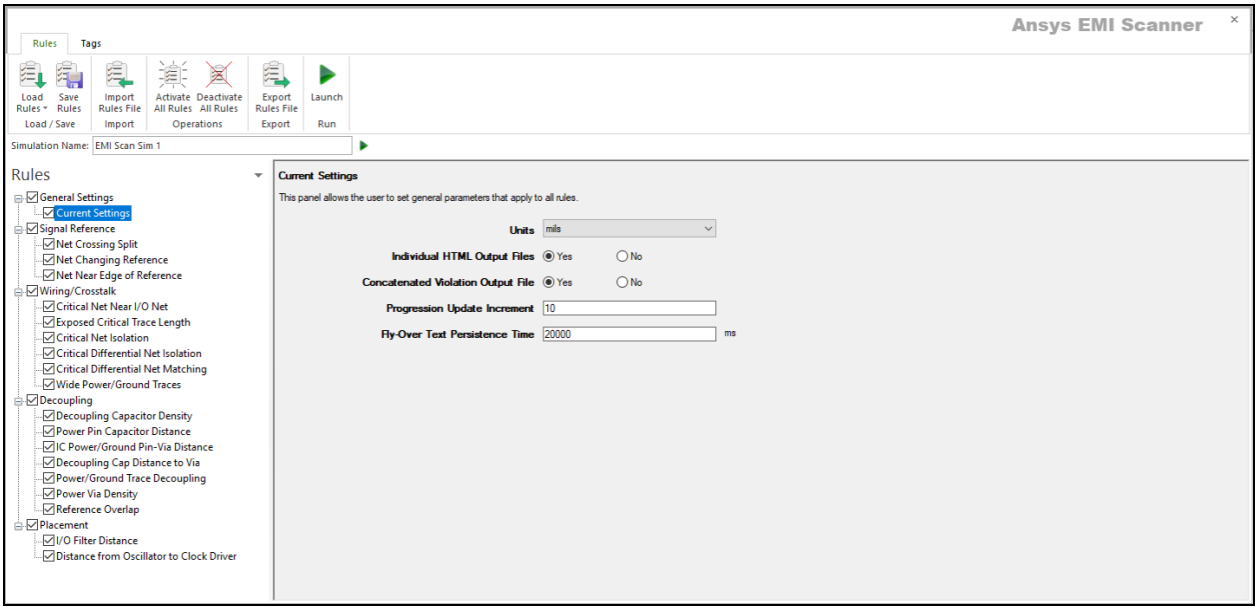
> **Note:**
>
> - You can display a description of a rule parameter at any time as with the cursor over it.
> - Units of measure are set in General Settings.

Applying Net Integrity Rules

To change EMI Scanner Net Integrity rules:

1. Launch EMI Scanner.

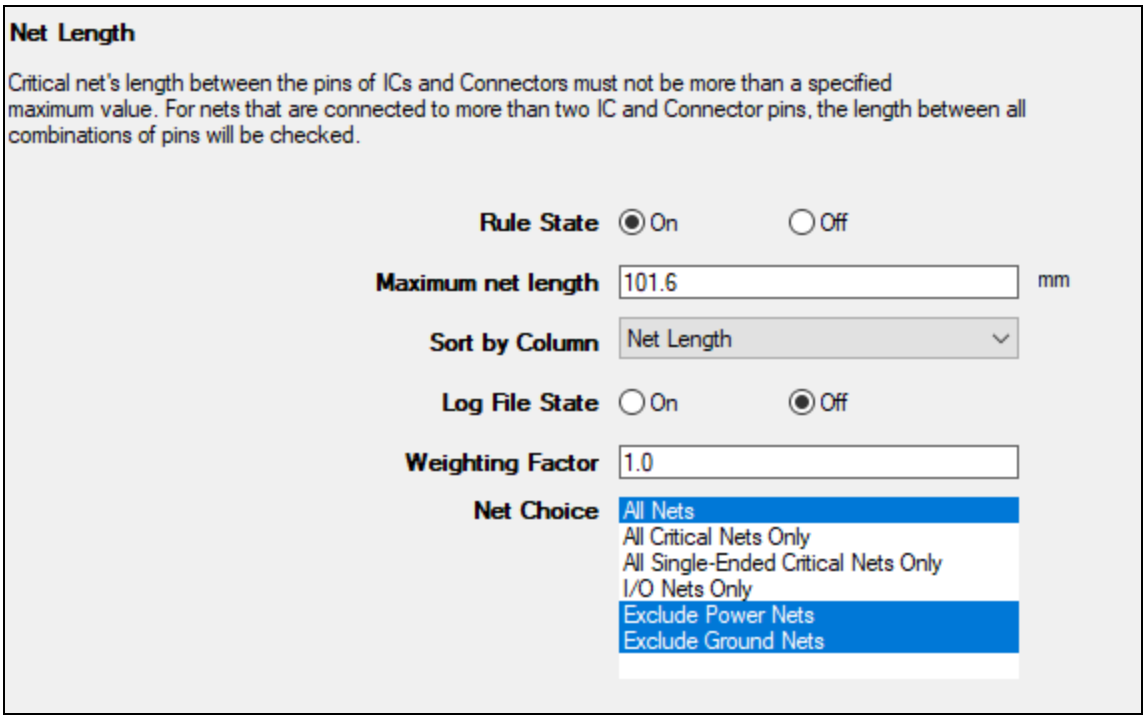
   The **EMI Scanner** window opens, on the **Rules** tab.



2. Click **Load Rules** and select a profile containing Signal Integrity rules (e.g., Default SI Rules Profile).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. From the Rules pane, select one of the eight subcategories under **Net Integrity**:
   - **Net Length** – displays the **Net Length** rule configuration.



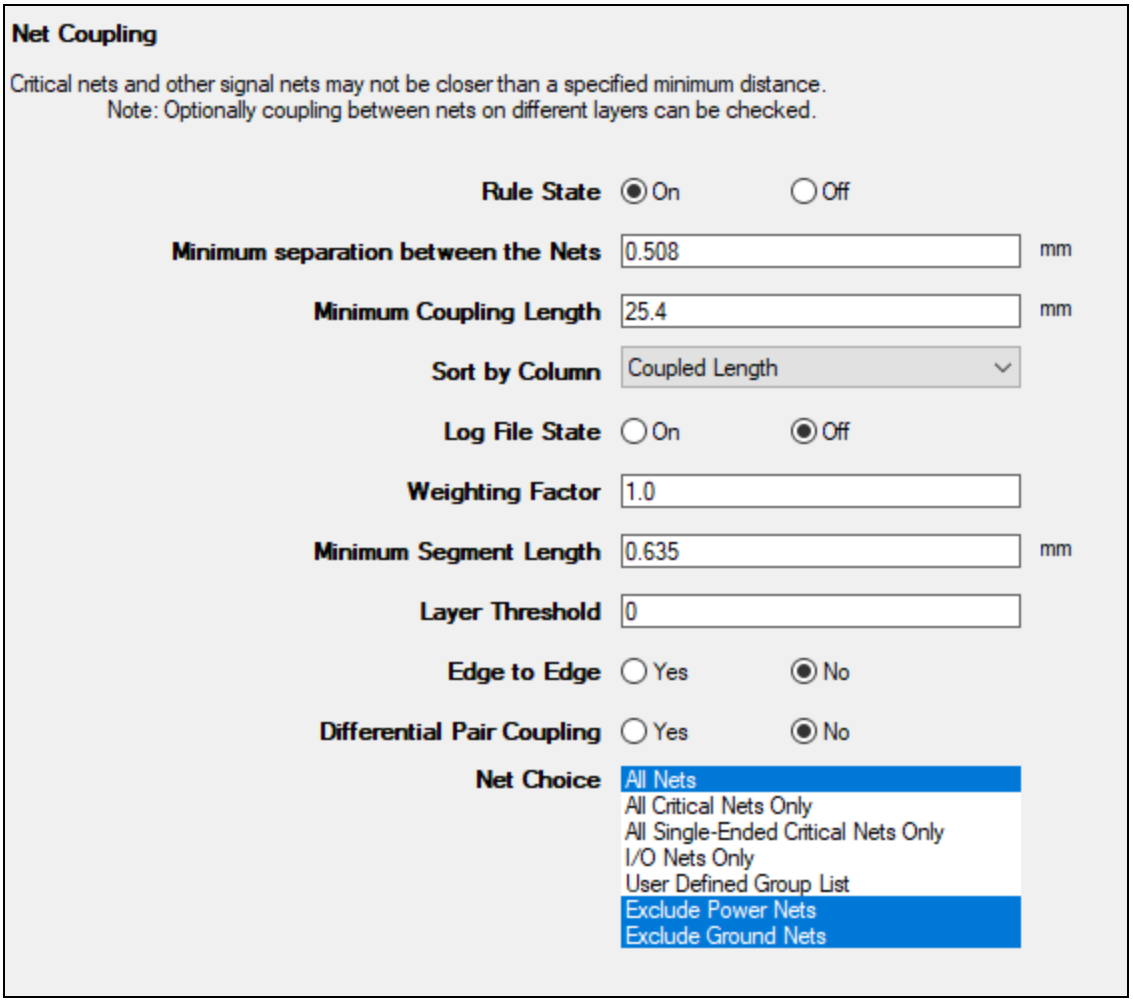
This rule states that a critical net's length between pins of ICs and Connectors must not be more than a specified value.

From here, you can set the following:

- **Rule State** – toggles Net Length rules on or off.
- **Maximum Net Length** – specifies the maximum net length.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Net to Net Coupling** – displays the **Net Coupling** rule configuration.



This rule states that critical nets and other signal nets may not be closer than a specified minimum distance.

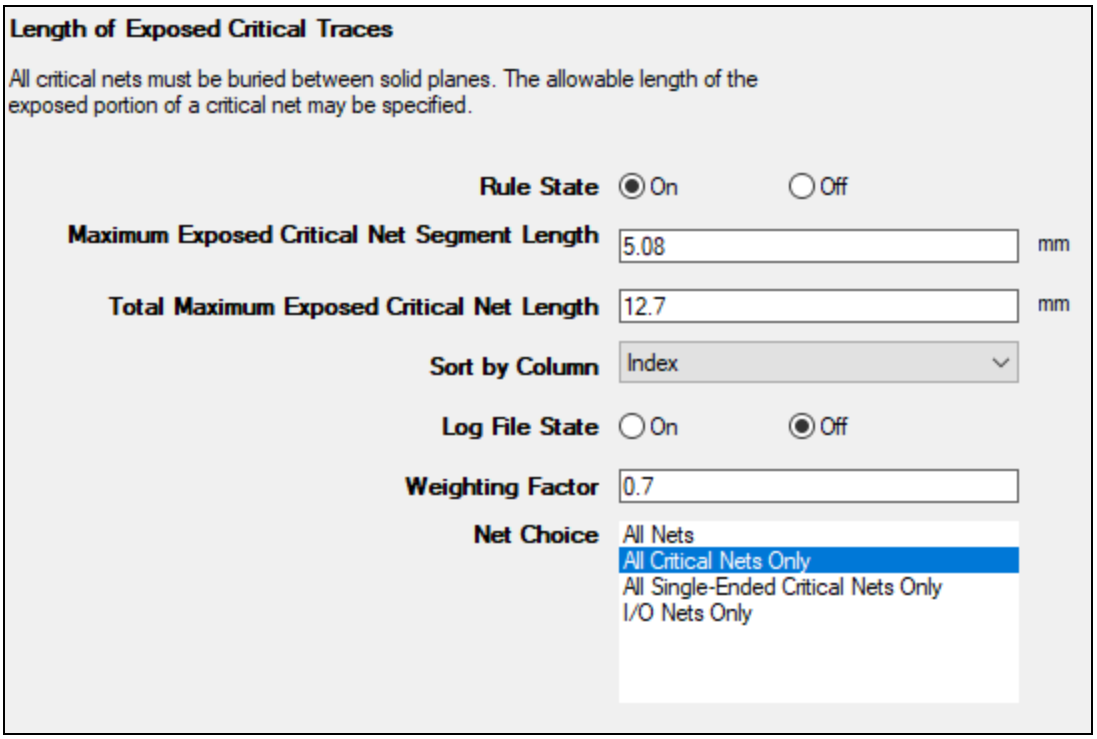
From here, you can set the following:

- **Rule State** – toggles Net Coupling rules on or off.
- **Minimum Separation Between the Nets** – controls how close the nets can be before they are considered coupled.
- **Maximum Coupling Length** – specifies how much coupling must exist before a violation is reported.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Minimum Segment Length** – specifies the smallest net segment length to check for coupling. Any segments smaller than this length will be ignored.
- **Layer Threshold** – sets the number of layers above and below to check for coupling (e.g., 0 = only the selected layer, 1 = the selected layer plus one layer above and one layer below).
- **Edge to Edge** – by default, the minimum distance between nets is based on center-to-center measurement. Selecting this option changes the measurement to edge-to-edge.
- **Differential Pair Coupling** – determines whether to allow or ignore coupling between the nets that make up a differential pair.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Exposed Critical Trace Length** – displays the **Length of Exposed Critical Traces** rule configuration.



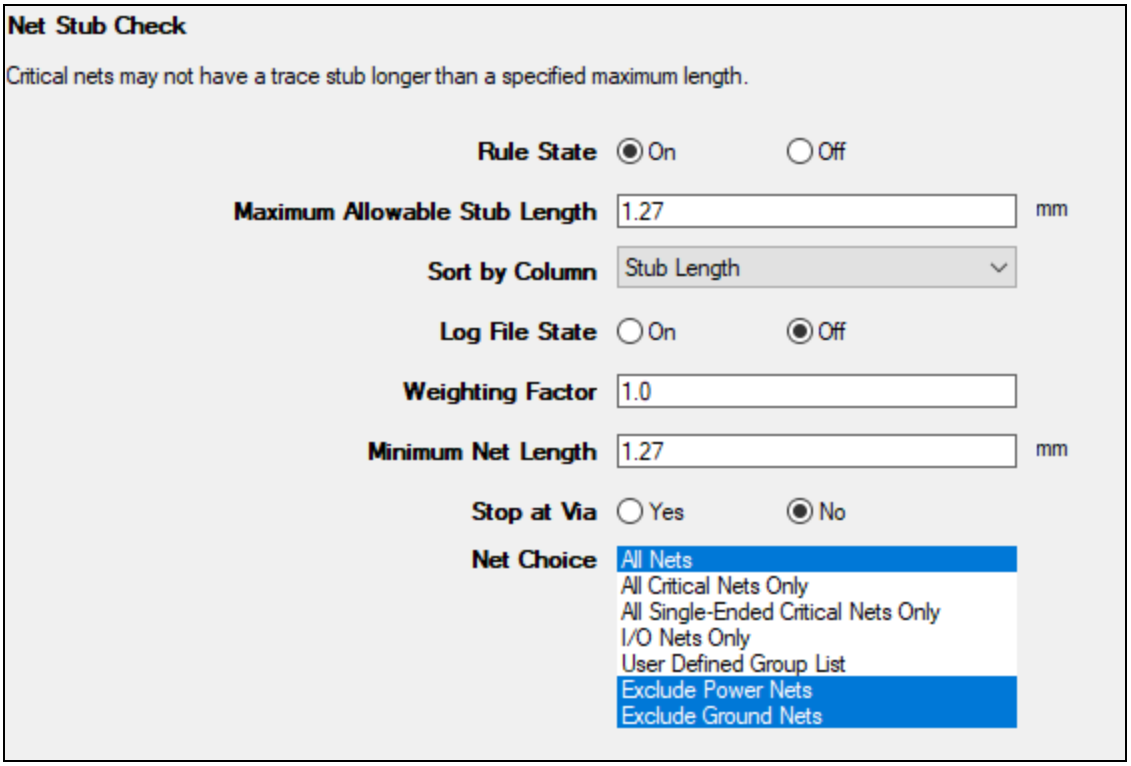
This rule states that all critical nets must be buried between solid planes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

From here, you can set the following:

- **Rule State** – toggles Net Length rules on or off.
- **Maximum Exposed Critical Net Segment Length** – specifies the maximum critical net segment length allowed on external (exposed) layers.
- **Total Maximum Exposed Critical Net Length** – specifies the total maximum critical net length allowed on external (exposed) layers (e.g., multiple segments on a critical net may be exposed, but short enough to not cause a violation individually).
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Net Stub** – displays the **Net Stub Check** rule configuration.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

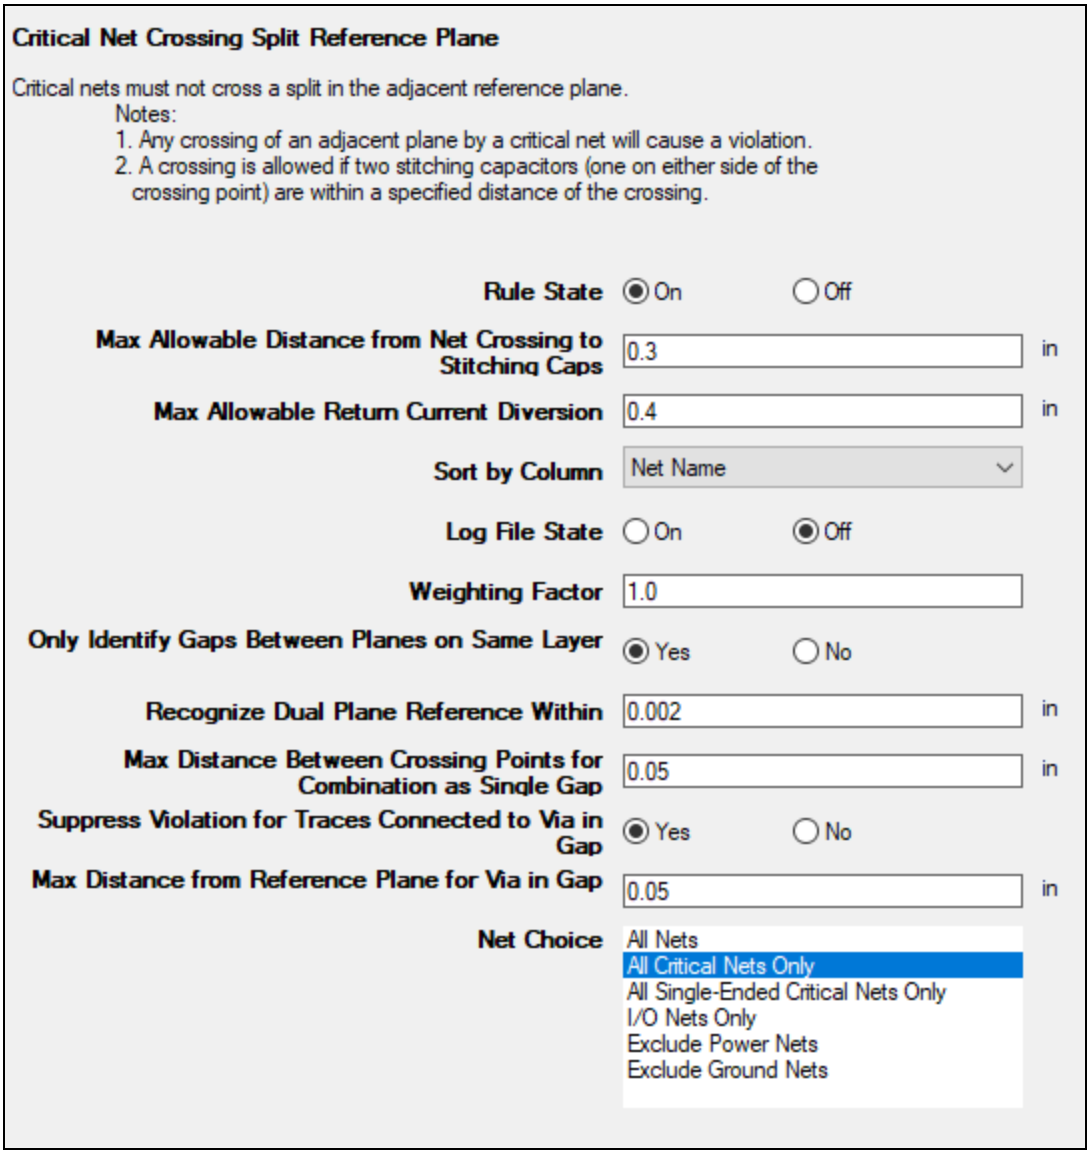
This rule states that critical nets may not have a trace stub longer than the specified maximum length.

From here, you can set the following:

- **Rule State** – toggles Net Stub Check rules on or off.
- **Maximum Allowable Stub Length** – specifies the maximum stub length. Stubs longer than this are violations.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Minimum Net Length** – sets the minimum length at which nets are included.
- **Stop at Via** – determines whether vias count as a stub termination condition. By defauly, the termination of a stub is a pin or a fork in the net, whichever is found first. Setting this parameter to 'yes' adds vias (to pins and forks) as a stub termination condition.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Net Crossing Split** – displays the **Critical Net Crossing Split Reference Plane** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This rule states that critical nets must not cross a split in the adjacent reference plane.

From here, you can set the following:

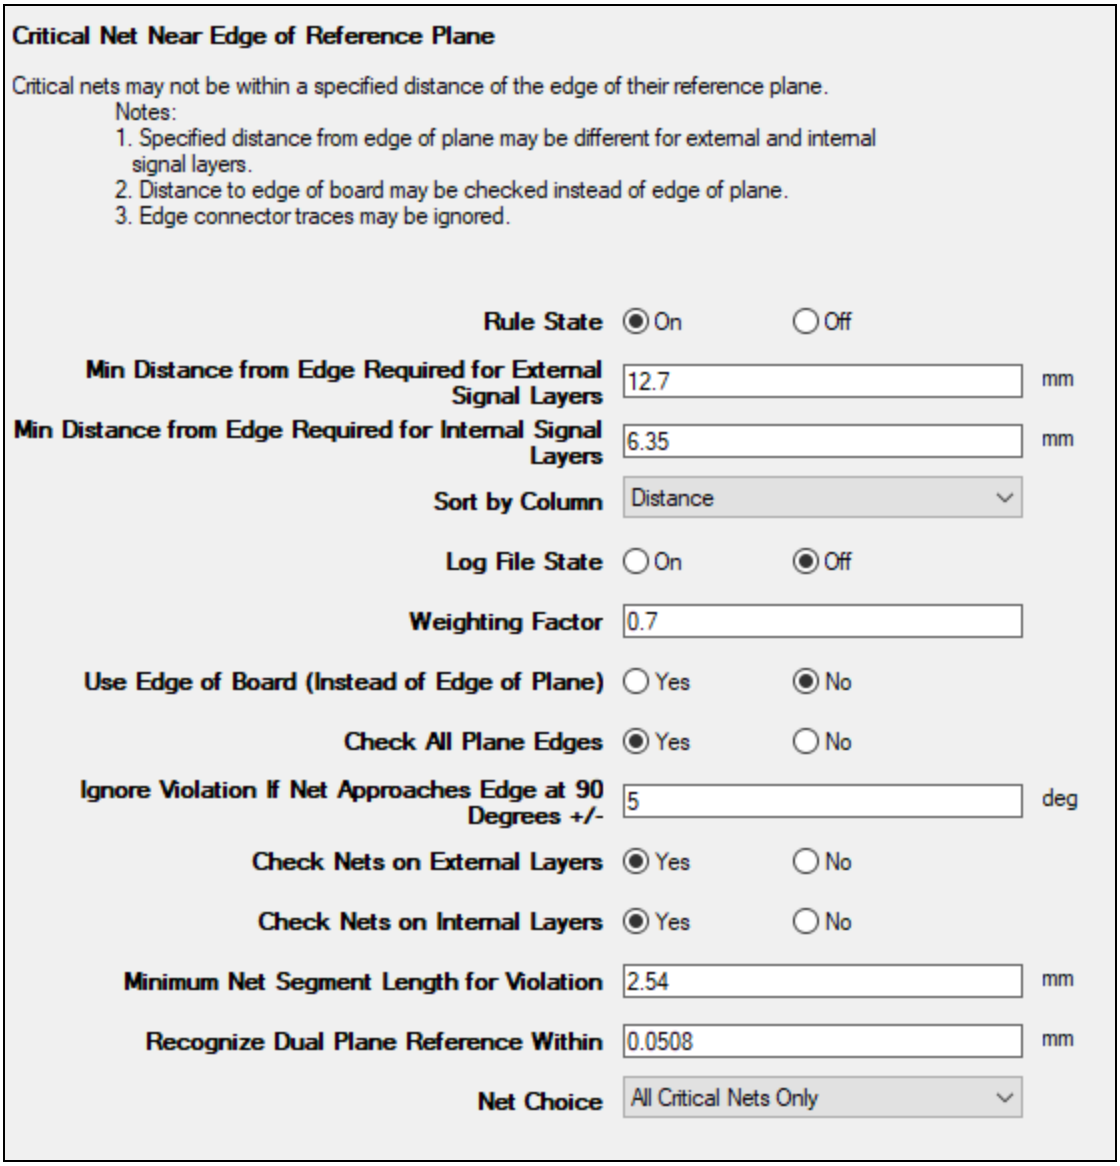
- **Rule State** – toggles Net Crossing Split rules on or off.
- **Max Allowable Distance from Net Crossing to Stitching Caps** – sets the distance on the point where the net crosses a split in its reference plane at which two stitching capacitors must be found.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Max Allowable Return Current Diversion** – determines whether a signal's return current can divert itself around the gap in the reference plane. The total distance of the diversion must be less than this value.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Only Identify Gaps Between Planes on Same Layer** – chooses whether gaps are only between planes on the same layer. When the rule tries to pair up nearby plane boundary crossing points and identify gaps, this parameter will enable or disable a check for layer commonality.
- **Recognize Dual Plane Reference Within** – specifies a distance and instructs EMI Scanner to consider both planes as a reference when checking for gap crossing when the distance difference to each plane is less than the specified distance. This allows recognition of both planes as references for strip line traces when the trace is offset on the exact center by a small amount (normally for manufacturing reasons).
- **Max Distance Between Crossing Points for Combination as a Single Gap** – specifies the distance under which nearby crossing points are combined into a single violation. Setting too large a value can cause the algorithm to pair up unrelated crossing points, and setting too small a value can prevent crossing points from being paired up, resulting in more violations. It is recommended to set the value slightly larger than the typical plane separation within a layer, based on the board design technology being used.
- **Suppress Violation for Traces Connected to Via in Gap** – instructs EMI Scanner whether to ignore trace crossing split/gap when connected to a via within that gap.
- **Max Distance from Reference Plane for Via in Gap** – specifies the maximum distance from edge of the reference plane to the via. Violations will not be suppressed (from above) for vias within gap if the trace extends greater than the specified distance.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Net Near Edge of Reference** – displays the **Critical Net Near Edge of Reference Plane** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This rule states that critical nets may not be within a specified distance of the edge of their reference plane.

From here, you can set the following:

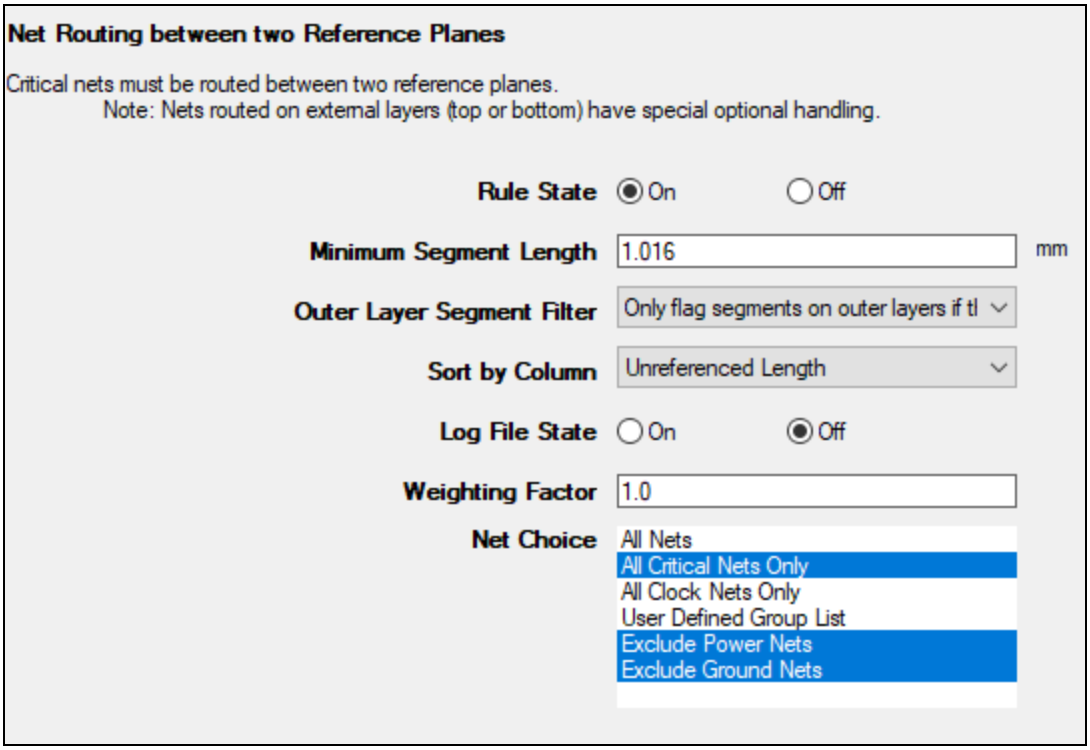
- **Rule State** – toggles Net Near Edge of Reference rules on or off.
- **Min Distance from Edge Required for External Signal Layers** – specifies the minimum distance that must exist between the edge of the reference plane and a critical signal net when the net is on an external layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Min Distance from Edge Required for Internal Signal Layers** – specifies the minimum distance that must exist between the edge of the reference plane and a critical signal net when the net is on an internal layer.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Use Edge of Board (Instead of Edge of Plane)** – allows EMI Scanner to check distance from critical nets to the edge of the board instead of the edge of the reference plane. This can be useful if the board is only partially complete and all reference planes are not yet completed.
- **Check All Plane Edges** – checks the distance from nets to any edge of their reference plane, rather than limiting the check to reference plane edges near the edge of the board.
- **Ignore Violation If Net Approaches Edge at 90 Degrees +/-** – EMI scanner ignores edge connectors that approach the edge of the reference plane or board at a 90 degree angle, tolerating approaches slightly off a perfect 90 degrees.
- **Check Nets on External Layers** – specifies whether nets on external layers should be checked.
- **Check Nets on Internal Layers** – specifies whether nets on internal layers should be checked.
- **Minimum Net Segment Length for Violation** – specifies the minimum net segment length before EMI Scanner will report a violation if the net is in the specified distance on the edge of the reference plane (or board).
- **Recognize Dual Plane Reference Within** – specifies a distance and instructs EMI Scanner to consider both planes as a reference when checking for traces too close to the edge of reference planes when the distance difference to each plane is less than the specified distance. This allows recognition of both planes as references for strip line traces when the trace is offset on the exact center by a small amount (normally for manufacturing reasons).
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Between Ref Plane Routing** – displays the **Net Routing Between Two Reference Planes** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



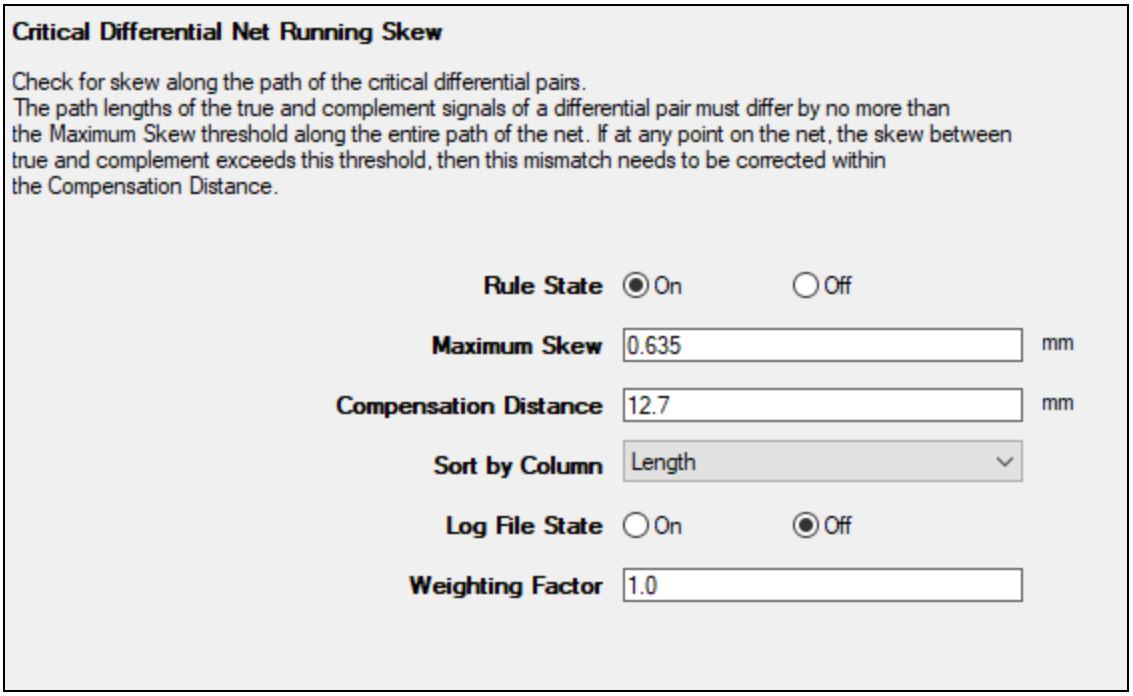
This rule states that critical nets must be routed between two reference planes.

From here, you can set the following:

- **Rule State** – toggles Net Routing Between Two Reference Planes rules on or off.
- **Minimum Segment Length** – specifies the minimum net segment length before EMI Scanner will report a violation.
- **Outer Layer Segment Filter** – specifies how segments on outer layers are treated.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Diff Running Skew** – displays the **Critical Differential Net Running Skew** rule configuration.



This rule checks for skew along the path of critical differential pairs.

From here, you can set the following:

- **Rule State** – toggles Diff Running Skew rules on or off.
- **Maximum Skew** – sets the maximum allowable skew.
- **Compensation Distance** – skew that exceeds the maximum allowable skew must be corrected within this distance.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

4. Rules are automatically saved for the current EMI scan. To save them for a future scan, click **Save Rules**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

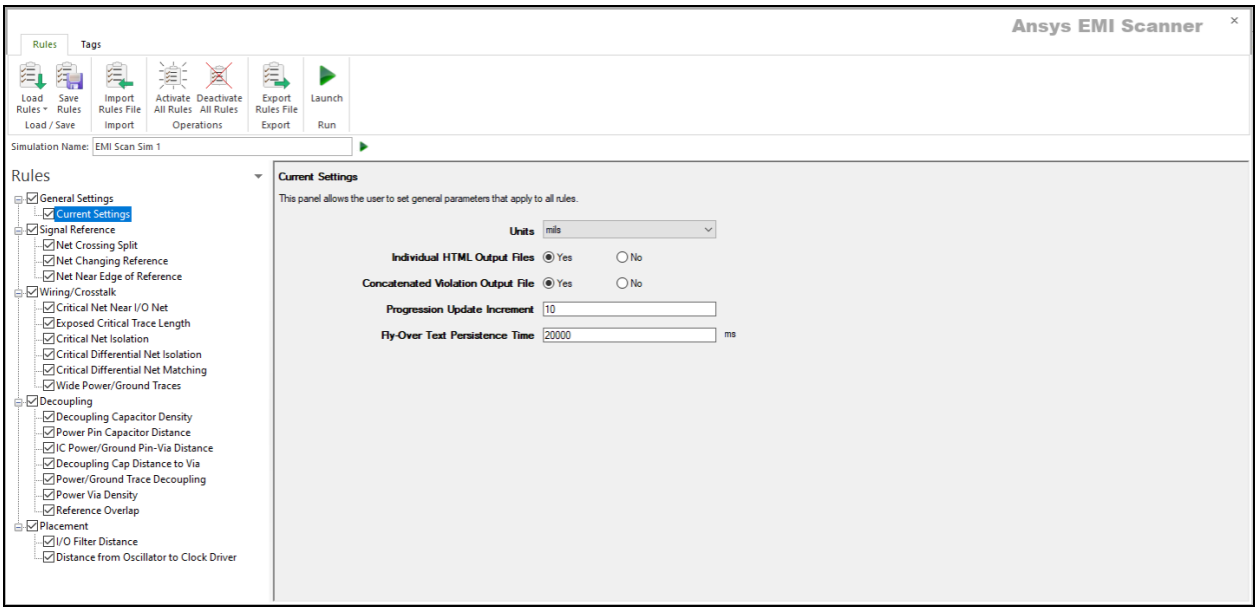
- You can display a description of a rule parameter at any time by hovering the cursor over it.
- Units of measure are set in General Settings.

Applying Via Integrity Rules

To change EMI Scanner Via Integrity rules:

1. Launch EMI Scanner.

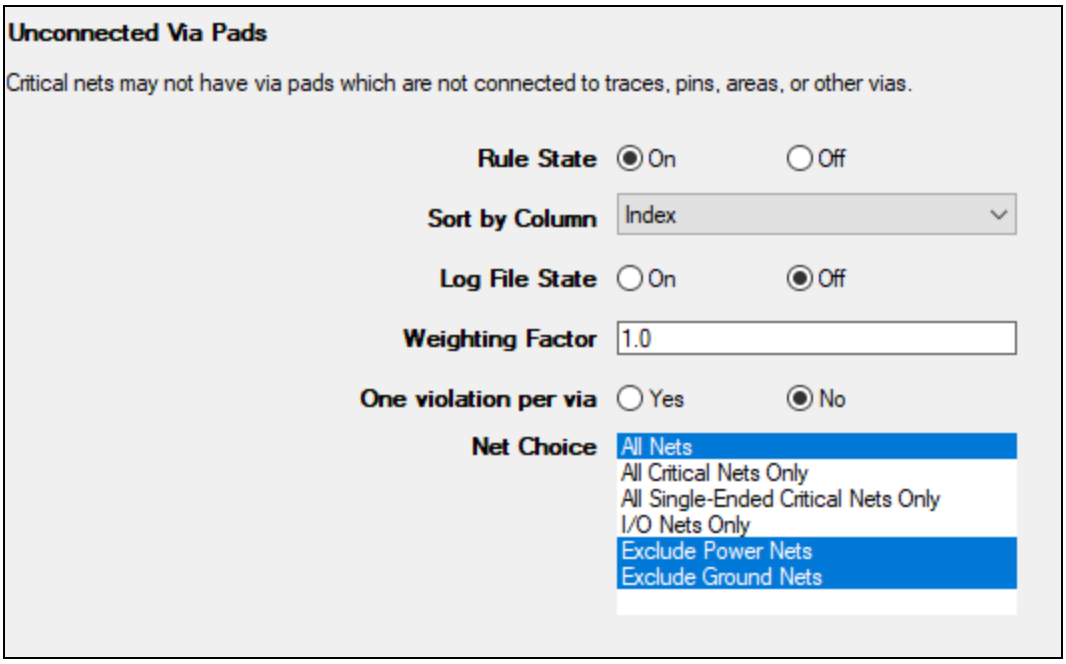
   The **EMI Scanner** window opens, on the **Rules** tab.



2. Select a profile containing Via Integrity rules (e.g., Default SI Rules Profile) on the **Load Rules** drop-down menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. From the Rules pane, select one of the four subcategories under **Via Integrity**:
   - **Unconnected Via Pads** – displays the **Unconnected Via Pads** rule configuration.



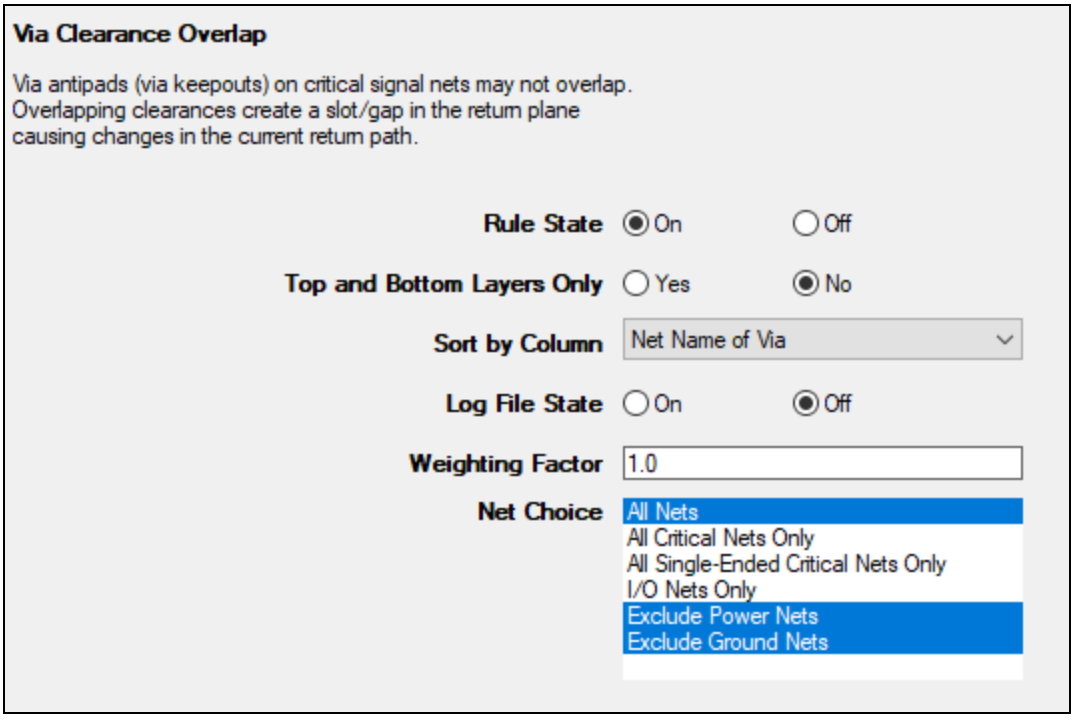
This rule states that critical nets may not have via pads that are not connected to traces, pins, areas, or other vias.

From here, set the following:

- **Rule State** – toggles Unconnected Via Pads rules on or off.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **One Violation Per Via** – when **Yes** is selected, multiple violations on a via are counted as one violation.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Via Clearance Overlap** – displays the **Via Clearance Overlap** rule configuration.



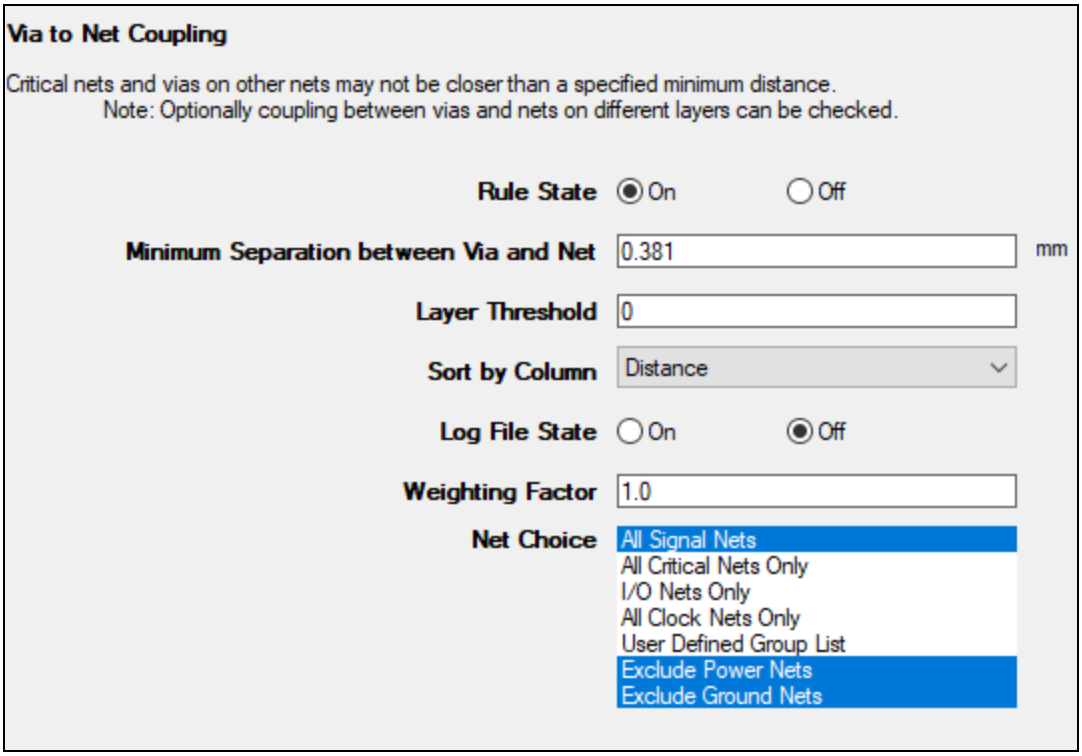
This rule states that via antipads on critical signal nets may not overlap.

From here, set the following:

- **Rule State** – toggles Via Clearance Overlap rules on or off.
- **Top and Bottom Layers Only** – limits analysis to the top and bottom layers only.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Via to Net Coupling** – displays the **Via to Net Coupling** rule configuration.



This rule states that critical nets and vias on other nets may not be closer than a specified minimum distance.

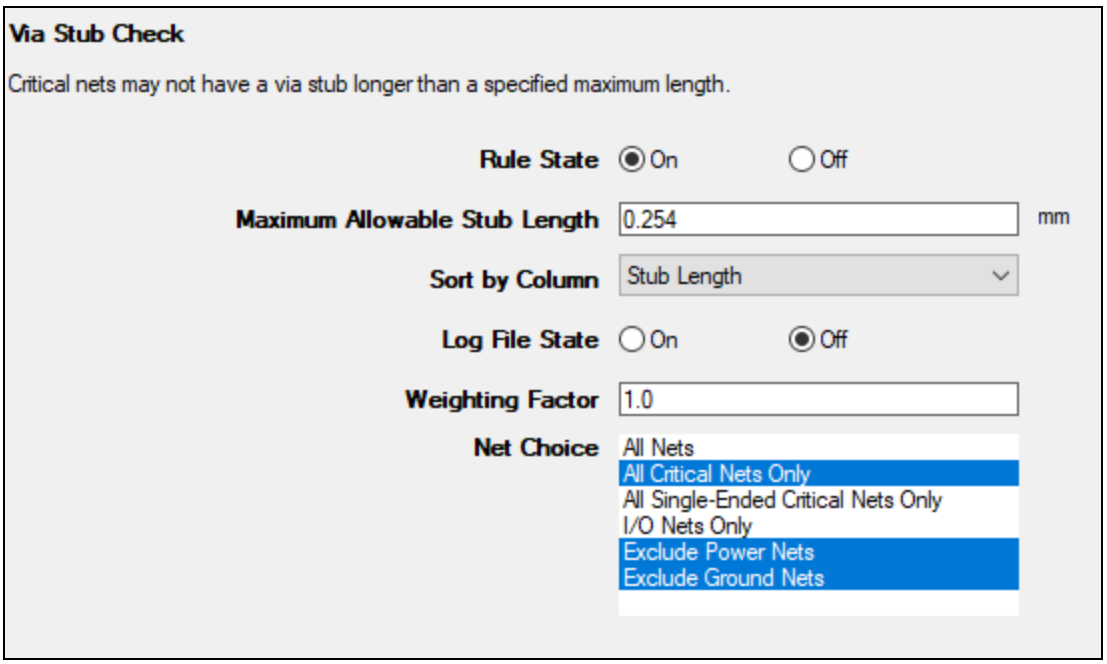
From here, set the following:

- **Rule State** – toggles Via to Net Coupling rules on or off.
- **Minimum Separation Between Via and Net** – controls how close the net and the via can be before they are considered coupled.
- **Layer Threshold** – sets the number of layers above and below to check for coupling (e.g., 0 = only the selected layer, 1 = the selected layer plus one layer above and one layer below).
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Via Stub** – displays the **Via Stub Check** rule configuration.



This rule states that critical nets may not have a via stub longer than a specified maximum length.

From here, set the following:

- **Rule State** – toggles Via Stub rules on or off.
- **Maximum Allowable Stub Length** – specifies the maximum stub length. Any stub longer than this setting is a violation.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Rules are automatically saved for the current EMI scan. To save them for a future scan, click **Save Rules**.

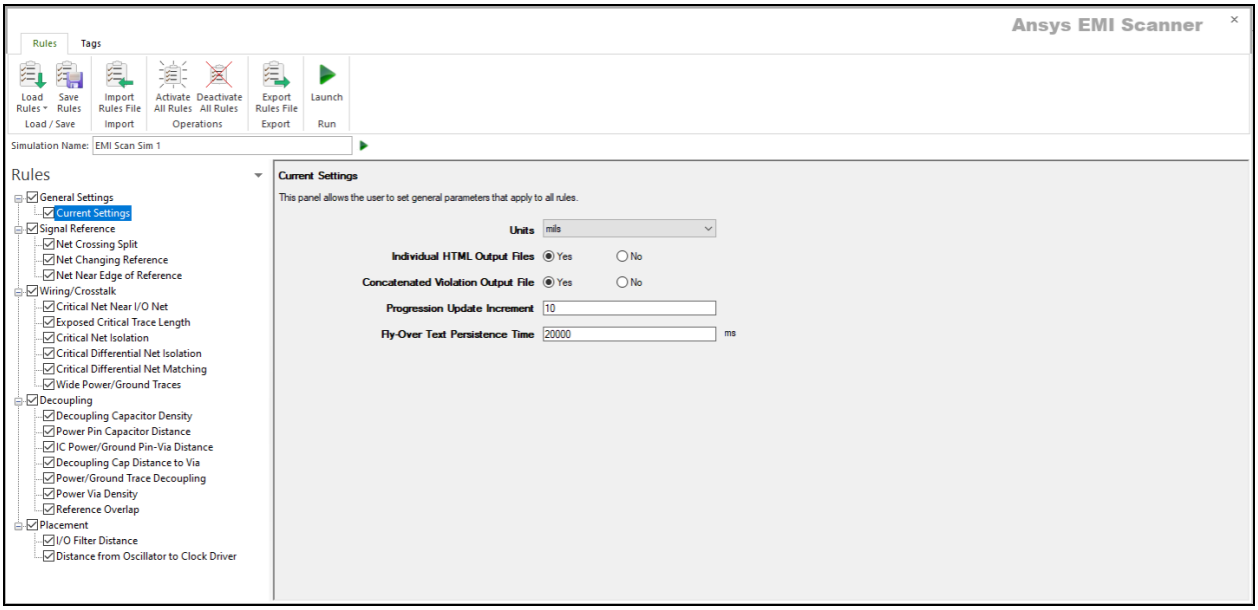
> **Note:**
>
> - You can display a description of a rule parameter at any time as with the cursor over it.
> - Units of measure are set in General Settings.

Applying Power Integrity Rules

To change EMI Scanner Power Integrity rules:

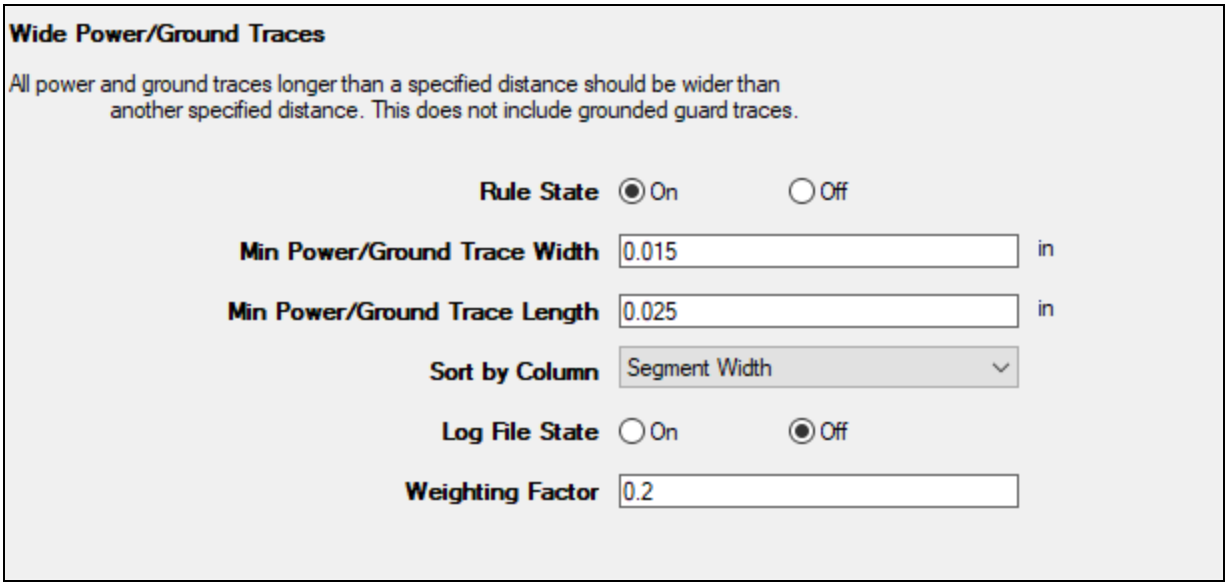
1. Launch EMI Scanner.

   The **EMI Scanner** window opens, on the **Rules** tab.



2. Click **Load Rules** and select a profile containing Power Integrity rules (e.g., Default SI Rules Profile).
3. From the Rules pane, select one of the seven subcategories under **Power Integrity**:
   - **Wide Power/Ground Traces** – displays the **Wide Power/Ground Traces** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



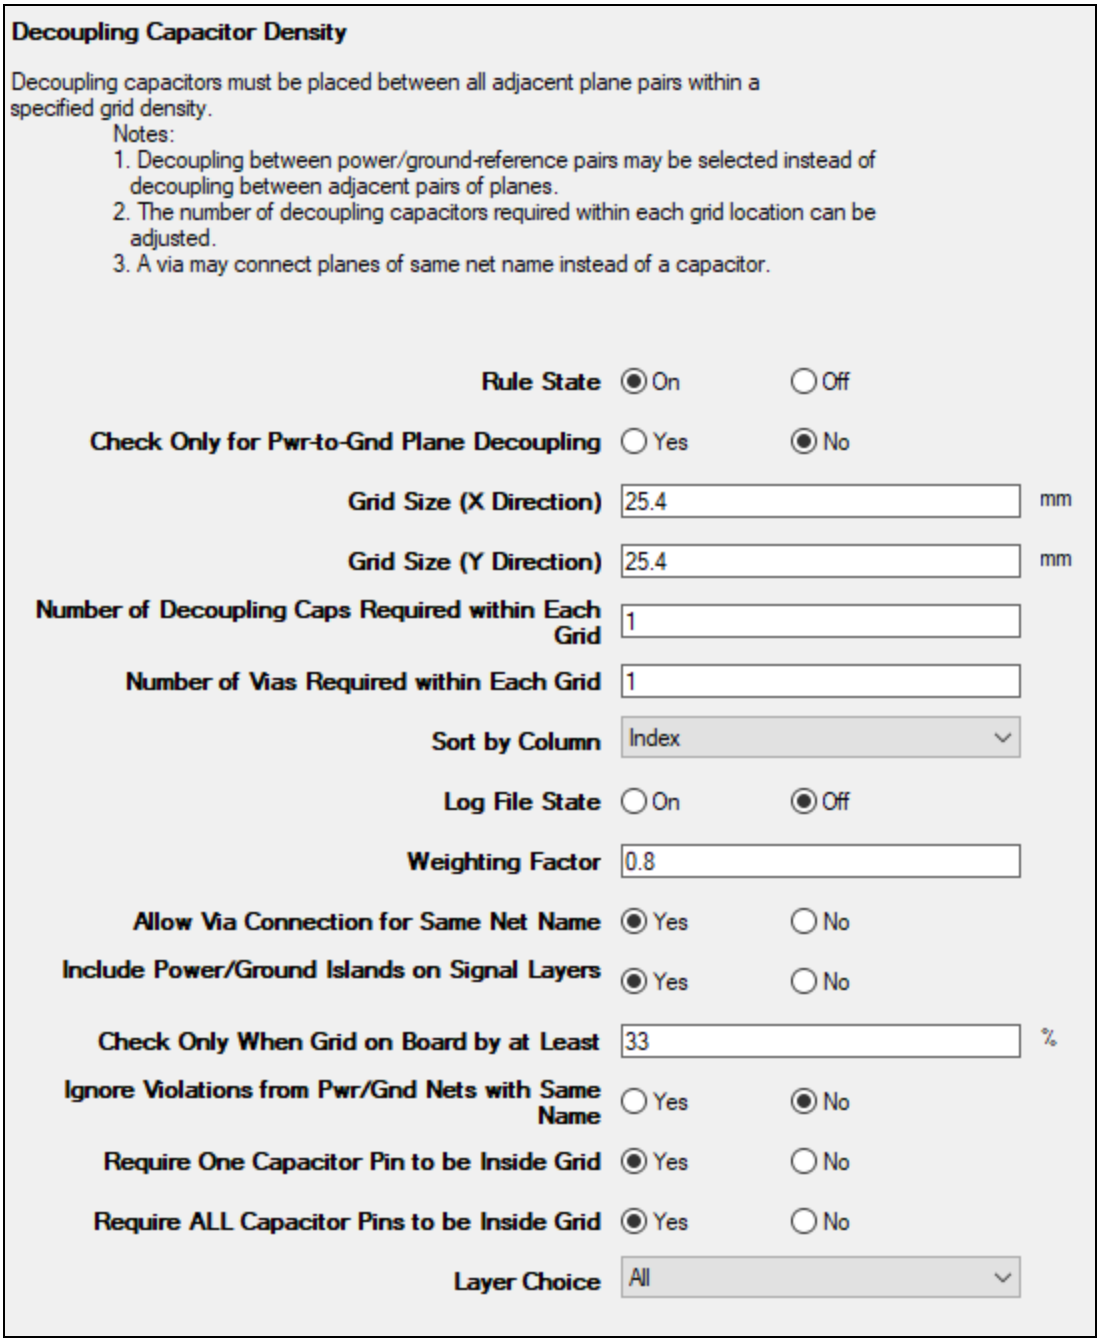
This rule states that all power and ground traces longer than a specified distance should be wider than another specified distance.

From here, set the following:

- **Rule State** – toggles Wide Power/Ground Traces rules on or off.
- **Min Power/Ground Trace Width** – sets the minimum width limit for all power/ground traces (except grounded guard traces).
- **Min Power/Ground Trace Length** – sets the minimum length limit for all power/ground traces (except grounded guard traces).
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

- **Decoupling Capacitor Density** – displays the **Decoupling Capacitor Density** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This rule states that decoupling capacitors must be placed between all adjacent plane pairs within a specified grid density.

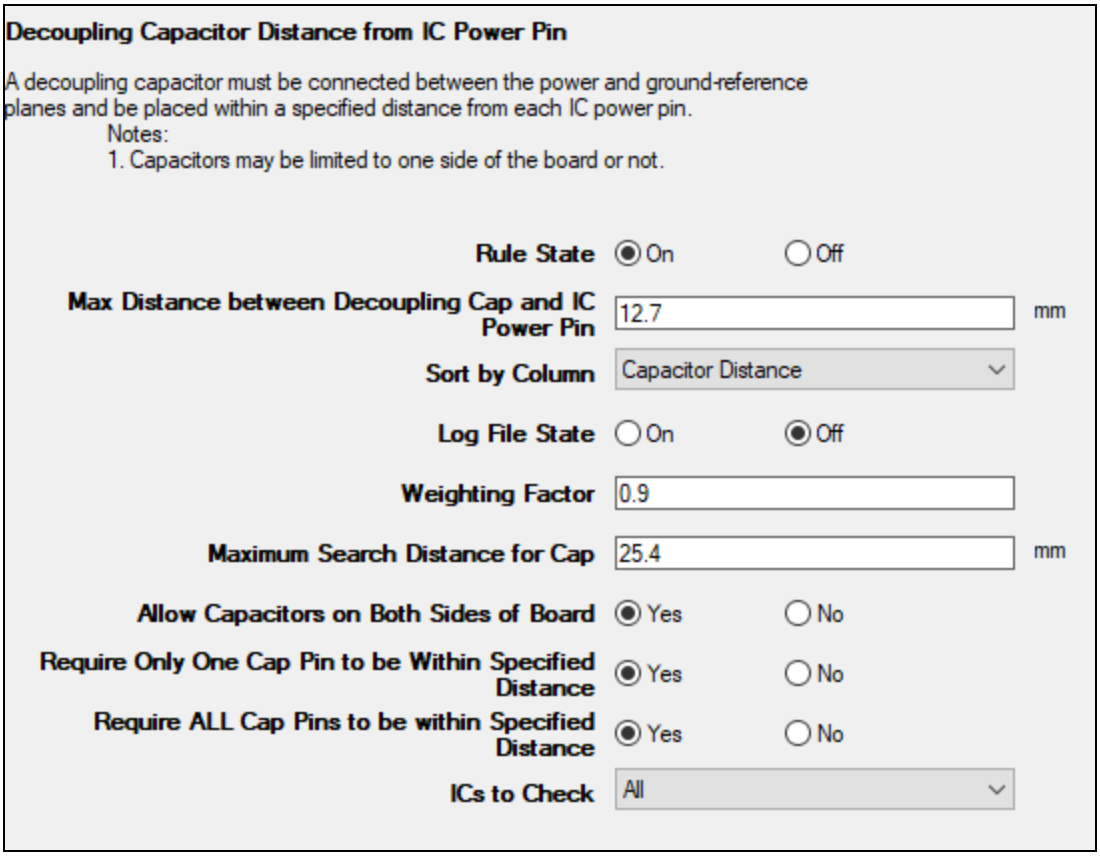
From here, set the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Rule State** – toggles Decoupling Capacitor Density rules on or off.
- **Check Only for Pwr-to-Gnd Plane Decoupling** – sets whether to ignore plane-to-plane decoupling and check only for decoupling capacitors between power and ground planes.
- **Grid Size (X Direction)** – specifies the size of the grid used to check for decoupling capacitors. Used in conjunction with **Grid Size (Y Direction)**.
- **Grid Size (Y Direction)** – specifies the size of the grid used to check for decoupling capacitors. Used in conjunction with **Grid Size (X Direction)**.
- **Number of Decoupling Caps Required within Each Grid** – specifies the number of decoupling capacitors connecting between planes that are required within each grid location.
- **Number of Vias Required within Each Grid** – specifies the number of vias connecting between planes that are required within each grid location. You must select **Allow Via Connection for Same Net Name** to use this option.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Allow Via Connection for Same Net Name** – determines whether EMI Scanner allows a via in place of a decoupling capacitor when the two planes are the same net name.
- **Include Power/Ground Islands on Signal Layers** – specifies whether to check for decoupling on power/ground islands.
- **Check Only When Grid on Board by at Least** – specifies the percentage of a grid that must be on the board in order for it to be checked.
- **Ignore Violations from Pwr/Gnd Nets with Same Name** – determines that only one plane of a given name is checked for violations (e.g., if two planes are "gnd" and a violation occurs between gnd and another layer, only one violation is reported).
- **Require One Capacitor Pin to be Inside Grid** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.
- **Require ALL Capacitor Pins to be Inside Grid** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.
- **Layer Choice** – specifies the layers to include in this rule analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Power Pin Capacitor Distance** – displays the **Decoupling Capacitor Distance from IC Power Pin** rule configuration.



This rule states that a decoupling capacitor must be connected between the power and ground-reference planes and be placed within a specified distance of each IC power pin.

From here, set the following:

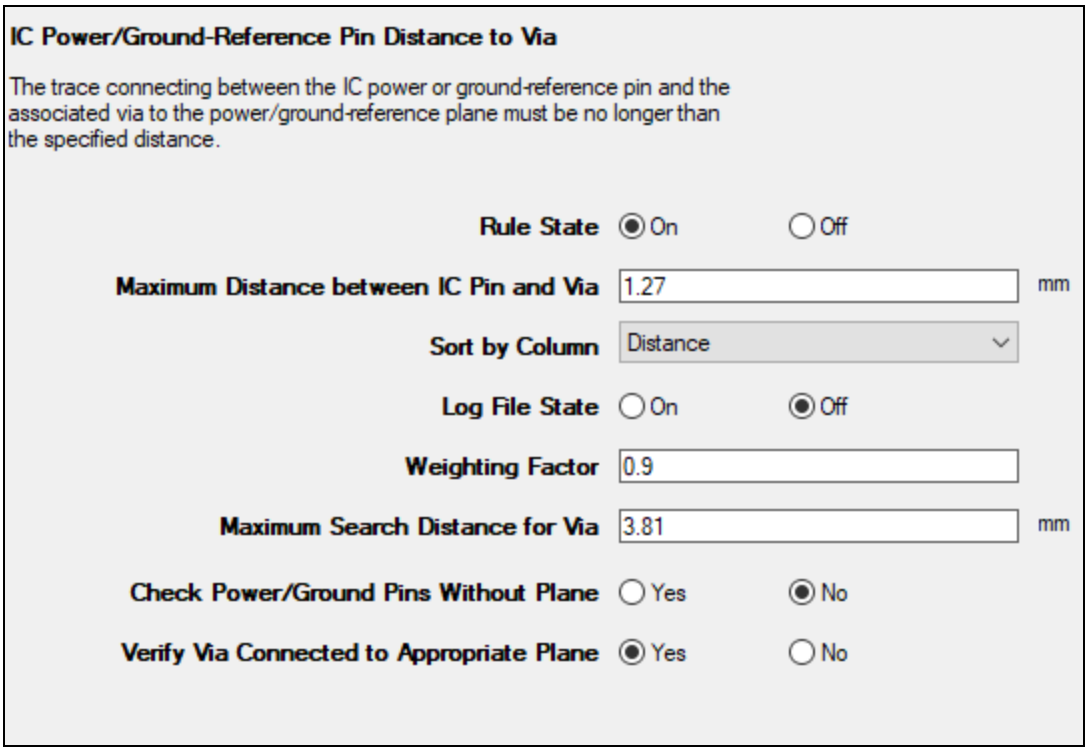
- **Rule State** – toggles Power Pin Capacitor Distance rules on or off.
- **Max Distance Between Decoupling Cap and IC Power Pin** – specifies the maximum distance between an IC power pin and its decoupling capacitor.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

- **Maximum Search Distance for Cap** – specifies the maximum search distance for a capacitor. A larger search box increases the chances of EMI Scanner finding capacitors, but can slow processing time.
- **Allow Capacitors on Both Sides of Board** – allows EMI Scanner to include capacitors on both sides of the board to satisfy this rule.
- **Require Only One Cap Pin to be within Specified Distance** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.
- **Require ALL Cap Pins to be within Specified Distance** – changes how EMI Scanner determines whether a component is inside or outside the grid. See Technical Note.
- **ICs to Check** – specifies the types of components to include in this rule analysis.

- **IC Power/Ground Pin-Via Distance** – displays the **IC Power/Ground-Reference Pin Distance to Via** rule configuration.



This rule states the trace connecting the IC power or ground-reference pin and the associated via to the ground/reference plane must be no longer than a specified

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

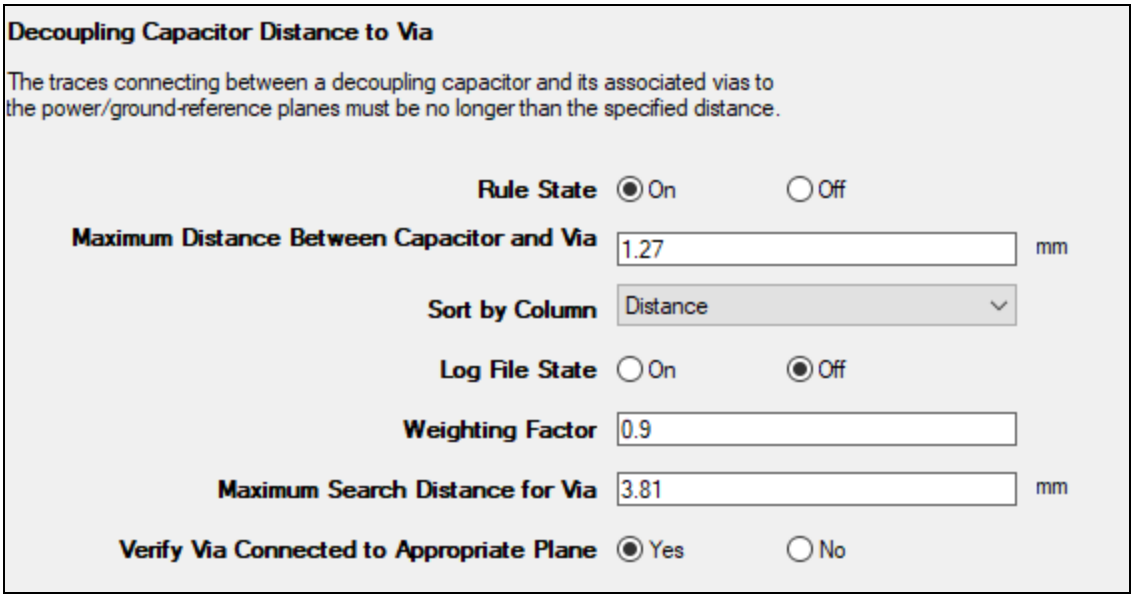
distance..

From here, set the following:

- **Rule State** – toggles IC Power/Ground Pin-Via Distance rules on or off.
- **Maximum Distance Between IC Pin and Via** – specifies the maximum distance between the IC power or ground-reference pin and the via to the power or ground-reference plane.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Maximum Search Distance for Via** – specifies the maximum search distance for a via when a violation is found. This allows users to quickly determine if the via is barely outside the original requirement and therefore not a serious violation.
- **Check Power/Ground Pins Without Plane** – specifies whether to check the distance between the IC power/ground pin and its via when the power/ground plane has not been completed yet.
- **Verify Via Connected to Appropriate Plane** – specifies whether EMI Scanner verifies the via connects to the selected plane (shape). Selecting 'no' speeds up processing.

- **Decoupling Cap Distance to Via** – displays the **Decoupling Capacitor Distance to Via** rule configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



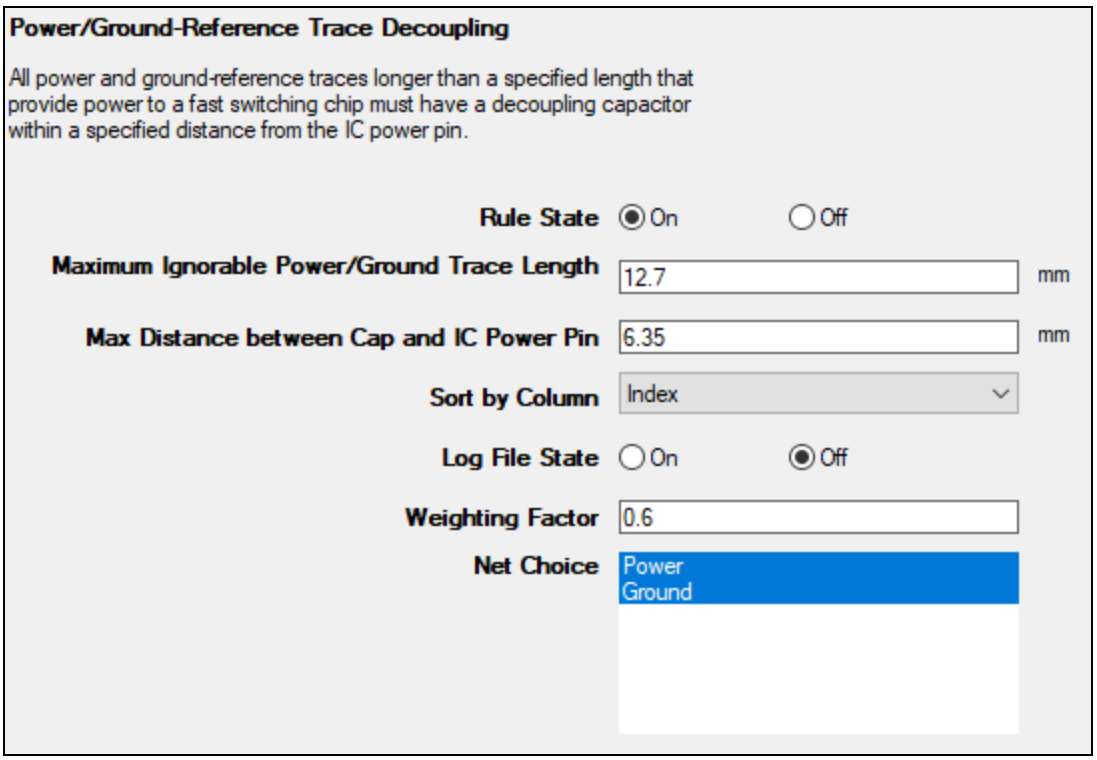
This rule states the traces connecting a decoupling capacitor and its associated vias to the power/ground-reference planes must be no longer than a specified distance.

From here, set the following:

- **Rule State** – toggles Decoupling Capacitor Distance to Via rules on or off.
- **Maximum Distance Between Capacitor and Via** – specifies the maximum distance between the capacitor pin and the via to the power or ground-reference plane.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.
- **Maximum Search Distance for Via** – specifies the maximum search distance for a via when a violation is found. This allows the user to quickly determine if the via is barely outside the original requirement and therefore not a serious violation.
- **Verify Via Connected to Appropriate Plane** – specifies whether EMI Scanner verifies the via connects to the selected plane (shape). Selecting 'no' speeds up processing.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Power/Ground Trace Decoupling** – displays the **Power/Ground-Reference Trace Decoupling** rule configuration.



This rule states that all power and ground-reference traces longer than a specified length that provide power to a fast switching chip must have a decoupling capacitor within a specified distance on the IC power pin.

From here, set the following:

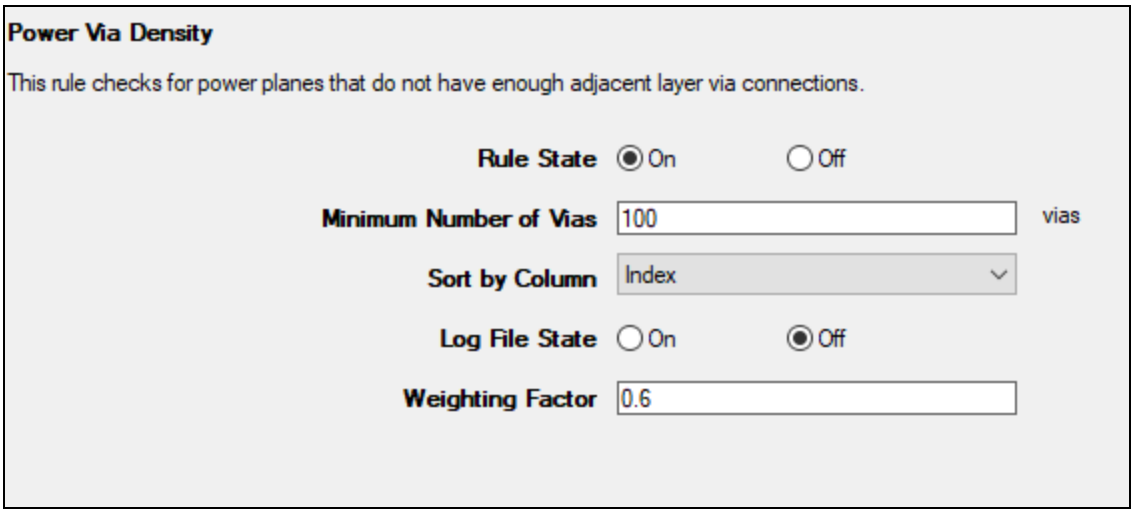
- **Rule State** – toggles Power/Ground-Reference Trace Decoupling rules on or off.
- **Maximum Ignorable Power/Ground Trace Length** – specifies the maximum allowable power/ground trace length that may be ignored. All traces longer than this length must meet this rule's requirement.
- **Max Distance Between Cap and IC Power Pin** – specifies the maximum distance between the capacitor pin and the power or ground-reference pin.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

- **Net Choice** – specifies the nets to include in this rule analysis. Select one, or **Ctrl**+click to select multiple nets.

- **Power Via Density** – displays the **Power Via Density** rule configuration.



This rule checks for power planes that do not have enough adjacent layer via connections.

From here, set the following:

- **Rule State** – toggles Power Via Density rules on or off.
- **Minimum Number of Vias** – sets the minimum number of vias required to connect adjacent power planes.
- **Sort by Column** – specifies the column by which results are sorted.
- **Log File State** – determines whether EMI Scanner creates a log file with additional details (intended for use in debugging).
- **Weighting Factor** – specifies the weighting factor (0<factor<=1) that is applied to violations of this rule when assigning a rank. A violation's rank is its own "degree of badness" multiplied by the weighting factor. See Exporting EMI Scanner Results and Analyzing EMI Scanner Results Using iQ-Harmony.

4. Rules are automatically saved for the current EMI scan. To save them for a future scan, click **Save Rules**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

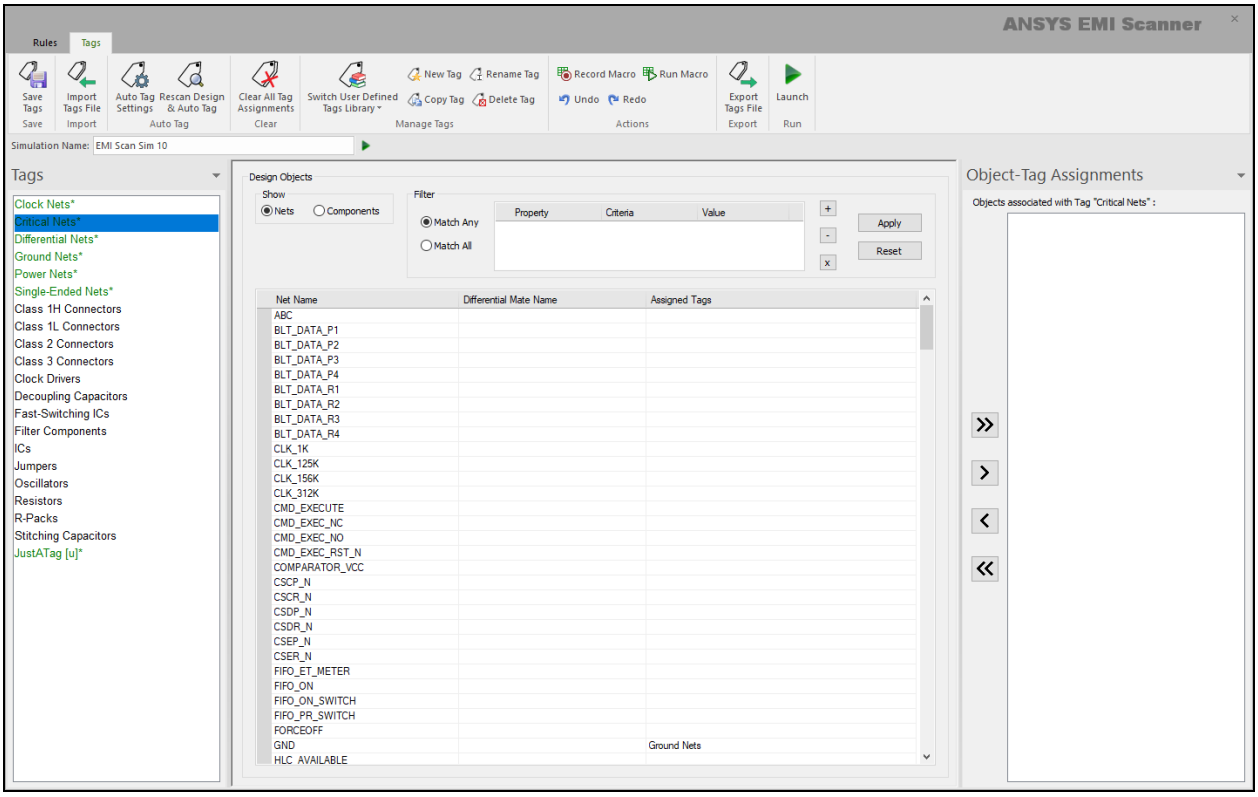
- You can display a description of a rule parameter at any time as with the cursor over it.
- Units of measure are set in General Settings.

Using Tags in EMI Scanner

The EMI Scanner **Tags** tab contains tag assignment panes and a ribbon with the following buttons:

- **Save Tags** – saves tags to the **Tags** pane.
- **Import Tags File** – allows you to import tags from a *.tgs file.
- **Auto Tag Settings** – allows you to change default tagging behavior.
- **Rescan Design & Auto Tag** – applies new tagging behavior.
- **Clear All Tag Assignments** – unassigns all nets and components from tags.
- **Switch User-Defined Tags Library** – allows you to browse to a different tagset.
- **New Tag** – creates a new tag.
- **Rename Tag** – renames a user-created tag.
- **Copy Tag** – copies a tag's properties into a new tag.
- **Delete Tag** – removes a tag on the **Tags** pane.
- **Record/Stop Macro** – starts or stops macro recording.
- **Run Macro** – runs a previously recorded macro.
- **Undo** – used to undo the previous action (only for manual assignments).
- **Redo** – used to restore an undone action (only for manual assignments).
- **Export Tags File** – allows you to export tags in a *.tgs file for later use.
- **Launch** – begins the EMI scan.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



From the Tags pane (located on the left), Net tags appear in green, while Component tags appear in black. User-created tags are denoted by **[u]**.

Tags can be assigned automatically or manually.

Also add custom tags or create a tagging macro.

Assigning Tags Automatically

Upon loading, some tags are automatically assigned nets or components. By default, Auto Tag makes the following selections:

- **Critical Nets** – non power-ground nets that have a port.
- **Differential Nets** – those set up in the Differential Nets workspace.
- **Power/Ground Nets** – those set up in the Power/Ground workspace. Otherwise, distinguished by net name.
- **Decoupling Capacitors** – capacitors with names starting from C or EMC, with a value less than 10uF.
- **Stitching Capacitors** – capacitors connecting two power planes or two ground planes.

To change Auto Tag settings:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

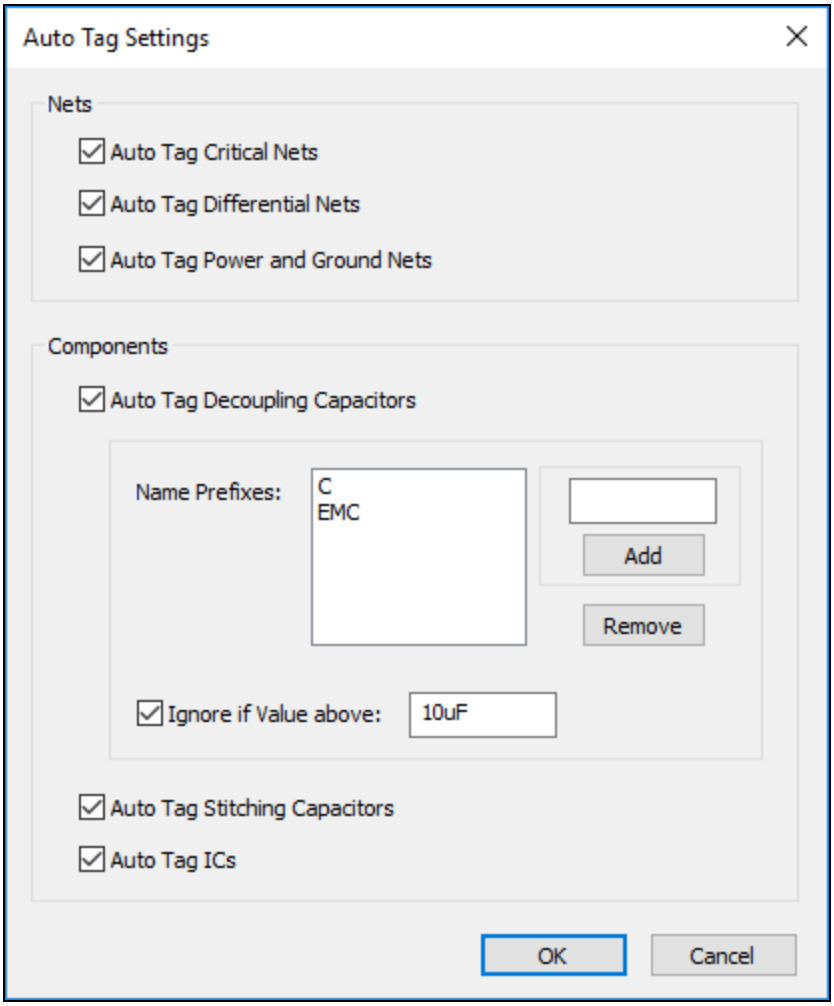
1. Launch EMI Scanner.
2. Click **Tags**.

   The **EMI Scanner** displays the **Tags** tab.

   Net tags appear in green, while Component tags appear in black.

3. From the **Auto Tag** area, click **Auto Tag Settings** to open the **Auto Tag Settings** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. From the **Nets** area, determine the types of nets you want automatically tagged.
5. From the **Components** area, use the check boxes to determine whether to automatically tag Decoupling Capacitors, Stitching Capacitors, or ICs.

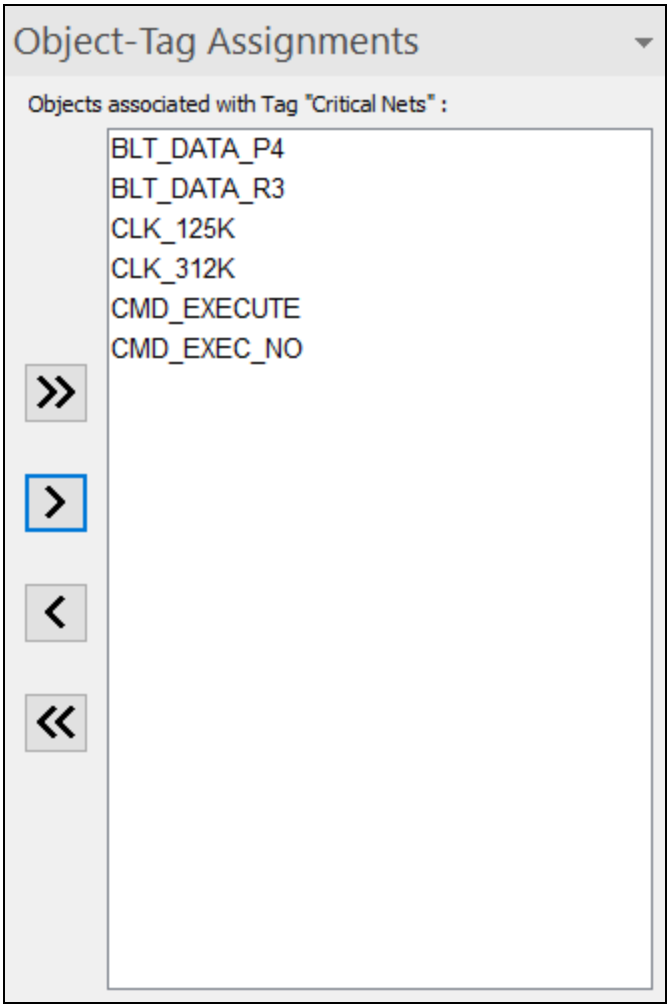
   If you select **Auto Tag Decoupling Capacitors**, select to **Add** or **Remove** name prefixes using the list and field. Also select **Ignore if Value above** to ignore capacitors above the value you specify.

6. Click **OK** to apply settings and return to the **EMI Scanner** window.
7. Click **Rescan Design & Auto Tag**.

   The design is scanned and tagged according to your settings.

   The **EMI Scanner** window displays the new tags in the **Object-Tag Assignments** pane for each tag.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



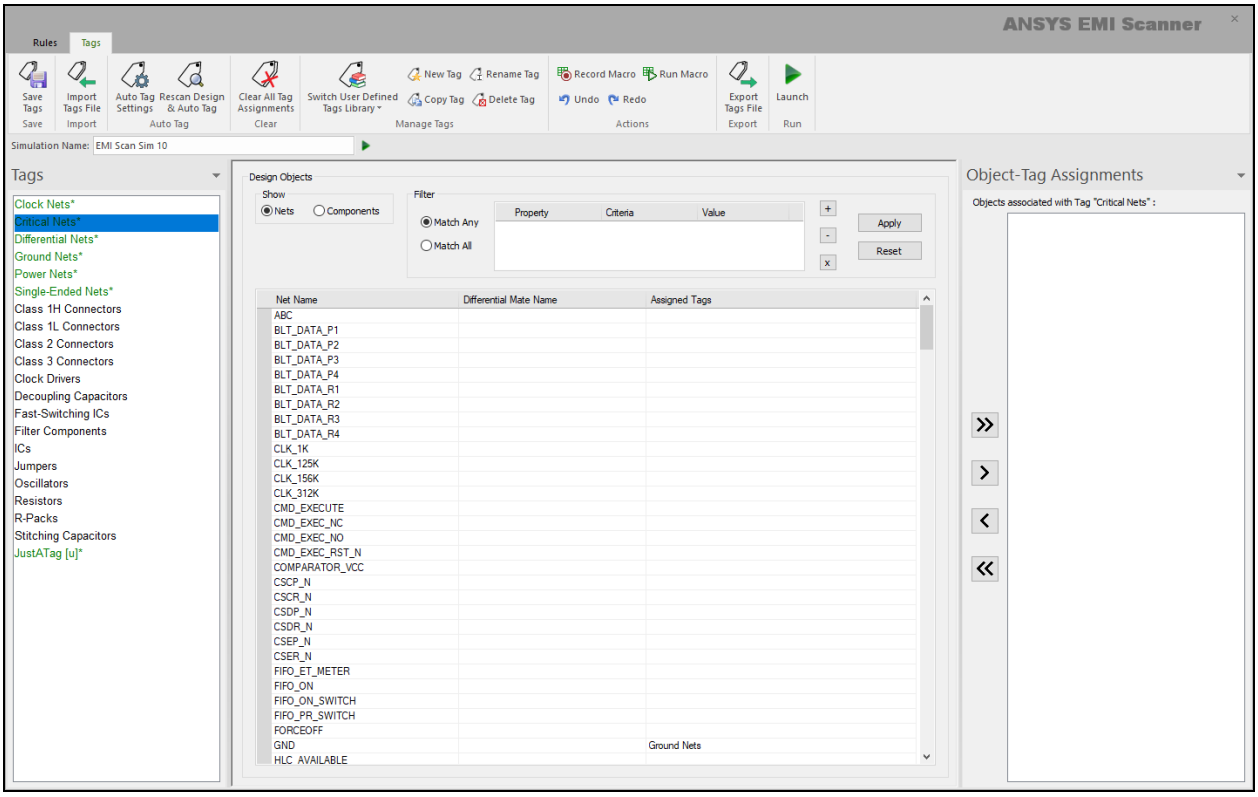
Assigning Tags Manually

To assign tags manually:

1. Launch EMI Scanner.
2. Click **Tags**.

   The **EMI Scanner** displays the **Tags** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



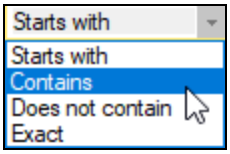
Net tags appear in green, while Component tags appear in black.

3. From the **Tags** pane, select a tag (e.g., Clock Nets, Decoupling Capacitors, Resistors) to which you want to assign nets or components. Also add custom tags.
4. The center pane updates to display a list of eligible nets or components. If selected, apply filters to view only the nets or components you're looking for:

   a. Select either **Match Any** (nets or components matching any one criterion displays) or **Match All** (only nets or components meeting all criteria displays).
   b. Add or remove rows on the filter list by clicking **+** and **-**. Also clear all criteria by clicking (**X**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

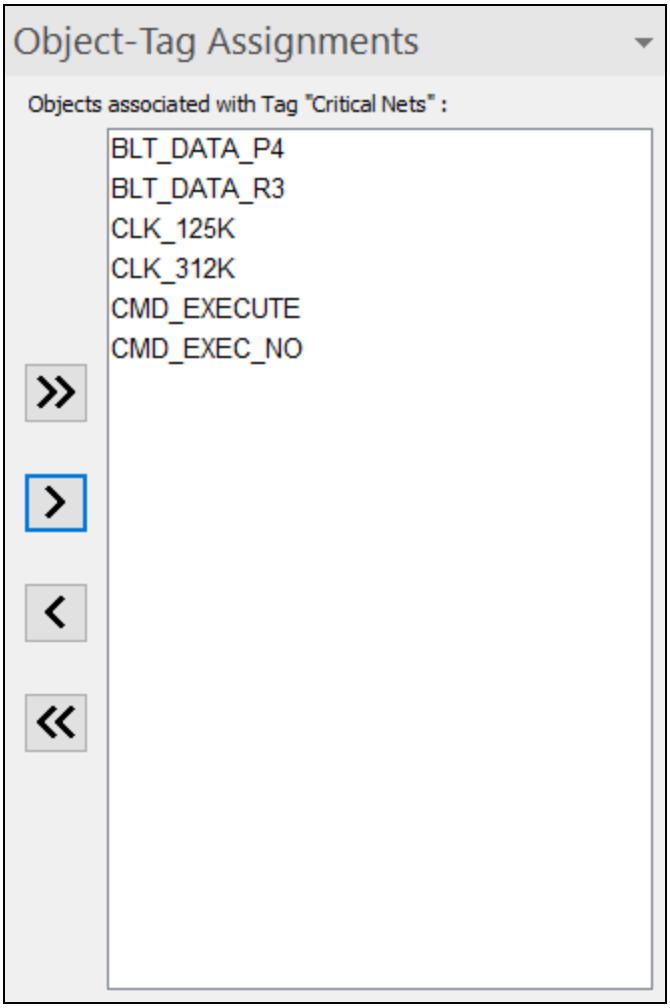
c. Click the **Criteria** drop-down menu to select the filter type.



d. Enter filter values in the **Value** field.
e. Click **Apply** to apply the filters and update the net/component list.
f. Click **Reset** to remove the filter and display the default nets or components.

5. Select nets or components in the list, and use the right arrow button (**>**) to assign them. Use the double arrow (**>>**) to assign all listed nets or components to that tag.

   Assigned nets or components appear in the **Object-Tag Assignments** pane.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can unassign nets or components individually by selecting them and using the left arrow (**<**), or unassign all nets or components using the double arrow (**<<**).

6. If selected, click **Export Tags File** to save your tags as a *.tgs file. You can later click **Import Tags File** to use these settings again.

Working with Custom Tags

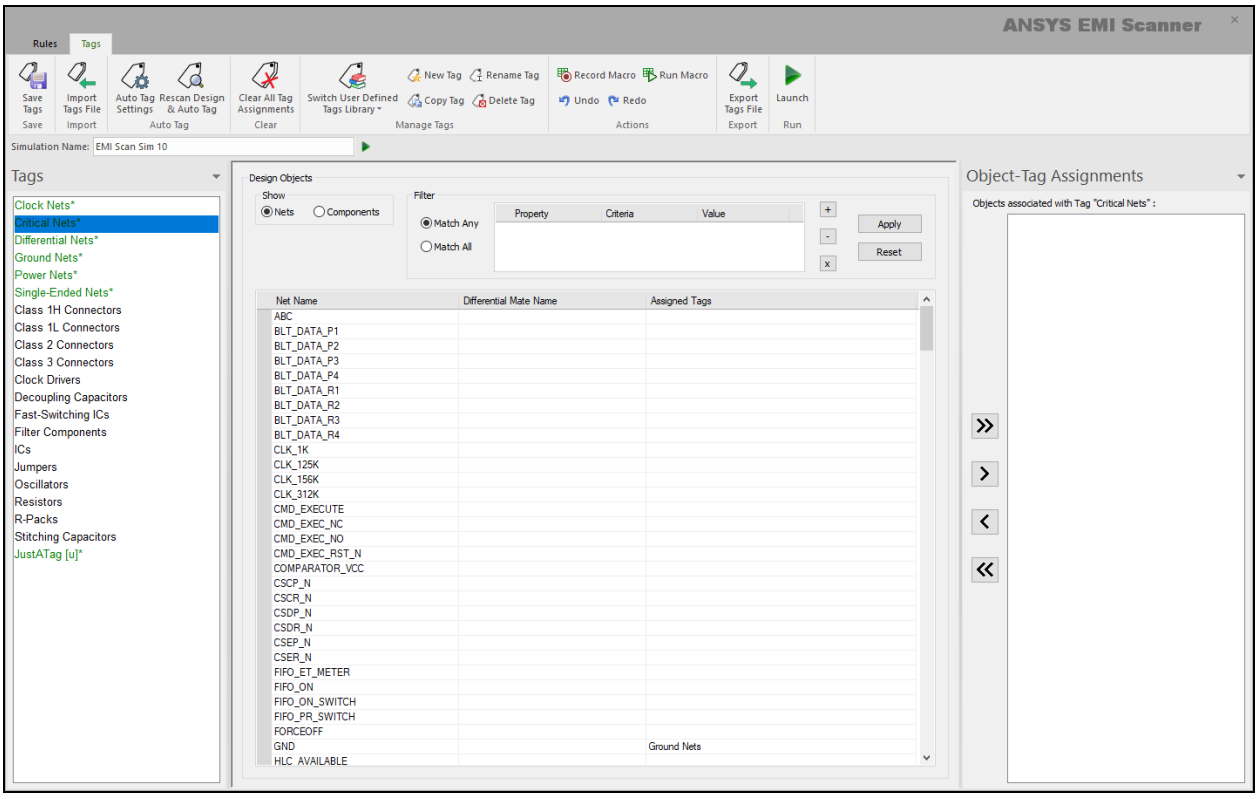
EMI Scanner also allows you to create and assign custom tags. User-created tags are denoted by **[u]** in the Tags pane, and can be assigned manually.

Adding Custom Tags

To add tags:

1. Launch EMI Scanner.
2. Click **Tags**.

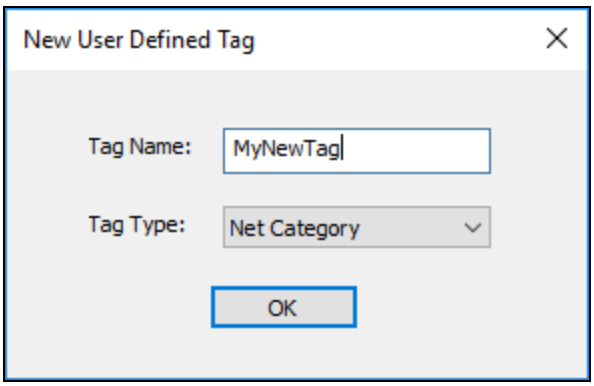
   The **EMI Scanner** displays the **Tags** tab.



Tags are listed in the Tags pane on the left. Net tags appear in green, while Component tags appear in black.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

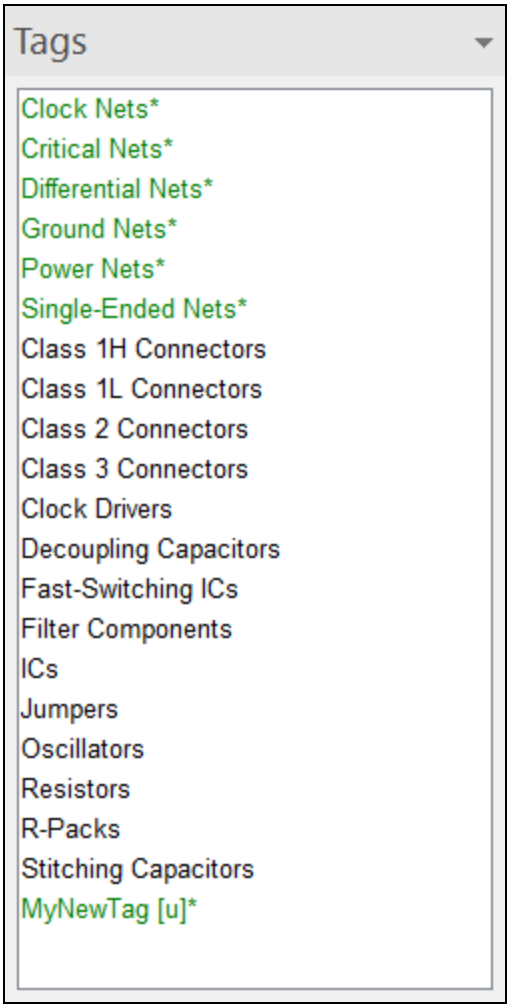
3. From the **Manage Tags** area of the ribbon, select **New Tag** to open the **New User-Defined Tag** window.



4. Enter a **Tag Name** and select the **Tag Type**. You can create a tag either in the **Net Category** or **Component Category**.
5. Click **OK** to return to the **EMI Scanner** window.

   The new tag appears at the bottom of the **Tags** pane, with a **[u]** indicating that it is a user-created tag.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



6. To save your tags, click **Save Tags**.

   Your tags appears in the **Tags** pane the next time you launch EMI Scanner.

Also create a custom tag from an existing tag. To do so:

1. Select a tag on the **Tags** pane.
2. From the **Manage Tags** area, click **Copy Tag**.

   The **Copy User-Defined Tag** window opens, with the **Tag Type** already selected.

3. Name the new tag and click **OK**.

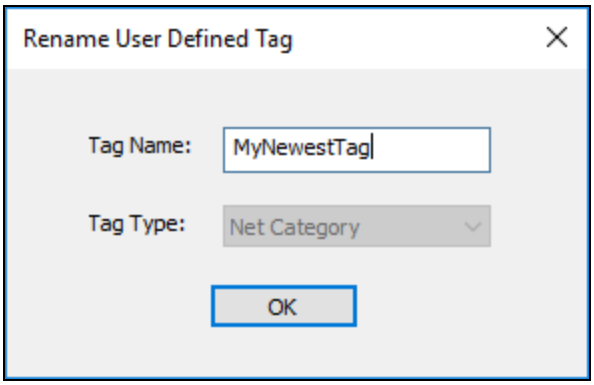
   The new tag appears in the **Tags** pane.

Renaming a Custom Tag

To rename a custom tag:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select the tag on the **Tags** pane.
2. From the **Manage Tags** area, select **Rename Tag** to open the **Rename User-Defined Tag** window.



3. Rename the tag and click **OK**.

> **Note:**
>
> You can only rename custom tags. You cannot rename a default tag.

Deleting a Custom Tag

To delete a custom tag:

1. Select the tag on the **Tags** pane.
2. Use the double left arrow (**<<**) in the **Object-Tag Assignments** pane to remove any assignments.

> **Important:**
>
> You cannot delete a tag until all object assignments are removed from it.

3. From the **Manage Tags** area, click **Delete Tag**.

   The tag disappears on the **Tags** pane.

> **Note:**
>
> You can only delete custom tags. You cannot delete a default tag.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

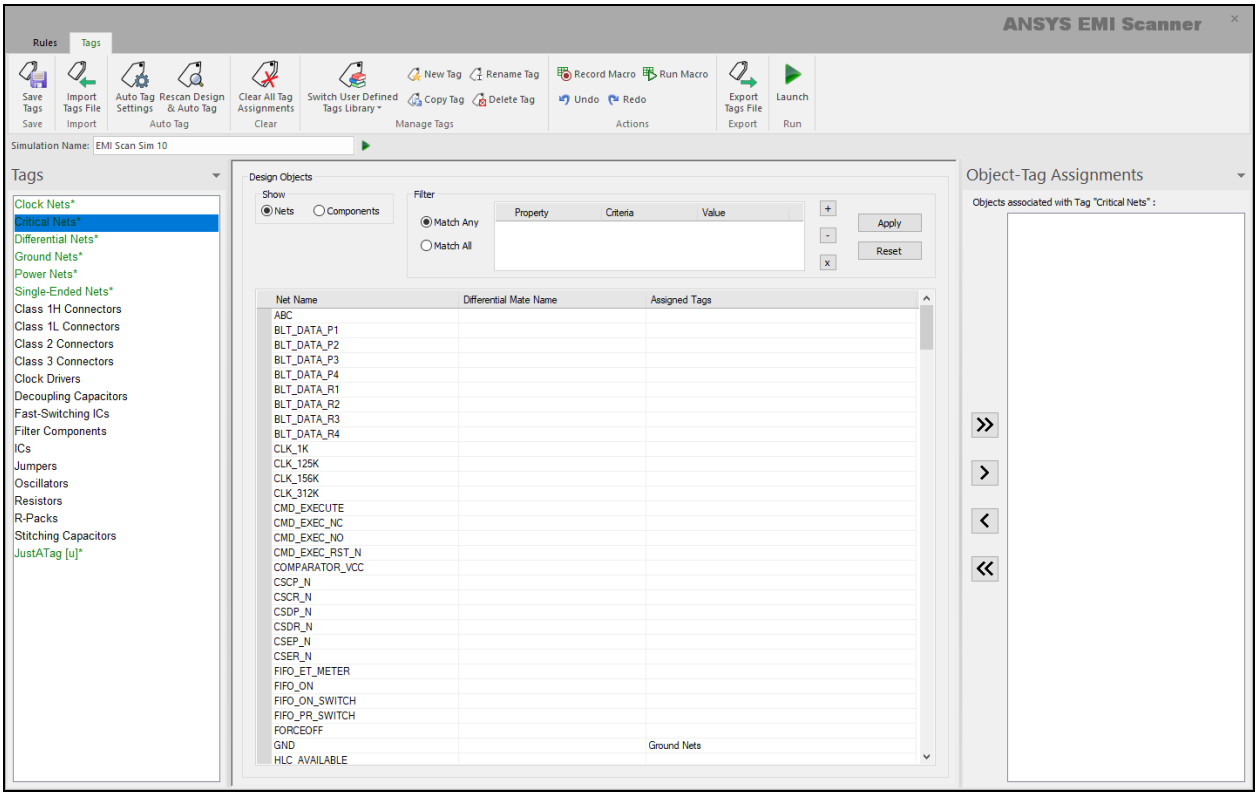
Creating Tagging Macros

You can save your tagging process as a series of steps. Macros are saved as XML-based *.tmx files.

To create a macro:

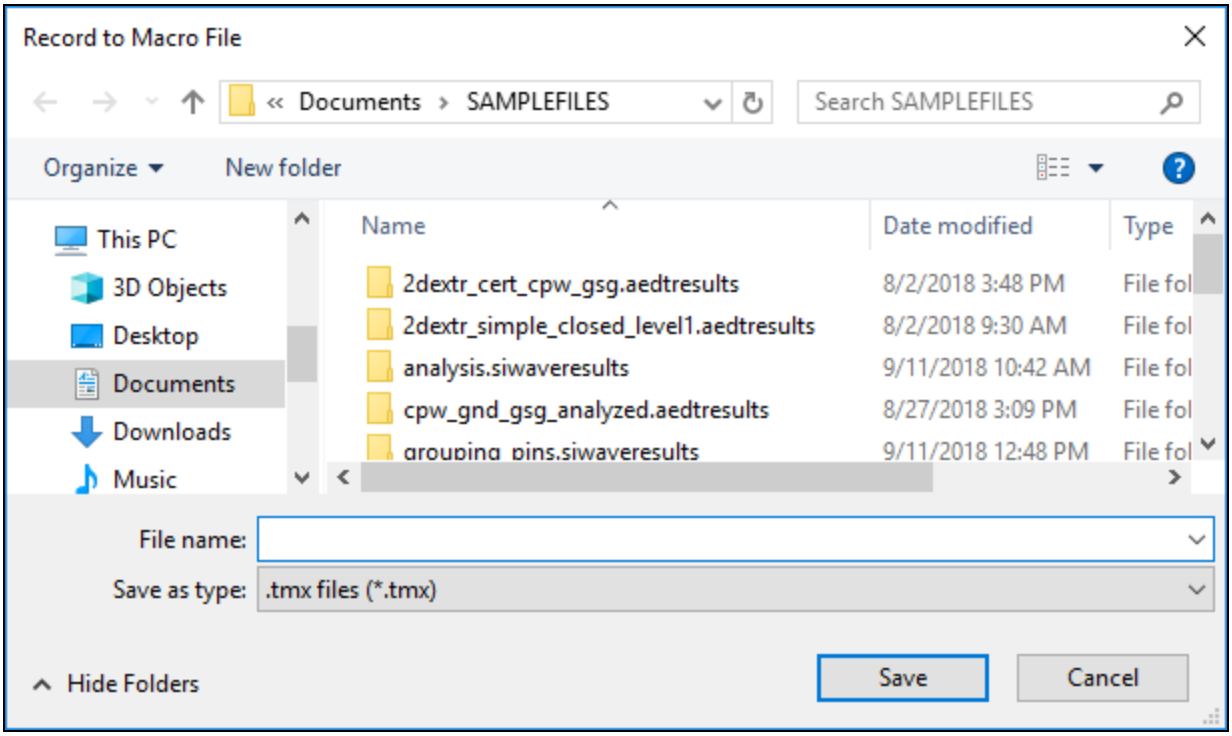
1. Launch EMI Scanner.
2. Click **Tags**.

   The **EMI Scanner** displays the **Tags** tab.



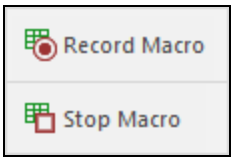
3. From the **Actions** area of the ribbon, select **Record Macro** to open the **Record to Macro File** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Navigate to your selected save location, enter a **File name**, and click **Save**.

   Record Macro becomes **Stop Macro**.



5. Complete the appropriate actions to save as a macro. You can **Undo** or **Redo** actions using the buttons in the Actions area.
6. When you are finished, click **Stop Macro**.

   The macro *.tmx file is saved at the location you specified earlier.

To run a saved macro, click **Run Macro**.

> **Note:**
>
> You cannot record and run a macro at the same time.

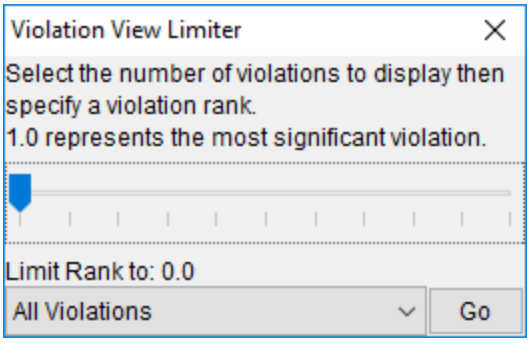
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Analyzing EMI Scanner Results Using iQ-Harmony

iQ-Harmony receives violations on the EMI Scanner and, based on signal characteristics, makes predictions on the seriousness of the violations. This offers meaningful comparison between rule limits and violations, in order to make "what if" comparisons and determine impacts.

To analyze EMI Scanner results:

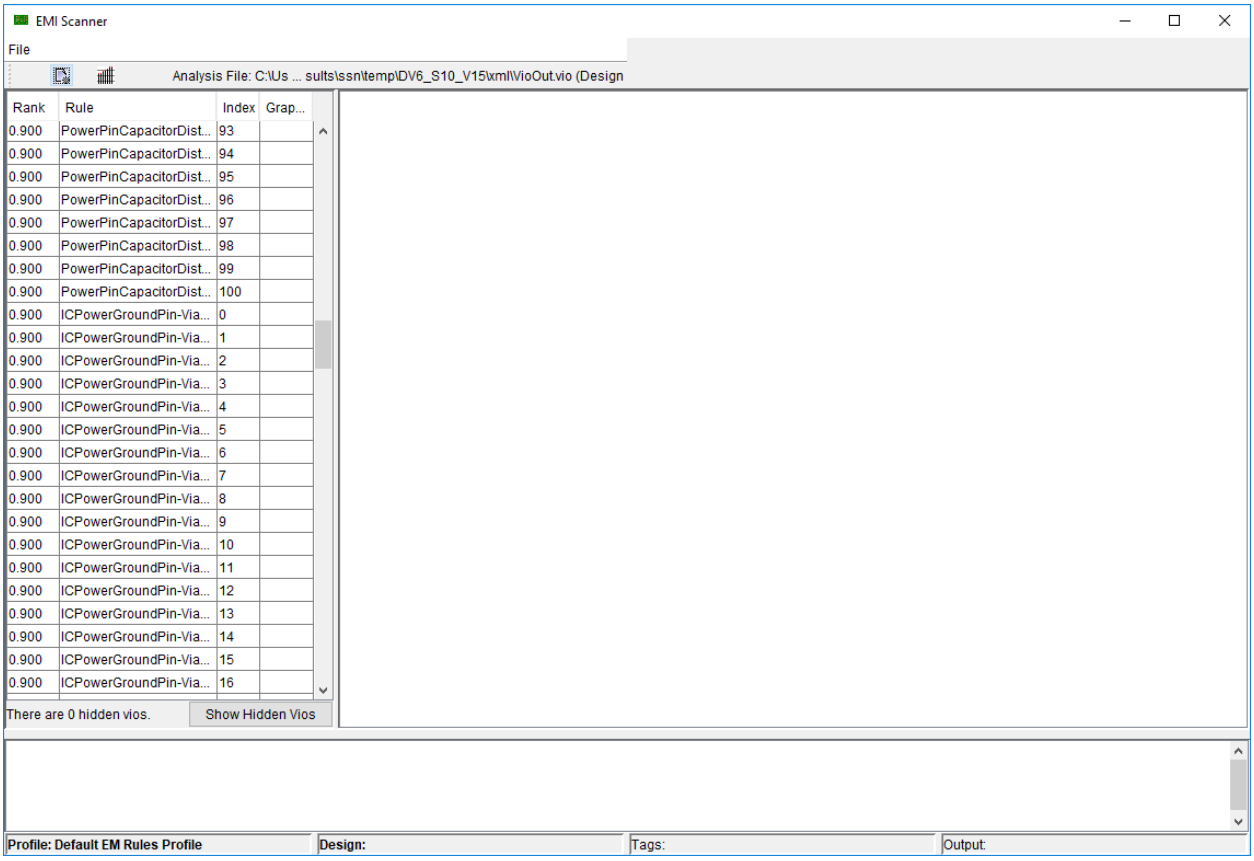
1. Run an EMI scan.
2. From the **Project Manager** window, right-click **EMI Setup** and select **Results** > **Analyze with iQ-Harmony** to open the **Violation View Limiter** window.



3. Use the drop-down menu to select the number of violations to display. The default is **All Violations**.
4. Use the slider to select a minimum violation rank to display. 0.0 is the least severe and 1.0 is the most severe.

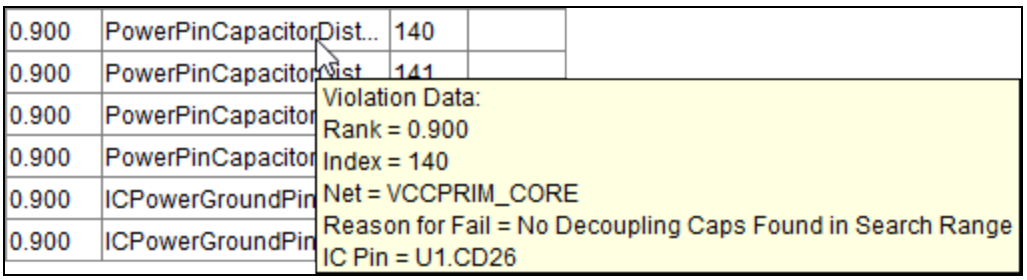
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Click **Go** to open the **EMI Scanner** window.



Violations are listed in the left-hand pane. By default, they are sorted by rank, with the most severe violations at the top of the list. Click the column headings to change the sorting.

Hovering the cursor over a violation offers more information about the violation.

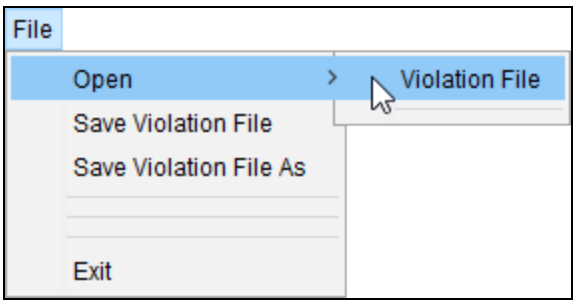


If there are any hidden violations, text at the bottom of the pane notes this, and offers you the option to **Show Hidden Vios**.

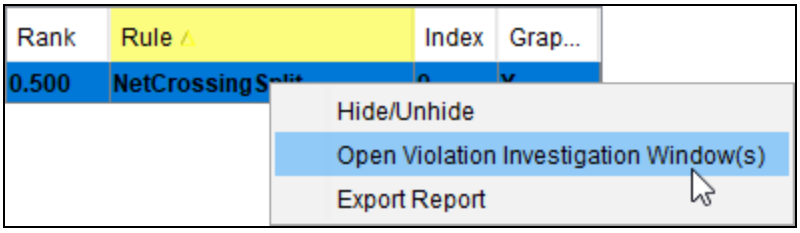
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **File** menu allows you to save the violations list as a *.vio file, or open an existing *.vio file.

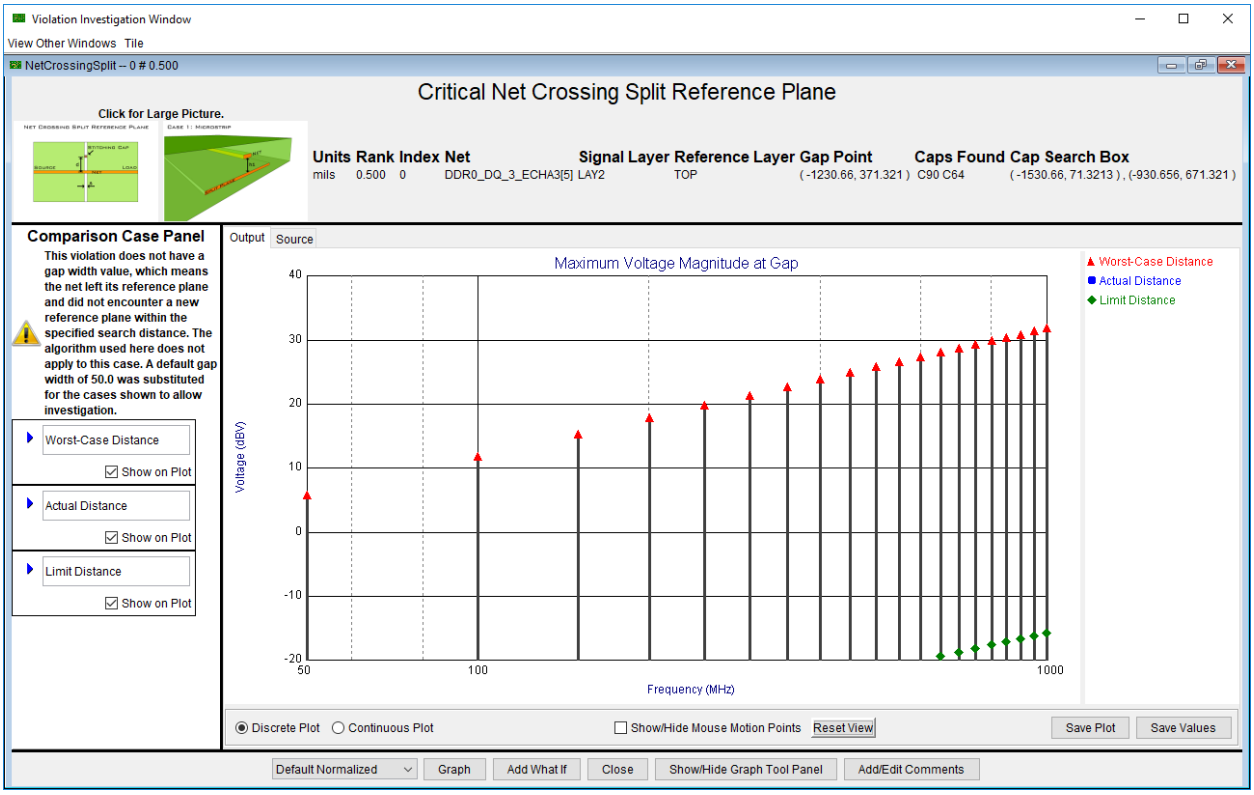
Also open an existing *.vio file by clicking the **Open Analysis File** ( ) icon.



The **Current Spectra Library** icon ( ) opens the **Spectra Configuration** window. From the left pane, either double-click a violation, or right-click it and select **Open Violation Investigation Window(s)** to open the **Violation Investigation** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The top of the **Violation Investigation** window displays information about the violation's location and severity, and graphic representations of the type of violation. Click a graphic to enlarge it for easier viewing.

The left pane is the **Comparison Case Panel**. The default cases vary depending on the type of violation, and can include: Worst-Case Distance, Actual Distance, Limit Distance, Search Limit Distance. Click the blue triangles to expand the cases and view their display options. Add a comparison case by clicking **Add What If**.

The comparison cases allow you to see how changes in signal characteristics affects the violations. Use the **Show on Plot** check boxes to determine which cases are displayed. You can rename a case by typing into its name field.

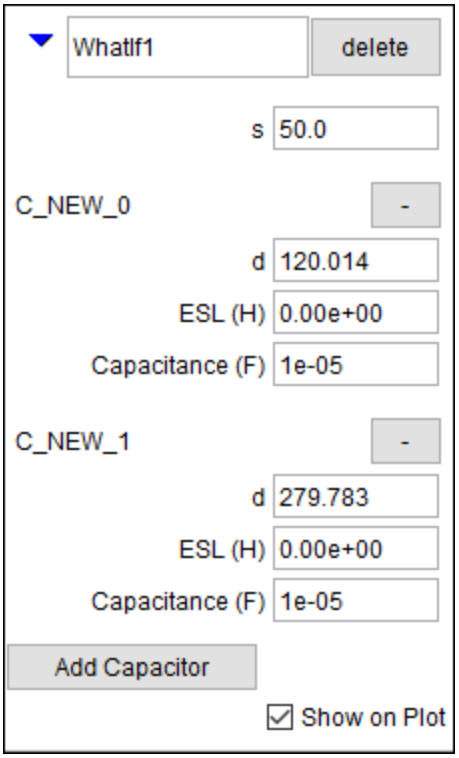
The bottom of the **Violation Investigation** window allows you to make additional changes.

Options include:

- **Choose A Spectrum** – allows you to select a default spectrum or one you have added via Spectra Configuration.
- **Graph** – after you change data, click this button to refresh the graph.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Add What If** – adds a new comparison case to the Comparison Case Panel.

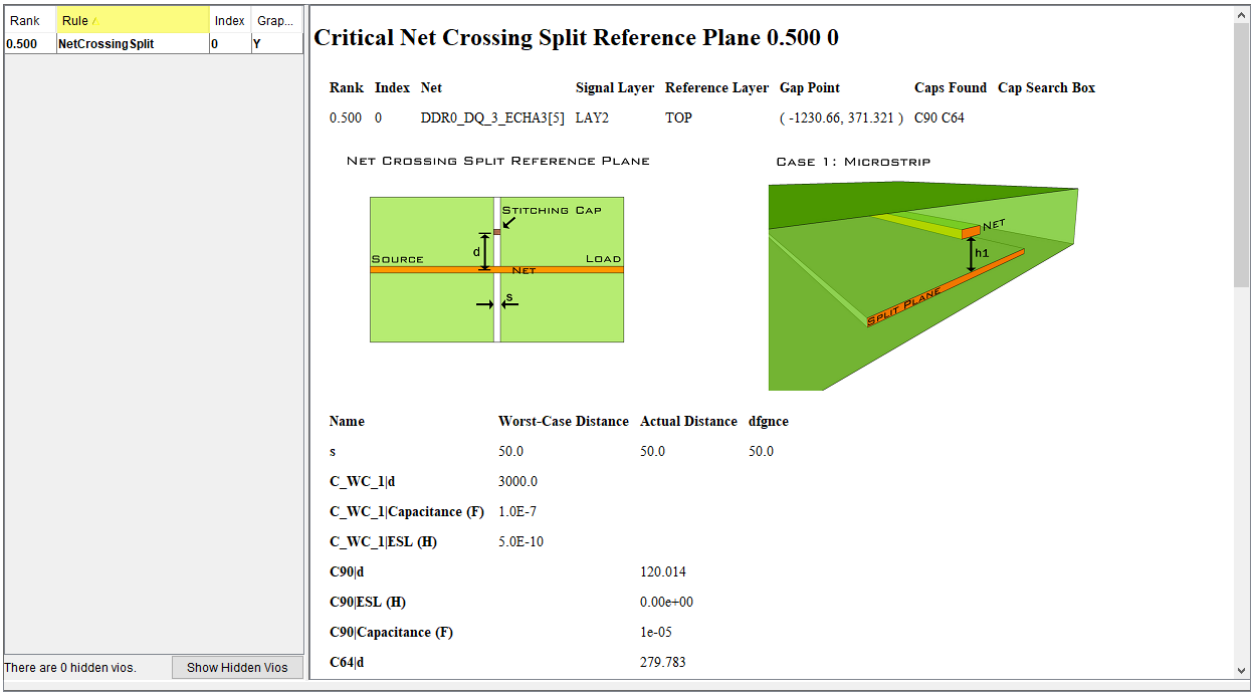


Change the settings and rename the case just as with default comparison cases. Also delete the custom case.

- **Close** – closes the Violation Investigation Window and returns you to the EMI Scanner window.
- **Show/Hide Graph Tool Panel** – toggles the display of the Graph Tool Panel:
- **Add/Edit Comments** – opens a blank text window to type comments. These are saved with the *.vio file.

6. Analyze the data as selected.
7. Click **Save Plot** to save the plot as a *.jpeg or *.png image.
8. Click **Save Values** to save the values in plain text format.
9. Click **Close** to close the **Violation Investigation** window closes, and the **EMI Scanner** window displays your analysis in the right pane.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

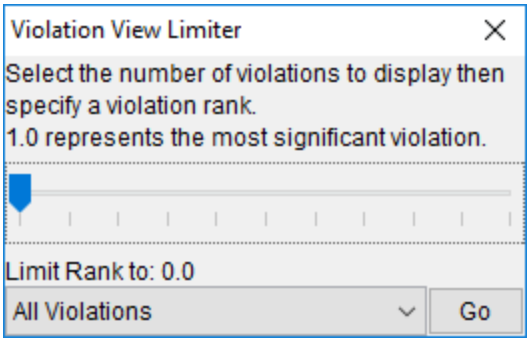


10. When you are finished analyzing, click **File** > **Save Violation File** or **File** > **Save Violation File As** to save your analysis in *.vio format.

Spectra Configuration

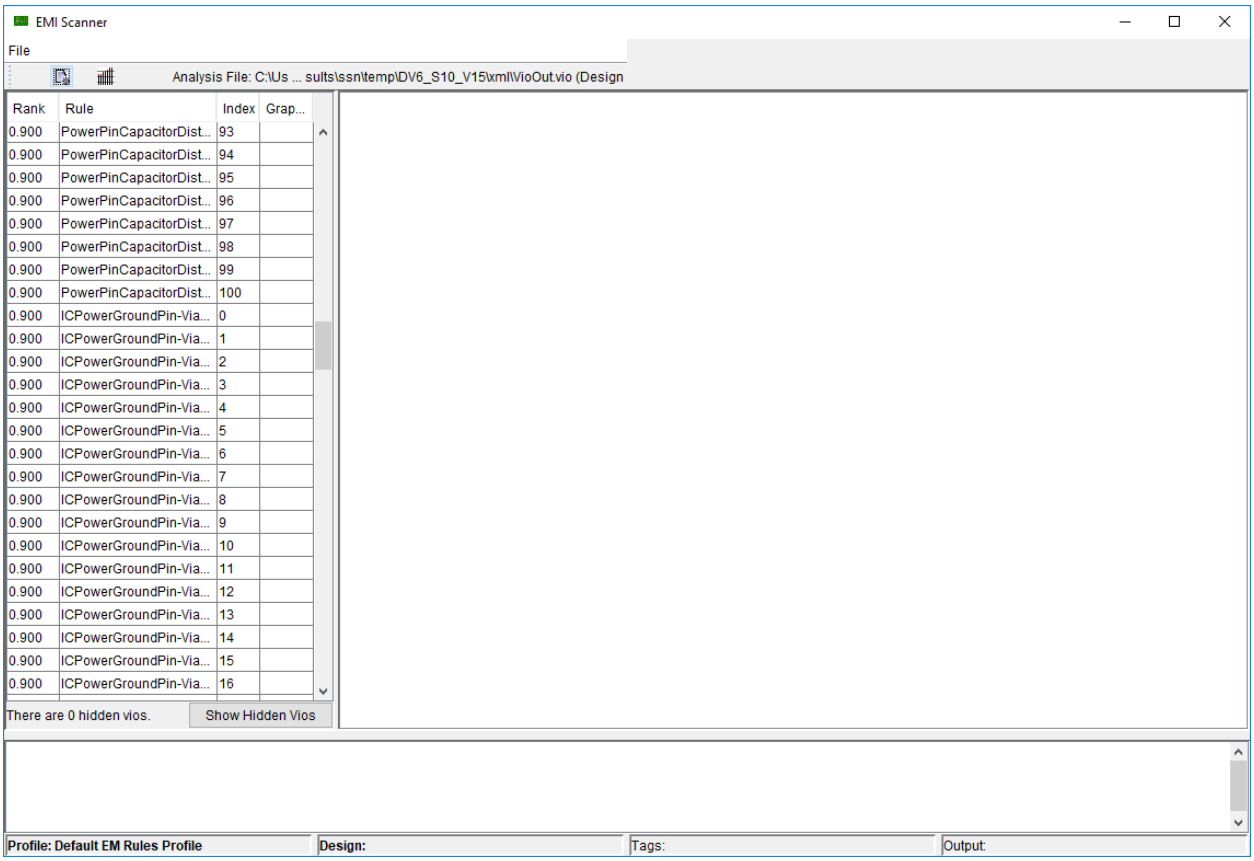
To configure the Spectra library:

1. Run an EMI scan.
2. Click **Results**.
3. Use the EMI Scan drop-down menu to select **[Simulation Name]** > **Analyze with iQ-Harmony** to open the **Violation View Limiter** window.



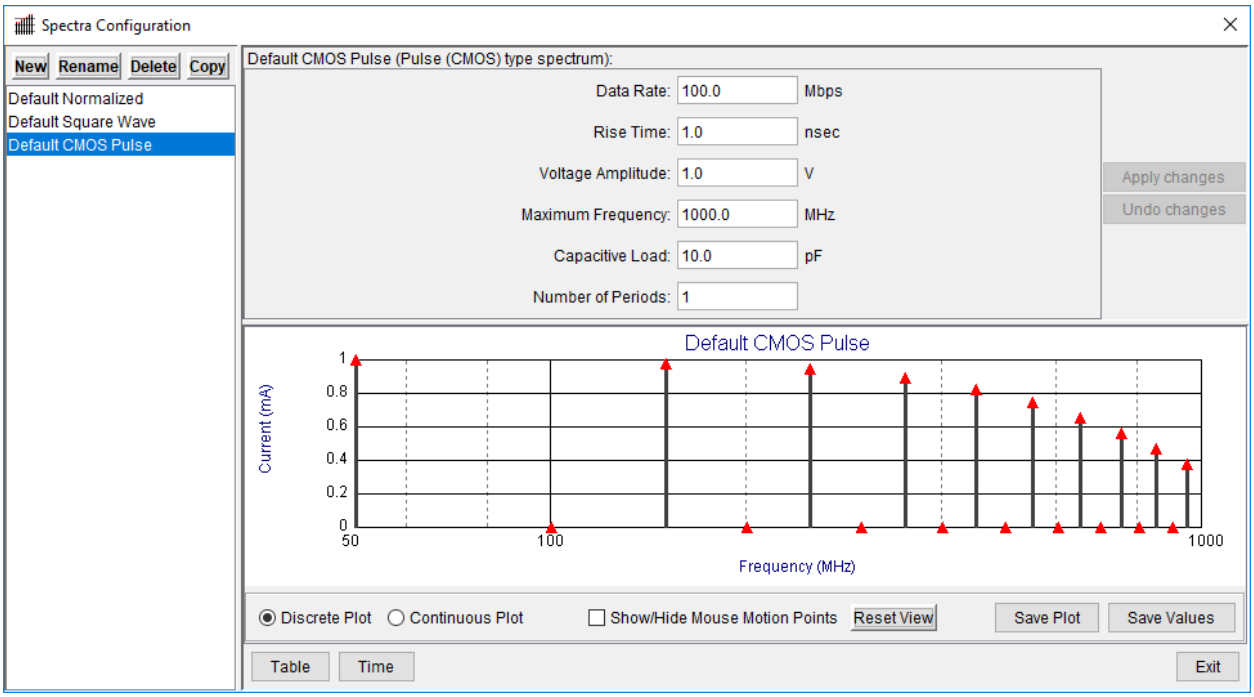
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Use the drop-down menu to select the number of violations to display. The default is **All Violations**.
5. Use the slider to select a minimum violation rank to display. 0.0 is the least severe and 1.0 is the most severe.
6. Click **Go** to open the **EMI Scanner** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. Click the **Current Spectra Library** ( ) icon to open the **Spectra Configuration** window.



Select a spectrum in the left pane to view its settings and plot to the right. You can edit fields directly, then **Apply changes** or **Undo changes**.

By default, a Frequency/Current plot appears. The plot can be viewed as a **Discrete Plot** or a **Continuous Plot**.

You can **Save Plot** as a *.png or *.jpeg image, or **Save Values** in plain text format.

Click **Table** to view information as a table instead of a graph.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

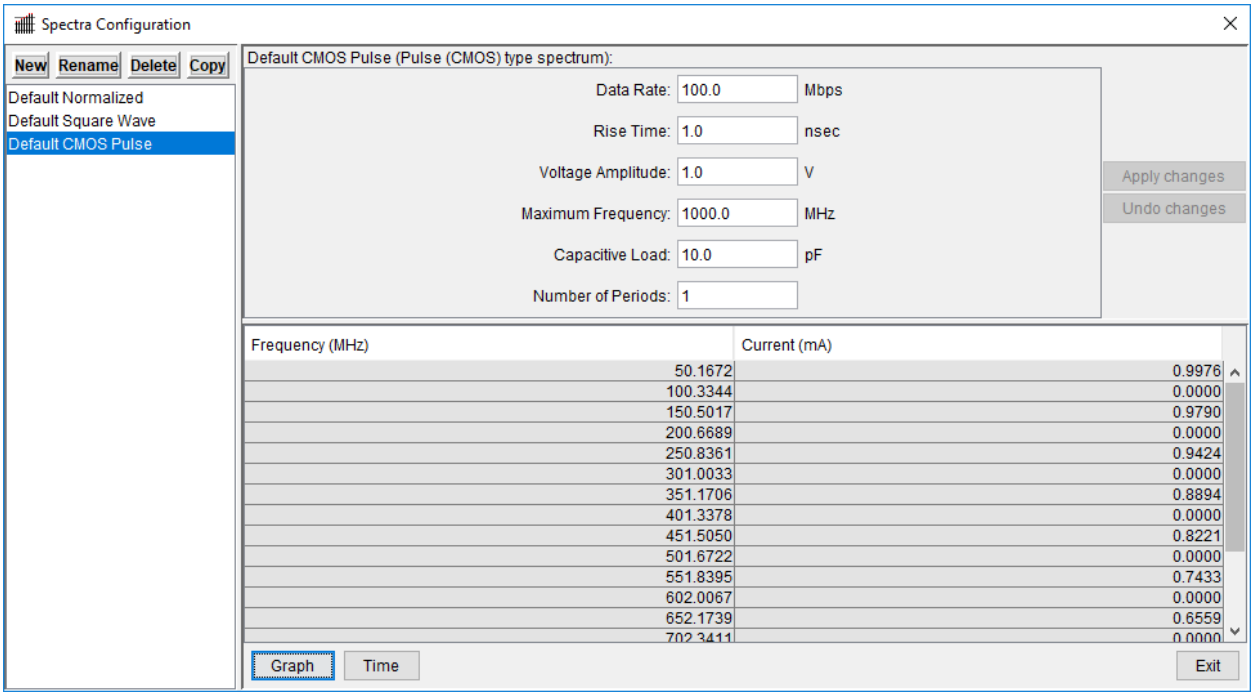


Table becomes **Graph**. Click it again to restore the plot view.

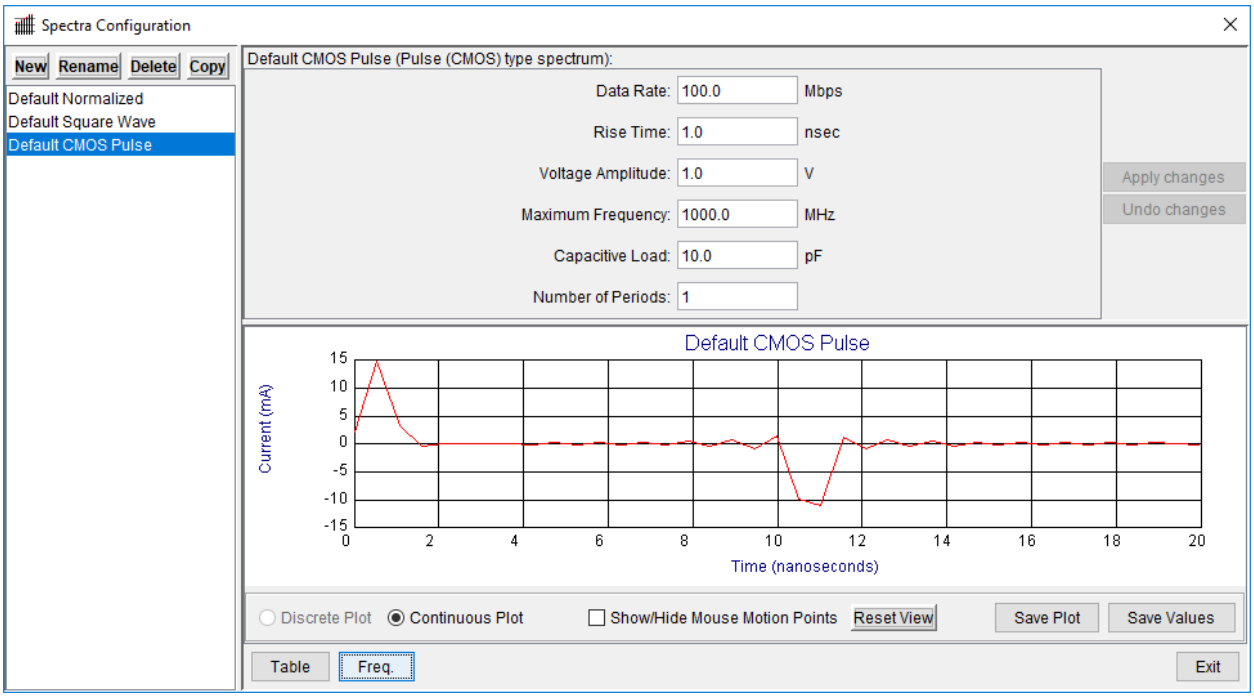
Click **Time** to view Current/Time information instead of Current/Frequency.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Time becomes **Freq.**. Click it again to return to Current/Frequency.

From the Spectra Configuration window, you can also perform the following actions:

- **New** – create a new spectrum.
- **Rename** – change a spectrum name.
- **Delete** – remove a spectrum.
- **Copy** – create a copy of an existing spectrum with a new name.

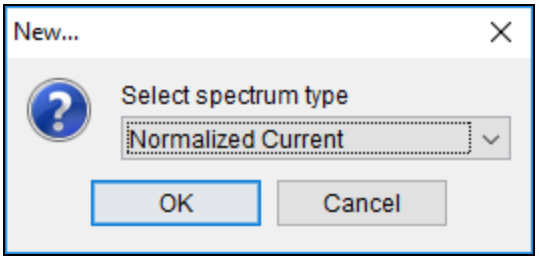
8. Click **Exit** to return to the **EMI Scanner** window.

   Any changes you made are now available in the **Violation Investigation** window.

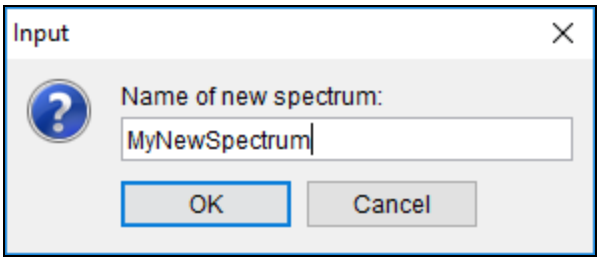
Creating a New Spectrum

To create a new spectrum on the Spectra Configuration window:

1. Click **New** to open the **New** window.



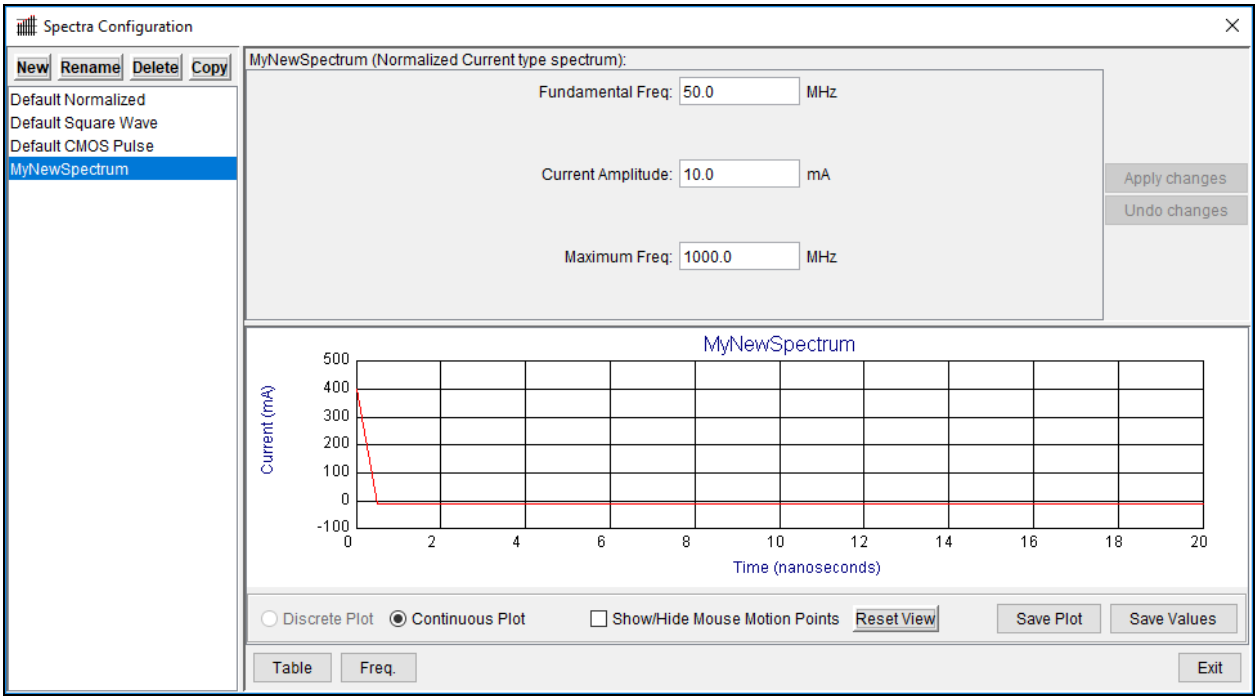
2. Use the drop-down menu to select an existing spectrum type (**Normalized Current**, **Square Wave**, or **Pulse CMOS**), or select **User-defined** to import settings.
3. Click **OK** to open the **Input** window.



4. Name the new spectrum and click **OK**.

   The new spectrum appears in the left pane, and its settings and plot appear to the right.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



> **Note:**
>
> Configurable settings vary based on the type of spectrum you selected previously.

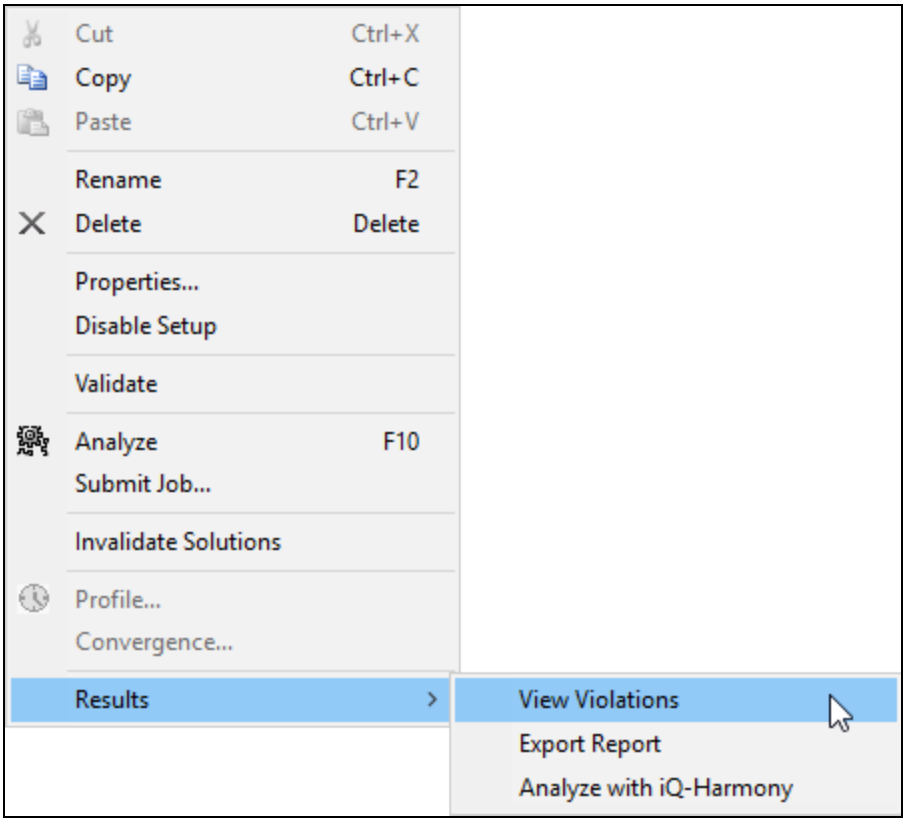
5. Enter the applicable settings and click **Apply Changes**.
6. Click **Exit** to return to the **EMI Scanner** window.

Viewing EMI Scanner Results

Follow these steps to view EMI Scanner results.

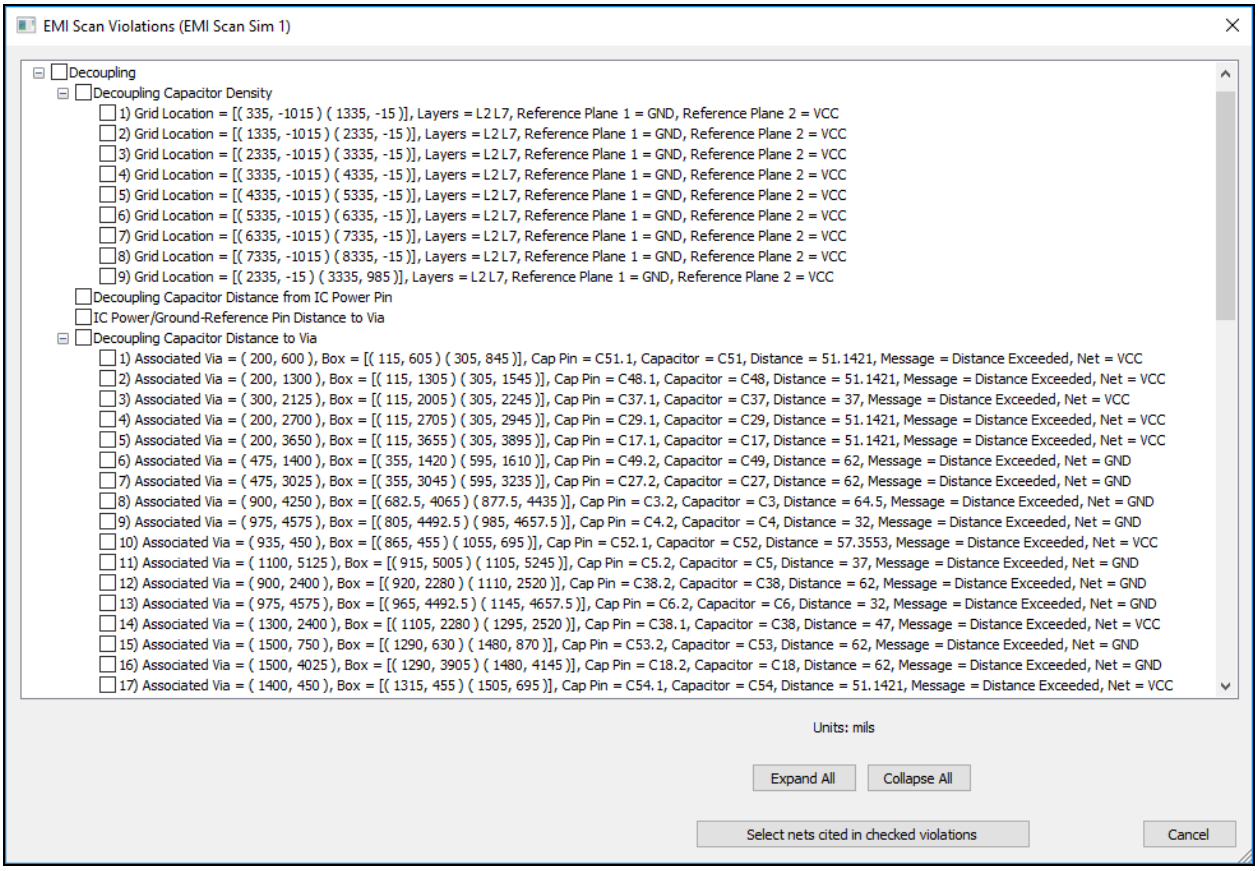
1. From the **Project Manager** window, right-click **EMI Setup** and select **Results** > **View Violations**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



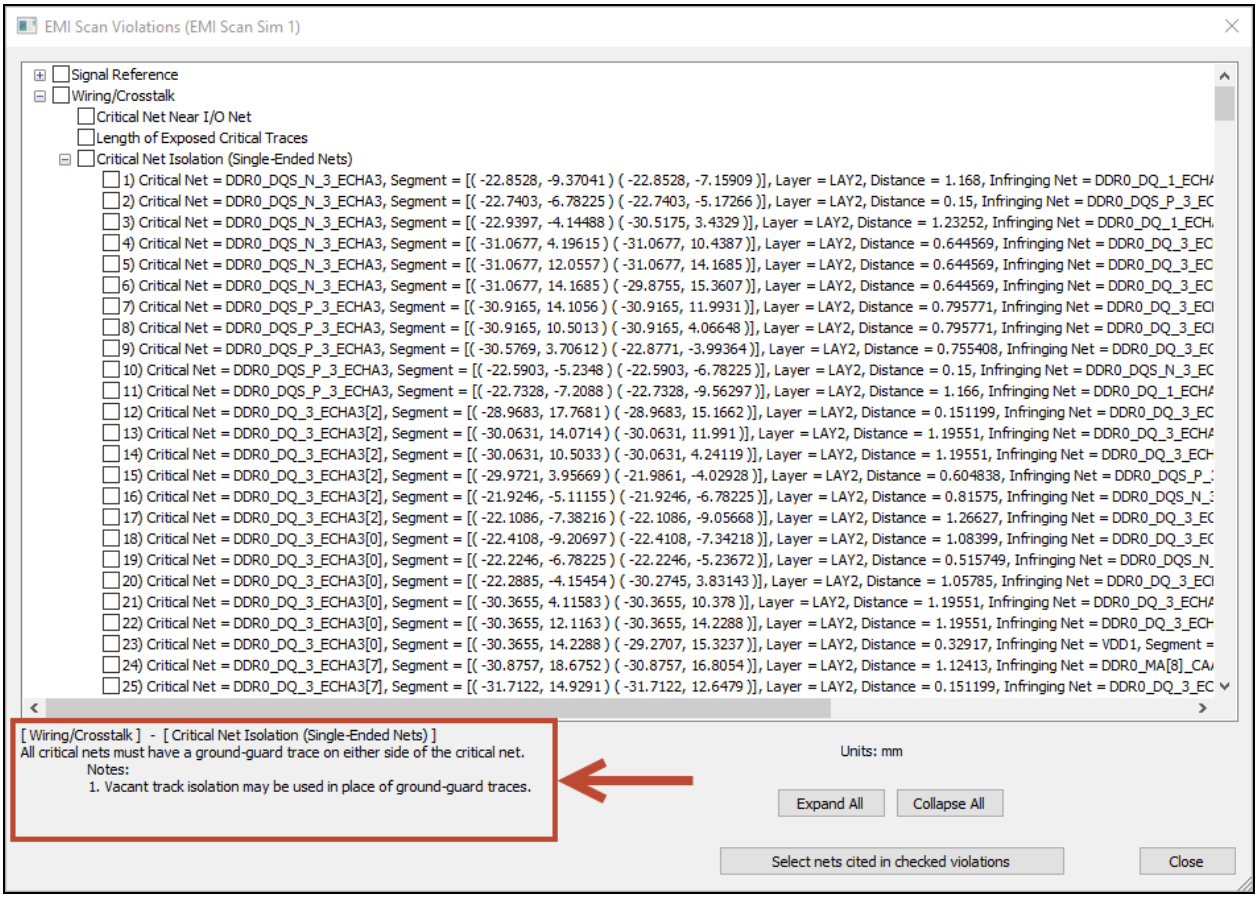
The **EMI Scan Violations** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Violations are listed in a tree, by type. Expand and collapse items in the tree, or click **Expand All**/**Collapse All**.
3. Click a violation to zoom to its location in the **Design Area**. Clicking a violation also populates the **EMI Scan Violations** window with a description of the violation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Use the check boxes in the tree to select multiple violations.
5. Click **Select nets cited in checked violations** to select these nets in the *Modeling* workspace.

Other Results Menu options include:

- **Export Report** – allows you to export an HTML report of EMI rules and violations.
- **Analyze with iQ-Harmony** – opens the Violation View Limiter window, the first step in analyzing EMI Scanner results.

Exporting EMI Scanner Results

To export EMI Scanner results:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From the **Project Manager** window, right-click **EMI Setup**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Select **Results** > **Export Report** to open an HTML report in the default Internet browser.

ANSYS EMI Scanner RULES

ANSYS EMI Scanner RULE RESULTS

SIGNAL REFERENCE

Critical Net Crossing Split Reference Plane - Violations: 0	ON
Critical Net Changing Reference Plane - Violations: A - 6, B - 0, C - 0	ON
Critical Net Near Edge of Reference Plane - Violations: 0	ON

WIRING/CROSSTALK

Critical Net Near I/O Net - Violations: 0	ON
Length of Exposed Critical Traces - Violations: 10	ON
Critical Net Isolation (Single-Ended Nets) - Violations: 0	ON
Critical Net Isolation (Differential Nets) - Violations: 0	ON
Critical Differential Net Length Matching and Spacing - Violations: 0	ON
Wide Power/Ground Traces - Violations: 434	ON

DECOUPLING

Decoupling Capacitor Density - Violations: 0	ON
Decoupling Capacitor Distance from IC Power Pin - Violations: 101	ON
IC Power/Ground-Reference Pin Distance to Via - Violations: 178	ON
Decoupling Capacitor Distance to Via - Violations: 146	ON
Power/Ground-Reference Trace Decoupling - Violations: 0	ON
Power Via Density - Violations: 1	ON

PLACEMENT

I/O Filter Distance to I/O Connector - Violations: 0	ON
Distance from Oscillator to Clock Driver - Violations: 0	ON

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

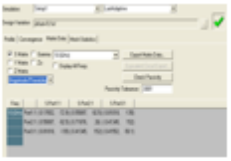
You can change whether EMI Scanner produces one large, combined HTML report or several individual HTML files in the EMI Scanner General Settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

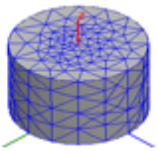
19 - Postprocessing and Generating Reports

As Ansys Electronics Desktop completes a solution, you can display and analyze the results:

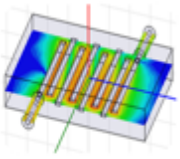
View Solution Data



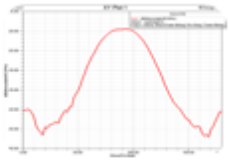
View Optimetrics Results



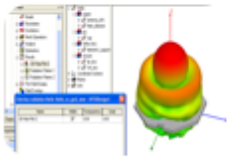
Create Mesh Plots



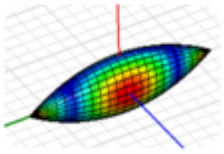
Plot Field Overlays



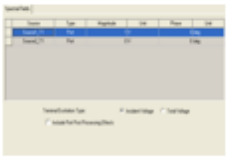
Create or Modify 2D or 3D Reports



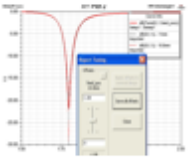
Overlay 3D Field Plot on Model



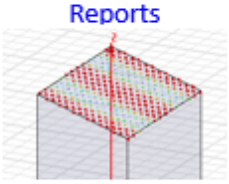
Create Animations



Scale Excitation Mag/Phase



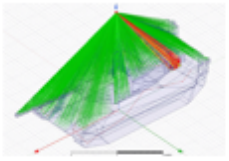
Tune Reports



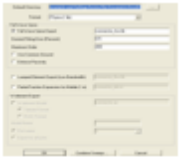
Port Field Display

Specify Output Variables

Radiated Fields Observation Regions

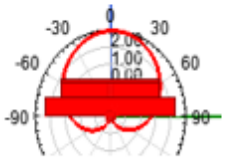


Visual Ray Trace

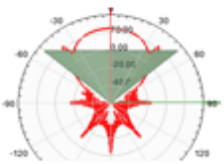


Export Equivalent Circuit Data

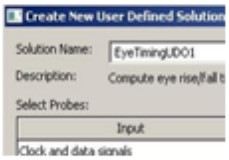
Fields Calculator / Derived Field Quantities



Overlay 2D Radiation Fields



Overlay Monostatic/ Bistatic RCS



User Defined Outputs

User Defined Documents

Network Data Explorer

- View solution data including the following: convergence information, computing resources that were used during the solution process, mesh statistics, and matrices computed for the S-parameters, impedances, and propagation constants during each adaptive, non-adaptive, or sweep solution. For eigenmode solutions, you can view the real and imaginary parts of the frequency and quality factor Q computed for each eigenmode. Solution data can also be viewed while Ansys Electronics Desktop is generating a solution.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- View analysis results for Optimetrics solutions.
- Plot field overlays - representations of basic or derived field quantities - on surfaces or objects.
- Overlay Field Plots on Models
- Create 2D or 3D reports of S-parameters, basic and derived field quantities, and radiated field data.
- Plot the finite element mesh on surfaces or within 3D objects.
- Create animations of field quantities, the finite element mesh, and defined project variables.
- Scale an excitation's magnitude and modify its phase.
- Apply Derivative Tuning to Reports

> **Note:**
>
> Except in the case of non-model boxes drawn in the global coordinate system (CS), non-model objects cannot be used for any fields post processing operation You can use non-model boxes drawn in the global CS for post processing operations, including integration and solution domaining.

Viewing Solution Data

While Ansys Electronics Desktop is generating a solution, or when it is complete, you can view the following information about the solution:

- Convergence information.
- Computing resources, or profile information, that were used during the solution process.
- Matrices computed for the S-parameters, impedances, and propagation constants during each adaptive, non-adaptive, or sweep solution.
- Mesh statistics
- For eigenmode solutions, view the real and imaginary parts of the frequency and quality factor Q computed for each eigenmode.
- For Characteristic Modes solutions, a CMA Data tab reports the the Number of Modes, Characteristic Angle and current, Modal Significance and Quality Factor, and Voltage per port based in edit sources weighting.
- The state of solved solutions.
- For transient solutions, Transient Data.

To access the **Solution Data** window, in which the information above can be accessed, do one of the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **Circuit**> **Results**> **Solution Data**.
- Right-click **Results** in the Project Manager, and then click **Solution Data** on the shortcut menu.
- Select the **Results** tab on the ribbon, and click the **Solution Data** icon.

Viewing a Solution Profile

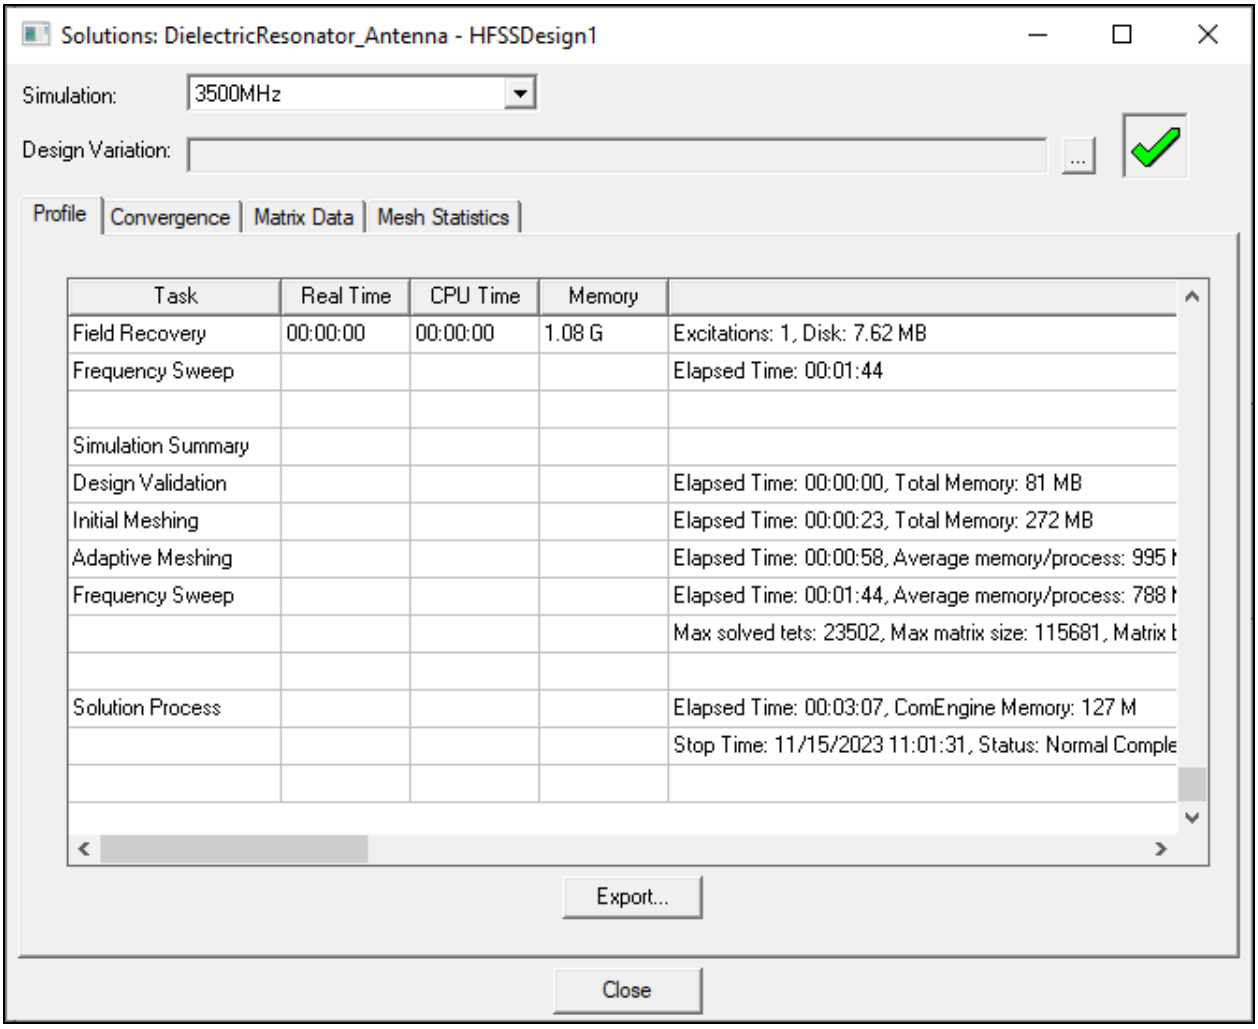
At any time during or after the solution process, you can examine the computing resources or profile data that were used by Ansys Electronics Desktop solvers during the analysis. The profile data is essentially a log of the tasks performed by Ansys Electronics Desktop during analysis. The log indicates the length of time each task took and how much physical and disk memory was required.

1. In the project tree, right-click a solution setup, and select **Profile**.

   The **Solutions** dialog box appears, with the **Profile** tab selected. You can also click the **Solution Data** icon on the ribbon to open the **Solutions** dialog box, and then select the **Profile** tab.

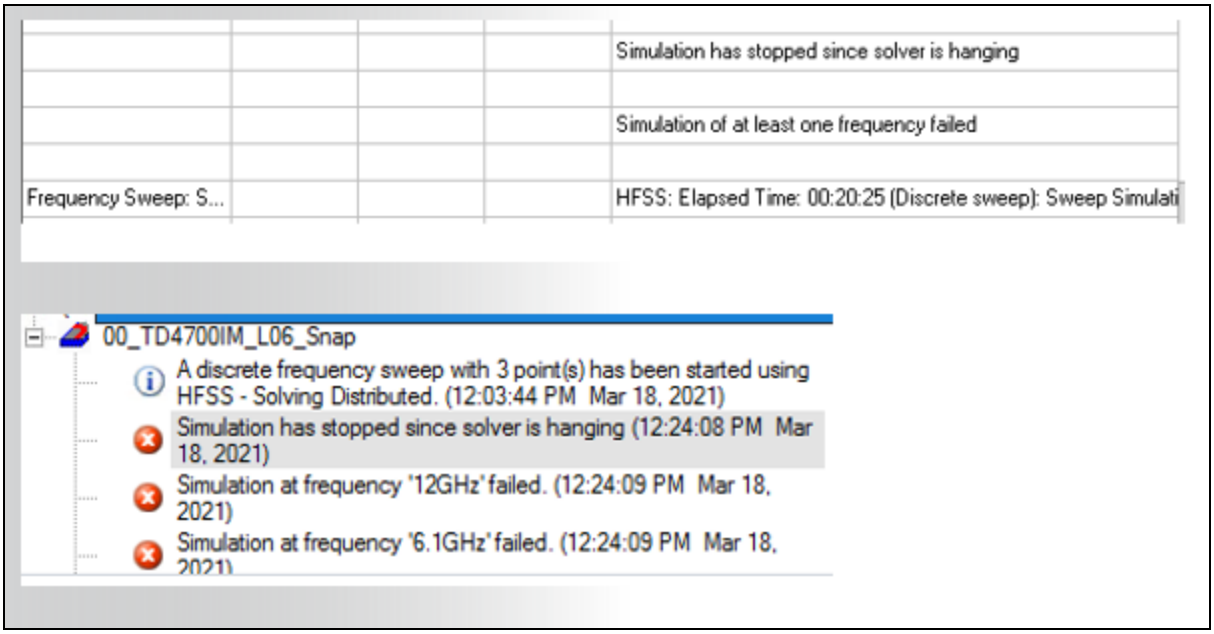
   The displayed data depends on the type of problem and solution setup.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



If the simulation hangs, equivalent messages appear in the Message window and the Solution **Profile** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. If one or more dependent setups exist, you can select the desired profile information from the **Simulation** drop-down menu. In general, the information displayed includes:

Task	Lists the type of task that was performed. Tasks include Start, various Mesh tasks, Simulation Setup, Port Adaptation, Adaptive Pass tasks, including simulation setup, Matrix Assembly, Solver tasks, and Field Recovery, Sweep tasks, and Solution Process summary and Totals for time.
Real Time	The difference in time between the start of the task and the end of the task (elapsed time).
CPU Time	The amount of CPU time required to perform the task.
Memory	The peak amount of physical memory (RAM) used by the individual executable running the task. The memory is freed for other uses after each task is complete.
Information	General information about the solution (for example, the number of tetrahedra used in the mesh, disk use, solver information, sweep information, and totals).

The matrix solver writes specific information in some of these fields, as outlined below:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Task	The matrix solver task reports the type of solution performed by the solver, based on the physics of the problem. It has the form "Solver *pdsn*" (e.g., Solver MRS2, Solver DCS4-L2), where: • *p*, the precision type is: M (mixed for direct solver), or Mxx (for distributed direct solver), or D (double for direct and iterative solver) or E (extended precisions solve) • *d*, the matrix data type is: R (real) or C (complex) • *s*, the symmetry type is: S (symmetric), A (asymmetric), or H (hermitian) • *n*, the number of processors used. You specify the number of available processors on the local machine in the solver options. If a solve does not use all available processors (local or distributed), the number reported may be less than the number available. If a simulation uses the iterative solver, the Solver designation can include a level indicator appended. to an Iterative solver designation (L2 in the example above). The higher the Level number the lower the memory, you will never see L1 (this would be equivalent to direct solver. And a first order solve will only display L2 since it only has one level of order to go down for preconditioning. A second or mixed order solve may display L3 depending on the mesh quality. If the solver switches from the Iterative Solver to the Matrix solver, you see a Matrix solver warning: Switch from Iterative Solver to Direct Solver.
Information	The matrix solver information line includes, for example, Disk = 0 KBytes, matrix size 11137 , matrix bandwidth 20.3. • **Disk** – The amount of hard disk space used during the calculation of the matrix solution. If the disk usage for matrix solver is non-zero in profile, it usually indicates off-core matrix solver. If the matrix solver must solve off-core, smaller blocks of the data to be solved are created on disk, each block is then solved in physical memory, and then the matrix solution is reassembled. As a result of this additional processing, the time required to calculate a solution is higher. • **Matrix size** – The size of the matrix that was solved (the number of unknowns) • **Matrix bandwidth** – An FEM matrix is a sparse matrix. The solver only stores the non-zero entries. The matrix bandwidth is the average number of non-zeros per row. It gives an idea of the sparsity of a FEM matrix.Storage for the sparse matrix is proportional to the total number of nonzeros = #rows x bandwidth. The higher the bases order, the larger the bandwidth. • **Iterations** – For the Iterative Solver.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To export the profile data:

1. Open the **Solutions** dialog box and select the **Profile** tab.
2. Click **Export Profile**.

   This opens a file save dialog box that lets you provide a file name and location.

3. Click **Save**.

   The data is saved in a text file with a .prof extension.

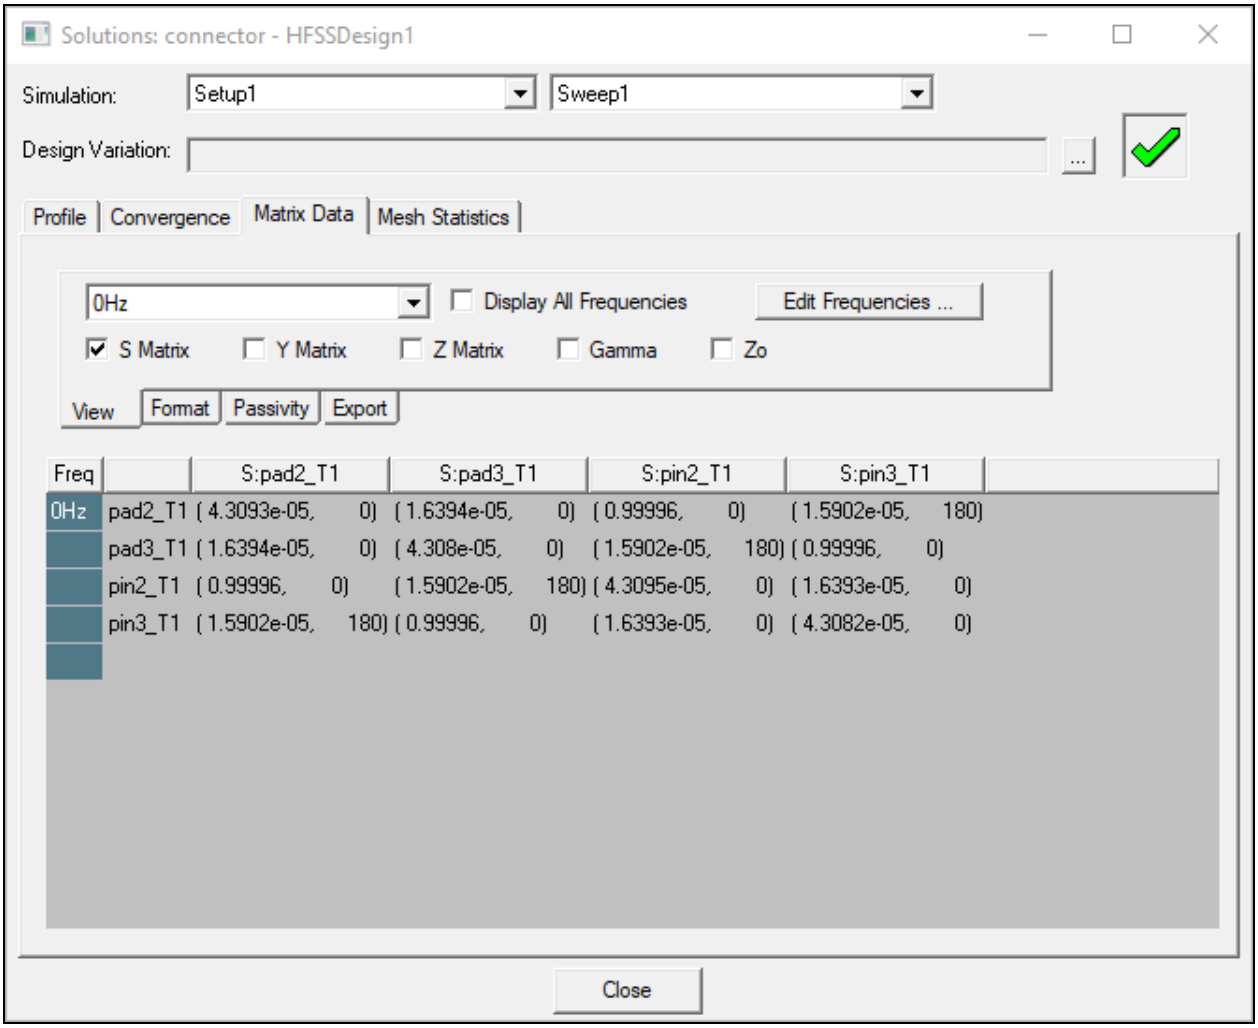
Viewing Matrix Data

To view matrices computed for the S-parameters, impedance, and propagation constants during each adaptive, non-adaptive, or sweep solution:

1. In the **Project** tree, right-click the solution setup of interest, and then click **Matrix Data** on the shortcut menu, or on the **Results** tab of the ribbon, click **Solution Data**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **Solution Data** dialog box appears. The **Matrix Data** tab is selected.

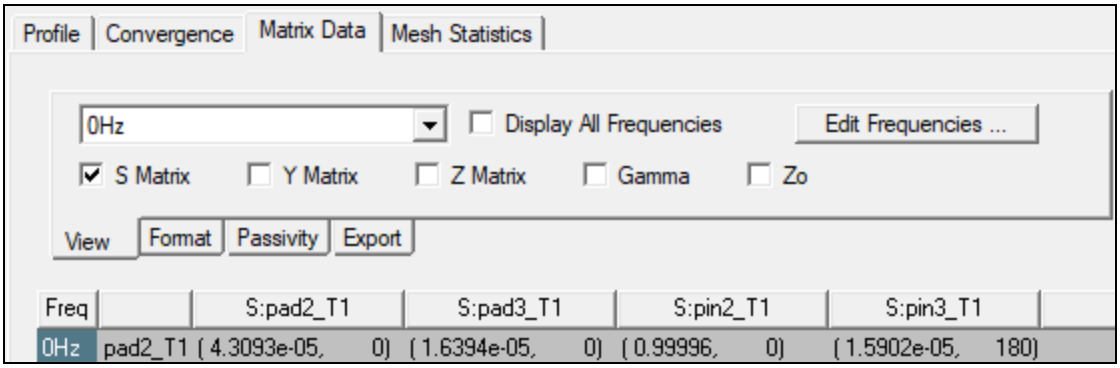


2. Select which pass to view in the drop down list to the right of the **Simulation** list. To select a specific adaptive pass:
    a. Choose **Adaptive Pass**.
    b. On the **View** tab, select the pass you want from the **Pass** list.
3. If design variations exist, in the **Design Variation** text box, specify the design with the matrices you want to view.

    Optionally, choose a design variation solved during an Optimetrics analysis from the **Set Design Variation** dialog box. This lists all the solved variations in the design. This dialog box is accessible from the **Solution Data** window by clicking the ellipsis button on the right of the Design Variation field, and via the **[solver]** > **Results** > **Apply Solved Variation** command.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. In the **Simulation** drop-down menu, click the solution setup and solved pass - adaptive, single frequency solution, or frequency sweep - for which you want to view matrices.
5. Select the type of matrix you want to view: **S-matrix**, **Y-matrix**, **Z-matrix**, **Gamma**, or **Zo** (characteristic impedance.) The available types depend on the solution type.



6. Select the solved frequencies to display:
   - To display the matrix entries for all solved frequencies, select **Display All Freqs**.

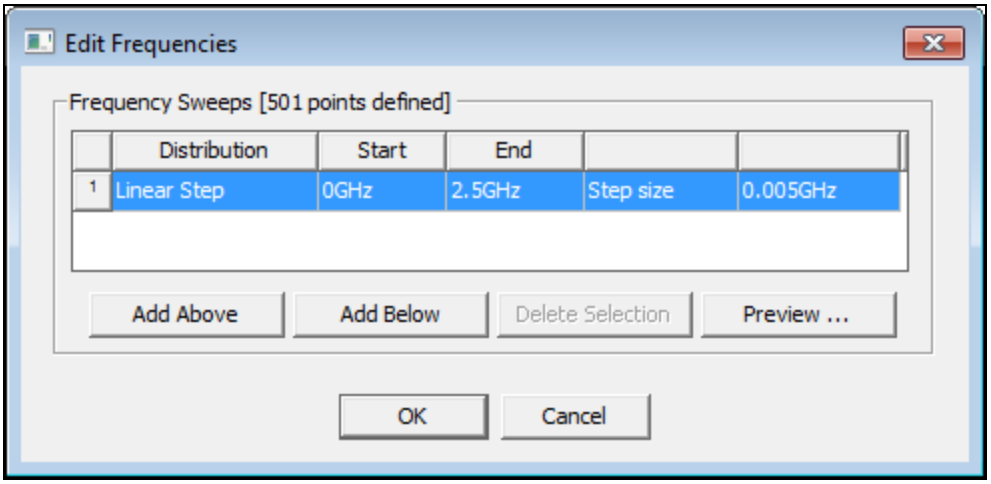
     If **Display All Freqs** is enabled, the drop-down frequency select list is disabled.
   - To show the matrix entries for a selected solved frequency, ensure that **Display All Freqs** unchecked and use the dropdown list to select the solved frequency for which you want to view matrix entries. You can use a scroll bar for selecting from long frequency lists.

     For adaptive passes, only the solution frequency specified in the **Solution Setup** dialog box is available. For frequency sweeps, the entire frequency range is available.
   - To insert or delete one or more displayed frequencies, click **Edit Frequencies**.

> **Note:**
>
> This command is only available if the sweep type is Fast or Interpolating.

Clicking **Edit Freqs** displays the **Edit Frequencies** dialog box. The current values are displayed in a table.

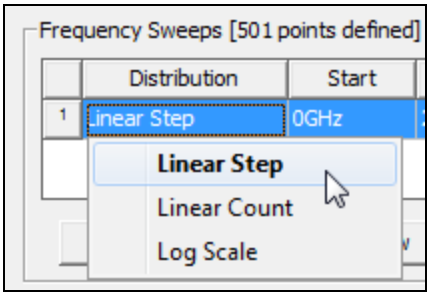
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

Changes to the Start value and End value cannot be outside of the initial range. No message is issued: rather the range is implicitly restricted.

Use the **Add Above** or **Add Below** button to add a new frequency to the table above or below the currently selected value. If no value, or the start value is selected, the new frequency repeats the current Start value and increments the count at the start a new row. You can select the type of distribution for a new Row by selecting from the drop down.

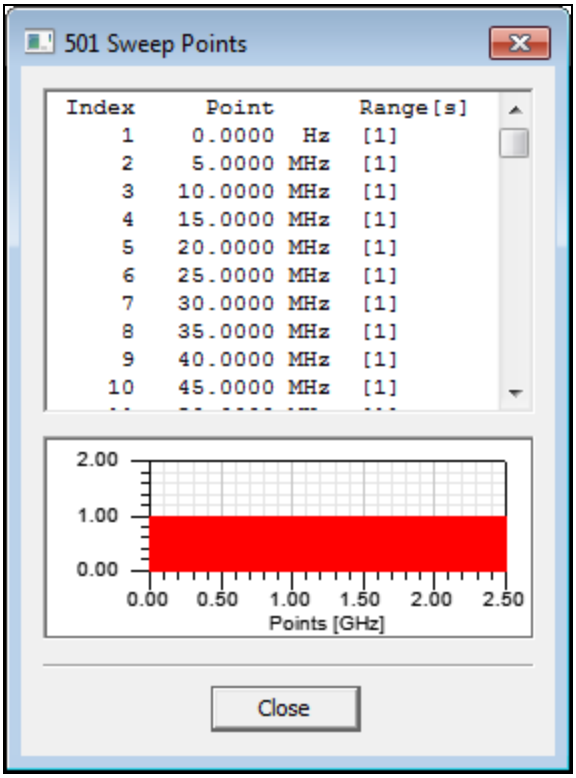


You can then edit the **Start** and **Stop** fields as appropriate for the new row.

The **Delete Selection** button enabled only if a value is selected. **Delete Selection** removes the selected value and decrements the Number of Values field.

The **Preview** button opens a dialog showing the defined sweep points.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



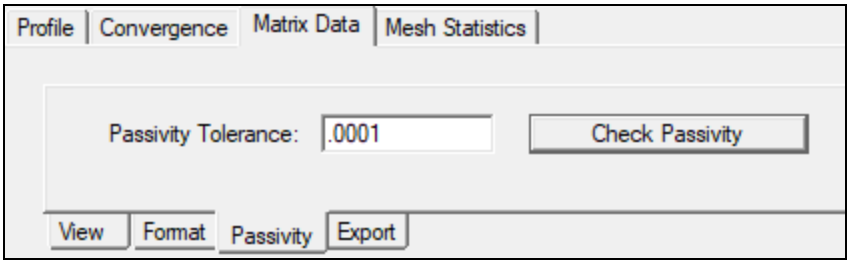
7. Select the display format — On the **Format** tab, select from the drop down menu which has the options **Magnitude/ Phase (deg)**, **Real/ Imaginary**, **dB/Phase (deg)**, **Magnitude**, **Phase (deg)**, **Real**, **Imaginary**, and **dB** — in which to display the matrix information and then in the next drop down menu, select **Terminal Data** or **Differential Pairs**.
8. Click **OK** to apply the changes to the **Solutions** dialog **Matrix Data** tab and close the **Edit Sweep** dialog box, or **Cancel** to close the dialog without applying the changes.

   If you choose to export the matrix data for the Fast or Interpolating sweep after modifying the frequencies in the **Edit Frequencies** dialog box, only those frequencies displayed under the **Matrix Data** tab will be exported.

   The data is displayed in the table. By default, wave ports are listed in alphabetical, then numerical order, just as they appear in the excitation tree. To change the port order, change setting for Default Matrix sort order in the HFSS General options. You may also want see how you can Reorder Matrix Data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9. Optionally, select the **Passivity** tab and **Check Passivity**.



This passivity check tests whether the S-parameter data from HFSS is passive or not. If the S-Matrix is not passive at one or more frequencies, this check displays a dialog saying that the solution is passive for all frequencies or that identifies the worst frequency violation and identifies the passivity in that case. A uniform renormalization of 50 ohms is performed on the solution data for Passivity checking.

Selecting the Matrix Display Format

The **Solutions** dialog offers a range of formats for the Matrix display. The available formats depend on the matrix type being displayed. When selected, dB formatting only applies to S - matrix data, even if other matrix types are displayed. The column heads in the display identify the format for the matrix type. You can display matrix data in the following formats.

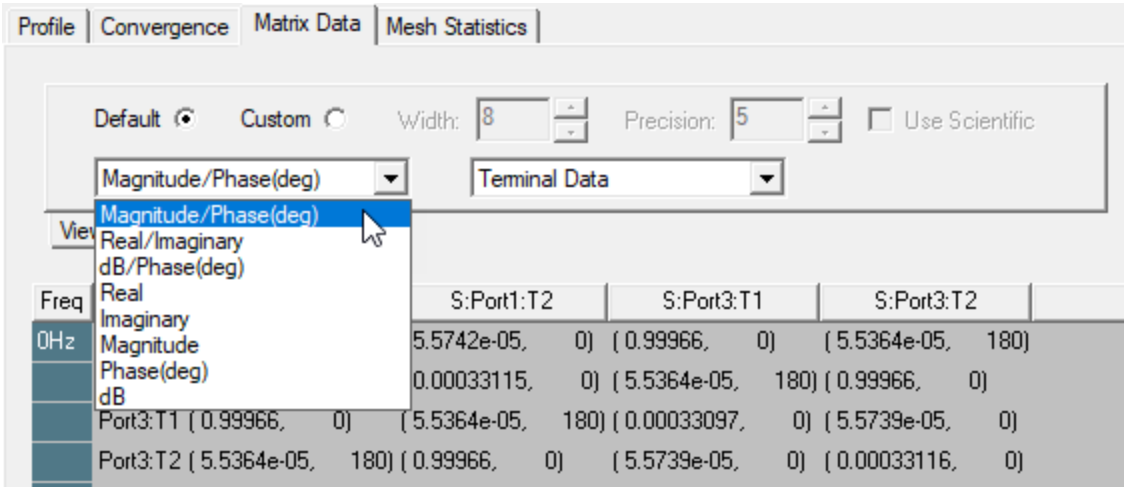
Magnitude, Phase (deg)	Displays the magnitude and phase (in degrees) of the matrix type.
Real, Imaginary	Displays the real and imaginary parts of the matrix type.
dB, Phase (deg)	Displays the magnitude in decibels and phase in degrees of the matrix type.
Magnitude	Displays the magnitude of the matrix type.
Phase (deg)	Displays the phase in degrees of the matrix type.
Real	Displays the real parts of the matrix type.
Imaginary	Displays the imaginary parts of the matrix type.
dB	Displays the magnitude in decibels of the matrix type.

After you select a format, choose whether to display terminal data or differential pairs.

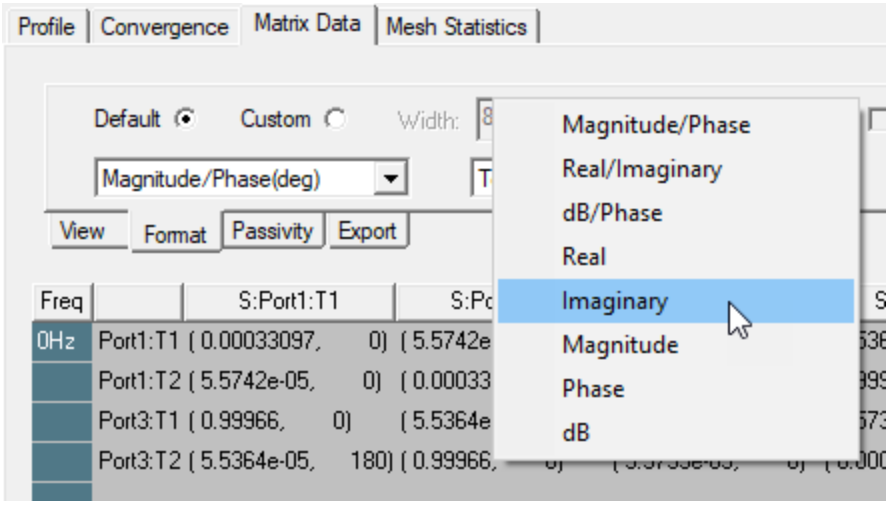
In the **Matrix Data** tab of the **Solutions** window, open the **Format** tab to select the display format in one of two ways:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Select the drop-down menus under the formats:



- right-click the column headings to display a pop-up format menu.



- Selecting from this menu also adds the name of the selected format to the column head, if the format is anything other than dB.

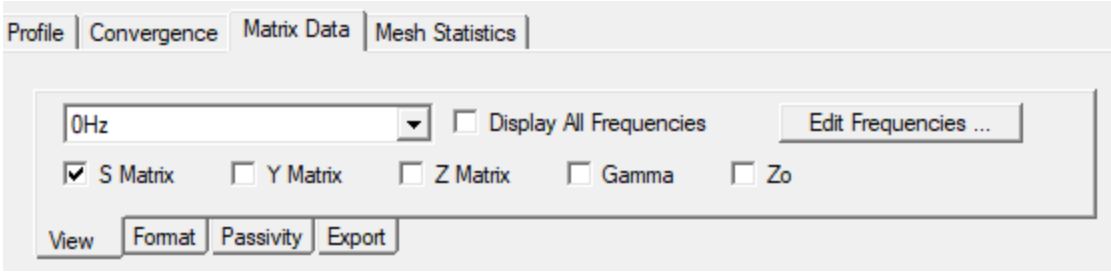
Freq		S:pad2_T1 (Imag)	S:pad3_T1 (Imag)	S:pin2_T1 (Imag)	S:pin3_T1 (Imag)
5 (GHz)	pad2_T1	-0.10414	0.056068	-0.75051	-0.1483
	pad3_T1	0.056068	-0.104	-0.14825	-0.75036
	pin2_T1	-0.75051	-0.14825	-0.16368	0.064232
	pin3_T1	-0.1483	-0.75036	0.064232	-0.1635

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

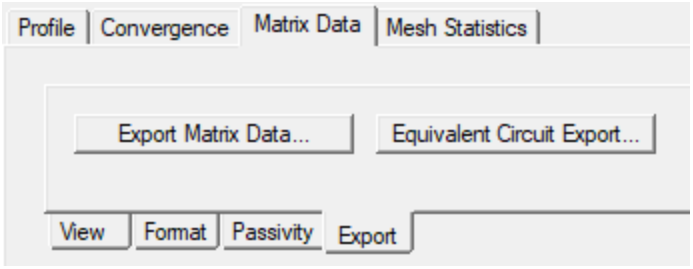
Exporting Matrix Data

1. In the project tree, right-click the solution setup of interest, and then click **Matrix Data** on the shortcut menu.

The **Solution Data** window appears. The **Matrix Data** tab is selected. You can also access the **Solution Data** window from the **Results** tab on the ribbon by clicking the **Solution Data** icon.

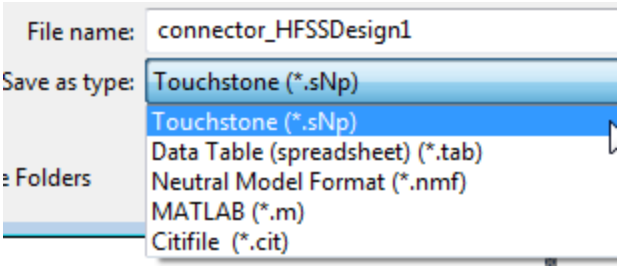


2. Select the type of matrix you want to view: **S-matrix**, **Y-matrix**, **Z-matrix**, **Gamma**, or **Zo** (characteristic impedance.)
3. Select the **Export** tab and click **Export Matrix Data**.



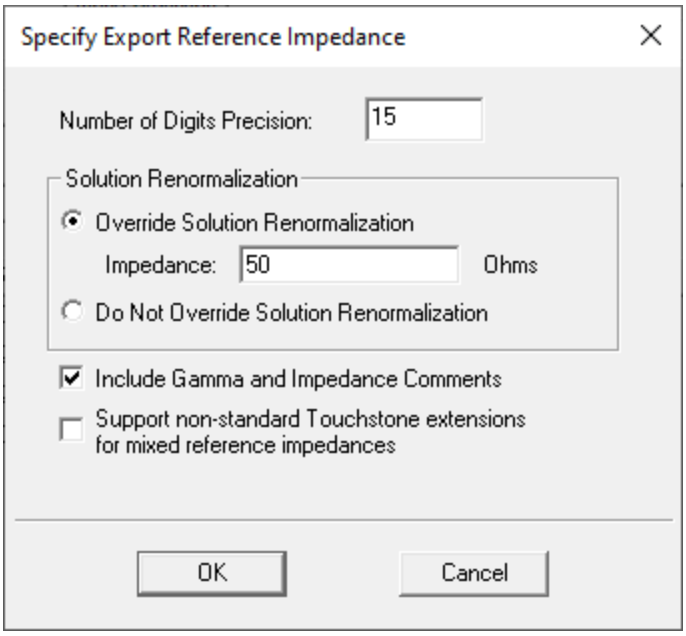
A file browser appears.

4. Type the name of the file you are exporting to in the **File name** text box.
5. Select one of the following file formats from the **Save as type** drop-down menu:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Format	Type	Description
(spreadsheet) *.tab	Data Table	A text file in which the elements of the S-matrix are arranged in a series of columns that are tab-separated and include a first row of headings. The file may be imported into a spreadsheet or similar utility.
***.sNp**	Touchstone	A Touchstone S-parameter file in which the number of ports is indicated by *n*. For example, a Touchstone file with one port would have the file extension .s1p. When you export this format, you are presented with a dialog.



You can specify:

- **Number of Digits Precision** (Default 15)
- **Override Solution Renormalization**. This refers to overriding the renormalization impedances that may have been asked for in the port setup. If so, the export renormalizes impedance
- **Do Not Override Solution Renormalization.** This leaves any port setup renormalization options in place, and grays out the Impedance setting on the dialog.
- **Include Gamma and Impedance Comments**
- **Support for non-standard Touchstone extensions for mixed reference impedances**. Writing gamma and Z_0 is not Touchstone standard, but rather an HFSS "feature" that only HFSS will

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

		recognize.
		If you want to export raw S-Parameter data for later use, you may choose to not renormalize the solution.
		If all ports and associated modes/terminals are normalized to the same impedance and you choose **Do Not Override Solution Renormalization** during export, the Touchstone file header will indicate the normalized impedance.
		The comment header in the Touchstone file lists the port and mode numbers to show which column contains which port name (in case of confusion between alphabetical and force repriority ordering of ports and associated modes).
		`! Touchstone file exported from HFSS 2025.2`
		`! File: D:/Program Files/AnsysEM/v242/Examples/HFSS/Signal Integrity/package.aedt`
		`! Generated: 1:56:02 PM Apr 01, 2020`
		`! Design: HFSSDesign1`
		`! Project: package`
		`! Setup: Setup1`
		`! Solution: Sweep1`
		`!`
		`# GHZ S MA R 50.000000`
		`! Terminal data exported`
		`! Port[1] = P01__NET179__T1`
		`! Port[2] = P02__NET178__T1`
		`! Port[3] = P03__NET178__T1`
		`! Port[4] = P04__NET179__T1`

***.nmf**	Neutral Model format	Neutral Model file format defined by the MAFET Consortium. When you save to this format, if the design includes variables, you are presented with the NMF Parameters dialog that lets you select which variables to select as parameters in the NMF file. Non-selected variables will be give the constant value shown. You are then presented a dialog that lets you specify the number of digits precision for the renormalizing impedance.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

***.m**	MATLAB	The Mathworks' MATLAB file in which the elements of the S-, Y-, or Z-matrix are arranged in a series of rows. Matlab only allows creation of complex numbers by specifying real and imaginary parts, not by specifying magnitude and phase.
***.cit**	Citifile	Common Instrumentation Transfer and Interchange file format. It is an ASCII format defined by instrument and CAE designers.

> **Note:**
>
> For Touchstone files, you no longer see a **Combine Sweeps** option on the **Export Network Data** solution dialog box. This is because the current Sweep setup allows you to define multiple sweeps for a single simulation, meaning any needed combining is defined with the sweep setup.

6. Click **Save**.

The data is exported to the file.

- By default, wave ports are listed in alphabetical, then numerical order, just as they appear in the excitation tree. You can change this order to creation order and back without invalidating the solution on the HFSS Options dialog box.
- If you select Touchstone format, you are first presented with a dialog in which you can specify the Number of Digits precision, and Override the Solution Renormalization. If so, you can specify the export renormalizing impedance (an integer value). Here you also can specify and whether to include **Gamma and Impedance Comments**, and **Number of Digits Precision** (Default 15).
- If you select Neutral File Format, you are presented with a **Specify Export Renormalizing Impedance** dialog that lets you specify the Number of digits precision for the save file.

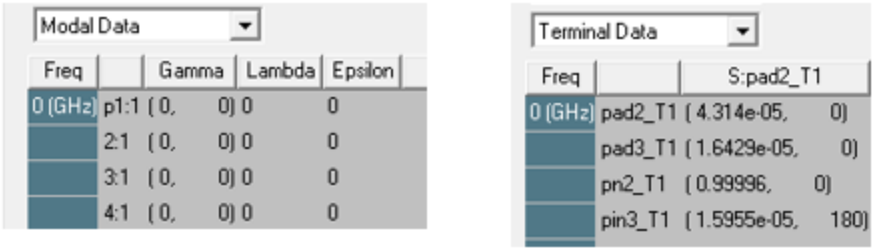
> **Note:**
>
> If you modify the display of solved frequencies in an Interpolating or Fast sweep under the **Matrix Data** tab (by clicking **Edit Freqs** and then modifying the values in the **Edit Sweep** dialog box,) only those frequencies listed will be exported to the file.

Renaming Matrix Data

In the project tree, you can right-click a port excitation to rename it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When you rename a port excitation, the associated Matrix data is reordered so that it can be presented in the same manner. The reordering is done to match the tree-sort order presented for the ports (renamed matrix data is reordered so that alphabetic values appear before numeric values).



Exports of the matrix data are ordered in the same manner. This reordering is conducted as part of post processing and does not force a re-solve.

Reordering Matrix Data

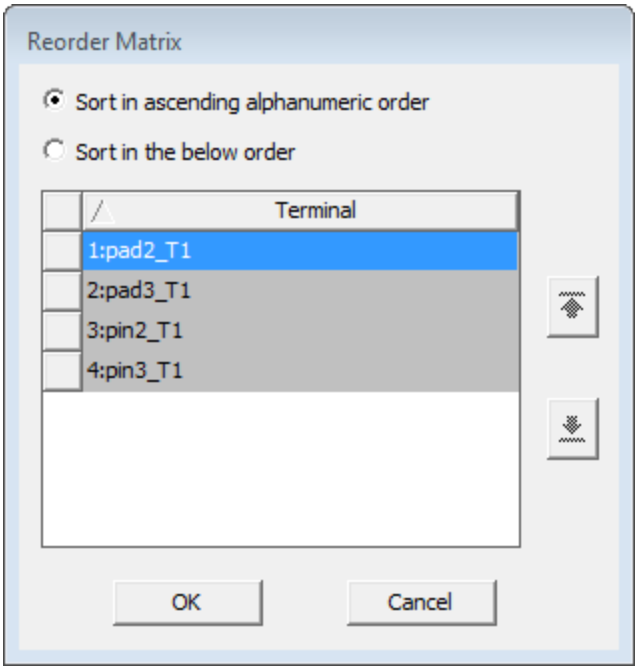
HFSS lets you reorder the matrix data as a post-processing step.

1. To re-order the matrix data, either as the default ascending alphanumeric order, or a user specified order, click **HFSS>Excitations>Reorder Matrix**, or right-click Excitations in the Project tree, and click **Reorder Matrix** on the shortcut menu.

   This displays the **Reorder Matrix** dialog. It lists the ports for a modal solution, or the terminals for a terminal solution. For Transient solutions, the dialog displays separate lists for

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

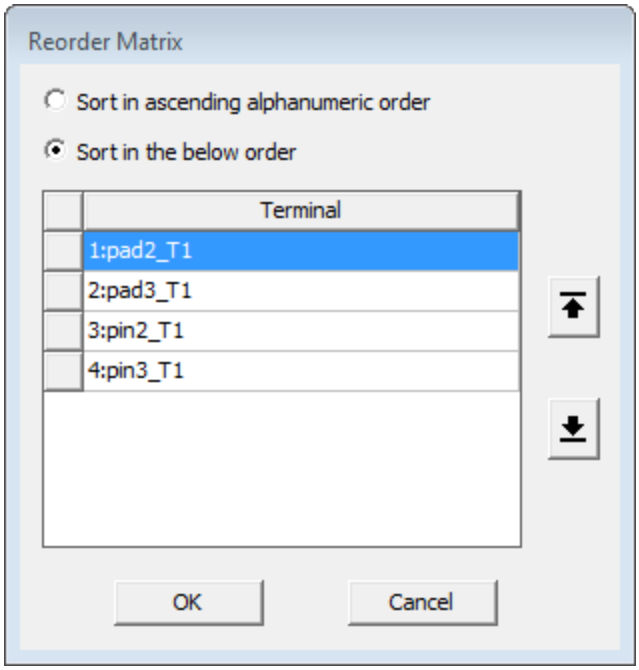
Active and Passive ports.



2. You can select the radio button for **Sort in ascending alphanumeric order**, or **Sort in the below order**.

If you select **Sort in the below order**, you can select any port or terminal to enable the up and down arrow keys. Use the keys to move the ports into any desired order. In the case of Transient, the arrow keys operate only within a partition, that is only within Active or Passive lists.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can also use Ctrl+click to select multiple arbitrary ports, or hold Shift to select a range of ports. Clicking outside the list deselects all selections.

> **Note:**
>
> If there are differential pairs, the sort order is still specified) in terms of the underlying terminal names, but the entries that make up the pair should appear in the appropriate sort location for the terminals that are used to define them.

3. Click **OK** to accept the order specified.

For Transient solutions, removing an active source will not affect the solve but might affect the matrix order. Adding an active source will require a resolve if that source has not already been solved.

Exporting Equivalent Circuit Data

You can export S-parameter data from a Driven Terminal solution to PSpice, HSPICE, Spectre or Maxwell Spice format. Importing the new data file to PSpice, HSPICE, Spectre or Maxwell Spice will enable you to include wave effects in the circuit simulations. You can also export a W-Element model for a port.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

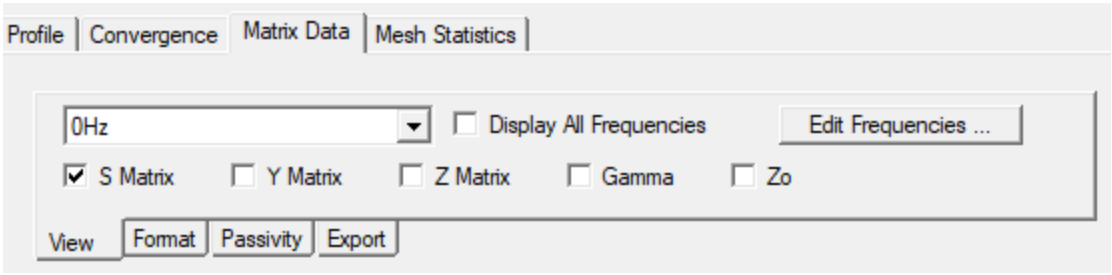
You must have a frequency sweep solution and five or more frequency points to successfully export an equivalent circuit data file. See the *Choosing Frequencies for Full-Wave SPICE* topic of the help for suggestions about the frequency range of the sweep.

The GUI lets you export full-wave Spice for a model that contains differential pairs, but it will silently export the data in its original single-ended form. The full-wave Spice model is a "broadband" equivalent circuit (that is, its S-parameters match those of the solution across the whole frequency sweep range.)

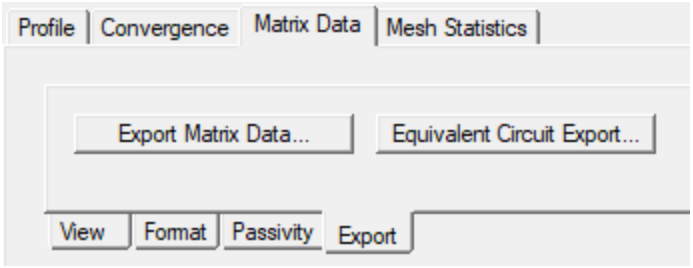
Certain discrete sweeps permit Full-Wave SPICE exports. It is allowed if the discrete data is evenly spaced, includes DC, and has at least 500 frequency points.

1. In the project tree, right-click the solution setup of interest, and then click **Matrix Data** on the shortcut menu.

The **Solution Data** window appears. The **Matrix Data** tab is selected. You can also access the **Solution Data** dialog from the **Results** tab on the ribbon by clicking the **Solution Data** icon.



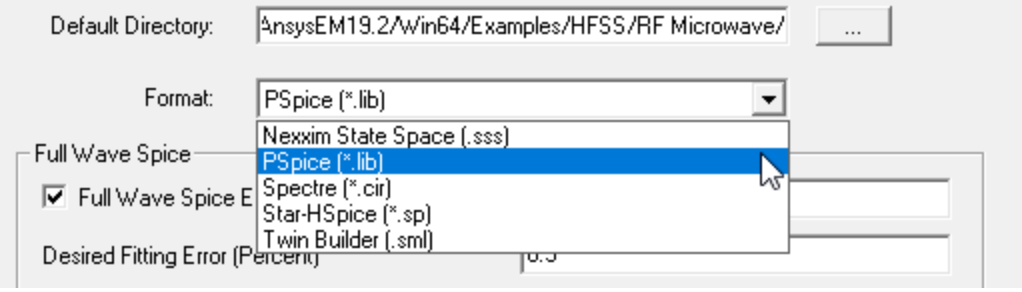
2. Select the **Export** tab and Click **Equivalent Circuit Export**.



The **Equivalent Circuit Export Options** dialog box appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Type the name or browse to the directory in which you want to store the data.



4. Click one of the following formats in the **Format** list:

   PSpice (*.lib)
   Nexxim State Space (.sss)
   Spectre (*.cir)
   Star HSpice (*.sp)
   Twin Builder (.sml)

Your format selection affects the options available under **Full Wave Spice Export**. When Twin Builder format is requested, both *.sml and *.png are created. The latter contains the image in GIF format.

> **Note:**
>
> The Export to Twin Builder here does not use the same settings as Nexxim or Network Data Explorer. If you intend to export to Twin Builder, you should use the NdExplorer.

5. If the **Full-Wave Spice Export** check box is enabled, you can select it. Checking the box enables the text field for the file name, and depending on the format selection, other options may be enabled.
6. Desired Fitting Error (percent) has a default value of 0.5. You can edit this.
7. Maximum Order has a default value of 10000.
8. HFSS supports Full Wave Spice Export from a driven modal design as long as all ports have exactly one mode each. However, HFSS does not support definition of differential pairs in a driven modal design.
9. By default **Use Common Ground** is checked and produces circuit models with a "common" (suppressed) ground terminal. Uncheck Use Command Ground to apply one negative reference terminal per port.
10. Optionally, select **Enforce Passivity**. Selecting this enforces passivity in the output file. Passive devices can only dissipate or temporarily store energy, but never generate it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(You can also check passivity from the **Matrix Data** tab using the Check Passivity button.)

This option is useful in cases where the transient simulation fails due to passivity violations in the circuit model. This circuit model is based on fitting a rational function to the S-parameter data computed by the field solver. Small errors in the data fitting can result in non-passive behavior. Selecting the **Enforce Passivity** option will take more CPU time, but ensures that the resulting model will be passive. The **Enforce Passivity** check box uses "Iterated fitting of passivity violations (IFPV)" method to do the passivity enforcement.

The passivity check tests whether the S-parameter data from HFSS is passive or not. For more information see Passivity.

11. Optionally, select **Lumped Element Export (Low Bandwidth)** if you want to save the data as a low-frequency circuit model using simple lumped elements (resistors, capacitors, inductors, and dependent current sources). The low-bandwidth model is only going to be accurate in a limited frequency range around the adaptive solution frequency

    This option is not enabled for Spectre export.

12. Optionally, select **Partial Fraction Expansion for Matlab** if you want to specify a file that expands the partial fractions for use in Matlab. The partial fractions involved describe the frequency response of the low-bandwidth model from the previous step.
13. You can also select **Combine Sweeps** to select and combine available sweeps into a single output file.

    By option, for Nexxim State Space, Spectre, and Star-HSpice, you can Export W-Element Data.

14. Click **OK**.

    The S-matrices are written to the data file that you specified in the equivalent circuit data format.

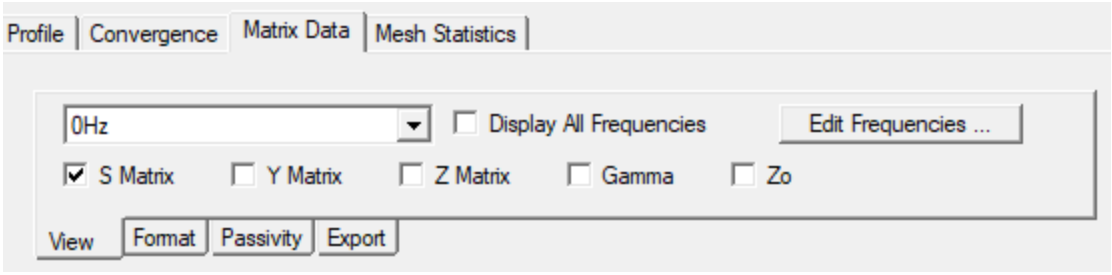
Exporting W-element Data

It is possible to extract a W-element model for a port. This W-element model can be used in a SPICE model to represent a length of transmission line of the same cross-section as the port. A W-element model can be extracted for a port only solution and for a full 3D solution.

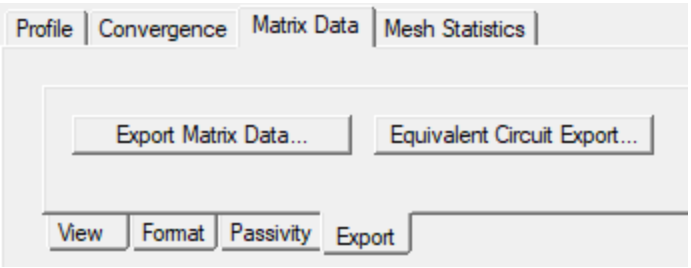
1. In the project tree, right-click the solution setup of interest, and then click **Matrix Data** on the shortcut menu.

   The **Solution Data** window appears. The **Matrix Data** tab is selected. You can also access the **Solution Data** dialog from the **Results** tab on the ribbon by clicking the **Solution Data** icon.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

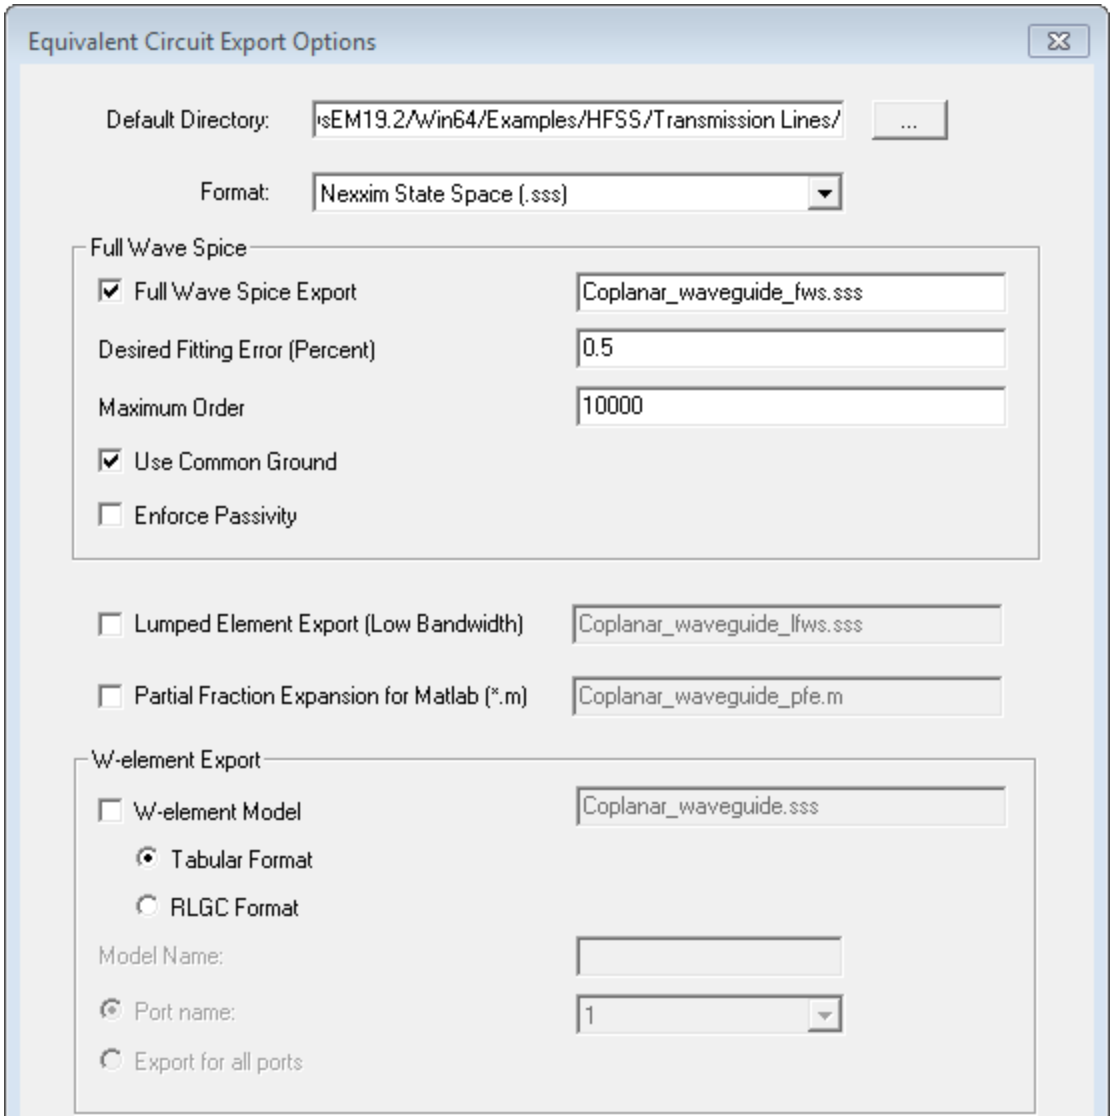


2. Select the **Export** tab and click **Equivalent Circuit Export**.

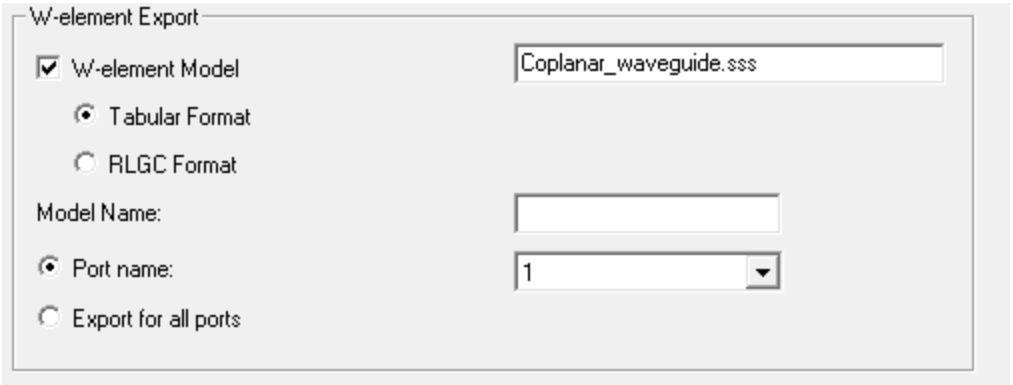


The **Equivalent Circuit Export Options** dialog box appears. If you select the format as Nexxim State Space, Spectre, or Star-HSpice, at the bottom of the dialog you see the W-element model check box enabled.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Click the W-element model check box to enable the W-element fields.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. The W-element model name field has the project name by default. You can change this if desired.
5. Choose the format as Tabular Format (the default) or RGLC format for W-element export.

Tabular Format: provides a unique RLGC model for each frequency in the solution.

RLGC Format: provides a RLGC fit over a frequency range based on Ro, Lo, Go, Co, Rs and Gd parameters.

> **Note:**
>
> For the RLGC Format, if only a single frequency solution is selected (e.g., LastAdaptive) then Rs and Gd parameters are ignored.

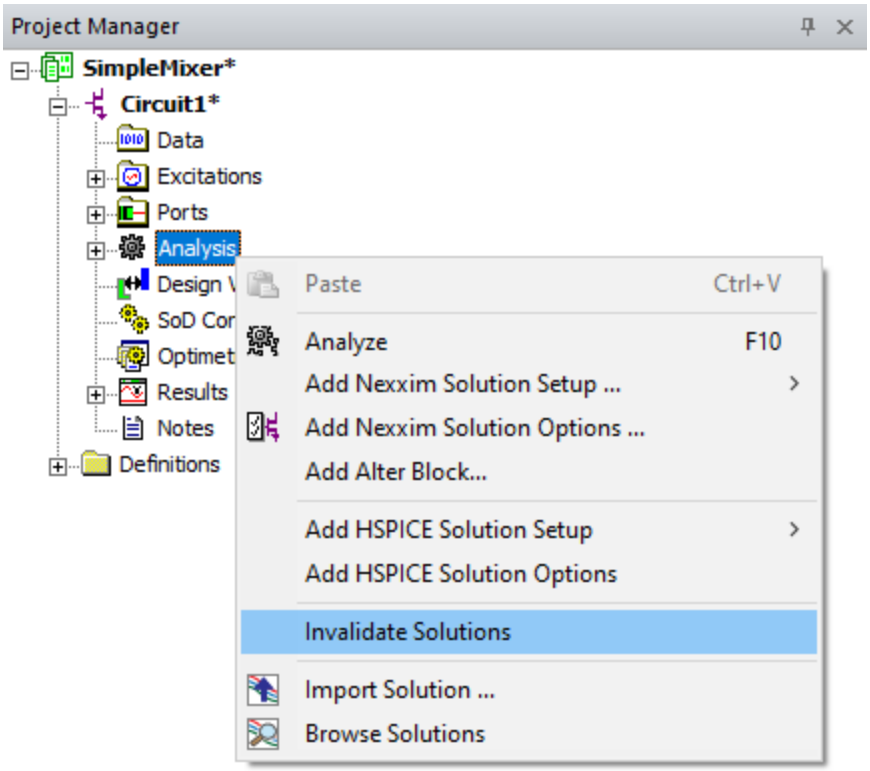
6. In the **Model name** field, provide a model name.
7. Either select the port from the **Port Name** pull down, or, to export a W-element model for all ports, select the **Export for All Ports** radio button.
8. Click **OK**.

The W-element model is written to the data file that you specified.

Invalidate Solutions

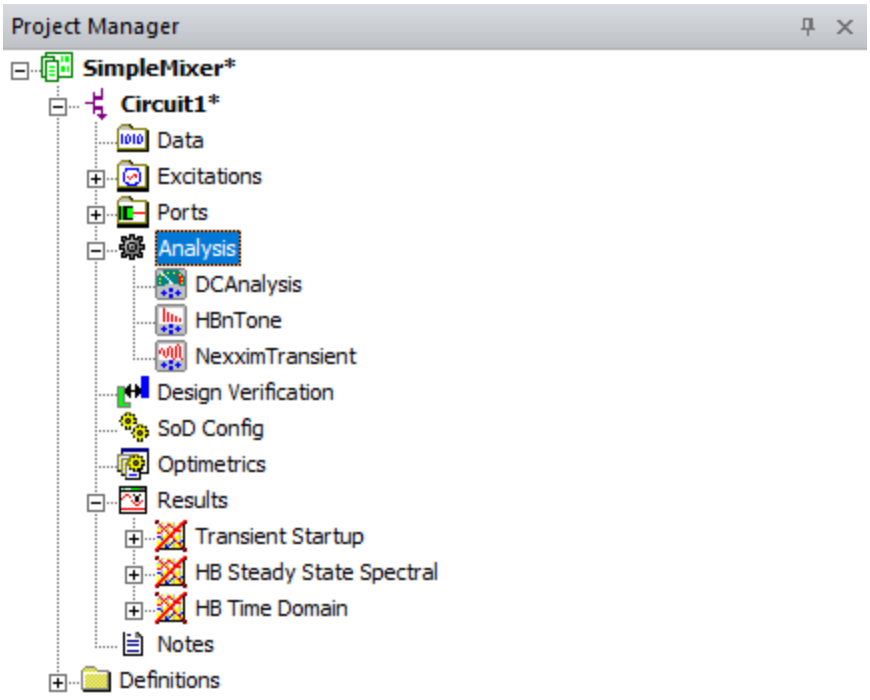
If necessary, the user can erase all solution data, including mesh, matrix, and fields data for all adaptive passes and frequency sweeps. From the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Analysis** and select **Invalidate Solutions**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Any post-processing results, reports, and/or field overlays that include deleted data will be marked with a red "**X**" in the Project Manager window. Any results marked with an "**X**" is invalid until new solution data is generated.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Deleting Reports

To use **Delete All Reports**:

1. Click **Circuit** > **Results** > **Delete All Reports.** You can also right-click on the Results folder in the Project Manager, to display the shortcut menu, and click **Delete All Reports.**

   All items under the Results folder in the Project Manager are removed.

To use **Delete** for a selected report:

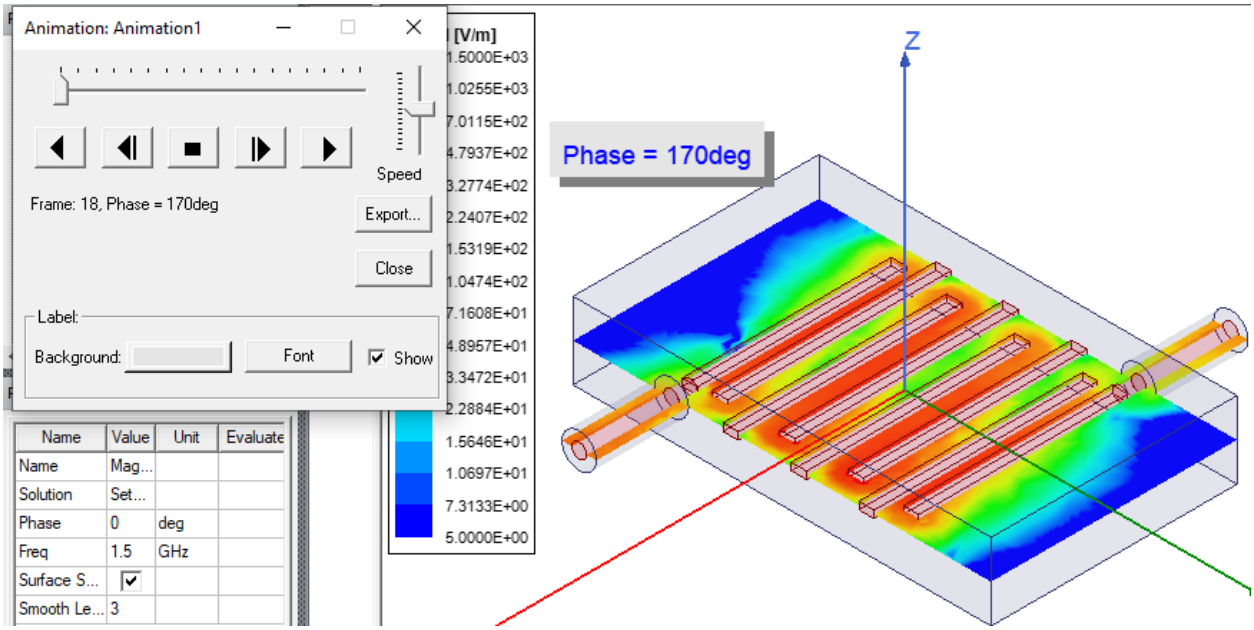
1. Right-click a report icon in the Project Manager to display the shortcut menu.
2. Click **Delete** to remove this report.

> **Warning:**
>
> Solution data that has been deleted cannot be recovered!

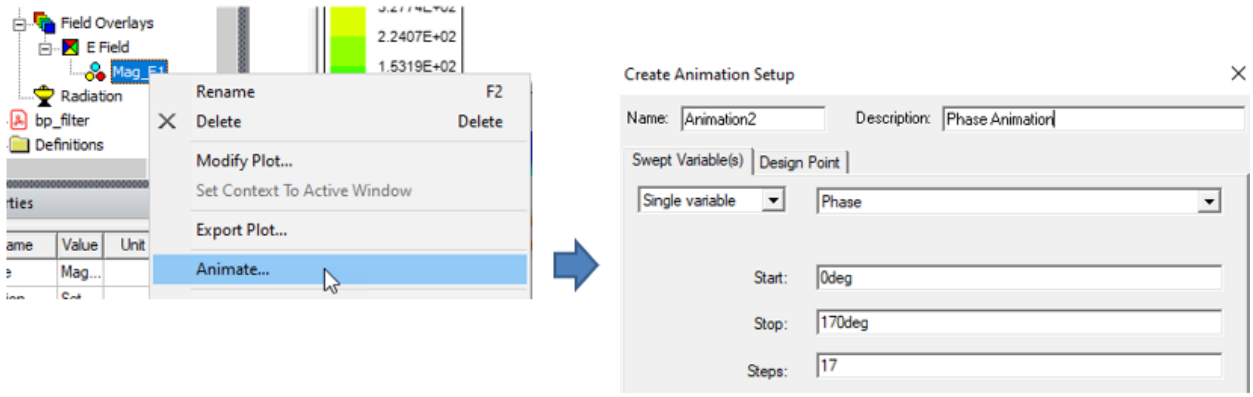
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Creating Animations

An animated plot is a series of frames that displays a field, frequency, parametric value, mesh, virtual ray trace or geometry at varying values.



To create an animated plot, you specify the values of the plot that you want to include, just as an animator takes snapshots of individual drawings that make up a cartoon. Each value is a frame in the animation. You specify how many frames to include in the animation.



The following sections describe how to create different kinds of animations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Each animation frame requires memory for storage which depends upon the mesh size and type of plot. Memory usage may become very large during plot animations. To reduce memory usage, specify the minimum number of frames possible. See General Options for more information.

Note:

Graphics System requirements for Optimal Performance

In order to obtain optimal performance improvements on fields overlay plot, a workstation-class 3D-capable graphics card with at least 512 MB of memory that supports OpenGL version 2.0 or higher is needed.

On Windows, the default OpenGL version support is v1.1, so you might need to update graphics driver to the latest version;

If you access the application through Windows Remote Desktop which only supports Generic GDI (functionally equivalent to OpenGL v1.0), the performance improvement will also not be available;

To view OpenGL version/extensions supported by your card, the OpenGL Extension Viewer tool is accessible via softpedia.com.

If animation is slow, especially for complex models, for some older graphics cards, you can improve performance by accessing **NVIDIA Control Panel**> **3D Settings**> **Manage 3D Settings – Global Settings** tab and choosing the **Workstation App – Dynamic Streaming** option from the **Global Presets** drop-down menu.

You can export the animation to animated Graphics Interchange Format (GIF), to Audio Video Interleave (AVI) format, or to WebM (.webm) format.

Creating Phase Animations

You can create phase animations of field plots of frequency sweeps.

Prerequisites

Before creating a phase animation, you must solve a frequency sweep for the project.

Create a field plot.

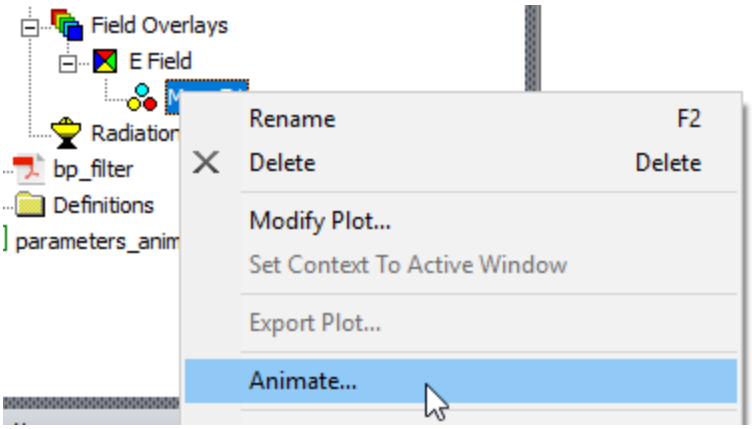
Procedure:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

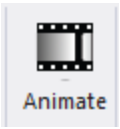
To animate a plot with respect to the phase of the plotted field:

1. Create a field overlay plot to animate.
2. Select the plot in the **Project** tree, and click **HFSS>Fields>Animate...**, or right-click in the **Modeler** window, and click **View>Animate...**.

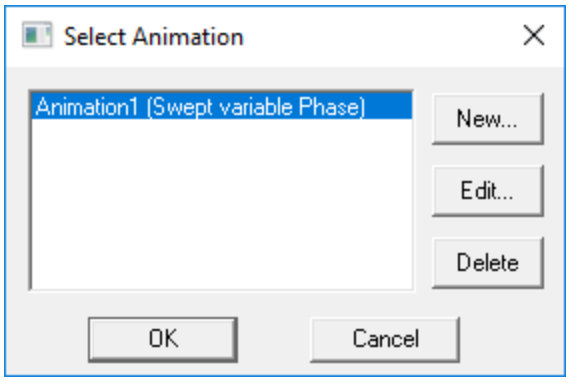
Or right-click the field overlay plot of interest and click **Animate...** from the shortcut menu,



Or select the field overlay plot of interest, select the **View** tab of the ribbon, and click the **Animate** icon.



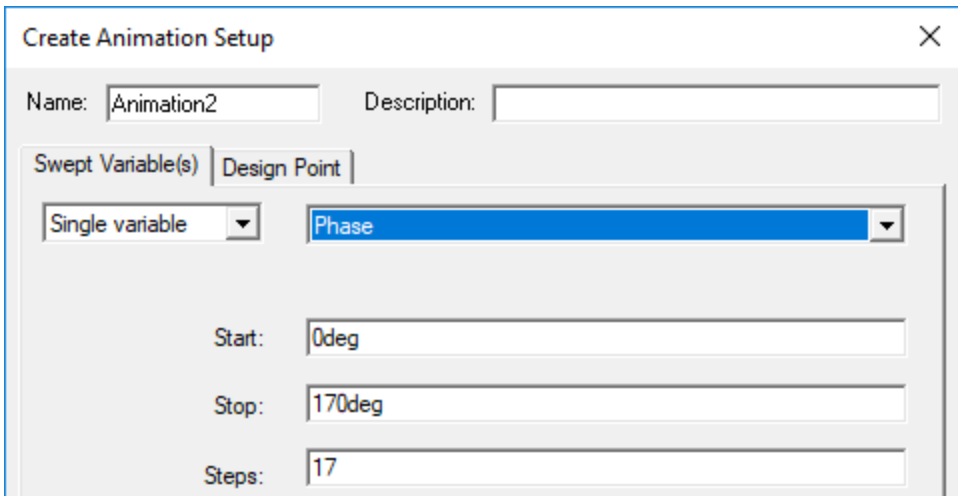
If you already created an animation, the **Select Animation** dialog box appears. Selecting an existing animation from that list starts it.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

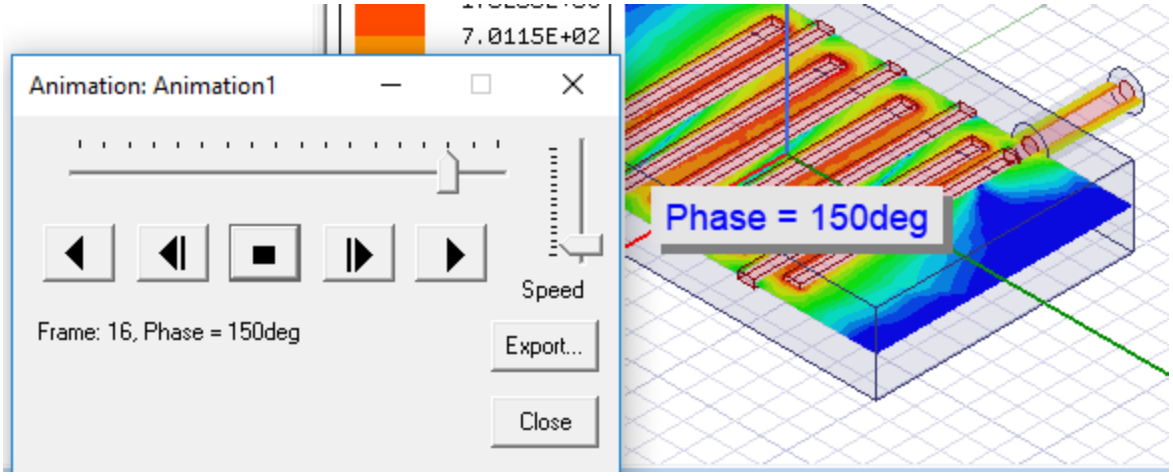
Selecting an existing animation from that list starts it when you click **OK**. Click **Edit...** to open the **Modify Animation Setup** dialog.To create a new animation, click **New**.

The **Create Animation Setup** dialog box appears.



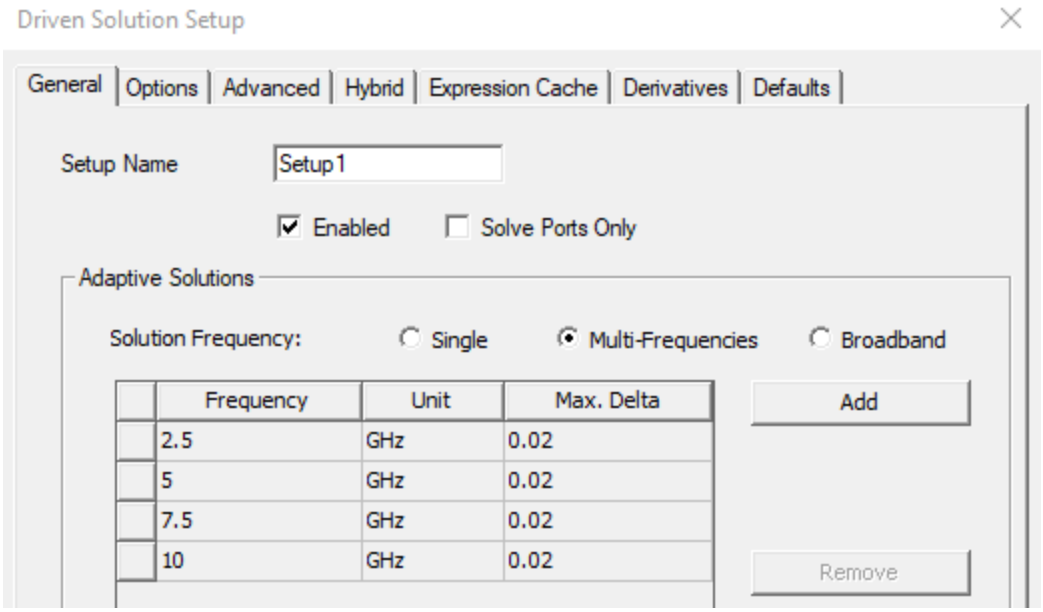
3. Under the **Swept Variable** tab, select **Single Variable** and accept Phase.
4. Specify the phase values you want to include in the animation, as Start, Stop, and Steps to include (e.g., if the **Start** value is **10**, the **Stop** value is **160**, and the number of steps is **10**, the animation will display the plot at 10 phase values between 10 and 160. The start value will be the first frame displayed, resulting in a total of 11 frames in the animation.). If the design has multiple project or intrinsic variables, click the **Design Point** tab to set the values of the non-animated variables.
5. Click the **Design Point** tab.
6. Deselect the **Use defaults** check box.
7. In the table, select the row corresponding to the variable setting of interest.
8. Click **OK** and the animation begins in the view window. The play panel appears in the upper-left corner of the desktop, enabling you to stop, restart, and control the speed and sequence of the frames.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Creating Frequency Animations

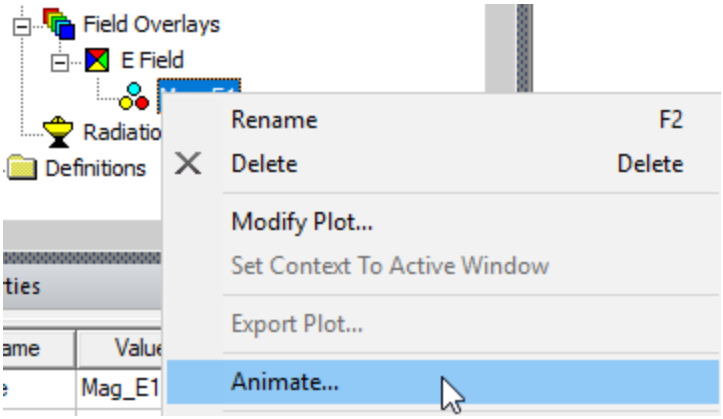
1. In order to create Frequency animations, you must define the frequencies of interest in the Solution setup, using the Multi-Frequencies option.



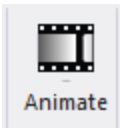
2. After running the analysis, Create a field overlay plot to animate.
3. Do one of the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

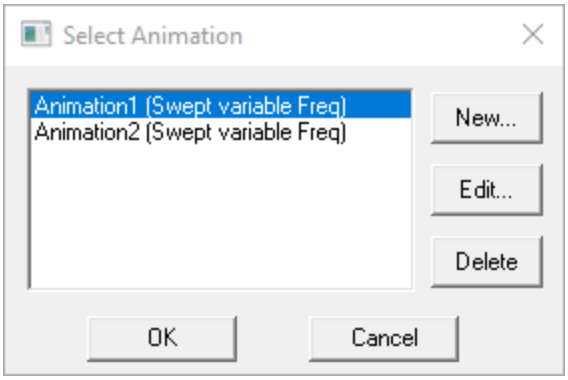
- Click **HFSS>Fields>Animate** .
- Right-click the field overlay plot of interest and click **Animate...** from the shortcut menu.



- Select the field overlay plot of interest, select the **View** tab of the ribbon, and click the Animate icon.

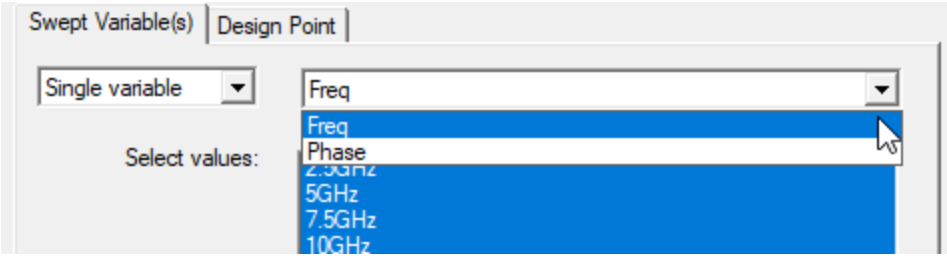


4. If you already created an animation, the **Select Animation** dialog box appears



Selecting an existing animation from that list starts it when you click **OK**. Click **Edit...** to open the **Modify Animation Setup** dialog. To create a new animation, click **New** and the **Create Animation Setup** dialog box appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

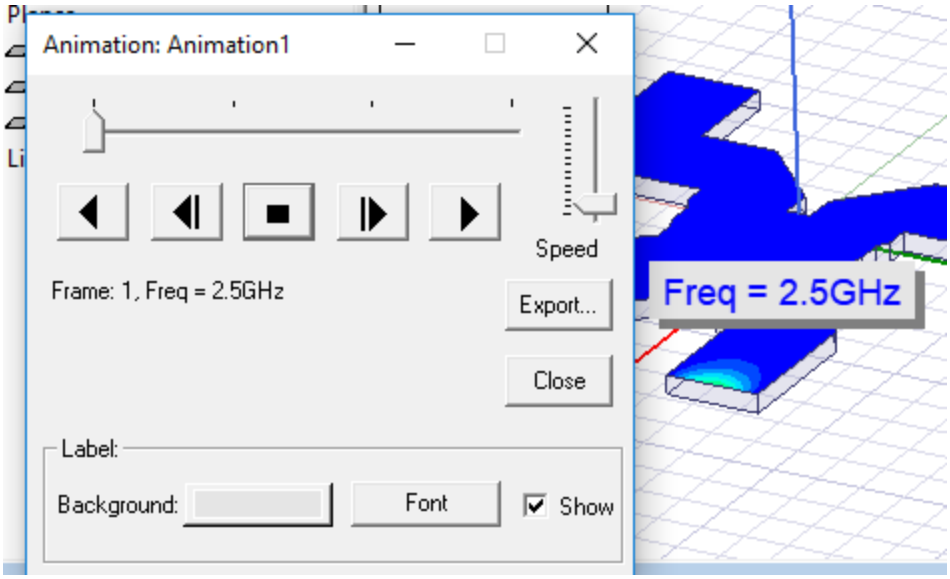


5. Under the **Swept Variable** tab, select **Frequency** from the **Swept Variable** list.
6. Select the frequency values you want to include in the animation from the **Select values** list.

   Use the **Shift** key to select a series of values, and the **Ctrl** key to select values that are not in sequence.
7. If the design has multiple project or intrinsic variables, click the **Design Point** tab to set the values of the non-animated variables.
8. Click the **Design Point** tab.
9. Deselect the **Use defaults** check box. In the table, select the row corresponding to the variable setting of interest.
10. Click **OK** and the animation begins in the view window. It will display one frame for each frequency value you selected. The play panel appears in the upper-left corner of the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

desktop, enabling you to stop, restart, and control the speed and sequence of the frames.



Creating Geometry Animations

You can create geometry animations to evaluate the effect of varying geometry variables on the model. You can also create more complex animations by creating time variables associated with object locations. This section describes the general procedure for geometry animation, and shows a geometry animation with a field overlay, and a second animation for an HFSS Antenna Example project that includes multiple objects moving with respect to a time variable.

Prerequisites

You must define at least one variable associated with the geometry before you create a geometry animation.

If you want to overlay a Field Solution on a geometry animation you must have solved fields for an Optimetrics setup using the same variable.

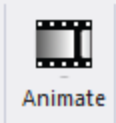
Procedure:

Following is the general procedure for creating an animation that varies a part of the model geometry.

1. Right-click in the *Modeler* window, and click to **View** > **Animate...** or

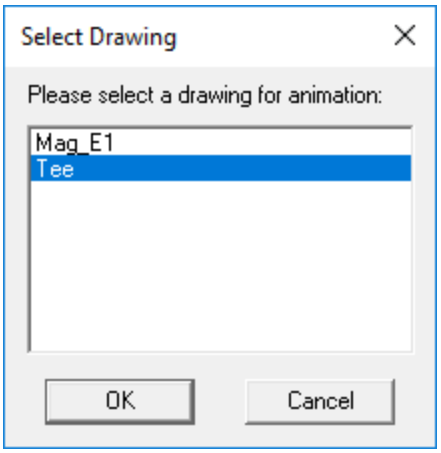
   Select the **View** tab of the ribbon, and click the **Animate** icon.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

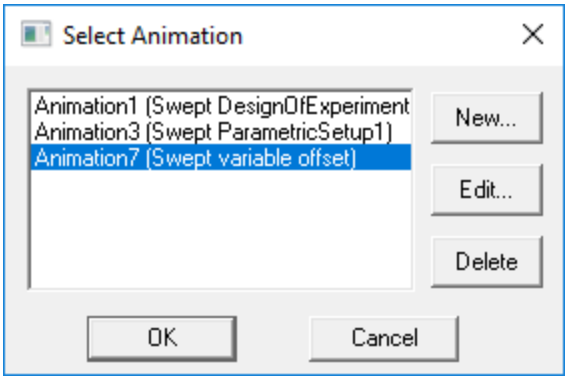


If multiple geometries can be varied in the design, the *Select Drawing* dialog box appears; proceed to step 2. If only one geometry is variable, proceed to step 3.

2. In the *Select Drawing* dialog box, select the object that you want to animate.

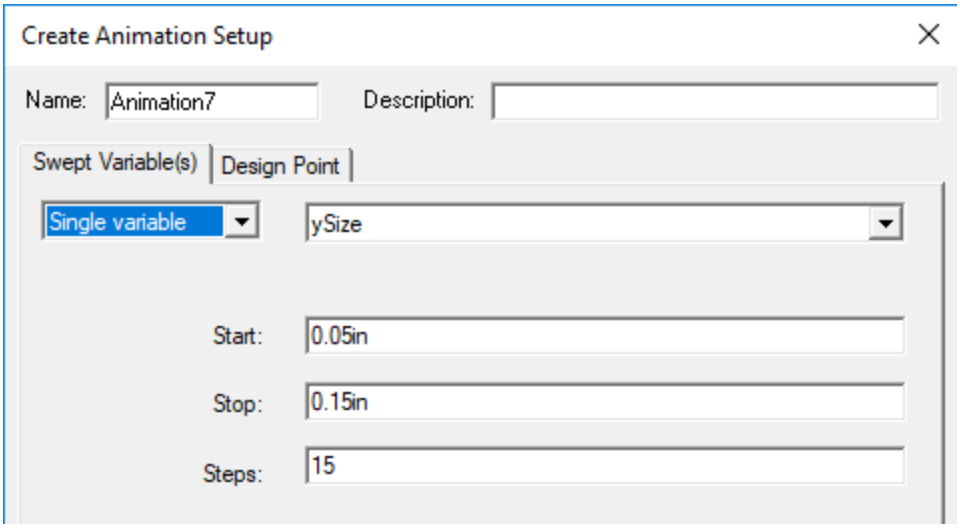


If previous animations have been created for this project, the *Select Animation* dialog box will appear. Selecting an existing animation from that list starts it when you click **OK**. Click **Edit...** to open the *Modify Animation Setup* dialog box. You may choose an animation setup from the list if one is associated with the geometry variable of interest, and the animation will start. If no existing animation setup is acceptable, select **New** and continue at Step 3 below.

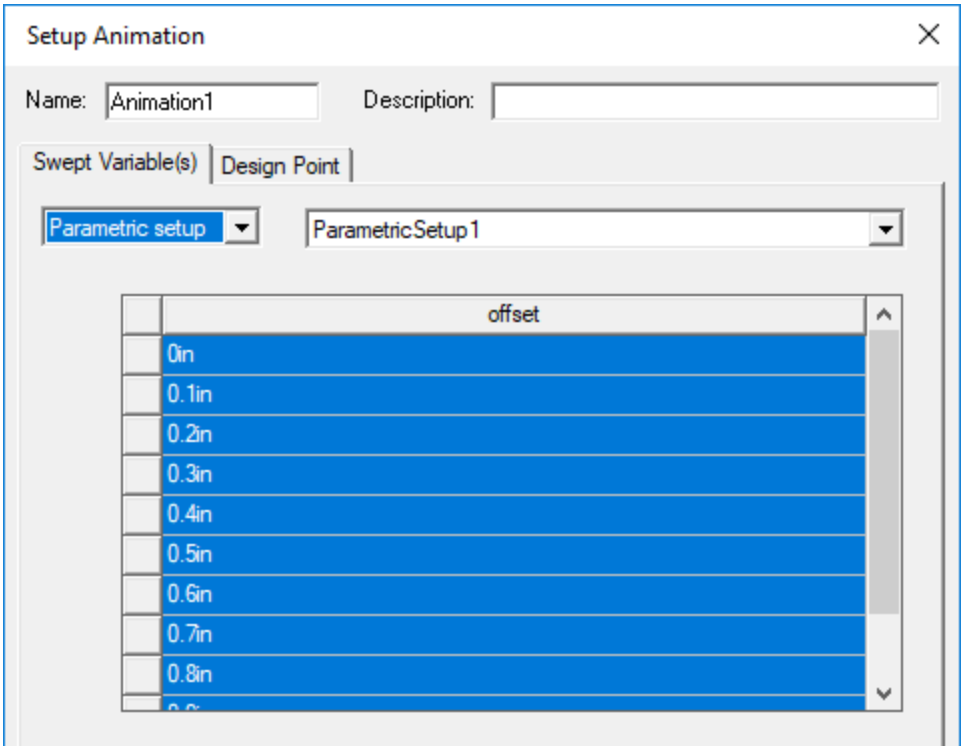


The *Create Animation Setup* dialog box appears:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. For single variable:
    a. Select the geometry variable that you want to animate from the **Swept Variable** list.
    b. Specify the Start, Stop, and Steps values to include in the animation.
4. If your have created one or more Parametric Sweeps for one or more geometric variable, you can select, **Parametric setup**, the setup to use, and the variable values to animate.



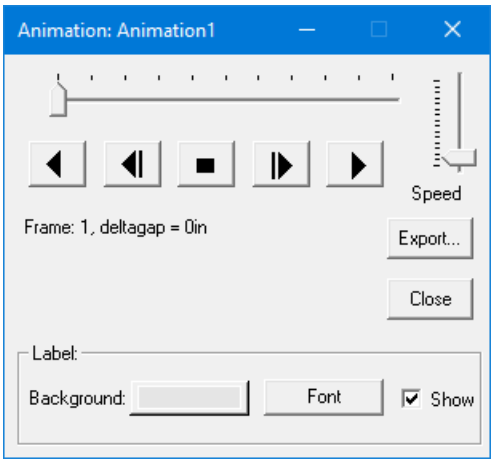
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. If you have created a **Design of Experiments** setup, you can select to define an animation based on that setup and values.
6. If the design has multiple project or intrinsic variables, you use the **Design Point** tab to set the values of the non-animated variables.
7. Click **OK**.

   The animation begins in the view window. It will display one frame for each variable value.

Controlling the Animation's Display

When an animation is displayed in the view window, the **Animation** window (also called the *play panel*) appears in the upper-left corner of the desktop. It has buttons that enable you to control the speed and sequence of the frames, start and stop the animation, and export the animation. Click an area of the window image below to learn its function.



Animation slider	Each dot on the slider represents a frame in the animation. Drag the slider to the right to display the next frame in the animated plot. Drag the slider to the left to display the previous frame in the animation.
	Plays the plot's animation sequence backwards.
	Steps backward through the animated plot one frame at a time.
	Stops the animation.
	Steps forward through the animated plot one frame at a time.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	Plays the plot's animation sequence forwards.
	Drag the **Speed** slider to the top to increase the speed of the animation. Drag the **Speed** slider to the bottom to decrease its speed.
Frame information	The current frame and phase at which the plot is being displayed is listed below the control buttons.
	Enables you to export the animation to an animated Graphics Interchange Format (GIF) or to Audio Video Interleave (AVI) format.
	Closes the animation window.
Show label check box	If you select the Show check box, a label showing the swept variable value appears in the animation. You can select the label with the mouse and drag it to a location. Background button.	Click the background button to open a color pallet dialog that lets you set the background for the swept variable label. 	The font button opens a font selection dialog that you can use to set the Font, Font Style, and Size for the label. The Default is Arial Narrow 14pt.

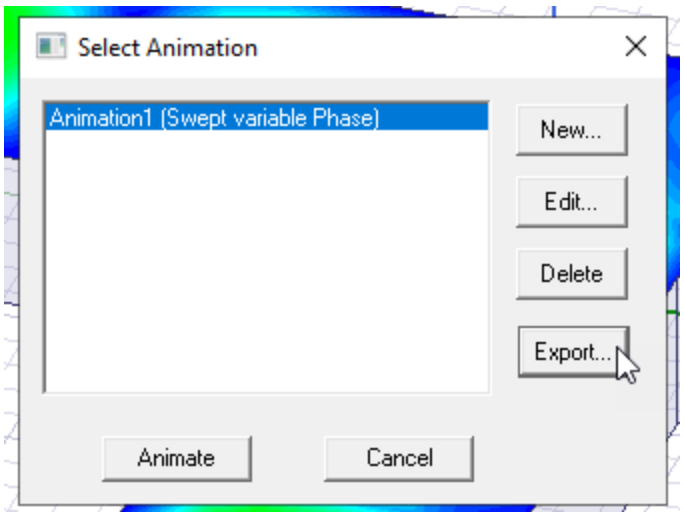
Exporting Animations

You can export animations from the **Animation** control dialog box, or, for Ensight format, from the **Select Animation** dialog box.

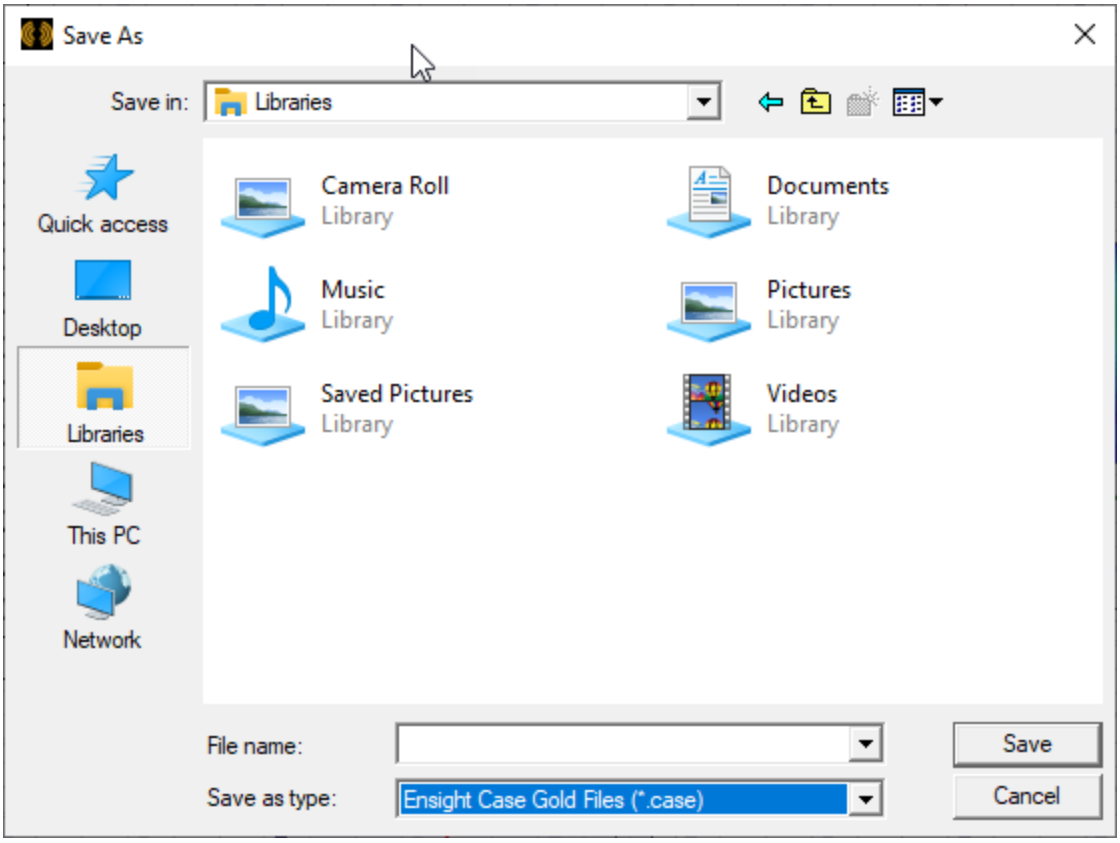
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Exporting Ensight from the Select Animation Dialog Box

1. Create the animation you want to export.
2. In the **Select Animation** dialog box, select **Export...**



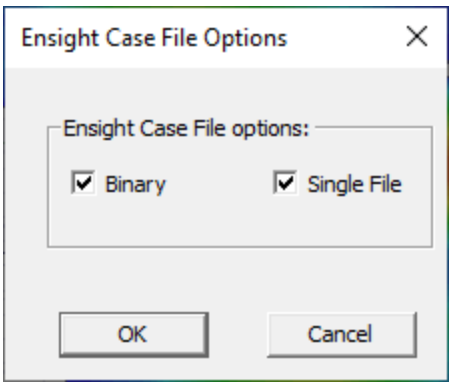
3. This opens the Browser window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Navigate to the desired location and provide a file name. The format will be Ensight .case files.

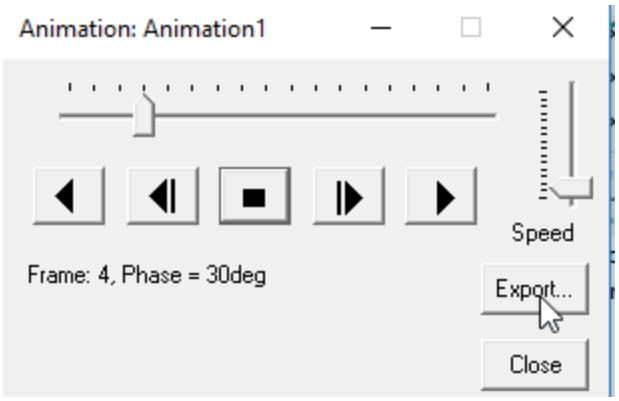
4. When you select **Save**, the **Ensight Case File Options** dialog box opens.



The binary option permits a more compact and efficient animation creation process in Ensight. The Single File options leverages the Ensight transient dataset capability to export all frames of field/geometry data to a single case file. On **OK**, every visible and animatable field plot should generate a case file with name in the format of "UserTypedName_fieldPlotName.case"

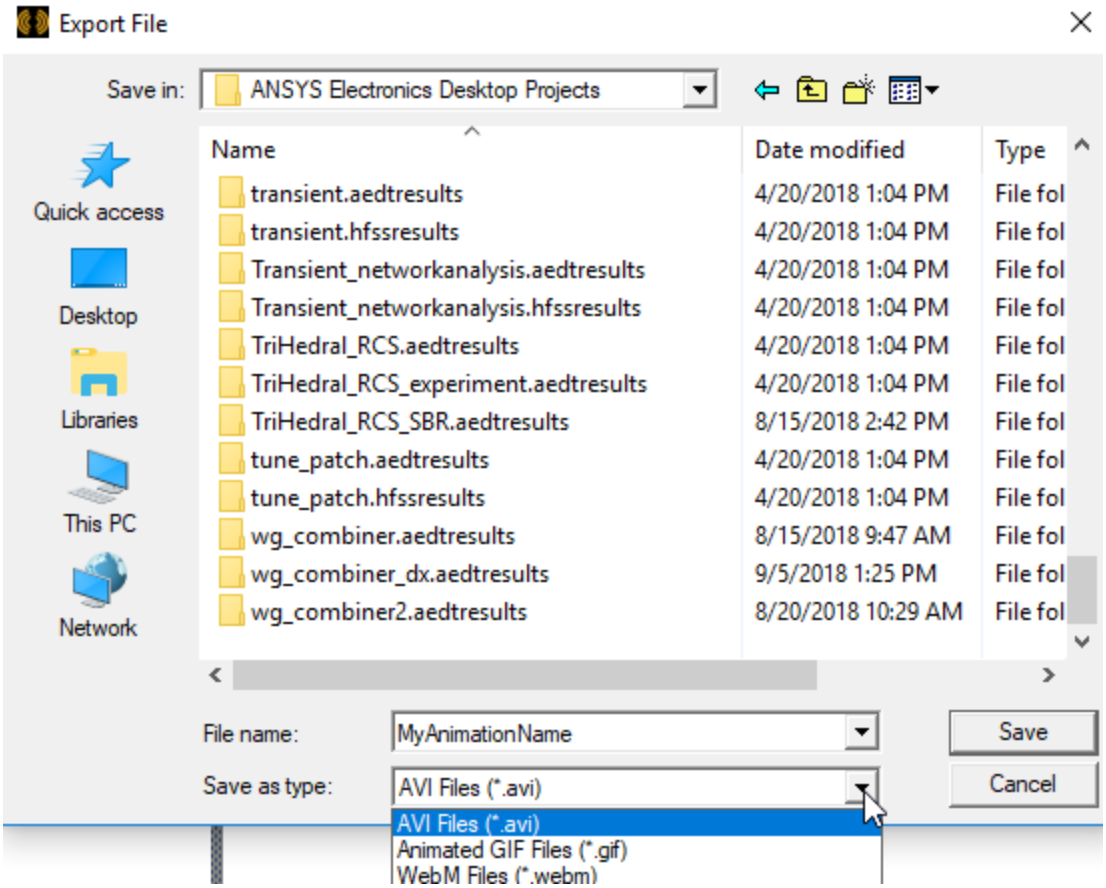
Exporting from the Animation Control Dialog Box

1. Create the animation you want to export.
2. In the play panel, click **Export...**.



The *Export File* dialog box appears.

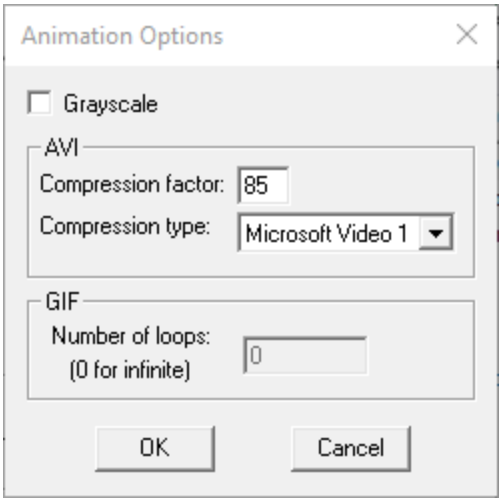
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Specify the directory to **Save in**, the **File name**, and use the **Save as type** drop-down menu to select **Animated GIF File (.gif), AVI File (.avi),** or **WebM File (.webm)**.

   The *Animation Options* dialog box appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. To replace colors in the file with 256 shades of gray, select **Grayscale**.

   Grayscale animations tend to use less memory than full color animations.

5. For AVI format export, specify the **Compression factor** (the default is 85) and one of the following **Compression types**:
   - INTEL Indeo
   - Cinepak
   - Microsoft Video 1
   - None
6. For GIF format export, specify the number of loops. The default "0" denotes infinite loops.
7. Click **OK** to close the *Animation Options* dialog box.

   The animation is exported to the file format you specified.

Creating Reports

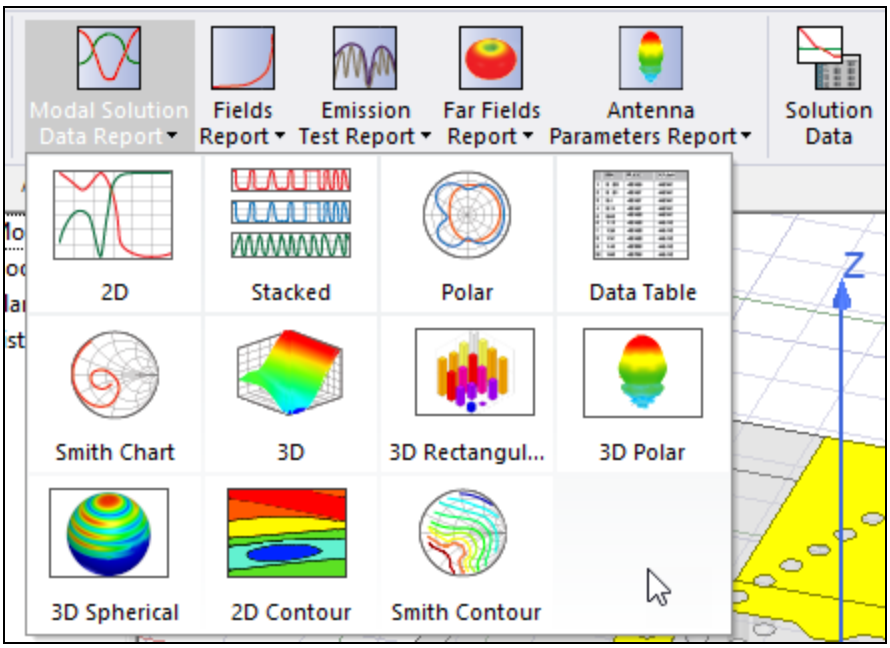
After a solver generates a solution, you can analyze all the results for that solution. Ansys Electronics Desktop lets you create 2D or 3D plots. A 2D or 3D plot shows the relationship between a design's values and the corresponding results of the analysis. You can create reports using either the **Create Quick Report** option or the **Create *<type>* Report** commands. The **Quick Report** feature lets you select from a list of predefined categories (such as S-parameters) from which to create a rectangular plot.

For each solution **<type>** (for instance, Modal, Terminal, Transient, Eigenmode, Characteristic mode, Fields, Far Fields, Emission test, Partial Discharge, Multipaction, and so forth), the **Results** menus present a list of **Create *<type>* Report** commands based on the solution data of direct interest for the design. For example, for the Eigenmode solution type, the **Results** menu contains templates for Eigenmode Parameters and for Fields. These appear on the menus as

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create Eigenmode Parameters Report and **Create Fields Report**. For the Modal and Terminal Solution types, several different types appear, appropriate to each solution type. Each of these **Create <*type*> Report** menu items includes a further cascading menu that lists the Display Types available for that report. For some reports you can modify the Display Type from the Properties for that Report. For reports for Transient designs, see this discussion.

The **Results** tab for the Ribbon will show icons and drop-down menus for available report types for the active project.



If you have created custom report templates (for example, including your company name or other format changes), you can also create a report based on that template by selecting **Circuit** > **Results** > **Report Templates** > <***templateName***>. You can also access previously defined 2D templates using **Report2D** > **Report Templates** > **Apply Settings...**. You can save the properties for a modified report to provide the custom default settings for all new reports.

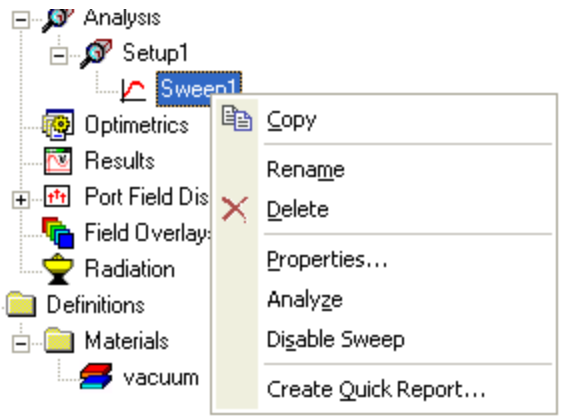
You can also use the **Report2D** > **Export** or **Report 3D** >**Export** feature, select the *Ansoft ReportData Files (.rdat)* format, and **Save** the file, which you can later select to Create Report from File.

Creating a Quick Report

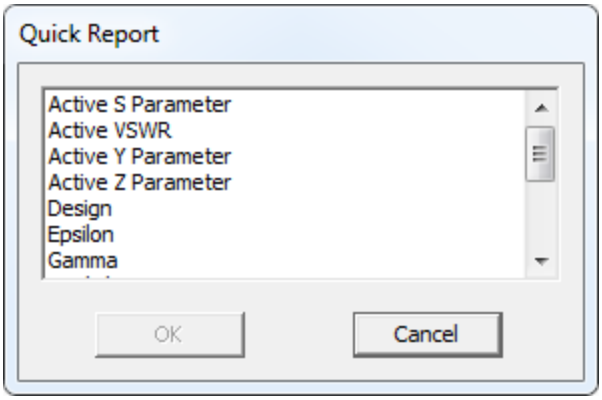
Following is the procedure for creating a quick report.

1. On the Project tree under Analysis, select a **setup** or **sweep icon**, or the **Results** icon.
2. Right-click to display the shortcut menu and select **Create Quick Report**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Quick Report** dialog box appears.



The list of available reports differs depending on the Solution type. The figure shows reports for a Modal solution. Eigen mode solutions and Terminal solutions provide different selections.

3. Select the one or more categories for the report from the list and click **OK**.

A rectangular plot for each selected category displays. The new plot or plots appear in the Project tree under the Results icon. The default Report Name that appears derives from the report type specified in the **Quick Report** dialog box.

Creating a New Report

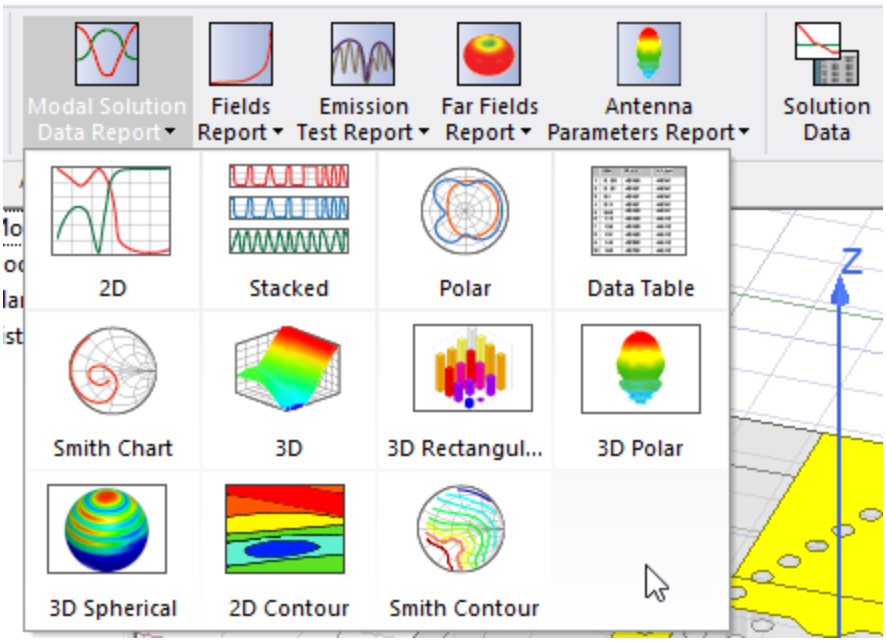
Following is the general procedure for creating a new report:

1. On the **Circuit** menu or the Project Manager, point to **Results**, select **Create *<type>* Report**, and select the **Display Type** template. There are more **Report Type** templates available for terminal solutions (terminal, modal, fields, near fields, and far fields) and for modal solutions (modal and fields). For Eigenmode solutions, the **Report Type *<templates>*** are for Eigenmode Parameters and for Fields. Characteristic Modes

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

solution reports include quantities for Significance, Value, and Angle.

The **Results** tab for the Ribbon will show icons and drop-down menus for available report types for the active project.



If you have created custom report templates (for example, including your company name or other format changes), you can also create a report based on that template by selecting **Circuit** > **Results** > **Report Templates** > **PersonalLib** > *<templateName>*. You can also make such changes the default for new reports by right-clicking a modified report and selecting **Report Templates** > **Save Settings as default**.

When you have selected the report and display type from the **Results** menu, the **Report** dialog box appears, with the **Trace** tab selected by default.

2. In the Context section, you make selections depending on the design and solution type.
3. In the **Y** Component section of the dialog box, make selections for the following:
    a. Categories – those depend on the Solution type and the design. For example, Eigenmode quantities include Eigenmodes, variables, output variables, and the design. Driven solutions include such categories as S parameters. Report categories for Transient designs include Spectral and Transient. For a Transient Network design with differential pairs defined, the Reporter interface allows selection of single-ended or differential signals just as for driven terminal. Characteristic Mode Data Reports include Characteristic Mode quantities for Significance, Value, and Angle. Report categories for SBR+ designs that include an Incident Plane wave and an RCS selection as Monostatic do not require a geometry selection and include a range of Monostatic Quantities when select Monostatic RCS

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

as the Report Category. For SBR+ designs and RCS Monostatic you can choose between Freq, IWaveTheta and IWavePhi variables for specifying sweeps. The selected Category provides the default plot name. You can edit the plot names in the project tree and the plot header text in the report synchronizes.

b. Quantities for Y are relative to the selected category.

> **Note:**
>
> The Quantity text field can be used to filter the Quantity list by typing in text, or by using the four predefined selections. This is useful if the Category selected produces a lengthy Quantities list. See Filtering Quantity Selections for the Reporter.
>
> When the matrix is very large, the number of quantities can be correspondingly huge. Therefore, the Quantities field can optionally use a tree structure to divide matrix quantities into groups by their first element name. The initial display shows groups, without initially listing group members. See Report Setup Options.

c. **Function** list to apply to the Y quantities.

d. Value field displays the currently specified Quantity and Function. You can edit this field directly.

> **Note:**
>
> Color shows valid expression.

e. **Range Function** button – opens the **Set Range Function** dialog box. This applies to the currently specified Quantity and Function.

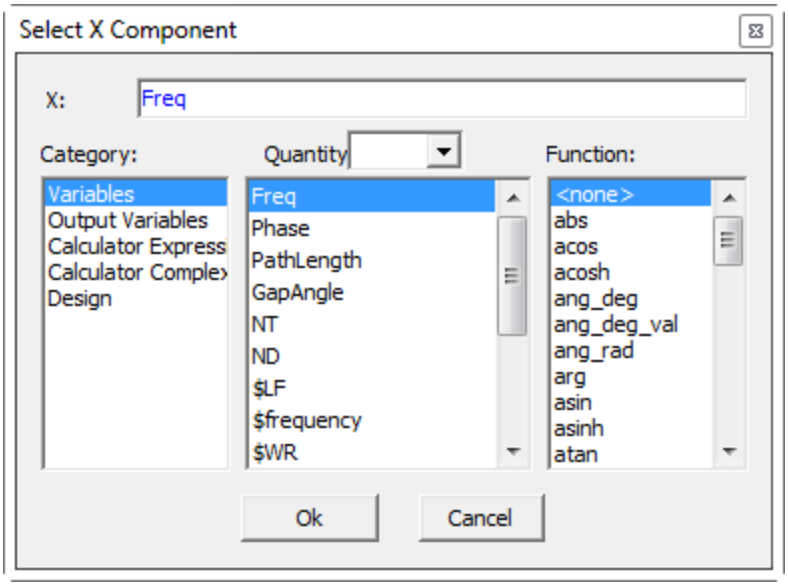
f. To use a dataset in this report, set the **Y** component to a Piecewise Linear Function `pwl(dataset_expression, primary_sweep)` where is the `primary_sweep` is what you set in the next step.

4. In the **X (Primary Sweep)** section, make selections for the following:

   a. Select the Primary value(s) from the drop-down menu.

      To select an X component that is different from the Primary Sweep, uncheck the Default field to enable the X field and **Browse** [...] button. Click **Browse** [...] to display the **Select X Component** dialog.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the dialog box to assign the X component.

b. If sweeps are available, you can select **Browse** [...] to display a panel that lets you select Use all values, or selected sweep or sweeps, or access an Edit Sweep dialog box with further editing options. Post-Processing variables are Post-Processing sweeps/editable sweeps, so you can use the **Edit Sweep** dialog box to create your own sweep.

c. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (for example, for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the **Families** tab with columns for the variable, the value, and an Edit column with an ellipsis [**...**] button. See Using Families tab for Reports.

5. **Update Report** setting
   - **Real Time** checked – enable real time updates for all reports while the reports are being edited.
   - **Real Time** unchecked – enables drop down menu to **Update All Reports** or **Update Report**. Reports will only be updated with one of these user selectable update options or upon exiting the report dialog box. This can be useful if you expect a trace to take time to display. You can then add additional traces without having to wait.
6. The **Report** dialog command buttons permit you create a new report with the settings you provide, or to modify an existing report.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Output Variables** – opens the **Output Variables** dialog box.
- **Add Trace** – this is enabled when you have created or selected a report. Add one or more traces to include in the report.
- **Update Trace** – updates the selected traces in a report based on further processing or changes.
- **New Report**. Adds a report to the Project tree under the Results icon. The new Report is displayed in the Project window.
- **Options** – opens the **Report Setup Options** dialog box. This contains a check box for using the advanced mode for editing and viewing trace components. This mode is automatic if the trace requires it. It also contains a field for setting the maximum number of significant digits to display for numerical quantities.
- **Close** – closes the **Report** dialog box.

7. Click **New Report** to create a new report in the Project Manager.

   The report appears in the view window. It will be listed in the project tree under Results, with the default name based on the Report Category you selected, for example, S Parameter Plot *n* or Output Variables Plot *n*. You can edit the plot names in the project tree and the plot header text in the report synchronizes. Traces within the report also appear in the project tree.

   Some plots may take time to complete. Performing a **File** > **Save** in such cases after the plot has been created will permit you to review the plot later without having to repeat the calculation time when you reopen the project later.

8. To speed redraw times for changed plots, perform a **Save**. This saves the data that comprises expressions. For example if re(S_{11})*re(S_{22}) is requested over multiple widths, each of the S_{11} and S_{22} are stored when you save. If you do not do a save of a changed plot, the changed version is not stored.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Remember that the evaluated value of an expression is always interpreted in SI units. However, when an angle quantity is plotted in a report, you have the option to plot values in units other than SI. If you want to plot the polar angle of a complex simulation result, S11 say, you can choose between ang_deg(S_{11}) and ang_rad(S_{11}). Both of these return the exact same angle quantity but in degree and radian units respectively.

Note that when used in expressions, some surprising outcomes might result. For example, the expression "1+ang_deg(S11)" represents an 'angle' and the number "1" is treated as "1 rad". The angle SI unit is attached to any unitless number that is added/subtracted from an angle value. If you want to treat "1" as degrees, make it explicit and use "1deg + ang_deg(S_{11})" instead.

If you are interested in unitless degree values, two additional functions exist: ang_deg_val(S_{11}) and cang_deg_val(S_{11}). These return simple numbers and are treated as such by any expression. If the complex S_{11} lies on the positive Y axis say, ang_deg_val (S_{11}) would be 90 and "1 + ang_deg_val(S_{11})" will be 91.

Context Section for Reports

In the **Context** section, make selections from the following field or fields, depending on the design and solution type.

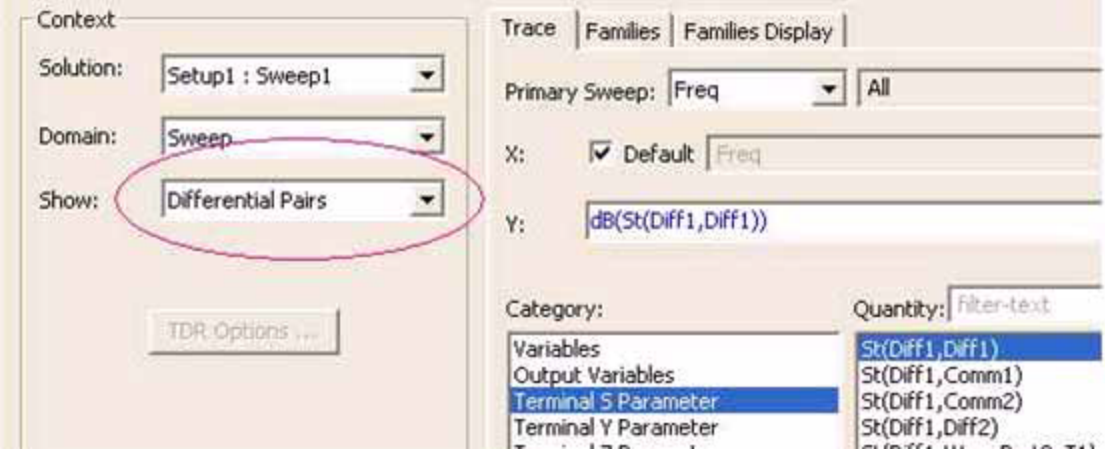
1. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
2. Domain field with a drop down selection list. Whether this field appears, and domains are listed, depends on the Solution type and the report ***<type>*** selected. For modal and terminal solution data reports, the domain can be **Sweep** or **Time**.

   For Near Field or Far Field report, for a Rectangular Contour Plot, the Domain can be Theta, Phi, or Sine Space. Before you can create a Sine Space plot, you must create the appropriate Radiation Setups. If you manually enter Phi or Theta component of a far field quantity when you using Az/El or El/Az far field infinite sphere definition, then the Report uses the Z axis of the Az/El or El/Az coordinate system definition as pole to calculate theta/phi component for rE.

3. Geometry field with a drop-down selection list. For field and radiated field reports, this applies the quantity to a geometry or radiated field setup. For SBR+ designs with an Incident Plane Wave and Monostatic RCS selected, the Geometry field is unavailable. In this case, the solver computes the scattered field in the direction of the plane wave.
4. Show field with a drop-down selection list for Differential pairs or Terminals. This field appears for designs using terminal solutions that have differential pairs defined. It lets you

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

plot either differential pair data, or single-ended terminal data, or both in the same plot without having to disable or enable differential pairs under the Excitations heading in the Project Manager. Note that single-ended quantities are computed as if no differential pairs existed. So in the unlikely case of several terminals where only a subset is combined into pairs, the results may not be as expected.

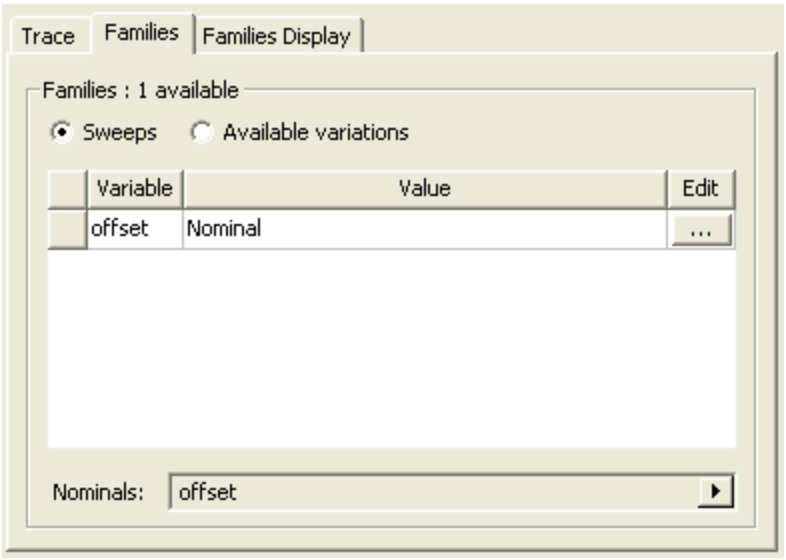


5. Derivative field with a drop-drown selection list of none, all, and specific variables for which you specified **Use** on the Derivatives tab of the solution setup. You can use derivatives in some Optimetrics situations, Far Field reports, non-Port excitations including incident wave, linked field, voltage source, current source, and magnetic bias with the Derivative Tuning feature in the Reporter.
6. A Sources combo box appears in the Reporter when you have specified at least one source in the **Edit Sources** dialog box. For a usage example, see: *User Defined Solution for MIMO Calculations*.

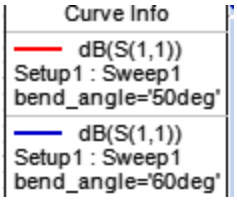
Using Families Tab for Reports

The **Families** tab of the **Report** dialog box provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined and solutions exist for multiple variable values (for example, for a parametric sweep or re-running an analysis with a different variable value). If no variables are defined, or none have solutions for different values, 0 families will be available. If so, the variables other than the **X (Primary sweep)**, are listed under the **Families** tab with columns for the variable, the solution value (which may be All, Nominal, or a Specific value), and an Edit column with an ellipsis [**...**] button. Families gives the number available. If an existing variable is specified as Nominal, only that value is currently available. You can set any solved variables as Nominal, All, or select from values provided for Available solutions.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



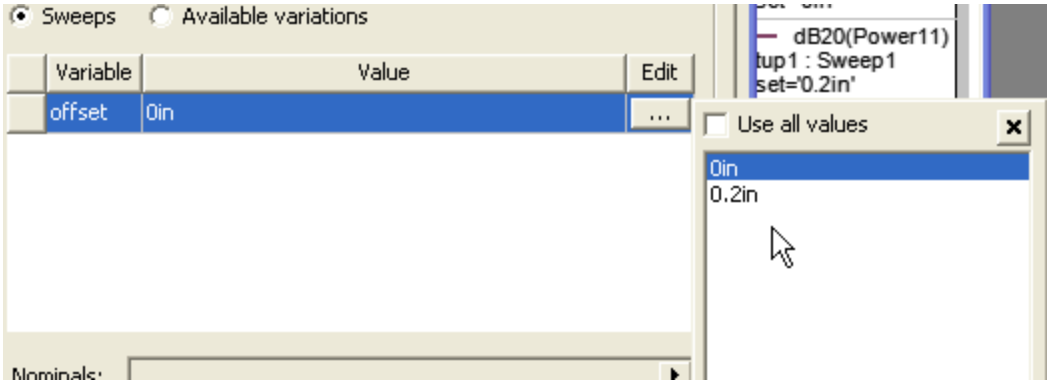
When you select a variable with multiple solved values, a trace for each solved value appears in the Report, with the variable value appended to the trace name in the Report legend.



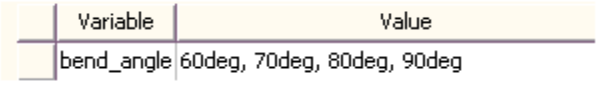
When families are available, you can make selections for the following:

1. Select the **Sweeps** radio button (the default) to list the swept variables you can select or the Available variations button to list and select variation values for which solutions exist.
2. With the **Sweeps** radio button selected, click the ellipsis [**...**] button to display a list of variable values for a particular variable. If many variables exist, you can use a scroll bar to navigate the list.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

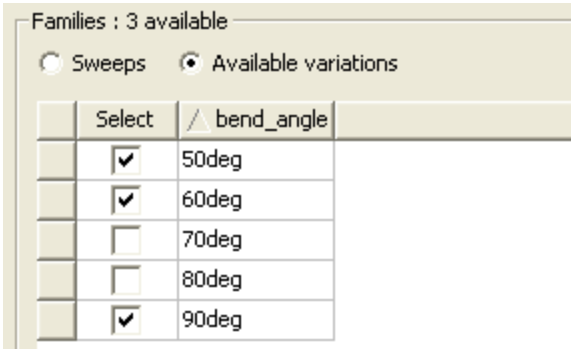


- To select all values, click the check box for **Use all** values. This writes "All" in the value field for that variable. You can also select individual values by clicking on them.
- To select a range of values, hold down the shift key, and click again.
- To select intermittent additional values, hold the Ctrl key and click additional. The values you select are highlighted in the list, and are also listed in the Values column for that variable.
- To select all, use the **Select All** button. This highlights the complete list, as well as listing all values for the variable in the Value field.



- To clear the selections, use the **Clear All** button.

Select the **Available variations** radio button to list the choices that derive from variable combination.

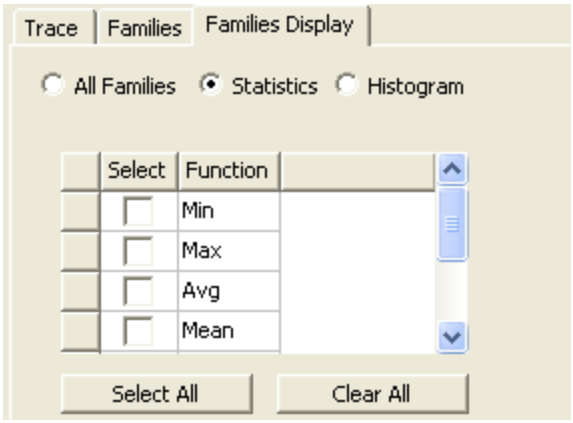


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

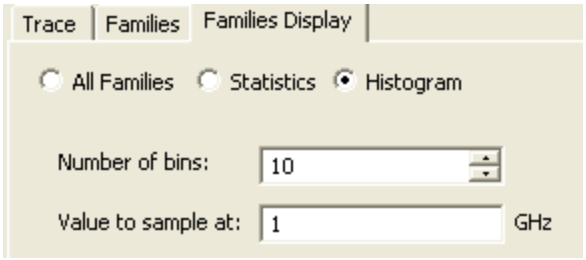
a. To select individual variations, check the select box.
b. To check or clear all variations at once, click the **Select** button at the top of the column.
c. To invert the list order, click the triangle beside the variable name.

The **Families Display** tab has three radio button selections.

a. **All Families**
b. **Statistics** lists a table statistical functions that you can select to apply to the plot. The functions include Min, Max, Avg, Mean, Variance, Std Dev, and Sum. You can use the Select check boxes or the Select All and Clear All button.



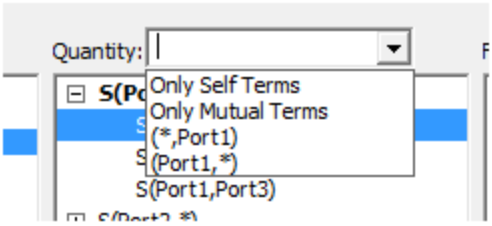
c. **Histogram** lets you select the number of bins to use for a histogram plot, and the sampling frequency to use.



Filtering Quantity Selections for the Reporter

When a two-port quantity Category is selected, four predefined filters are added to the combo box. "Port1" is the first matrix element name found in the quantity list.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Only Self Terms – Only display quantities when the first and second port are same.
- Only Mutual Terms – Only display quantities when the first and second port are different.
- (*,Port1) – Only display quantities when the second element name is "Port1". You can edit the element name to display quantities for other elements.
- (Port1,*) – Only display quantities when the first element name is "Port1". You can edit the element name to display quantities for other element.

Modifying Reports

To modify the data that is plotted in a report:

1. In the Project Manager, click the report you want to modify.
2. Right-click **Modify Report**.

   The **Report** dialog box appears.

3. The **Report** dialog box command buttons permit you create a new report with the settings you provide, or to modify an existing report.
   - **Output Variables** – opens the **Output Variables** dialog box.
   - **Add Trace** – this is enabled when you have created or selected a report. Add one or more traces to include in the report.
   - **Update Trace** – updates the selected traces in a report based on further processing or changes.
   - **New Report** – adds a report to the Project tree under the Results icon. The new Report is displayed in the main window.
   - **Options** – opens the **Report Setup Options** dialog box. This contains a check box for using the advanced mode for editing and viewing trace components. This mode is automatic if the trace requires it. It also contains a field for setting the maximum number of significant digits to display for numerical quantities.
   - **Close** – closes the **Report** dialog box.

   The updated report appears in the view window.

4. **Update Report** setting
   - **Real Time** checked – enable real time updates for all reports while the reports are being edited.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Real Time** unchecked – enables drop-down menu to **Update All Reports** or **Update Report**. Reports will only be updated with one of these user selectable update options or upon exiting the report dialog box. This can be useful if you expect a trace to take time to display. You can then add additional traces without having to wait.

5. In the **Context** section you make selections depending on the design and solution type.
6. The Families tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (for example, for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the **Families** tab with columns for the variable, the value, and an Edit column with an ellipsis [**...**] button. See Using Families tab for Reports.
7. In the **Y** Component section of the dialog make selections for the following:
   a. Categories – those depend on the Solution type and the design. For example, Eigenmode quantities include Eigenmodes, variables, output variables, and the design. Driven solutions include such categories as S parameters. Report categories for Transient designs include Spectral and Transient. For a Transient Network design with differential pairs defined, the Reporter interface allows selection of single-ended or differential signals just as for driven terminal. Report categories for SBR+ designs that include an Incident Plane wave and an RCS selection as Monostatic do not require a geometry selection and include a range of Monostatic Quantities when select Monostatic RCS as the Report Category. For SBR+ designs and RCS Monostatic you can choose between Freq, IWaveTheta and IWavePhi variables for specifying sweeps. The selected category provides the default name of the plot, for instance S Parameter Plot *n*. You can edit the plot names in the project tree and the plot header text in the report synchronizes.
   b. Quantities for Y are relative to the selected category.

> **Note:**
>
> The Quantity text field can be used to filter the Quantity list by typing in text, or by using the four predefined selections. This is useful if the Category selected produces a lengthy Quantities list. See Filtering Quantity Selections for the Reporter.
>
> When the matrix is very large, the number of quantities can be correspondingly huge. Therefore, the Quantities field can optionally use a tree structure to divide matrix quantities into groups by their first element name. The initial display shows groups, without initially listing group members. See Report Setup Options.

   c. **Function** list to apply to the Y quantities.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

d. Value field displays the currently specified Quantity and Function. You can edit this field directly.

> **Note:**
>
> Color shows valid expression.

e. **Range Function** button – opens the **Set Range Function** dialog box. This applies currently specified Quantity and Function.

8. In the **X (Primary Sweep)** section, make selections for the following:
   a. Select the Primary value(s) from the drop-down menu.

      To select an X component that is different from the Primary Sweep, uncheck the Default field to enable the X field and **Browse** [...] button. Click **Browse** [...] to display the **Select X Component** dialog box.

      This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the dialog to assign the X component.

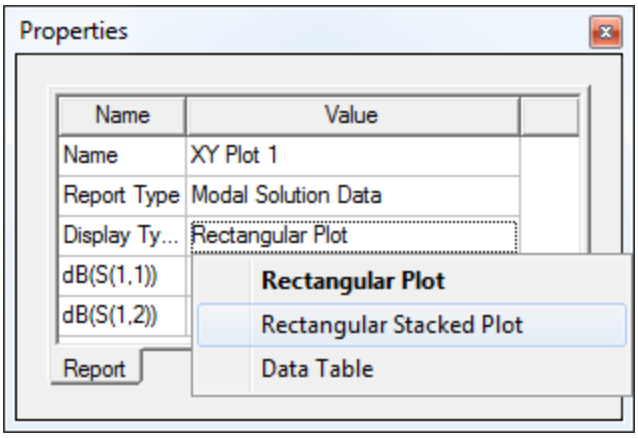
   b. If sweeps are available, you can select **Browse** [...] to display a panel that lets you select Use all values, or selected sweep or sweeps, or access an Edit Sweep dialog box with further editing options. Post-Processing variables are Post-Processing sweeps/editable sweeps, so you can use the *Edit Sweep* dialog box to create your own sweep.
   c. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (for example, for a parametric sweep). If

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the **Families** tab with columns for the variable, the value, and an Edit column with an ellipsis [**...**] button. See Using Families tab for Reports.

You can also view and edit the properties of Reports and their traces via their Properties windows. See Modifying the Background Properties of a Report.

You can also modify the display type of an existing plot from the Properties dialog box for that plot. Select the Report icon in the Project Manager to display the **Properties** dialog box. Selecting the Display Type field displays a menu with selections available for that plot.



Once you make a selection, the plot display updates for the current selection.

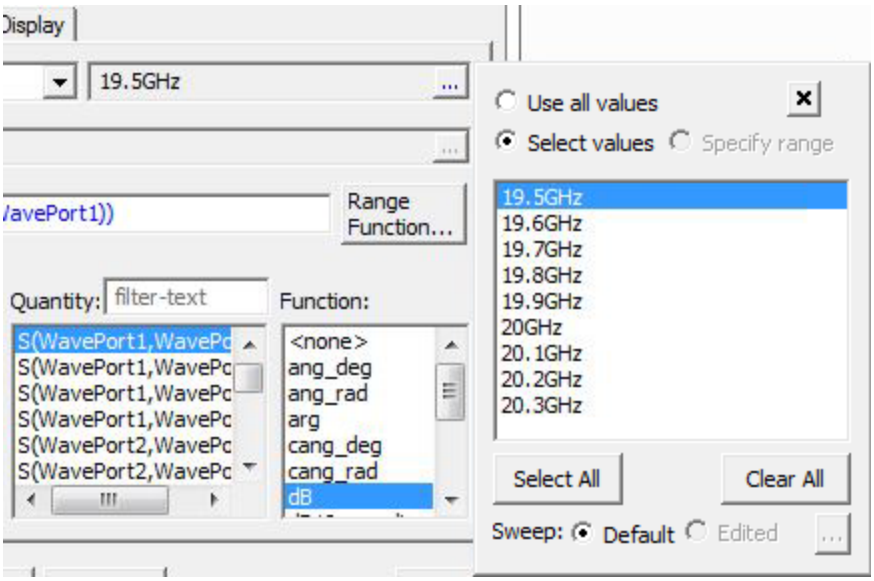
Note:

Remember that for many excitations of interest for plotting, you can control the default base names through the dialog box described here: Setting Default Boundary/Excitation Base Names. This may save you the need to edit individual names in the plots.

Modify Report: Selecting Use All Values or Making Selection

Clicking the browse button on **Primary Sweep** line shows the default selection of **Use all values**. Choose **Select values** to display the sweeps and enable editing, including the **Select All** and **Clear All** buttons.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



With **Select values** selected, you can select one or more by clicking an individual value, dragging to select multiple values, or using Alt+click to select specific values.

You select either the Sweep radio button for Default or Edited selection.

You can also select **Browse** [...] here to display the Edit Sweep dialog for Modify Reports, which includes additional editing features.

Modify Report: Using the Edit Sweep Dialog Box

Clicking **Browse** [...] at the lower right corner of the **Use all values** pane opens the **Edit Sweep** dialog box for Modify Report. This lets you edit the current Primary sweep variable values, including radio button selections for Single value, Linear step or count, and Decade, Octave, or Exponential Counts.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can specify start, stop and step values and units, and add specific values to the list of current sweep values. The **Add>>** and **Update>>** buttons let you edit the value list.

You can use the mouse click, drag, and Alt+click to select values. You can also edit individual values.

Creating a Report from an Ansoft Report Data File

If you have previously saved an Ansoft Report Data Format (using Report2D > Export), you can create a report from that rdat file. This provides a way to reuse the data and/or the format of a previously created report.

1. Right-click the Results icon in the Project Manager to display the short cut menu and select **Create Report From File**, or click **Circuit** > **Results** > **Create Report From File**.

   A file browser displays.

2. Select an .rdat format file, and click **Open**.

   The report is created. If it contains data, it displays the report with traces. If not, the report uses the format exported to the .rdat file.

Zooming and Fitting Reports

The standard Zoom and Fit commands operate on reports. After clicking in an open report, you can also use a mouse wheel to zoom in and out.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Modifying the Background Properties of a Report

To modify the appearance of a report, or to modify the display properties any object in a report, including traces, axis labels, grids, colors, fonts, legends, color maps, contour color, and so forth:

1. Open the report you want to modify.
2. Select an editable object in the report to be able to edit its properties. Click on an object to select it and to view its properties in the docked **Properties** window. To open a floating **Properties** window, either double-click the selected object, or select **Edit** > **Properties** from the menu bar.

   The **Properties** tabs and options displayed for editable plot objects varies depending on the report type (for example, whether 2D rectangular, 2D polar, Smith, Stacked, or 3D), but can include the following:

   - **Cartesian** – controls the scroll bar and thumb properties for 2D rectangular plots.
   - **Header** – controls the properties for the text displayed at the top of the report, including the Title font, Company Name, Show Design Name, Subtitle Font. The plot title is tied to the report's name and is not a Header property. If you change the report name in the Project tree, plot title synchronizes. The Company Name and the Show Design Name check box are grouped in the **Properties** dialog box as Subtitle. Edits to the Subtitle Font Property affects both of them.
   - **General** – controls the background color (the perimeter around the trace display) for the plot, the contrast color (the trace display background), the Field width, the Precision, and whether to use scientific notation for marker and delta marker displays. (X and Y notation display is set separately, in the Axis property tabs.) An Auto Scale Fonts property is on by default and scales text in plots and colorkey (contour plot, field plots in 3D modeler) for high resolution screens.
   - **Legend** – controls the properties for whether to include a Legend Name, Show Trace Name, Solution Name, and Variation Key. At least one of these must be selected. Legend Name is blank by default. When non-empty, a header row for the Legend in plot shows up with that string. You can also specify the File Name Display as Full Path, File Name without Path, or as an Array Index. You can also edit the Font, the background color of the Legend box, the Border Color, the Border Width, Grid Color (for the lines between Trace descriptions), and the Grid line width. See: Modifying the Legend in a Report.
   - **Color Key** – for 3D plots, controls the appearance of the color key (colors, transparency, border appearance, fonts, number format, field width and precision.
   - **Contour** – for 3D plots, controls the appearance of the color map, including map type, ramp color, spectrum, IsoValType, levels, number of contours, and values shown.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Radiation Pattern** – for 2D polar plots, controls whether to show the circular grid and angle lines.
- **Stacked** – for stacked plots, controls properties for X scrollbar, thumb properties, and stack layout, auto fit, and stack height.
- **Smith** – for Smith charts, controls whether to show grids for Imp., Adm., Cir, and angle lines.
- **Traces** – controls the properties for traces, including: Color, Line Style, Line Width, Trace Type, whether to Show a symbol, Symbol Frequency, Symbol style, whether to Fill symbol, symbol color, and whether to show arrows. You can select traces either in the Legend or on the plot. See: Editing the Display Properties of Traces.
- **Axis** for X, Y or Z, or for Phi, Theta or Rho, and circular – the defaults for most of these values (applying to 2D and 3D both) are set in the **Report 2D Options**Axis tab.
  - Display name – check box for whether to display the axis name.
  - Specify name – check box for specifying the Axis name.
  - Name – this describes the axis to which the following properties/options refer. These are selected in the **Report** dialog box.
  - Axis Color – set the color by double-clicking to display the **Set color** dialog box. Select a default or custom color and click OK.
  - Axis Font – click the cell to display the **Edit Text Font** dialog box. The dialog box lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The dialog box also contains a preview field. OK the selections to apply the font edits and to close the dialog box.
  - Display Units – this specifies whether to display the axis units.
  - **Window (section):**
    - Window Mode – can be Axis range, Continuous moving window, or Step moving window.
    - Window Width (in) – provide an integer value for the previous selection.
  - **Manual Format** (section):
    - Number format – select from the drop down menu, Auto, Decimal, or Scientific notation.
    - Field Width – enter a real value.
    - Field Precision – enter a real value.
- X or Y or Z **Scaling Tab** – These properties provide control over scaling:
  - Axis Scaling – use the drop-down menu to select scaling as Linear or Log. For the Y axis, all zero or negative values are discarded before log scaling is applied. For 3D plots, scaling is on the Axis tabs
  - Specify Min – check box
  - Min – text entry in same units as axis units. Saved as SI internally.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Specify Max – check box
- Max – text entry in same units as axis units. Saved as SI internally.
- Specify Spacing – check box
- Spacing – text entry in same units as axis units. Saved as SI internally
- **Manual Units** (section):
  - Auto Units – use the check box compute the correct units for the axis.
  - Units – click on the cell to select from a menu of available units if you have not checked Auto Units.
- **Infinity Visualization** (section):
  - Map Infinity Mode – check box.

    Each axis can be set to treat infinity values in a user defined way. When you check the Map Infinity Mode, any infinity values in the input data get the infinityMap value (negative infinity get the value*-1 and positive infinity the positive value specified). This can be useful if there are zeros, or very small values that Circuittreats as zero, in the data, for example, dB Gain.

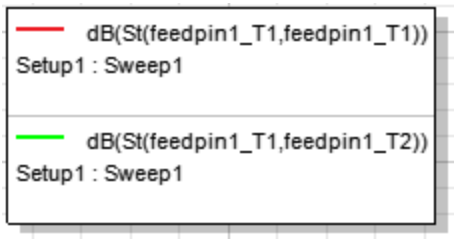
  - Map Infinity To – enter a real value for the Map Infinity Mode.

- **Grid** – properties for grid labels and grid style, appearance, line styles, color, major and minor lines, major and minor circles on polar grids, and scaling. For the 3D rectangular plots, there are separate tabs for the XY, YZ and ZX axes, and for 3D Polar plots, tabs for phi-rho, or theta-rho grids.

3. Edit the properties, and **OK** the dialog box to apply the changes.

Modifying the Legend in a Report

The legend in a report is a list of the curves being plotted. For each curve, the legend gives the name, shows the line color, and lists the setup and the adaptive pass used to generate the curve.



To show or hide a legend in a report:

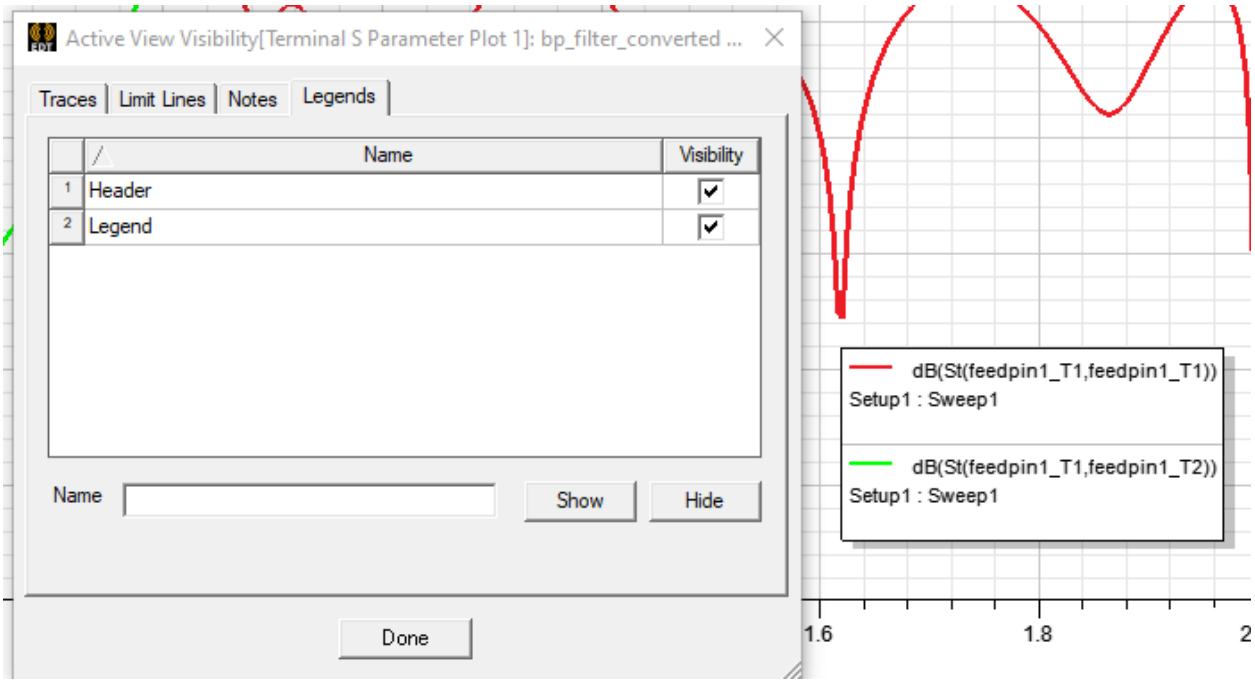
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Make the report the active view.
2. Use **View** > **Active View Visibility** or the **Show/Hide** icons on the toolbar to display or hide the report.

   Either command displays the **Active View** dialog box.

3. Select the **Legend** tab.

   This lists the legend (or legends) in the report.



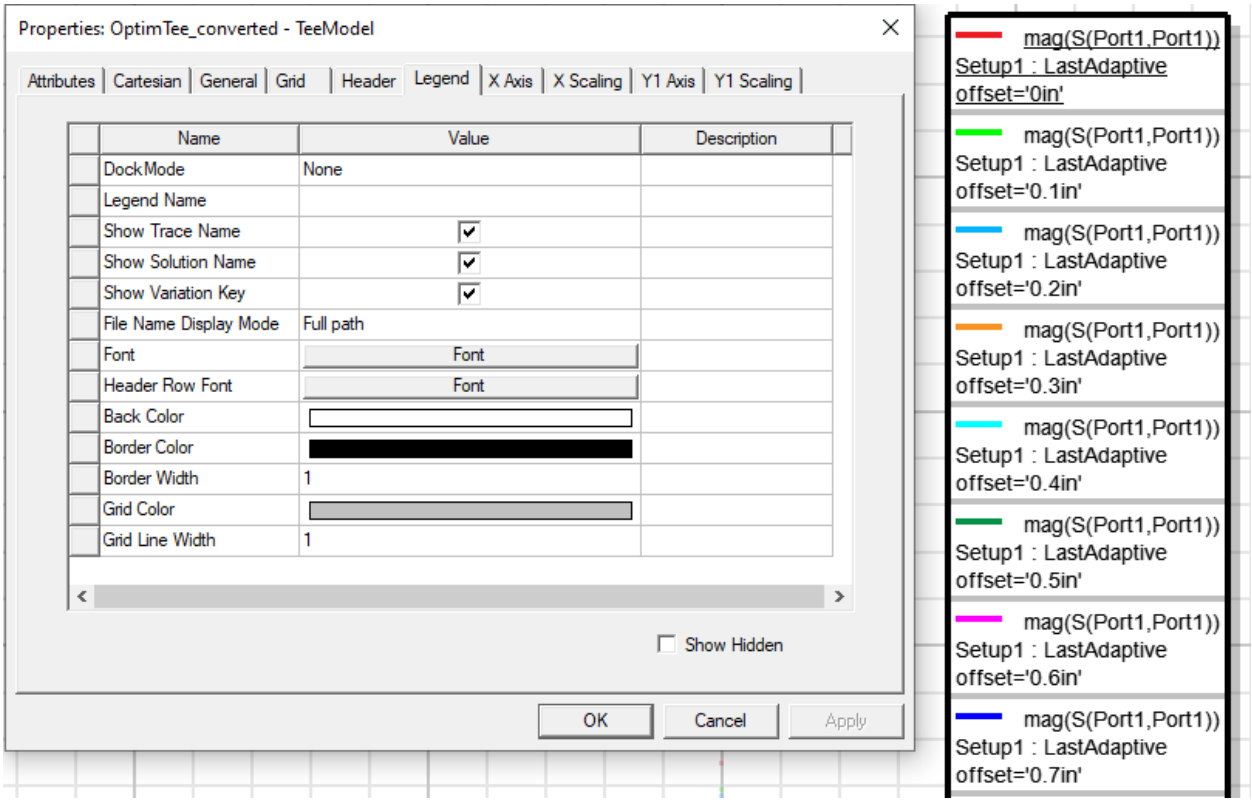
4. Enable the visibility check box, and click **OK** to close the dialog box and apply the change.

To edit the display properties of a legend:

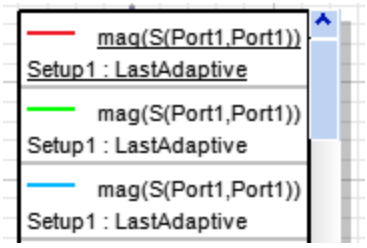
1. Double-click a legend in a report to display a docked properties window, or right-click on the legend and select **Edit** > **Properties** to display the floating **Properties** dialog box.

   This lets you edit the Properties for Dock Mode, Legend Name (default is no name. When non-empty, a header row for the Legend in plot shows up with that string.), whether to Show Trace Name, Solution Name, and Variation Key (which applies to parametric variables, if present). If none of these three are selected, only a trace color shows.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Here is an example with Variation Key off.



You can also edit the Font by clicking the Font cell to display the **Edit Text Font** dialog box. The dialog box lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The dialog also contains a preview field. OK the selections to apply the font edits and to close the dialog box.

You can also edit the background color of the Legend box, the Border Color, the Border Width, Grid Color (for the lines between Trace descriptions), and the Grid line width.

2. Click **OK** to close the **Properties** dialog box and apply the selections.

To change the display name for traces, see: Editing Trace Properties.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To move a legend in a report:

1. Click and hold on the legend.

   The cursor changes to crossed lines with arrow tips.

2. Still holding, drag the legend to a new location and release.

   The legend is released and the crossed lines change back to a mouse pointer.

To resize a legend in a report:

1. Position the mouse tip over the edge you want to resize.

   The mouse pointer changes to a horizontal or vertical line with arrow tips.

2. Click and drag the horizontal or vertical edge to the desire size.
3. Release.

Creating Custom Report Templates and Defaults

You can edit properties from any report type and save it as a template or as the default. This can save repeated editing of properties (for example, the company name, or color schemes and plot attribute settings) when you create other reports. You can prepare a template by copy/pasting plots settings from one plot to another of the same display type. Once you create templates, you can access them from the **Results** > **Report Templates** > menu and the **Report2D** > **Report Templates** > **Apply Settings** menu.

See Modifying the Background Properties of a Report for a discussion of format changes you can make to any report.

To save an edited report as a template:

1. In the Project Tree, right-click the report name of interest to display the shortcut menu and click **Report Templates** > **Save...**. You can also click **Report2D** > **Report templates** > **Save...** or **Report3D** > **Save As Template...**

   This displays the **Save As Report Template** file browser. By default, the directory is your AnsysEM\<*productName*>\userlib\ReportTemplates directory. You can also save to the SysLib directory.

2. Typically, you accept the directory.
3. You must provide a file name, which will be given an *.rpt extension.

   It is good practice to give the template a descriptive name, showing both the kind of format you begin with (such as XY Plot or 3D Plot) and apt description of the distinguishing edits (such as for company name, or color scheme). Once, saved, this name will appear on the *PersonalLib* menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **Save As Type** field currently supports the Ansoft Report Format (*rpt) format.

4. Click **Save** to save the template to the PersonalLib menu.

All *.rpt templates in the userLib directory appear on the **Results> Report Templates> PersonalLib** menu. Selecting a report from the PersonalLib menu opens a report that you can then Modify to add traces or perform other edits. Templates in the SysLib directory appear on the **Report Templates** menu.

To save an edited report as a default:

1. In the Project Tree, right-click the report name of interest to display the shortcut menu and click **Report Templates** > **Save Settings as default**. You can also click **Report2D** > **Report templates** > **Save Settings as default** or **Report3D** > **Save Settings as default**.

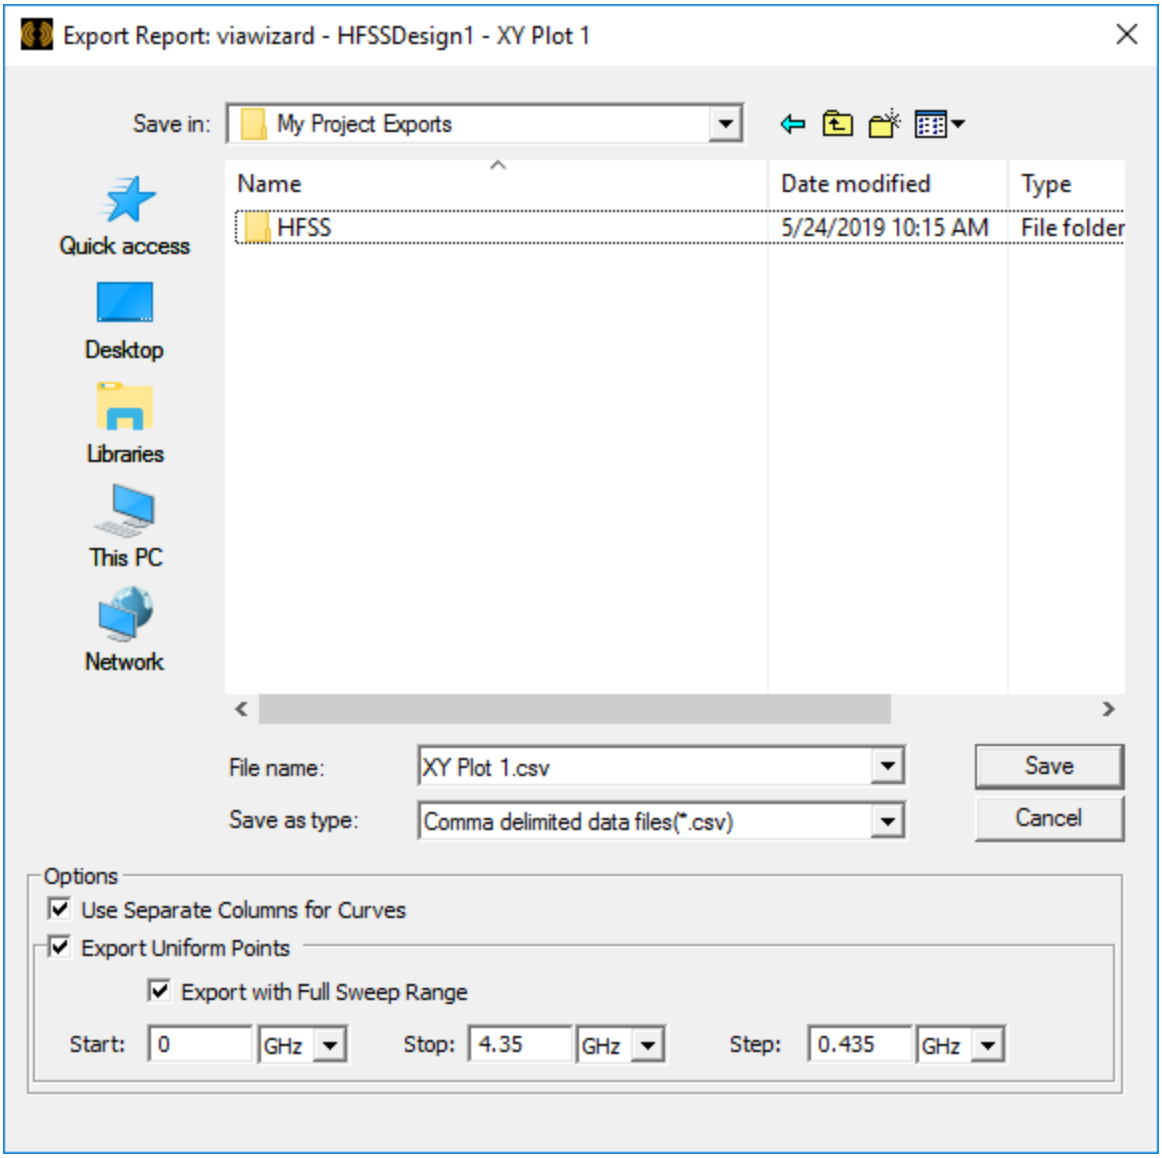
Exporting Ansoft Report Data Format Files

Ansoft Report Data format (*.rdat) files provide a way to export reports or report formats, which you can then import using **Reports> Create Report From File**. This can save repeated editing of properties (for example, the company name or color schemes) when you create other reports. You must have an existing plot open to see the **Report2D** menu.

1. Click **Report2D** > **Export...** or **Report 3D**> **Export...**

   The **Export Report** dialog box appears:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Use the **Save as type** drop-down menu to select **Ansoft Report Data Files (*.rdat)** format.
3. Browse to a destination folder and enter a name for your file in the **File name** field.
4. The **Export Uniform Points** option, if available for your report type, allows the *.rdat file to contain points for the start, stop, and step at the given frequencies. If you do not select this option, the file contains only the current file format, including any modifications you have applied.
5. Click **Save**.

   The file is exported to the specified location as an Ansoft Report Data file (*.rdat).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

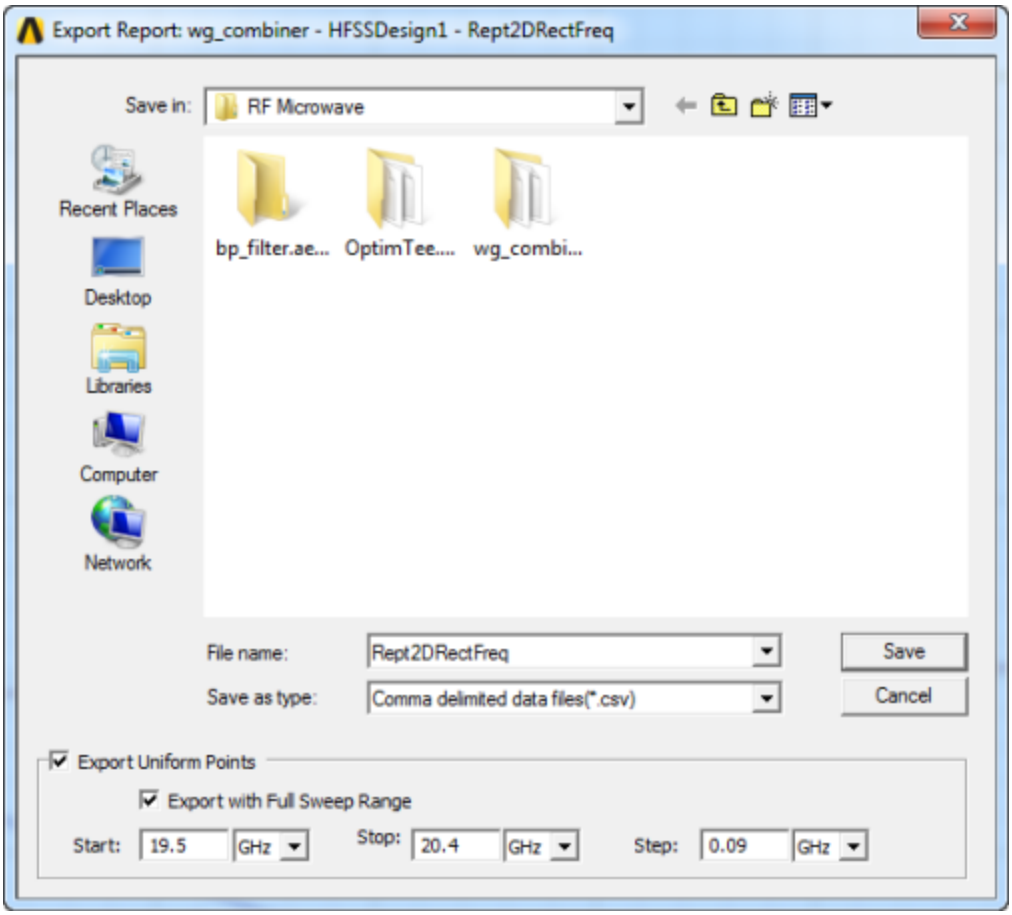
The file will then be available for import using Create Report from file.

Exporting Reports as Graphics

You can export reports as figures in several formats. You must have an existing plot open to see the **Report2D** or **Report 3D** menu.

1. With a report open, click **Report2D** > **Export...** or **Report3D** > **Export...**

   The **Export Report** dialog box appears:



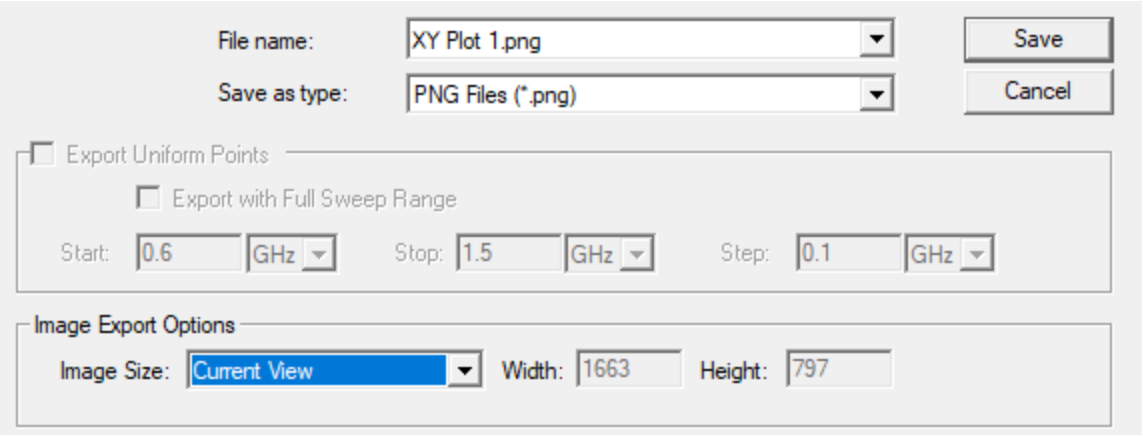
2. Click **Browse...** to open the **Export Report** browser window.
3. Specify the file location and name, and select a graphics format from the drop-down menu:

   - .bmp
   - .gif
   - .jpeg

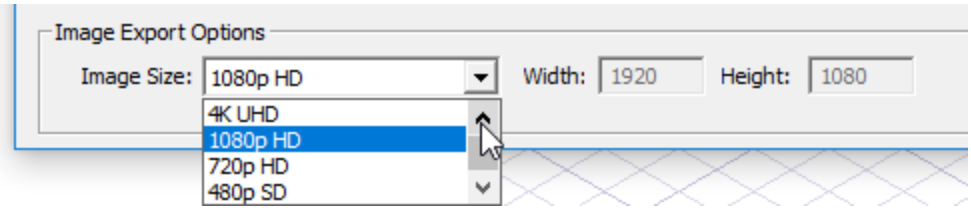
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- .png
- .tiff
- .wrl

4. When you select an image format, the **Image Export Options** appear at the bottom of the dialog box:



5. Specify the **Image Export Options** by selecting from the drop-down menu. You may need to scroll or click the up or down arrows to see all selections. These include: Current View, User Defined (which enables the Width and Height fields), Full Screen, 8K UHD, 4K UHD, 1080p HD, 720p HD, and 480p SD. The resolution for the current selection is displayed in the Width and Height fields.



6. Click **Save** to close the browser window, and then **OK** to close the **Export** window.

To export an image file of a report to specified high resolution, use the scripting commands. The image can be created at a specified resolution. Fonts and line thickness is not scaled. Only the image. You will have to iteratively increase font sizes until you find a suitable output.

Report File Formats

The following table provides information about the file formats that can be imported into plot data reports:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

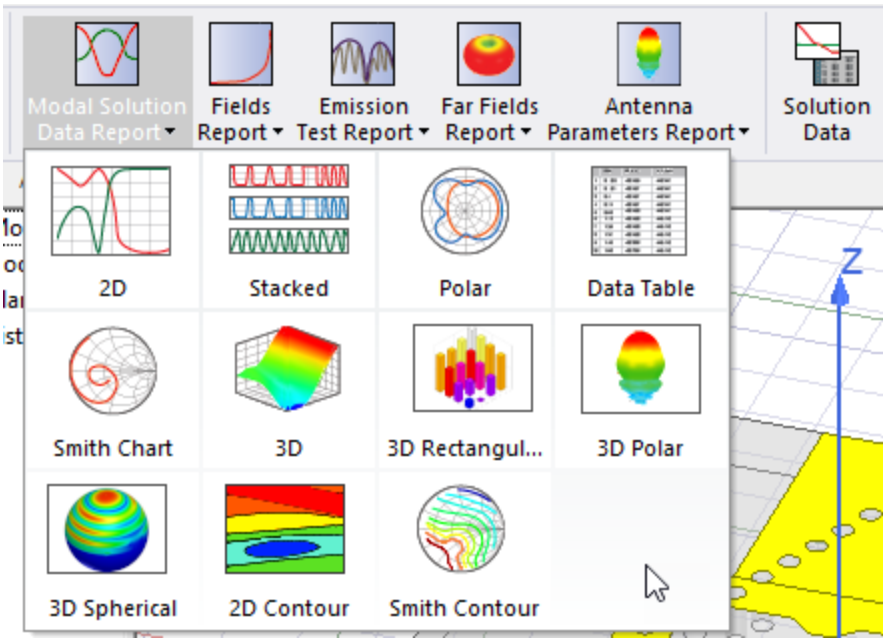
File Extension	Information
csv	• Uses a comma (,) as the separation character. • The x-axis value is in the first column. Each curve's Y-values make up one column, and the curves are in the same order as in the plot legend. • The first row is the X-axis name [unit] and the information for each curve, which is the same as the plot curve legend. • Other rows are the X-axis value and the Y-value for each curve.
tab	• Uses the tab character as the separation character. • The x-axis value is in the first column. Each curve's Y-values make up one column, and the curves are in the same order as in the plot legend. • The first row is the X-axis name [unit] and the information for each curve, which is the same as the plot curve legend. • Other rows are the X-axis value and the Y-value for each curve.
txt	The txt file must begin with a header that contains the following: • A first line made of 92 equal signs (=) • A second line that begins with the company name and ends with the date in MM/DD/YY format • A third line that begins with a plot name and ends with the time in hh:mm:ss format • A fourth line, which is empty • A fifth line made of 92 hyphens (-) **Note:** Each header line must be 92 characters in length, except the empty line. • Each column has a fixed width, separated by white space. • The x-axis value is in the first column. Each curve's Y-values make up one column, and the curves are in the same order as in the plot legend. • The first row is the X-axis name [unit] and the trace name [unit] for each curve, which is the same as the plot curve legend. • The second row is an empty column and the variable values for each curve, which is the same as the plot curve legend. • Other rows are the X-axis value and the Y-value for each curve.
dat	DAT is an Ansys-specific format. Ansys recommends that you do not generate

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

File Extension	Information
	files using this format. Files imported with these formats should be exported only from Ansys products.
rdat	RDAT is an Ansys-specific format. Ansys recommends that you do not generate files using this format. Files imported with these formats should be exported only from Ansys products.

Selecting the Display Type

The information in a report can be displayed in several formats. When you select the **Results** tab in the ribbon, depending on reports available for a given design and Solution type, you see a selection of report type groups (for example, Modal Solution Data, or Fields Report, Emission Test, Antenna Parameters, Near Fields, Terminal Solution Report, Far Fields Report, Characteristic Mode Data, etc.), with drop-down menus that displays the kinds of reports available for the design in that group:



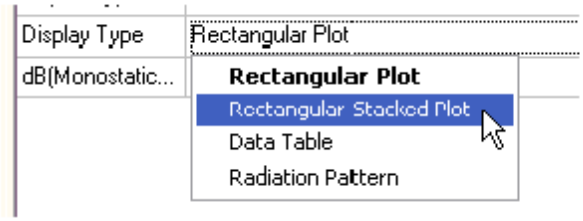
For the initial plot, you can also select from the following **Display Type** formats in the **Create<*type*> Report** submenu:

Rectangular Plot	A 2D rectangular (x-y) graph.
Rectangular	This choice puts each trace into its own 2D rectangular plot, and stacks each

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Stacked Plot	plot, rather than overlaying the traces on the same plot.
3D Rectangular Plot	A 3D rectangular (x-y-z) graph.
3D Rectangular Bar Plot	A 3D plot of rectangular bars.
Rectangular Contour Plot	A rectangular (x-y-z) graph. Contour plots are useful to visualize surfaces (e.g., Directivity as a function of phi/theta).
Polar Plot	A 2D circular chart divided by spherical coordinates.
3D Polar Plot	A 3D circular plot divided by spherical coordinates.
3D Spherical Plot	A 3D circular plot where the radius (rho) of the plot at all points is uniform and is equal to the maximum of all rhos at each (theta, phi) points.
Smith Chart	A 2D polar chart of S-parameters upon which a normalized impedance grid has been superimposed.
Smith Contour Plot	A polar chart. Contour plots are useful to visualize surfaces.
Data Table	A grid with rows and columns that displays, in numeric form, selected quantities against a swept variable or another quantity.
Radiation Pattern	A 2D polar plot of radiated fields.

You can also modify the display type of an existing plot from the **Properties** dialog for that plot. Select the Report icon in the Project tree to display the Properties dialog box. Selecting the **Display Type** field displays a menu with selections available for that plot.



Once you make a selection, the plot display updates for the current selection.

Creating 2D Rectangular Plots

A rectangular plot is a 2D, x-y graph of results.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. On the **Results** menu (under the **Circuit** menu, or right-click **Results** in the Project Manager), click **Create < *type* > Report**, and select **Rectangular Plot**.

   The *Report* dialog box appears.

2. In the **Context** section make selections from the following field or fields, depending on the design and solution type:
   a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
   b. Domain field with a drop down selection list. Whether this field appears, and the domains listed, depend on the Solution type and the report <*type*> selected. For modal and terminal solution data reports, the domain can be **Sweep** or **Time**.

      Before you can examine the time domain, you must perform an Interpolating sweep for a driven solution (Modal or Terminal). If you select **Time**, the **TDR Options** button is enabled. Select it and follow the directions for time-domain plotting.

   c. Geometry field with a drop-down selection list. For field and radiated field reports, this applies the quantity to a geometry or radiated field setup.
3. Under the **Trace** tab, **Y** component section, specify the information to plot along the y-axis:
   a. In the **Category** list, click the type of information to plot. The category selected provides the default plot name.
   b. In the **Quantity** list, click the value to plot.
   c. In the **Function** list, click the mathematical function of the quantity to plot.
   d. Value field displays the currently specified Quantity and Function. You can edit this field directly.

      > **Note:**
      >
      > Color shows valid expression.

   e. **Range Function** button -- opens the **Set Range Function** dialog box. This applies currently specified Quantity and Function.
4. On the **Trace** tab, **X** (Primary sweep) line, specify the quantity to plot along the x-axis in one of the following ways:
   - Select the sweep variable to use from the drop-down list.
   - If sweeps are available, you can select the browse button to display a dialog that lets you select particular sweep or sweeps, or all sweeps. The quantity will be plotted against the primary sweep variable listed.
5. On the **Families** tab, confirm or modify the sweep variables that will be plotted.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

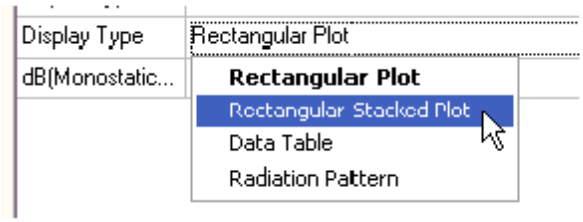
6. Click **New Report**.

   This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog.

   The function of the selected quantity will be plotted against the swept variable values or quantities you specified on an x-y graph. The plot is listed under **Results** in the project tree and the traces are listed under the plot. The default name is based on the Report Category you selected, (for example, S Parameter Plot *n* or rE Plott *n*). You can edit the plot names in the project tree and the plot header text in the report synchronizes. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

You can also modify the display type of an existing plot from the Properties dialog for that plot. Select the Report icon in the Project tree to display the Properties dialog box. Selecting the Display Type field displays a menu with selections available for that plot.

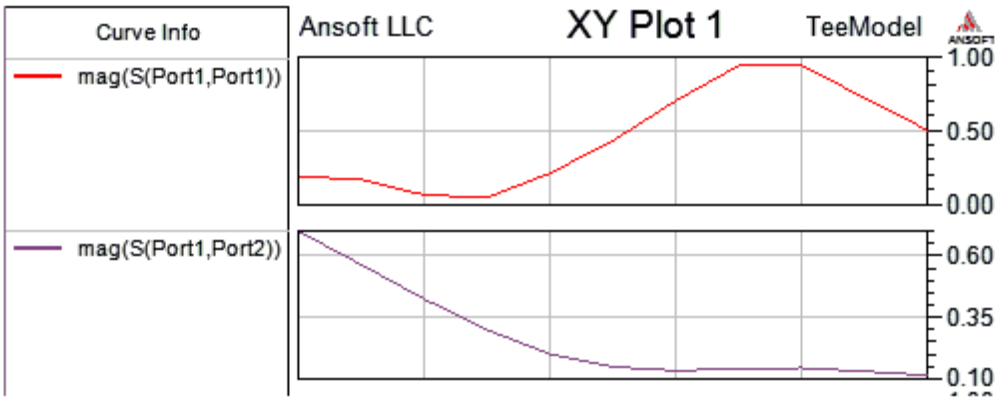


Once you make a selection, the plot display updates for the current selection.

Creating 2D Rectangular Stacked Plots

A rectangular stacked plot is a 2D, x-y graph of results, with each trace displayed on a separate plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. On the **Results** menu (under the **Circuit** menu or right-click **Results** in the Project Manager), click **Create <*type*> Report**, and select **Rectangular Stacked Plot**.

   The *Report* dialog box appears.

2. In the **Context** section make selections from the following field or fields, depending on the design and solution type:
   a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
   b. Domain field with a drop-down selection list. Whether this field appears, and the domains listed, depend on the Solution type and the report ***<type>*** selected. For modal and terminal solution data reports, the domain can be **Sweep** or **Time**.

      Before you can examine the time domain, you must perform an Interpolating sweep for a driven solution (Modal or Terminal). If you select **Time**, the **TDR Options** button is enabled. Select it and follow the directions for time-domain plotting.

   c. Geometry field with a drop down selection list. For field and radiated field reports, this applies the quantity to a geometry or radiated field setup.
3. Under the **Trace** tab, **Y** component section, specify the information to plot along the y-axis:
   a. In the **Category** list, click the type of information to plot. The category you select provides the default plot name.
      b. In the **Quantity** list, click the value to plot.
   c. In the **Function** list, click the mathematical function of the quantity to plot.
   d. Value field displays the currently specified Quantity and Function. You can edit this field directly.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> Color shows valid expression.

e. **Range Function** button -- opens the *Set Range Function* dialog box. This applies currently specified Quantity and Function.

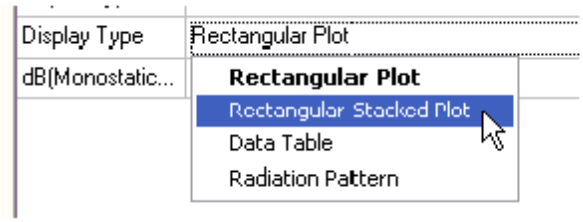
4. On the **Trace** tab, **X** (Primary sweep) line, specify the quantity to plot along the x-axis in one of the following ways:
   - Select the sweep variable to use from the drop down list.
   - If sweeps are available, you can select the browse button to display a dialog that lets you select particular sweep or sweeps, or all sweeps. The quantity will be plotted against the primary sweep variable listed.
5. On the **Families** tab, confirm or modify the sweep variables that will be plotted.
6. Click **New Report.**

   This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, (for example, S Parameter Plot *n* or rE Plot *n*). You can edit the plot names in the project tree and the plot header text in the report synchronizes.

   The function of the selected quantity will be plotted against the swept variable values or quantities you specified on an x-y graph. The plot is listed under **Results** in the project tree and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

You can also modify the display type of an existing plot from the Properties dialog for that plot. Select the Report icon in the Project tree to display the Properties dialog box. Selecting the Display Type field displays a menu with selections available for that plot.

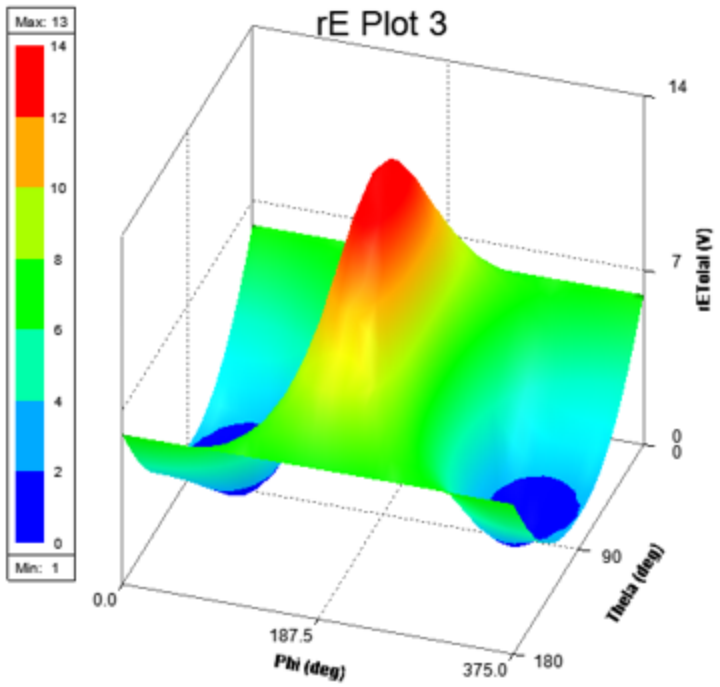


Once you make a selection, the plot display updates for the current selection.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Creating 3D Rectangular Plots

This is a 3D, x-y-z graph of results.



Working with a 3D Rectangular Plot

You can Rotate, Zoom, and Pan a plot. When you rotate, the Cartesian grid responds so that the curve always remains in front and the grids behind.

Clicking on a plot entity selects it, highlighting the selected entity in bold.

Double-clicking anywhere in the plot brings up the Properties dialog box. The properties are grouped appropriately under various tabs, which correspond to plot entities:

- General: For general plot properties such as Visual Detail level and background color
- Header: Properties related to plot Header/Title.
- Axis [X|Y|Z]: Properties related to the 3 axes
- Grid [XY|YZ|ZX]: Properties related to the 3 grids
- ColorKey: Properties related to ColorKey, including borders, background, Min and Max, as well as number format and precision.
- Contour: Properties related to contouring of all curves/surfaces
- Surface: Properties related to the curve

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Selecting a property also displays its properties in the Property window. You can edit the properties to customize the appearance of the plot. See "Controlling Visual Detail in a 3D Plot" on the facing page.

Creating a 3D Rectangular Plot

1. On the **Results** menu (under the **Circuit** menu or right-click **Results** in the Project Manager), click **Create *<type>* Report**, and select **3D Rectangular plot** from the report type menu.

   The *Report* dialog box appears.

2. In the **Context** section make selections from the following field or fields, depending on the design and solution type.
   a. Solution field with a drop-down selection list. This lists the available solutions, whether sweeps or adaptive passes.
   b. Geometry field with a drop-down selection list. For field and radiated field reports, this applies the quantity to a geometry or radiated field setup.
3. Under the **Trace** tab **Z** Component area, specify the information to plot along the z-axis:
   a. In the **Category** list, click the type of information to plot. The category you select provides the default plot name.
   b. In the **Quantity** list, click the value to plot.
   c. In the **Function** list, click the mathematical function of the quantity to plot.
   d. The **Value** field displays the currently specified Quantity and Function. You can edit this field directly.

      > **Note:**
      >
      > Color shows valid expression.

   e. **Range Function** button -- opens the *Set Range Function* dialog box. This applies currently specified Quantity and Function.
4. On the **Trace** tab **Y** (Secondary sweep) lines, specify the information to plot along the y-axis in one of the following ways:
   - Select the sweep variable to use from the drop-down list.
   - If sweeps are available, you can select the browse button to display a dialog that lets you select particular values. The quantity will be plotted against the primary sweep variable listed.
5. On the **Trace** tab **X** (Primary sweep) lines, specify the information to plot along the x-axis in one of the following ways:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Select the sweep variable to use from the drop-down list.
- If sweeps are available, you can select the browse button to display a dialog that lets you select particular values. The quantity will be plotted against the primary sweep variable listed.

6. On the **Families** tab, confirm or modify the sweep variables that will be plotted.
7. Click **New Report.**

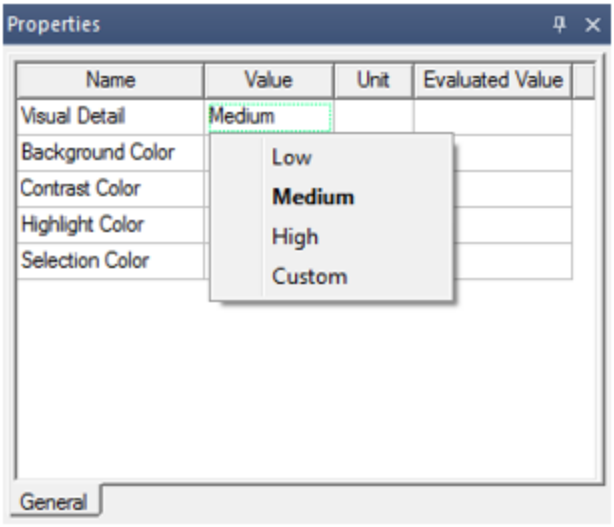
   This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, (for example, S Parameter Plot *n* or rE Plot *n*). You can edit the plot names in the project tree and the plot header text in the report synchronizes.

   The function of the selected quantity or quantities will be plotted against the values you specified on an x-y-z graph. The plot is listed under **Results** in the Project Manager. When you select the traces or plots, axis or grid labels, plot header, color key, or variable labels, their properties are displayed in the Properties window. The properties for each plot element can be edited directly to modify the plot content and appearance. See Modifying the Background Properties of a Report.

8. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

Controlling Visual Detail in a 3D Plot

If a particular plot seems busy with information, you can edit plot properties, such as Axis and Grid Attributes for discrete levels of visual detail to improve readability. Double-click anywhere on a plot to display the Properties dialog box. The Visual Detail property on the General tab also provides control suited to different screen and plot sizes.

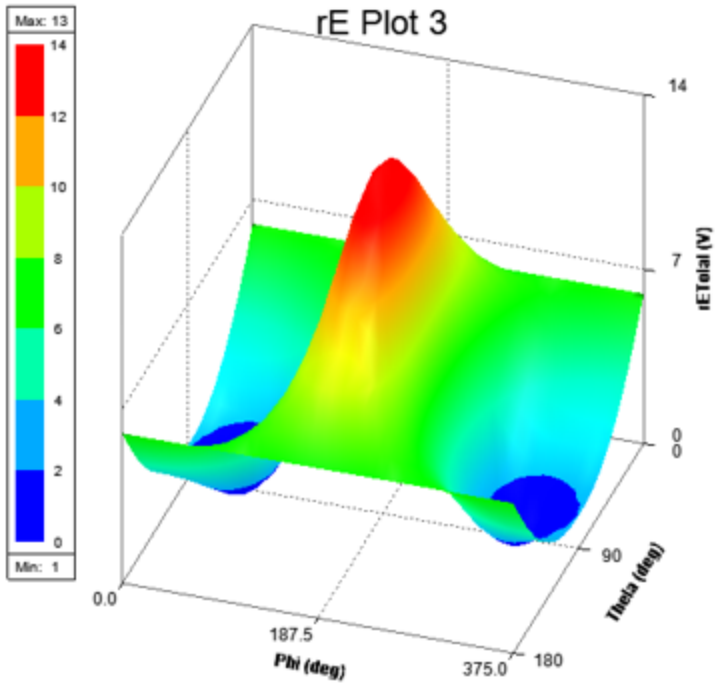


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The Visual Detail menu has four options: Low, Medium (the default), High, and Custom. If you select any Visual Detail, the 3D plot is rendered according to the selected Visual Detail level and the properties reflect the values chosen for the selected visual detail level. From this predefined visual detail level, if you modify any properties, Visual Detail is automatically set to Custom (or to another predefined visual detail level if the edits happen to match the settings for that level).

You can also manually set Visual Detail to Custom. In such a case, Custom will inherit property values corresponding to the previous level. This ensures that you can customize settings starting from a baseline provided by the preconfigured Low, Medium or High Visual Detail levels.

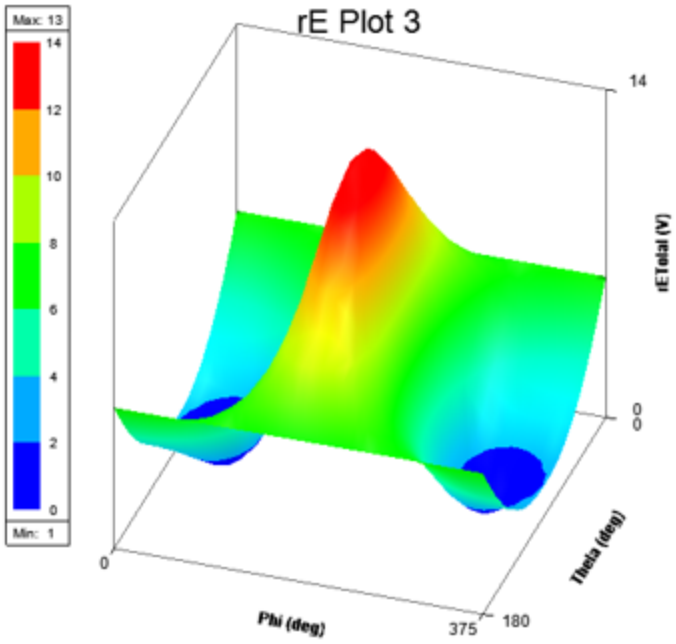
3D Rectangular Plot with Medium Visual Detail



On creation, a 3D Rectangular Plot has Visual Detail set to Medium and looks and feels as shown above. Specifically, under Medium Visual Detail level, a 3D Rectangular Plot has 3 ticks per axis (X, Y, Z axis) which will show min, max and middle value. This setting also shows axes labels.

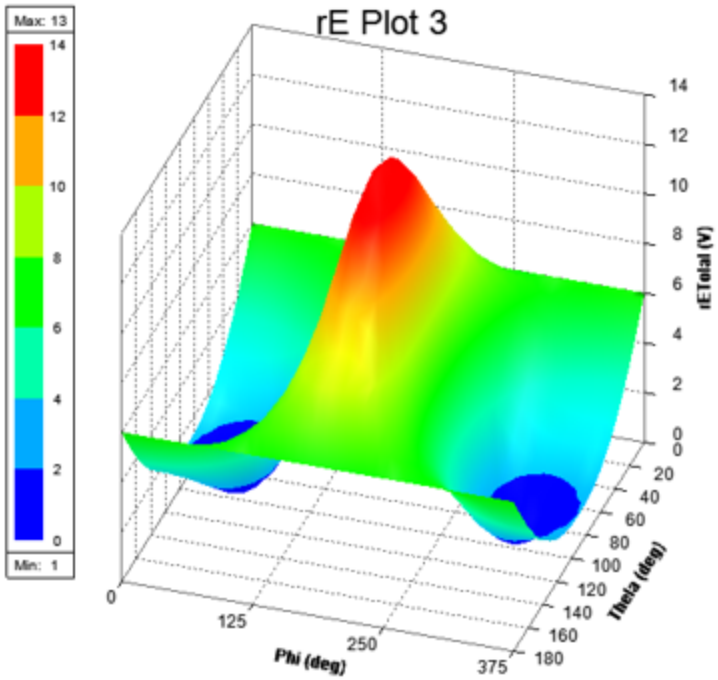
3D Rectangular Plot with Low Visual Detail

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



With Visual Detail set to Low, a 3D Rectangular Plot shows axes with 2 ticks corresponding to min and max values. It also shows axes labels and grid borders.

3D Rectangular Plot with High Visual Detail

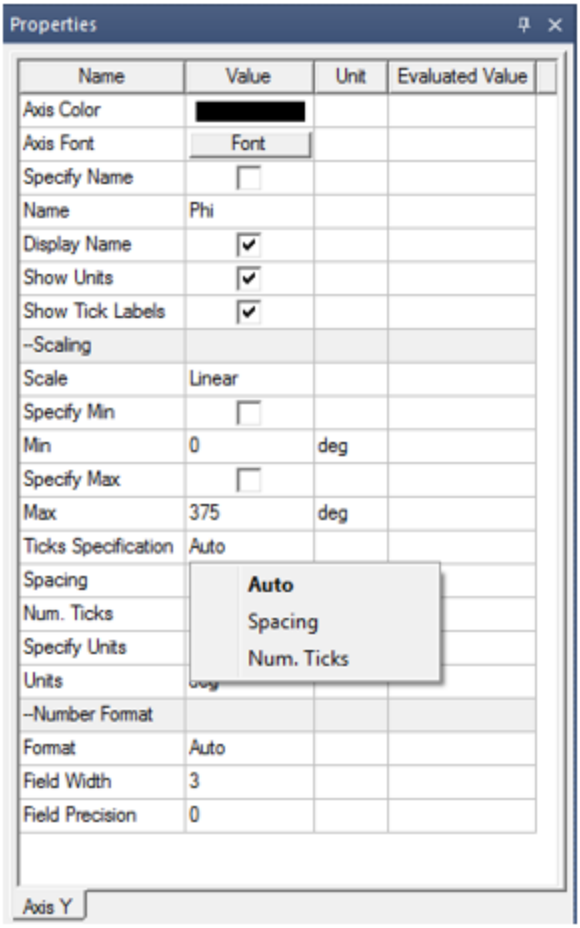


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

With Visual Detail set to High, a 3D Rectangular Plot shows all Cartesian axes and grids together with all ticks and axes labels.

Axis Properties: Ticks Specification and Num. Ticks

Ticks Specification is available on Axis properties, as shown below:



Ticks Specification is a menu with possible values as Auto, Spacing, and Num. Ticks, with Auto being the default value. If Ticks Specification is Auto, then a spacing value is automatically calculated and used to calculate and display the tick labels. **Spacing** shows the calculated value, and Num. Ticks shows the number of ticks based on this spacing value, as shown below:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

--Scaling			
Scale	Linear		
Specify Min	☐		
Min	0	deg	
Specify Max	☐		
Max	375	deg	
Ticks Specification	Auto		
Spacing	125	deg	
Num. Ticks	2		

You can edit the **Spacing** field when Ticks Specification is set to Spacing; otherwise, it is read only.

You can edit the **Num. Ticks** field when Ticks Specification is Num. Ticks; otherwise, it is read only.

Valid Num. Ticks are between 0 and 100, including 0 and 100. If you enter an invalid value, an error message is shown. If you enter a spacing value that results in number of ticks greater than 100, then an appropriate value is shown.

- If Num. Ticks is 0, then no ticks are shown on the axis.
- If Num. Ticks is 1, then only the max value tick is shown on the axis.
- If Num. Ticks is 2, then only the min and max value ticks are shown on the axis.
- If Num. Ticks is greater than 2, then evenly spaced ticks (including min and max) are shown on the axis.

> **Note:**
>
> With the addition of the Ticks Specification property to Axis properties, the **Specify Spacing** property was removed as an Axis property.
>
> - If an R18.0 or R18.1 project is opened with **Specify Spacing** as Unchecked, Ticks Specification is set to Auto.
> - If an R18.0 or R18.1 project is opened with **Specify Spacing** as Checked, Ticks Specification is set to Spacing.

Creating Rectangular Contour Plots

This is an x-y-z graph of results. Any data that you can currently plot in 3D (as 3D Cartesian or 3D polar) is a candidate for a contour plot.

1. On the **Results** menu (**Circuit** menu or right-click **Results** in the Project Manager), click **Create *<type>* Report**, and select **Rectangular Contour plot** from the report type menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The *Report* dialog box appears.

2. In the **Context** section make selections from the following field or fields, depending on the design and solution type:
    a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
    b. Geometry field with a drop-down selection list. For field and radiated field reports, this applies the quantity to a geometry or radiated field setup.
    c. Domain field with a drop-down selection list. For Near and Far Field reports, if you have defined the respective Radiation Setups, a Domain field lists Theta, Phi, and Sine Space.

    For details, see Creating Sine Space plots.

3. Under the **Trace** tab **Z** Component area, specify the information to plot as contours:
    a. In the **Category** list, click the type of information to plot. The selected Category provides the default plot name.
    b. In the **Quantity** list, click the value to plot.
    c. In the **Function** list, click the mathematical function of the quantity to plot.
    d. The **Value** field displays the currently specified Quantity and Function. You can edit this field directly.

    > **Note:**
    >
    > Color shows valid expression.

    e. **Range Function** button -- opens the *Set Range Function* dialog box. This applies currently specified Quantity and Function.
4. On the **Trace** tab **Y** (Secondary sweep) lines, specify the information to plot along the y-axis in one of the following ways:
    - Select the sweep variable to use from the drop-down list.
    - If sweeps are available, you can select the browse button to display a dialog that lets you select particular values. The quantity will be plotted against the primary sweep variable listed.
5. On the **Trace** tab **X** (Primary sweep) lines, specify the information to plot along the x-axis in one of the following ways:
    - Select the sweep variable to use from the drop-down list.
    - If sweeps are available, you can select the browse button to display a dialog that lets you select particular values. The quantity will be plotted against the primary sweep variable listed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Click **New Report**.

   This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, for example, S Parameter Plot *n* or Output Variables Plot *n*). You can edit the plot names in the project tree and the plot header text in the report synchronizes.

   The function of the selected quantity or quantities will be plotted against the values you specified on an x-y-z graph. The plot is listed under **Results** in the Project Manager. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

   The Trace Properties for Cartesian plots include tabs for:

   - Attributes tab, including Name, Line Style, Line Width, and Color.
   - Contour tab, including Colormap Type, Color, Spectrum, IsoValType, whether to Overlay Contour Lines (on Fringe or Tone plots), Scaling parameters, and Number of contours and spacing.

   Colormap Type can be Spectrum, Ramp, or Uniform.

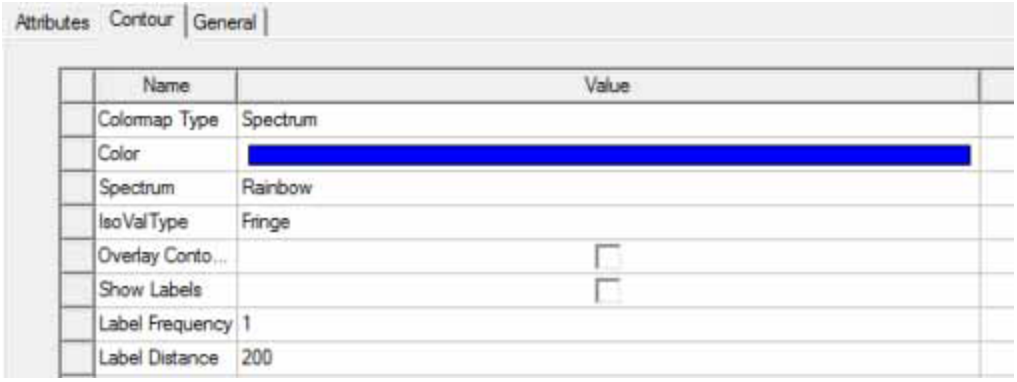
   Spectrum can be Rainbow, Temperature, Magenta, or Gray

   IsoValType can be Line, Fringe, or Tone.

   General tab, including Back Color, Plot Area Color, Enable Y Axis Stripes, Field Width, Prevision, and whether to Use Scientific Notation.

   You can also access these properties by double-clicking on the Contour plot and viewing the **Contour** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

Creating Sine Space Plots

Sine Space plots provide an alternate way to view radiated field quantities. The transformation from theta, phi space to u, v sine space is defined as follows:

u = sin(theta)*cos(phi)

v = sin(theta)*sin(phi)

Note that this is similar to a polar coordinate system, where the radius is given by sin(theta) and the angle is given by phi. Another way to think about this: Given theta and phi that define a unit sphere, then these u,v coordinates are like viewing the unit sphere from above or below the XY plane. So, a sine space plot is a 2D plot that lies on a unit circle in the u,v space, that shows the values of radiated field quantities projected onto the upper or lower half of a full 3D sphere.

Sine Space Plots

Sine Space plots are implemented as a new Context in Reporter. They will leverage the existing radiated field setups and calculations.

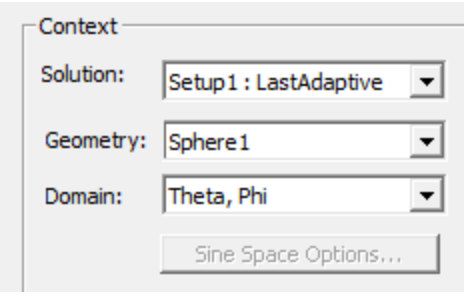
To create a Sine Space plot, after you have specified radiated field Setups.

1. Click **Results> Create Far Fields Report> Rectangular Contour Plot** or **Data Table**

   Results> Create Near Fields Report> Rectangular Contour Plot or **Data Table**.

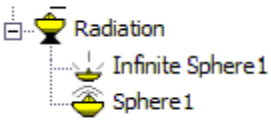
   The *Report* dialog box displays and shows choices for Domain in the Context field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



"Theta, Phi" is selected by default and gives the existing functionality.

Notice that the Context shown above already includes selection of a Geometry, which corresponds to a Radiation setup.

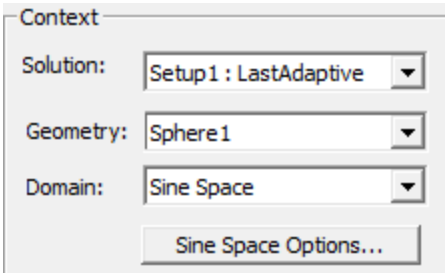


This radiation setup is used to calculate the fields for the Sine Space plot. Internally, this computes the values of the complex E vector based on the theta, phi sampling in the radiation setup. When data is requested for a sine space plot, it will correspond to some arbitrary theta, phi, and the fields will be interpolated to this location on the sphere. Note that this interpolation will occur on the complex E vector, and can be more detailed than a simple linear interpolation between sample points.

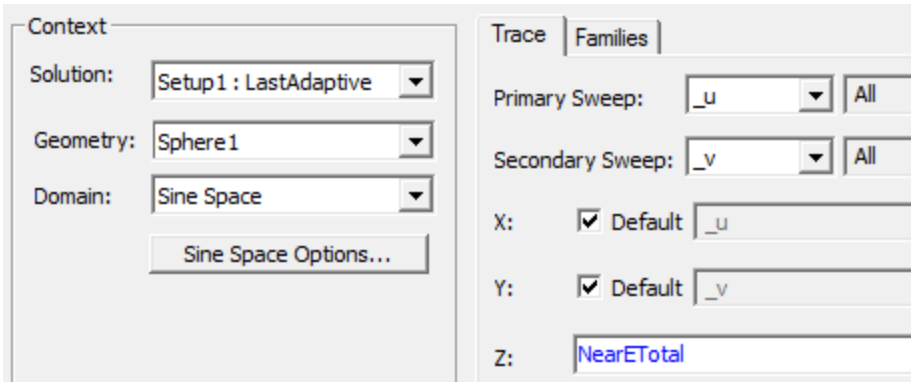
In order to support sine space plots, the radiation setup must have appropriate sampling in theta and phi. By default, a sphere is defined with phi from 0 to 360 (angle of rotation about Z), and theta from 0 to 180 (angle of rotation away from Z). These settings support a full unit circle representing the upper (theta from 0 to 90) or lower (theta from 90 to 180) half space. If the range of theta is reduced to 0 to 90, it would be possible to support upper half space only. Other ranges of theta and phi will likely create odd sine space plots, such as a partial circle, and these are not allowed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

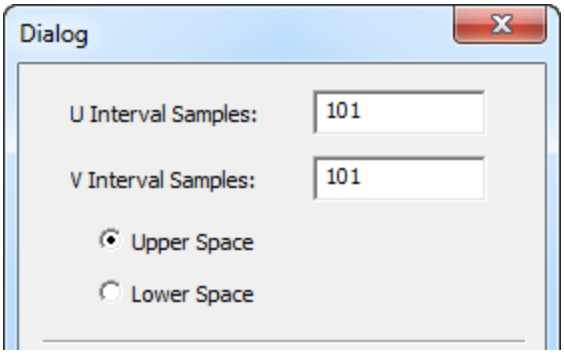
2. Select Sine Space as the Domain. This also enables the **Sine Space** options button.



Selecting "Sine Space" changes the Primary Sweep to U, and the Secondary Sweep to V.



The Sine Space Options provide additional settings, including the sampling interval for the u,v coordinates (default of .05 would provide 40 samples over each axis, -1 to 1) and selection of upper or lower half space (default to upper).

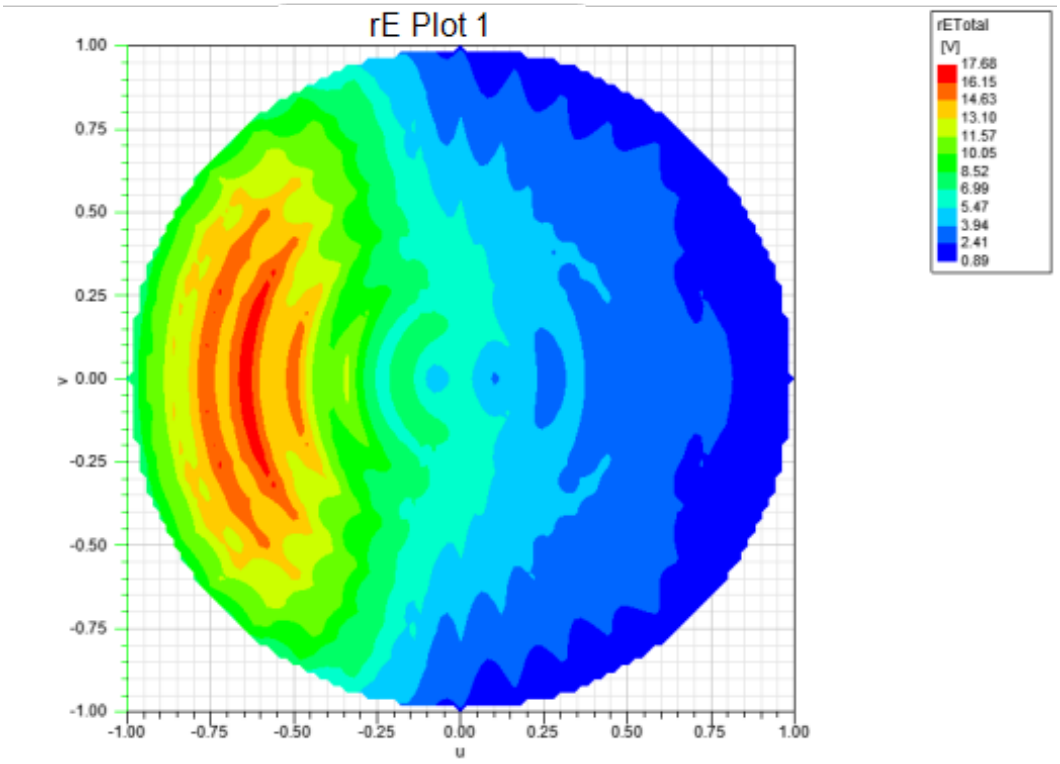


Once you have set up the domain, you define the Sine Space plot, selecting Category, Quantity and Function settings as appropriate. The Report Category you select provides the default report name, for example, S Parameter Plot *n* or Output Variables Plot *n*. Given

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

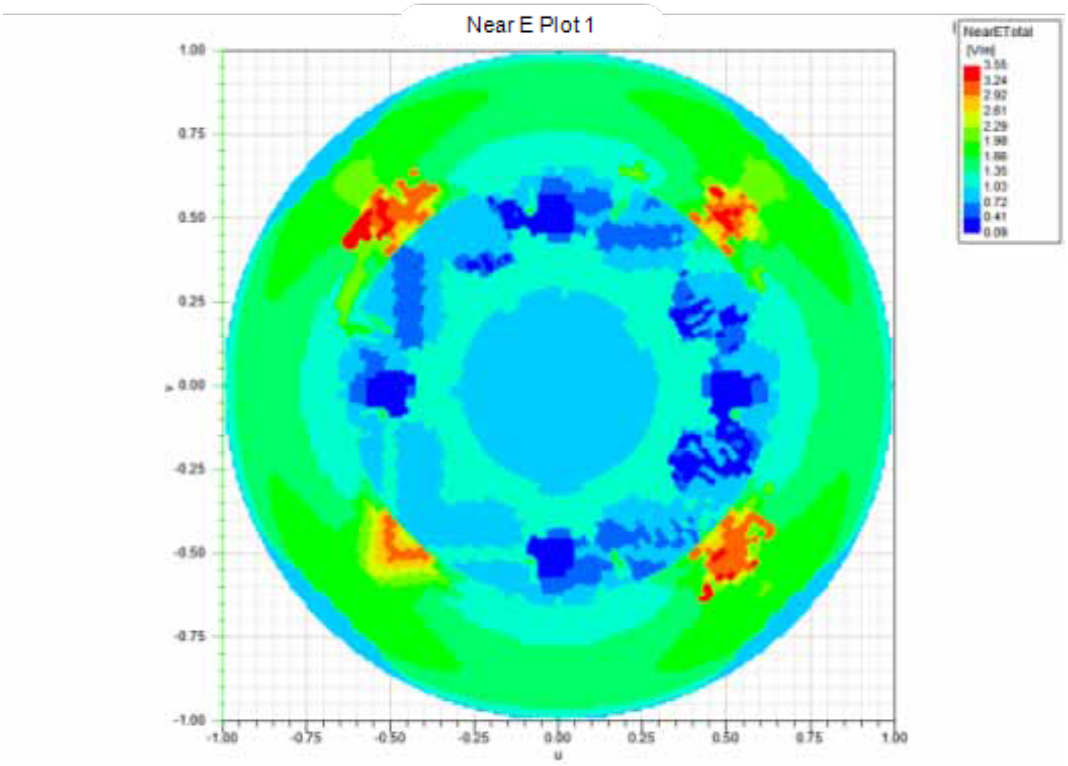
that the u,v sampling is set in the Sine Space Options, it should not be necessary to modify the sweeps in the Trace area of the dialog box.

Here is an example Sine Space plot of Far Field rETotal.



And here is an example Sine Space plot of Near field E Total.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can use the **Contour** tab of the *Properties* dialog box to modify the appearance of the plot. See Creating Rectangular Contour Plots for discussion and examples.

Creating 2D Polar Plots

In Circuit, a polar plot is a 2D circular chart divided by the spherical coordinates R and theta, where R is the radius, or distance from the origin, and theta is the angle from the x-axis. Following is the general procedure for drawing a polar graph of results:

1. On the **Results** menu (Circuit menu or right-click **Results** on the Project tree), click **Create <*type*> Report**, and select **Polar Plot** from the report type menu.

The **Report** dialog appears.

2. In the **Context** section make selections from the following field or fields, depending on the design and solution type.
    a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
    b. Domain field with a drop down selection list. Whether this field appears, and the domains listed depend on the Solution type and the ***<type>*** selected. For modal and terminal solution data reports, the domain can be **Sweep** or **Time**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Before you can examine the time domain, you must perform an Interpolating sweep for a driven solution (Modal or Terminal). If you select **Time**, the **TDR Options** button is enabled. Select it and follow the directions for time-domain plotting.

c. Geometry field with a drop down selection list. For field and radiated field reports, this applies the quantity to a geometry or radiated field setup.

3. In the **Trace** tab **PolarComponent** area, specify the information to plot:
   a. On the **Category** drop-down menu, click the type of information to plot.
   b. On the **Quantity** list, click the values to plot. Use Ctrl+click to make multiple selections.
   c. In the **Function** list, click the mathematical function to apply to the quantity for the plot.
   d. The **Value** field displays the currently specified Quantity and Function. You can edit this field directly.

> **Note:**
>
> Color shows valid expression.

   e. **Range Function** button -- opens the **Set Range Function** dialog box. This applies currently specified Quantity and Function.
4. Click **New Report.**

This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, (for example, S Parameter Plot *n* or rE Plot *n*). You can edit the plot names in the project tree and the plot header text in the report synchronizes.

The function of the selected quantity will be plotted against the swept variable values or quantities you specified on an x-y graph. The plot is listed under **Results** in the project tree and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

5. Optionally, add another trace to the plot by following the procedure above, using **Add Trace rather than New Report**.

Reviewing 2D Polar Plots

For a polar plot of S-parameters, HFSS displays in the lower-left corner the following derived information about the cursor's location:

MP The magnitude and phase of the point.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

RX The normalized resistance (**R**) and reactance (**X**).

GB An alternate view of the normalized resistance and reactance in the form of

$$R + jX = \frac{1}{G + jB}$$

where

- ***G*** = conductance
- ***B*** = susceptance

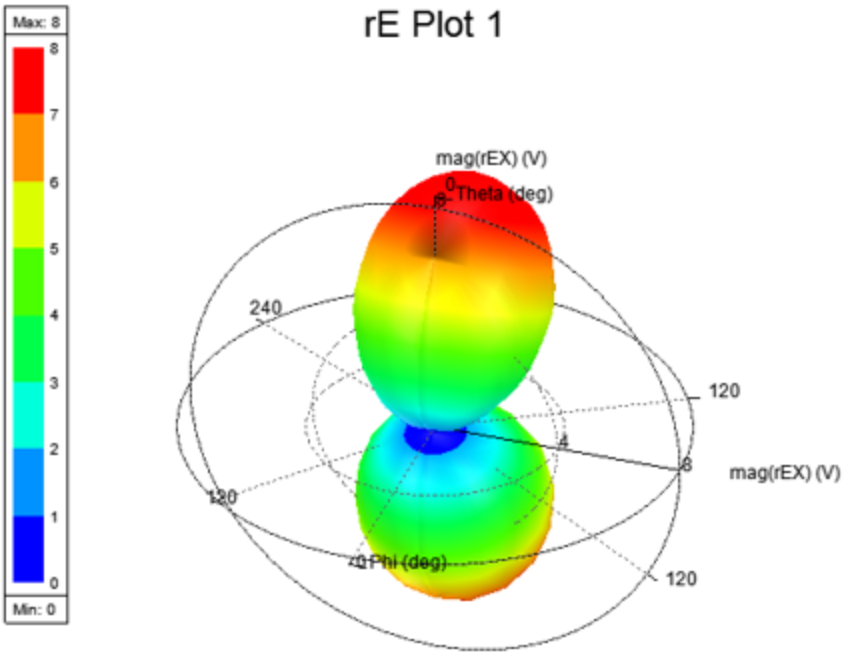
Q The quality factor.

VSWR The voltage standing wave ratio, calculated from the equation $\frac{1 + |S_{ij}|}{1 - |S_{ij}|}$.

A scale below the plot displays the scale of points along the R-axis.

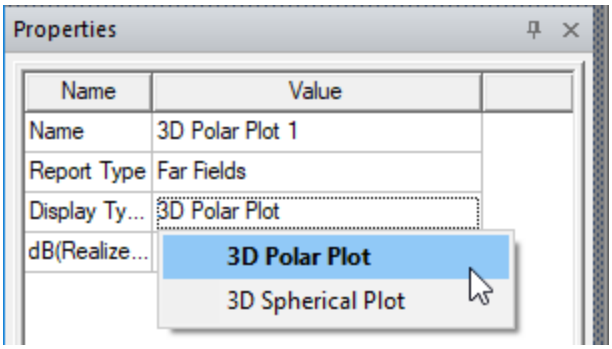
Creating 3D Polar Plots

A 3D polar plot is a 3D circular chart divided by the spherical coordinates R, theta, and phi, where R is the radius, or distance from the origin, theta is the angle from the x-axis, and phi is the angle from the origin in the z direction.

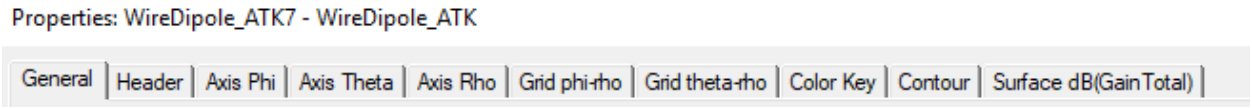


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To convert a 3D Polar plot to a 3D Spherical Plot, select the plot in the Project tree, and select from the Display type menu in the Properties window:



Double-clicking anywhere in the plot brings up the display **Properties** dialog box. The properties are grouped appropriately under various tabs, which correspond to plot entities.



- General: For general plot properties such as Visual Detail level and background color
- Header: Properties related to plot Header/Title
- Axis Phi: Properties related to the circular axis which is in XY plane
- Axis Theta: Properties related to the circular axis which is in YZ plane
- Axis Rho: Properties related to the radial axis
- Grid phi-rho-theta(0): Properties related to phi-rho grid at theta = 0 (XY plane)
- Grid theta-rho-phi(90): Properties related to theta-rho grid at phi = 90 (YZ plane)
- Color Key: Properties related to the color key, including borders, background, Min and Max, as well as number format and precision.
- Contour: Properties related to contouring of all curves/surfaces
- Surface: Properties related to the curve

You can edit the properties on these tabs to customize the appearance of the plot. See "Controlling Visual Detail in a 3D Polar Plot" on page 19-98 below.

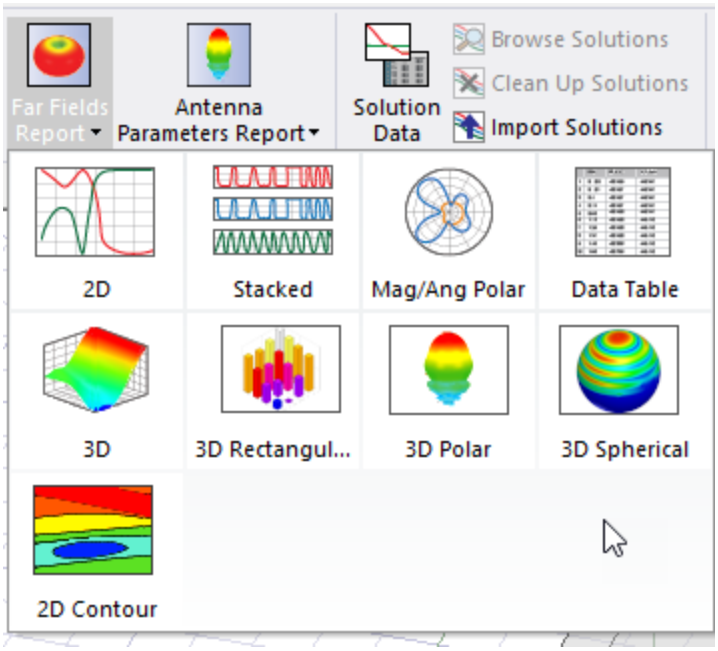
Creating 3D Polar Plots

Following is the general procedure for drawing a 3D polar plot of results:

1. On the **Results** menu (HFSS menu or right-click **Results** on the Project tree), click **Create <*type*> Report**, and select **3D Polar Plot** from the report type menu.

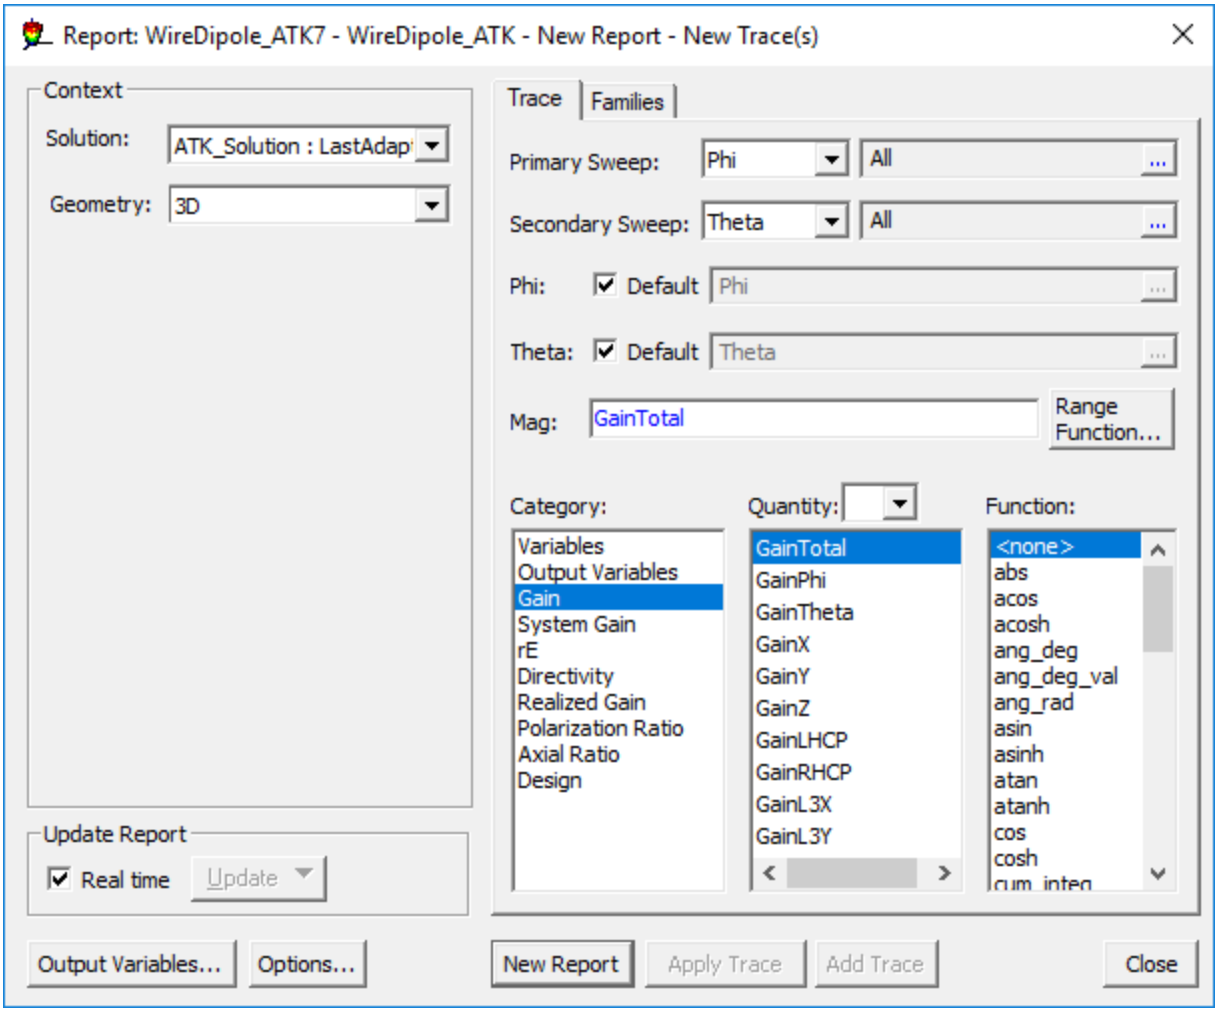
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can also select 3D Polar Plots from the **Results** tab of the ribbon if such plots are appropriate for the current design.



The **Report** dialog box appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. In the **Context** section make selections from the following field or fields, depending on the design and solution type.
    a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
    b. Geometry field with a drop down selection list. For field and radiated field reports, this applies the quantity to a geometry or radiated field setup.
3. In the **Trace** tab **Mag** area, specify the information to plot along the R-axis, or the axis measuring magnitude:
    a. From the **Category** drop-down menu, select the type of information to plot. The selected category provides the default plot name.
    b. In the **Quantity** list, click the values to plot. Ctrl+click to make multiple selections.
    c. In the **Function** list, click the mathematical function to apply to the quantity for the plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

d. The **Value** field displays the currently specified Quantity and Function. You can edit this field directly.

> **Note:**
>
> Color shows valid expression.

e. **Range Function** button -- opens the **Set Range Function** dialog box. This applies currently specified Quantity and Function.

4. On the **Trace** tab **Theta (Secondary Sweep)** line, select the sweep variable from the drop-down menu and specify all values or select values to plot along the theta-axis.
5. On the **Trace** tab **Phi(Primary Sweep)** line, select the sweep variable from the drop-down menu, and specify all values or select values to plot along the phi-axis.
6. Click **New Report.**

   This button creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, (for example, S Parameter Plot *n* or rE Plot *n*). You can edit the plot names in the project tree and the plot header text in the report synchronizes.

   The function of the selected quantity or quantities will be plotted against the R-, phi-, and theta-axes on a 3D polar graph. The plot is listed under **Results** in the project tree. When you select the traces or plots, axis or grid labels, plot header, color key, or variable labels, their properties are displayed in the Properties window. The properties for each plot element can be edited directly to modify the plot content and appearance. See Modifying the Background Properties of a Report

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

Interacting with 3D Polar Plots

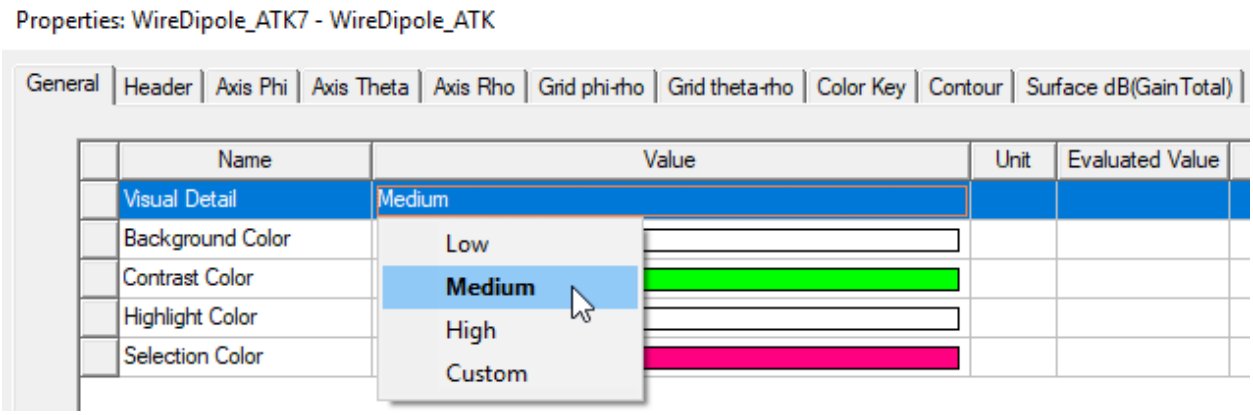
You can Rotate, Zoom, and Pan a plot. When you rotate, the Cartesian grid responds so that the curve always remains in front and the grids behind. Also, see Using the Orientation Gadget.

Controlling Visual Detail in a 3D Polar Plot

If a particular plot seems busy with information, you can edit plot properties, such as Axis and Grid Attributes for discrete levels of visual detail to improve readability. Double-click anywhere on a plot to display the **Properties** dialog box. Clicking on a plot entity selects it, highlighting the selected entity in bold.

The Visual Detail property on the **General** tab also provides control suited to different screen and plot sizes.

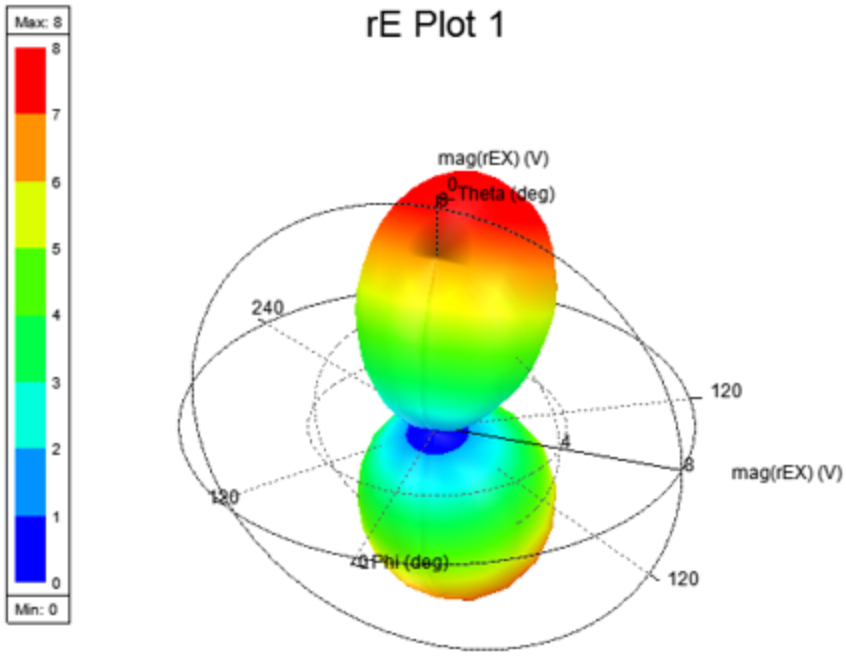
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The Visual Detail menu has four options: Low, Medium (the default), High, and Custom. If you select any Visual Detail, the 3D plot is rendered according to the selected Visual Detail level and the properties reflect the values chosen for the selected visual detail level. From this predefined visual detail level, if you modify any properties, Visual Detail is automatically set to Custom (or to another predefined visual detail level if the edits happen to match the settings for that level).

You can also manually set Visual Detail to Custom. In such a case, Custom will inherit property values corresponding to the previous level. This ensures that you can customize settings starting from a baseline provided by the preconfigured Low, Medium or High Visual Detail levels.

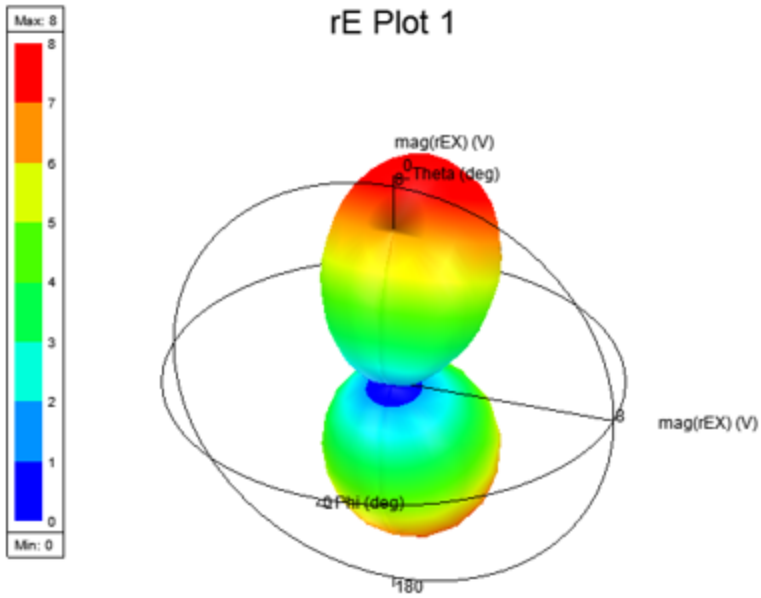
3D Polar Plot with Medium Visual Detail



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

On creation, a 3D Polar Plot has Visual Detail set to Medium and looks and feels as shown above. Specifically, under the Medium Visual Detail level, 3D Polar Plot has 3 ticks per axis (phi, theta and rho axis) which show min, max and middle value. This setting also shows axes labels.

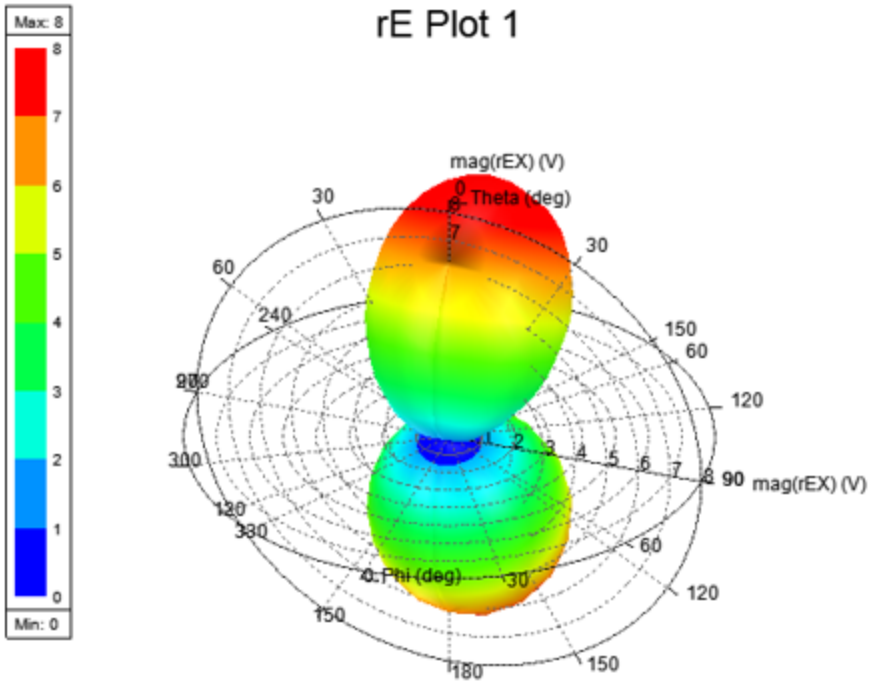
3D Polar Plot with Low Visual Detail



With Visual Detail set to Low, 3D Polar Plot does not show polar grids or grid lines. It only shows axes with 2 ticks corresponding to min and max values. This setting also renders axis labels.

3D Polar Plot with High Visual Detail

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

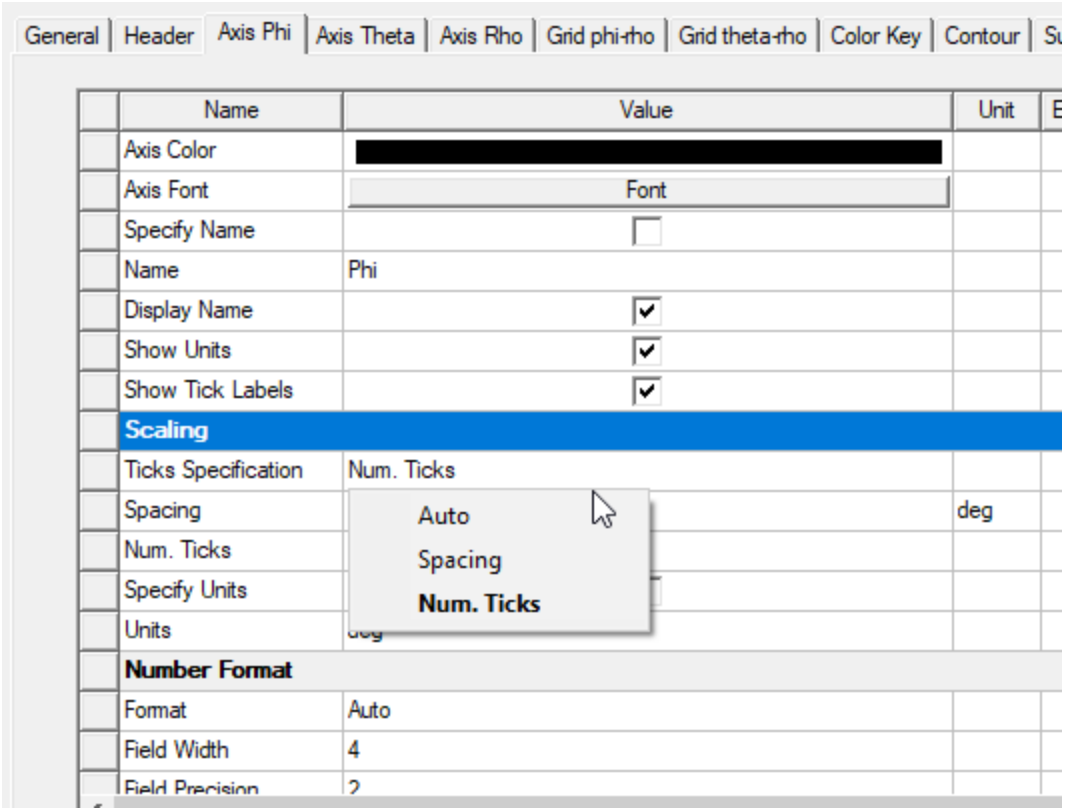


With Visual Detail set to High, a 3D Polar Plot shows all polar axes and grids together with all nice ticks and axes labels. This is ideal for large plot sizes.

Axis Properties: Ticks Specification and Num. Ticks

Ticks Specification is available on Axis properties, as shown below:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ticks Specification is a menu with possible values as Auto, Spacing, and Num. Ticks, with Auto being the default value. If Ticks Specification is Auto, then a spacing value is automatically calculated and used to calculate and display the tick labels. **Spacing** shows the calculated value, and Num. Ticks shows the number of ticks based on this spacing value, as shown below:

--Scaling			
Scale	Linear		
Specify Min			
Min	0	deg	
Specify Max			
Max	375	deg	
Ticks Specification	Auto		
Spacing	125	deg	
Num. Ticks	2		

You can edit the **Spacing** field when Ticks Specification is set to Spacing; otherwise, it is read only.

You can edit the **Num. Ticks** field when Ticks Specification is Num. Ticks; otherwise, it is read only.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Valid Num. Ticks are between 0 and 100, including 0 and 100. If you enter an invalid value, an error message is shown. If you enter a spacing value that results in number of ticks greater than 100, then an appropriate value is shown.

- If Num. Ticks is 0, then no ticks are shown on the axis.
- If Num. Ticks is 1, then only the max value tick is shown on the axis.
- If Num. Ticks is 2, then only the min and max value ticks are shown on the axis.
- If Num. Ticks is greater than 2, then evenly spaced ticks (including min and max) are shown on the axis.

> **Note:**
>
> With the addition of the Ticks Specification property to Axis properties, the **Specify Spacing** property was removed as an Axis property.
>
> - If an R18.0 or R18.1 project is opened with **Specify Spacing** Unchecked, Ticks Specification is set to Auto.
> - If an R18.0 or R18.1 project is opened with **Specify Spacing** Checked, Ticks Specification is set to Spacing.

Grid Properties for Phi-Rho and Theta-Rho

You can control a range of display properties for the pho-rho and theta-rho grids, including line styles and colors for major and minor grids.

Overlay 3D Polar Plot on Model Window

For a 3D polar plot to be eligible for overlay, it must have its primary and secondary sweep from variables Phi and Theta or IWavePhi and IWave Theta in that order. If the plot is unsuitable, the **Overlay** commands are disabled.

Once you create a suitable plot, you can overlay the 3D polar plot on the model window.

Creating Smith Charts

A Smith chart is a 2D polar plot of S-parameters upon which a normalized impedance grid has been superimposed. Following is the general procedure for creating a Smith chart of results:

1. On the **Results** menu (HFSS menu or right-click **Results** on the Project tree), click **Create <*type*> Report**, and select **Smith Chart** from the report type menu.

   The **Report** dialog appears.

2. In the **Trace** tab **PolarComponent** area, specify the information to plot:
   a. On the **Category** drop-down menu, click the type of information to plot. The category selected provides the default plot name.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. On the **Quantity** list, click the values to plot. Use Ctrl+click to make multiple selections.
c. In the **Function** list, click the mathematical function to apply to the quantity for the plot.
d. The **Value** field displays the currently specified Quantity and Function. You can edit this field directly.

> **Note:**
>
> Color shows valid expression.

e. **Range Function** button -- opens the **Set Range Function** dialog box. This applies currently specified Quantity and Function.

3. Click **New Report.**

This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, (for example, S Parameter Plot *n* or rE Plot *n*). You can edit the plot names in the project tree and the plot header text in the report synchronizes.

The function of the selected quantity will be plotted against the values you specified on a polar plot. In addition, each circle on the plot is labeled with values of *R*, measuring normalized resistance, and each line is labeled with values of *X*, measuring normalized reactance. The plot is listed under **Results** in the project tree and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

4. Optionally, add another trace to the plot by following the procedure above, using **Add Trace rather than New Report**.

Creating Smith Contour Charts

A Smith contour chart is a polar plot of S-parameters upon which a normalized impedance grid has been superimposed. Following is the general procedure for creating a Smith chart of results:

1. On the **Results** menu (HFSS menu or right-click **Results** on the Project tree), click **Create <*type*> Report**, and select **Smith Chart** from the report type menu.

The **Report** dialog appears.

2. In the **Trace** tab **Mag** area, specify the information to plot:
   a. On the **Category** drop-down menu, click the type of information to plot. The Category selection provides the default plot name.
   b. On the **Quantity** list, click the values to plot. Use Ctrl+click to make multiple selections.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

c. In the **Function** list, click the mathematical function to apply to the quantity for the plot.

d. The **Value** field displays the currently specified Quantity and Function. You can edit this field directly.

> **Note:**
>
> Color shows valid expression.

e. **Range Function** button -- opens the **Set Range Function** dialog box. This applies currently specified Quantity and Function.

3. On the **Trace** tab **(Secondary Sweep)** line,select the sweep variable from the drop-down menu and specify all values or select values to plot along the theta-axis:

To select an Secondary sweep component that is different from the default, uncheck the Default field to enable the X field and **Browse** [...] button. Click **Browse** [...] to display the **Select X Component** dialog box. This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the dialog to assign the X component.

a. If sweeps are available, you can select **Browse** [...] to display a dialog that lets you select particular sweep or sweeps, or all sweeps.

b. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (for example, for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the **Families** tab with columns for the variable, the value, and an Edit column with an ellipsis [**...**] button. See Using Families tab for Reports.

4. On the **Trace** tab **(Primary Sweep)** line,select the sweep variable from the drop-down menu, and specify all values or select values to plot along the phi-axis:

To select an X component that is different from the default, uncheck the Default field to enable the X field and browse [...] button. Click **Browse** [...] to display the **Select X Component** dialog box. This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the dialog to assign the X component.

a. If sweeps are available, you can select **Browse** [...] to display a dialog that lets you select particular sweep or sweeps, or all sweeps.

b. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (for example, for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the **Families** tab with columns for the variable, the value, and an Edit column with an ellipsis [**...**] button. See Using Families tab for Reports.

5. Click **New Report.**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, (for example, S Parameter Plot *n* or rE Plot *n*). You can edit the plot names in the project tree and the plot header text in the report synchronizes.

The function of the selected quantity will be plotted against the values you specified on a polar plot. In addition, each circle on the plot is labeled with values of *R*, measuring normalized resistance, and each line is labeled with values of *X*, measuring normalized reactance. The plot is listed under **Results** in the project tree and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

6. Optionally, add another trace to the plot by following the procedure above, using **Add Trace rather than New Report**.

Creating Data Tables

A data table is a grid with rows and columns that displays, in numeric form, selected quantities against a swept variable or other quantities.

1. Click **Circuit**> **Results**> **Create *<type>* Report** or right-click **Results** in the Project Manager and click **Create *<type>* Report**.
2. In the **display type** menu, click **Data Table**.

   The *Report* dialog box appears.

3. In the **Context** section make selections from the following field or fields, depending on the design and solution type.
   a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
   b. Domain field with a drop down selection list. Whether this field appears, and the domains listed depend on the Solution type and the report ***<type>*** selected. For modal and terminal solution data reports, the domain can be **Sweep** or **Time**.

      Before you can examine the time domain, you must perform an Interpolating sweep for a driven solution (Modal or Terminal). If you select **Time**, the **TDR Options** button is enabled. Select it and follow the directions for time-domain plotting.

   c. Geometry field with a drop down selection list. For field and radiated field reports, this applies the quantity to a geometry or radiated field setup.
4. Under the **Trace** tab **Y** component section, select the quantity you are interested in and its associated function:
   a. On the **Category** drop-down menu, click the type of information to plot. The category selected provides the default name for the plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. On the **Quantity** list, click the values to plot. Use Ctrl+click to make multiple selections.
c. In the **Function** list, click the mathematical function to apply to the quantity for the plot.
d. The **Value** field displays the currently specified Quantity and Function. You can edit this field directly.

> **Note:**
>
> Color shows valid expression.

e. **Range Function** button -- opens the *Set Range Function* dialog box. This applies currently specified Quantity and Function.

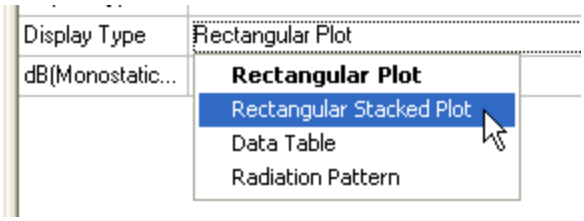
5. On the **Trace** tab **X (Primary sweep)** line, select the sweep variable from the drop-down menu and specify all values or select values.
6. Click **New Report**.

   This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, for example, S Parameter Plot *n* or Output Variables Plot *n*. You can edit the plot names in the project tree and the plot header text in the report synchronizes.

   The Y quantity will be listed at each variable value or additional quantity value you specified. The data table is listed under **Results** in the project tree. The plot is listed under **Results** in the project tree and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

You can also modify the display type of an existing plot from the Properties dialog for that plot. Select the Report icon in the Project tree to display the Properties dialog box. Selecting the Display Type field displays a menu with selections available for that plot.



Once you make a selection, the plot display updates for the current selection.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If you choose to print a data table:

- Selecting print "All" prints the whole table for current data page (if there is more than one data page).
- Selecting print "Pages" prints user-specified pages.
- If the table is bigger than the screen view (that is, it has scroll bar), printing first scrolls right, prints until no more scrolling and then scroll down.
- The Page number appears at the bottom of the page, aligned at center.
- The table layout of each page follows the screen, but with no scroll bar will be printed, and no data page bar as on screen.

Creating Radiation Patterns

A radiation pattern is a 2D polar plot displaying the intensity of near- or far-field radiation patterns. It is divided by the spherical coordinates R and theta, where R is the radius, or distance from the origin, and theta is the angle from the x-axis. Following is the general procedure for drawing a radiation pattern of results:

1. Click **HFSS>Results>Create Far Fields Report>Radiation Pattern**, or right-click the **Results** icon in the **Project tree** and click **Create Far Fields Report>Radiation Pattern**.

The **Report** dialog box appears, and a Radiation Pattern Plots icon appears under **Results** in the Project tree.

3. In the **Context** section make selections from the following field or fields, depending on the design and solution type.
    a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
4. In the **Trace** tab area, specify the Primary Sweep and Ang information to plot along the R-axis, or the axis measuring magnitude. The Primary Sweep field has a drop-down menu of current choices for Theta, Phi, and defined variables. Click the ellipsis button if you want to select from available values.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. In the **Ang**, if you want to change the default, uncheck to enable the field and ellipsis button.

   a. On the **Category** drop-down menu, click the type of information to plot. The selected category also provides the default plot name.
   b. On the **Quantity** list, click the values to plot. Use Ctrl+click to make multiple selections.
   c. In the **Function** list, click the mathematical function to apply to the quantity for the plot.
   d. The **Mag** field displays the currently specified Quantity and Function. You can edit this field directly.

> **Note:**
>
> Color shows valid expression.

   e. **Range Function** button -- opens the **Set Range Function** dialog box. This applies currently specified Quantity and Function.

5. The **Families** tab is helpful if you want to use the plot as an overlay and you need to restrict the Phi (default) or Theta values to make the plot appropriate for overlay. See Overlaying 2D Radiation Field Plots on Models.
6. Click **New Report.**

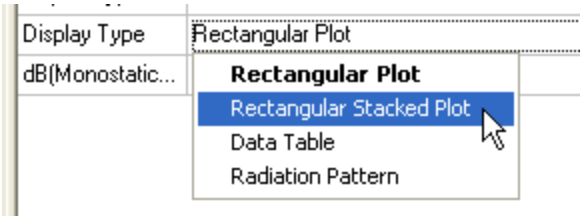
This creates a new report in Project tree, displays the report with the defined trace, and enables **Add Trace** on the **Report** dialog box. The default name is based on the Report Category you selected, for example, System Gain Plot *n* or Directivity Plot *n*. You can edit the plot names in the project tree and the plot header text in the report synchronizes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The function of the selected quantity or quantities will be plotted against the values you specified on a 2D polar plot. The plot is listed under **Results** in the project tree and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

You can also modify the display type of an existing plot from the Properties dialog for that plot. Select the Report icon in the Project tree to display the Properties dialog box. Selecting the Display Type field displays a menu with selections available for that plot.



Once you make a selection, the plot display updates for the current selection.

Delta Markers in 2D Reports

To view the difference between any two marker points in a report:

1. Set the first marker by clicking and holding the mouse button.
2. Move the mouse without releasing left button to another position, and then release the left button to create second marker.

In the marker text window, you see the difference between the two markers instead of the X, Y value of marker.

Plotting in the Time Domain

> **Note:** Time-Domain Reflectometry is supported for Circuit LNA designs only.

The idea behind Time-Domain Reflectometry (TDR) is to excite a structure with a step function, and inspect the reflections as a function of time. Before you can examine the time domain, you must perform an Interpolating sweep for a driven solution (Modal or Terminal or Transient). You can then select **Time** from the **Domain** list in the **Report** dialog box. You also need to specify the input signal, whether step or impulse.

With **Time** selected as the domain, you can select from several Categories and associated Quantities to plot, for example mag(S_{11}). When you plot in the Time domain, every frequency

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

domain quantity is first converted to the time-domain before the formula is evaluated. For example, if you type in

$S_{11} / (1 - S_{11})$

and plot it in the time domain the reporter will plot

$IFFT(S_{11} * input)/(IFFT(input)-IFFT(S_{11} * input))$

It will NOT plot

$IFFT(S_{11}/ (1 - S_{11}) * input)$

The two expressions are not equivalent.

If you select Time Domain Impedance as the Category, you can select the TDRZ quantity. This is defined as

$TDRZ(t)=Zref*(IFFT(input)+IFFT(S_{11} * input))/(IFFT(input)+IFFT(S_{11} * input))$

where "input" denotes the Fourier transform of the input signal (step or impulse) and "IFFT(.)" denotes the inverse FFT.

This equation is the instantaneous ratio of the time-domain voltage v(t) to the time-domain current i(t). That is because voltage and current are defined (in the frequency domain) in terms of the incident and reflected waves a and b, respectively, as

$V = sqrt(Zo) * (a + b) = sqrt(Zo) * (1 + S_{ii}) * a$

$I = 1/sqrt(Zo) * (a - b) = 1/sqrt(Zo) * (1 - S_{ii}) * a$

This lets the incident wave be the input step signal, and so when we take the inverse FFT of V and I, we get v(t) and i(t) in the time domain. Taking their ratio as a function of time then yields TDRZ(t). By default, Zo is equal to 50 Ohm. For frequency dependent Z_0, such as from an HFSS waveport, we recommend renormalizing to a constant Z_0, such as Z_0 = 50 ohms. This mimics the measurements techniques from which TDR was developed.

For HFSS, HFSS 3D or Layout Linear Network Analysis on Circuit, to create a plot in the **Time Domain**:

1. For a design with an existing sweep setup, follow steps 1 - 4 for creating a report for design.
2. In the **Report** dialog box, in the **Domain** list, click **Time**.

   This enables the **TDR Options** button and for terminal solution data reports includes the Terminal TDR Impedance in the Category list.

3. Click the **TDR Options button**.

   The **TDR Options** dialog box appears.

4. Select the input signal type, **Step** or **Impulse**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A **Step** describes a sustained change in the signal, whereas the **Impulse** is a brief excitation. **Impulse** is a very narrow rectangular pulse, with zero rise and fall time, width of 1 time step, and height of 1/(time step).

Selecting **Step** enables the **Rise Time** field, and **Impulse** disables it.

5. If you selected **Step**, enter the rise time of the pulse in the **Rise Time** text box.

The rise time should be appropriate for the frequency context.

With a band width from DC to f_{max}, the best time resolution that can be achieved is $1/(2f_{max})$.

A rise time of $1/(2f_{max})$ is the shortest rise time that can be resolved. However, a rise time of 0 s gives equally valuable information, so 0 is the default in this panel. See the example plot.

6. Enter the total time on the plot in the **Maximum Plot Time** text box.

The default maximum plot time in the **TDR Options** dialog is related to the delta frequency df in the frequency sweep: it is 1/2df, since that is the extent of time for which the IFFT gives information. This is often very long relative to the time delay that corresponds to the length of your device under test, so you may want to reduce this value. Alternatively, you can adjust the time axis of your TDR plot after it has been created.

7. Set the number of time points to plot in the **Delta Time** text box. By default, this is set to the number of points in the frequency sweep.

The delta time is based on the bandwidth of the sweep: with a frequency sweep from DC to f_{max}, the smallest time resolution you can obtain is given by $1/(2f_{max})$. The IFFT algorithm provides data points as a spacing of $1/(2f_{max})$, but you can smoothly interpolate between points by setting a finer resolution, e.g., $1/(10f_{max})$, at the expense of extra computation time.

8. Optionally, under **TDR Window**, modify the window type and width.
9. You can use the **Save as Default** to set the current values as a default, and the **Use Defaults** button to use previously saved options. Note that when you select a trace, the initial displayed values are those of the selected trace.
10. Click **OK**.

Optionally, to plot Terminal TDR impedance (that is, rather than calculate the S-parameter for waveport1 versus frequency, instead calculate the delay versus time at a particular impedance), do the following:

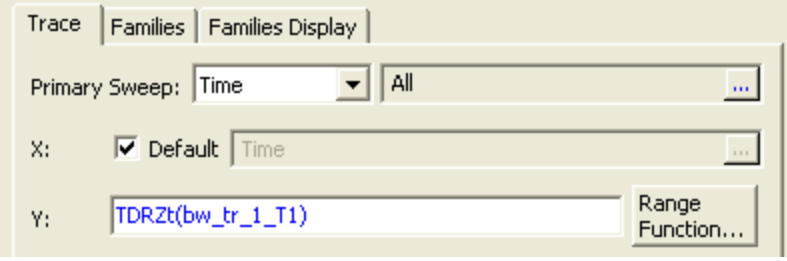
a. In the **Category** list, click **Terminal TDR Impedance**.
b. In the **Quantity** list, click a quantity to plot.

The default impedance (Zo) for the TDRZ quantity is 50 Ohms, unless you specified differently when you Set Renormalizing Impedance for Terminals when you created the terminals in the model. If you need a different impedance value, you can either edit the value in the **Report** dialog (as shown below), or you can create an Output Variable

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

representing Zo × $(1+S_{ii})/(1-S_{ii})$ with the Zo of your choice. To edit the Zo value in the **Report** dialog:

1. For the Category, select Terminal TDR Impedance, and the Port and Function of interest.



2. Edit the value by placing the cursor in the Value field.

   In this example, the value for Zo is changed from the default to 75 Ohms by typing ',Zo=75ohm' in the Y-column field.

   c. In the **Function** list, click the mathematical function of the quantity to plot.

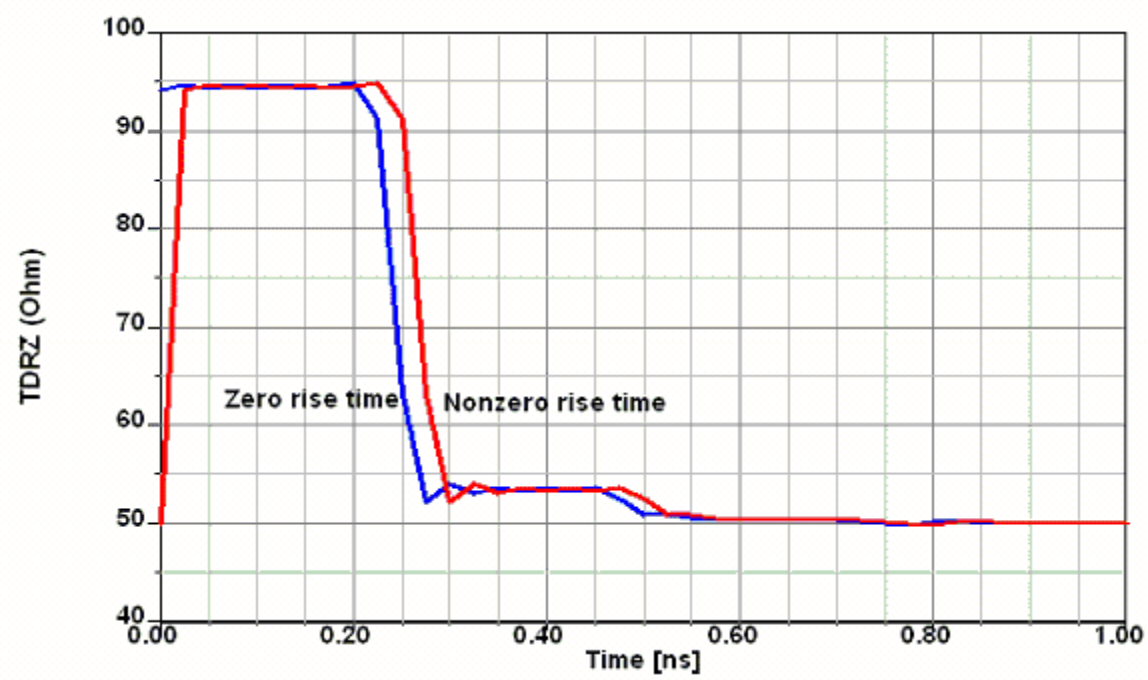
3. Click **Done**.

The report appears in the view window. It will be listed in the project tree.

If S_{11} = 0 at DC, the time-domain step response will settle to zero and the TDRZ step response settles to Zref. If S_{11} is nonzero at DC, the time-domain step response will settle to a nonzero value and TDRZ will settle to a value different from Zref. The time-domain impulse response will always settle to zero, since it can be seen as the derivative of the step response. The TDRZ impulse response will always settle to Zref.

The plot below shows the difference between a short nonzero rise time and zero rise time for a transmission line segment of 94 Ohm. Note that the trace with zero rise time starts at the correct line impedance while the other starts at the renormalizing impedance. Other than that, one trace is a shifted version of the other. The reason the plot with finite rise time starts at 50 ohms is that the time-domain voltage and current are still at their steady state values, so v = Zref * i. As the pulse arrives, the TDRZ response changes from the steady-state behavior because there's a reflection from the transmission line back to the exciting source, which has a different renormalizing impedance from the characteristic impedance of the transmission line.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Some things to keep in mind with TDR:

$$Spatial resolution \Delta x = c/(2B) \quad (1)$$

where c is the speed of light in the medium and B is the bandwidth of the signal. Since TDR is usually based on a frequency band that starts at DC, the spatial resolution becomes

$$\Delta x = c/(2F_{max}) \quad (2)$$

where F_{max} is the highest frequency in the frequency sweep. For example, if F_{max} = 15 GHz and the medium has ε_r=4, the spatial resolution will be (1.5E8 m/s)/(3E10 /s) = 5 mm.

A spatial resolution of c/(2F_{max}) corresponds to a resolution in time

$$\Delta t = 1/(2F_{max}) \quad (3)$$

Let N be the number of points in the IFFT. N equals the number of time samples, and it also equals twice the number of frequency samples. The density of frequency samples in the frequency sweep influences the total time T as follows:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$2F_{max}/(\Delta f) = N(\text{number of points in IFFT}) = T/\Delta t \quad (4)$$

So increasing the density of the frequency samples leads to an increase in total time T. In practical case, this often leads to a long tail in the TDR plot with little useful information. Therefore, the TDR Options interface lets you set the maximum plot time to a smaller value.

The TDR Options interface also lets you choose a smaller Δt than given by equation (3) above. When you choose a smaller Δt, you increase F_{max} by "zero padding" (adding zero values for S_{11} beyond the calculated frequency sweep). Whether this is justified depends on your judgment. It leads in practice to a smoother TDR signal.

HFSS also lets you set the rise time of your input signal. The rise time should be at least $1/(2F_{max})$. Even this rise time is a bit short for comfort, as it equals the duration of only one time sample. An input signal with a longer rise time has a smaller high-frequency content and will lead to reduced "ringing" in the TDR response.

A Hamming or Hann filter will also reduce the high-frequency content and tends to lead to a smoother TDR response. With these filters, one can select a width. A width of 100% is often a good choice.

TDR Windowing Functions

Windowing functions cause the FFT of the signal to have non-zero values away from ω. Each window function trades off the ability to resolve comparable signals and frequencies versus the ability to resolve signals of different strengths and frequencies. The window type list includes the following:

Window Function	Preferred Use
Rectangular	A low dynamic range function offering good resolution for signals of comparable strength. Poor when signals have very different amplitudes. $w(n)=1$. Bartlett	A high dynamic range function, with lower resolution, designed for wide band applications. $w(n) = a_0 - a_1\left\lvert\frac{n}{N-1} - \frac{1}{2}\right\rvert - a_2\cos\left(\frac{2\pi n}{N-1}\right)$

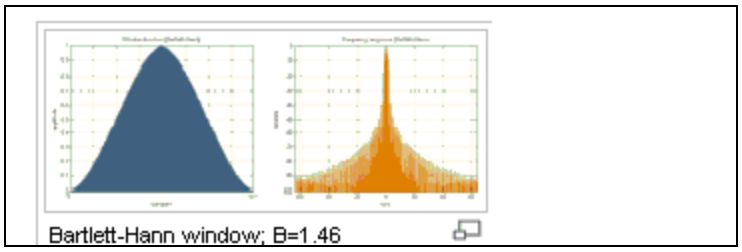
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

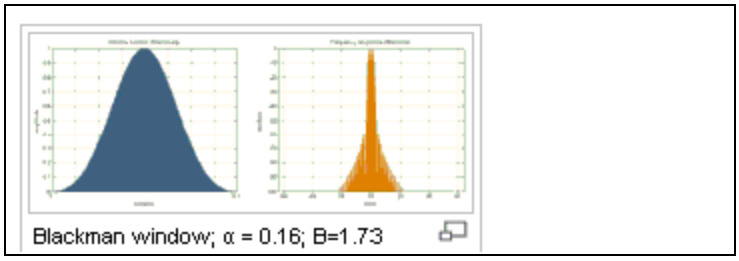
Window Function	Preferred Use
	where a_0=0.62; a_1=0.48; a_2=0.38



Blackman — A high dynamic range function, with lower resolution, designed for wide band applications.

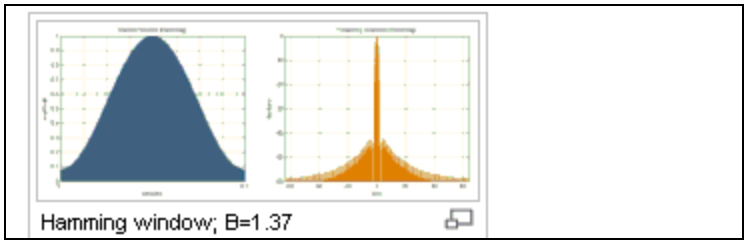
$$w(n) = a_0 - a_1 \cos\left(\frac{2\pi n}{N-1}\right) + a_2 \cos\left(\frac{4\pi n}{N-1}\right)$$

where a_0 =(1-α)/2; α_1=1/2; α_2=α/2



Hamming — A moderate dynamic range function, designed for narrow band applications. It minimizes the maximum sidelobe.

$$w(n) = 0.54 - 0.46\cos\left(\frac{2\pi n}{N-1}\right)$$



Hanning (default) — A moderate dynamic range function, designed for narrow band applications.

$$w(n) = 0.5\left(1 - \cos\frac{2\pi n}{N-1}\right)$$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Window Function	Preferred Use
	Kaiser	Selecting the Kaiser plot also enables a field to specify an associated Kaiser parameter. The larger the Kaiser parameter, the wider the window. The parameter controls the trade off between width of the central lobe and the area of the side lobes.  Welch	This approach applies a parabola-shaped window to the frequency domain data. It is based on the Bartlett method but splits the signal into overlapping segments, which are then windowed. The intent is to balance the influence of data in the center of the function.

You can use the **Save as Default** to set the current values as a default.

Working with Traces

A trace in a 2D or 3D report defines one or more curves on a graph. A trace in a data table defines part of the displayed matrix of text values.

The values used for a plot's axes (which may be X, Y, Z, phi, theta, or R depending on the display type) can be variables in the design, such as frequency, or functions and expressions based on the design's solutions. If you have solved one or more variables at several values, you can "sweep" over some or all of those values, resulting in a curve in 2D or 3D space.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A report can include any number of traces and, for rectangular graphs, up to 20 independent y-axes. Traces appear in the Project tree under their report. They can be selected, copied and pasted.

When you move a cursor over a trace in a report, the cursor changes to show that you can make a selection:

- For PC systems, the cursor changes to the color of the selectable trace.
- For Linux systems, the cursor changes to a solid black arrow, rather than the default black outline.

In general, to add a trace to a report:

1. Select a report in the Project window and right-click and select **Modify Report**.
2. In the *Report* dialog box, specify the Y component information.
    a. Specify the Category of information you want to plot from the drop-down menu.

       The Category drop-down menu lists the available categories for the Solution type and the current design. Selecting a category changes the Quantity and Function lists to represent what is available for that category.

    b. Specify the Quantity you want to plot by selecting from the Quantity list.

       The selected quantity appears in the Value field, operated on any selected function.

    c. Select the Function to apply to the specified quantity.
    d. The Value field shows the trace being readied for plotting on the Y-axis. This field is editable when the text cursor is present. You can modify the information to be plotted by typing the name of the quantity or sweep variable to plot along an axis directly in the text boxes.

       > **Note:**
       >
       > Color shows valid expression.

    e. **Range Function** button -- opens the *Set Range Function* dialog box. This applies the currently specified Quantity and Function.
3. In the *Report* dialog box, specify the X axis information (for example Primary Sweep).
4. Click **Add Trace**.

   A trace is added to the traces list under its report icon in the Project tree. The trace represents the function of the quantity you selected and will be plotted against other quantities or swept variable values. Selecting a Trace in the Project tree displays the Properties window for that Trace. Selecting a trace in the report or legend displays the display Properties window for that trace.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Trace icons can be selected, copied, and pasted for their definitions or their data. They can be selected and deleted from the Project Manager.

By the default, the Trace name is the definition (the category, quantity and function). The trace will be visible in the report when you click **Add Trace**.

Trace properties can be edited directly in the respective Properties windows or edited in the *Report* dialog box. To change the name or definition of a trace, see Editing Trace Properties. To edit other display properties of a trace, see Editing the Display Properties of Traces

Editing Trace Properties

To edit trace properties such as the name, Y Axis association, the component definition, the context, or the variables select the trace in the Project tree.

To edit a **trace name**:

1. Select the trace in the Project Manager.

   This displays a docked Properties window for the Trace.

2. Check the Specify Name box.

   This enables editing of either the Name field in the docked properties dialog box, or the Trace label text in the Project tree. Editing this name changes the display in the Legend and in the Project tree, but not the underlying Y-component definition.

> **Note:**
>
> To control the display of the Solution Name and Variation Key in the Legend, see Report 2D: Legend Tab.

To edit the Y Axis associated with the trace (2D Rectangular and Rectangular Contour plots):

1. Select the trace in the Project Manager.
2. In the docked properties window for the trace, select the Y Axis to be associated with the trace from the drop-down menu. Up to twenty independent Y axes can be added to a plot.

To edit a **trace component definition**:

1. Select the trace in the Project Manager.
2. In the docked Properties window for the trace, select the component field of interest, and select **Edit...** from the drop-down menu.

   This displays the edit Component field window from which you can edit the category, quantity and function.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Click **OK** to apply the changes and close the dialog box.

To edit a **trace Context**:

1. Select the trace in the Project Manager to display the docked properties window.
2. In properties window, click the **Solution** field or the **Domain** field. If other selections are possible, they can be selected from the drop-down menu.

To edit a **variable** for a trace:

1. Select the trace in the Project Manager to display the docked properties window.
2. Under the **Variables** category, on the Families line, click the **Edit** button to display the Edit families dialog box.

   From this dialog box, you can select the **Sweeps** or **Variations** radio buttons. If other nominal values are available you can click the ellipsis button to select from a list.

Editing the Display Properties of Traces

Editing the display properties of traces differs for 2D and 3D reports. To edit the display properties of a trace for a 2D report:

1. Select a trace in an open **Report** window.
2. Click once on the trace to view settings in the docked *Properties* window, or double-click to open *Properties* dialog box.

   The display properties window for a 2D trace includes a **General** tab and an **Attributes** tab.

   The *General* tab properties apply to the general appearance of the plot. They include the Background color, Contrast color, Field width, and Whether to use Scientific notation for marker and delta marker displays. (X and Y notation display is set separately, in the Axis property tabs.)

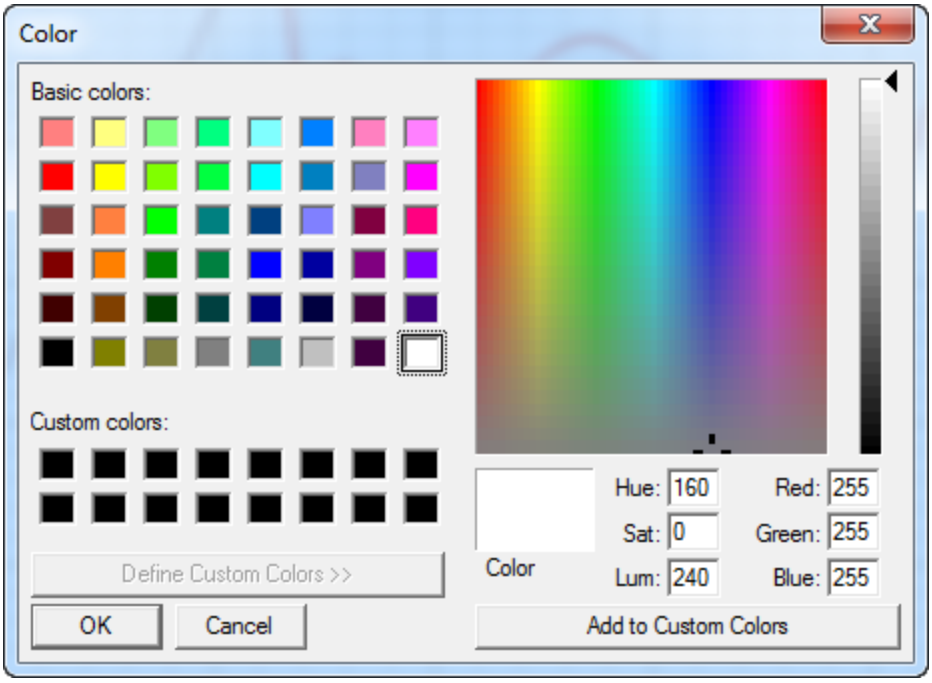
   The *Attributes* tab properties apply specifically to the trace. The defaults are set in the Report2D options. They include:

   - Name -- not editable by selecting the trace from the Report. It shows the characteristics of the trace as defined in the *Report* dialog box.

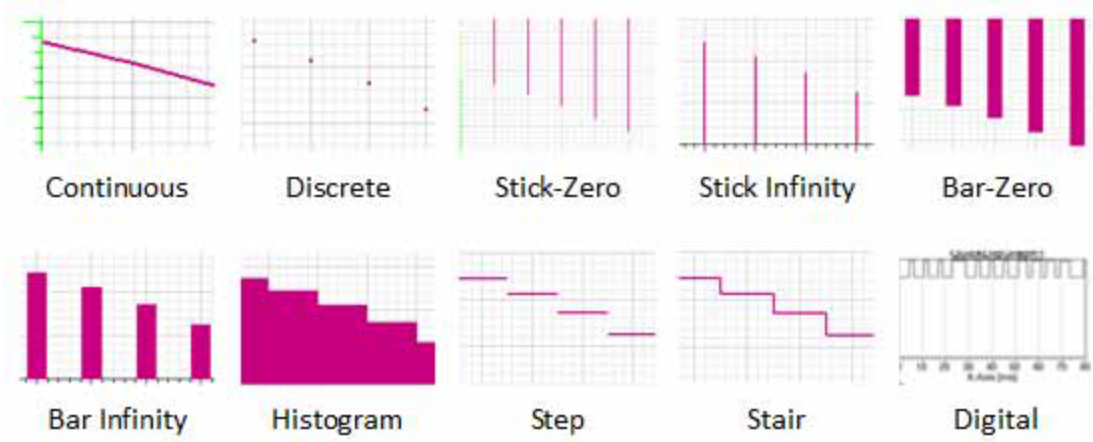
     To edit a trace name, see Editing Trace Properties.

   - Color -- shows the Trace color. Double-click to open a Color dialog box. You can select from Basic colors, or custom colors. You can define up to 16 custom colors by selecting or by editing the values for Hue, Saturation, Luminescence, and the Red, Green, and Blue.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



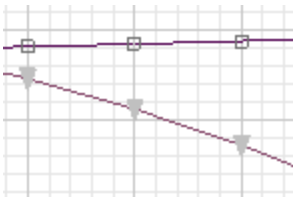
- Line style -- a drop-down menu lets you select Solid, Dot, Dash, or Dot-dash.
- Line width -- a text field lets you edit the numeric value.
- Trace type -- the drop-down menu contains entries for Continuous, Discrete, Bar-Zero, Bar Infinity, Stick Zero, Stick Infinity, Histogram, Step, and Stair.



Notice the difference between Stair and Digital is that each Stair centers on a data point with transitions halfway between points, and Digital transitions from each data point to the next value.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The next four properties work together to define whether to show a symbol on data points, the symbol frequency, the symbol style, and whether to display the symbol as solid or hollow.



- Show Symbol -- whether to show a symbol at the data points on the line.
- Symbol Frequency -- how often to show symbols on the trace, based on the number of data points per symbol used. For example, specify 1 for one symbol per data point. Specify 10 for one symbol for every 10 data points.
- Symbol Style -- use a drop-down menu to select from box, circle, vertical ellipse, horizontal ellipse, vertical up triangle, vertical down triangle, horizontal left triangle, horizontal right triangle.
- Fill Symbol -- use the check box to set the symbol display as a solid or as hollow.
- Symbol Arrows -- use the check box to use arrows on the curve ends.

> **Note:**
>
> So that curves with single points always appear, Box is the default symbol.

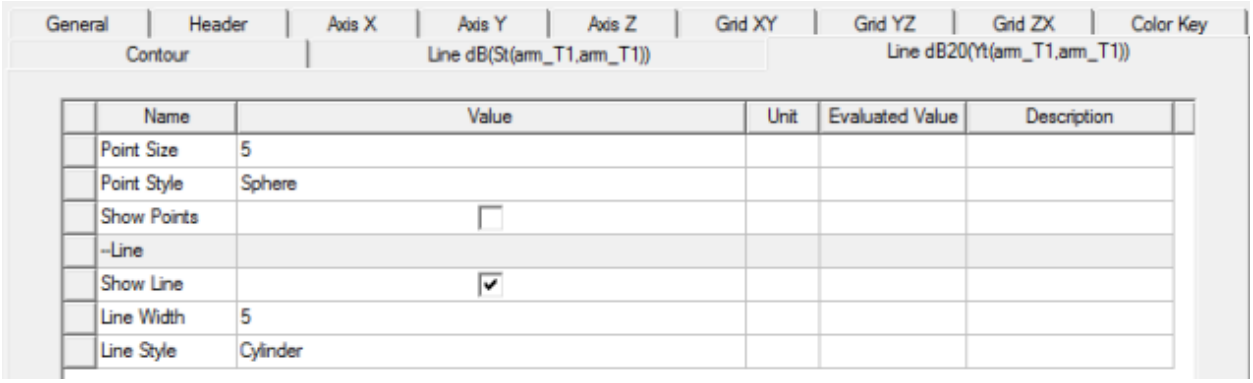
3. Edit the properties, if needed. Click OK to apply the changes and close the window.

To edit the display properties of a trace in a 3D report:

1. Click on the trace. This opens a Properties dialog for the plot with a tab named for the trace selected.
2. The editable properties include Point size, Point Style, whether to show points, whether to

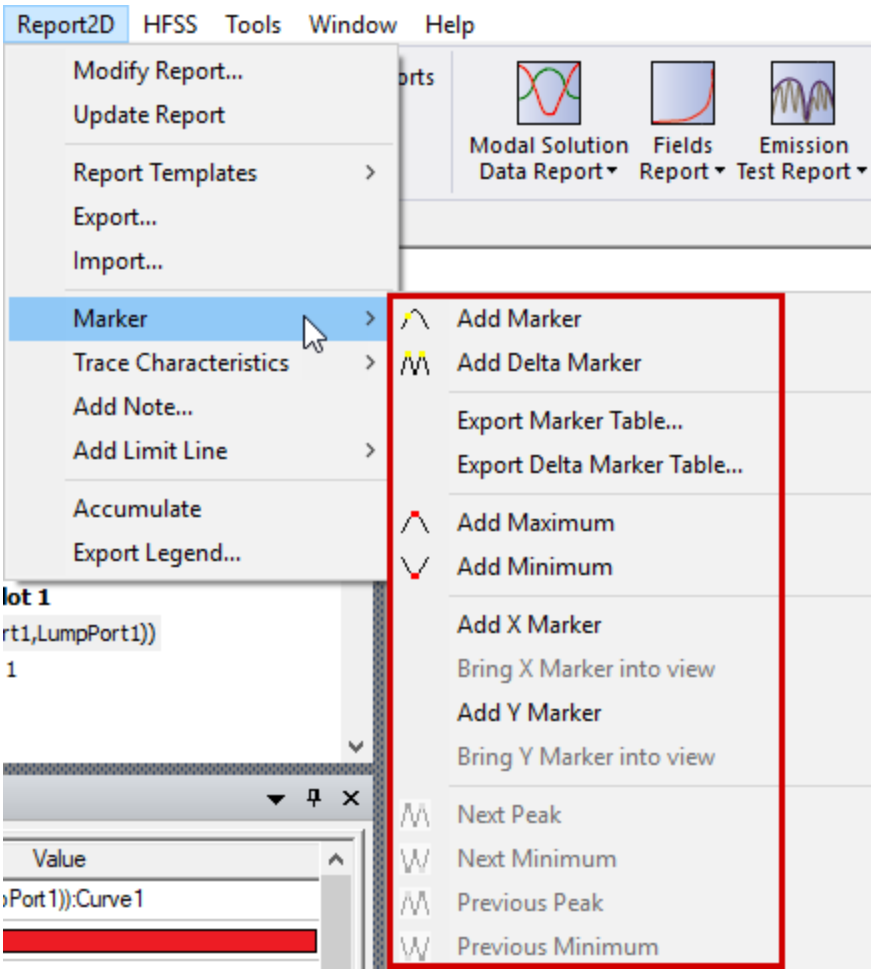
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

show line, line width, and line style.



Adding Data Markers to Traces

The Reporter includes **Report 2D** > **Marker** > menu commands and icons:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can also access these commands from the shortcut menu that appears when you right-click inside a report plot window.

These command let you add markers to traces. A marker appears as "m*N*" at the marked point, where *N* increments from 1 as you place additional markers. Each marker can be selected and has editable properties including name, font, background and color. As you place markers, one or more marker legends may be displayed, depending on the **View** > **Active View Visibility** settings for the legends. The main marker legend appears in the upper left of the plot, and lists the marker names and their X and Y values in a table. You can control the number format for the table values via the properties window, general tab. Under *Marker/Other Number Format*, you can specify field width, precision, and whether to use scientific notation. This value is independent of the Axis tab number properties. A separate marker legend appears for Delta Markers, as described for the **Delta Marker** command.

When you enter Marker mode, the cursor arrow is accompanied by an "m" while a circle on the selected trace shows the current position for a potential marker.

To end Marker mode, right-click to display the shortcut menu, and select **End Marker Mode**.

The available Marker mode commands and associated icons are the following:

- **Marker** – this command lets you place a marker at an arbitrary point on a selected trace.
- **X Marker** – this command adds up to 10 movable markers at the origin of the plot with a vertical line rising from the X axis. Each added marker has its own color and editable properties. To move an X marker, click on the X label and drag it to the desired location. The label at the bottom of the line gives the X coordinate, and flag on the vertical line identifies the Y coordinate on the trace. A trace property lets you lock the drag feature to leave the marker in place. The X markers are cleared by the **Clear All** command.
- **Bring X Marker into view** – this command is enabled if an X Marker is not visible in the plot. It allows you to select from a list of existing X Markers to bring into view.
- **Y Marker** – this commands adds up to 10 Y Markers with a horizontal line extending from the Y axis. For more detail on Y Markers and their use, see Y Markers in stacked XY plots.
- **Bring Y Marker into view** – this command is enabled if a Y Marker is not visible in the plot. It allows you to select from a list of existing Y Markers to bring into view.
- **Maximum** – places a marker at the Maximum value on the selected trace.
- **Minimum** – places a marker at the Minimum value on the selected trace.
- **Delta Marker** – enters delta marker mode, placing a circle on the selected trace. Clicking on the trace sets an initial point and subsequent clicks on arbitrary points on the trace place additional markers until you leave marker mode. These markers have their own legend, which includes the following information for each pair of markers specified:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name	Delta(X)	Delta(Y)	Slope(Y)	InvSlope(Y)
d(m2,m3)	0.4700	1.8319	3.8976	0.2566

- **Next Peak** – moves a selected marker on the next peak on a trace. You must exit marker mode and select a marker to enable this command.
- **Next Minimum** – moves a selected marker to the next minimum on a selected trace. You must exit marker mode and select a marker to enable this command.
- **Previous Peak** – moves a selected marker on the previous peak on a selected trace. You must exit marker mode and select a marker to enable this command.
- **Previous Minimum** – places a marker on the previous minimum on a selected trace. You must exit marker mode and select a marker to enable this command.
- **Go to Start** (Right arrow) – moves a selected trace marker to the first data point. Enabled by leaving marker mode and selecting a marker.
- **Go to Previous** (Left arrow) – moves a selected trace marker to the previous data point.
- **Go to Next** – moves a selected trace marker to the next data point.
- **Go to End** – moves a selected trace marker to the last data point.
- **Next Curve** – selects the next curve in the report, based on the order in the trace legend.
- **Previous Curve** – selects the previous curve in the report, based on the order in the trace legend.
- **Clear All** – clears all markers on a report.

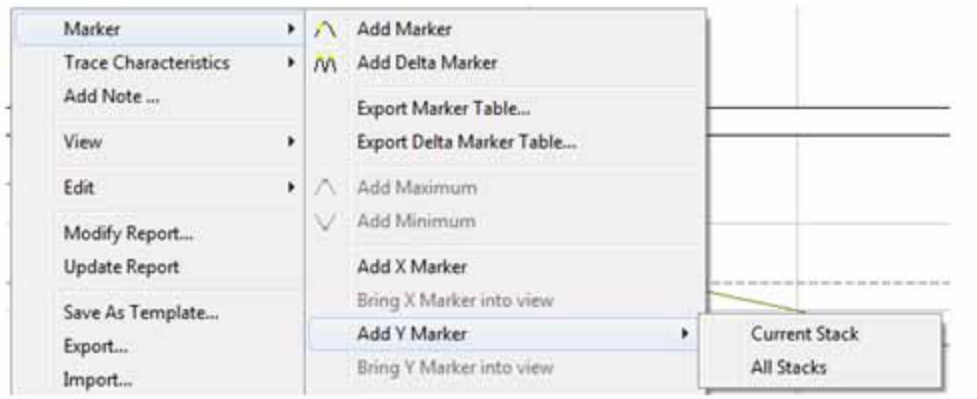
Y Markers in Stacked XY Plots

Y Markers allows for easy analysis and comparison of curves at a particular y-coordinate. Y Markers can be used to compare stacked curves.

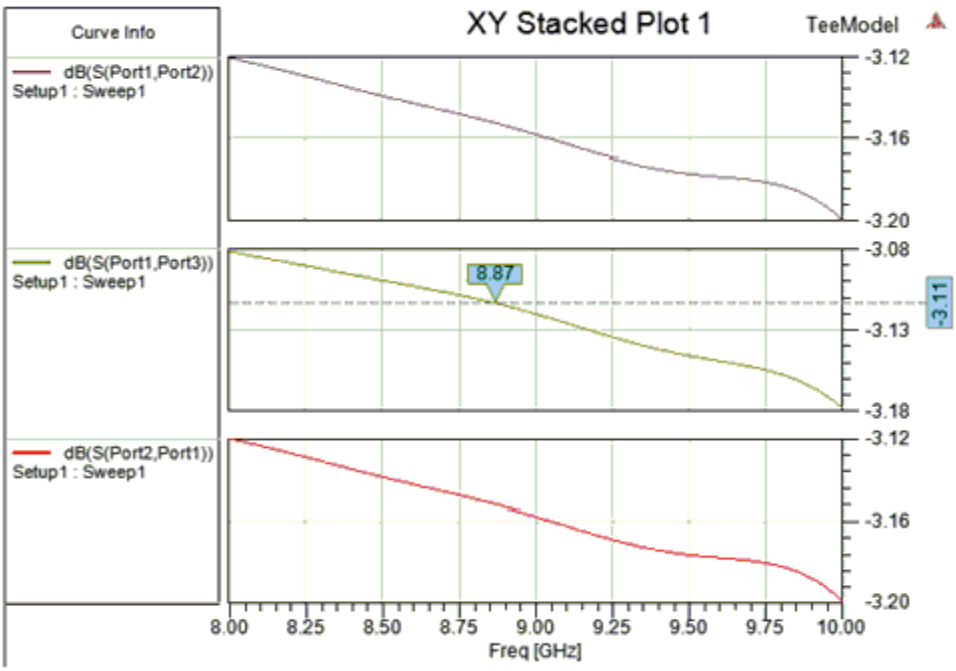
Creating Y Markers in Stacked Plots

There are two ways to create Y Markers in Stacked Plots. You can create a Y Marker for a particular stack or for all stacks. Right-clicking on any stack shows the following shortcut menu:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

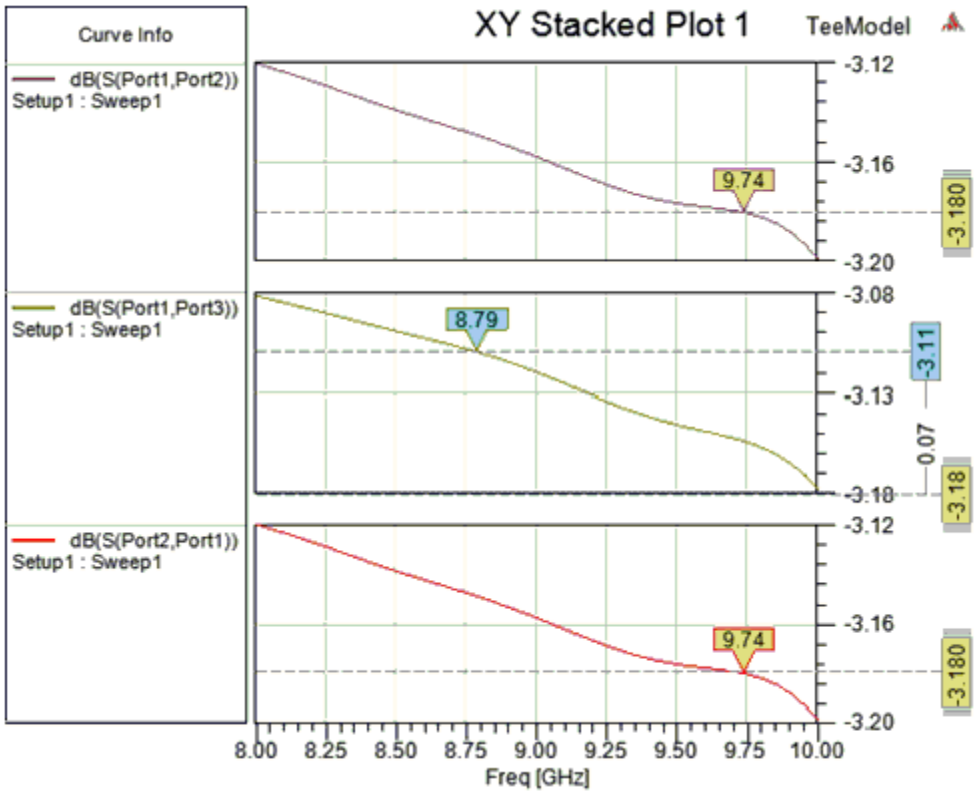


Add Y Marker > **Current Stack** creates a Y marker for the stack on which user performed right mouse button click. The following figure shows that a Y Marker was added to second stack only:



Add Y Marker > **All Stacks** creates one Y marker in each stack with same value. Initially this value is the minimum Y value of the Y ranges in all the stacks. This is shown is figure below:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

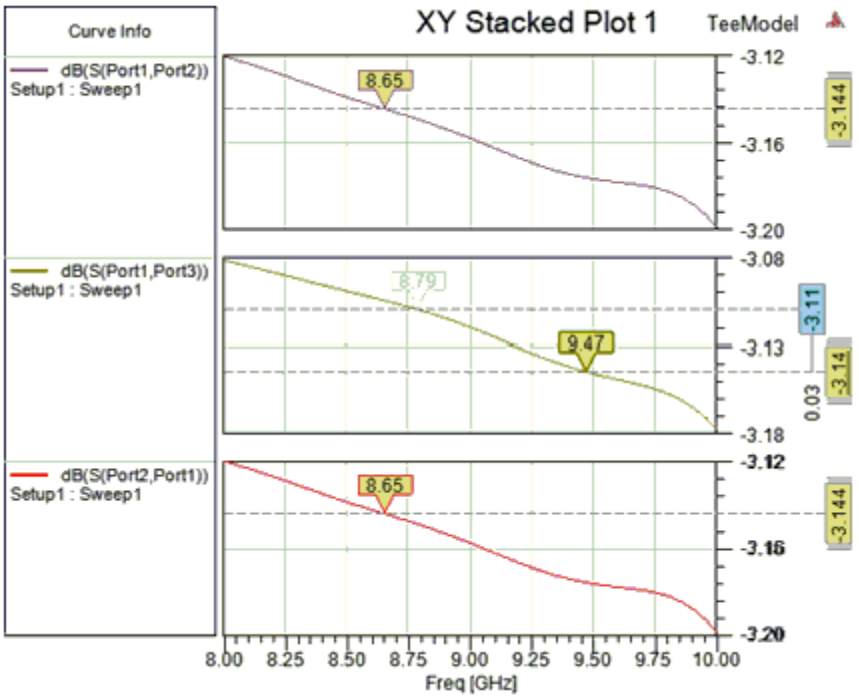


Notice that the Y Marker for All Stacks has a different appearance than the Y Marker for a particular stack, that is, it has double parallel lines above and below the Y Marker textbox.

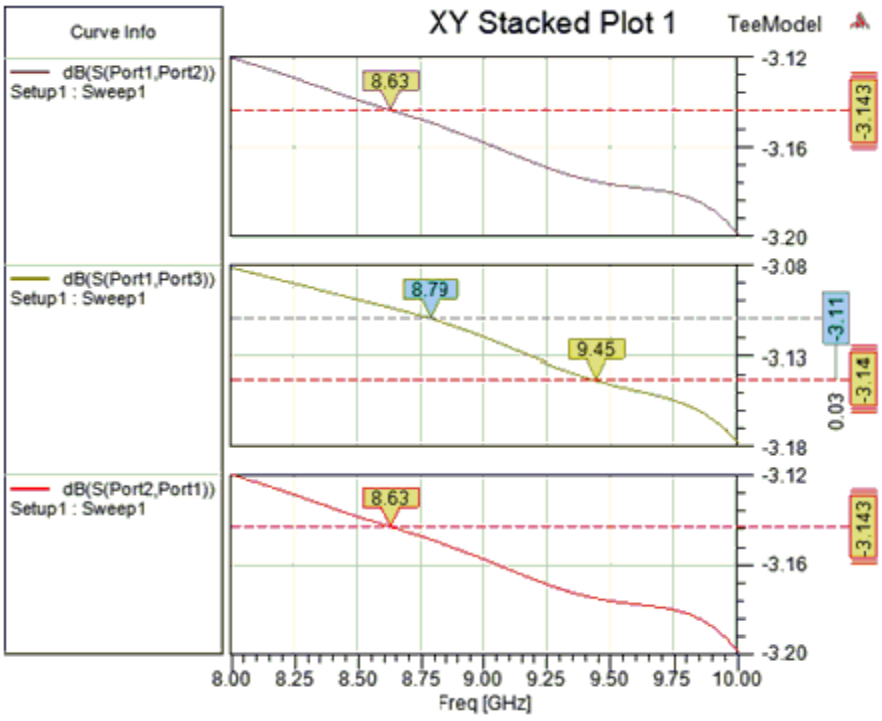
Synchronized Y Markers

All the "same" Y markers for all stacks are synchronized, that is to say that if one Y marker is dragged or it's value is changed, all the "same" Y markers in all the stacks will change their position too. The following figure shows that when Y marker in bottom stack was dragged, Y marker in top stacks moved as well:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



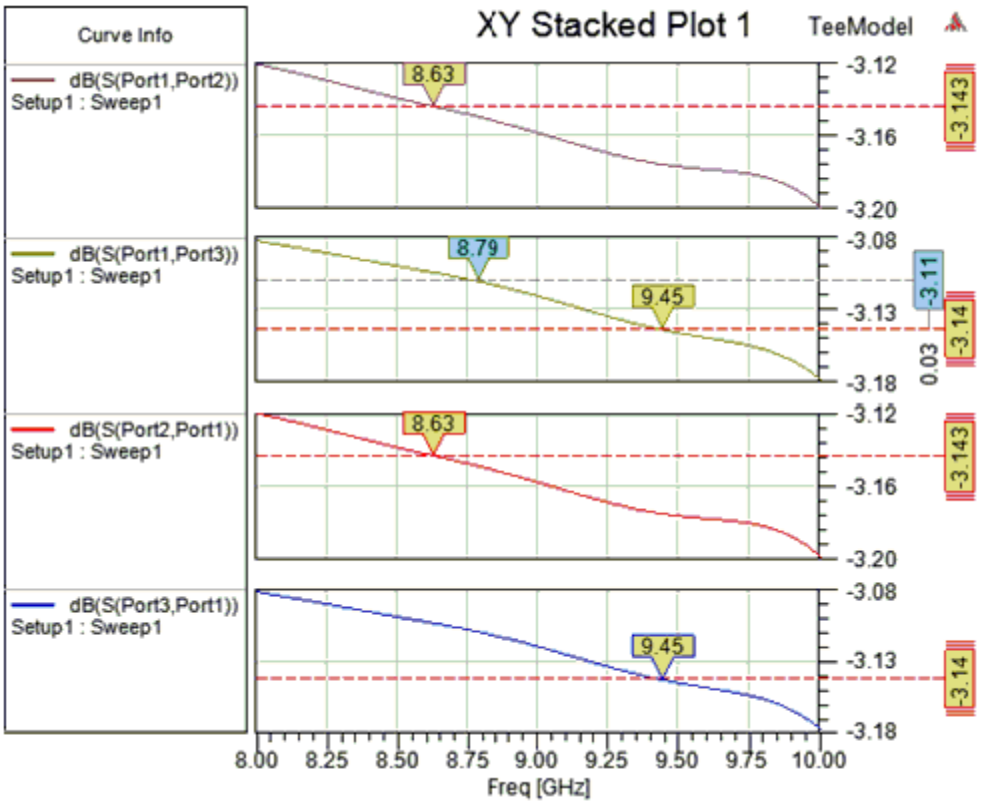
Also if a property of any one Y Marker is changed, all the "same" Y Markers show the change in property as well. For example the following figure shows that when the line color of a Y Marker in the top stack was changed to red color, a Y Marker in bottom stack show the same line color as well:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Automatic Y Markers for the New Stack

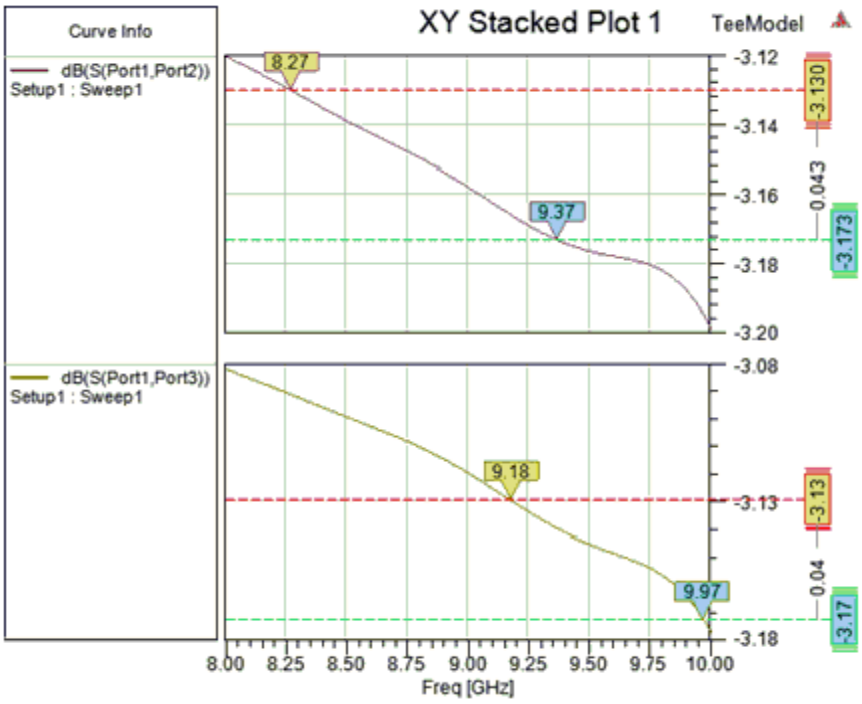
When a new curve is added to the plot, it gets all the Y Markers for all stacks in other stacks, excluding the Y Marker for particular stacks. The following figure shows that when the new curve "dB(S(Port3, Port1)" was added, a Y Marker was added to it with value -3.14 and it has all the same properties as other "same" Y Markers in other stacks:



Y Marker Delta Annotations

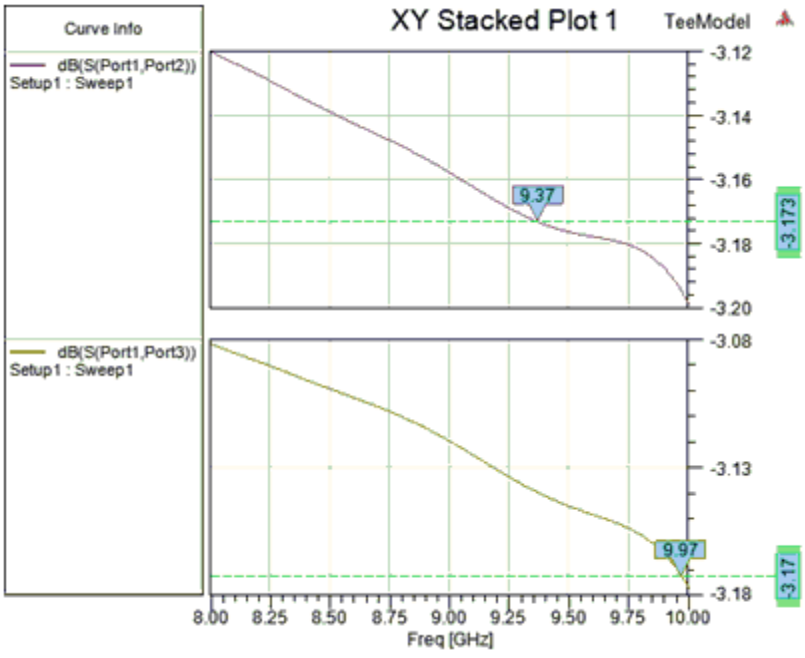
When two more Y Markers are present in a Stacked Eye Diagram, then delta annotations are shown between a pair of adjacent Y Markers in all the stacks, as shown in figure below:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Deleting a Y Marker

To delete a Y Marker, select a Y Marker in any stack and press the Delete key. This action will also delete all the corresponding Y Markers in all the stacks. For example, when the Y Marker with value -3.13 (red Y Marker) was deleted from the bottom most stack, all of the corresponding Y Markers were also deleted:

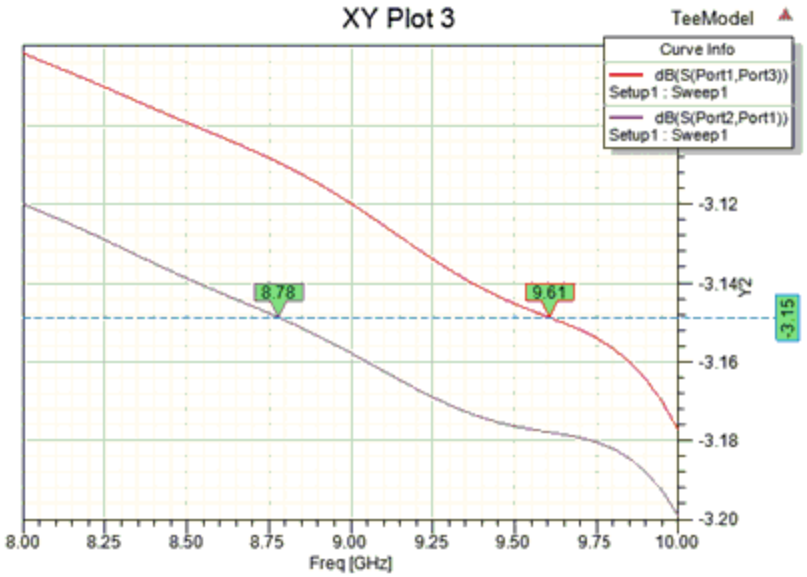


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

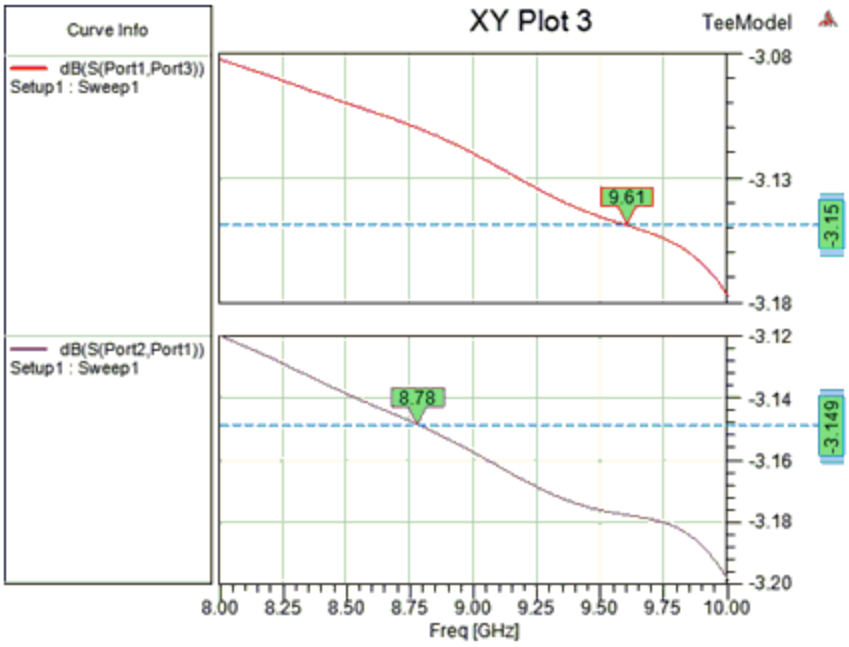
Note that on deleting a stack, Y Markers in other stacks are not affected.

Converting Rectangular XY Plot to Rectangular Stacked XY Plot

The following figure shows a Rectangular XY Plot with two curves and a Y Marker with value -3.15 (blue Y Marker):



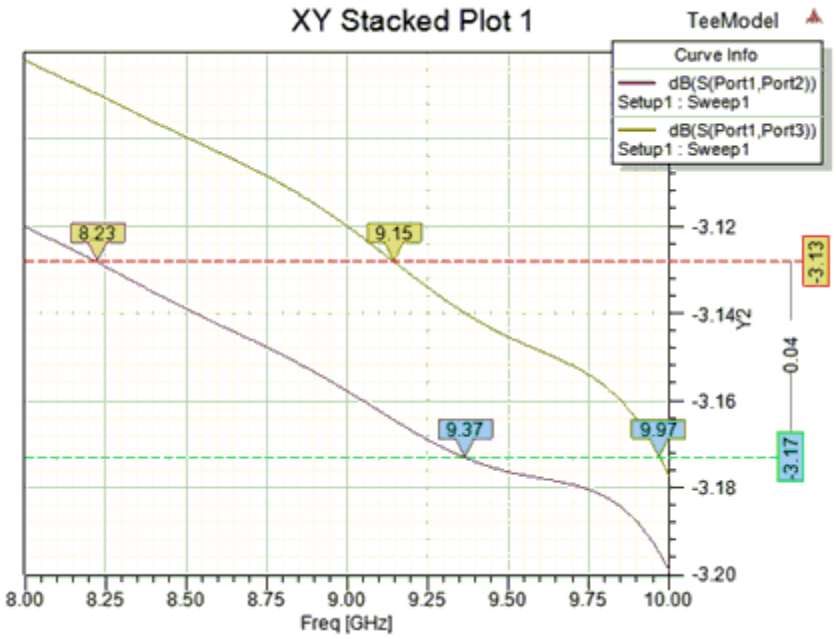
If you change the Display Type property of this plot to Rectangular Stacked Plot then a Rectangular Stacked XY Plot is created with each curve in its own stack and a Y Marker is shown in each stack with value -3.15 (blue Y Marker):



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Similarly when you change a Rectangular Stacked XY Plot to a Rectangular XY Plot then all the "same" Y Markers in all the stacks are shown as a single Y Marker in Rectangular XY Plot as shown in following figures:

The Rectangular Stacked XY Plot in the previous figure, when converted to Rectangular XY Plot, looks like the following figure:



Discarding Report Values Below a Specified Threshold

To prevent real small numbers from skewing a plot, you can discard small values (below a specifiable threshold).

1. Double-click the X or Y axis of interest on an open plot display.

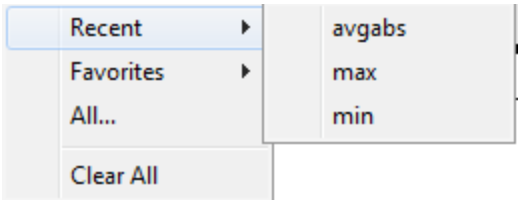
   This opens the **Properties** window for the Axis.

2. Under the **Axis** tab, use the scroll bar to find the **Specify Discard Values** property.
3. Click the check box to enable the property.
4. Enter a value in the **Discard Below** field. Units specified elsewhere in the Axis property are applied to this value. The Discard Below text box is inactive if the Specify Discard Values check box is not enabled.
5. Click **OK** to apply the Discard Values to the report.

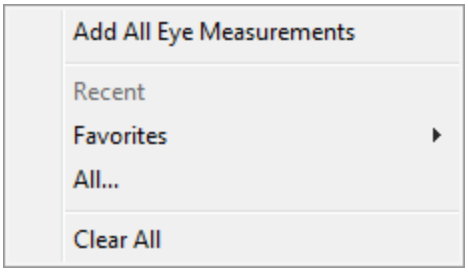
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Adding Characteristics to a Trace

There are several options for adding characteristics to a trace. When you click **Report2D** > **Trace Characteristics**, or right-click a selected trace, the shortcut menu is displayed. The following example shows the menu with expanded **Recent** selections.



The following shows the shortcut menu for Eye Measurements, which includes the **Add All Eye Measurements** option. You can use this option to add all eye measurements at once.



Adding a Recently Used Trace Characteristic

If you recently used a characteristic, you can add it to a selected trace by selecting from a list of recently used characteristics. A maximum of 10 is displayed in the menu, and they are sorted alphabetically.

To add a recently used characteristic to a selected trace:

1. Select a trace in a report plot or legend.
2. Click **Report2D** > **Trace Characteristics**, or right-click the selected trace to display the shortcut menu.
3. Select **Recent**, and then select the function you want. The specified characteristic is added to the trace.

Adding a Trace Characteristic from Favorites

You can add a trace characteristic to a selected trace by selecting from a list of favorites. A maximum of 10 is displayed in the menu, and they are sorted alphabetically.

To add a favorite characteristic to a selected trace:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select a trace in a report plot or legend.
2. Click **Report2D** > **Trace Characteristics**, or right-click the selected trace to display the shortcut menu.
3. Select **Favorites** and then select the function you want. The specified characteristic is added to the trace.

Adding Trace Characteristics to your Favorites

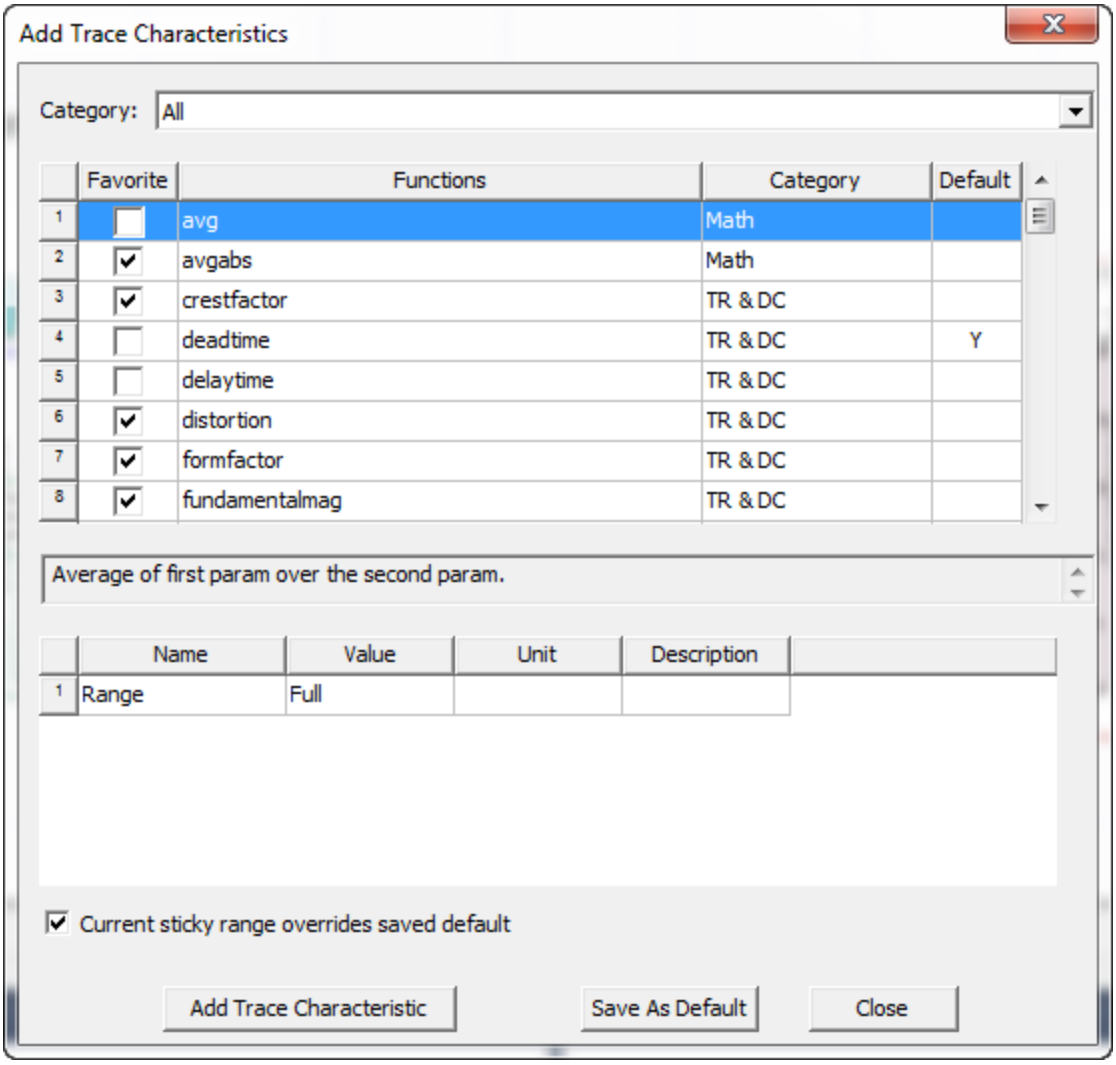
You can add trace characteristics to your list of favorites.

To add characteristics to your list of favorites:

1. Select a trace in a report plot or legend.
2. Click **Report2D** > **Trace Characteristics** or right-click the selected trace to display the shortcut menu.
3. Select **All**.

   The *Add Trace Characteristics* dialog box displays.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Click the **Favorite** check box in front of any function you want to add to your Favorites. You can define as many favorites as you need, but no more than ten are displayed in the menu, and they are displayed in alphabetical order.
5. Click **Close**. You can view the current favorites by selecting Favorites in the Category drop-down menu.

> **Note:**
>
> You can remove favorites by clearing the **Favorite** check box for one or more functions, and clicking **Close**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

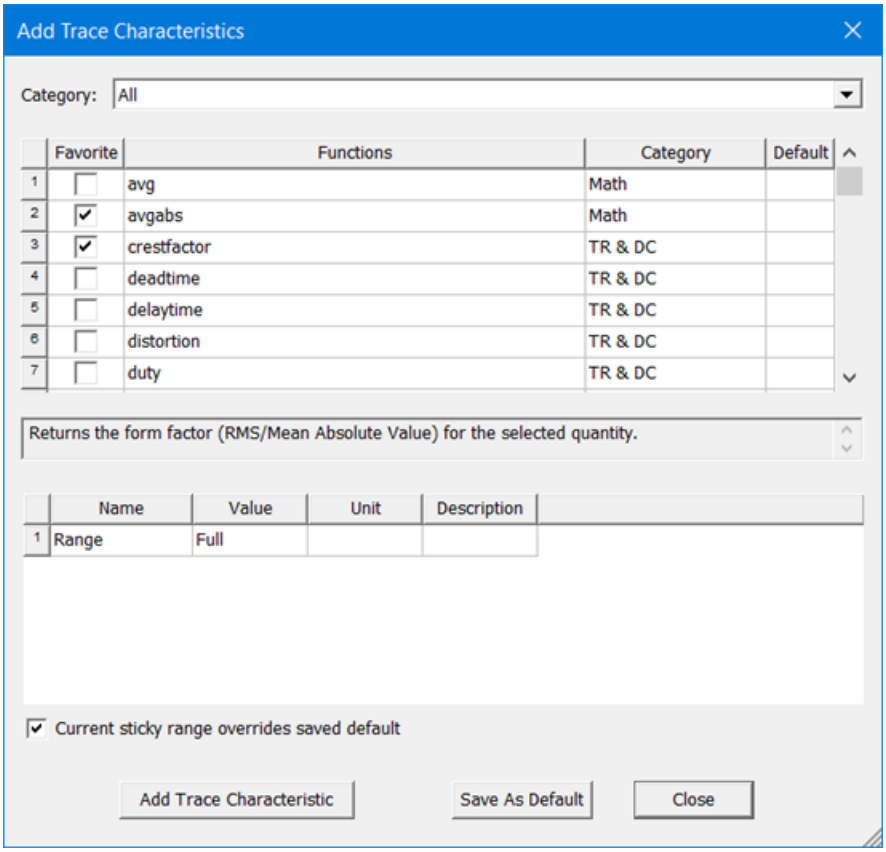
Adding Characteristics Using the Add Trace Characteristics Window

You can add characteristics to a selected trace by selecting from the **Add Trace Characteristics** window.

To add additional characteristics to a selected trace:

1. Select a trace in a report plot or legend.
2. Click **Report2D** > **Trace Characteristics**, or right-click the selected trace to display the short cut menu.
3. Select **All**.

   The **Add Trace Characteristics** window displays:



4. Select the desired **Category**.

   The available categories depend on the plot, and the selecting of a category displays its associated functions.

> **Note: Categories** and **Functions** only appear if they are available for that plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Category	Functions
Recent	Displays the most recent functions used, sorted by the time they were added.
Favorites	Displays all favorites. The defaults are avg, max, min, and pk2pk.
All	Displays all available functions.
Math	avg, avgabs, integ, integabs, max, mean, min, pk2pk, pkavg, ripple, rms, rmsAC, stddev, sum, variance, XatYMax, XatYMin, XatYVal, XWidthAtYVal, YatXMax, YatXMin, YatXVal
PulseWidth	pulsefall9010, pulsefront1090, pulsefront3090, pulsemax, pulsemaxtime, pulsemin, pulsemintime, pulsetail50, pulsewidth5050, pw_minus, pw_minus_avg, pw_minus_max, pw_minus_min, pw_minus_rms, pw_plus, pw_plus_avg, pw_plus_max, pw_plus_min, pw_plus_rms
Overshoot/ Undershoot	overshoot, overshootAbs, undershoot, undershootAbs
TR & DC	crestfactor, deadtime, delaytime, distortion, formfactor, fundamentalmag, risetime, settlingtime
Error	iae, ise, itae, itse
Period	per, pmax, pmin, prms
AC	gainmargin, phasemargin, gaincrossover, phasecrossover, lowercutoff, uppercutoff, bandwidth, peakgain, peakgainfreq
Radiation	lSidelobeY, rSidelobeY, lSidelobeX, rSidelobeX, xdb10Beamwidth, xdb20Beamwidth
Eye Measurements	EyeLevelZero, EyeLevelOne, EyeAmplitude, EyeHeight, EyeSignalToNoise, EyeOpeningFactor, EyeWidth, EyeJitterP2P, EyeJitterRMS, EyeRiseTime, EyeFallTime, MinEyeWidth, MinEyeHeight
TDR	Shunt_C_in_pF, Series_L_in_nH

For a selected function, the *Add Trace Characteristics* dialog box displays the function's purpose in a text field.

5. Some categories and functions call for you to specify one or two additional values in a table. You can save these values using the **Save as Default** button. The Default column shows a Y if there is a saved default value for the function.
6. Select the **Current sticky range overrides saved default** check box if you do not want the range value in the table to be changed when the function selection is changed: the current range value becomes the "sticky range." If the check box is not checked, the range value is updated from the saved default values and becomes a new sticky range.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. Click the **AddTrace Characteristic** button to add the specified characteristics to the trace.
8. Click **Close**.

Removing All Trace Characteristics

1. Select a trace in a report plot or legend.
2. Click **Report2D** > **Trace Characteristics** or right-click the selected trace to display the shortcut menu.
3. Select **Trace Characteristics** > **Clear All**.

Trace characteristics are cleared from the selected trace.

Removing Traces

You can remove traces from the traces list in the following ways:

To *remove one trace* from the report:

- Select the trace you want to remove from the Project tree, and then click **Delete**.

To *remove all traces* from the report:

- Select all the traces and click **Delete**.

Copy and Paste of Report and Trace Definitions

You can copy and paste report and individual trace definitions within a single design or across designs. The report or trace definition will be evaluated within the context of the target design or report.

> **Note:**
>
> - If the report or trace definition contains properties that do not exist in the target design (for example, a port name) an error will be posted that indicates a solution does not exist for this trace
> - You must copy and paste trace definitions between the same report types. For example, you cannot copy a trace from a Modal Solution Data report and paste it in a Far Fields report.

To copy a Report Definition:

Right-click the report name in the Project Manager and select **Copy Definition** from the shortcut menu.

To paste the Report Definition:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Right-click Results in the Project Manager of the target design and select **Paste**.

A new report is created and it contains the copied definitions.

To copy an individual Trace Definition(s):

Right-click the trace or traces under a report name in the project tree and select **Copy Definition**.

To paste the Trace Definition(s):

Right-click the report in the target design to which you would like to copy the trace or traces and select **Paste**.

A new trace(s) is added to the report and it contains the copied trace definition(s).

> **Note:**
>
> If you copy and paste a report or trace definition to a design that contains a definition with the same name, then an incremented number is appended to the pasted report or trace name.

Copy and Paste of Report and Trace Data

You can copy and paste report and individual trace data within a single design or across designs. The report and trace definitions and all underlying data within the report or trace are copied and pasted to the target design or report.

To copy all data from a report:

Right-click the report name in the project tree and select **Copy Data**, or use the menu bar **Edit** > **Copy Data**, or right-click within a plot to display a shortcut menu with **Copy Data**.

To paste copied report data:

Right-click Results in the project tree of the target design and select **Paste**.

To copy data from an individual trace(s) in a report:

Right-click the trace or traces under a report name in the project tree and select **Copy Data**.

To paste copied trace data:

Right-click the report in the target design to which you would like to copy the trace data and select **Paste**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

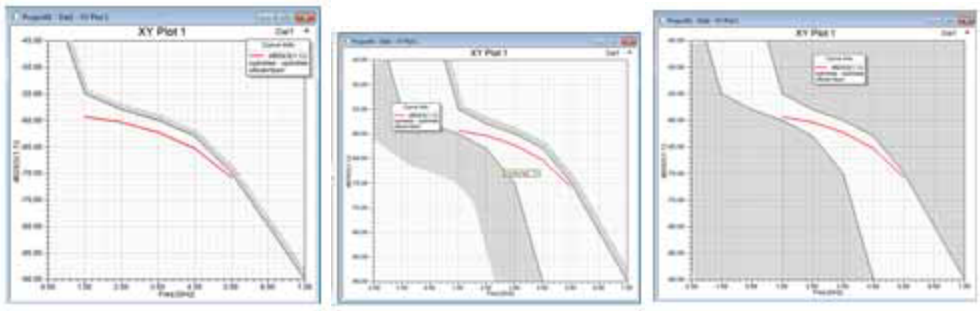
Note:

If you copy and paste report or trace data which contains the same name definition as a report or trace in the target design then an incremented number will be appended to the pasted name.

Limit Lines in Cartesian Plots

Limit lines are simple graphical representation of constraints on XY plots. These are modeled as a sequence of XY point pairs, or as offsets from a selected curve. You can designate a single limit line to delineate an upper limit, or two lines to delineate upper and lower limits, or upper and lower offset lines simultaneously.

You can control the display properties of the line including color and hatch width in pixels. These lines are available only on XY plots (and not on the XY-like plots: bode, stacked etc)

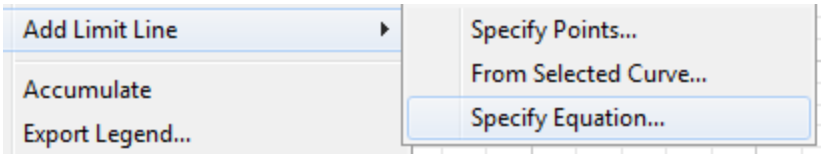


Note:

Limit lines are available only on Rectangular (XY) plots, not on XY-like plots such as Bode or Rectangular Stacked. On 2D Plots, the axes extents are based on the extents of the curves.

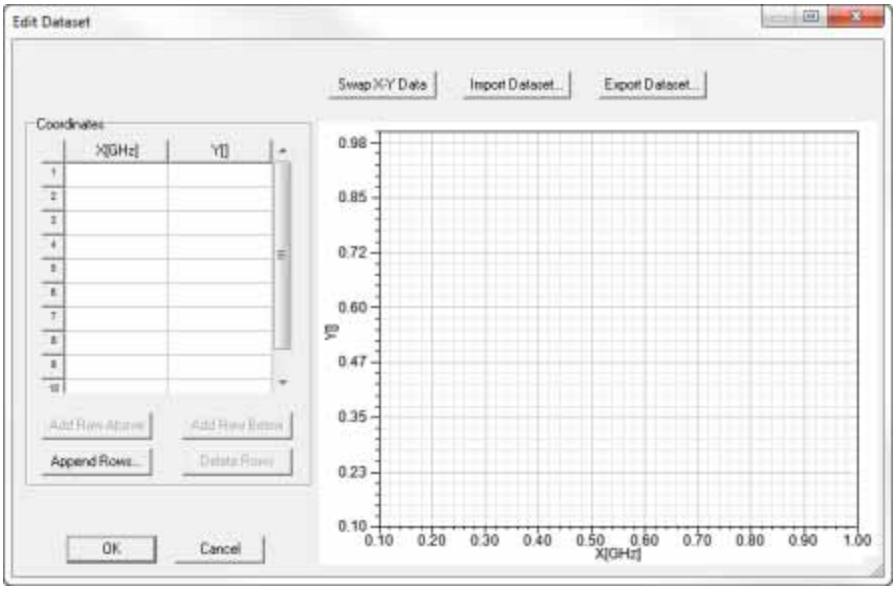
To create a limit line:

1. Click **Report2D** > **Add Limit Line** or right-click an XY plot and select **Add Limit Line...** from the Context menu. You then select whether to **Specify Points**, or **From a Selected Curve**, or **Specify Equation**.

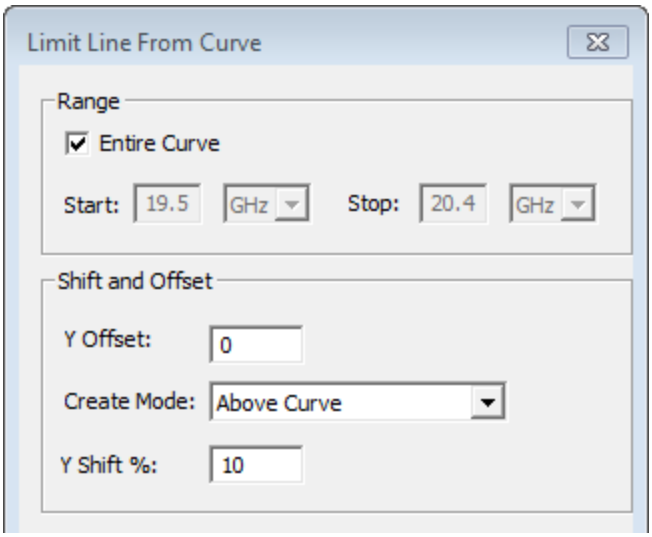


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Select **Specify Points** to open an *Edit Dataset* dialog box so that you can specify points.

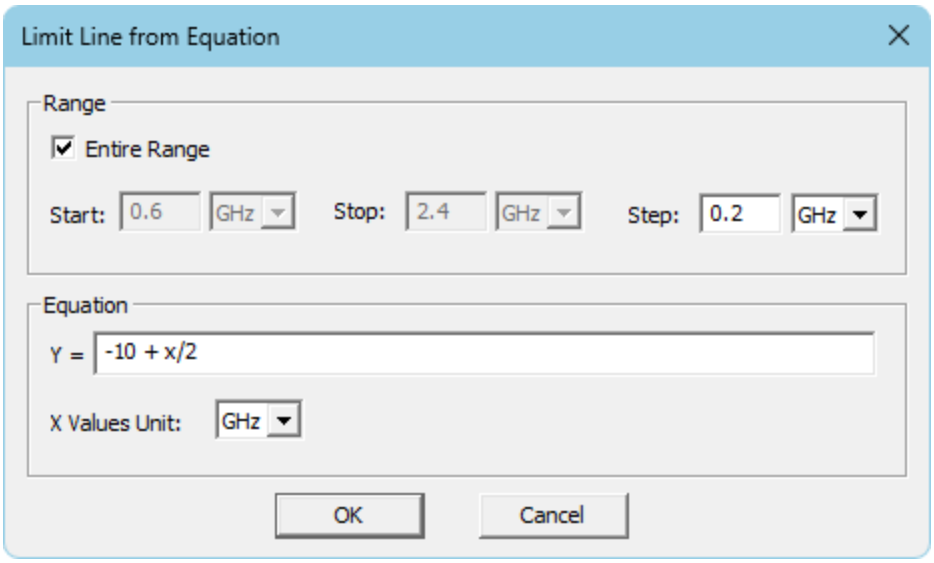


Select **From Selected Curve** to open the *Limit Line From Curve* dialog box.



Select **Specify Equation** to open the *Limit Line from Equation* dialog box. Specify the desired **Equation** (y as a function of x). Choose the **X Values Unit** from the drop-down menu. The available units depend on the type of sweep quantity (frequency, distance, and so on). The default choice is the current X axis unit for the plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. You can use the *Edit Dataset* dialog box to do the following:
   - enter the EY values directly.
   - import XY values from a .tab file.
   - export Dataset to a file.

   If you require additional data points, you can use the buttons to **Append Rows** to the Coordinates table. If you select a row in the Coordinates table, you can then use the buttons to **Add Row Above**, **Add Row Below** the selected rows, or **Delete Rows**.

   You can use Shift+click to select multiple adjacent rows, or Ctrl+click to select any rows for deletion.

   > **Note:**
   >
   > Each limit line is associated with a particular Y axis (because it has to be scaled the same way as all the curves associated with the axis, follow its log/linear scale and so on). This Y axis association defaults to the first available Y axis when the limit line is created. However, if the plot contains multiple Y axes, it can be associated with a different Y axis later via its properties tab.

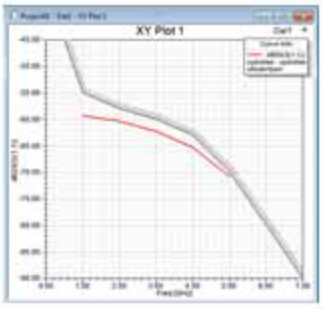
3. You can use the *Limit Line From Curve* dialog box to create a limit line:
   - Define a range using the Entire Curve, or a specified Start and Stop.

   If you uncheck “Entire Curve,” the Start and Stop fields are enabled and initialized based on the zoom level.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

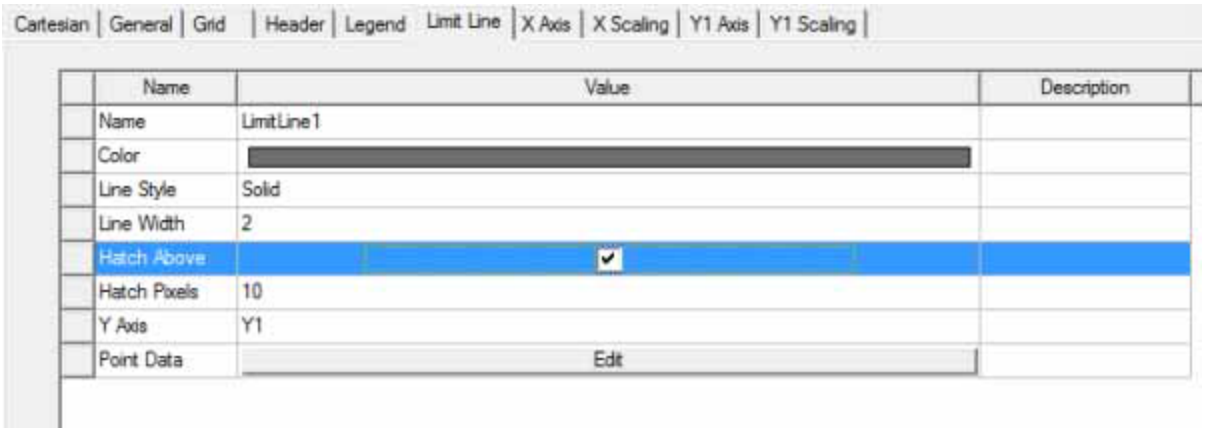
- Shift and Offset relative to the Y, either as a Y Offset value or as a Y Shift %.
- Create Mode as Above Curve, Below Curve, or Above and Below Curve.

4. You can use the *Limit Line from Equation* dialog box to create a limit line based on an equation in the form Y = f(x).
   - Only x variable is allowed
   - x value is linearly sampled and f(x) is evaluated to get y. By default, the entire range for plot is covered. You can uncheck **Entire Range** to specify Start and Stop. You can always edit Step and unit values for x.
   - If y results in NaN, an error is indicated and limit line is shown.
   - If y results in Inf value, then it maps to the MapInfValue specified on its associated y axis.
   - Selecting the limit line added in such a way should show: Start, Stop, Step, and Equation in limit line property window. You can edit these values in the Properties window.
5. Once you click **OK**, the limit line, or lines, you define are added to the plot. Each limit line divides the plot into two regions within the context of its length. By default, the upper region is hatched to designate constraint violation.



6. You can select the limit line in the plot to edit its properties via the **Limit Line** tab of the plot properties.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

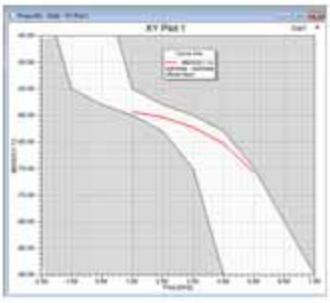


- Line properties: Color, Style and Width
- Y axis association
- Hatch properties
- Hatch width in pixels
- Hatch direction (hatch above or below the Limit line)
- The point definition of the limit line itself.

For a limit line specified as an Equation, the Properties also include:

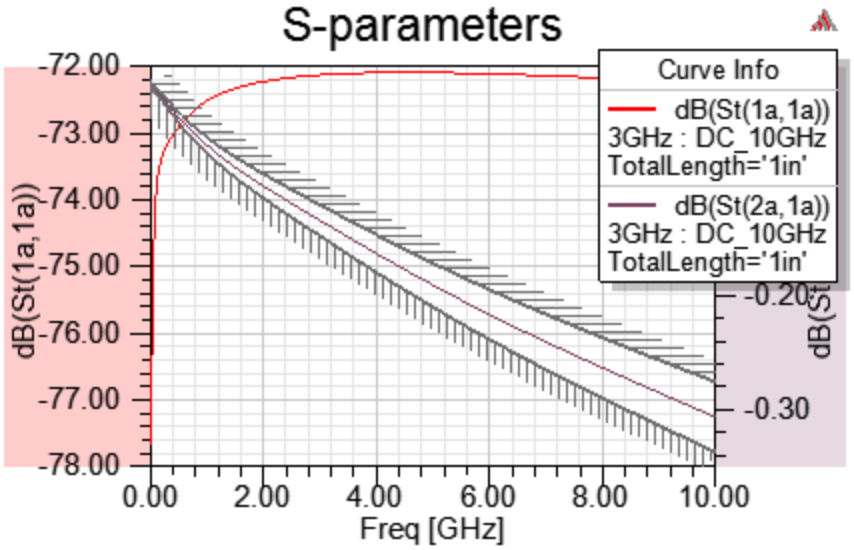
- Start, Stop, Step, and Equation values.

7. If you add a second limit line, you can designate it as hatch below by unchecking **Hatch Above** to produce a tunnel marking upper and lower constraints.



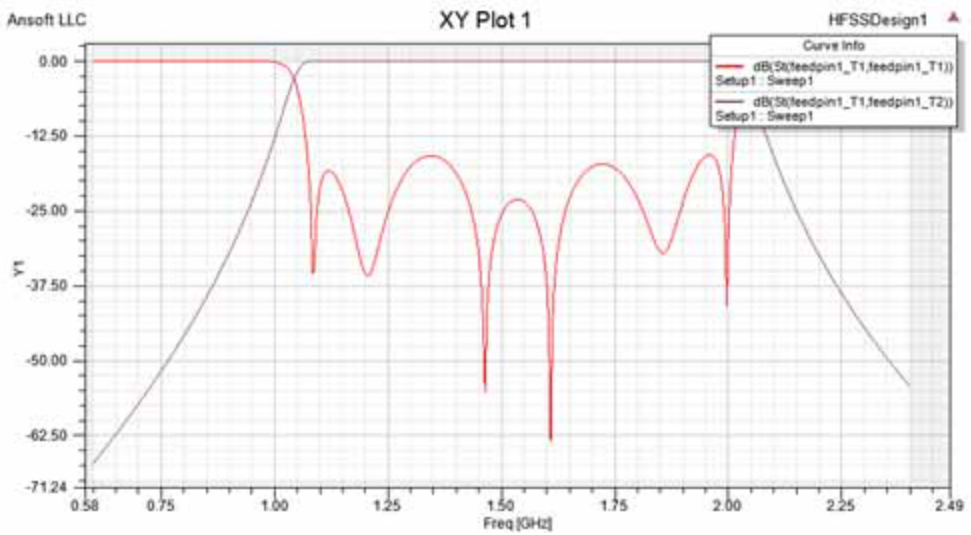
The following example shows the a limit line from curve plot, where the Hatch Above property for the lower limit line has been unchecked.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



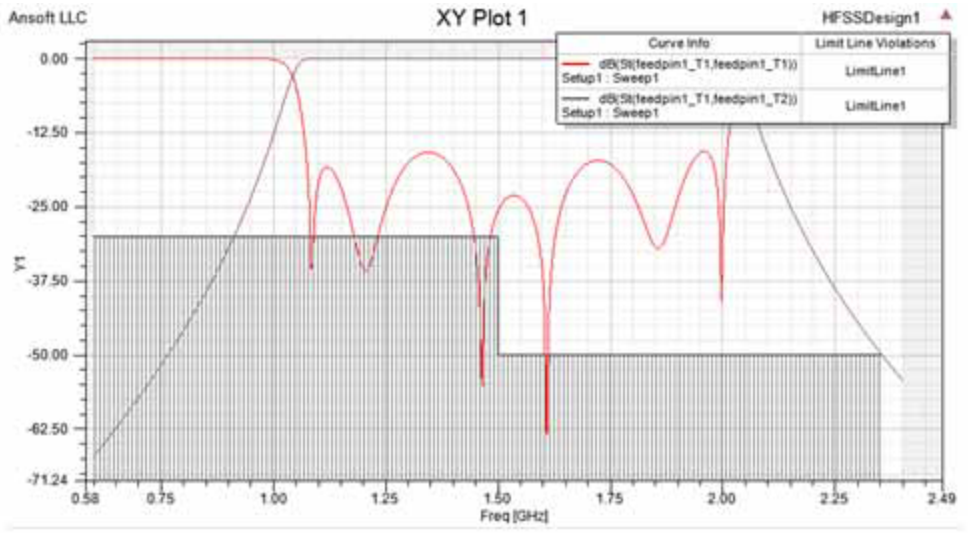
Limit Line Violations

You can use a plotting feature to help you discern whether a curve violates a limit line or not. Consider following plot which shows two curves:

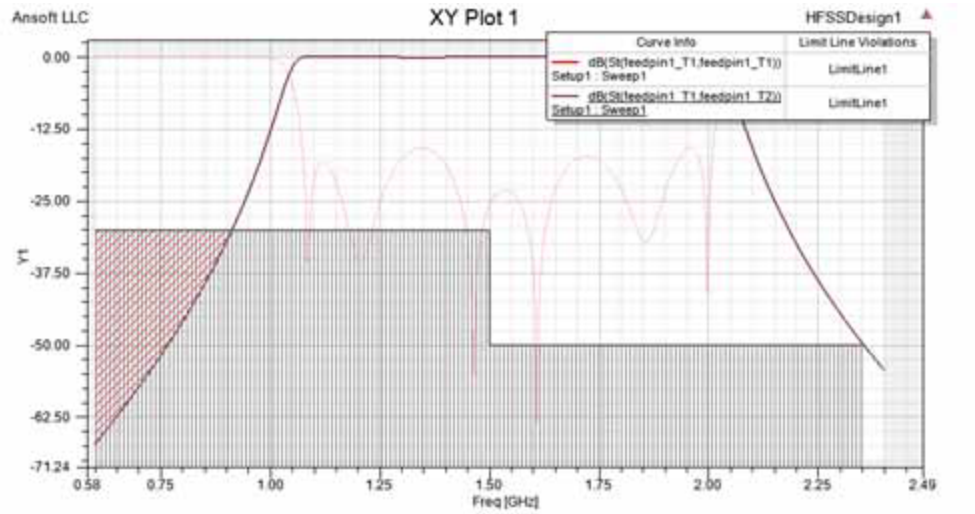


Suppose that the response cannot be below -30 dB until 1.5 GHz, and cannot be below -50 dB at 1.5 GHz or higher. You add a limit line for this requirement in the plot using 'Add a Limit Line' functionality. The plot automatically calculates whether a curve violates this requirement, that is, the limit line and show it in the legends window, as shown in following figure:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



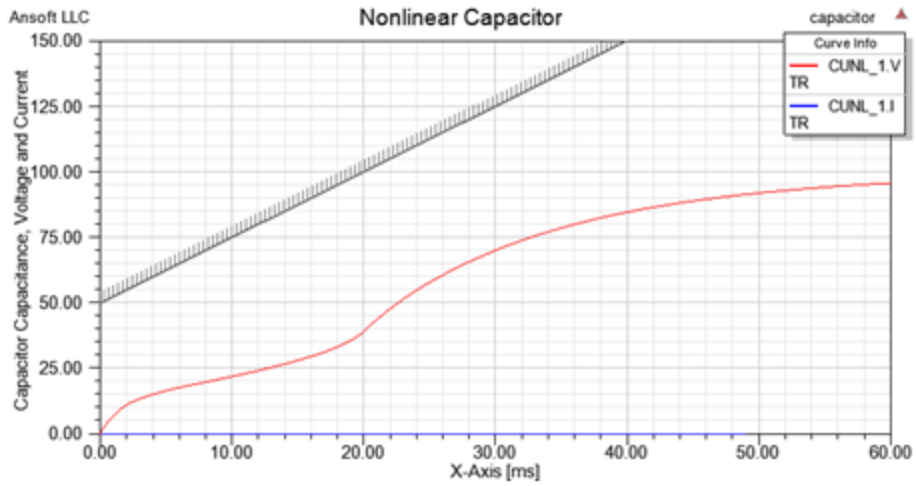
If a curve is selected, then the plot shows the region of the curve that violates the limit line (shaded with slanted red lines), as shown in following figures:



Note:

As shown in the following figure, if no curve violates a limit line, then the limit line hatching is restrained to 10 pixels in length. The minimal hatching keeps the focus on the curve traces rather than the limit lines.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Error Handling

If an error is encountered while calculating Limit Line Violations for a particular plot trace, the *Curve Info* window shows "NaN (*<Limit Line name>*)" under the *Limit Line Violations* column for that curve. For example, if a value is not available or goes to infinity at a particular point, the program is unable to evaluate that point. One of the coordinates is "Not-a-Number" (NaN).

Sweeping a Variable in a Report

In Circuit, a swept variable is a variable that typically has more than one value. You can plot any calculated or derived quantity against one or more of the swept variable's values.

For large projects or projects with many variables, you may obtain faster post processing before generating a solution by selecting which variables function as Sweep variables. Only the variables with Sweep enabled are indexed for post processing. See Adding a Design Variable and Adding a Project variable.

To specify the swept variable values to plot a selected quantity against:

1. In the **Report** dialog box, select the variable from the X (Primary Sweep) drop-down menu.
2. To modify the values that will be plotted for a variable:
    a. Click the ellipsis **[...]** button on the **X (Primary Sweep)** line of the **Report** dialog to displays a pop-up list of the possible values.
    b. Select **Use all values** or click the Edited button to display a dialog that lets you specify the sweeps to use.

    All of the selected variable's values will be plotted.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Selecting a Function for a Plot

The value of a quantity being plotted depends upon its mathematical function, which you select from the **Trace** tab **Function** list in the *Report* dialog box. The available, valid functions depend on the type of quantity (real or complex) that is being plotted. The function is applied to the quantity which is implicitly defined by all the swept and current variables. For example, "S(11)" is the value of the S-parameter for every swept combination of variables (e.g., "height", "frequency"). (A smaller set of functions appears for the Function list in the Output Variables dialog.)

These functions can also be applied to previously specified Quantities and Functions as **Range Functions** when using the Set Range Function dialog box.

Some of these functions can operate along an entire curve. These are: min, max, integ, avg, rms, pk2pk, cang_deg and cang_rad.

You can select from the following functions in the **Trace** tab **Function** list or type them directly into the Yor X field, if necessary.

abs	Absolute value of the simulation quantity which results in a number that is always positive.
acos	Arc cosine (the inverse function of a cosine).
acosh	Inverse hyperbolic arc cosine.
ang	Magnitude of an angle.
ang_deg	Angle (phase) of a complex number, cut at +/-180. Returns angular values in degree units, and not suitable for use in Optimetrics, which works in SI values and evaluates ang_deg expressions in radians. See ang_deg_val.
ang_deg_val	Angle (phase) of a complex number in unitless degree values, and suitable for use in Optimetrics, which works in SI values. Returns simple numbers.
ang_rad	Angle in radians.
arg	Argument of a complex number. It is the angle the complex number makes with the positive x axis. Same as **ang_deg**.
asin	Arc sine (the inverse function of sine).
asinh	Inverse hyperbolic sine.
atan	Arc tangent (the inverse function of a tan).
atanh	Inverse hyperbolic tan.
atan2	Two argument function. For non-0 x,y, the function returns the angle between the + x-axis and the given x,y coordinates.
avg	Returns the average of the values of the selected quantity.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	avg = (Area between the curve and the X-axis) / (X length of the curve)
avgabs	Returns the mean of the absolute value of the selected quantity.
bandwidth	Returns the 3dB bandwidth of the selected simulation quantity. For bandwidth, the calculation is based on 3dB below the maximum peak.
cang_deg	Cumulative angle (phase) of the first parameter (a complex number) in degrees, along the second parameter (typically sweep variable). Returns a double precision value cut at +/-180. Returns angular values in degree units, and not suitable for use in Optimetrics, which works in SI values and evaluates cang_deg expressions in radians. See cang_deg_val.
cang_deg_val	Cumulative angle (phase) of the first parameter of the selected simulation quantity in unitless degree values and suitable for use in Optimetrics, which works in SI values. . Returns simple numbers.
cang_rad	Cumulative angle of the first parameter in radians along a second parameter (typically a sweep variable). Returns a double precision value.
cmplx(*re*, *im*)	A complex number, where *re* is the real part and *im* is the imaginary part.
conjg	Conjugate of the complex number.
cos	Cosine.
cosh	Hyperbolic cosine.
crestfactor	Returns the crest factor (peak/RMS) for the selected quantity.
cum_integ	The cumulative integral function returns a set of values that have the same length as the original set of points (the first element will always be zero). Element *I* of the set returned by cum_integ is the integral of elements 1 through *I* of the original data set.
cum_sum	The cumulative sum function returns a data set that has the same length as the original set of points. Element *I* of the set returned by cum_sum is the sum of elements 1 through *I* of the original data set.
dB(x)	20*log10(|x|) to base 10.
dBc	Decibels relative to the carrier. It is the power ratio of the signal to a carrier signal. Gives the relative signal strength.
dBm(x)	10*log10(|x|) +30.
dBm	(for electric field quantities) is computed as: 20.0*log10(x) + 60.0
dBu	(for electric field quantities) is computed as: 20.0*log10(x) + 120.0
dBW(x)	10*log10(|x|).
dB10	10*log(|x|) to base 10.
dB10normalize	10*log [normalize(mag(x))].

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

dB20	20*log(x) to base 10.
dB20normalize	20*log [normalize(mag(x))].
deadtime	Obtains the latest time when the qtyl is within a tolerance of zero.
delaytime	Obtains the time from zero to 50% of the target point.
degel	Conversion from degrees electrical to seconds with respect to Hz.
deriv	Derivative of a given parameter.
distortion	Returns the total distortion for the selected simulation quantity and an additional argument frequency, which is the frequency in Hz at which to calculate the fundamental RMS of the simulation quantity.
even	Returns 1 if integer part of the number is even; returns 0 otherwise.
exp	Exponential function (the natural anti-logarithm) of the simulation quantity.
fmod	nReturns the double precision remainder of x/y.
formfactor	Returns the form factor (RMS/Mean Absolute Value) for the selected quantity.
fundamentalmag	Returns the RMS value of the fundamental frequency for the selected quantity, and an additional argument, Frequency, which specifies the fundamental frequency.
gaincrossover	Returns the gain crossover frequency (where the gain is 0 dB) of the selected simulation quantity in Hz.
gainmargin	Returns the gain margin in dB at the phase crossover frequency of the selected simulation quantity. It also requires a reference simulation quantity to which the measured quantity is compared and the AC magnitude and phase angle of the reference quantity. These are entered as the arguments Reference Channel, Base Source Magnitude, and Base Source Angle.
iae	Returns the integral of the absolute deviation of the selected quantity from a target value that is entered via the additional argument.
if	if(cond_exp,true_exp, false_exp).
im	Imaginary part of the complex number.
int	Truncated integer function.
integ	Integral of the selected quantity. Uses trapezoidal area.
integabs	Absolute value of integral.
ise	Returns the integral of the squared deviation of the selected quantity from a target value that is entered via an additional argument.
itae	Returns the time-weighted squared deviation of the selected quantity from a target value that is entered via an additional argument.
itse	Returns the time-weighted squared deviation of the selected quantity from a target value that is entered via an additional argument. To use

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	this function, you need to open the Add Trace Characteristics dialog and select the Error category.
j0	Bessel function of the first kind (0^{th} order).
j1	Bessel function of the first kind (1^{st} order).
jn	Bessel function of the first kind (nth order).
ln	Natural logarithm.
log	Natural logarithm (same as ln).
log10	Logarithm base 10.
lowercutoff	Returns the lower 3dB frequency of the selected simulation channel in Hertz.
lsidelobeX	The 'x' value for the left side lobe: the next highest value to the left of the max value.
lsidelobeY	The 'y' value for the left side lobe: the next highest value to the left of the max value.
mag	Magnitude of the complex number.
max	Returns maximum value of the simulation quantity.
max_swp	Returns maximum value of a sweep.
max2	Maximum value of the two simulation quantities. For example, **max2 (a,b)** will plot maximum of **a** and **b** for a particular instance.
mean	Returns the average in the set of quantities selected. mean = sum(all y-value) / (number of y-values)
min	Returns the minimum value of the simulation quantity.
min_swp	Returns the minimum value of a sweep.
min2	Minimum value of the two simulation quantities. For example, **min2 (a,b)** will plot minimum of **a** and **b** for a particular instance.
mod	Returns the double precision modulus (x - floor(x/y)*y). Not supported in solvers.
nint	Nearest integer.
none	Returns null value.
normalize	Divides each value within a trace by the maximum value of the trace. ex. normalize(mag(x)).
odd	Returns 1 if integer part of the number is odd; returns 0 otherwise.
overshoot	Calculates peak overshoot given a threshold value and number of evenly spaced points over entire time range.
peakgain	Returns the peak value of gain of the selected simulation quantity in dB.
peakgainfreq	Returns the frequency in Hz at which the peak gain of the selected simulation quantity occurs.
polar	Coverts the complex number in rectangular co-ordinates to polar co-

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	ordinates.
per	Returns the period of a simulation quantity.
phasecrossover	Returns the phase crossover frequency, at which the phase is -180 degrees, in Hz for the selected simulation quantity.
phasemargin	Returns the phase angle in degrees at the gain crossover frequency of the selected simulation quantity.
pk2pk	Peak to peak. Difference between max and min of the first parameter over the second parameter. Returns the peak-to-peak value for the selected simulation quantity.
pkavg	Returns the ratio of the peak to peak-to-average for the selected quantity.
pmax	Maximum period of the selected simulation quantity.
pmin	Minimum period of the selected simulation quantity.
pow	Raises x to the power of y; pow(x,y).
prms	Period Root Mean Square.
pulsefall9010	Returns the pulse fall time of the selected quantity according to the 90%-10% estimate.
pulsefront1090	Returns the pulse front time of the selected quantity according to the 10%-90% estimate.
pulsefront3090	Returns the pulse front time of the selected quantity according to the 30%-90% estimate.
pulsemax	Returns the pulse maximum from the front and tail estimates for the selected quantity.
pulsemaxtime	Returns the time at which the maximum pulse value of the selected quantity is reached.
pulsemin	Returns the pulse minimum from the front and tail estimates for the selected quantity.
pulsemintime	Returns the time at which the minimum pulse value of the selected quantity is reached.
pulsetail50	Returns the pulse tail time of the selected quantity from the virtual peak to 50%.
pulsewidth5050	Returns the pulse width of the selected quantity as measured from the 50% points on the pulse front and pulse tail.
pwl	Piecewise Linear.
pwl_periodic	Piecewise Linear for periodic extrapolation on x.
pwlx	Piecewise Linear x with linear extrapolation on x.
pw_minus	Pulse width of the first negative pulse.
pw_minus_avg	Returns the average of the negative pulse width input stream.
pw_minus_max	Returns the maximum pulse width of the negative pulse of input stream.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

pw_minus_min	Returns the minimum pulse width of the negative pulse of input stream.
pw_minus_rms	RMS of the negative pulse width input stream.
pw_plus	Pulse width of the first positive pulse.
pw_plus_avg	Average of the positive pulse width input stream.
pw_plus_max	Max. Pulse width of the positive pulse of input stream.
pw_plus_min	Min. Pulse width of the positive pulse of input stream.
pw_plus_rms	RMS of the positive pulse width input stream.
re	Real part of the complex number.
rect	Converts the complex number in polar to rectangular co-ordinates.
rem	Returns the fractional part of a decimal number such that rem(x) = x-int (x) Syntax: rem(x)
ripple	Returns the ripple factor (AC RMS/Mean) for the selected quantity.
risetime	Obtains the time taken to go from 10% to 90% of target point.
rms	Returns the root mean square value of the selected quantity.
rmsAC	Returns the AC RMS for the selected quantity.
root	nth root function.
rSidelobeX	Returns the X value of right side-lobe occurrence.
rSidelobeY	Returns the Y value of right side-lobe occurrence.
settlingtime	Returns the latest time at which the value of the selected simulation quantity fell outside its tolerance band. The target value of the quantity and the +/- bandwidth of the tolerance band are the additional args.
sgn	Sign extraction.
sin	Sine.
sinh	Hyperbolic sine.
slidingmean	Returns the moving average value of the selected simulation quantity (specified by the first argument). The average is calculated over a period (specified by the second argument).
slidingrms	Returns the moving RMS value of the selected simulation quantity (specified by the first argument). The RMS value is calculated over a period (specified by the second argument).
sqr	Square of the selected simulation quantity.
sqrt	Square root of the selected simulation quantity.
stddev	Returns the standard deviation of given values.
sum	Returns the sum of the given values.
tan	Tangent.
tanh	Hyperbolic tangent.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

undershoot	Calculates peak undershoot given a threshold value and number of evenly spaced points over entire time range.
uppercutoff	Returns the upper 3dB frequency of the selected simulation channel in Hz.
variance	Calculates the variance of the given values.
XAtYMax	Threshold crossing time: report first time (x value) at which an output quantity crosses YMax.
XAtYMin	Threshold crossing time: report first time (x value) at which an output quantity crosses a user definable threshold.
XAtYVal	Returns the X value at the first occurrence of Y value.
XWidthAtYVal	Returns the X width between the first 2 occurrence of Y value.
xdb10beamdwidth	Width between left and right occurrences of values 'x' db10 from max. Takes 'x' as argument (3.0 default). To use this function, you need to open the Add Trace Characteristics dialog and select the Radiation category.
xdb20beamwidth	Width between left and right occurrences of values 'x' db20 from max. Takes 'x' as argument (3.0 default). To use this function, you need to open the Add Trace Characteristics dialog and select the Radiation category.
YAtXMax	Returns the X value at maximum value of Y.
YAtXMin	Returns the Y value at minimum value of X.
YAtXVal	Returns the Y value at the first occurrence of X value.
y0	Bessel function of the second kind (0^{th} order).
y1	Bessel function of the second kind (1^{st} order).
yn	Bessel function of the second kind (nth order).

Plotting Imported Solution Data

1. In the **Solution** drop-down menu of the *Report* dialog box, click the imported data you want to plot.
2. Follow the procedure for creating a report.

Setting a Range Function

To apply a range function to the Y, Z, or Mag component of a trace:

1. Click **Range Function** in the *Report* dialog box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This opens the *Set Range Function* dialog box. The functions available are the same as described in the Selecting a Function section, with the exception of those for the Eye Measurements category.

2. To enable Range function selection, click the Specified radio button.

   Selecting the None radio button disables the Range Function fields.

3. Select the **Category**, and then an associated Function to apply. The available categories depend on the plot, and Category enables the display of associated functions.

   Given a selected Function, and Category, the **Set Range Function** dialog displays a text field that explains the Purpose of the function. See figure above.

   Selecting a function causes the display of a description in the **Purpose** field. If the function requires a value (such as the XatYVal Math function or the pw_minus_max Pulse Width function), the following table the function field displays the name, editable value field, unit, and description.

4. Use the **Over Sweep** drop-down menu to select from available sweeps.
5. To select from available Sweeps, or to edit them, use the ellipsis [**...**] button and uncheck **Use All Sweeps**.

   This enables a list of the sweeps. The sweep(s) you select is displayed on the Over Sweep line. You can use the buttons to **Clear All Selections** or **Select All** sweeps.

6. Select the Sweeps **Default** or **Edited** radio buttons to specify whether to accept the default or edited sweeps.
7. To edit the sweeps further, select the ellipsis button to display an *Edit Sweep* dialog box.

   For frequency variables, this lets you specify a single value, linear step, linear count, decade count, octave count, or exponential count. You can **Add** legal values to the list of sweep values, **Update** the list for changes, or **Delete** selected entries.

8. Click **OK** to apply the range function.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Range Functions

The following table shows the **Functions** according to their **Categories**. The most commonly used range categories are **Math** and **Radiation**. Other functions could be used if needed. Use the category links to navigate to tables with definitions of functions.

Category	Functions
Math	max, min, pk2pk, rms, sum, mean, variance, stddev, integabs, avgabs, rmsAC, ripple, pkavg, XatYMin, XatYMax, YAtXMin, YAtXMax, XAtYVal, YAtXVal, XWidthAtYVal
PulseWidth	pulsemin, pulsemax, pulsemintime, pulsemaxtime, pulsefall9010, pulsefront1090, pulsefront3090, pulsetail50, pulsewidth5050, pw_plus, pw_minus, pw_plus_avg, pw_minus_avg, pw_plus_max, pw_minus_max, pw_plus_min, pw_minus_min, pw_plus_rms, pw_minus_rms
Overshoot, Undershoot	overshoot, undershoot.
TR & DC	crestfactor, formfactor, distortion, fundamentalmag, delaytime, risetime, deadtime, settlingtime
Error	iae, ise, itae, itse
Period	per, pmax, pmin, prms
AC	gainmargin, phasemargin, gaincrossover, phasecrossover, lowercutoff, uppercutoff, bandwidth, peakgain, peakgainfreq.
Radiation	xdb10bandwidth, xdb20bandwidth, lSidelobeX, lSidelobeY, rSidelobeX, rSidelobeY
Eye Measurements	EyeLevelZero, EyeLevelOne, EyeAmplitude, EyeHeight, EyeSignalToNoise, EyeOpeningFactor, EyeWidth, EyeJitterP2P, EyeJitterRMS, EyeRiseTime, EyeFallTime, MinEyeWidth, MinEyeHeight

> **Note:**
>
> Refer to the SI Wave or Nexxim help for more information. The Purpose field offers brief descriptions of each.

Math Functions	
***avg**	Returns the average of the values of the selected quantity. avg = (Area between the curve and the X-axis) / (X length of the curve)
avgabs	Returns the mean of the absolute value of the selected quantity.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Math Functions	
integabs	Absolute value of integral.
max	Returns maximum value of the simulation quantity.
mean	Returns the average in the set of quantities selected. mean = sum(all y-value) / (number of y-values)
min	Returns the minimum value of the simulation quantity.
rms	Returns the root mean square value of the selected quantity.
rmsAC	Returns the AC RMS for the selected quantity.
ripple	Returns the ripple factor (AC RMS/Mean) for the selected quantity.
pkavg	Returns the ratio of the peak to peak-to-average for the selected quantity.
pkp2pk	Peak to peak. Difference between max and min of the first parameter over the second parameter. Returns the peak-to-peak value for the selected simulation quantity.
sum	Returns the sum of the given values.
stddev	Returns the standard deviation of given values.
variance	Calculates the variance of the given values.
XAtYMax	Threshold crossing time: report first time (x value) at which an output quantity crosses YMax.
XAtYMin	Threshold crossing time: report first time (x value) at which an output quantity crosses a user definable threshold.
XAtYVal	Returns the X value at the first occurrence of Y value.
XWidthAtYVal	Returns the X width between the first 2 occurrences of Y value.
YAtXMax	Returns the X value at maximum value of Y.
YAtXMin	Returns the Y value at minimum value of X.
YAtXVal	Returns the Y value at the first occurrence of X value.

Radiation Functions	
lsidelobeX	The 'x' value for the left side lobe: the next highest value to the left of the max value.
lsidelobeY	The 'y' value for the left side lobe: the next highest value to the left of the max value.
rSidelobeX	Returns the X value of right side-lobe occurrence.
rSidelobeY	Returns the Y value of right side-lobe occurrence.
xdb10beamdwidth	Width between left and right occurrences of values 'x' db10 from max. Takes 'x' as argument (3.0 default). To use this function, you need to open the Add Trace Characteristics dialog and select the Radiation category.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

xdb20beamwidth	Width between left and right occurrences of values 'x' db20 from max. Takes 'x' as argument (3.0 default) To use this function, you need to open the Add Trace Characteristics dialog and select the Radiation category.

Pulse Width Functions

> **Note:**
>
> In this table, the functions with the asterisk (*) do not appear on the Range Function drop-down menu. They can still be used via text entry.

pulsefall9010	Returns the pulse fall time of the selected quantity according to the 90%-10% estimate.
pulsefront1090	Returns the pulse front time of the selected quantity according to the 10%-90% estimate.
pulsefront3090	Returns the pulse front time of the selected quantity according to the 30%-90% estimate.
pulsemax	Returns the pulse maximum from the front and tail estimates for the selected quantity.
pulsemaxtime	Returns the time at which the maximum pulse value of the selected quantity is reached.
pulsemin	Returns the pulse minimum from the front and tail estimates for the selected quantity.
pulsemintime	Returns the time at which the minimum pulse value of the selected quantity is reached.
pulsetail50	Returns the pulse tail time of the selected quantity from the virtual peak to 50%.
pulsewidth5050	Returns the pulse width of the selected quantity as measured from the 50% points on the pulse front and pulse tail.
***pwl**	Piecewise Linear.
***pwl_periodic**	Piecewise Linear for periodic extrapolation on x.
***pwlx**	Piecewise Linear x with linear extrapolation on x.
pw_minus	Pulse width of the first negative pulse.
pw_minus_avg	Returns the average of the negative pulse width input stream.
pw_minus_max	Returns the maximum pulse width of the negative pulse of input stream.
pw_minus_min	Returns the minimum pulse width of the negative pulse of input stream.
pw_minus_rms	Returns the rms of the negative pulse width input stream.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

pw_plus	Returns the pulse width of the first postive pulse.
pw_plus_avg	Returns the average of the positive pulse width input stream.
pw_plus_max	Returns the maximum pulse width of the positive pulse of input stream.
pw_plus_min	Returns the minimum pulse width of the positive pulse of input stream.
pw_plus_rms	Returns the rms of the positive pulse width input stream.

Overshoot/Undershoot	
Overshoot	Calculates peak overshoot given a threshold value and number of evenly spaced points over entire time range.
Undershoot	Calculates peak undershoot given a threshold value and number of evenly spaced points over entire time range.

TR & DC Functions	
crestfactor	Returns the crest factor (peak/RMS) for the selected simulation quantity.
formfactor	Returns the form factor (RMS/Mean Absolute Value) for the selected quantity.
distortion	Returns the total distortion for the selected simulation quantity and an additional argument frequency, which is the frequency in Hz at which to calculate the fundamental RMS of the simulation quantity.
fundamentalmag	Returns the RMS value of the fundamental frequency for the selected quantity, and an additional argument, Frequency, which specifies the fundamental frequency.
delaytime	Obtains the time from zero to 50% of the target point.
risetime	Obtains the time taken to go from 10% to 90% of target point.
deadtime	Obtains the latest time when the qtyl is within a tolerance of zero.
settlingtime	Returns the latest time at which the value of the selected simulation quantity fell outside its tolerance band. The target value of the quantity and the +/- bandwidth of the tolerance band are the additional arguments.

Error Functions	
iae	Returns the integral of the absolute deviation of the selected quantity from a target value that is entered via the additional argument.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ise	Returns the integral of the squared deviation of the selected quantity from a target value that is entered via an additional argument.
itae	Returns the time-weighted squared deviation of the selected quantity from a target value that is entered via an additional argument.
itse	Returns the time-weighted squared deviation of the selected quantity from a target value that is entered via an additional argument. To use this function, you need to open the Add Trace Characteristics dialog and select the Error category.

Periodic Functions	
per	Returns the period of a simulation quantity.
pmax	Max period of the selected simulation quantity.
pmin	Minimum period of the selected simulation quantity.
prms	Period Root Mean Square.

AC Functions	
gainmargin	Returns the gain margin in dB at the phase crossover frequency of the selected simulation quantity. It also requires a reference simulation quantity to which the measured quantity is compared and the AC magnitude and phase angle of the reference quantity. These are entered as the arguments Reference Channel, Base Source Magnitude, and Base Source Angle.
gaincrossover	Returns the gain crossover frequency (where the gain is 0 dB) of the selected simulation quantity in Hz.
phasecrossover	Returns the phase crossover frequency, at which the phase is -180 degrees, in Hz for the selected simulation quantity.
phasemargin	Returns the phase angle in degrees at the gain crossover frequency of the selected simulation quantity.
lowercutoff	Returns the lower 3dB frequency of the selected simulation channel in Hz.
uppercutoff	Returns the upper 3dB frequency of the selected simulation channel in Hz.
bandwidth	Returns the 3dB bandwidth of the selected simulation quantity. For bandwidth, the calculation is based on 3dB below the maximum peak.
peakgain	Returns the peak value of gain of the selected simulation quantity in dB.
peakgainfreq	Returns the frequency in Hz at which the peak gain of the selected simulation quantity occurs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

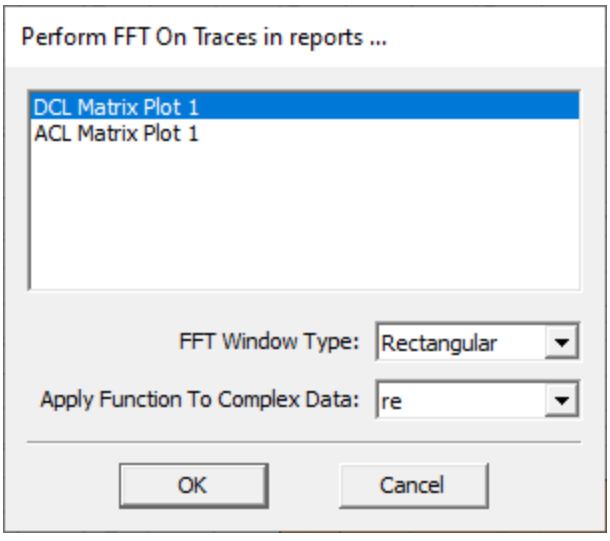
Eye Measurement Range Function Parameters

The Eye Measurement category of range functions provide the means to evaluate several characteristics of eye diagrams. Each of the Eye Measurement functions includes the following parameters. Specify the Value by editing the Value text field for the parameter name. Specify the unit for the parameter by selecting from the Unit drop-down menu.

Name	Default Value	Default Unit	Description
Unit Interval	0	ns	Unit interval of signal
Start Offset	0	ns	Offset at beginning of signal
End Offset	0	ns	Offset at end of signal
Autocrossing amplitude	1		Nonzero number means that crossing amplitude is calculated automatically.
Crossing amplitude	0	mV	Specify crossing amplitude used for eye measurement data computation.

Perform FFT on a Report

You can perform FFT on an existing 2D plot by using the **Results** > **Perform FFT** command. You can perform TDR on an existing 3D plot by using **Circuit** > **Results** > **Perform FFT**. This opens the **Perform FFT on Traces in Reports** dialog box.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select the report you want from the list.
2. Select the FFT window type to apply. Winding functions cause the FFT of the signal to have non-zero values away from ω. Each window function trades off the ability to resolve comparable signals and frequencies versus the ability to resolve signals of different strengths and frequencies.
3. Select the function to apply to complex data.

   The new report appears under **Results** in the **Project Manager**. The new report name prefixes FFT to the name of the original report. Trace names are also prefixed with FFT.

FFT Window Functions

The window type list for **Perform FFT on Report** includes:

Window Function	Preferred Use
Rectangular	A low dynamic range function offering good resolution for signals of comparable strength. Poor when signals have very different amplitudes. $w(n)=1$ Tri	A Bartlett window with the endpoints valued at zero. Van Hann	A moderate dynamic range function, designed for narrow band applications. $w(n) = 0.5(1 - cos\frac{2\pi n}{N-1})$ 
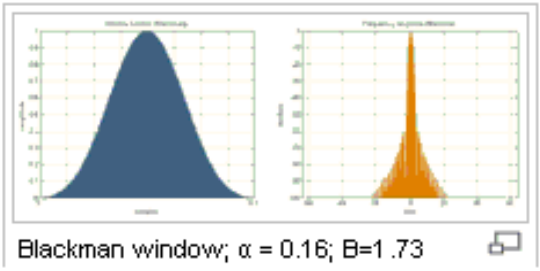
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Window Function	Preferred Use
Blackman	A high dynamic range function, with lower resolution, designed for wide band applications.

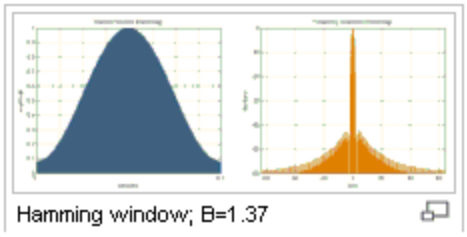
$$w(n) = \alpha_0 - \alpha_1 cos(\frac{2\pi n}{N-1}) + \alpha_2 cos(\frac{4\pi n}{N-1})$$

where a_0 =(1-α)/2; α_1=1/2; α_2=α/2

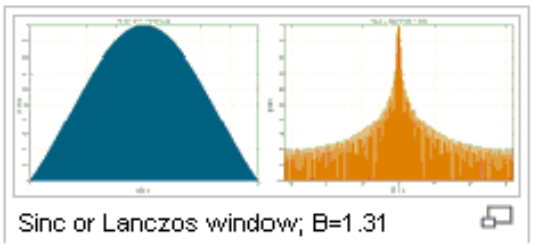


Hamming	A moderate dynamic range function, designed for narrow band applications. It minimizes the maximum sidelobe.

$$w(n) = 0.54 - 0.46 cos\left(\frac{2\pi n}{N-1}\right)$$



Lanczos	The Lanczos window offers a windowed form of the infinite sinc filter, providing the central lobe of a horizontally stretched sinc, sinc(x/a) for -a £ x £ a.



Weber	
Welch	This approach applies a parabola-shaped window to the frequency domain

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Window Function	Preferred Use
	data. It is based on the Bartlett method but splits the signal into overlapping segments, which are then windowed. The intent is to balance the influence of data in the center of the function.

Apply FFT to Report Functions

The choices in the Perform FFT on Traces in Reports dialog include:

ang_deg	**Angle (phase) of a complex number, cut at +/-180**
ang_deg_val	**Angle (phase of a complex number in unitless degree values. Returns simple numbers.**
ang_rad	**Angle in radians**
arg	
cang_deg	**Cumulative angle (phase) of the first parameter (a complex number) in degrees, along the second parameter (typically sweep variable). Returns a double precision value cut at +/-180.**
cang_deg_val	**Cumulative angle (phase) of the first parameter of the selected simulation quantity in unitless degree values. Returns simple numbers.**
cang_rad	**Cumulative angle of the first parameter in radians along a second parameter (typically a sweep variable) Returns a double precision value.**
dB(x)	**20*log10(|x|)**
dB 10normalize	**10*log [normalize(mag(x))]**
dB 20normalize	**20*log [normalize(mag(x))]**
dBc	
GetGroupDelay	
im	**Imaginary part of the complex number**
mag	**Magnitude of the complex number**
normalize	**Divides each value within a trace by the maximum value of the trace. ex. normalize (mag(x))**
re	**Real part of the complex number**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The evaluated value of an expression is always interpreted in SI units. However, when an angle quantity is plotted in a report, you have the option to plot values in units other than SI. If you want to plot the polar angle of a complex simulation result, S_{11} say, you can choose between ang_deg(S_{11}) and ang_rad(S_{11}). Both of these return the exact same angle quantity but in degree and radian units respectively.

Note that when used in expressions, some surprising outcomes might result. For example, the expression "1+ang_deg(S_{11})" represents an ‘angle’ and the number "1" is treated as "1 rad". The angle SI unit is attached to any unitless number that is added/subtracted from an angle value. If you want to treat "1" as degrees, make it explicit and use "1deg + ang_deg(S_{11})" instead.

If you are interested in unitless degree values, two additional functions exist: ang_deg_val(S_{11}) and cang_deg_val(S_{11}). These return simple numbers and are treated as such by any expression. If the complex S_{11} lies on the positive Y axis say, ang_deg_val (S_{11}) would be 90 and "1 + ang_deg_val(S_{11})" will be 91.

Perform TDR on Report

You can perform TDR on an existing 2D plot by using the **Results** > **Perform TDR on Report** command. You can perform TDR on an existing 3D plot by using the **HFSS 3D Layout** > **Results** > **Perform TDR on Report** command. This opens a **Perform TDR on Traces in reports** dialog box.

1. Select the report you want from the list in the dialog box.
2. Specify the input signal as **Step** or **Impulse**.
3. Set the **Rise Time**.
4. In the **Type** drop-down menu, select which window type to apply.

   Windowing functions cause the FFT of the signal to have non-zero values away from ω. Each window function trades off the ability to resolve comparable signals and frequencies versus the ability to resolve signals of different strengths and frequencies.

5. To specify a window width, enter a percentage into the **Width (%)** field.
6. If you select the Kaiser function, specify a number in the **Kaiser Parameter**.

The new report displays and appears in the Project tree. The new report name prefixes TDR to the name of the original report. Trace names are also prefixed with TDR.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Animated Reports

The following sections describe how you can postprocess field overlay displays to create and then view various animated reports. Any of the field overlay displays can be animated by cycling the overlays as a series of frames. Refer to the following topics for details on creating the field overlays:

- Overlaying Surface Currents on a 3D View
- Overlaying Far Fields on a 3D View
- Overlaying Near Fields on a 3D View

There are two modes of animation: frequency-based and phase-based. Frequency-based animation creates a series of frames by calculating the field overlay at each of the swept frequencies. Phase-based animation creates a series of frames by calculating the field overlay at a fixed set of phase deviations around a selected frequency. The animation controls can also change the simulation design point.

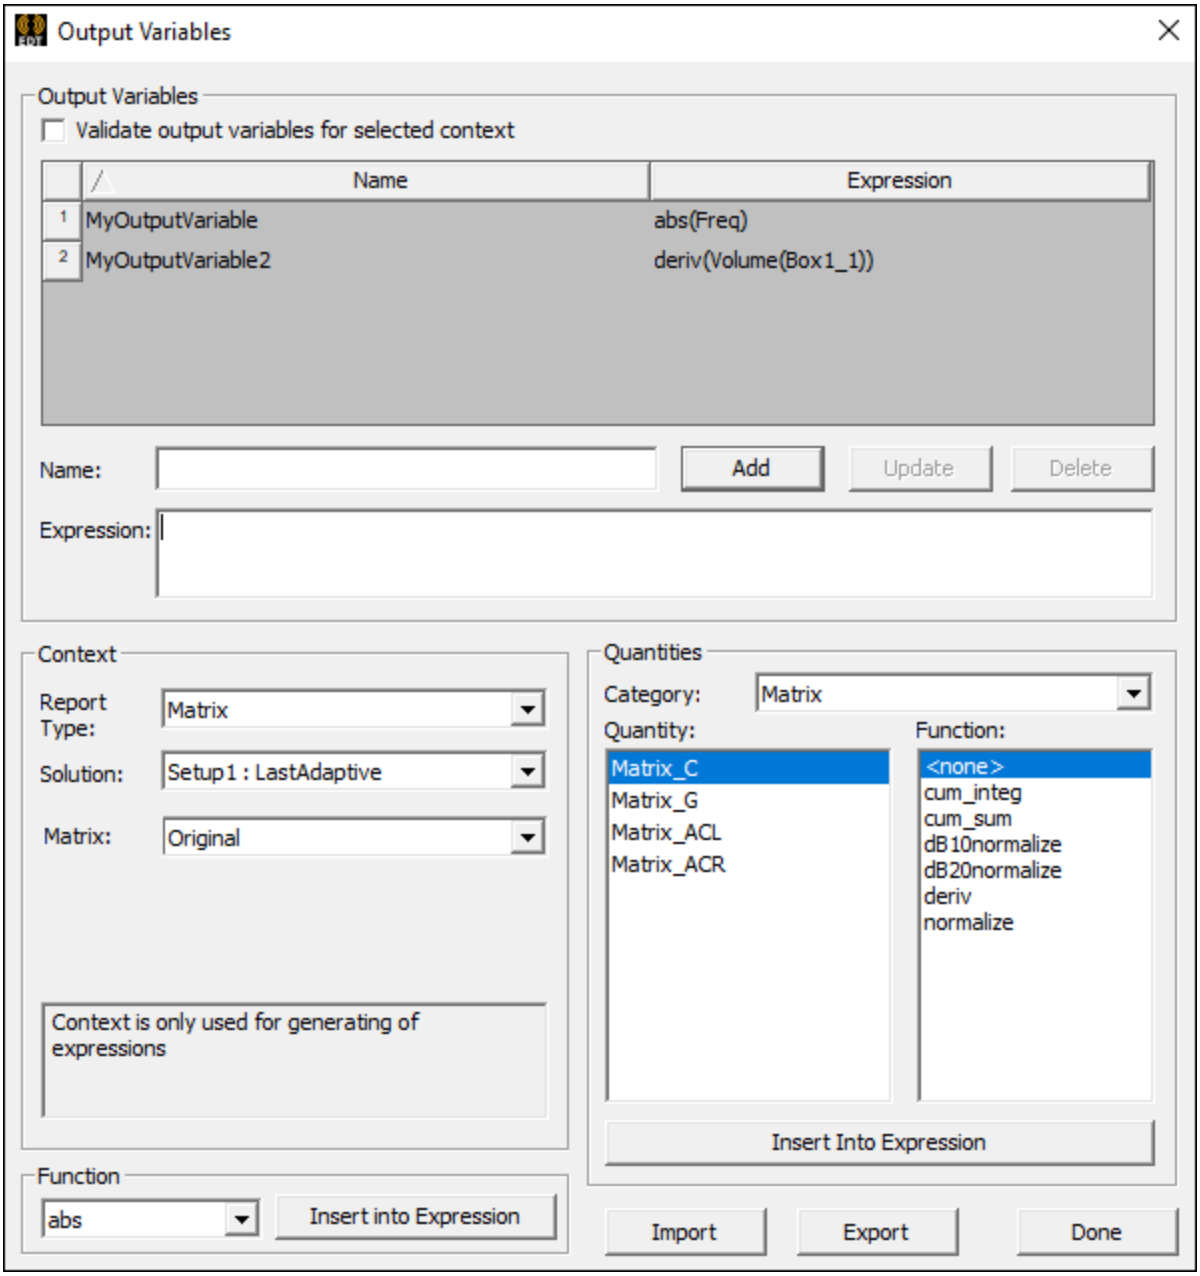
Specifying Output Variables

You can define output variables to use calculated expressions of results as adaptive convergence goals and for reports. You can use output variables in the Expression Cache tab of the **Solution Setup** dialog box and select them as Categories in the **Reports** dialog box, as well as the **Output Variables** window.

Access the **Output Variables** window one of several ways:

- Click **Circuit** > **Results** > **Output Variables**.
- In the Project Manager, right-click **Results** and select **Output Variables** from the shortcut menu.
- In the **Solution Setup** dialog box, select the **Expression Cache** tab, click **Add...** to display the **Add to expression cache** dialog box, and click the **Output Variables** button.
- Click the **Output Variables** button in the **Report** dialog box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Output Variables** window contains four sections:

- **Output Variables** – contains a list of existing output variables, and allows you to specify the name and expression for a new output variable. The **Validate output variable...** check box allows you to validate an expression before adding it. Valid expressions appear in blue and invalid expressions appear in red.
- **Context** – specifies the Report Type and Solution. Depending on the type of report selected, additional fields may appear. All selections affect the functions and quantities

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

listed.

> **Note:**
>
> The context is used only for generating expressions.

- **Quantities** – allows you to insert quantities into the Expression area of the **Output Variables** section.
- **Function** – allows you to insert completed expressions into the Expression area of the **Output Variables** section.

To add an output variable:

1. Enter a **Name** for the variable.
2. Specify the **Context**. This impacts the available quantities and functions.
3. Specify the **Quantities** (required) and **Functions** (optional) using the **Insert Into Expression** buttons.
4. Review the **Expression**. When it is ready, click **Add**.

   The new output variable appears in the **Output Variables** list.

To delete an output variable:

1. Remove all references to the output variable from the project.
2. Save the project to erase the command history.
3. Open the **Output Variables** window using one of the methods above.
4. Select the variable from the **Output Variables** list and click **Delete**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The evaluated value of an expression is always interpreted in SI units. However, when an angle quantity is plotted in a report, you have the option to plot values in units other than SI. For example, if you want to plot the polar angle of a complex simulation result S_{11}, you can choose between ang_deg(S_{11}) and ang_rad(S_{11}). Both of these return the exact same angle quantity, but in degree and radian units respectively.

When using non-SI units in expressions, surprising outcomes might result. For example, the expression 1+ang_deg(S_{11}) represents an angle and the number 1 is treated as 1 rad. The angle SI unit is attached to any unitless number that is added/subtracted from an angle value. If you want to treat 1 as degrees, make it explicit and use 1deg + ang_deg(S_{11}) instead.

If you are interested in unitless degree values, two additional functions exist: ang_deg_val(S_{11}) and cang_deg_val(S_{11}). These return simple numbers and are treated as such by any expression. For example, if the complex S_{11} lies on the positive Y axis, ang_deg_val(S_{11}) would be 90 and 1 + ang_deg_val(S_{11}) would be 91.

Function List for Output Variables

The **Output Variables** window includes a second function list containing functions to enter directly into the Expression field. These functions can also be applied to previously specified Quantities and Functions.

Some of these functions can operate along an entire curve. These are: min, max, integ, avg, rms, pk2pk, cang_deg and cang_rad.

You can select from the functions in the **Output Variables** dialog box's **Function** list or type them directly into the Expression field, if necessary.

Derivative Tuning for Reports

The Derivative Tuning feature available in the results menu is based on the derivatives that you can request for selected variables in the solution setup. It is limited to quantities like S-parameters and Far Fields, where far-field tuning supports the following:

- Incident Wave
- Linked Field
- Voltage Source
- Current Source
- Magnetic Bias : Note: Sensitivity analysis of a design variable associated with the magnetic bias region assumes that the magnetic bias field does not change. In some

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

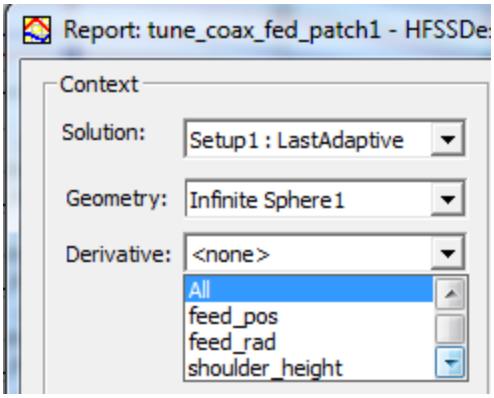
cases this assumption may not be appropriate and requires user discretion to ensure its applicability especially for non-uniform ferrite models.

Tuning far field quantities determines the derivatives of the response of electromagnetic devices with respect to variations in geometric or material properties. Designs can include port excitations or non-port excitations (that is, incident waves, linked field, voltage source and current source.

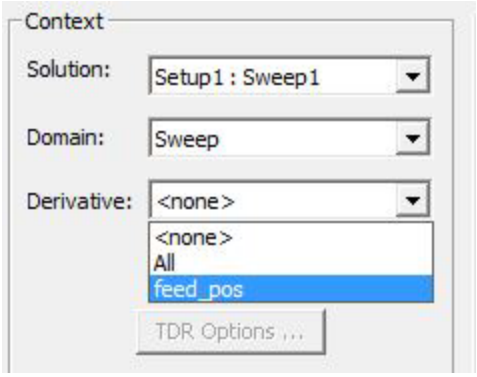
Note: Sensitivity analysis of a design variable associated with the magnetic bias region assumes that the magnetic bias field does not change. In some cases this assumption may not be appropriate and requires user discretion to ensure its applicability especially for non-uniform ferrite models.

Results obtained by the “Tune Reports” functionality is only an estimate, it is recommended that designs be re-analyzed with the variables values changed to include any tuning offsets to get an accurate result.

Frequencies, and local quantities cannot be tuned. If you have defined variables in the solution setup, the Context area of the Reporter displays the Derivative field, from which you can select the variable(s) for a tunable report.

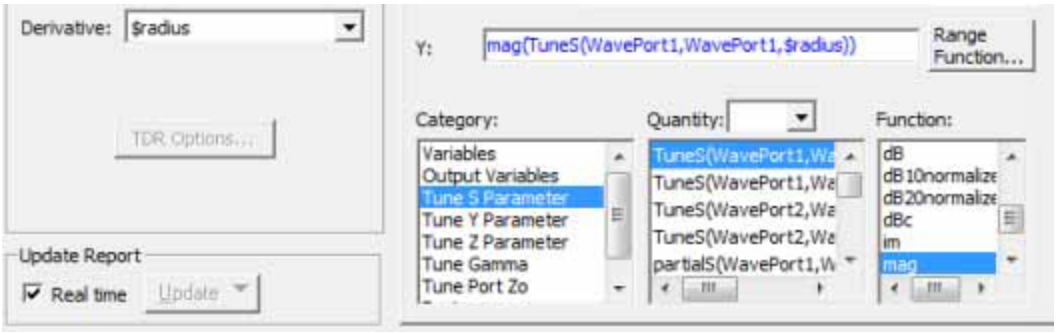


A common way to use this feature is to produce, for an output quantity of interest, two curves in one plot. One curve is produced with the **Report** dialog selection for the Context Derivative as <none>. The other has the All or specific variable selection.

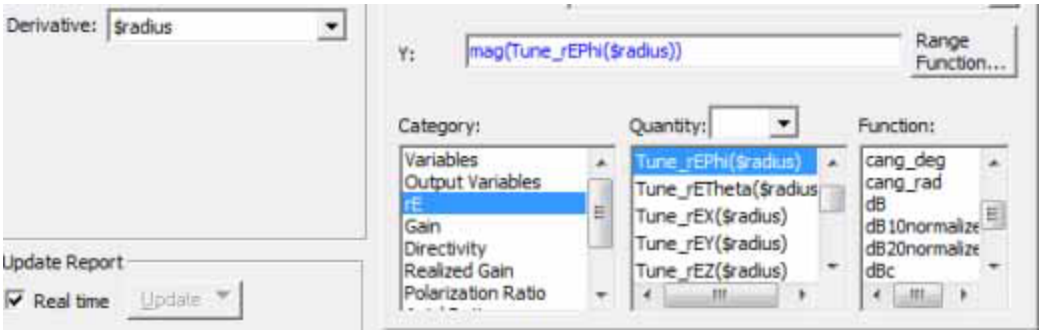


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

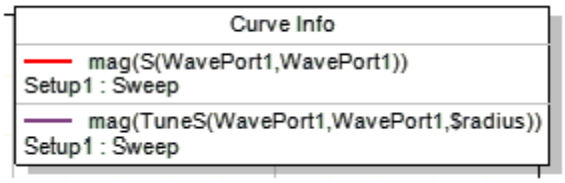
When you select All or a variable, notice that the Context field of the Report dialog shows the names of various parameters prefixed with Tune. Some of the Quantities associated with the category also show a Tune prefix. This labeling makes it easier to distinguish the Tuned traces from the reference traces.



In the case of a Far Fields plot, the Tune prefix appears in only in the Quantity field.

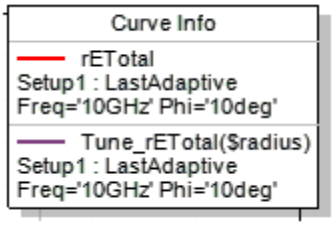


This gives you a plot with initially two identical curves, one on top of the other. The curve info table shows the trace names. This example shows the curve info for a plot with a normal S-parameter trace with a TuneS trace that can be tuned using the value of the $radius variable.

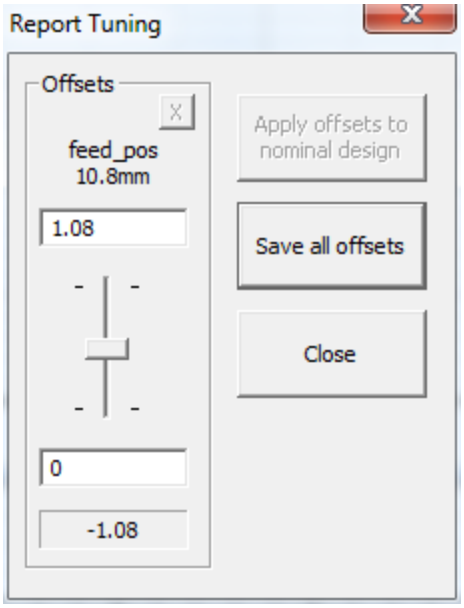


This example shows the curve info for a plot with a normal rETotal trace with a Tune_rETotal trace that can be tuned using the value of the $radius variable.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can then right-click Results in the Project tree and select **Tune Reports**. The **Report Tuning** window appears. You can use the slider to tune the Tune curve interactively while the reference curve stays to provide a reference. This way you can see interactively how small changes in variables affect the result. You can then apply those offsets to the original variable values and re-solve the design.



The overall procedure for Report Tuning follows.

1. Generate a solution with one or more variables for which you select Use on the **Derivatives** tab of the solution setup.
2. Use the Reporter to create one curve with Derivative selection in the Context panel of the report dialog set to None.
3. Then create another curve, but in the Context pane. select for Derivatives, All or the variable of interest. Select to build your new trace from the Categories and Tune Quantities listed.

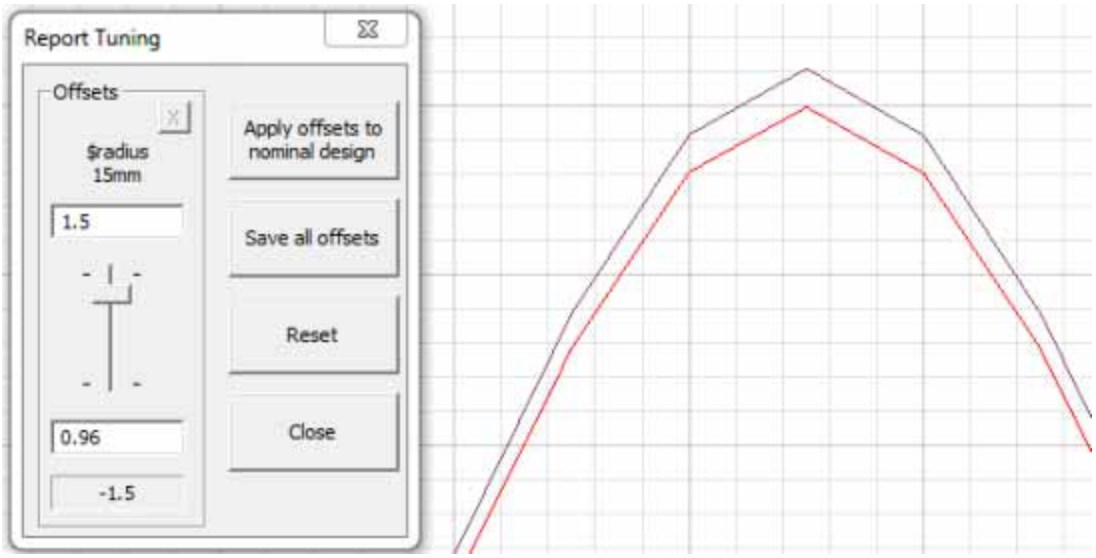
This gives you two identical curves, one top of the other. Notice that you are not limited in the number of traces that you define. You may choose to limit the number of traces for more ease in observing the results of tuning.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click the **HFSS>Results>Tune Reports** or right-click **Results** in the Project tree and click **Tune Reports** from the short cut menu. The menu item is disabled if no variables have been selected in the Derivatives tab of the solution setup.

This displays a **Report Tuning** dialog which lists the variables available for tuning. The example above shows a **Report Tuning** dialog for a design with only one variable but it can show more.

5. You can use the slider to adjust the value of each available Tune variable. When you move a slider, the **Apply offsets to nominal design** button and the **Save all offsets** buttons are enabled. The Report shows the change to all Tune traces, relative to any reference traces you define.



The Tune dialog displays the change to the variable selected. For example, if the variable is $length with a value of 1mm, and the slider shows 0.1mm, then the effective value of $length for the purpose of derivatives is 1.1mm. If you exit the dialog by applying the offset or offsets (click **Apply offsets to nominal design**), $length is assigned a value of 1.1mm. You can then re-solve, and get results based on the derivative's prediction.

6. **Close** lets you close the dialog.

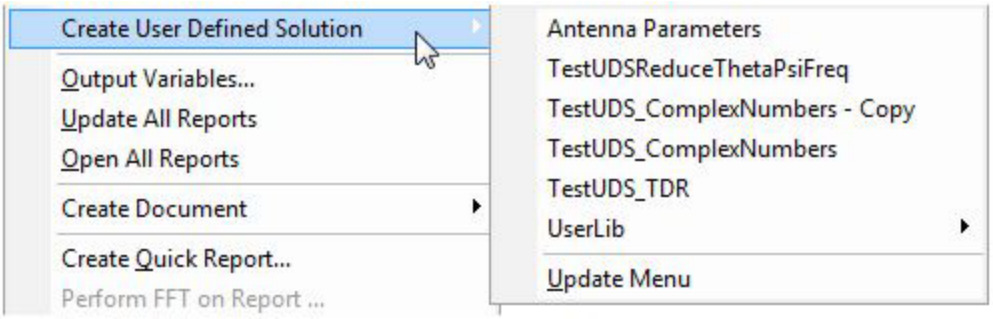
User-Defined Outputs (UDOs)

User-defined outputs (UDOs) allow users to define calculations through IronPython scripts or any .NET language (and used by the IronPython script). The UDO scripts need to be in the **UserDefinedOutputs** directory under either **syslib**, **userlib**, or **Personallib** with any directory structure needed for organization. (The **Lib** directory name is special and its purpose will be explained later on in the document.)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The UDO scripts that are placed in syslib/UserDefinedOutputs, userlib/UserDefinedOutputs, or Personallib/UserDefinedOutputs become available to the user to create "User Defined Solutions" through the **Results** > **Create User Defined Solution** menu.

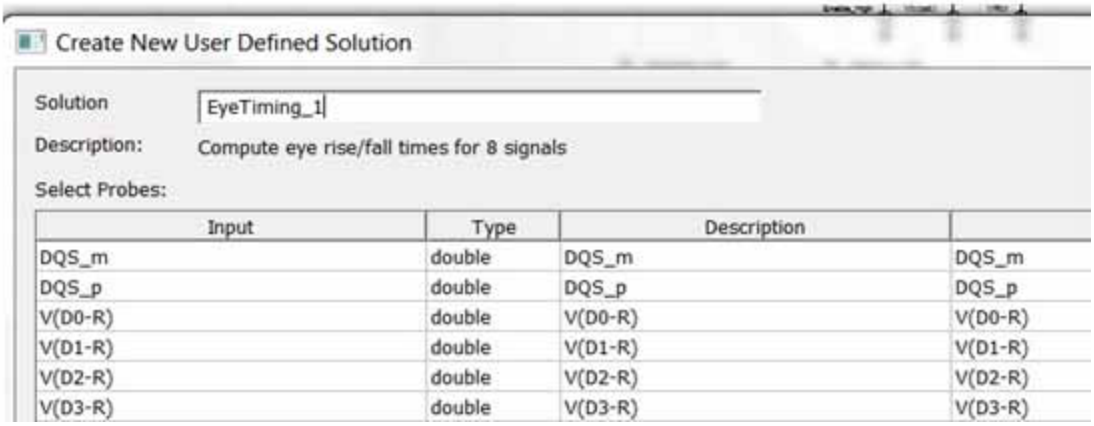
Use **Results** > **Create User Defined Solution** > **Update Menu** to refresh the menu to include the new UDO scripts that might have been copied to syslib, userlib, or Personallib; or exclude them if they have been deleted, after the launch of desktop. Once the user-defined-solution is created, the solution and the calculations defined by UDO become available in Reporter as any other quantities in a new "User Defined" report type.



Named Probes and Properties in User-Defined Outputs

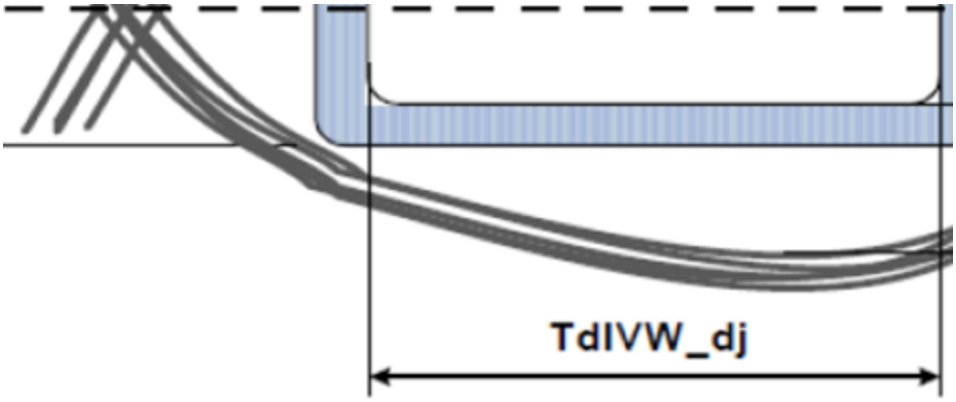
UDOs allow processing data across traces, solutions, and report types. A UDO specifies the named probes and properties for which user selects or enters the values at the time of creation of user-defined solution. Probes are very similar to traces except that the user selects the values of only intrinsic variables for probes. The values of design or project variables are selected when a trace is created based upon the user defined solution in reporter.

For example, you could create a user-defined solution called EyeTiming_1.



You can then access this solution in the Reporter.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



In another example, you could create a user-defined solution called **UDS Distance Trace Arithmetic Result1**:

Then access this solution in the **Create User Defined Solution** menu:

Computation of Traces Based UDO Calculations

When traces that are based upon UDO outputs are computed, the data for probes is computed and passed to the UDO script for each design variation. Along with the probe data, the values of properties entered by user are also passed. The information about the UDO calculations that need to be computed is also made available. The UDO then performs the computation and passes the results to reporter. Note that UDOs can compute and pass back more calculations than have been requested at that point of time. This allows UDOs to compute a set of calculations that take almost same amount of computational resources as any one calculation in that set and cache that with reporter. *When those calculations are subsequently plotted by user, reporter will use the cached results instead of invoking the computation on UDO*.

Dimensions Reduction by UDO Calculations

The probes in a UDO can have heterogeneous dimensions of data, for example, one probe in a UDO can have data that is a function of *n* intrinsic variable, while another probe in same UDO can have data that is function of *m* intrinsic variables, with *n* and *m* are potentially different. UDOs allow you to reduce any number of these intrinsic variables. In the above example, UDO calculations can be a function of any number of intrinsic variables including not being function of any intrinsic variable at all. UDO calculations can also be a function of an intrinsic variable that none of the probes is function of. *The only restriction is that Freq cannot be reduced if any of the probes are on a Fields report type.*

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Dynamic Probes

In addition to named probes and properties, UDOs can specify named dynamic probes. The difference between probes and dynamic probes is that while the end user of UDO specifies the complete trace definition for probe, the expression for dynamic probe is specified by UDO code itself and not by end user. This allows UDOs to access the data for probes without requiring the end user to enter each individual probe. For example, a UDO can access data for a huge S matrix for 100 port design without having the end user enter the probe information for each of those 10,000 quantities. Each dynamic probe is associated with a named probe that is entered by user. Information about solution, context, and intrinsic variables is used from selected probes; however multiple dynamic probes can be associated with the same user selected probe. The dynamic probes are acquired from UDOs at the time of trace computation and not at the time of creation of user defined solution.

This means that you select solution, context, and values of intrinsic variables just once, and the same information is used (in this case) for all clock and data signals. The expression for those signals comes from the UDO code.

User-Defined Outputs: Python Script API

A User-Defined Output (UDO) extension is implemented as an IronPython script that defines a class with a specific name: **UDOExtension**, which derives from a specific base class **IUDOPluginExtension** and implements its abstract methods.

- UDO Extension Implementation
- Data Types Used in UDO Python Scripts
- Working With Properties for UDO
- Other Application Specific Classes Used in Python Scripts
- User-Defined Outputs: Messaging Methods
- Using .NET Collection Classes and Interfaces in Python Scripts

UDO Extension Implementation

The purpose, argument list, and expected return types for each of the IUDOPluginExtension abstract methods, which the UDO author is expected to implement are described below.

- Import Statements
- UDOExtension Class
- IUDOPluginExtension Abstract Class

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Import Statements

The base class to use and the types it uses in turn are contained in .NET assemblies. The use of these requires that the assemblies be imported into the UDO script. The following import statements should be added to the top of the Python script:

```
from Ansys.Ansoft.ModulePluginDotNet.Common.API import *
 from Ansys.Ansoft.ModulePluginDotNet.Common.API.Interfaces import *
 from Ansys.Ansoft.ModulePluginDotNet.UDO.API.Interfaces import *
 from Ansys.Ansoft.ModulePluginDotNet.UDO.API.Data import *
```

UDOExtension Class

The UDO itself should be implemented as an IronPython class called **UDOExtension** which *must* derive from the **IUDOPluginExtension** abstract base class (from the **Ansys.Ansoft.ModulePluginDotNet.UDO.API.Interfaces** namespace).

Note that power users could derive a class hierarchy tuned toward a specific type of UDOs and that they can derive from their own base classes. The only requirement is that directly or indirectly, the UDO class must derive from **IUDOPluginExtension**.

The UDOExtension abstract class declares the optional Validate abstract method that may be implemented in the UDOExtension class or one of its base classes.

Example:

```
def BaseClassUDO ((IUDOPluginExtension):
 #base class implementation
 …
 def UDOExtension ((BaseClassUDO):
 #UDO class implementation …
```

Validate

This optional method is used to validate the user choices. The values of the properties entered, the probes etc. can be checked for suitability. This function, while a part of the IUDOExtensionabstract class, has a meaningful default implementation and is therefore optional. However, it can be overridden to take advantage of advanced functionality.

UI Access	NA		
Parameters	Name <errorStringList>	Type List<string>	Description [out] C# list of Python strings. Should be set only if validation failed;

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

			ignored if validation is successful. One error string should be set per each validation error.
	<udsProbParams>	List<UDSProbeParams>	[in] C# list of UDSProbeParams objects.
	<propList>	IPropertyList object	[in] list of properties
	< userSelectionForDynamicProbes >	List<UDSProbeParams>	[in] C# list of UDSProbeParams objects.
Return Value	Boolean. True on validation success and false on failure. The default implementation always returns true.		

Python Syntax	Validate (<*errorList*>, <*probeList*>, <*propertiesList*>, <*dynamicProbes*>)

Python Example	`def Validate(self, errorStringList, probeList, propList, dynamicProbes):`
	`  if probeList == None or probeList.Count == 0:`
	`  errorStringList.Add("Empty probe list")`
	`  return False`
	`  return True`

IUDOPluginExtension Abstract Class

The implementation of the IUDOPluginExtension class will be described in this section using a simple UDO example that expects a single probe and reduces its dimension returning as its outputs, the max, min, and average of its input probe data. The script in its entirety will also be listed later on.

Required functions:

The IUDOPluginExtension abstract class declares the following abstract methods that must be implemented in the UDOExtension class or one of its base classes. Not implementing any of these methods will result in a run-time error and a non-functioning UDO. The UDS refers to User Defined Solution parameters.

- GetUDSName
- GetUDSDescription

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- GetUDSSweepNames
- GetCategoryNames
- GetQuantityNames
- GetQuantityInfo
- GetInputUDSParams
- GetDynamicProbes
- Compute

GetUDSName

Return a string that is used as a prefix for all solution instances created using this UDO.

UI Access	NA
Parameters	None
Return Value	String

Python Syntax	GetUDSName

Python Example	`def GetUDSName(self):`
	`  return "MinMaxAvg"`
	`udsName = UDOPluginEntention.GetUDSName`

GetUDSDescription

Returns a description for the UDO, its purpose, etc. This is used in multiple UDO related dialogs in the application to describe the UDO.

UI Access	NA
Parameters	None
Return Value	String

Python Syntax	GetUDSDescription
Python Example	`def GetUDSDescription(self):` `  return "Sample UDO for dimension reducing quantities`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GetUDSSweepNames

Returns a list of sweep names to be used for the solution generated by the UDO. These will appear in the sweeps list displayed in the standard reporter dialog when used to create reports from the solution generated by the UDO.

UI Access	NA
Parameters	None
Return Value	List of strings. If the UDO outputs have no sweeps, return the empty list [].

Python Syntax	GetUDSSweepNames

Python Example	`# Returns list of sweeps names`
	`# We have no sweeps as we reduce them.`
	`def GetUDSSweepNames(self):`
	`  return []`

GetCategoryNames

The outputs that the UDO solution provides or generates can be classified into multiple categories, like how the application is displayed in the report creation dialog box.

UI Access	The output will be listed in the categories box in the dialog when creating reports from the UDO generated solution data.
Parameters	None
Return Value	List of strings

Python Syntax	GetCategoryNames
Python Example	`def GetCategoryNames(self):` `  return ["UDOOutputs"]`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GetQuantityNames

For each of the category names returned from the GetCategoryNames method, this function is called to return a list of quantities to be organized under that category name.

> **Note:**
>
> The quantity names must be unique across the categories; that is, no two categories can have quantities with the same name.

UI Access	NA		
Parameters	Name <*categoryName*>	Type String	Description [in] Name of category.
Return Value	List of strings		

Python Syntax	GetQuantityNames(<*categoryName*>)

Python Example	`# returns a list of quantity names for the supplied category name`
	`def GetQuantityNames(self, catName):`
	`  if catName == "UDOOutputs":`
	`  return ["min_val", "max_val", "avg_val"]`
	`  else:`
	`  return []`

GetQuantityInfo

For each quantity that the UDO creates, it must also describe the quantity (unit and other details). This method is called for each quantity name (across all categories) as returned from an earlier call of the GetQuantityNames method.

UI Access	NA		
Parameters	Name <*quantityName*>	Type String	Description Name of quantity
Return Value	Object of type QuantityInfo.		

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Python Syntax	GetQuantityInfo(<*quantityName*>)

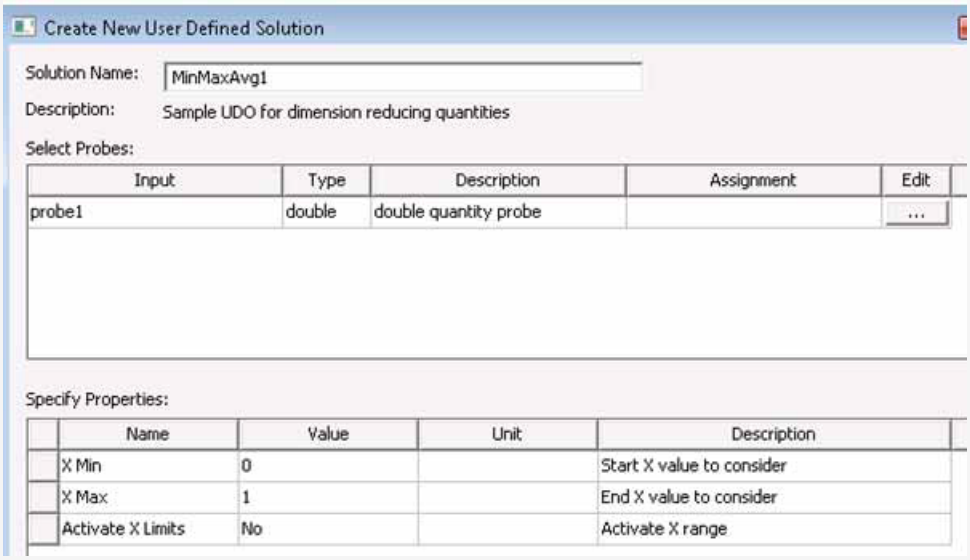
Python Example	`# Returns an instance of QuantityInfo for the qtyName supplied or None if such a`
	`# quantity could not be found`
	`def GetQuantityInfo(self, qtyName):`
	`    # All the quantities we have are simple doubles`
	`    # we can leave them unitless`
	`    return QuantityInfo(Constants.kDoubleParamStr)`

GetInputUDSParams

This is the main definition method of the UDO. The supplied arguments populate details of the parameters to which the UDO user will specify value, specify the probe names and their types as well as the dynamic probe selections.

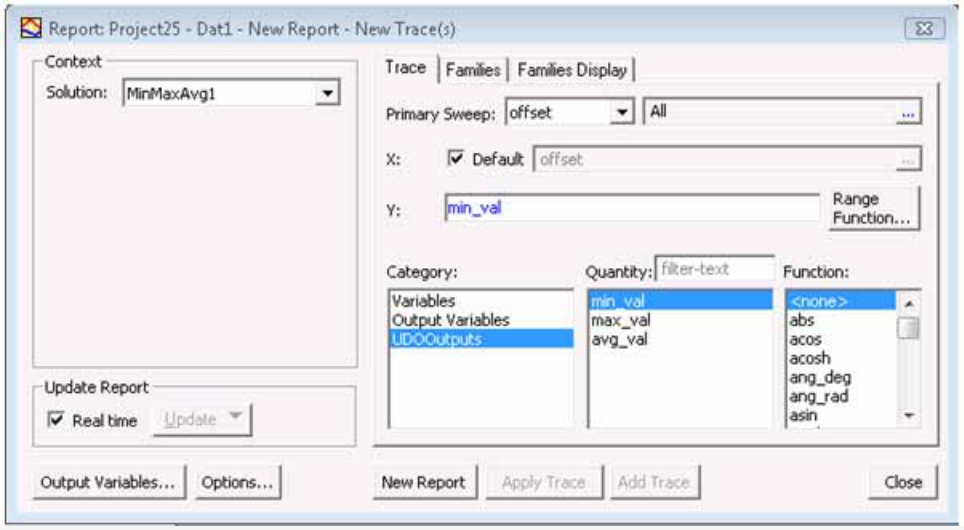
UI Access

The **GetInputUDSParams** function results in the following dialog when you click **Results**>**Create User Defined Solution**. The mapping from the UDSParams and the properties to the GUI elements should be unambiguous. The name and description of the UDS are also displayed in the **Create New User Defined Solution** window.



When a report is created from the UDO dialog box, the category and quantity names specified by the UDO are used (as seen below).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Parameters

Name	Type	Description
<udsParams>	List< UDSProbeParams >	Parameters for the probe. The UDO script must add one instance of UDSProbeParams for each probe definition it will display. When creating the UDO solution, the UDO user must assign a matching quantity to each probe. When user define a UDS in the GUI, the user must select a design-solution-quantity for each UDSProbeParam .
<propList>	IPropertyList	The propList object is used to add properties that should be displayed to the user for data collection. These properties with their user-supplied values are returned to the UDO script by the Compute method.
<	List<	When user defines a

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	userSelectionForDynamicProbes >	UDSProbeParams >	UDS in the GUI, the user ONLY needs to specify the Design-Solution. This quantity will be assigned dynamically by matching the component-expression defined in each UDSProbeParam.
Return Value	Boolean. If true, the event was handled successfully. If false, it was not.		

Python Syntax	GetInputUDSParams(<*udsParams*>, <*propList*>, <*userSelectionForDynamicProbes*>)

Python Example	`# Returns list of UDSParams and list of dynamic properties`
	`# Adds setup time properties to the propList`
	`def GetInputUDSParams(self, udsParams, propList, userSelectedDynamicProbes):`
	
	`  # Add the probes. We need only one double quantity`
	`  param1 = UDSProbeParams("probe1", "double quantity probe", Constants.kDoubleParamStr, "", "")`
	`  udsParams.Add(param1)`
	
	`  # Add the properties we want the user to supply`
	`  # In this case, we will ask for a start/end range for`
	`  # X parameters. Since we cannot reasonably provide defaults`
	`  # as we have no idea what the sweep limits will be, we will`
	`  # also ask if the limits are to be activated.`
	`  prop = propList.AddNumberProperty("X Min", "0")`
	`  prop.Description = "Start X value to consider"`
	
	`  prop = propList.AddNumberProperty("X Max", "1")`
	`  prop.Description = "End X value to consider"`
	
	`  # For menus, the first option is the default.`
	`  prop = propList.AddMenuProperty("Activate X Limits", ["No", "Yes"])`
	`  prop.Description = "Activate X range"`
	
	`  return True`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GetDynamicProbes

This is the primary mechanism by which the UDO script obtains the probe data (as double precision values) for its compute process.

UI Access	NA		
Parameters	Name <*dynamicProbes*>	Type List< UDSDynamicProbes >	Description [out] List of dynamic probes
Return Value	Boolean. If true, the method was successful. If false, it was not.		

Python Syntax	GetDynamicProbes(<*dynamicProbes*>)

Python Example	`# Returns list of UDSParams and list of dynamic properties`
	`# output UDSDynamicProbeCollection probes`
	`  def GetDynamicProbes(self, probes):`
	`  pass`

Compute

This is the main computation method which generates the data for the quantities that make up the UDO solution.

UI Access	The data is received from the UI using IUDSInputData. It is processed and the result data is sent to the UI using IUDSOutputData.		
Parameters	Name <*inData*> <*outData*> <*propList*> <*progressMonitor*>	Type IUDSInputData IUDSOutputData IPropertyList IProgressMonitor	Description Used to get the input probe data. Used to set the UDO solution quantity and sweep data. Used to get the user entered values for each of the properties defined during the GetInputUDSParams call. This can be used to set progress for long running calculations, check for user initiated abort etc.
Return Value	Boolean. If true, the method was successful. If false, it was not.		

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Python Syntax	Compute (<*inData*>, <*outData*>, <*propList*>, <*progressMonitor*>)

Python Example	`# IUserDefinedSolutionHandle API implementation.`
	`# Calculates output values and sets them using IUDSInputData/IUDSOutputData API.`
	`def Compute(self, inData, outData, propList, progMon):`
	
	`  # Get the sweeps associated with the probe and validate`
	`  # use the probe name that we had defined earlier`
	`  sweeps = inData.GetSweepNamesForProbe("probe1")`
	`  if (sweeps == None or sweeps.Count > 1):`
	`  AddErrorMessage(self.GetName() + "Unexpected sweep count 0 or > 1 in Compute")`
	`  return False`
	
	`  # Get the data associated with our probe`
	`  probeData = inData.GetDoubleProbeData("probe1")`
	`  sweepData = inData.GetSweepsDataForProbe("probe1", sweeps[0])`
	
	`  # Get the user specified properties.`
	`  # Note that ideally, these "X Min" etc names should be`
	`  # written as constant members and referred to in both`
	`  # the GetInputUDSParams and in Compute to reduce the`
	`  # change of typos.`
	`  useXRangeProp = propList.GetMenuProperty("Activate X Limits").SelectedMenuChoice`
	`  xRangeStart = propList.GetNumberProperty("X Min").ValueSI`
	`  xRangeEnd = propList.GetNumberProperty("X Max").ValueSI`
	
	`  # At this stage, one can look at the`
	`  # RequestedQuantities and create a dictionary to later`
	`  # check against. However, I am simply computing all`
	`  # the quantities.`
	`  minVal = 0`
	`  maxVal = 0`
	`  avgVal = 0`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
# Check if we need to perform range computation
if useXRangeProp == "Yes":
  seenAny = False
  avgSum = 0
  count = 0

# zip is used since we also need to pull in sweep data
# an index and the array notation could also have been
# used
for probeVal, sweepVal in zip(probeData, sweepData):
  if sweepVal < xRangeStart or sweepVal > xRangeEnd:
    pass

# Note that in a better written script, this code
# would be refactored into its own function to
# avoid code duplication
if not seenAny:
  minVal = probeVal
  maxVal = probeVal
  avgSum = probeVal
  seenAny = True
  count = 1
else:
  if probeVal < minVal:
    minVal = probeVal

  if probeVal > maxVal:
    maxVal = probeVal

  avgSum += probeVal
  count += 1

if seenAny:
  avgVal = avgSum/count

else:
  seenAny = False
  avgSum = 0
  for probeVal in probeData:
    if not seenAny:
      minVal = probeVal
      maxVal = probeVal
      avgSum = probeVal
```

Data Types Used in UDO Python Scripts

There are several types that you must use while authoring a Python script. Some of them are used to pass data from the UI to a Python script and to provide interface for working with this data. Some are used to pass data from a Python script to the UI.

To pass data from a Python script to the UI, the objects must be created in the Python script. Then they can be set as a function's return values or set to the output parameters using their API.

Constants

- **kTraceTypeStr** : string constant used to specify an input of trace type
- **kSolutionTypeStr** : string constant used to specify an input of solution type
- **kNumberTypeStr** : string constant used to specify an input of number type
- **kTextTypeStr** : string constant used to specify an input of text type
- **kBoolTypeStr** : string constant used to specify an input of boolean type
- **kStandardReportStr** : string constant to specify a standard report
- **kEyeDiagramReportStr** : string constant to specify an eye diagram report
- **kUserDefinedReportStr** : string constant to specify a user defined report
- **kSweepDomainStr** : string constant to specify the sweep domain
- **kTimeDomainStr** : string constant to specify the time domain

Abstract Classes

- IProgressMonitor
- IUDSInput
- IUDSOutput

IUDSInputData

The purpose of this class is to get data (probe and sweep) from Desktop. The IUDSInputData abstract class declares the following abstract methods:

- GetDoubleProbeData
- GetSweepsDataForProbe
- GetComplexProbeData
- GetSweepNamesForProbe
- GetRequiredQuantities

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- GetVariableValues
- GetInterpolationOrdersData

Examples in this section are just to show proper syntax of the function calls. For actual usage of the class, see the Compute function's example.

GetDoubleProbeData

This is the primary mechanism by which the UDO script obtains the probe data (as double precision values) for its compute process.

UI Access	NA		
Parameters	Name <*probeName*>	Type String	Description Name of the probe for which data is requested. This is one of the many probes supplied during a call to the UDO's GetInputUDSParams method. Each probeName must be unique within an UDO.
Return Value	Double array of data for the specified probe if the probe exists or null if the probe is unknown.		

Python Syntax	GetDoubleProbeData (<*probeName*>)
Python Example	`# doubleData is a list of floats` `doubleData = inData.GetDoubleProbeData("probe1")`

GetSweepsDataForProbe

All probe data that is supplied is associated with one or more sweep (an intrinsic quantity like Time, Frequency, Theta, Phi, etc. that is swept) quantities.

UI Access	NA		
Parameters	Name <*probeName*> <*sweepName*>	Type String String	Description Name of the probe for which data is requested. This is one of the many probes supplied during a call to the UDO's GetInputUDSParams method. Each probeName must be unique within an UDO. Name of the sweep.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Return Value	Double array of data for the specified probe and sweep.

Python Syntax	GetSweepsDataForProbe(<*probeName*>, <*sweepName*>)
Python Example	`# sweepData is C# Array of doubles (floats in python)` `sweepData = inData.GetSweepsDataForProbe ("FarFieldsProbe","Freq"])`

GetComplexProbeData

The primary mechanism by which the UDO retrieves data for its input probes (if it expects complex data for the probe).

UI Access	NA		
Parameters	Name <*probeName*>	Type String	Description Name of the probe for which data is requested. This is one of the many probes supplied during a call to the UDO's GetInputUDSParams method. Each probeName must be unique within an UDO.
Return Value	Double array (float in Python) of data for the specified probe. Each pair of floats represents one complex number. The first value is for real part and the second value it the imaginary part. For instance, array [10.0, 0, 5.1, 2.1] represents 2 complex numbers: (10.0, 0) and (5.1, 2.1).		

Python Syntax	GetComplexProbeData(<*probeName*>)

Python Example	`# complexDataAsDouble is C# Array of doubles (floats in Python)`
	`# each pair of floats represents one complex number`
	`complexDataAsDouble = inData.GetComplexProbeData ("FarFieldsProbe")`
	`# creating a list of complex numbers from complexDataAsDouble array`
	`complexData = []`
	`if complexDataAsDouble != None:`
	`  for i in xrange(0,complexDataAsDouble.Count, 2):`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	`complexData.append(complex(complexDataAsDouble [i],complexDataAsDouble[i+1]))`

GetSweepNamesForProbe

Retrieves a list of sweep quantity names associated with a given probe. This also indicates the dimensionality of the data. One name implies that the probe-data is 2D (probe-quantity vs Sweep Quantity) and two names implies 3D data (probe-quantity vs Sweep 1 X Sweep 2).

UI Access	NA		
Parameters	Name <*probeName*>	Type String	Description Name of the probe for which data is requested. This is one of the many probes supplied during a call to the UDO's GetInputUDSParams method. Each probeName must be unique within an UDO.
Return Value	IList<string> - list of sweep names for the current probe name.		

Python Syntax	GetSweepNamesForProbe(<*probeName*>)
Python Example	`# sweepNames is C# Array of strings` `sweepNames = inData.GetSweepNamesForProbe("FarFieldsProbe")`

GetRequiredQuantities

A given UDO can specify that it provides one or more computed quantities. The user might choose to create a report from only a few among the various available UDO outputs. This function returns the list of UDO output quantities that the user requested. Only these need be computed in the UDO's Compute method.

UI Access	NA
Parameters	None
Return Value	IList<string>

Python Syntax	GetRequiredQuantities()

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Python Example	`# quantities is C# Array of strings` `quantities = inData.GetRequiredQuantities()`

GetVariableValues

This allows the UDO to obtain the names and values of all the design variables for which the UDO quantities are being requested.

UI Access	NA
Parameters	None
Return Value	IDictionary<string,string> of key-value pairs for variables. Both key and value are strings.

Python Syntax	GetVariableValues()

Python Example	`# theDict is C# Dictionary<string, string>`
	`theDict = inData.GetVariableValues()`
	`if theDict != None:`
	`  #varPair is of .Net KeyValuePair type`
	`  for varPair in theDict:`
	`  varName = varPair.Key #string`
	`  varValue = varPair.Value #string`

GetInterpolationOrdersData

Returns the interpolation orders that are associated with the probe-data. The probe data is specified at each value of the various sweeps. Any value in between the sweep data points, can use the interpolation data to get a possibly more accurate (compared to linear interpolation) inter-sweep value.

UI Access	NA		
Parameters	Name *<probeName>*	Type String	Description Name of the probe for which data is requested. This is one of the many probes supplied during a call to the UDO's GetInputUDSParams method. Each probeName must be unique within an UDO.
Return Value	Byte array of interpolation order for the specified probe. These are to be		

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	treated as 8-bit signed integers, that is, their values range from 0-127.

Python Syntax	GetInterpolationOrdersData(<*probeName*>)

Python Example	`# interData is C# Array of bytes (integers in Python)`
	`interData = inData.GetInterpolationOrdersData(kProbeNames[0])`
	`for interValue in theDict:`
	`  # interValue and order are integers`
	`  order = interValue`

IUDSOutputData

This type is a twin of the IUDSInputData in that it is used to store the values computed by the UDO's Compute method. The IUDSOutputData abstract class declares the following abstract methods:

- SetSweepsData
- SetDoubleQuantityData
- SetComplexQuantityData

Examples in this section are just to show proper syntax is function calls. For actual usage of the class, see the Compute function example.

SetSweepsData

Each quantity that is computed by the UDO can be associated with a sweep. If it is, the values that make up the sweep's data points must be specified using this call.

UI Access	NA		
Parameters	Name	Type	Description
	<*sweepName* >	String	Name of the sweep
	<*sweepData*>	List<floats>	Sweep data for the specified sweep.
Return Value	Boolean. If true, the event was handled successfully. If false, it was not.		

Python Syntax	SetSweepsData (<*sweepName*>,<*sweepData*>)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Python Example	`sweepList = [12.3, 14.5, 16.7]` `outData.SetSweepsData("Freq", sweepList)`

SetDoubleQuantityData

This method is used to record the computed quantity data for each output that is computed. Please note that unless all the sweeps are reduced, this should be used in conjunction with SetSweepsData.

UI Access	NA		
Parameters	Name <*qtyName*> <*qtyData*>	Type String List<Floats>	Description Name of the quantity. Quantity data for the specified quantity.
Return Value	Boolean. If true, the event was handled successfully. If false, it was not.		

Python Syntax	SetDoubleQuantityData (<*qtyName*>,<*qtyData*>)
Python Example	`doubleList = [12.3, 14.5, 16.7]` `outData.SetDoubleQuantityData("V1PlusV2", doubleList)`

SetComplexQuantityData

If the quantity computed is a complex quantity, use this method to set the quantity values. Any sweep values must be set separately via the SetSweepsData method.

UI Access	NA		
Parameters	Name <*qtyName* > <*qtyData* >	Type String List<floats>	Description Name of the quantity. Quantity data for the specified quantity. Complex numbers are passed as pairs of floats in a list.
Return Value	Boolean. If true, the method was successful. If false, it was not.		

Python Syntax	SetComplexQuantityData (<*qtyName*>,<*qtyData*>)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Python Example	doubleFromComplexList=[]
	complexList = [(1+1j), (2+4j), (9.1+3.2j)]
	for aComplex in complexList:
	    doubleFromComplexList.append(aComplex.imag)
	    doubleFromComplexList.append(aComplex.real)
	    outData. SetComplexQuantityData ("V1PlusV2", doubleFromComplexList)

Working With Properties for UDO

A property is the unit for collecting and using input from the user that is used to influence the UDO's Compute. These are initially set up when the UDOs **GetInputUDSParams** method is called and are retrieved in the UDO's Compute method.

There are three supported property types that could be used in the UDO script:

- INumberProperty to specify number properties (with unit support).
- IMenuProperty to allow the user to select from a list of options.
- ITextProperty to allow the user to enter text.

The IPropertyList type implements a collection for these properties:

- IPropertyList Abstract class
- IProperty Abstract class
- INumberProperty Abstract class
- ITextProperty Abstract class
- IMenuProperty Abstract class

IPropertyList Abstract Class

Attributes:

- AllProperties (IEnumerable<IProperty> - see IProperty)
- NumProperties (int)

Functions:

- GetProperty(string propName): Returns a named property as an IProperty.
- GetMenuProperty (string propName): Returns the named property as an IMenuProperty.
- GetTextProperty (string propName): Returns the named property as an ITextProperty.
- GetNumberProperty (string propName): Returns the named property as an INumberProperty.
- DeleteProperty (string propName): Deletes an already added named property.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- AddNumberProperty(string name, string numberWithUnits): Adds a new number property. If a property with the same name already exists, it is overwritten.
- AddTextProperty(string name, string textValue): Adds a new named text property with the supplied value. Any existing property with the same name is overwritten.
- AddMenuProperty(string name, IList<string> menuChoices): Creates a new named menu property with the supplied list of choices. The default selection is set to item 0 (the first item). Any property with the same name is overwritten.

IProperty Abstract Class

Attributes:

- Name (string)
- Description (string)
- PropType (read-only EPropType - see Constants)

Constructor:

- IProperty(string name, EPropType type)

The class is used as base class for INumberProperty, IMenuProperty, and ITextProperty.

INumberProperty Abstract Class

Base class:

- abstract class IProperty

Attributes:

- ValueSI (read-only double)
- ValueInUnits (read-only double)
- Units (read-only string)
- HasUnits (read-only bool)

Constructor:

- INumberProperty(string name)

Functions:

- Set(string numberWithUnits)
- SetDouble(double number, string unitString)

ITextProperty Abstract Class

Base class:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- abstract class IProperty

Attributes:

- Text (string)

Constructor:

- ITextProperty(string name)

IMenuProperty Abstract Class

Base class:

- abstract class IProperty

Attributes:

- MenuSelection (int): This represents the index into the MenuChoices list.
- SelectedMenuChoice (string): This is the item in the MenuChoices list corresponding to the MenuSelection index.
- MenuChoices (IList<string>)

Constructor:

- IMenuProperty (string name)

Example:

```
# adding data to IPropertyList propList; used in Compute function
prop = propList.AddNumberProperty('Offset 1', '0')
prop.Description = 'Trace 1 Offset'
prop = propList.AddNumberProperty("TRATE", "800 MHz")
prop.Description = "Frequency"
prop = propList.AddTextProperty("Text", "The Text")
prop.Description = "Text Property"
prop = propList.AddMenuProperty('Operation', ['Add', 'Subtract',
'Max' ,'Min','Mean'])
prop.Description = 'Operation menu'

# reading data from IPropertyList propList; used in Validate function
numOfNumberProperties = 0
if propList != None and propList.AllProperties != None:
        for prop in propList.AllProperties:
                if prop.PropType == Constants.EPropType.PT_NUMBER:
                        numOfNumberProperties ++
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Other Application-Specific Classes Used in Python Scripts

This section describes other classes used in Python scripts:

Constants Class

UDSProbeParams Class

UDSDynamicProbes Class

QuantityInfo Class

IProgressMonitor Abstract Class

Constants Class

The constants used in a Python script are defined in the Constants class.

Attributes:

- kDoubleParamStr : string constant used to specify *double* as the type of a quantity
- kComplexParamStr: string constant used to specify *complex* as the type of a quantity
- Enum EPropType: (used to set property type)
  - EPropType.PT_NUMBER
  - EPropType.PT_TEXT
  - EPropType.PT_MENU

Example:

```
paramType = Constants.kDoubleParamStr
propType = Constants.EPropType.PT_NUMBER
```

UDSProbeParams Class

This class defines which data quantity that a UDO will be pulled from the design to compute the UDO output (results). The objects of this class must be created in a Python script with the GetInputUDSParams function. They are supplied to the Validate function if implemented.

Attributes:

- ProbeName (read-only string)
- ProbeDescription (read-only string)
- ParamType (read-only string)
- ReportTypeName (read-only string)
- ComponentExpression (read-only string)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Constructor: UDSProbeParams(string probeName, string probeDescription, string paramType, string reportTypeName, string componentExpression);

- probeName - required.
- probeDescription - optional (can be empty string).
- paramType - required; can be one of the Constants:
  - kDoubleParamStr
  - kComplexParamStr
- reportTypeName - optional (can be empty string)
- ComponentExpression - optional (can be empty string)

Example:

```
udsProbParam = UDSProbeParams("probe1","", Constants.kDoubleParamStr,
"", "",)
```

UDSDynamicProbes Class

Attributes:

- UDSParam (read-only UDSProbeParams)
- UserSelectedProbeName (read-only string)

Constructor: UDSDynamicProbes (UDSProbeParams udsParam, string userSelectedProbeName)

- udsParam - required
- userSelectedProbeName - required

Example:

```
udsProbParam = UDSProbeParams("probe1","", Constants.kDoubleParamStr,
"", "",)
selectedName = "probe1"
udsDynamicProbParam = UDSDynamicProbes(udsProbParam, selectedName )
```

QuantityInfo Class

Attributes:

- ParamType (read-only string)
- FullUnitType (read-only string)

Constructors:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- QuantityInfo(string paramType)
- QuantityInfo(string paramType, string fullUnitType)

Parameters:

- paramType can be one of the Constants:
  - kDoubleParamStr
  - kComplexParamStr
- fullUnitType is a case insensitive string representing full unit type. It is not defined in Constants. Instead you can use any of the units in string representation - for example, "mm" or"ghz".

Example:

```
quantityInfo1 = QuantityInfo(Constants.kDoubleParamStr)
quantityInfo2 = QuantityInfo(Constants.kDoubleParamStr,"ghz")
```

IProgressMonitor Abstract Class

The object of this class is a progress monitor. It displays a task's calculated progress in the UI and checks if the user has requested to abort the computation. Use this object for computations that take a long time to complete or if the UI might freeze during the computation. When displayed in the application, each progress message has four items:

- A task name
- A sub-task name
- The progress amount
- A button to abort the task in progress

This class provides the following functionality and abort interaction:

- SetTaskName (string taskName)
- SetSubTaskName (string subTaskName)
- BeginTask (string name)
- SetTaskProgressPercentage(int progressPercent)
- CheckForAbort()
- EndTask (bool passFail)

Example:

```
progMon.BeginTask("Process DQS")
progMon.SetSubTaskName("Compute UI segments")
progMon.SetTaskProgressPercentage(33)
progMon.SetSubTaskName("Compute the rest")
progMon.SetTaskProgressPercentage(100)
progMon.EndTask(True)
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> There should be the same number of calls to BeginTask as to EndTask.

SetTaskName

Sets the name of the task whose progress is being monitored.

UI Access	NA		
Parameters	Name <*TaskName*>	Type String	Description Name of the task
Return Value	None		

Python Syntax	SetTaskName (<*TaskName*>)
Python Example	`progMon.SetTaskName("Compute UI")`

SetSubTaskName

Sets the name of the subtask whose progress is being monitored.

UI Access	NA		
Parameters	Name <*TaskName*>	Type String	Description Name of the task
Return Value	None		

Python Syntax	SetSubTaskName (<*TaskName*>)
Python Example	`progMon.SetSubTaskName("Compute UI segments")`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BeginTask

Sets the name of the task whose progress will be monitored. Call this method only once for each task and subtask.

UI Access	NA		
Parameters	Name <*Name*>	Type String	Description Name of the task
Return Value	None		

Python Syntax	BeginTask (<*Name*>)
Python Example	`progMon.BeginTask("Process DQS")`

SetTaskProgressPercentage

Sets the progress percentage of a task to a specific value.

UI Access	NA		
Parameters	Name <Percent>	Type Integer	Description Percent of progress
Return Value	None		

Python Syntax	SetTaskProgressPercentage (<*Percent*>)
Python Example	`progMon.SetTaskProgressPercentage(33)`

CheckForAbort

Checks if a user has aborted the task. Call this method if the quantities are computationally expensive. This method can be called multiple times.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UI Access	Abort button on the progress dialog.
Parameters	None
Return Value	Boolean flag that if true indicated that the user requested an abort and you should call EndTask. If false, allow the task to continue.

Python Syntax	CheckForAbort
Python Example	`should_abort = progMon.CheckForAbort`

EndTask

Stops a task from running. Call this method only once for each task and subtask. In a script, there should be the same number of BeginTask calls as **EndTask** calls.

UI Access	NA		
Parameters	Name <PassFail>	Type Boolean	Description Flag that indicates whether to continue the main task or not. If true, the task will continue to process the next subtask. If false, the main task stops and an error icon appears in the UI.
Return Value	None		

Python Syntax	EndTask (<*PassFail*>)
Python Example	`progMon.EndTask(True)`

Using .NET Collection Classes and Interfaces in Python Scripts

Some of the API functions specified above use .Net collection classes and interfaces, that is, Array class, IList interface, IEnumerable interface, and IDictionary interface. The following section describes how to work with the .Net collection objects in Python scripts.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

.NET Array, IEnumerable, and IList objects can be indexed and iterated over as if they were Python lists. You can also check for membership using 'in'. To get .Net Array and IList sizes you can use Python's 'len' or .Net 'Count'.

Example:

Getting size:

```
arraySize = doubleDataArray.Count
   arraySize = len(doubleDataArray)
listSize = sweepsNamesList.Count
 listSize = len(sweepsNamesList)
```

Iterating:

```
for sweep in sweepsNamesList:
   print sweep
for in in xrange(listSize)
      print sweepsNamesList[i]
```

Checking for membership:

```
if 'Time' in sweepsNamesList:
   doThis()
  else:
   doThat()
```

For .NET IDictionary, the same as for Array and IList, you can get size with 'len' or 'Count' and check for membership of the keys using 'in'. Getting values for the keys also works the same way as in Python 'dict'.

Example:

Getting size:

```
varValuesSize = varValues.Count
 varValuesSize = len(varValues)
```

Checking for membership:

```
if 'offset' in varValues:
   print varValues['offset']
```

Getting value:

```
if 'offset' in varValues:
   offsetValue = varValues['offset']
```

As for iteration .NET Dictionary is different from Python dict. While iterating, python dict will return keys, .Net Dictionary will return .Net KeyValuePair.

Example:

Iterating:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

for .NET IDictionary:

```
for varPair in varValues: #varPair is of .Net KeyValuePair type
     varName = varPair.Key
    varValue = varPair.Value
```

for Python dict:

```
for varName in varValues:
   varValue = varValues[varName]
```

You can use Python types instead of .NET types if you prefer. For this, you need to cast .NET array and .Net iList to Python list type and .NET Dictionary to Python dict type.

Casting should not be used for data arrays - it can be extremely costly for the memory usage as well as time consuming.

Example:

```
aPythonList = list(dotNetArray)
  aPythonList = list(dotNetList)
   aPythonDict = dict(dotNetDictionary)
```

User-Defined Outputs: Messaging Methods

Messaging methods are provided to convey additional information to the user from any of the UDOs methods. The Compute function is the one typically location where such use is anticipated. Any message sent via these functions are displayed in the application's message window using the appropriate icon.

These functions can also be used for debugging purposes.

- AddErrorMessage
- AddInfoMessage
- AddWarningMessage

Example script:

```

return True
```

AddErrorMessage

Call this method to convey an error condition to the user.

UI Access	NA		
Parameters	Name <message>	Type String	Description Error message
Return Value	None		

Python Syntax	AddErrorMessage (<*message*>)
Python Example	`AddErrorMessage(self.GetName() + "Unexpected sweep count 0 or > 1 in Compute"))`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

AddInfoMessage

Call this method to convey an informational message to the user. This is the call to use when outputting messages for debugging purposes.

UI Access	NA		
Parameters	Name <message>	Type String	Description Warning message
Return Value	None		

Python Syntax	AddInfoMessage (<*message*>)
Python Example	`AddInfoMessage("Enter starting X value.")`

AddWarningMessage

Call this method to convey a warning message, typically used for conditions that are not ideal but can be tolerated by the script.

UI Access	NA		
Parameters	Name <message>	Type String	Description Warning message
Return Value	None		

Python Syntax	AddWarningMessage (<*message*>)
Python Example	`AddWarningMessage("Unexpected sweep count in Compute")`

User-Defined Outputs: Script Organization

As described in the Introduction section, the UDO scripts should all reside under the **UserDefinedOutputs** folder under either of the three library locations (system, user, or personal).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Using Script Libraries

If you decide that you need base classes, additional data files, and etc., to organize your UDOs better, you can do so. This type of library organization allows code reuse between similar UDOs and can be very helpful. There is special support provided for this type of script-library organization:

- **All script-library and other support files need to be in a *Lib* sub-directory under the *UserDefinedOutputs* directory**. Any *.py* files found in such **Lib** directories are ignored and not displayed in the GUI as a valid UDO choice.
- For a UDO script at any given directory depth, all Lib directories in its parent directories will be automatically added to the system include path (and so, any support script files from any Lib directory through the top level *UserDefinedOutputs* directory can be imported).

Using Additional .NET Assemblies

Because the UDO functionality uses IronPython, we have access to the full .NET eco system. If needed, any subset of the UDO functionality can be implemented in any .NET language and used by the UDO script. There are simple rules to follow to achieve this.

1. Build your .NET assembly for .NET 2.0 runtime.
2. Drop the built assembly in any **Lib** directory upstream of the UDO script location: that is, if you have your UDO script in *C:\Users\x\PersonalLib\UserDefinedOutputs\a\b\c\myudo.py* and have a .NET assembly called *com.Acme.UDOLib* You can keep the .NET assembly under:
    - UserDefinedOutputs\Lib
    - UserDefinedOutputs \a\Lib
    - UserDefinedOutputs \a\b\Lib
    - UserDefinedOutputs\a\b\c\Lib
3. Add the following lines to your Python script:
    - `Import clr`
    - `clr.AddReference("com.Acme.UDOLib")`
    - `import com.Acme.UDOLib` -or- `from com.Acme.UDOLib import * etc`

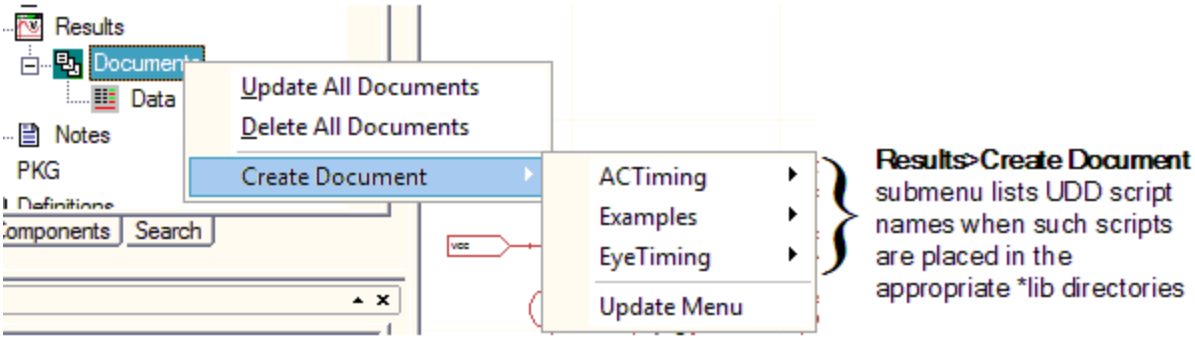
If for some reason you cannot place the .NET assemblies into a Lib directory under *UserDefinedOutputs*, you need to do a couple more steps before step 3 listed above.

```
Import sys
sys.path.append("full path to your .NET assembly location")
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

User-Defined Documents (UDDs)

User-defined documents (UDDs) are custom reports that you define through IronPython scripts. Once placed in a Lib directory, you can access the scripts via the **Create Document** command. The scripts describe a *Create User Defined Document* dialog box that lets you specify trace and solution inputs. After you confirm your input selections, XML, HTML, and PDF documents are generated. A web browser window opens to display the generated HTML file. The created document appears in the Project Manager, under Results in the Documents folder.



The general UDD process flow is as follows:

The UDD Python scripts must be placed in the **UserDefinedDocuments** directory under either of **syslib**, **userlib**, or **Personallib** with any subdirectory structure needed. The Lib directory can contain Python scripts that have common code that other scripts can use.

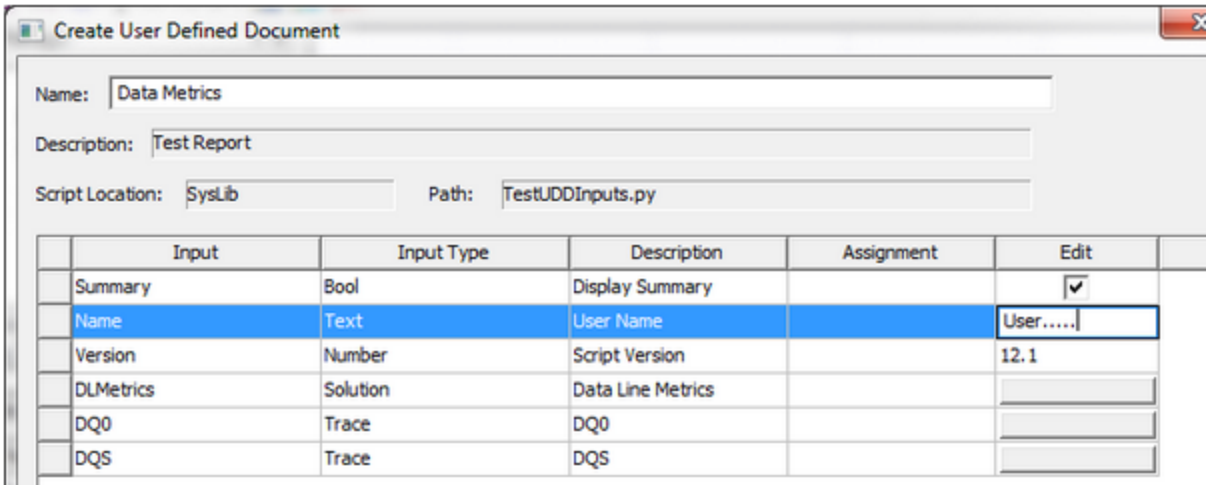
Use **Circuit** > **Results** > **Create Document**> **Update Menu** to refresh the menu to include the new UDD scripts that have been copied to syslib, userlib, or Personallib, or to exclude them if they have been deleted after the launch of desktop.

The UDD scripts that are in syslib/UserDefinedDocuments, userlib/UserDefinedDocuments, or Personallib/UserDefinedDocuments are available through the **Circuit** > **Results** > **Create Document** menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create User-Defined Document Inputs

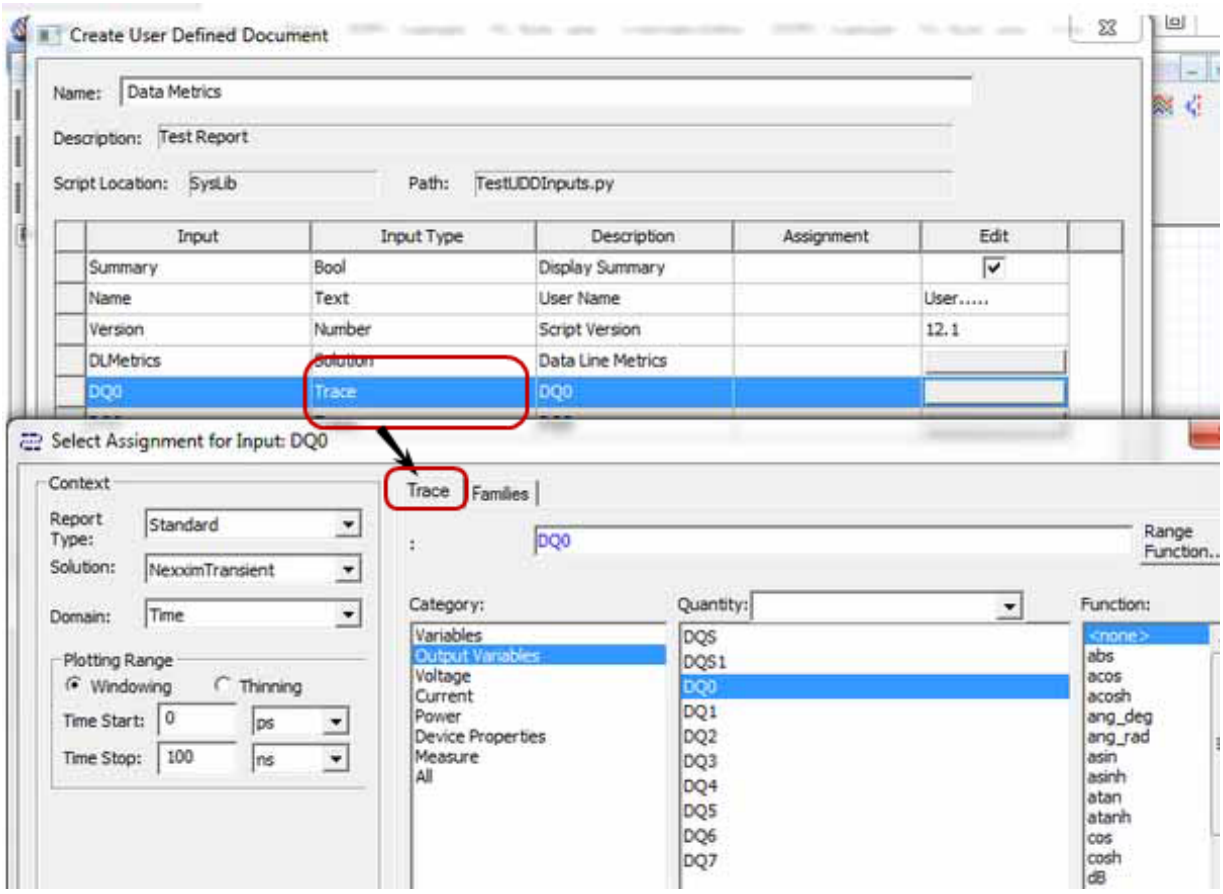
User-defined documents allow data from traces, solutions, and report types as inputs. A UDD can specify the named inputs, which you select or enter the values of in the *Create User Defined Document* dialog box that displays when you run **Circuit** > **Results** > **Create Document**> <*scriptName*>.



Input Types can be of Boolean, number, text, trace, or solution type. The boolean, number, and text type can be given a default value that you can interactively override when the document is created or modified. For example, you can select a trace when you create or modify a UDD document. The trace data is available to the user and can be accessed from the Python script.

At the time of selection, you can choose from the *Reporter* dialog box the report type (Standard, Eye Diagram, User Defined), solution name, context, and the quantity for which you want the trace data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

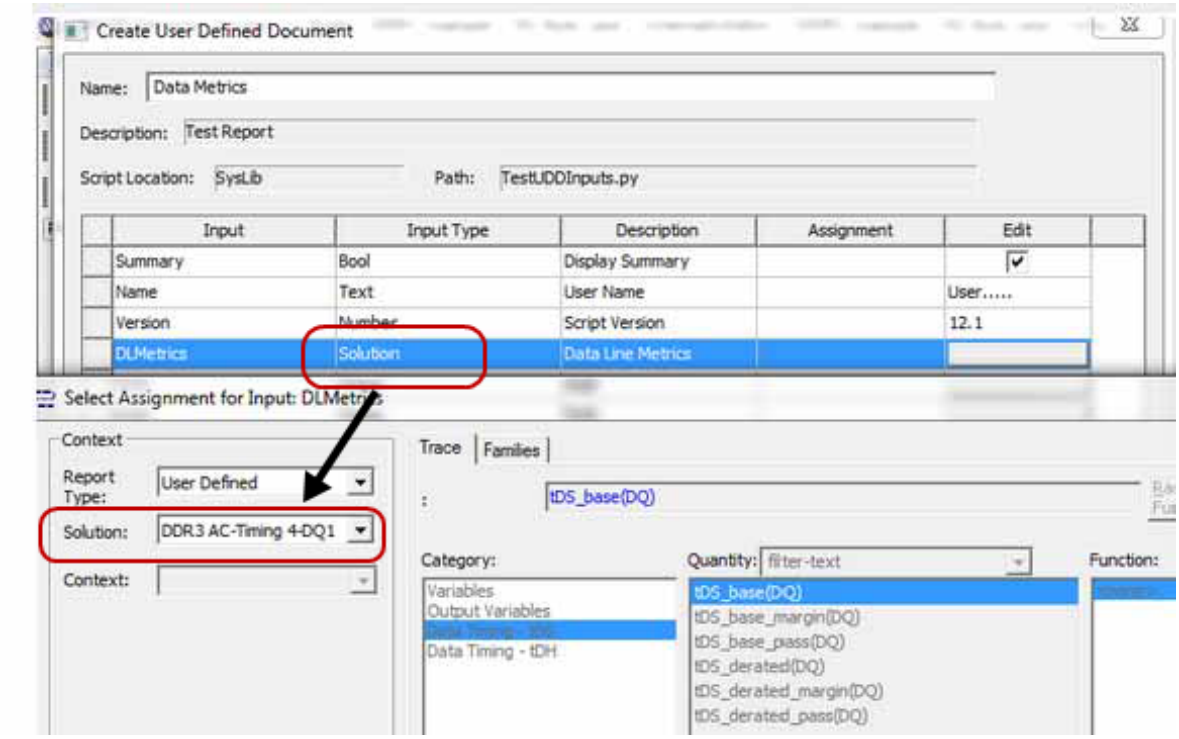


Input Type can also be Solution. You can select an entire solution when the document is created or modified. The solution data in its entirety is now available to the user and can be accessed from the Python script.

At the time of selection, you can choose from the reporter dialog the report type (Standard, Eye Diagram, User Defined), solution name, and context. A specific quantity cannot be selected since data for all quantities in the solution are available.

> **Note:** The Category/Quantity/Function portion of the dialog is disabled for user input.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

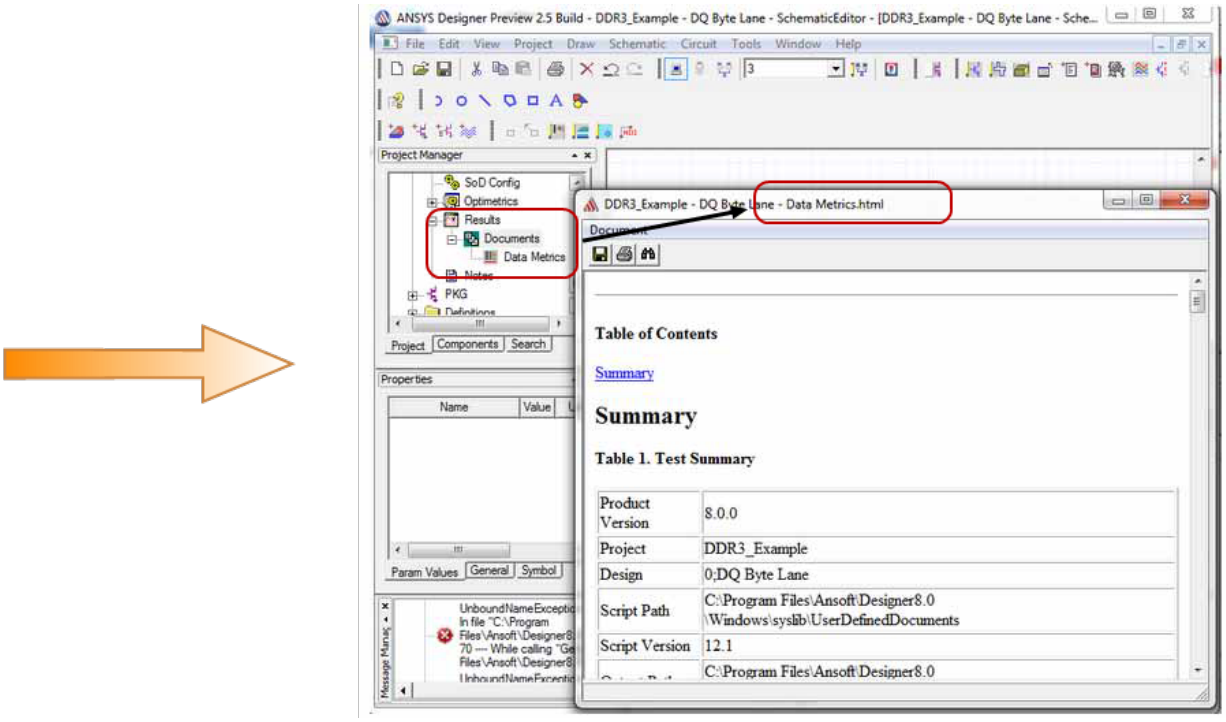


UDD Document Creation and Display

After all the input selections for a UDD are confirmed, based on the script, XML, HTML, and PDF documents are generated based on the inputs provided by the user. (The XML, HTML, and PDF generation is based on specific calls in the Python script, which are explained in a following section.) A web browser window also opens to display the generated HTMLfile.

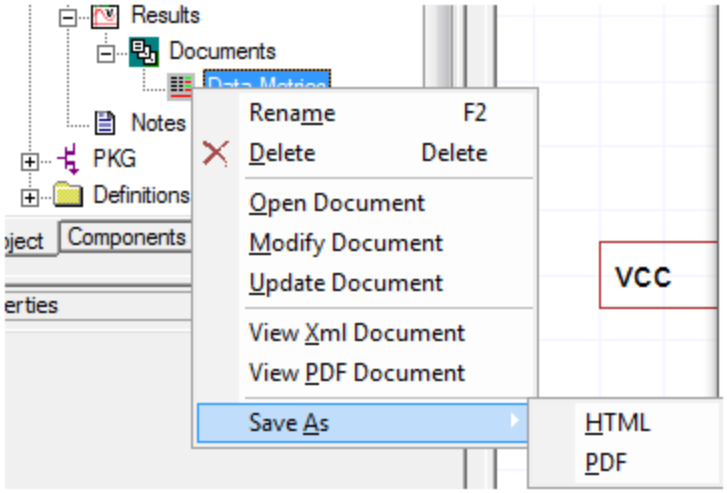
The created document will be placed under a new folder named **Documents** under the **Results** folder. All documents that are created by the user for the design will be placed under this folder.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Managing Documents Listed in the Project Window Under Results

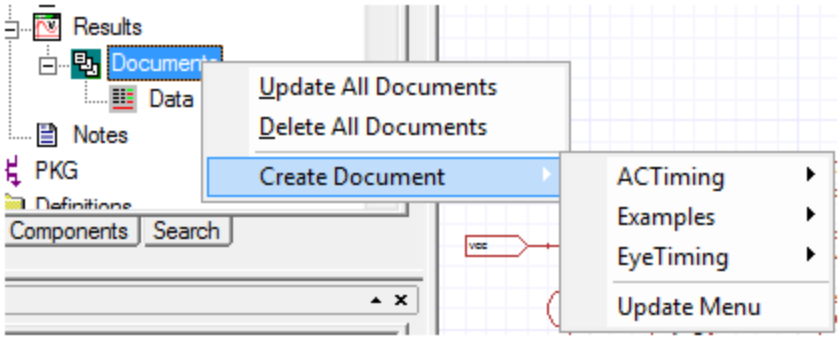
Right-click a user-defined document displayed in the Project Manager tree to bring up a menu where you can rename, delete the document. **Open document** opens the web browser with the html document. **Modify document** opens the setup dialog box, where you can change the selections for the input. To view the XML and the PDF document simply choose the appropriate menu items. There is also a menu item to save the document in a different location.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Documents Folder's Context Menu

Right-click the documents folder has the menu options to **Update All Documents** or **Delete All Documents**. It also provides the option of creating a document from here.

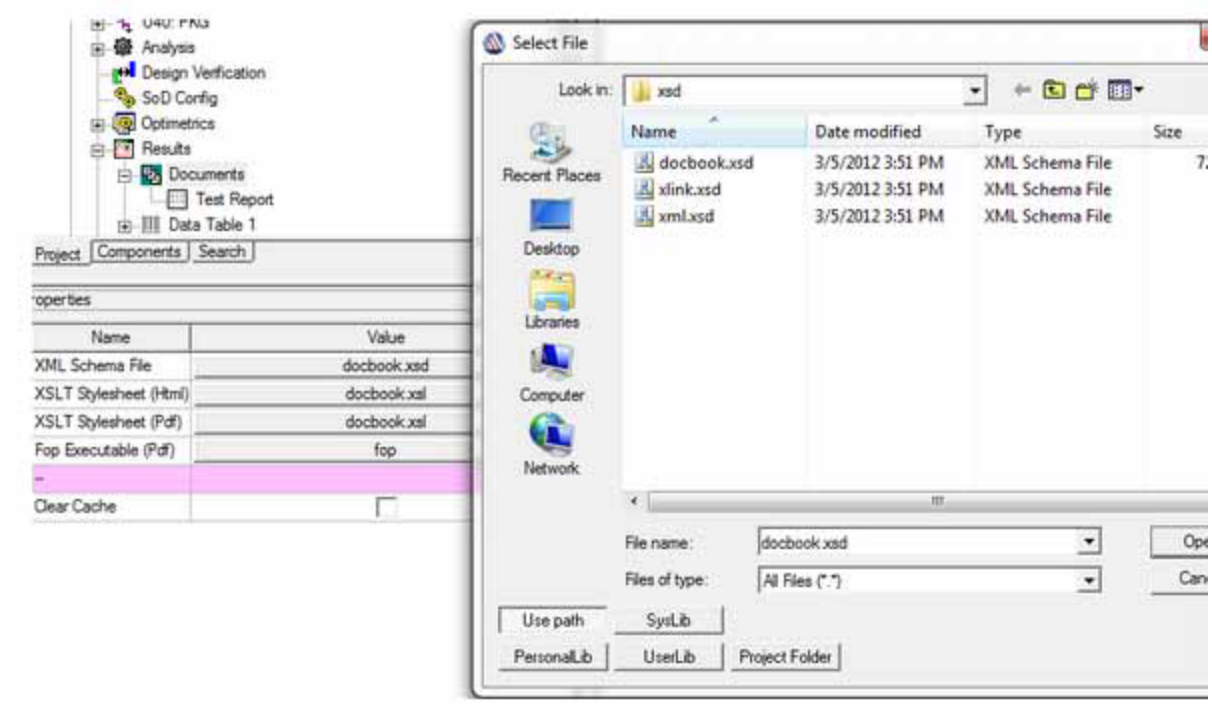


Document Folder's Property Window

When the documents folder is selected, the *Property* window shows the following properties:

- **XML Schema File** - File path to the XML schema file.
- **XSLT StyleSheet (HTML)** - File path to the XSLT stylesheet file used for HTML generation.
- **XSLT StyleSheet (Fo)** - File path to the XSLT stylesheet file used for PDF generation.
- **Fop Executable (PDF)** - File path the Fop executable used for PDF generation.
- **Clear Cache** - Clears the cached XSL transform object and forces creation of a new one. (The caching is done to save time during document generation, so subsequent generation or update of the document can use the cached transform object. But sometimes you may want to force a recompile of the document if you change the stylesheet).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

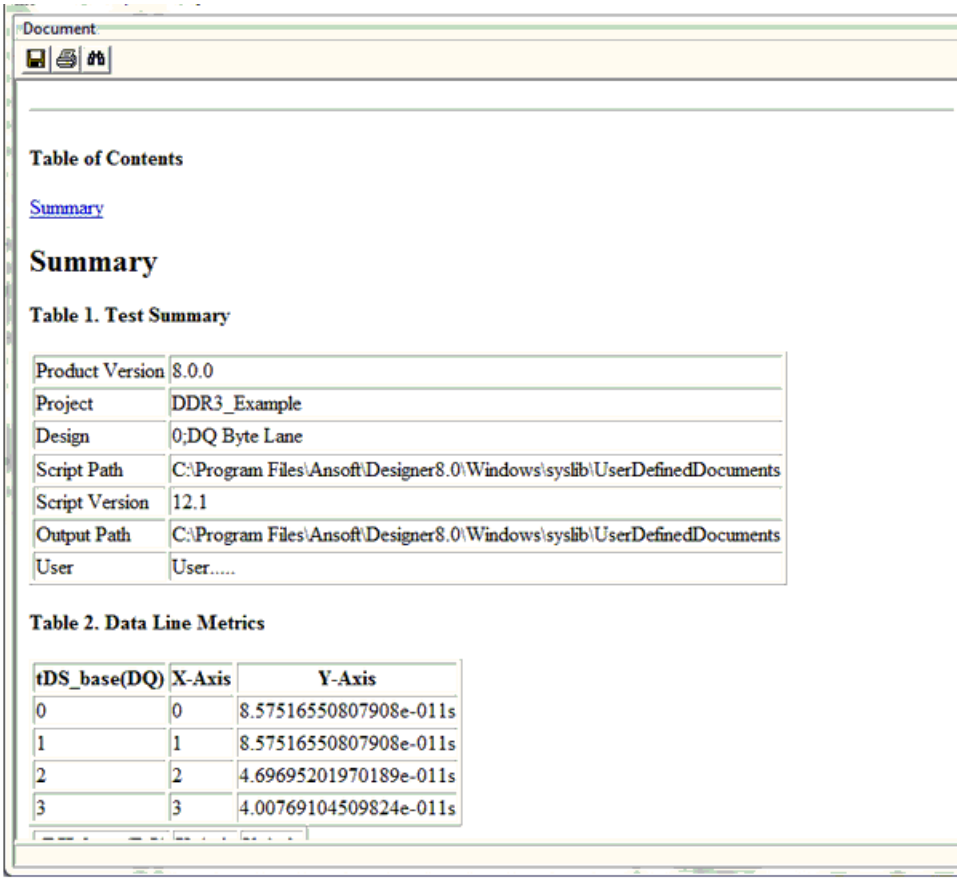


The XML, HTML, and PDF generation require the XML schema file and XSLT stylesheets to generate proper output. In addition, the PDF generation requires a FOP executable. You can use the defaults provided in the installation or provide the file paths of your own preferred stylesheets and fop executable installed in his machine.

Viewing UDDs with an HTML Web Browser

The XML and HTML documents can be viewed in a web browser with some basic functionality like printing the document, searching the document for a phrase or sentence, and saving the document.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



UDD Script Libraries

Base classes and data files shared between similar UDDs can be organized to reuse the code in a better way. All script-library and other support files need to be in a Lib sub-directory under the UserDefinedDefinitions directory. Any .py files found in such Lib directories are ignored and not displayed in the GUI as a valid UDD choice. For a UDD script at any given directory depth, all Lib directories in its parent directories will be automatically added to the system include path (and so, any support script files from any Lib directory through the top level UserDefinedDefintions directory can be imported).

The UDD functionality uses IronPython so we have access to all the .NET assembles. If needed, any subset of the UDD functionality can be implemented in any .NET language and used by the UDD script. There are simple rules to follow to achieve this.

1. Build your .NET assembly for .NET 2.0 runtime.
2. Drop the built assembly in any Lib directory upstream of the UDD script location: that is, if you have your UDD script in C:\Users\x\PersonalLib\UserDefinedDefintions\a\b\c\myudd.py and have a .NET

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

assembly called com.Acme.UDDLib You can keep the .NET assembly under:

- UserDefinedDefintions\Lib
- UserDefinedDefintions\a\Lib
- UserDefinedDefintions\a\b\Lib
- UserDefinedDefintions\a\b\c\Lib

3. Add the following lines to your Python script:

```
Import clr

clr.AddReference("com.Acme.UDDLib")

import com.Acme.UDDLib -or- from com.Acme.UDDLib import * etc
```

If for some reason you cannot place the .NET assemblies into a Lib directory under UserDefinedDefintions, you need to do a couple more steps before step 3 listed above:

```
Import sys

sys.path.append("full path to your .NET assembly location")
```

User-Defined Documents: Python Script API

A User-Defined Documents (UDD) extension is implemented as an IronPython script that defines a class with a specific name: UDDExtension which derives from a specific base class IUDDPluginExtension and implements its abstract methods.

This API supports multiple data types in the forms of constants and classes. It also has several input interfaces.

User-Defined Document scripting commands are provided in this product's scripting guide. An complete example with a line by line explanation of how to use these methods is available.

Import Statements

The base class to be used and the types it uses in turn are contained in .NET assemblies. The use of these requires that the assemblies be imported into the UDD script: the following import statements should be added to the top of the python script:

```
from Ansys.Ansoft.DocGeneratorPluginDotNet.DocGenerator.API.Data
import *
from
Ansys.Ansoft.DocGeneratorPluginDotNet.DocGenerator.API.Interfaces
import *
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Data Types Used in UDD Python Scripts

There are several types that you must use while authoring a Python script. Some of them are used to pass data from the UI to a Python script and to provide interfaces for working with this data. Some are used to pass data from a Python script to the UI.

To pass data from a Python script to the UI, the objects of the C# class must be created in the Python script using their C# constructors. Then they can be set as a function's return values or set to the output parameters using their API.

Constants

- **kTraceTypeStr** : string constant used to specify an input of trace type
- **kSolutionTypeStr** : string constant used to specify an input of solution type
- **kNumberTypeStr** : string constant used to specify an input of number type
- **kTextTypeStr** : string constant used to specify an input of text type
- **kBoolTypeStr** : string constant used to specify an input of boolean type
- **kStandardReportStr** : string constant to specify a standard report
- **kEyeDiagramReportStr** : string constant to specify an eye diagram report
- **kUserDefinedReportStr** : string constant to specify a user defined report
- **kSweepDomainStr** : string constant to specify the sweep domain
- **kTimeDomainStr** : string constant to specify the time domain

Abstract Classes

- IProgressMonitor Abstract Class
- UDDExtension Class
- UDDInputData class
- UDDInputParams class

IProgressMonitor Abstract Class

The object of this class is a progress monitor. It displays a task's calculated progress in the UI and checks if the user has requested to abort the computation. Use this object for computations that take a long time to complete or if the UI might freeze during the computation. When displayed in the application, each progress message has four items:

- A task name
- A sub-task name
- The progress amount
- A button to abort the task in progress

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This class provides the following functionality and abort interaction:

- SetTaskName (string taskName)
- SetSubTaskName (string subTaskName)
- BeginTask (string name)
- SetTaskProgressPercentage(int progressPercent)
- CheckForAbort()
- EndTask (bool passFail)

Example:

```
progMon.BeginTask("Process DQS")
progMon.SetSubTaskName("Compute UI segments")
progMon.SetTaskProgressPercentage(33)
progMon.SetSubTaskName("Compute the rest")
progMon.SetTaskProgressPercentage(100)
progMon.EndTask(True)
```

> **Note:**
>
> There should be the same number of calls to BeginTask as to EndTask.

SetTaskName

Sets the name of the task whose progress is being monitored.

UI Access	NA		
Parameters	Name <*TaskName*>	Type String	Description Name of the task
Return Value	None		

Python Syntax	SetTaskName (<*TaskName*>)
Python Example	`progMon.SetTaskName("Compute UI")`

SetSubTaskName

Sets the name of the subtask whose progress is being monitored.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UI Access	NA		
Parameters	Name <*TaskName*>	Type String	Description Name of the task
Return Value	None		

Python Syntax	SetSubTaskName (<*TaskName*>)
Python Example	`progMon.SetSubTaskName("Compute UI segments")`

BeginTask

Sets the name of the task whose progress will be monitored. Call this method only once for each task and subtask.

UI Access	NA		
Parameters	Name <*Name*>	Type String	Description Name of the task
Return Value	None		

Python Syntax	BeginTask (<*Name*>)
Python Example	`progMon.BeginTask("Process DQS")`

SetTaskProgressPercentage

Sets the progress percentage of a task to a specific value.

UI Access	NA		
Parameters	Name <Percent>	Type Integer	Description Percent of progress
Return Value	None		

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Python Syntax	SetTaskProgressPercentage (<*Percent*>)
Python Example	`progMon.SetTaskProgressPercentage(33)`

CheckForAbort

Checks if a user has aborted the task. Call this method if the quantities are computationally expensive. This method can be called multiple times.

UI Access	Abort button on the progress dialog.
Parameters	None
Return Value	Boolean flag that if true indicated that the user requested an abort and you should call EndTask. If false, allow the task to continue.

Python Syntax	CheckForAbort
Python Example	`should_abort = progMon.CheckForAbort`

EndTask

Stops a task from running. Call this method only once for each task and subtask. In a script, there should be the same number of BeginTask calls as **EndTask** calls.

UI Access	NA		
Parameters	Name <PassFail>	Type Boolean	Description Flag that indicates whether to continue the main task or not. If true, the task will continue to process the next subtask. If false, the main task stops and an error icon appears in the UI.
Return Value	None		

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Python Syntax	EndTask (<*PassFail*>)
Python Example	`progMon.EndTask(True)`

IUDDPluginExtension Abstract Class

The **IUDDPluginExtension** abstract class declares the following abstract methods which must be implemented in the UDDExtension class or one of its base classes. If any of these methods are not implemented, a run-time error will occur and the UDD will not function.

- GetUDDName
- GetUDDDescription
- ShowDefaultSetupDialog
- GetUDDInputParams
- Generate

This class also provides for the following optional methods:

- SetupUDDInputParams
- HandleUDDEvents
- GetUDDSchema
- GetUDDStyleSheetForHtml
- GetUDDStyleSheetForPdf
- GetFopExecutable
- GetUDDAppContext
- GetUDDDesignContext

GetUDDName

Retrieves a prefix to use for all solution instances created using this UDD.

UI Access	NA
Parameters	None
Return Value	String that is the prefix

Python Syntax	GetUDDName()

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Python Example	`def GetUDDName(self):` `  return "MinMaxAvg"`

GetUDDDescription

Retrieves a description for the UDD, its purpose, etc.

UI Access	NA
Parameters	None
Return Value	String that is the description

Python Syntax	GetUDDDescription()
Python Example	`def GetUDDDescription(self):` `  return "Sample UDD"`

ShowDefaultSetupDialog

Retrieves whether to show the default setup dialog box. If not, the user might want to implement or show a customized setup dialog.

UI Access	NA
Parameters	None
Return Value	Boolean. If true, the default dialog should be shown. If false, the user does not want to see the default dialog.

Python Syntax	ShowDefaultSetupDialog()
Python Example	`def ShowDefaultSetupDialog(self):` `  return True`

GetUDDInputParams

Retrieves inputs parameters for the User Defined Document. These parameters are the input's name, description, and data type. The UDD user specifies the value of the inputs through a

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

dialog or within the script.

UI Access	Depending on the input parameters, the following dialog may be displayed when you click **Circuit**> **Results**> **Create Document**. The name and description of the UDD are also displayed in this dialog. Parameters	Name: *<uddInputs>* Type: List< UDDInputParams >* Description: The UDD script is expected to add one instance of UDDInputParams for each input definition that it will to display. When creating the UDD, the user will assign a matching value to each such input.
Return Value	Boolean. If true, the method was successful. If false, it was not.

Python Syntax	GetUDDInputParams(*<probeName>*)

Python Example	`def GetUDDInputParams(self, uddInputs)`
	`    # Boolean input`
	`    param1 = UDDInputParams("Summary","Display Summary", Constants.kBoolTypeStr, True)`
	`    uddInputs.Add(param1)`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
    # Text input
    param2 = UDDInputParams("Name","User Name",
Constants.kTextTypeStr, "Sita Ramesh")
    uddInputs.Add(param2)
    # Number input
    param3 = UDDInputParams("Version","Script Version",
Constants.kNumberTypeStr, 1021)
    uddInputs.Add(param3)
    # Solution input
    param5 = UDDInputParams("DLMetrics","Data Line
Metrics",Constants.kSolutionTypeStr)
    uddInputs.Add(param4)
    # Trace input
    param5 = UDDInputParams
("DQ0","DQ0",Constants.kTraceTypeStr)
    uddInputs.Add(param5)
    return True
```

Generate

This is the main method which accesses the data from the uddInputs and generates the document.

UI Access	NA		
Parameters	Name	Type	Description
	<uddInputs>	List< UDDInputData>	The list of inputs that the user setup in the dialog box. They are now available to query for data.
	<generator>	IUDDGenerator	This is the document generator object which used to create different elements of the document like titles, sections, tables, images and write the data too. See the Document Generator Interfaces.
	<progressMonitor>	IProgressMonitor	This can be used to set progress for long running calculations and check for any user-initiated aborts.
Return Value	Boolean. If true, the method was successful. If false, it was not.		

Python	Generate(*<uddInputs>*, *<generator>*, *<progressMonitor>*)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Syntax	

Python Example	def Generate(self, input, docgen, progMon):
	
	    # Gather data from inputs
	    boolinput = input[0].Data()
	    textinput = input[1].Data()
	    dblinput = input[2].Data()
	
	    # Get document root
	    docroot = docgen.GetDocumentRoot()
	
	    # Add Section
	    section1 = docroot.AddSection("Summary", "Overall Results ")
	
	    # Add a table
	    table1 = section1.AddTable("Test Summary")
	
	    #Add a table group with 2 columns
	    tgroup1 = table1.AddTableGroup(2)
	
	    # get desktop application
	    oApp = self.GetUDDAppContext()
	    if oApp != None:
	        oDesktop = oApp.GetAppDesktop()
	    if oDesktop != None:
	        # version number
	        version = oDesktop.GetVersion()
	        text1 = tgroup1.AddContent()
	        text1 .Add(0, "Product Version")
	        text1 .Add(1, version)
	
	    oProject = oDesktop.GetActiveProject()
	    if oProject != None:
	        projectname= oProject.GetName()
	        text1 = tgroup1.AddContent()
	        text1 .Add(0, "Project")
	        text1 1.Add(1, projectname)
	
	    oDesign = self.GetUDDDesignContext()
	    if oDesign != None:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
        designname = oDesign.GetName()
        text1 = tgroup1.AddContent()
        text1 .Add(0, "Design")
        text1 .Add(1, designname)

    # Provides a script path
    scriptpath = docgen.GetScriptPath()
    text1 = tgroup1.AddContent()
    text1 .Add(0, "Script Path")
    text1 .Add(1, scriptpath)

    #Provides the script version
    text1 = tgroup1.AddContent()
    text1 .Add(0, "Script Version")
    text1 .Add(1, str(dblinput))

    #Provides the output xml path
    outputpath = docgen.GetOutputFilePath()
    text1 = tgroup1.AddContent()
    text1.Add(0, "Output Path")
    text1.Add(1, outputpath)

    #Provides the user information
    text1 = tgroup1.AddContent()
    text1 .Add(0, "User")
    text1 .Add(1, textinput)

    # Generate Xml output
    docgen.Write(False)

    # Generate Html output
    docgen.WriteHTML()

    # Generate PDF output
    docgen.WritePDF()

    return True
```

SetupUDDInputParams

This optional method displays a customized dialog and returns the user choices for the input params.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UI Access	NA		
Parameters	Name *<uddInputs>*	Type List< UDDInputParams >	Description .NET list of UDDInputParams objects with values for each of them. These can be the user choice for each input obtained through a custom dialog or some other non-graphical assignment. This method cannot process trace and solution types of input with a custom dialog because there is no way of assigning solution data to the input without the invocation of the reporter dialog.
Return Value	Boolean. If true, the event was handled successfully. If false, it was not.		

Python Syntax	SetupUDDInputParams(*<uddInputs>*)

Python Example	`def SetupUDDInputParams(self, uddInputs)`
	`    udddialog = BaseExampleUDDDialog()`
	`    if udddialog.ShowDialog() == Forms.DialogResult.OK:`
	`        # Boolean input`
	`        param1 = udddialog.GetInput("Summary")`
	`        uddInputs.Add(param1)`
	
	`        # Text input`
	`        param2 = udddialog.GetInput("Name")`
	`        uddInputs.Add(param2)`
	
	`        # Number input`
	`        param3 = udddialog.GetInput("Version")`
	`        uddInputs.Add(param3)`

HandleUDDEvents

This optional method is the event handler for all link events set by the SetEventLink() method on a IUDDText. Refer to the definition of the IUDDText object in the Document Generator Interface. The tags associated with the event are received by plugin using this abstract class.

UI Access	NA

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Parameters	Name Type Description <*eventTags*> List<string> Event tags.
Return Value	Boolean. If true, the event was handled successfully. If false, it was not.

Python Syntax	HandleUDDEvents(<*eventTags*>)

Python Example	`def HandleUDDEvents(self, uddLinks):`
	`  if uddLinks[0] == "Open Report":`
	`  # Get Design Name`
	`  oDesign = self.GetUDDDesignContext()`
	`  if oDesign != None:`
	`  oDesign.OpenReport(uddLinks[1])`
	`  return True`

GetUDDSchema

This optional method retrieves the file path of the schema to validate the XML. This will override the default schema used.

UI Access	NA
Parameters	None
Return Value	String containing the full file path of the schema.

Python Syntax	GetUDDSchema()

Python Example	`def GetUDDSchema(self):`
	`  return "C:\\Program Files\\ANSYS Inc\\v252\\AnsysEM\\common\\docbook\\schema\\xsd\\docbook.xsd"`
	`schemaPath = pluginExt.GetUDDSchema()`

GetUDDStyleSheetForHtml

This optional method retrieves the file path of the style sheet used to generate the HTML document. This will override the default stylesheet for HTML.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UI Access	NA
Parameters	None
Return Value	String containing the full file path of the style sheet.

Python Syntax	GetUDDStyleSheetForHtml()

Python Example	`def GetUDDStyleSheetForHtml(self):`
	`  return "C:\\Program Files\\ANSYS Inc\\v252\\AnsysEM\\common\\docbook\\"`
	`styleSheet = pluginExt.GetUDDStyleSheetForHtml()`

GetUDDStyleSheetForPdf

This optional method retrieves the file path of the style sheet used to generate the PDF document. This will override the default stylesheet for PDF.

UI Access	NA
Parameters	None
Return Value	String containing the full file path of the style sheet.

Python Syntax	GetUDDStyleSheetForPdf()

Python Example	`def GetUDDStyleSheetForPdf(self):`
	`  return "C:\\Program Files\\ANSYS Inc\\v252\\AnsysEM\\common\\docbook\\xsl\\fo\\docbook.xsl"`
	`styleSheet = pluginExt.GetUDDStyleSheetForPdf()`

GetFopExecutable

This optional method retrieves the file path of the fop executable used to generate the PDF document.

UI Access	NA

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Parameters	None
Return Value	String containing the full file path of the fop executable.

Python Syntax	GetFopExecutable()

Python Example	`def GetFopExecutable(self):`
	`    return "C:\\Program Files\\ANSYS Inc\\v252\\AnsysEM\\common\\ApacheFOP\\fop-1.0\\fop"`
	`fopExe = pluginExt.GetFopExecutable()`

GetUDDAppContext

This optional method retrieves the UDD Owner if it is set. This is a Dispatch wrapper that is essentially a COM IDispatch implementation and corresponds to the IDispatch pointing to the desktop app.

UI Access	NA
Parameters	None
Return Value	the IDispatch for the desktop object

Python Syntax	GetUDDAppContext()
Python Example	`oDesktop = self.GetUDDAppContext()`

GetUDDDesignContext

This optional method retrieves the UDD Owner if it is set. This is a Dispatch wrapper that is essentially a COM IDispatch implementation and corresponds to the IDispatch pointing to the design.

UI Access	NA
Parameters	None

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Return Value	IDispatch for the specified design object

Python Syntax	GetUDDDesignContext()
Python Example	`oDesign = self.GetUDDDesignContext()`

UDDExtension Class

The UDD itself should be implemented as an IronPython class called **UDDExtension** which must derive from the IUDDPluginExtension abstract base class (from the **Ansys.Ansoft.DocGeneratorPluginDotNet.DocGenerator.API.Interfaces** namespace).

Note that power users could derive a class hierarchy tuned toward a specific type of UDDs and that they can derive from their own base classes. The only requirement is that directly or indirectly, the UDD class must derive from **IUDDPluginExtension**.

Example:

```
def BaseClassUDD ((IUDDPluginExtension):
#base class implementation
…
def UDDExtension ((BaseClassUDD):
#UDD class implementation
…
```

> **Note:**
>
> This class is modeled after the UDO class UDOExtension, therefore the usage is similar.

UDDInputData Class

This class contains user input data and can be used in the generated document. UDDInputData has the constructor UDDInputData(string name) and the following properties accessors:

Property accessor	Purpose	Form
Name	Get/Set the name of an input.	string Name();
Type	Get/Set the type of an input	string Type();

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The data can be any of the following types, based on the UDDInputParams type specified in the script.

- UDDInputBool
- UDDInputDouble
- UDDInputSolution
- UDDInputText
- UDDInputTrace

UDDInputBool

Method purpose	Return Value	Data type of the returned value in C#
Retrieves boolean value of the input data.	a boolean value of input data	string Data();

UDDInputDouble

Method purpose	Return Value	Data type of the returned value in C#
Retrieves double data.	a double value of input data	double Data();

UDDInputSolution

Method purpose	Return Value	Data type of the returned value in C#
Retrieves x and y double data for a probe	Data collection	IDictionary<double, double> DoubleData (string name);
Retrieves x and y double data for a probe for a particular variation	Data collection	IDictionary<double, double> DoubleData (string name, IDictionary<string, string> variation);
Retrieves x and y complex data for a probe	Data collection	IDictionary<double, double[]> ComplexData (string name);
Retrieves x and y complex data for a probe for a particular variation	Data collection	IDictionary<double, double[]> ComplexData (string name, IDictionary<string, string> variation);
Retrieves x and y text data for a probe	Data collection	IDictionary<string, string> TextData(string name, IDictionary<string, string> variation);

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Retrieves x and y text data for a probe for a particular variation	Data collection	IDictionary<string, string> TextData(string name);
Retrieves a list of category names	A string collection	IList<string> CategoryNames();
Retrieves a list of quantity names given a category name	A string collection	IList<string> QuantityNames(string category);
Retrieves a list of variable values	A string collection	IList<Dictionary<string, string>> VariableValues();

UDDInputText

Method purpose	Return Value	Data type of the returned value in C#
Retrieves string data	a string value of input data	string Data();

UDDInputTrace

Method purpose	Return Value	Data type of the returned value in C#
Retrieves x and y double data	Double	IDictionary<double, double> DoubleData();
Retrieves x and y double data for a particular variation	Double	IDictionary<double, double> DoubleData (IDictionary<string, string> variation);
Retrieves x and y complex data	Double	IDictionary<double, double[]> ComplexData();
Retrieves x and y complex data for a particular variation	Double	IDictionary<double, double[]> ComplexData (IDictionary<string, string> variation);
Retrieves x and y text data	Text	IDictionary<string, string> TextData();
Retrieves x and y text data for a particular variation	Text	IDictionary<string, string> TextData (IDictionary<string, string> variation);
Retrieves a list of variable values	A string collection	IList<Dictionary<string, string>> VariableValues();
Retrieves an image of the trace data in a plot	An image	string Image();

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDDInputParams Class

The objects of this class must be created in Python script in the GetUDDInputParams and SetUDDInputParams functions.

Attributes :

- Input Name (string)
- Input Description (string)
- Input Type (string) (This can be boolean, number, text, trace, or solution.)
- BoolData (boolean)
- DoubleData (double)
- TextData (string)
- ReportType (string)
- SolutionName (string)
- DomainName (string)

Constructors:

- UDDInputParams(string name, string description, string type)
- UDDInputParams(string name, string description, string type, bool data)
- UDDInputParams(string name, string description, string type, double data)
- UDDInputParams(string name, string description, string type, string data)
- UDDInputParams(string name, string description, string type, string reportType, string solutionName, string domainName)

Property Accessors :

- Name : Get/Set the name of an input
- Description : Get/Set the description of an input
- Type : Get/Set the type of an input
- BoolData : Get/Set the data of a boolean input
- DoubleData : Get/Set the data of a number input
- TextData : Get/Set the data of a text input
- ReportType : Get/Set the report type
- SolutionName : Get/Set the name of the solution
- DomainName : Get/Set the name of the domain

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDD Input Interfaces

The Generate function takes in a list of inputs which allows the user to access data from the design.

IUDDInputBool : This interface exposes 3 methods.

- Name() : Gets the inputs name.
- Type() : Gets the input type.
- Data() : Gets the boolean data, set by the user in the setup dialog.

IUDDInputDouble : This interface exposes 3 methods.

- Name() : Gets the inputs name.
- Type() : Gets the input type.
- Data() : Gets the double data, set by the user in the setup dialog.

IUDDInputText : This interface exposes 3 methods

- Name() : Gets the inputs name.
- Type() : Gets the input type.
- Data() : Gets the text data, set by the user in the setup dialog.

IUDDInputTrace : This interface exposes 9 methods

- Name() : Gets the inputs name.
- Type() : Gets the input type.
- DoubleData() : Method used to return x and y double data as a IDictionary<double, double>
- DoubleData(IDictionary<string, string> variation) : Method used to return x and y double data as a IDictionary<double, double>, given a variation.
- ComplexData() : Method used to return x data and y complex data as a IDictionary<double, double[]>
- ComplexData(IDictionary<string, string> variation) : Method used to return x data and y complex data as a IDictionary<double, double[]>, given a variation.
- TextData() : Method used to return x data and y data as a IDictionary<string, string>
- TextData(IDictionary<string, string> variation) : Method used to return x data and y data as a IDictionary<string, string>, given a variation.
- VariableValues() : Method used to get a list of variations as a IList<Dictionary<string, string>>

IUDDInputSolution : This interface exposes 11 methods

- Name() : Gets the inputs name.
- Type() : Gets the input type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- DoubleData(string name): Method used to return x and y double data as a IDictionary<double, double>, given a quantity name.
- DoubleData(string name, IDictionary<string, string> variation) : Method used to return x and y double data as a IDictionary<double, double>, given a quantity name and a variation.
- ComplexData(string name) : Method used to return x data and y complex data as a IDictionary<double, double[]>, given a quantity name.
- ComplexData(string name, IDictionary<string, string> variation) : Method used to return x data and y complex data as a IDictionary<double, double[]>, given a quantity name and a variation.
- TextData(string name) : Method used to return x data and y data as a IDictionary<string, string> given a quantity name.
- TextData(string name, IDictionary<string, string> variation) : Method used to return x data and y data as a IDictionary<string, string>, given a quantity name and a variation.
- CategoryNames() : Method to return a list of category names in the solution as an IList<string>
- QuantityNames(string category) : Method to return a list of quantity names in the solution as an IList<string>, given a category.
- VariableValues() : Method used to get a list of variations as a IList<Dictionary<string, string>>

Examples

```
def Generate(self, input, docgen, progMon):
# Getting the boolean data set by the user
boolinput = input[0].Data()
# Getting the double data set by the user
dblinput = input[1].Data()
# Getting the text data set by the user
textinput = input[2].Data()
# Getting the category names in a solution
categories = input[3].CategoryNames()
# Getting the quantity names based on a category
quantities = input[3].QuantityNames(categories[0])
# Getting the XY data from the trace
xydata = input[4].DoubleData()
```

Document Generator Interfaces

This document briefly describes the API interfaces available in the document generator plugin.

(Ansys.Ansoft.DocGeneratorPluginDotNet.dll)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Scripting objects available in the script for the Generate function:

- oApp = self.GetUDDAppContext()

  Gets the application context. Use this interface to get the active project ad the version of the product.

```
oDesktop = oApp.GetAppDesktop()
  if oDesktop != None:
  vr = oDesktop.GetVersion()
  oProject = oDesktop.GetActiveProject()
```

- oDesign = self.GetUDDDesignContext()

  Gets the design context. Use this interface to get the design name.

```
oDesign = self.GetUDDDesignContext()
  if oDesign != None:
    nm = oDesign.GetName()
```

- IUDDGenerator interface

  This interface available in the Generate method of the UDDPluginExtension. This interface can be used to:

  1. Set the document output file path.
     ```
     docgen.SetOutput("C:\\Examples\\DocumentOutput.xml")
     ```
  2. Get the document root.
     ```
     docroot = docgen.GetDocumentRoot()
     ```
  3. Write out to the output file.
     ```
     docgen.Write()
     ```
  4. Write HTML document
     ```
     void WriteHTML();
     ```
  5. Write PDF document
     ```
     void WritePDF();
     ```
  6. Load the HTML transform object
     ```
     void LoadHTMLTransform();
     ```
  7. Load the cached PDF transform object
     ```
     void LoadPDFTransform();
     ```
  8. Get script path
     ```
     string GetScriptPath();
     ```
  9. Get output file path
     ```
     string GetOutputFilePath();
     ```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- IUDDRoot interface

  Calling GetDocumentRoot() on the IUDDGenerator interface provides you with the this interface. This interface can be used to:

  1. Add a new section to the document. Provide a section title.
     ```
     section1 = docroot.AddSection("Section title")
     ```
  2. Add a new section to the document. Provide a section title and subtitle.
     ```
     section1 = docroot.AddSection("Section title", "Section subtitle")
     ```
  3. Add a new title
     ```
     section1 = docroot.AddTitle("Title")
     ```
  4. Add a new subtitle
     ```
     section1 = docroot.AddSubtitle("Subtitle")
     ```

- IUDDSection interface

  Calling AddSection() on the IUDDRoot interface provides you with this interface. This interface can be used to:

  1. Set an ID for the section for internal links.
     ```
     section1.SetID("id")
     ```
  2. Add a new table to the document. Provide a table title.
     ```
     table1 = section1.AddTable("Table title")
     ```
  3. Add a new image to the document. Provide an image title and a file path to the image file.
     ```
     image1 = section1.AddImage("Image title")
     ```
  4. Add text to the document.
     ```
     text1 = section1.AddText("Random text........")
     ```

- IUDDImage interface

  Calling AddImage() on the IUDDSection interface provides you with this interface. In this interface, you can call the following methods:

  1. Set an ID for the image for internal links.
     ```
     image1.SetID("id")
     ```
  2. Set alignment information; can be "center", "left", and "right".
     ```
     image1.SetAligment("center")
     ```
  3. Set the file path of the image file; not necessary if image file path is set through the AddImage() method.
     ```
     image1.SetFileRef("Image path")
     ```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Set the format of the image file; can be "BMP", "PNG", "JPEG", "JPG", "DVI", etc.
   ```
   image1.SetFormat("format")
   ```

- IUDDText interface

  Calling AddText() on the IUDDSection interface provides you with the this interface. In this interface, you can call the following methods:

  1. Set an ID for the text for internal links.
     ```
     text1.SetID("id")
     ```
  2. Set the emphasis attribute on the text.
     ```
     text1.SetEmphasis()
     ```
  3. Set the quotes attribute on the text.
     ```
     Text1.SetQuotes()
     ```
  4. Set the block quotes attribute on the text.
     ```
     text1.SetBlockquotes()
     ```
  5. Set quotes on the text.
     ```
     Text1.SetQuotes()
     ```
  6. Set the wordsize attribute on the text
     ```
     text1.SetSize(size as an integer)
     ```
  7. Set a link to an ID of any element to provide internal links
     ```
     text1.SetLink("linkname")
     ```
  8. Set an event link to handle an event. The HandleUDDEvents method should be implemented in the script to handle the event.
     ```
     text1.SetEventLink("linkname")
     ```

- IUDDTable interface

  Calling AddTable() on the IUDDSection interface provides you with the this interface. In this interface, you can call the following methods:

  1. Set an ID for the table for internal links.
     ```
     table1.SetID("id")
     ```
  2. Set alignment information; can be "center", "left", and "right".
     ```
     table1.SetAlignment("center")
     ```
  3. Set the background color of the table
     ```
     table1.SetBgColor(string bgcolor)
     ```
  4. Set the frame type; can be "all", "bottom", "top", "sides", and "topbot".
     ```
     table1.SetFrame(string frame)
     ```
  5. Add a table group and specify the number of columns. A table can have multiple table groups.
     ```
     IUDDTableGroup table1.SetTableGroup(int columns)
     ```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- IUDDTableGroup interface

  Calling AddTableGroup() on the IUDDTable interface provides you with the this interface. In this interface, you can call the following methods:

  1. Set an ID for the table group for internal links.
     ```
     tgroup1.SetID("id")
     ```
  2. Set alignment information; can be "center", "left", and "right".
     ```
     tgroup1.SetAlignment("center")
     ```
  3. Set the column width of a column given the index of the column and the required width. Width can be set in 2 ways.
     - Width can be set relative to 1. E.g Setting it to "2*" makes the column width double the width of the others.
     - If the entire table width is considered to be 99.99 units. Width can be a number relative to this.

     ```
     tgroup1.SetColumnWidth(int index, string width)
     ```
  4. Add a header to the table group
     ```
     IUDDTableRow tgroup1.AddHeader()
     ```
  5. Add a header with multiple rows to the table group; it takes number of sub rows.
     ```
     IUDDTableRow tgroup1.AddHeader(int rows)
     ```
  6. Add a row of content to the table group
     ```
     IUDDTableRow tgroup1.AddContent()
     ```
  7. Add content with multiple rows to the table group; it takes number of sub rows.
     ```
     IUDDTableRow tgroup1.AddContent(int rows)
     ```
- IUDDTableRow interface

  Calling AddHeader() & AddContent() on the IUDDTableGroup interface provides you with the this interface. In this interface, you can call the following methods:

  1. Set an ID for the table row for internal links.
     ```
     trow1.SetID("id")
     ```
  2. Set alignment information; can be "center", "left", and "right".
     ```
     trow1.SetAlignment("center")
     ```
  3. Set cell text; can be cell content or header text. It takes a column index and a text string. It is added to the first row.
     ```
     IUDDTextElement trow1.Add(int column, string text)
     ```
  4. Set cell text; can be cell content or header text. It takes a column index, row index and a text string and takes in a row number because a table row can have multiple sub rows.
     ```
     IUDDTextElement trow1.Add(int column, int subrow, string
     text)
     ```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Set cell content; takes a column index and an int value. It is added to the first row.
   ```
   IUDDTextElement trow1.Add(int column, int value)
   ```
6. Set cell content; takes a column index, row index and a int value.
   ```
   IUDDTextElement trow1.Add(int column, int subrow, string text)
   ```
7. Set cell text; takes a column index and a double value. It is added to the first row.
   ```
   IUDDTextElement trow1.Add(int column, double value)
   ```
8. Set cell text; takes a column index, row index and a double value.
   ```
   IUDDTextElement trow1.Add(int column, int subrow, double value)
   ```
9. Set cell text spanning two columns; can be cell content or header text. It takes a sub-row index , starting column index, ending column index, and a text string.
   ```
   IUDDTextElement trow1.AddSpanningcolumnst(int subrow, int columnstart, int columnend, string text)
   ```
10. Set cell text; can be cell content or header text. It takes a column index, starting sub-row index, ending sub-row index, and a text string.
    ```
    IUDDTextElement trow1.AddpanningRows(int column, int subrowstart, int subrowend, string text)
    ```

Includes all the methods exposed by the IUDDText interface.

Post-processing and Generating Reports for 2D and Circuit

After HFSS 3D Layout, Nexxim, or Nexsys has generated a solution, all the results are available for analysis. The graphical plots and other reports described in this topic help you to visualize the relationship between design parameters and analysis results.

Creating Reports for 2D and Circuit Projects

A report is generated using the **New Report** window. The appearance of the **New Report** window differs depending on the type of design:

- EM Design (HFSS_3DLayout)
- Circuit Design (Nexxim, Nexsys)

the type of report:

- Standard Report
- Constellation Report
- Eye Diagram Report
- Statistical Eye Report

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

and the type of display:

- Polar Plot
- Data Table
- Smith Chart
- 3D Polar Plot
- Rectangular Plot
- Smith Contour Plot
- 3D Rectangular Plot
- Rectangular Stacked Plot
- Rectangular Contour Plot

> **Note:** Depending on the nature of your installation and the projects loaded into Electronics Desktop, at times only a subset of the types listed above may appear in the display-types submenu.

When you have selected the display type (e.g., by clicking **Product** > **Results** > **Create Standard Report** > **Rectangular Plot**) a **New Report** window opens that allows you to create the report. The following topics describe how to fill out the **New Report** window for various types of reports and displays.

2D and Circuit Report Types

When you click **Product > Results (** or right-click **Results** in the **Project Tree**), one or more of the following report types and **display types** are available, depending upon the nature of your installation and the projects loaded into Electronics Desktop.

Report Type	Display Type
Create Standard Report	A “Standard” report can be depicted in any of the following display types: • Rectangular Plot • Data Table • Polar Plot • Smith Chart • Rectangular Stacked Plot • 3D Rectangular Plot • 3D Polar Plot • Rectangular Contour Plot

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

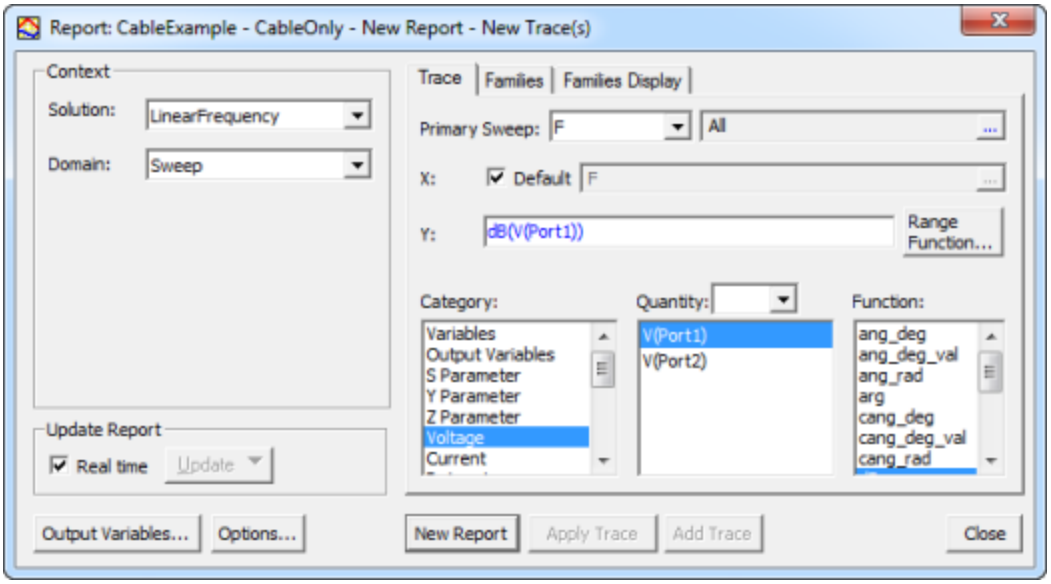
	• Smith Contour Plot
Create Eye Diagram Report	An “Eye Diagram” report can be depicted in any of the following display types: • Rectangular Plot • Data Table • Stacked Eye Diagram Plot
Create Constellation Report	A “Constellation” report can be depicted in any of the following display types: • Rectangular Plot • Data Table
Create Statistical Eye Report	A “Statistical Eye” report can be depicted in any of the following display types: • Rectangular Plot • Data Table
Create Report From File	A “Data File” report can be created in any of the available display types using a previous report that has been saved to a file.

Note: Depending on the nature of your installation and the projects loaded into Electronics Desktop, at times only a subset of the types listed above may appear in the display-types submenu.

2D and Circuit New Report Window

When you click **Product > Results (** or right-click **Results** in the **Project Tree**) and select a **report type** and a **display type** , a **New Report** window similar to the following opens:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



> **Note:** Depending on the nature of your installation and the projects loaded into Electronics Desktop, at times only a subset of the following report options may appear in the **New Report** window.

In the **New Report** window, make selections in the following group boxes to create a report:

Context Group Box

Context group box

- **Solution** – lists the available sweeps.
- **Domain** – lists the available domains.
- **Show** — lists the quantity types to display. (Differential Pairs only)

Harmonics Group Box

- For Harmonic Balance simulation setups (HB1Tone, HBNtone, Oscillator, OscillatorNTone, PXF, TVNoise) this box displays the first five harmonic quantities of a Sweep or Network Function domain.
- **Edit** – You can select/filter and change the displayed harmonic quantities by clicking **Edit** to open the output quantity window; any changes that are made are reflected in the original setup window.

Plotting Range Group Box

- Long-time domain simulations may contain extremely large amounts of data.
- **Windowing** – shows data within a range of times:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

  - Time Start — allows you to set the start time and units.
  - Time Stop — allows you to set the stop time and units.
  - Note that the maximum number of points displayed is 20,000,000. This may limit the range that can be shown. For example a Transient Analysis with 10ms Stop Time and 1ns Step Time creates 100,000,000 points; only a subset of these (2ms worth) can be displayed. To see the entire range, increase the Step Time.
- **Thinning** — removes unnecessary detail:
  - dy/dx tolerance — a delta voltage that should be set to be smaller than the overall voltage swing (min, max) and greater than the voltage fluctuations to be ignored. This number is used to calculate slope variations and eliminates points that have equal slopes (in these variations). For square or triangular waves, this can limit the number of points to two per group box of constant slope.
  - Number of Points gives the maximum points displayed and is applied after the dy/dx tolerance. It must be less than the maximum number of points.
- **Time Start** – allows you to set the start time and units.
- **Time Stop** — allows you to set the stop time and units.

Constellation Trace Tab

- **Primary Sweep** — drop-down menu allows you to select a primary sweep, or browse for the selection by clicking **[...]**.
- **Constellation** — displays the applicable function. Contains a drop-down menu for selecting the value(s) and a **[...]** browse button for selecting from a list of sweeps (if available). Clicking **Range Function** opens the **Set Range Function** window where a different function can be chosen and applied apply.
- **Category** window- these depend on the Solution type and the design. This lets you specify the category of information for the report.
- **Quantity** – allows you to specify a quantity for the **Constellation** report.
- **Function** – allows you to specify a function for the **Constellation** report.

Eye Diagram Trace Tab

- **Primary Sweep** — drop-down menu allows you to select a primary sweep, or browse for the selection by clicking **[...]**
- **Eye Diagram** — displays the applicable function. Contains a drop-down menu for selecting the value(s) and a **[...]** browse button for selecting from a list of sweeps (if available). Clicking **Range Function** opens the **Set Range Function** window and allows you to choose a different function to apply.
- **Category** window- these depend on the Solution type and the design. This lets you specify the category of information for the report.
- **Quantity** – allows you to specify a quantity for the **EyeDiagram** report.
- **Function** – allows you to specify a function for the **EyeDiagram** report.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Constellation Parameters Group Box

- Radio buttons allow you to choose between **Vector** and **Constellation**
- When **Constellation** is selected, you may specify a **Sample Period** and **Offset**.

Eye Parameters Group Box

- Allows you to specify a **Unit Interval** and **Offset**.

Update Report Group Box

- **Real Time** checked — enable real time updates for all reports.
- **Real Time** unchecked — enables the adjacent dropdown menu which allows you to choose **Update This Report** or **Update All Reports**. Both selections update traces to the latest data available.

Trace Tab

- **Primary Sweep** — drop-down menu allows you to select a primary sweep, or browse for the selection by clicking the **[...]**
- **X:**
  - Contains a drop-down menu for selecting the value(s) and a **[...]** button for selecting from a list of sweeps (if available).
- **Y**:
  - **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
  - **Category** window— these depend on the **Solution** type and the design. This lets you specify the category of information for the Y component.
  - **Quantity** – allows you to specify a quantity for the Y component.
  - **Function** – allows you to specify a function for the Y component.

Families Tab

- Lists the number of families available.
- Each member of a family defines one point on a curve.
- Radio buttons allow you to choose between **Sweeps** and **Available variations**. Allows you to edit sweeps; **Edit** lets you select variable **Values**.
- **Nominals** field (unavailable if none exist in the design) allows you to choose one of the following:
  - **Set All Variables to Nominal**
  - **Set All Unswept Variables to Nominal**
  - **Choose Nominals**

Families Display Tab

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Allows you to choose on the following types of families display: **AllFamilies**, **Statistics**, or **Histogram**.

Dialog Box Command Buttons

- **Output Variables** – opens the **Output Variables** window.
- **Options** – opens the Report Setup Options window. This contains a check box for using the advanced mode for editing and viewing trace components. This mode is automatic if the trace requires it. It contains a field for setting the maximum number of significant digits to display for numerical quantities.
- **New Report** – adds a report to the **Project** tree under the **Results** icon. The new report is displayed in the **Project** window.
- **Apply Trace** — applies the currently configured trace.
- **Add Trace** – this is enabled when you have created or selected a report. Add further traces. The new trace displays in the **Project** window under the report.
- **Close** – closes the **New Report** window.

Note: Remember that the evaluated value of an expression is always interpreted in SI units. However, when an angle quantity is plotted in a report, you have the option to plot values in units other than SI. If you want to plot the polar angle of a complex simulation result, S_{11} say, choose between ang_deg(S_{11}) and ang_rad(S_{11}). Both of these return the exact same angle quantity but in degree and radian units respectively.

Note that when used in expressions, some surprising outcomes might result. For example, the expression "1+ang_deg(S_{11})" represents an 'angle' and the number "1" is treated as "1 rad". The angle SI unit is attached to any unitless number that is added/subtracted from an angle value. If you want to treat "1" as degrees, make it explicit and use "1deg + ang_deg(S_{11})" instead.

If you are interested in unitless degree values, two additional functions exist: ang_deg_val(S_{11}) and cang_deg_val(S_{11}). These return simple numbers and are treated so by any expression. If the complex S_{11} lies on the positive Y axis say, ang_deg_val(S_{11}) is 90 and "1 + ang_deg_val(S_{11})" is 91.

2D and Circuit Display Types

The information in a report can be displayed in several formats. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Results**. Navigate to the appropriate report type, then choose from one of the following display types:

Rectangular	A 2D rectangular (x-y) graph.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Plot	
Polar Plot	A 2D circular chart divided by spherical coordinates.
Data Table	A grid with rows and columns that displays, in numeric form, selected quantities against a swept variable or another quantity.
Smith Chart	A 2D polar chart of S-parameters upon which a normalized impedance grid has been superimposed.
Rectangular Stacked Plot	A 2D rectangular (x-y) stacked graph.
3D Rectangular Plot	A 3D rectangular (x-y-z) graph.
3D Polar Plot	A 3D circular plot divided by spherical coordinates.
Rectangular Contour Plot	A 2D rectangular contour chart of the eye simulation results.
Smith Contour Plot	A 2D Smith contour chart of the load-pull results.
Eye Diagram Plot	A 2D rectangular-eye diagram with transient data available for post-processing
Stacked Eye Diagram Plot	One or more eye diagram plots in a horizontal stack.
PAM-4 Eye Plot	An eye diagram created from PAM-4 voltage traces with 4 symbol levels that create three distinct sub-eye openings between the three sequential pairs of symbol levels.
Statistical Eye Plot	A 2D rectangular-eye diagram with no retained data for post-processing

> **Note:** Depending on the nature of your installation and the projects loaded into Electronics Desktop, at times only a subset of the types listed above may appear in the display-types submenu.

2D and Circuit Rectangular Plot

A rectangular plot is a 2D, x-y graph of results.

1. Click **Product** > **Results** (or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Results**) and point to a appropriate **report type** . Then select **Rectangular Plot** to open the **New Report** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. In the **Context** group box make selections on the following field or fields, depending on the design and solution type.
    a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
    b. Domain field with a drop down selection list. Whether this field appears, and the domains listed, depend on the Solution type and the **report type** and **display type** selected.
    c. Show field with a drop down selection list. Whether this field appears depends on if differential pairs exist and are enabled.
3. Under the **Trace** tab **Primary Sweep** group box, make selections on the following categories:
    a. In the **Category** group box, click the type of information to plot.
    b. In the **Quantity** group box, click the value to plot.
    c. In the Function list, click the mathematical function of the quantity to plot.
    d. **Value** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
    e. **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
4. In the **X (Primary Sweep)** group box, make selections for the following:
    a. Select the Primary value(s) on the dropdown menu.
    To select an X component that is different on the Primary Sweep, uncheck the Default field to enable the X field and **[...]** button. Click **[...]** to open the **Select X Component** window. This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the window to assign the X component.
    b. If sweeps are available, select **[...]** to open a window that lets you select particular sweep or sweeps, or all sweeps.
    c. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (e.g., for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the Families tab with columns for the variable, the value, and an Edit column with an **[...]** button.
5. From the **Families** tab, confirm or modify the sweep variables that is plotted.
6. Click **New Report.**

    This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

    The function of the selected quantity is plotted against the swept variable values or quantities you specified on an x-y graph. The plot is listed under **Results** in the **Project Manager** window and the traces are listed under the plot. When you select the traces or

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

2D and Circuit Polar Plot

In Ansys Electronics Desktop, a polar plot is a 2D circular chart divided by the spherical coordinates R and theta, where R is the radius, or distance on the origin, and theta is the angle on the x-axis. Following is the general procedure for drawing a polar graph of results:

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type** . Then select **Polar Plot** top open the **New Report** window.
2. In the **Context** group box make selections on the following field or fields, depending on the design and solution type.
    a. Solution field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
    b. Domain field with a drop down selection list. Whether this field appears, and the domains listed, depend on the Solution type and the **report type** and **display type** selected.
    c. Show field with a drop down selection list. Whether this field appears depends on if differential pairs exist and are enabled.
3. In the **Trace** tab **Polar Component** group box, specify the information to plot:
    a. From the **Category** dropdown menu, select the type of information to plot.
    b. From the **Quantity** list, click the values to plot. Use **Ctrl**+click to make multiple selections.
    c. In the **Function** list, click the mathematical function to apply to the quantity for the plot.
    d. The **Value** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
    e. **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
4. Click **New Report.**

This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

The function of the selected quantity is plotted against the swept variable values or quantities you specified on an x-y graph. The plot is listed under **Results** in the **Project Manager** window and the traces are listed under the plot. When you select the traces or plots, their

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

5. Optionally, add another trace to the plot by following the procedure above, using **Add Trace rather than New Report**.

2D and Circuit Data Table

A data table is a grid with rows and columns that displays, in numeric form, selected quantities against a swept variable or other quantities.

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*]. Then right-click **Results**. Navigate to the appropriate **report type** . Then select **Data Table** to open the **New Report** window.
2. In the **Context** group box make selections on the following field or fields, depending on the design and solution type.
    a. Solution field with a drop down selection list.
    b. Domain field with a drop down selection list. Whether this field appears, and the domains listed, depend on the Solution type and the **report type** and **display type** selected.
    c. Show field with a drop down selection list. Whether this field appears depends on if differential pairs exist and are enabled.
3. Under the **Trace** tab **Primary Sweep** group box, make selections on the following categories:
    a. From the **Category** drop-down menu, select the type of information to plot.
    b. From the **Quantity** group box, click the values to plot. Use **Ctrl**+click to make multiple selections.
    c. In the **Function** group box, click the mathematical function to apply to the quantity for the plot.
    d. The **Value** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
    e. **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
4. In the **X (Primary Sweep)** group box, make selections for the following:
    a. Select the Primary value(s) on the dropdown menu.
    To select an X component that is different on the Primary Sweep, uncheck the Default field to enable the X field and **[...]** button. Click **[...]** to open the **Select X Component** window. This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the window to assign the X component.
    b. If sweeps are available, select **[...]** to open a window that lets you select particular sweep or sweeps, or all sweeps.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

c. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (e.g., for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the Families tab with columns for the variable, the value, and an Edit column with an **[...]** button.

5. Click **New Report**.

   This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

   The Y quantity is listed at each variable value or additional quantity value you specified. The data table is listed under **Results** in the **Project Manager** window. The plot is listed under **Results** in the **Project Manager** window and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

6. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

2D and Circuit Smith Chart

A Smith chart is a 2D polar plot of S-parameters upon which a normalized impedance grid has been superimposed. Following is the general procedure for creating a Smith chart of results:

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type** and select **Smith Chart** to open the **New Report** window.
2. In the **Trace** tab **Polar Component** group box, specify the information to plot:
   a. From the **Category** dropdown menu, select the type of information to plot.
   b. From the **Quantity** list, click the values to plot. Use **Ctrl**+click to make multiple selections.
   c. In the **Function** group box, click the mathematical function to apply to the quantity for the plot.
   d. The **Value** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
   e. **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
3. Click **New Report.**

This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

The function of the selected quantity is plotted against the values you specified on a polar plot. Each circle on the plot is labeled with values of *R*, measuring normalized resistance, and each line is labeled with values of *X*, measuring normalized reactance. The plot is listed

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

under **Results** in the **Project Manager** window and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

4. Optionally, add another trace to the plot by following the procedure above, using **Add Trace rather than New Report**.

2D and Circuit Rectangular Stacked Plot

A rectangular stacked plot is a 2D stacked x-y graph of results.

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type** . Then select **Rectangular Stacked Plot** to open the **New Report** window.
2. In the **Context** group box make selections on the following field or fields, depending on the design and solution type.
   a. Solution field with a drop down selection list.
   b. Show field with a drop down selection list. Whether this field appears depends on if differential pairs exist and are enabled.
3. Under the **Trace** tab **Z Component** group box, specify the information to plot along the z-axis:
   a. In the **Category** list, click the type of information to plot.
   b. In the **Quantity** list, click the value to plot.
   c. In the **Function** list, click the mathematical function of the quantity to plot.
   d. The **Value** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
   e. **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
4. From the **Trace** tab **Y** (Secondary sweep) lines, specify the information to plot along the y-axis in one of the following ways:

- Select the sweep variable to use on the drop down list.
- If sweeps are available, select the **[...]** button to display a window that lets you select particular values. The quantity is plotted against the primary sweep variable listed.

5. In the **X (Primary Sweep)** group box, make selections for the following:
   a. Select the Primary value(s) on the dropdown menu.
   To select an X component that is different on the Primary Sweep, uncheck the Default field to enable the X field and **[...]** button. Click **[...]** to open the **Select X Component** window. This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the window to assign the X component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. If sweeps are available, select **[...]** to display a window that lets you select particular sweep or sweeps, or all sweeps.

c. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (e.g., for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the Families tab with columns for the variable, the value, and an Edit column with an **[...]** button.

6. Click **New Report.**

This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

The function of the selected quantity or quantities is plotted against the values you specified on an x-y-z graph. The plot is listed under **Results** in the **Project Manager** window. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace rather than New Report**.

2D and Circuit 3D Rectangular Plot

A rectangular plot is a 3D, x-y-z graph of results.

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type** . Then select **3D Rectangular Plot** to open the **New Report** window.
2. In the **Context** group box make selections on the following field or fields, depending on the design and solution type.
   a. Solution field with a drop down selection list.
   b. Show field with a drop down selection list. Whether this field appears depends on if differential pairs exist and are enabled.
3. Under the **Trace** tab **Z** Component group box, specify the information to plot along the z-axis:
   a. In the **Category** group box, click the type of information to plot.
   b. In the **Quantity** group box, click the value to plot.
   c. In the **Function** list, click the mathematical function of the quantity to plot.
   d. The **Value** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
   e. **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
4. From the **Trace** tab **Y** (Secondary sweep) lines, specify the information to plot along the y-axis in one of the following ways:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the drop-down menu, select the sweep variable to use.
- If sweeps are available, select the **[...]** button to display a window that lets you select particular values. The quantity is plotted against the primary sweep variable listed.

5. In the **X (Primary Sweep)** group box, make selections for the following:
   a. Select the Primary value(s) on the drop-down menu.
   To select an X component that is different on the Primary Sweep, uncheck the Default field to enable the X field and **[...]**. Click **[...]** to open the **Select X Component** window. This lets you specify the X component as you do the Y; that is, in terms of Categories that define the selectable Quantities, and Functions to apply. After making selections, **OK** the window to assign the X component.
   b. If sweeps are available, select **[...]** to display a window that lets you select particular sweep or sweeps, or all sweeps.
   c. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (e.g., for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the Families tab with columns for the variable, the value, and an Edit column with an **[...]** button.
6. Click **New Report**.

   This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

   The function of the selected quantity or quantities is plotted against the values you specified on an x-y-z graph. The plot is listed under **Results** in the **Project Manager** window. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

2D and Circuit 3D Polar Plot

A 3D polar plot is a 3D circular chart divided by the spherical coordinates R, theta, and phi, where R is the radius, or distance on the origin, theta is the angle on the x-axis, and phi is the angle on the origin in the z direction. Following is the general procedure for drawing a 3D polar plot of results:

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type** . Then select **3D Polar Plot** to open the **Report** window.
2. In the **Context** group box make selections on the following field or fields, depending on the design and solution type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

a. Solution field with a drop-down menu.
b. Show field with a drop-down menu. Whether this field appears depends on if differential pairs exist and are enabled.

3. In the **Trace** tab **Mag** group box, specify the information to plot along the R-axis, or the axis measuring magnitude:
   a. From the **Category** drop-down menu, select the type of information to plot.
   b. From the **Quantity** group box, click the values to plot. Use **Ctrl**+click to make multiple selections.
   c. In the **Function** list, click the mathematical function to apply to the quantity for the plot.
   d. The **Value** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
   e. **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
4. From the **Trace** tab **Theta (Secondary Sweep)** line, make a selection on the sweep variable drop-down menu and specify all values or select values to plot along the theta-axis:
5. From the **Trace** tab **Phi (Primary Sweep)** line, select the sweep variable from the drop-down menu, and specify all values or select values to plot along the phi-axis:
6. Click **New Report.**

   This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

   The function of the selected quantity or quantities is plotted against the R-, phi-, and theta-axes on a 3D polar graph. The plot is listed under **Results** in the **Project Manager** window. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

7. Optionally, add another trace to the plot by following the procedure above, using **Add Trace** rather than **New Report**.

2D and Circuit Rectangular Contour Plot

This type of plot is a 2D rectangular contour chart of the eye simulation results. Its traces can have two characteristics for bit error rates: MinEyeHeight and MinEyeWidth.

To display a rectangular contour plot after a successful analysis:

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type** . Then select **Rectangular Contour Plot** to open the **New Report** window.
2. Select the output quantities of interest and click **Add Trace**.
3. Click **Done**. A Report window opens to display a graph of the analysis results.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2D and Circuit Smith Contour Plot

To display a contour chart of the load-pull results after a successful analysis:

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type** and select **Smith Contour Plot** to open the **New Report** window.
2. Select the output quantities of interest and click **Add Trace**.
3. Click **Done**. A Report window opens to display a graph of the analysis results.

Circuit Eye Diagram Plot

An eye diagram illustrates an overlay of rising and falling bit waveforms with a given unit interval or bit time.

1. Click **Circuit > Results (** or right-click **Results** in the **Project Tree**) , select **Create Eye Diagram Report** > **Rectangular Plot** to open the **New Report** window.
2. In the **Context** group box, make selections on the following fields, depending on the design and solution type.
    a. **Solution** field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
    b. **Domain** field with a drop down selection list. Whether this field appears, and the domains listed, depend on the Solution type and the **report type** and **display type** selected.
    c. **Show** field with a drop down selection list. Whether this field appears depends on if differential pairs exist and are enabled.
3. In the **Eye Parameters** group box, set the **Unit Interval** and **Offset** to match the specification for the source or driver of the signal.
4. Under the **Trace** tab **Primary Sweep** group box, make selections on the following categories:
    a. In the **Category** list, click the type of information to plot. For an Eye Diagram, **Voltage** is the usual Category.
    b. In the **Quantity** list, click the value to plot. The unit interval used to generate the quantity must be the same as the one specified for the report.
    c. In the **Function** list, click the mathematical function of the quantity to plot, typically <none>.
    d. The **Eye Diagram** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
    e. **Range Function** — opens the **Set Range Function** window. This applies to the currently specified Quantity and Function.
5. In the **X (Primary Sweep)** group box, make selections for the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

a. Select the Primary value(s) on the dropdown menu.
   To select an X component other than the Primary Sweep, click the **[...]** button to open the **Select X Component** window. This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the window to assign the X component.
b. If sweeps are available, select **[...]** to display a window that lets you select particular sweep or sweeps, or all sweeps.
c. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (e.g., for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the Families tab with columns for the variable, the value, and an Edit column with an **[...]** button.

6. From the **Families** tab, confirm or modify the sweep variables that is plotted.
7. Click **New Report.**

This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

The function of the selected quantity is plotted against the swept variable values or quantities you specified on an eye diagram. The plot is listed under **Results** in the **Project Manager** window and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

8. Optionally, add another trace to the plot by following the procedure above, using **Add Trace rather than New Report**. The added trace is overlaid on the existing eye traces.

2D and Circuit Stacked Eye Diagram Plot

A stacked eye diagram creates a multiple display of two or more eye diagrams with the same unit interval bit time. A stacked eye diagram is a convenient way to compare a set of eye diagrams with the same unit interval.

1. Click **Circuit > Results (** or right-click **Results** in the **Project Tree**) , select **Create Eye Diagram Report**, then select **Stacked Eye Diagram Plot** to open the **New Report** window.
2. In the **Context** group box, make selections on the following field or fields, depending on the design and solution type.
   a. **Solution** field with a drop down selection list. This lists the available solutions, whether sweeps or adaptive passes.
   b. **Domain** field with a drop down selection list. Whether this field appears, and the domains listed, depend on the Solution type and the **report type** and **display type** selected.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

   c. **Show** field with a drop down selection list. Whether this field appears depends on if differential pairs exist and are enabled.

3. In the **Eye Parameters** group box, set the **Unit Interval** and **Offset** to match the specification for the source or driver of the signal. **The unit interval is required.**
4. Under the **Trace** tab **Primary Sweep** group box, make selections on the following categories:
   a. In the **Category** list, click the type of information to plot. For an Eye Diagram, **Voltage** is the usual Category.
   b. In the **Quantity** list, click the value to plot. The unit interval used to generate the quantity must be the same as the one specified for the report.
   c. In the **Function** list, click the mathematical function of the quantity to plot, typically <none>.
   d. The **Eye Diagram** field displays the currently specified Quantity and Function. Edit this field directly. Note that invalid expressions are displayed in red.
   e. **Range Function** — opens the **Set Range Function** window. This applies to the currently specified Quantity and Function.
5. In the **X (Primary Sweep)** group box, make selections for the following:
   a. Select the Primary value(s) on the dropdown menu.
   To select an X component that is different on the Primary Sweep, click the **[...]** button to open the **Select X Component** window. This lets you specify the X component as you do the Y; that is, in terms of Categories which define the selectable Quantities, and Functions to apply. After making selections, **OK** the window to assign the X component.
   b. If sweeps are available, select **[...]** to display a window that lets you select particular sweep or sweeps, or all sweeps.
   c. The **Families** tab provides a way to select from valid solutions for sweeps where a simulation has multiple variables defined (e.g., for a parametric sweep). If so, the variables other than the one chosen as the **X (Primary sweep)**, are listed under the Families tab with columns for the variable, the value, and an Edit column with an **[...]** button.
6. From the **Families** tab, confirm or modify the sweep variables that is plotted.
7. Click **New Report.**

This creates a new report in **Project Tree**, displays the report with the defined trace, and enables **Add Trace** on the **Report** window.

The function of the selected quantity is plotted against the swept variable values or quantities you specified on an eye diagram. The plot is listed under **Results** in the **Project Manager** window and the traces are listed under the plot. When you select the traces or plots, their properties are displayed in the Properties window. These properties can be edited directly to modify the plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

8. Optionally, add another trace to the plot by following the procedure above, using **Add Trace rather than New Report**. The added trace becomes the lowest of the stacked eye diagrams.

> **Note:** The stacked eye diagram is very useful for comparing eye diagrams (e.g., for AMI analysis, stack the waveforms before and after the channel).
>
> - Sweep a variable and stack the resulting set of eye diagrams.
> - When Eye Measurements can be displayed, the Stacked Eye Diagram format displays the measurements in a convenient side column that does not block the chart.

Circuit Statistical Eye Plot

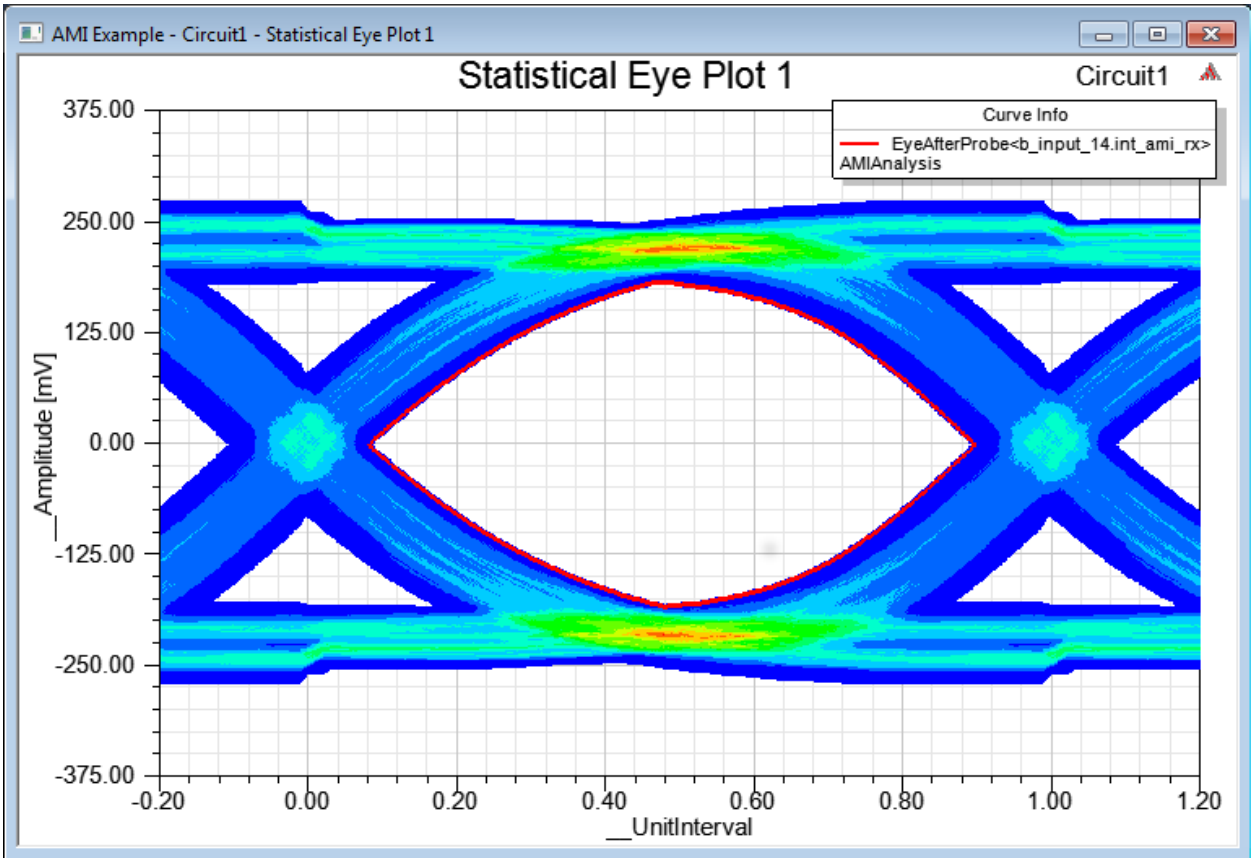
> **Note:** Statistical Eye Plots are intensity plots of Probability Mass Function (PMF) data. For bit-by-bit analyses (transient, QuickEye, AMI) the PMF data is computed on the waveform generated for the given bit pattern, and the inner eye contour of the plot corresponds to the worst-case eye for that bit pattern. *Inner eye contours on Statistical Eye Plots are not BER contours.* Contour plots provide BER contours.

To display a statistical eye plot of the transient, QuickEye, or AMI results after a successful analysis:

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type**. Then select **Statistical Eye Plot** to open the **New Report** window.
2. Select the output quantities of interest and click **Add Trace**.
3. Click **Done**. A Report window opens to display a graph of the analysis results.

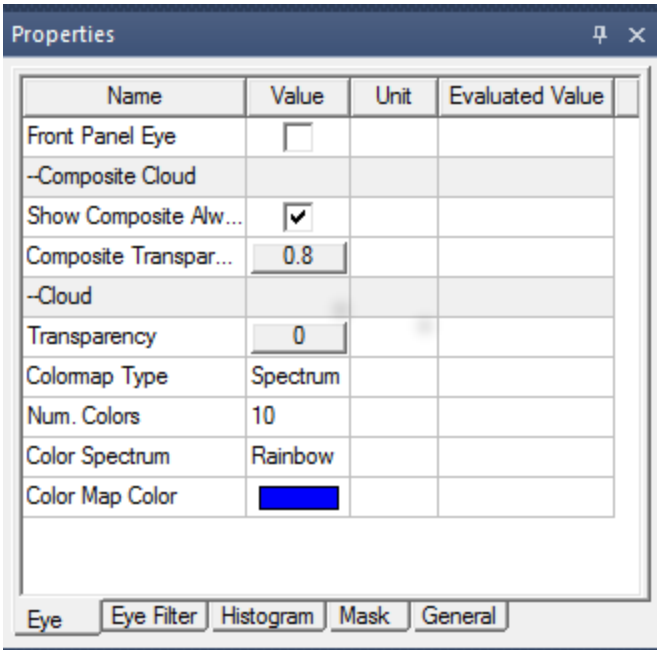
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

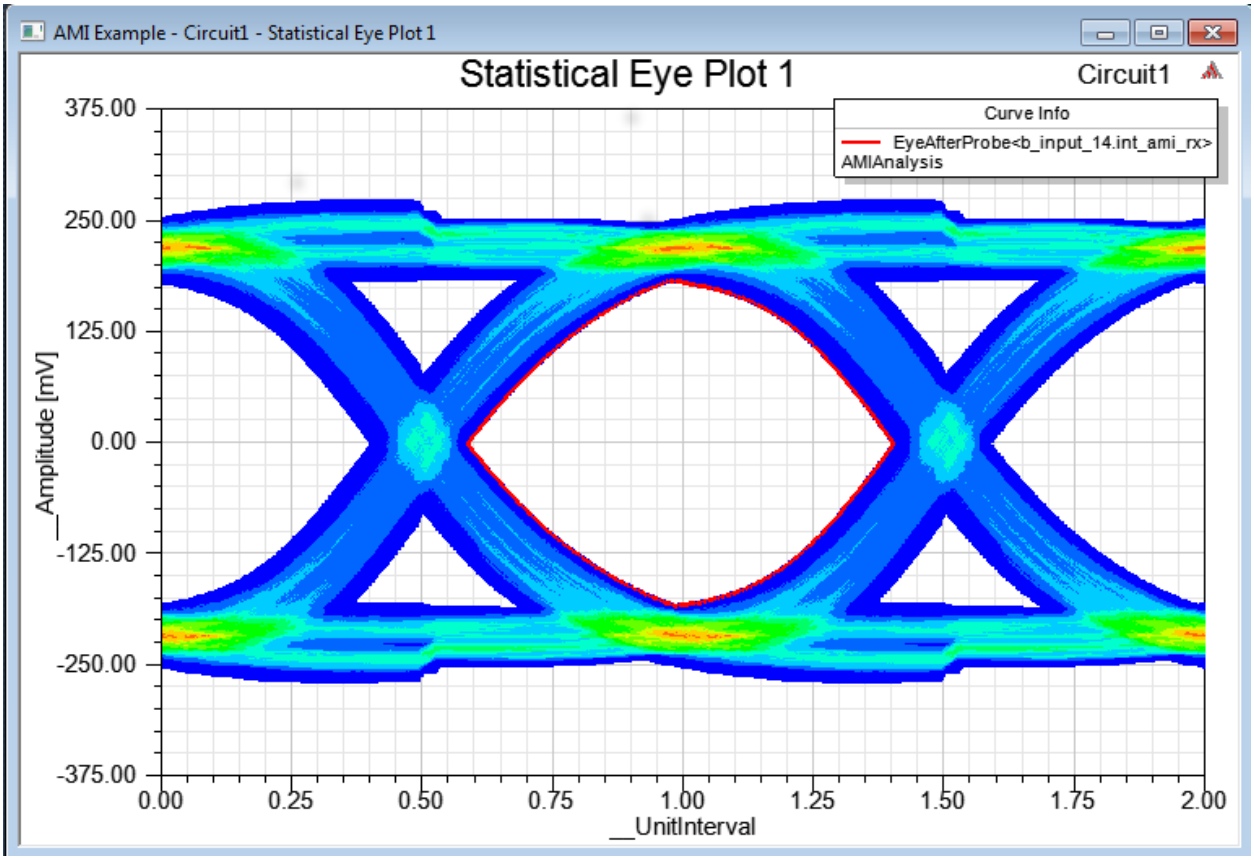
A Statistical Eye Plot resembles the following:



This eye diagram matches the UI extents displayed by the bathtub plot for the same trace and have a very similar eye opening position. The trace can be selected and the display changed to a "Front Panel" eye *(the default option for Statistical Eye Plots is a non-"Front Panel" eye)* via the "Eye" tab of the property window. This displays the [0, 2] UI extent front group box eye.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





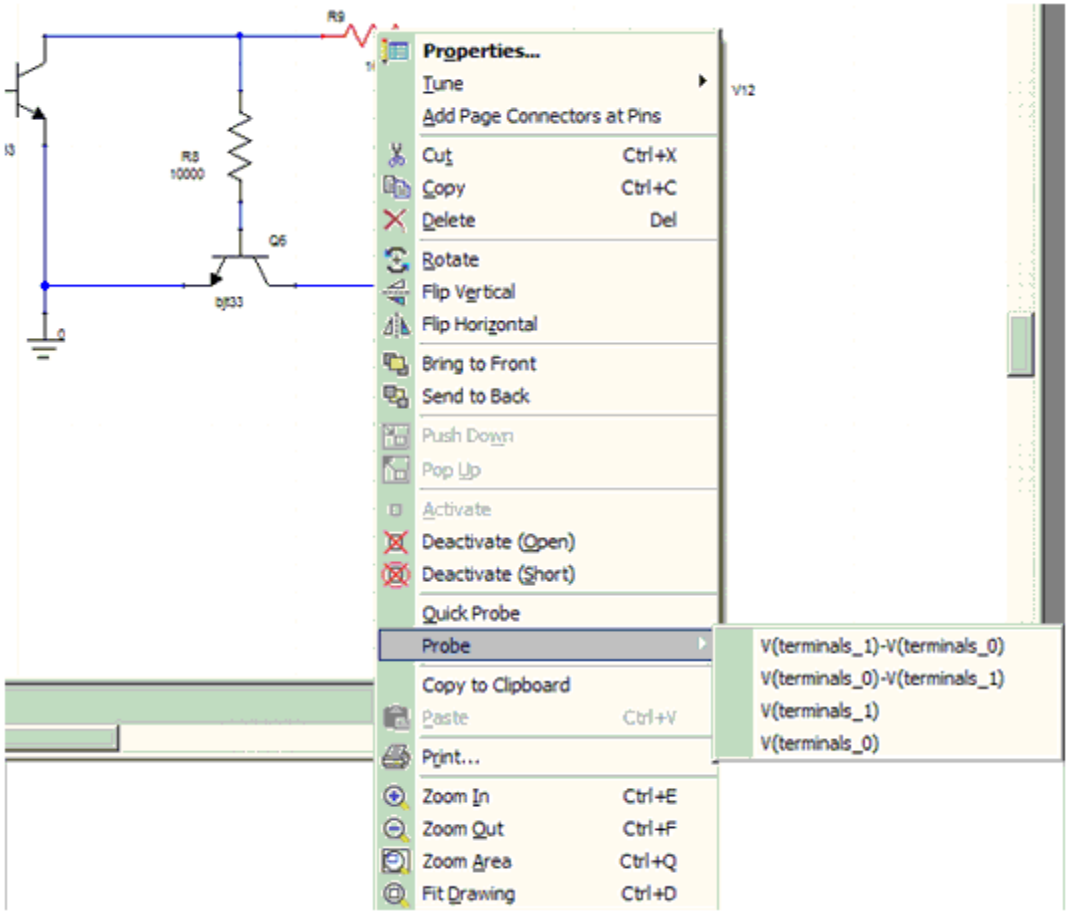
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2D and Circuit Plot-On-Schematic

One convenient way to generate a 2D report is to create a **Plot-On-Schematic**. A Plot-On-Schematic generates a standard 2D report but also associates it with the component being simulated. It then displays the plot alongside the component in the **Schematic** editor.

After simulating an analysis, select a component in the **Schematic Editor**, right-click over the component and highlight **Probe**. When you highlight the **Probe** menu item, a list of terminals that can be plotted is displayed (such as voltage across the component or various combinations of terminals). For larger pin components, more options appear in the **Probe** list, such as voltage across various terminals (including collector-to-base, base-to-collector, individual terminals, and any current or power options).

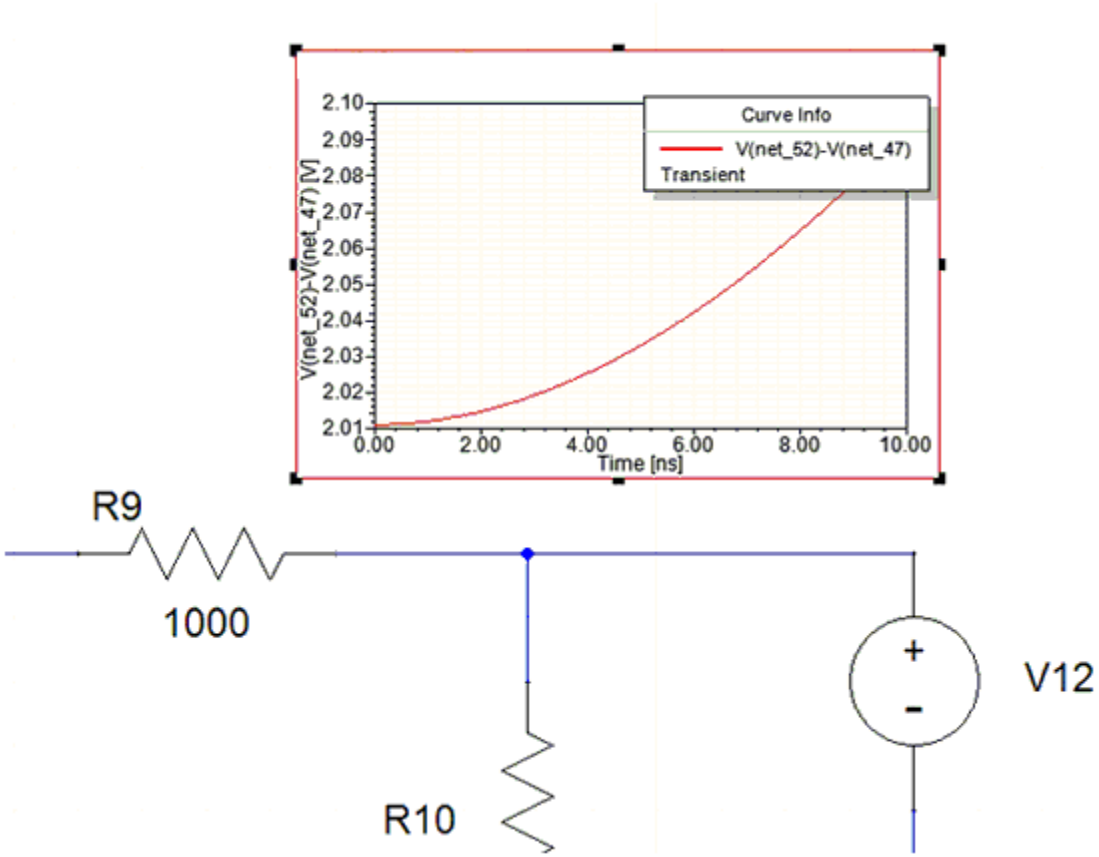
You can also generate a plot of a selected net, or a plot of multiple-selected nets. For instance, when you select two nets, a right-click option of **Quick Probe** allows you to create a **Plot-On-Schematic** of V(firstNet)-V(secondNet).



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When you select an entry in the **Probe** list, the quantity is automatically plotted and placed on the schematic next to the selected component. The plot is associated with the component — as the component moves, the plots moves with it. (The plot can also be directly relocated by dragging and dropping.)

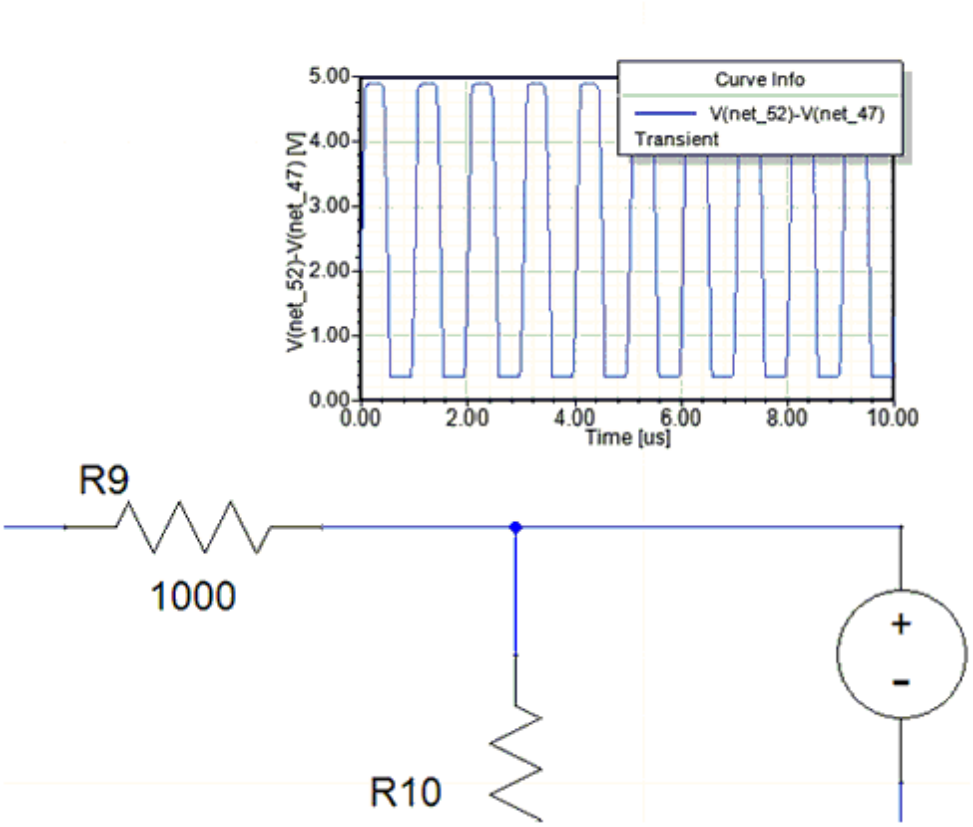
- The created plot also shows up in the **Results** folder in the **Project Tree**.
- Each component/net/port can have only one plot associated with it.
- You can have multiple plots on the same schematic, but only one such plot for each component.



If you right-click a plot in the schematic, choose the **Edit in Place** option (same as double-

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

clicking the plot). The plot then becomes fully editable.



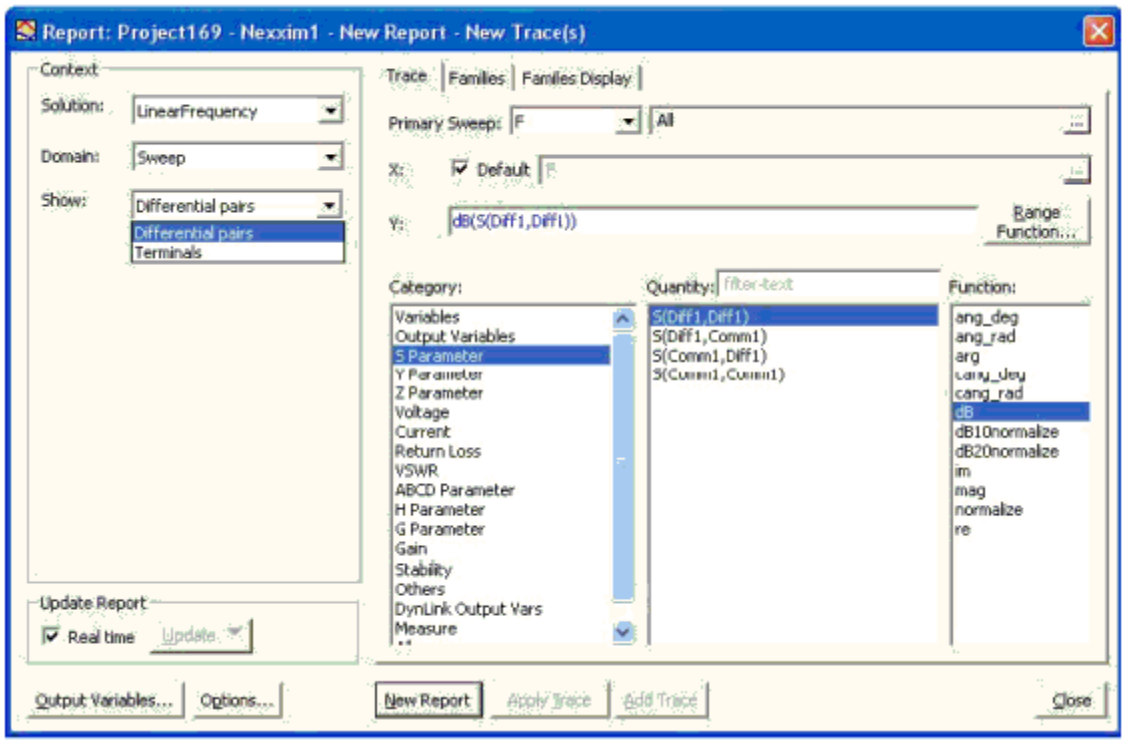
- You can move the legend bar around, change the color of traces, or change scaling for X and Y-axis — every operation that is normally performed in a regular plot window.
- You can also add plot markers.
- When you “click out” of the plot, it reverts back to being another schematic object.
- Plots are dynamically updated when you modify the analysis, so after you re-analyze, the **Plot-On-Schematic** is also updated.

For more information, see Modifying Reports.

2D and Circuit Reports with Differential Pairs

If differential pairs exist and are enabled, they change the reporter window – note the **Show** option in the **Context** group box. When differential pairs is selected as a **Show** option, the **Quantity** column changes on the original port names to the differential and common mode quantities.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2D and Circuit Creating a Report from a File

A report can be saved from one design and imported into another (or imported into the same design later). This allows you to take a static snapshot of a set of simulation data and view it at a later stage of the design process, or view the same dataset in one or more different designs.

To save a report to an Ansys Report Data File:

1. Create the report that you wish to save.
2. Right-click in the report window and select **Export** to open the **ExportReport** window.
3. Select the **Ansys ReportData files** option (.rdat) in the **Save as type** selection window.
4. Click the **Export Report** window to navigate to a appropriate location and either create a file name or select an existing file for the exported report. Then click **Save**.

To create a report from an existing Ansys Report Data File:

1. Right-click the **Results** folder in the **Project Manager** window and select **Create Report From File**.
2. Browse to select the appropriate **Ansys ReportData file** (.rdat). Then click **Open**.
3. The selected report is created in a new report window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

- Most report types supported by Electronics Desktop (including Rectangular Plots, Smith Charts, and Eye Diagrams) can be exported to **Ansys ReportDatafiles**. However, three-dimensional plots can not be exported or imported.
- Limited editing of reports created from files is supported. For example, change the color of a trace or an eye mask definition.

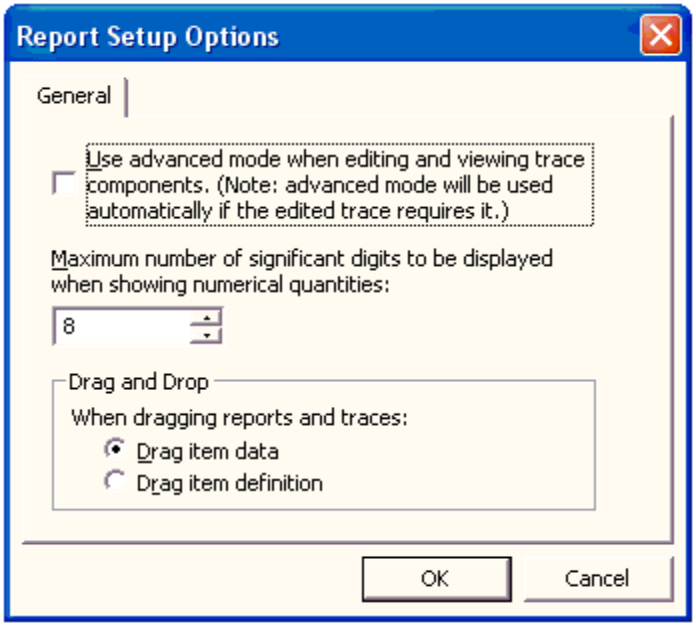
Setting 2D and Circuit Report Options

The following topics describe how to set up report options.

Setting Report Setup Options (2D and Circuit)

To set Report Setup Options in Electronics Desktop:

1. Click **Tools > Options > Report Setup Options** to open the **Report Setup Options** window.



2. Click the check box to specify whether to use **advancedmode** when editing and viewing trace components. (Advanced mode is used automatically if the trace requires it.)
3. Use the text-box/drop-down-menu to specify the number of **significantdigits** to use when displaying numeric values.
4. Specify the drag and drop behavior by clicking **Drag item data** or **Drag item definition**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Setting Report2D Options

To set Report2D options in Electronics Desktop:

1. Click **Tools > Options > Report2D Options**. The **Report2D Options** window opens, displaying several available tabs.

   For properties controlled by check boxes, you can set values for all curves by clicking the column header cell that contains the property title. To change cell values, right-click on a cell field and select **Cut**, **Copy**, or **Paste**. To make changes to entire rows, right-click on a menu cell to select **Copy** or **Paste**.

   You can use a Restore Defaults button.

2. Click each tab, and make the appropriate selections.
3. Click **OK**.

Report2D Options: Curve Tab

These options are set on the **Curve** tab of the **Report2D Options** window.

1. Line style — select the options from the drop-down menu. The options are Solid, Dot, Dash, and Dot dash.
2. Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
3. Width — set the line width by editing the real value in the field.
4. Arrows — click the check box to use arrows on the curve ends.
5. Symbol — click the check box to have symbols mark the locations of data points on the curve.
6. Sym Freq — set the symbol frequency by editing the integer value in the field.
7. Sym Style — select the symbol to display for the designated data points. The sym style can be box, circle, vertical ellipse, horizontal ellipse, vertical up triangle, vertical down triangle, horizontal left triangle, horizontal right triangle.
8. Fill Sym — click the check box to set the symbol display as a solid or as hollow.
9. Sym Color — set the color for the symbol by double-clicking to open the Set color window. Select a default or custom color and click OK.

Report2D Options: Axis Tab

These options are set on the **Axis** tab of the **Report2D Options** window.

1. Axis Name — this describes the axis to which the following options refer.
2. Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Auto Scale — click the check box to toggle whether to auto scale the axis.
4. Min Scale — if Auto Scale is not selected, edit the real value to set the minimum value of the axis.
5. Max Scale — if Auto Scale is not selected, edit the real value to set the maximum value of the axis.
6. Auto Units — click the check box compute the correct units for the axis.
7. Units — click the cell to select from a menu of available units if you have not checked Auto Units.
8. Font color — set the font color of the axis by double-clicking to open the Set color window. Select a default or custom color and click OK.
9. Edit Font — click the cell to display the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window.

Report2D Options: Grid Tab

These options are set on the **Grid** tab of the **Report2D Options** window.

1. Grid Name — lists the name or letter of the grid. Not editable.
2. Line Style — select the options on the dropdown menu. The options are Solid, Dot, Dash, and Dot dash.
3. Line Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.

Report2D Options: Header Tab

These options are set on the **Header** tab of the **Report2D Options** window. For the Title and subtitle, independently specify the following:

1. Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
2. Font — click the cell to open the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window.

Report2D Options: Note Tab

These options are set on the **Note** tab of the **Report2D Options** window.

1. Note Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Note Font — click the cell to display the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window.
3. Background Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
4. Background Visibility — click the check box to toggle the background for the note on or off.
5. Border Line Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
6. Border Visibility — click the check box to toggle the visibility of the note border.
7. Border Line Width — set the line width by editing the real value in the field.

Report2D Options: Legend Tab

These options are set on the **Legend** tab of the **Report2D Options** window.

1. Show Trace Name — click the check box to toggle the visibility of the trace name.
2. Show Solution Name — click the check box to toggle the visibility of the solution name.
3. Show Variation Key — click the check box to toggle the visibility of the variation key.
4. Text Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
5. Text Font — click the cell to display the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window.
6. Background Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
7. Border Line Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
8. Border Line Width — set the line width by editing the real value in the field.
9. Grid Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.

Report2D Options: Marker Tab

These options are set on the **Marker** tab of the **Report2D Options** window.

1. Marker Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
2. Marker Font — click the cell to display the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

window.

3. X Marker — use the following options to set the X Marker properties.
    a. Show Intersection — check box to show the intersection.
    b. XMarker Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
    c. XMarker Font — click the cell to display the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window.
    d. Box Background Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
    e. Line Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
    f. Line Style — select the options from the drop-down menu. The options are Solid, Dot, Dash, and Dot dash.
    g. Line Width — set the line width by editing the real value in the field.

Report2D Options: Marker Table Tab

These options are set on the **Marker Table** tab of the **Report2D Options** window.

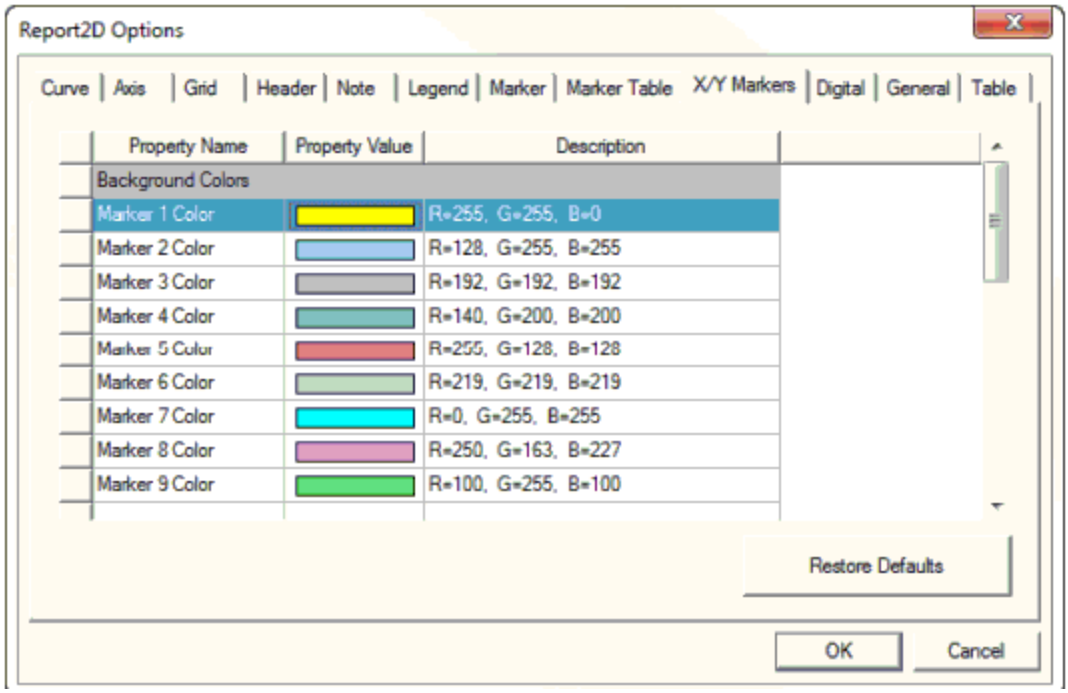
1. Precision — set the precision for marker placement by editing the real **Value** field.
2. Text Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
3. Text Font — click the cell to display the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window.
4. Background Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
5. Border Line Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
6. Border Line Width — set the line width by editing the real value in the field.
7. Grid Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
8. Grid Line Width — set the line width by editing the real value in the field.

Report2D Options: X/Y Markers Tab

Use this tab on the **Report2D Options** window to set the properties for the markers.

Background colors for Markers 1 through 10. You can set these by select the current color to open a color selection window, or by specifying RGB number values.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Properties, including

- On-screen intersection
- Marker Font
- Text color
- Line color
- Line style
- Line width
- Whether to Show Name
- Whether to Snap to Vertex

Inter marker deltas, including

- Whether to show delta
- Delta font
- Delta text color
- Line color
- Line style
- Line width

You can also **Restore Defaults**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Report2D Options: Digital Tab

These options are set on the **Digital** tab of the **Report2D Options** window.

Digital Literal Foreground color.

Whether to Expand Arrays/Records

Digital Stack Hight in Pixels for the following:

- Analog
- Digital
- Enum
- Event
- Literal.

You can also **Restore Defaults**.

Report2D Options: General Tab

These options are set on the **General** tab of the **Report2D Options** window.

1. Background Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
2. Contrast Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
3. Highlight Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
4. Accumulate Depth — sets the maximum number of accumulated traces on a single report. When Accumulate Depth is turned on (i.e., set to a non-zero value),run an analysis to generate a plot, then change some parameter value(s) and run another analysis. The newly generated plot now contains both old and new results that can then be compared. The plot keeps adding new results with each subsequent analysis until the accumulate length is reached.
5. Curve Tooltip Option — click the check boxes to toggle the following properties:
    a. Show Trace Name
    b. Show Variation Key
    c. Show Solution Name
6. Clipboard Option - specify the following properties:
    a. Capture Aspect Size Ratio — this can be As Shown or Full Screen.
    b. Capture Background Color — this can be As Shown or White.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Report2D Options: Table Tab

These options are set on the **Table** tab of the **Report2D Options** window.

1. Text Font — click the cell to display the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window.
2. Format — use the following properties to set the format:
    a. Field Width — set the table field width by editing the real value in the field.
    b. Precision — set the table precision by editing the real value in the field.
    c. Use Scientific Notation — click the check box to toggle scientific notation on or off.
3. Copy to Clipboard — use the following check boxes to toggle the following properties for table copy operations.:
    a. With Header
    b. With Tab Separator

Modifying 2D and Circuit Reports

After creating a report, See the following topics to modify the report's content, appearance and attributes.

Modifying 2D and Circuit Report Data

To modify the data that is plotted in a report:

1. From the **Project Manager** window, click the report you want to modify.
2. Right-click **Modify Report** to open the **Report**window.
3. The **Report** window command buttons permit you to create a new report with the settings you provide, or to modify an existing report.

- **Output Variables** – opens the **Output Variables** window.
- **Options** – opens the **Report Setup Options** window. This contains a check box for using the advanced mode for editing and viewing trace components. This mode is automatic if the trace requires it. It also contains a field for setting the maximum number of significant digits to display for numerical quantities.
- **New Report**. Adds a report to the Project tree under the Results icon. The new Report is displayed in **Electronics Desktop** window.
- **Apply Trace** – applies the selected traces in a report based on further processing or changes.
- **Add Trace** – this is enabled when you have created or selected a report. Add one or more traces to include in the report.
- **Close** – closes the **Report** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The updated report appears in the view window.

You can also view and edit the properties of Reports and their traces via their Properties windows. See *Modifying the Background Properties of a Report*

Modifying the Background Properties of a 2D or Circuit Report

The standard View menu Zoom and Fit commands operate on reports. When zooming on a report, axis labels and ticks adjust automatically during the zoom operation and rescale to their final value after the zoom operation is complete.

To modify the appearance of a report, or the display properties an object in a report:

1. Open the report you want to modify.
2. You must select an editable object in the report to be able to edit its properties. Click an object to select it and view its Properties in the docked properties window. To open a floating Properties window, either double-click the selected object, or click **Edit > Properties** on the toolbar.

The selectable objects in reports are as follows:

- **Header** – this lets you edit the Properties for the text displayed at the top of the report, including the Title font, Company Name, Show Design Name, Subtitle Font. The plot title is tied to the report's name and is not a Header property. If you change the report name in the **Project Manager** window, plot title synchronizes. The Company Name and the Show Design Name check box are grouped in the Properties window as Subtitle. Edits to the Subtitle Font Property affects both of them.
- **General —** this window (or General tab for other Report properties windows) lets you edit the background color (the perimeter around the trace display) for the plot, the contrast color (the trace display background), the Field width, the Precision, and whether to use scientific notation for marker and delta marker displays. (X and Y notation display is set separately, in the Axis property tabs.)
- **Legend —** this lets you edit the Properties for whether to Show Trace Name, Solution Name, and Variation Key. At least one of these three must be selected. You can also edit the Font, the background color of the Legend box, the Border Color, the Border Width, Grid Color (for the lines between Trace descriptions), and the Grid line width. Also see Modifying the Legend in a Report
- **Traces** – select traces either in the Legend or on the plot. The properties for traces include: Color, Line Style, Line Width, Trace Type, whether to Show a symbol, Symbol Frequency, Symbol style, whether to Fill symbol, symbol color, and whether to Show arrows. See Editing the Display Properties of Traces.
- X or Y **Axis Tab** — the defaults for most of these values are set in the **Report 2D Options** Axis tab.
  - Specify name — check box for specifying the Axis name.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Name — this describes the axis to which the following properties/options refer. These are selected in the **Report** window.
- Axis Color — set the color by double-clicking to open the Set color window. Select a default or custom color and click OK.
- Text Font — click the cell to open the Edit Text Font window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window.
- **Manual Format** (group box)

- Number format — choose a format (i.e., Auto, Decimal, or Scientific notation).
- Field Width — enter a real value.
- Field Precision — enter a real value.
  - X or Y **Scaling Tab** — These properties provide control over scaling.
- Axis Scaling — choose scaling as Linear or Log. For the Y axis, all zero or negative values are discarded before log scaling is applied.
- Specify Min — check box
- Min — text entry in same units as axis units. Saved as SI internally.
- Specify Max — check box
- Max — text entry in same units as axis units. Saved as SI internally.
- Specify Spacing — check box
- Spacing — text entry in same units as axis units. Saved as SI internally
- **Manual Units** (group box)
- Auto Units — click the check box compute the correct units for the axis.
- Units — click the cell to select from a menu of available units if you have not checked Auto Units.
- **Infinity Visualization** (group box)
- Map Infinity Mode — check box.

Each axis now can be set to treat infinity values in a user-defined way. When you check the Map Infinity Mode, any infinity values in the input data get the infinityMap value (negative infinity get the value*-1 and positive infinity the positive value specified). This can be useful if there are zeros, or very small values that Electronics Desktop treats as zero, in the data, for example, dB Gain.

- Map Infinity To — enter a real value for the Map Infinity Mode.

3. Edit the properties, and **OK** the window to apply the changes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Modifying the Legend in a 2D or Circuit Report

The legend in a report is a list of the curves being plotted. For each curve, the legend gives the name, shows the line color, and lists the setup and the adaptive pass used to generate the curve.

To show or hide a legend in a report:

1. Make the report the active view.
2. Use **View > Active View Visibility** or the **Show/Hide** icons on the toolbar to display or hide the report.

   Either command displays the **Active View** window.

3. Select the **Legends** tab.

   This lists the legend (or legends) in the report.

4. Check the visibility check box, and OK the window to close it and apply the change.

To edit the display properties of a legend:

1. Select the legend in a report by clicking on the group box to display a docked properties window, or right-click on the legend and select **Edit > Properties** to open the floating properties window.

   This lets you edit the Properties for whether to Show Trace Name, Solution Name, and Variation Key. At least one of these three must be selected.

   You can also edit the Font by clicking the Font cell to open the **Edit Text Font** window. The window lets you select from a list of available fonts, styles, sizes, effects, colors, and script. The window also contains a preview field. OK the selections to apply the font edits and close the window

   You can also edit the background color of the Legend box, the Border Color, the Border Width, Grid Color (for the lines between Trace descriptions), and the Grid line width.

2. Click OK to close the Properties window and apply the selections. To **change the display name** for traces, see Editing Trace Properties.

To move a legend in a report:

1. Click and hold and the legend.

   The cursor changes to crossed lines with arrow tips.

2. Still holding, drag the legend to a new location and release.

   The legend is released and the crossed lines change back to a mouse pointer.

To resize a legend in a report:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Position the mouse tip over the edge you want to resize.

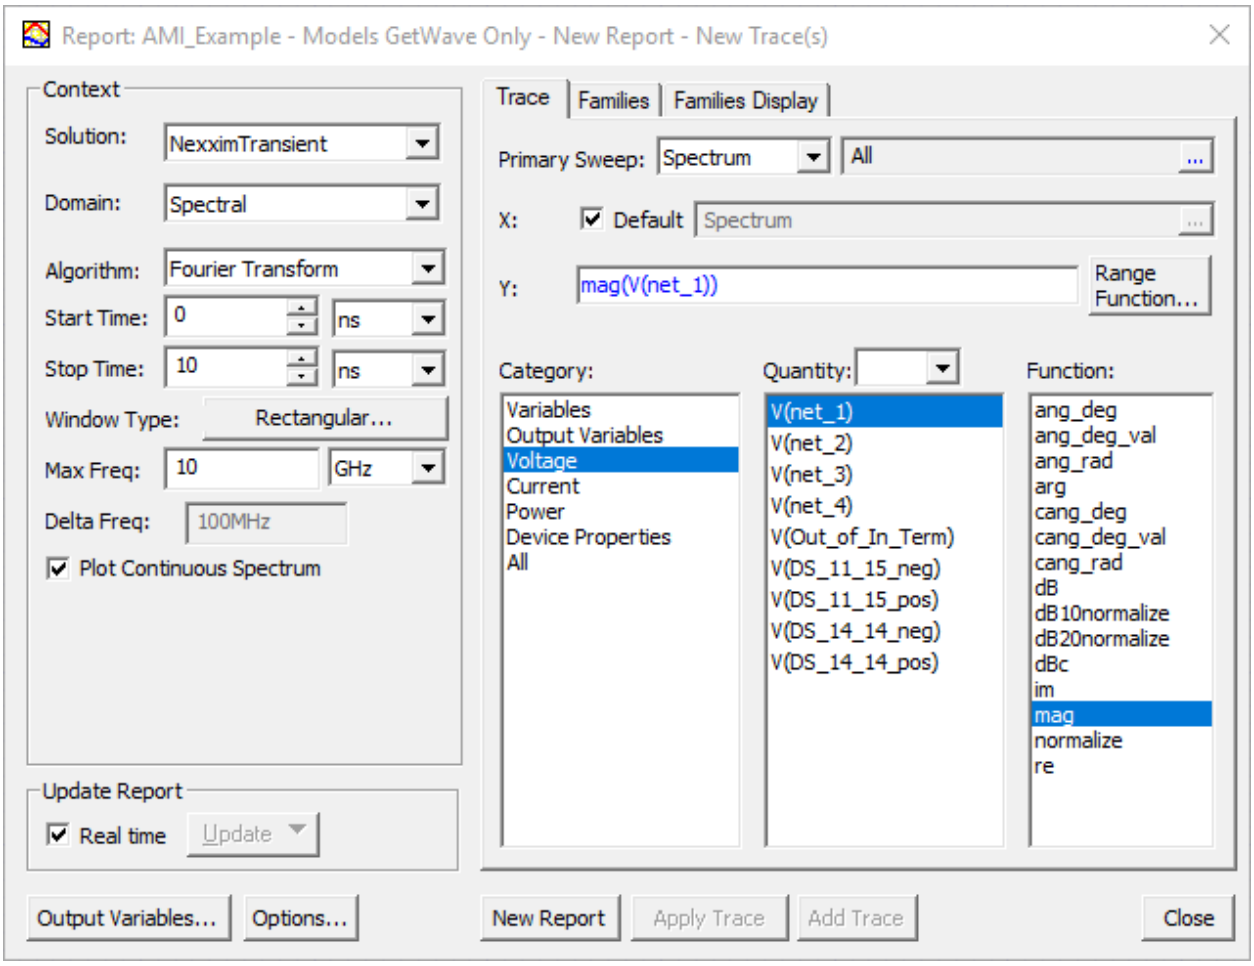
The mouse pointer changes to a horizontal or vertical line with arrow tips.

2. **Click+drag** the horizontal or vertical edge to the desire size.
3. Release.

Plotting Circuit Spectral Domain Data

After transient analysis, one can exam frequency components of the signal of interest by plotting spectral domain data on the Reporter.

1. Open a project in **Project Manager** window.
2. Right-click **Results**.
3. In **Solution**, choose **NexximTransient**.
4. In **Domain**, choose **Spectral**. Several fields appear in the **Report** window:



In the **Context** pane:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Start Time** and **Stop Time** define the signal duration T_0 = **Stop Time** - **Start Time**.

  > **Note: Stop Time** and **Start Time** should lie inside the transient simulation time limits.

- **Max Freq** sets the maximum frequency for spectral analysis and plotting.
- **Delta Freq** is automatically supplied as $1/T_0$ Hz.
- The **Algorithm** drop-down menu contains 3 options: **Fourier Integration** (FI), **FFT**, and **Fourier Transform**.

  Fourier Integration and **FFT** both provide Fourier Series (or Fourier Coefficients) of the transient signal with DFT, where periodicity is implicitly assumed and the period is defined as T_0 = **Stop Time** - **Start Time**.

  Fourier Integration computes Fourier series by numerically integrating the input waveform from its transient simulation. The sampled waveform may not be on a set of evenly spaced time points. **Fourier Integration** is much slower compared with **FFT**, but it can be more accurate since it preserves the shape of underlying waveform without re-sampling.

  The **FFT** algorithm re-samples the input waveform by interpolating to evenly spaced time points. It uses the FFTW library that is publicly available and whose computational complexity is

  $O(Nlog_2N)$

  where N is the sample size after re-sampling and N = 2 *#Harmonics +1, where #Harmonics = **Max Freq** /**Delta Freq**.

  > **Note:**
  >
  > - Based on the Nyquist-Shannon Theorem or Sampling Theorem, the sampling rate should be at least twice the bandwidth of the signal to avoid aliasing.
  > - Spectral plots based on **Fourier Integration** and **FFT** are single-sided with magnitudes of non-zero harmonics doubled because the negative frequency components are folded to the positive side.

  Fourier Transform (FT) provides the Fourier transform of a signal defined in [**Start Time**, **Stop Time**] by leveraging the **FFT** algorithm. The Fourier transform of a time limited signal f(t) in [0, T_0] is

$$F(f) = \int_{-\infty}^{\infty} f(t)e^{-i2\pi ft}dt = \int_{0}^{T_0} f(t)e^{-i2\pi ft}dt$$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The Fourier series of a periodic signal that is equal to f(t) in [0, T_0] and with period T_0 is

$$c_n = \frac{1}{T_0}\int_0^{T_0} f(t)e^{-i\frac{2\pi}{T_0}nt}dt$$

Hence,

$$c_n = \frac{1}{T_0}\mathrm{F}\left(\frac{n}{T_0}\right)$$

In other words, the Fourier series of f(t) based on **FFT** can be multiplied by T_0 in order to get the **Fourier Transform** of f(t) at sampled frequencies n/T_0.

> **Note:** Spectral plots based on **Fourier Transform** only show the positive frequency side.

- The **Plot Continuous Spectrum** check box provides a continuously plotted spectrum if selected and a discrete spectrum when cleared.
- **Window Type** determines which window type to apply.

  When applied to transient data, a window type can help resolve closely spaced harmonics and reduce spectral leakage due to the finite nature of the time signal. The following window types are available. (The “t” parameter is normalized time.)

  - **Rectangular**: 1.0
  - **Bartlett** (also known as the Parzen or triangular window): 1.0 - t
  - **Blackman**: 0.42 + 0.5*cos(π*t) + 0.08*cos(2*π*t)
  - **Hamming**: 0.54 + 0.46*cos(π*frac)
  - **Hanning**: 0.5 * (1.0 + cos(π*t))
  - **Kaiser**: BesselI0(KaiserParam * sqrt(1.0 - t*t)) / BesselI0(KaiserParam)
  - **Welch**: 1.0 - t^2
  - **Weber**: (0.828217*π^3*t^3 - 1.637363*π^2*t^2 + 0.041186*π*t + 0.99938)
  - **Lanzcos**: sin(π*t)

  Optionally, click the **Adjust Coherent Gain** check box to adjust signal levels (based on the window type) as if no window are used. When non-rectangular windows are used, the window automatically changes the power level of the signal. This is known as the “coherent gain” or “processing loss” of the window.

Delta Markers in 2D Reports (2D and Circuit)

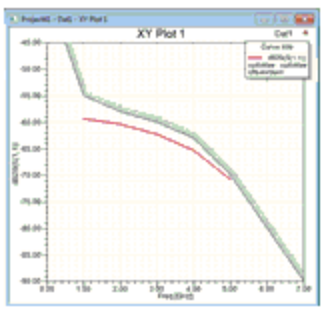
To view the difference between any two marker points in a report:

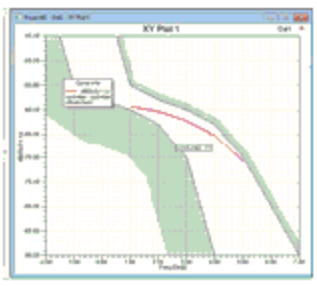
1. Set the first marker by clicking and holding the mouse button.
2. Move the mouse — without releasing the left — to another position, then release the left button to create the second marker.

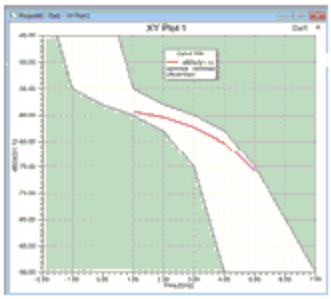
The marker text window displays the difference between the two markers, instead of the absolute X and Y values.

Limit Lines in 2D and Circuit Cartesian Plots

Limit lines are simple graphical representations of constraints on XY plots. These are modeled as a sequence of XY point pairs. For example, designate a single limit line to delineate either an upper or lower limit, or two limit lines to delineate upper and lower limits. Add as many limit lines as you want. You can control the display properties of the line including color and hatch width.







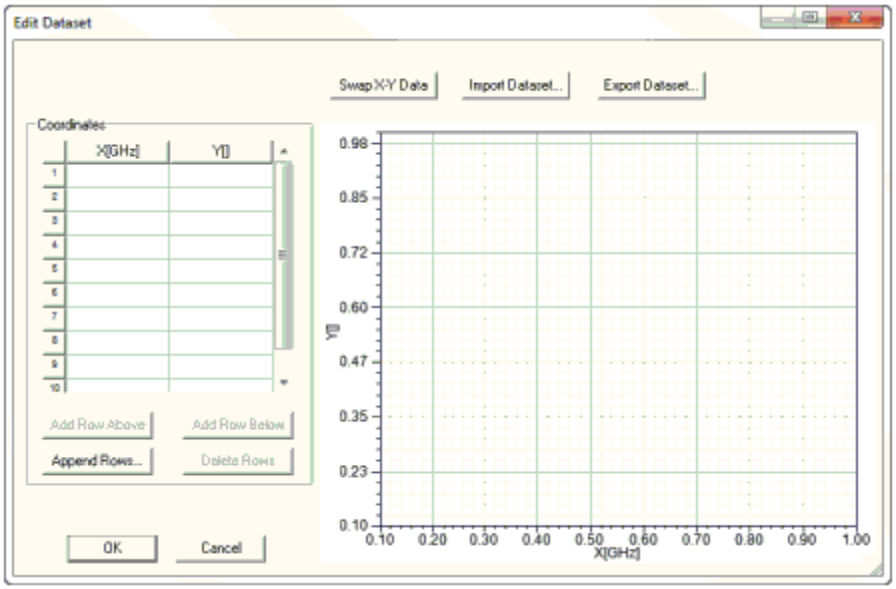
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: Limit lines are available only on Rectangular (XY) plots, not on XY-like plots such as Bode or Rectangular Stacked.

To create a limit line:

1. Click **Report2D>Add Limit Line**, or right-click an XY plot and select **Add Limit Line**.

   This opens an **Edit Dataset** window.



1. You can use this window to:

- Enter the XY coordinate values directly.
- Import XY values from a tab-delimited **.tab** file.
- Export dataset to a file.

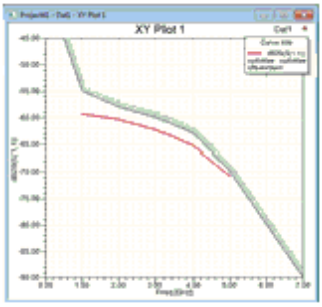
To add additional data points, click **Append Rows ...**, or modify the table by clicking **Add Row Above**, **Add Row Below**, and **Delete Rows**, as necessary.

You can press **Shift** +click to select multiple adjacent rows, or **Ctrl**+click to select any combination of rows for deletion.

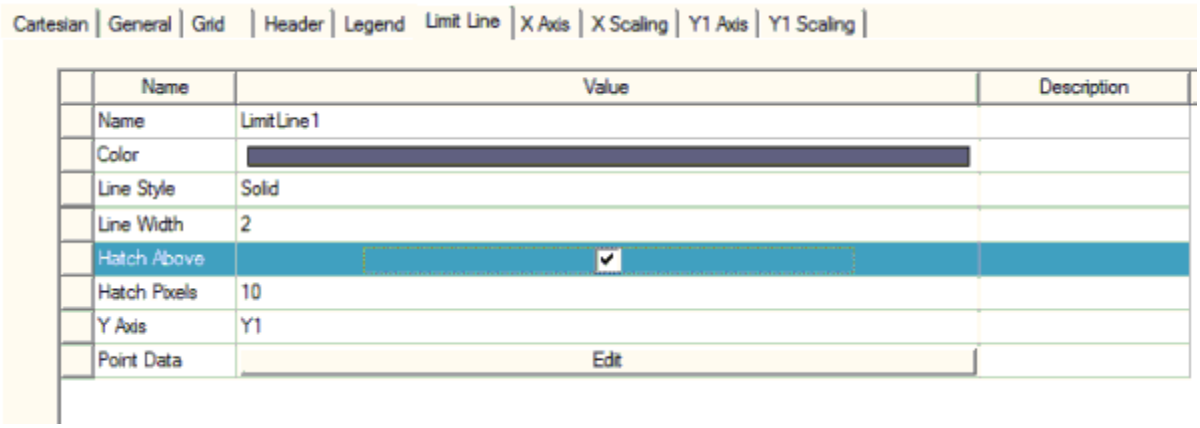
Note: Each limit line is associated with a particular Y axis (because it has to be scaled the same way as all the curves associated with the axis, follow its log/linear scale et cetera). This Y axis association defaults to the first available Y axis when the limit line is created. However, if the plot contains multiple Y axes, it can be associated with a different Y axis later via its properties tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Click **OK** to add the limit line you defined to the plot. The line divides the plot into two regions in the context of its length. By default, the upper region is hatched to designate constraint violation.



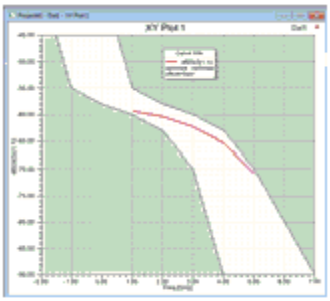
1. You can select the limit line in the plot to edit its properties on the **Limit Line** tab of the plot properties.



- Line properties: color, style and width
- Hatch direction (hatch above or below the limit line)
- Hatch width in pixels
- Y axis association
- The point data that defines the limit line itself

2. If you add a second limit line, designate it as hatch below by unchecking **Hatch Above** to produce a “tunnel” marking the upper and lower constraints.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2D and Circuit Spinning a 3D Report

You can set a 3D report spinning around any axis, to enable viewing from multiple angles without having to rotate repeatedly.

1. From the **View** menu, select **Spin**. Alternatively, right-click the 3D graph, select **View** on the dropdown menu, and select **Spin** on the subordinate menu. The cursor changes to the Spin mode cursor (curved arrows).
2. **Click+drag** the mouse in the direction and at the speed you want to spin the view. When you release the mouse button, the image begins spinning continually.
3. To stop spinning, click the mouse again in the report window. Start another spin in the same or another direction and speed by repeating step 2.
4. To end Spin mode, press **Esc** or deselect **Spin** on the **View** menu.

Reviewing 2D Polar Plots

For a polar plot of S-parameters, Electronics Desktop displays in the lower-left corner the following derived information about the cursor's location:

MP	The magnitude and phase of the point.
RX	The normalized resistance (**R**) and reactance (**X**).
GB	An alternate view of the normalized resistance and reactance in the form of

$$R + jX = \frac{1}{G + jB}$$

where

- ***G*** = conductance
- ***B*** = susceptance

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VSWR

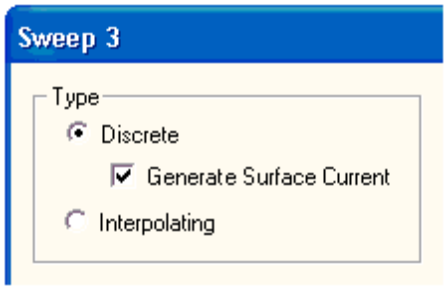
The voltage standing wave ratio, calculated on the equation $\frac{1+|S_{ij}|}{1-|S_{ij}|}$.

A scale under the plot displays the scale of points along the R-axis.

2D Overlaying Surface Currents on a 3D View

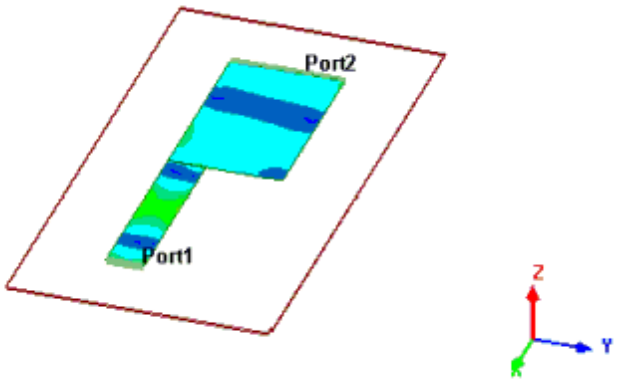
Surface currents calculated as the results of a simulation can be displayed as overlays on the 3D viewer.

1. To ensure that the surface current information is generated, the sweep setup must specify a **Discrete** frequency sweep, and the **Generate Surface Current** option must be enabled (checked):

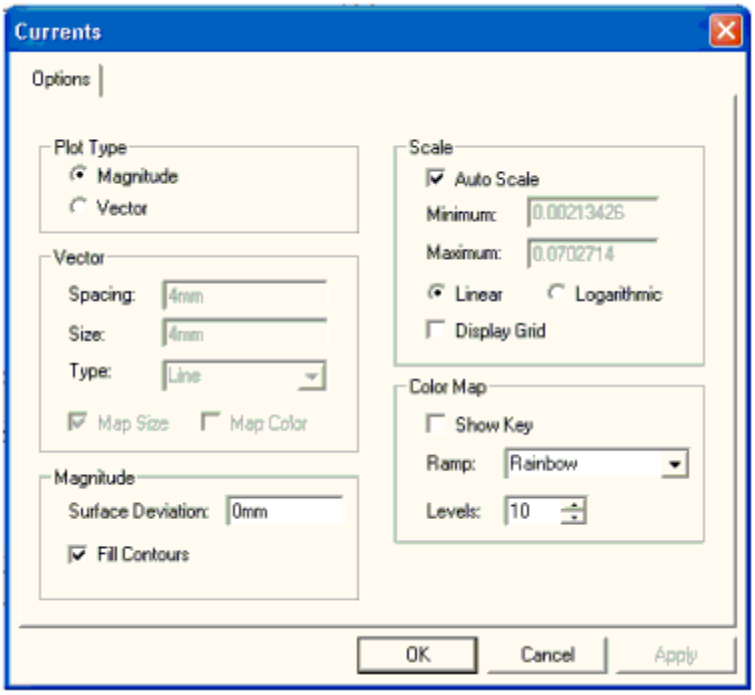


2. Run the analysis with the sweep.
3. to open the surface current as an overlay, expand the **Analysis** icon in the **Project Manager** window, and select **Setup***m* > **Sweep***n* > **Results** > **Display Currents** (*m* and *n* identify the particular solution setup and sweep setup, respectively). Also select from a list of corresponding Setup/Sweep overlay choices which are displayed when you right-click **Field Overlays** in the **Project Tree**. The 3D viewer window opens with the current values overlaid on the geometry:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. To change the display properties of the surface current overlay, expand the **Results** icon in the Project window, and select **Setup***m*:**Sweep***n*:**Currents***k* > **Properties** (*m*, *n*, and *k* identify the particular solution setup, sweep setup, and surface current setup, respectively). The **Currents** window opens:



In the **Plot Type** group box, select **Magnitude** to enable the **Magnitude** group box options or select **Vector** to enable the **Vector** group box options.

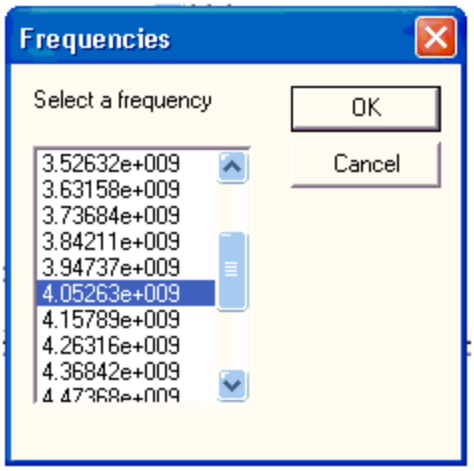
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In the **Scale** group box, select **Auto Scale** (the default), or deselect **Auto Scale** and enter custom **Minimum** and **Maximum** scaling values. Select **Linear** or **Logarithmic** scaling (the default is **Linear**), and toggle **Display Grid** on or off (the default is off).

In the **Color Map** group box, select the **Ramp** type (**Rainbow** is the default; other options are **HueScale**, **Magenta**, and **Temperature**), set the number of **Levels** (the default is 10 levels), and toggle the color key (**Show Key**) on and off (default is off).

Click **Apply** to apply any changes to the display without closing the window. Click **OK** to apply any changes and close the window. Click **Cancel** to close the window without changing any options.

5. To select the frequency for the current overlay, expand the **Results** icon in the **Project Manager** window, and select **Setup***m*:**Sweep***n*:**Currents***k* > **Frequency** (*m*, *n*, and *k* identify the particular solution setup, sweep setup, and surface current setup, respectively). The **Frequencies** window opens:



The list displays the frequencies that are swept in the analysis. When you select a frequency on the list, the overlay displays the surface current values calculated at that frequency. Click **OK** to leave the overlay at the selected frequency, or click **Cancel** to close the window without applying any frequency changes to the overlay.

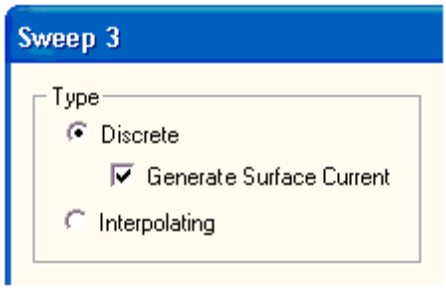
6. To dismiss the overlay, expand the **Results** icon in the **Project Manager** window, right-click **Setup***m*:**Sweep***n*:**Currents***k*, and select **Delete s** (*m*, *n*, and *k* identify the particular solution setup, sweep setup, and surface current setup, respectively).

2D Overlaying Far Fields on a 3D View

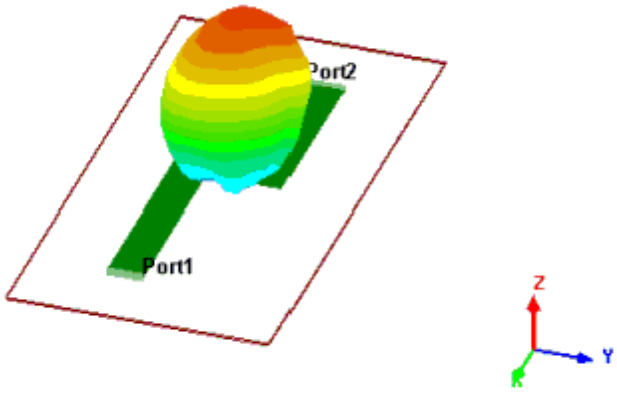
Far fields calculated as the results of a simulation can be displayed as overlays on the 3D viewer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. To ensure that the far field information can be generated, the sweep setup must specify a **Discrete** frequency sweep, and the **Generate Surface Current** option must be enabled (checked):



2. Run the analysis with the sweep.
3. to open the far field as an overlay, expand the **Analysis** icon in the **Project Manager** window, and select **Setup***m* > **Sweep***n* > **Results** > **Far Field** (*m* and *n* identify the particular solution setup and sweep setup, respectively). Also select from a list of corresponding Setup/Sweep overlay choices which are displayed when you right-click **Field Overlays** in the **Project Tree**. The 3D viewer window opens with the far field values overlaid on the geometry:

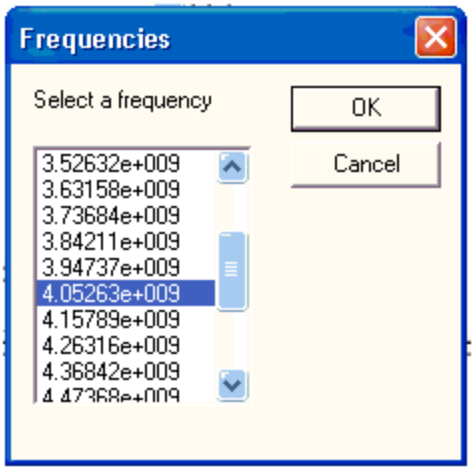


The display properties of the Far Field overlay cannot be changed. The Ramp type is Rainbow, and the number of levels is 20.

4. To select the frequency for the far field overlay, expand the **Results** icon in the **Project Manager** window, and select **Setup***m*:**Sweep***n*:**Far Field***k* > **Frequency**. The

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Frequencies window opens:



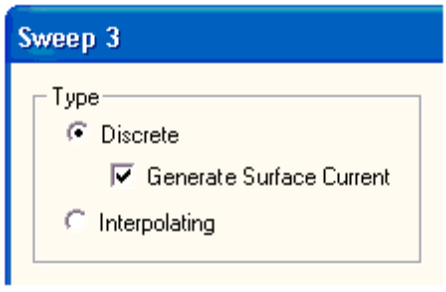
The list displays the frequencies that are swept in the analysis. When you select a frequency on the list, the overlay displays the far field values calculated at that frequency. Click **OK** to leave the overlay at the selected frequency, or click **Cancel** to close the window without applying any frequency changes to the overlay.

5. To dismiss the overlay, expand the **Results** icon in the **Project Manager** window, right-click **Setup*m*:Sweep*n*:Far Field*k***, and select **Delete** (*m*, *n*, and *k* identify the particular solution setup, sweep setup, and far field setup, respectively).

2D Overlaying Near Fields on a 3D View

Near fields calculated as the results of a simulation can be displayed as overlays on the 3D viewer.

1. To ensure that the near field information can be generated, the sweep setup must specify a **Discrete** frequency sweep, and the **Generate Surface Current** option must be enabled (checked):



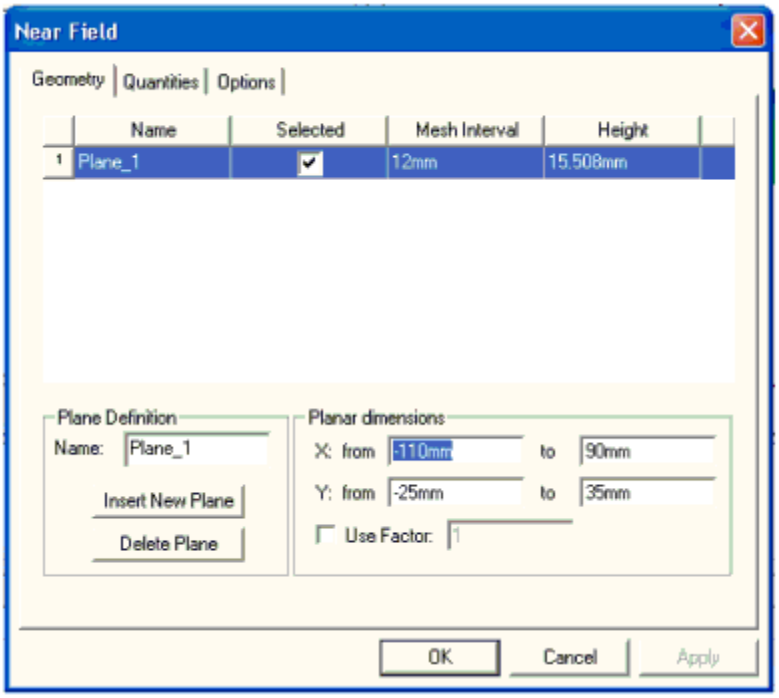
2. Run the analysis with the sweep.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. to open the near field overlay, expand the **Analysis** icon in the **Project Manager** window, and select **Setup***m* > **Sweep***n* > **Results** > **Near Field** (*m* and *n* identify the particular solution setup and sweep setup, respectively). Also select from a list of corresponding Setup/Sweep overlay choices which are displayed when you right-click **Field Overlays** in the **Project Tree** to open the **Near Field** window. The window has three tabs and at the bottom of each tab are three buttons:

- **Apply** is activated whenever you change a value. Click **Apply** to start the display, and see the effect of each change. The window stays open.
- When no values are changed on any tab, the **OK** button starts the display. When one or more values have been changed, **OK** applies the changes. In either case, **OK** closes the window and adds an icon for the overlay under the **Results** icon in the Project window.
- **Cancel** is active as long as no changes have been applied. **Cancel** closes the window without changing any values. If the overlay is already displayed, it does not change. If **Cancel** is pressed before any overlay is displayed, the overlay is canceled.

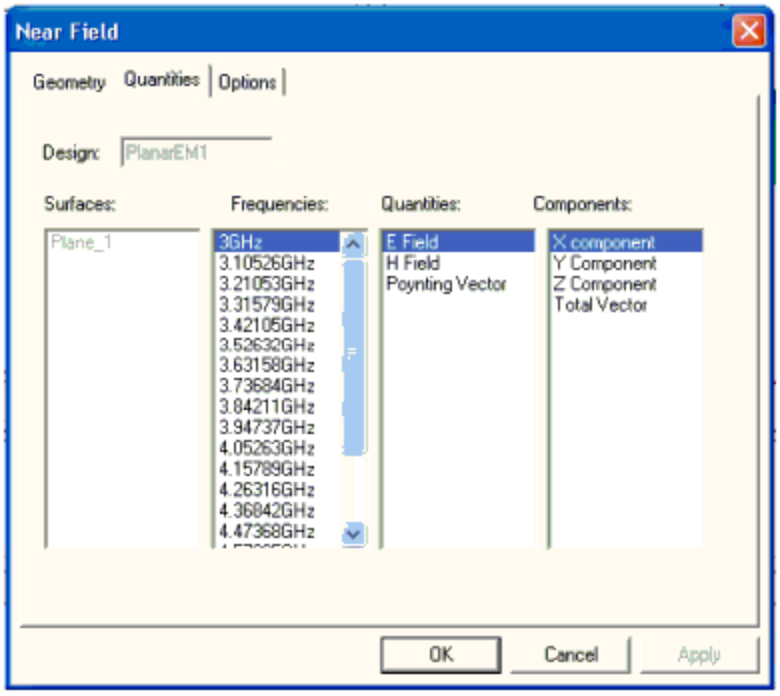
4. The **Near Field** window opens with the **Geometry** tab displayed:



5. Use the options in the **Geometry** tab to select (or define) one or more planes for the calculation, including the dimensions to be used, and a scale factor if appropriate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Click the **Quantities** tab to select the near field quantity to be calculated:



7. If more than one surface is involved, select a surface on the **Surfaces** group box.

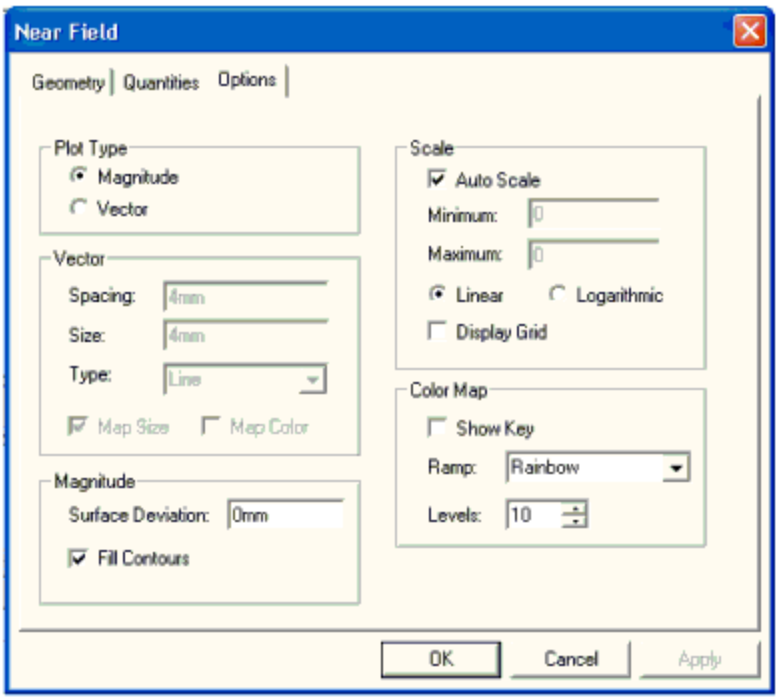
8. Select a frequency on the **Frequencies** list. The frequencies are the ones swept in the analysis.

9. Select a field type on the **Quantities** list. **E** is the electronic field, **H** is the magnetic field, and the **Poynting Vector** is the (E×H*) field, where H* is the complex conjugate of the H matrix.

10. Select a vector component on the **Components** field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

11. Click the **Options** tab to specify the display options for the near field overlay:



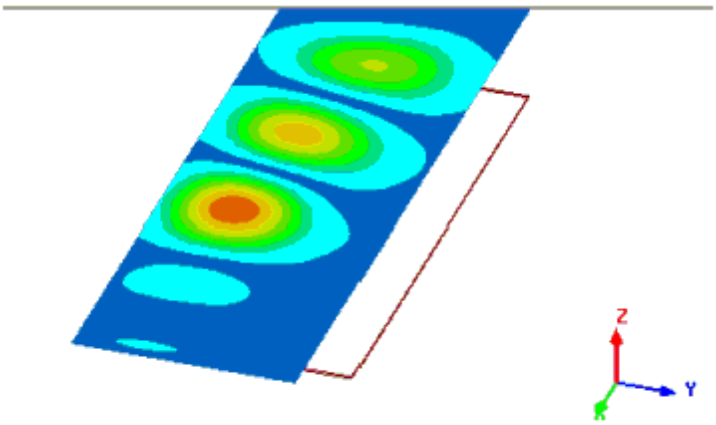
12. In the **Plot Type** group box, select **Magnitude** to enable the **Magnitude** group box options or select **Vector** to enable the **Vector** group box options.

13. In the **Scale** group box, select **Auto Scale** (the default), or deselect **Auto Scale** and enter custom **Minimum** and **Maximum** scaling values. Select **Linear** or **Logarithmic** scaling (the default is **Linear**), and toggle **Display Grid** on or off (the default is off).

14. In the **Color Map** group box, select the **Ramp** type (**Rainbow** is the default; other options are **HueScale**, **Magenta**, and **Temperature**), set the number of **Levels** (the default is 10 levels), and toggle the color key (**Show Key**) on and off (the default is off).

15. When you click **Apply** or **OK** in any of the **Near Field** window tabs, the 3D viewer window opens with the near field values overlaid on the geometry:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



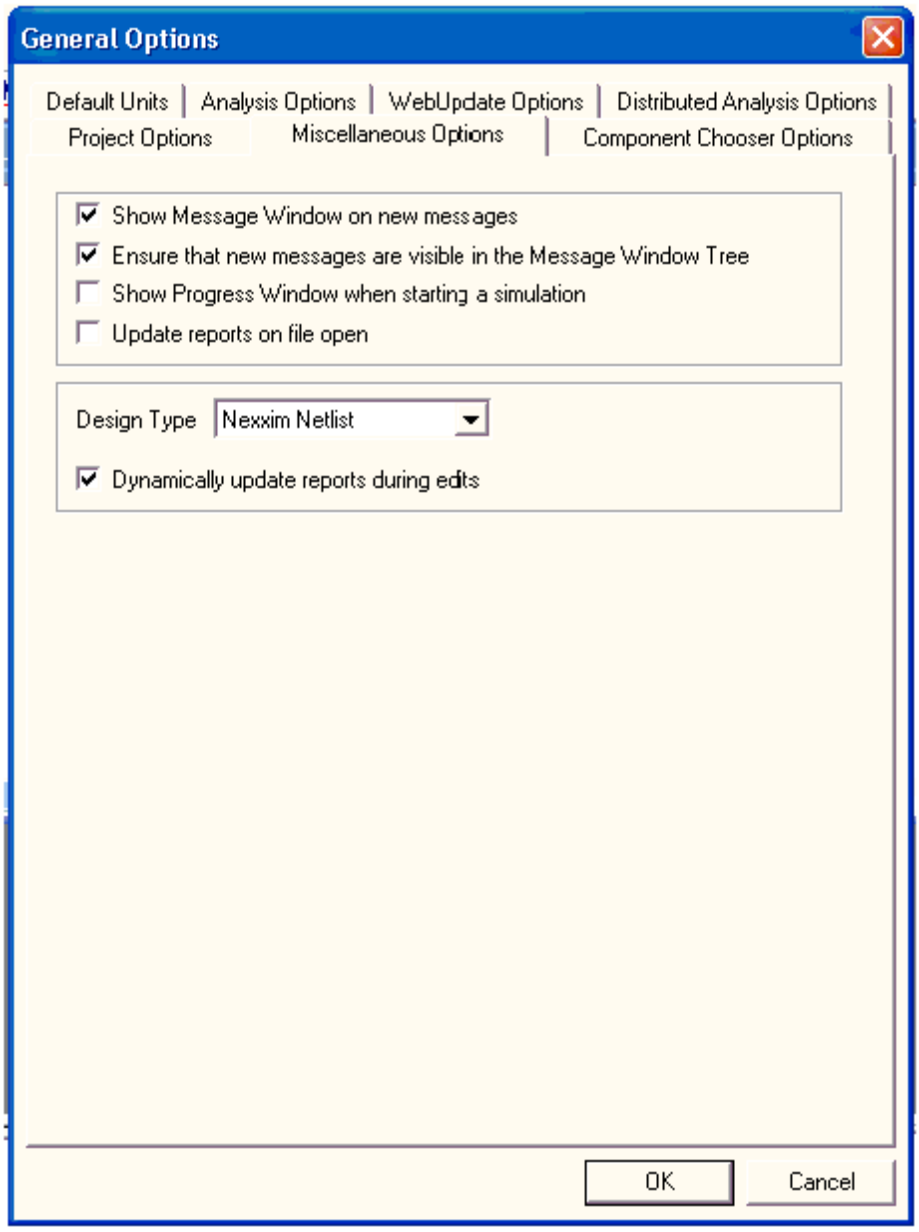
16. To dismiss the overlay, expand the **Results** icon in the **Project Manager** window, right-click **Setup** > **Sweep** > **Near Field**, and select **Delete**.

2D and Circuit Updating Post-processing Data

To manually update the report that is active in the design area using the latest simulation results, right-click in the report and select **Update Report** on the menu. Alternatively, click the **Report** entry in the menu and select **Update Report**(the text of the **Report** entry depends on the type of report being displayed).

In a schematic design, an option is available to control all schematic-based analyses. Select **Nexxim Circuit Options** from the **Tools > Options > General Options** drop-down. Here is the **Nexxim Options** window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



On all three options windows, the option **Dynamically update reports during edits** is available beneath the **Miscellaneous Options** tab and controls the version of solution data to be reported.

Electronics Desktop solution data is versioned. You might have solution data for a particular state of the Design, then edit the Design and re-simulate. Solution data is now available for both states of the Design. Suppose the following sequence occurs:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- You simulate and create a report. The report displays the current solution data (state 1).
- You edit the design. The report is marked ‘Invalid’ (a large “X” appears in the upper-right corner of the report window and on the report icon in the Results folder in the **Project Manager** window.
- You rerun the simulation. The report is updated with the latest solution data (state 2), and the report is marked as valid (the “X” disappears).
- Now you click **Undo**. Electronics Desktop still has the ‘old’ solution data (state 1). If the option **Dynamically update post-process data on edit** is off, the State 2 report data becomes invalid again. If **Dynamically update post-process data on edit** is on, Electronics Desktop reloads the now valid state 1 solution data into the plot and marks it valid.
- Upon **Redo**, the result again depends on the setting of the **Dynamically update post-process data on edit** option. If the option is off, the report becomes valid again (the state 1 data was not reloaded by the **Undo** operation, so the report is still displaying state 2). If the option is on, the state 2 data is reloaded dynamically and plot is also valid.

Deleting 2D and Circuit Reports

To Delete a Single Report

To delete a single report, right-click the report in the **Results** folder in the **Project Manager** window for the design, and click **Delete** on the menu. Or, select a report icon in the **Project Tree**, and right-click to open the shortcut menu, then click **Delete** on the shortcut menu or the “**X**” icon on the toolbar to delete the selected report.

To Delete All Reports

To delete all reports, on the **Product** menu, select **Results** > **Delete All Reports**, or, on the **Project Manager** window, expand the **Project Tree**. Then right-click the [*active design folder*] and select **Delete All Reports**. You can also right-click **Results** and select **Delete All Reports**.

Working with Traces in 2D and Circuit Reports

A trace in a 2D or 3D report defines one or more curves on a graph. A trace in a data table defines part of the displayed matrix of text values.

The values used for a plot’s axes (which may be X, Y, Z, phi, theta, or R depending on the display type) can be variables in the design, such as frequency, or functions and expressions based on the design’s solutions. If one or more variables has been solved, at several values, "sweep" over some or all of those values, resulting in a curve in 2D or 3D space.

A report can include any number of traces and, for rectangular graphs, up to four independent y-axes. Traces appear in the **Project Manager** window under their report. They can be selected, copied and pasted. When you move a cursor over a trace in a report, the cursor changes to show a selection can be made:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For Windows systems, the cursor changes to the color of the selectable trace.
- For Linux systems, the cursor changes to a solid black arrow, rather than the default black outline.

Adding a Trace to a 2D or Circuit Report

In general, to add a trace to a report:

1. Select a report in the **Project Manager** window and right-click and select **Modify Report.**
2. In the **Report** window specify the Y component information.
   a. From the drop-down menu, select the Category of information you want to plot.

      The Category drop-down menu lists the available categories for the Solution type and the active design. Selecting a category changes the Quantity and Function lists to represent what is available for that category.

   b. Specify the Quantity you want to plot by selecting on the Quantity list.

      The selected quantity appears in the **Value** field, operated on any selected function.

   c. Select the Function to apply to the specified quantity.
   d. The **Value** field shows the trace being readied for plotting on the Y-axis. This field is editable when the text cursor is present. Modify the information to be plotted by typing the name of the quantity or sweep variable to plot along an axis directly in the text fields. Invalid functions appear in red.
   e. **Range Function** — opens the **Set Range Function** window. This applies currently specified Quantity and Function.
3. In the **Report** window specify the X axis information (e.g., Primary Sweep).
4. Click **Add Trace**.

A trace is added to the traces list under its report icon in the **Project Manager** window. The trace represents the function of the quantity you selected and is plotted against other quantities or swept variable values. Selecting a Trace in the **Project Manager** window displays the Properties window for that Trace. Selecting a trace in the report or legend displays the display Properties window for that trace.

Trace icons can be selected, copied, and pasted for their definitions or their data. They can be selected and deleted on the **Project Tree**.

By the default, the Trace name is the definition (the category, quantity and function). The trace is visible in the report when you click **Add Trace**.

Trace properties can be edited directly in the respective Properties windows or edited in the **Report** window. To change the name or definition of a trace, see Editing Trace Properties. To edit other display properties of a trace, see Editing the Display Properties of Traces

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Editing 2D and Circuit Trace Properties

To edit trace properties such as the name, the component definition, or the context, or the variables select the trace in the Project tree.

To edit a **trace name**:

1. Select the trace in the **Project Manager** window.

   This displays a docked Properties window for the Trace.

2. Check the Specify Name box.

   This enables editing of either the Name field in the docked **Properties** window, or the Trace label text in the Project tree. Editing this name changes the display in the Legend and in the Project tree, but not the underlying Y-component definition.

> **Note:** To control the display of the Solution Name and Variation Key in the Legend, see Report 2D: Legend Tab.

To edit a **trace component definition**:

1. Select the trace in the **Project Manager** window.
2. In the docked Properties window for the trace, select the component field of interest and choose **Edit** on the drop-down menu.

   This displays the an edit Component field window.form which Edit the category, quantity and function.

3. Click OK to apply the changes and close the window.

To edit a **trace Context**:

1. Select the trace in the **Project Manager** window to open the docked properties window.
2. In properties window, click the Solution field or the Domain field. If other selections are possible, they can be selected on the drop-down menu.

To edit a **variable** for a trace:

1. Select the trace in the **Project Manager** window to open the docked properties window.
2. Under the -Variables category, on the Families line, click **Edit** to open the Edit families window.

   From this window, select **Sweeps** or **Variations**. Each selection changes the available editable values.

   If other nominal values are available, click the **[...]** button to select from a list.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Editing the Display Properties of Traces (2D and Circuit)

To edit the display properties of a trace:

1. Select a trace in an open **Report** window.
2. Clickce on the trace to view a **Docked Properties** window, or double-click to open **Properties** window.

The display properties window for a trace includes a **General** tab and an **Attributes** tab.

The General tab properties apply to the general appearance of the plot. They include the Background color, Contrast color, Field width, and Whether to use Scientific notation for marker and delta marker displays. (X and Y notation display is set separately, in the Axis property tabs.)

The Attributes Tab properties apply specifically to the Trace. The defaults are set in the Report2D options. They include:

- Name — not editable by selecting the trace on the Report. It shows the characteristics of the trace as defined in the **Report** window. To edit a trace name, see Editing Trace Properties
- Color — shows the Trace color. Double-click to open a Color window. You can select from Basic colors, or custom colors. You can define up to 16 custom colors by selecting or by editing the Hue, Saturation, Luminescence, and the Red, Green, and Blue values.
- Line style — a drop-down menu lets you select Solid, Dot, Dash, or Dot-dash.
- Line width — a field lets you edit the numeric value.
- Trace type — the drop-down menu contains entries for Continuous, Discrete, Bar-Zero, Bar Infinity, Stick Zero, Stick Infinity, Histogram, Step, and Stair.
- Show Symbol — whether to show a symbol at the data points on the line.
- Symbol Frequency — how often to show symbols on the trace.
- Symbol Style — use a drop-down menu to select from box, circle, vertical ellipse, horizontal ellipse, vertical up triangle, vertical down triangle, horizontal left triangle, horizontal right triangle
- Fill Symbol — click the check box to set the symbol display as a solid or as hollow.
- Symbol Arrows — click the check box to use arrows on the curve ends

> **Note:**
>
> So curves with single points always appear, Box is the default symbol. None cannot be selected as the symbol.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Edit the properties of interest and OK the Properties window to apply the changes and close the window.

Adding Data Markers to 2D and Circuit Traces

The Reporter includes **Report 2D > Marker** menu commands and toolbar icons

that let you add markers to traces. A marker appears as "m*N*" at the marked point, where *N* increments from 1 as you place additional markers. Each marker can be selected and has editable properties including name, font, background and color. As you place markers, one or more marker legends may be displayed, depending on the **View > Active View Visibility** settings for the legends. The main marker legend appears in the upper-left of the plot, and lists the marker names and their X and Y values in a table. You can control the number format for the table values via the properties window, general tab. Under Marker/Other Number format, specify field width, precision, and whether to use scientific notation. This value is independent of the Axis tab number properties. A separate marker legend appears for Delta Markers, as described for the **Delta Marker** command.

When you enter Marker mode, the cursor arrow is accompanied by an "m" while a circle on the selected trace shows the current position for a potential marker.

To end Marker mode, right-click to open the shortcut menu, and select **End Marker Mode**.

The available Marker mode commands and associated icons are the following:

- **Marker** – this command lets you place a marker at an arbitrary point on a selected trace.
- **X Marker** – this command adds a movable marker at the origin of the plot with a vertical line rising on the X axis. To move an X marker, click the X label and drag it to the appropriate location. The label at the bottom of the line gives the X coordinate, and flag on the vertical line identifies the Y coordinate on the trace. A trace property lets you lock the drag feature to leave the marker in place. This marker is not cleared by the **Clear All** command, and must be deleted by selecting it and using the **Edit Delete** command.
- **Maximum** — places a marker at the Maximum value on the selected trace.
- **Minimum** — places a marker at the Minimum value on the selected trace.

Delta Marker enters delta marker mode, placing a circle on the selected trace. Clicking on the trace sets an initial point and subsequent clicks on arbitrary points on the trace place additional markers until you leave marker mode. These markers have their own legend, which includes the following information for each pair of markers specified:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Marker** – this command lets you place a marker at an arbitrary point on a selected trace.
- **X Marker** – this command adds a movable marker at the origin of the plot with a vertical line rising on the X axis. To move an X marker, click the X label and drag it to the appropriate location. The label at the bottom of the line gives the X coordinate, and flag on the vertical line identifies the Y coordinate on the trace. A trace property lets you lock the drag feature to leave the marker in place. This marker is not cleared by the **Clear All** command, and must be deleted by selecting it and using the **Edit Delete** command.
- **Maximum** — places a marker at the Maximum value on the selected trace.
- **Minimum** — places a marker at the Minimum value on the selected trace.
- **Delta Marker** enters delta marker mode, placing a circle on the selected trace. Clicking on the trace sets an initial point and subsequent clicks on arbitrary points on the trace place additional markers until you leave marker mode. These markers have their own legend, which includes the following information for each pair of markers specified.:

Name	Delta(X)	Delta(Y)	Slope(Y)	InvSlope(Y)
d(m2,m3)	0.4700	1.8319	3.8976	0.2566

- **Next Peak** — moves a selected marker on the next peak on a trace. You must exit marker mode and select a marker to enable this command.
- **Next Minimum** — moves a selected marker to the next minimum on a selected trace. You must exit marker mode and select a marker to enable this command.
- **Previous Peak** — moves a selected marker on the previous peak on a selected trace. You must exit marker mode and select a marker to enable this command.
- **Previous Minimum** – places a marker on the previous minimum on a selected trace. You must exit marker mode and select a marker to enable this command.
- **Next Data Point** (Right) — moves a selected X marker to the next data point.
- **Previous Data Point** (Left) — moves a selected X marker to the previous data point.
- **Next Curve** – selects the next curve in the report, based on the order in the trace legend.
- **Previous Curve** – selects the previous curve in the report, based on the order in the trace legend.
- **Clear All** – clears all markers on a report except X Markers.

Discarding 2D and Circuit Report Values below a Specified Threshold

To prevent real small numbers from skewing a plot, you can discard small values (under a specifiable threshold).

1. Double-click the X or Y axis of interest on an open plot display.

This opens the **Properties** window for the Axis

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Under the **Axis** tab, drag the scroll bar to find the **Specify Discard Values** property.
3. Click the check box to enable the property.
4. Enter a value in the **Discard Below** field. Units specified elsewhere in the Axis property are applied to this value. The Discard Below field is inactive if the Specify Discard Values check box is not enabled.
5. Click **OK** to apply the Discard Values to the report.

Add 2D or Circuit Trace Characteristics

Add or clear additional characteristics to a selected trace. To add additional characteristics to a selected trace:

1. Select a trace in a report plot or legend.
2. Click **Report 2D > Trace Characteristics**, or right-click the selected trace to open the shortcut menu.
3. Select **Trace Characteristics > Add**

This displays the **Add Trace Characteristics** window.

4. Select the **Category** and an associated Function to apply. The available categories depend on the plot, and Category enables the display of associated functions.

Category	Functions for the Category
Math	max, min, pk2pk, rms, avg, integ, integabs, avgabs, rmsAC, ripple, pkavg, XatYMin, XatYMax, XatYVal, cmplx()
PulseWidth	pulsefall9010, pulsefront9010, pulsefront3090, pulsemax, pulsemaxtime, pulsemin, pulsemintime, pulsetail50, pulsewidth5050, pw_plus, pw_plus_max, pw_plus_min, pw_plus_avg, pw_plus_rms, pw_minus_max, pw_minus_min, pw_minus_avg, pw_minus_rms
Overshoot, Undershoot	overshoot, undershoot.
TR & DC	crestfactor, formfactor, distortion, fundamentalmag, delaytime, risetime, deadtime, settlingtime,
Error	iae, ise, itae, itse
Period	per, pmax, pmin, prms
Radiation	xdb10bandwidth, xdb20bandwidth, lSidelobeX, lSidelobeY, rSidelobeX, rSidelobeY

Given a selected Function, and Category, the **Add Trace** window displays a field that explains the Purpose of the function. For a full list of functions and their definitions, see Selecting a Function.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Some categories and functions call for you to specify one or two additional values in a table. Save these values by clicking **Default**.
6. Click **Add** to add the specified characteristics to the Trace.

To remove existing trace characteristics:

1. Select a trace in a report plot or legend.
2. Click **Report 2D > Trace Characteristics**, or right-click the selected trace to open the shortcut menu.
3. Select **Trace Characteristics > Clear All**

Trace characteristics are clear on the selected trace.

Removing Traces from 2D and Circuit Reports

You can remove traces on the traces list in the following ways:

To *remove one trace* on the report:

- Select the trace you want to remove on the Project tree, then click **Delete**.

To *remove all traces* on the report:

- Select all the traces and click **Delete**.

Define Traces Using Range Functions (2D and Circuit)

Range Functions are special functions that use a 2D dataset as input, along with 0 or more additional parameters. Range functions can be used to produce a user-created 2D report display that is a collection of traces and their attributes. The trace collection and attributes are used to generate a portion of a report-definition that generates a family of curves in the report window.

Range Functions can be applied to a range (subset) of points on an X-Y plot, then calculates a single-number representation of the specified range, and display that number directly over a plotted wave-form. Range functions can be used to extract trace characteristics (such as max, min, overshoot) from a plot and use those values for additional plotting, or use the values for exporting to a file, where the data table formats are supported. Range Functions are listed in the **Reporter** window and **Output Variable** window for users to employ. Extracted trace characteristics may also be used in optimetrics.

For example, with a wave-form in a transient plot that contains a square pulse, a range function can calculate and display a single value that represents the High-to-Low/Low-to-High transition states. Or, with a plot that shows a pulse, the PulseWidth and RiseTime Range Functions can use the entire plotted curve to calculate a single number that represents the width or rise-time, and display that single-number representation directly over the specified range of plotted points.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Range functions trace characteristics are displayed on the report window as a column in legend window
- Range functions are available from reporter and optimetrics
- Numerous range functions are available in the following categories:

— Pulse width functions

— Overshoot/Undershoot functions

— TR & DC functions

— Error functions

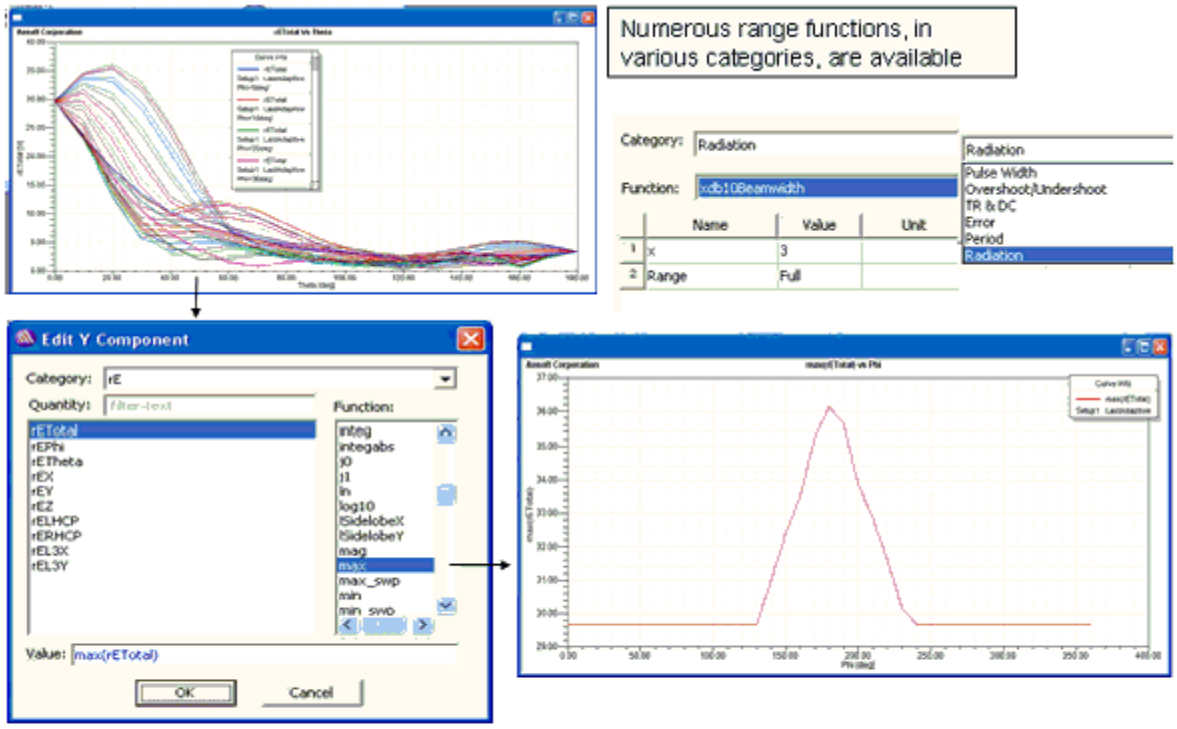
— Period functions

— Radiation functions

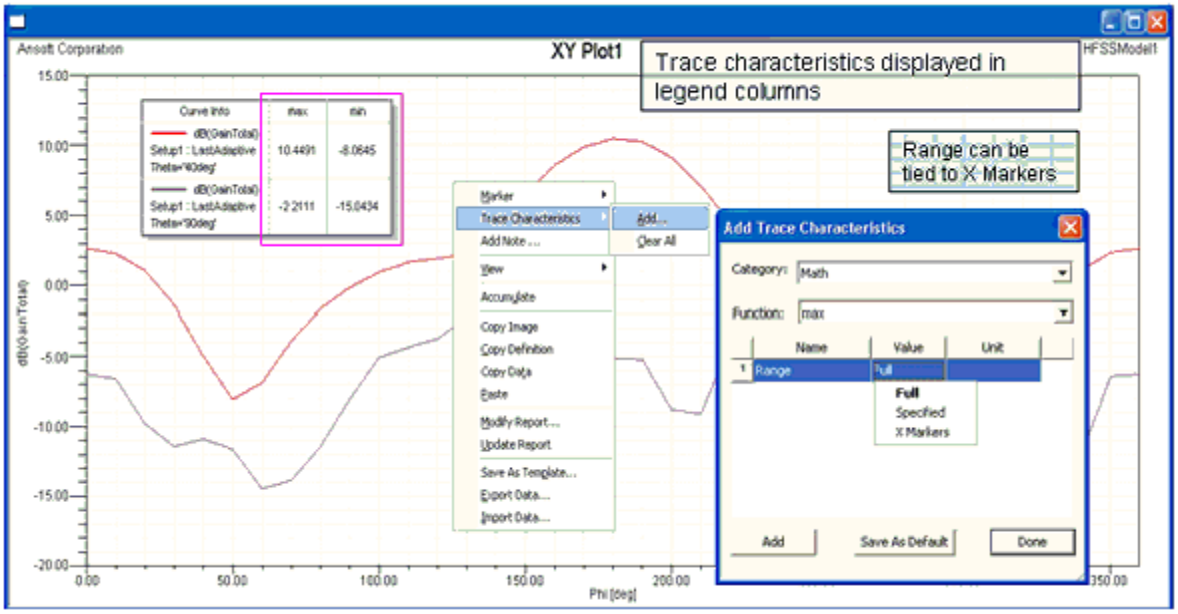
> **Note:**
>
> For all range functions, the second parameter is assumed to be a sweep variable, and if it is not, the following error message results: "**Second parameter to functions that apply to a range of values must be a sweep variable** ". You receives this message if you create a range function where the second parameter is a non-variable, such as deriv(dB(S11),dB(S12)). Whereas deriv(dB(S11),F) is acceptable.

Define Traces Using Range Functions

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Trace Characteristics



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The following table lists the available Range Functions:

Range Function	Category	Description	Parameter(s)
avg	Math	Average of first param over the second param.	N/A
avgabs	Math	Returns the mean of the absolute value of the selected quantity.	N/A
bandwidth	AC	Returns the bandwidth of the selected simulation quantity in Hz.	Base Gain: Ref AC magnitude; Base phase: Ref phase angle
cang_deg	TR & DC	Cumulative angle of the first param in degrees, along the second param (typically sweep variable). Returns double.	N/A
cang_rad	TR & DC	Cumulative angle of the first param in radians, along the second param (typically sweep variable). Returns double.	N/A
crestfactor	TR & DC	Returns the crest factor (peak/RMS) for the selected quantity.	N/A
deadtime	TR & DC	Obtains the latest time when the qtyl is within a tolerance of zero.	Tolerance:The +/- bandwidth around 0
delaytime	TR & DC	Obtains the time from zero to 50% of the target point.	Target: The target value for input
deriv	TR & DC	Derivative of a given param	N/A

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

distortion	TR & DC	Returns the total distortion for the selected simulation quantity and an additional argument frequency, which is the frequency in Hz at which to calculate the fundamental RMS of the simulation quantity.	Frequency: Freq in Hz at which to calculate the RMS of the qty
duty	TR & DC	Duty cycle measurement.	N/A
eyeheight	TR & DC	Eye-diagram characteristics.	N/A
eyejitter	TR & DC	Eye-diagram characteristics.	N/A
eyewidth	TR & DC	Eye-diagram characteristics.	N/A
FFT	Math	Fast Fourier Transform. Returns output signal.	Incoming signal.
formfactor	TR & DC	Returns the form factor (RMS/Mean Absolute Value) for the selected quantity.	N/A
fundamentalmag	TR & DC	Returns the RMS value of the fundamental frequency for the selected quantity and an additional argument frequency, which specifies the fundamental frequency.	Frequency: Freq in Hz at which to calculate the RMS of the qty
gaincrossover	AC	Returns the gain crossover	Base Gain: Ref AC magnitude; Base

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

		frequency (where the gain is 0 dB) of the selected simulation quantity in Hz.	phase: Ref phase angle
gainmargin	AC	Returns the gain margin in dB at the phase crossover frequency of the selected simulation quantity.	Base Gain: Ref AC magnitude; Base phase: Ref phase angle
iae	Error	Returns the integral of the absolute deviation of the selected quantity from a target value that is entered via the additional argument.	Target: Target value
integ	Math	Integral of the selected quantity. Uses trapezoidal area.	N/A
integabs	Math	Returns the integral of the absolute value of the selected qty.	N/A
ise	Error	Returns the integral of the squared deviation of the selected quantity from a target value that is entered via an additional argument.	Target: Target value
itae	Error	Returns the time-weighted absolute deviation of the selected quantity from a target value that is entered via an additional argument.	Target: Target value

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

itse	Error	Returns the time-weighted squared deviation of the selected qty from a target value that is entered via an additional argument.	Target: Target value
lowercutoff	AC	Returns the lower 3dB frequency of the selected simulation channel in Hz.	Base Gain: Ref AC magnitude; Base phase: Ref phase angle
max	Math	Maximum (of magnitudes).	N/A
min	Math	Minimum (of magnitudes).	N/A
overshoot	Overshoot/Undershoot (Overridable)	Calculates peak overshoot given a threshold value and number of evenly spaced points over entire time range.	Threshold: The reference value from where the overshoot/undershoot is calculated; Number of Points: Number of evenly spaced time points
peakgain	AC	Returns the peak gain of the selected simulation quantity in dB.	Base Gain: Ref AC magnitude; Base phase: Ref phase angle
peakgainfreq	AC	Returns the frequency in Hz at which the peak gain of the selected simulation quantity occurs.	Base Gain: Ref AC magnitude; Base phase: Ref phase angle
per	Period (Overridable)	Calculates period.	Threshold:Y transition value which determines the period; Number of Points: Number of evenly

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

			spaced time points
phasecrossover	AC	Returns the phase crossover freq, at which the phase is -180 degrees, in Hz for the selected simulation quantity.	Base Gain: Ref AC magnitude; Base phase: Ref phase angle
phasemargin	AC	Returns the phase angle in degrees at the gain crossover frequency of the selected simulation quantity.	Base Gain: Ref AC magnitude; Base phase: Ref phase angle
pk2pk	Math	Difference between max and min of the first param over the second param. Returns the peak-to-peak value for the selected simulation quantity.	N/A
pkavg	Math	Returns the ratio of the peak to peak-to-average for the selected quantity.	N/A
pmax	Period (Overridable)	Maximum period of input stream.	Threshold:Y transition value which determines the period; Number of Points: Number of evenly spaced time points
pmin	Period (Overridable)	Minimum period of input stream.	Threshold:Y transition value which determines the period; Number of Points: Number of evenly spaced time points
prms	Period (Overridable)	Rms of period of input stream.	Threshold:Y transition value which determines the period; Number of Points:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

			Number of evenly spaced time points
pulsefall9010	Pulse Width	Returns the pulse fall time of the selected quantity derived from estimates of the signal at 90% and 10% of its peak value.	N/A
pulsefront1090	Pulse Width	Returns the pulse front time of the selected quantity derived from estimates of the signal at 10% and 90% of its peak value.	N/A
pulsefront3090	Pulse Width	Returns the pulse front time of the selected quantity derived from estimates of the signal at 30% and 90% of its peak value.	N/A
pulsemax	Pulse Width	Returns the pulse maximum on the front and tail estimates for the selected quantity.	N/A
pulsemaxtime	Pulse Width	Returns the time at which the maximum pulse value of the selected quantity is reached.	N/A
pulsemin	Pulse Width	Returns the pulse minimum on the front and tail estimates for the selected quantity.	N/A

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

pulsemintime	Pulse Width	Returns the time at which the minimum pulse value of the selected quantity is reached.	N/A
pulsetail50	Pulse Width	Returns the pulse tail time of the selected quantity on the virtual peak to 50%.	N/A
pulsewidth5050	Pulse Width	Returns the pulse width of the selected quantity as measured on the 50% points on the pulse front and pulse tail.	N/A
pw_minus	Pulse Width (Overridable)	Pulse width of the first negative pulse.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time points
pw_minus_avg	Pulse Width (Overridable)	Average of the negative pulse width input stream.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time points
pw_minus_max	Pulse Width (Overridable)	Max. Pulse width of the negative pulse of input stream.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time points
pw_minus_min	Pulse Width (Overridable)	Min. Pulse width of the negative pulse of input stream.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

			evenly spaced time points
pw_minus_rms	Pulse Width (Overridable)	RMS of the negative pulse width input stream.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time points
pw_plus	Pulse Width (Overridable)	Pulse width of first positive pulse.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time points
pw_plus_avg	Pulse Width (Overridable)	Average of the positive pulse width input stream.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time points
pw_plus_max	Pulse Width (Overridable)	Max. Pulse width of the positive pulse of input stream.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time points
pw_plus_min	Pulse Width (Overridable)	Min. Pulse width of the positive pulse of input stream.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time points
pw_plus_rms	Pulse Width (Overridable)	RMS of the positive pulse width input stream.	Threshold:Y transition value which determines the pulse width ; Number of Points: Number of evenly spaced time

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

			points
ripple	Math	Returns the ripple factor (AC RMS/Mean) for the selected quantity.	N/A
risetime	TR & DC	Obtains the time taken to go from 10% to 90% of target point.	Target: The target value for input
rms	Math	Returns total RMS of the selected quantity.	N/A
rmsAC	Math	Returns the AC RMS for the selected quantity	N/A
settlingtime	TR & DC	Returns the latest time at which the value of the selected simulation quantity fell outside its tolerance band. The target value of the quantity and the +/- bandwidth of the tolerance band are the additional args.	Target; Tolerance
undershoot	Overshoot/Undershoot (Overridable)	Calculates peak undershoot given a threshold value and number of evenly spaced points over entire time range.	Threshold: The reference value from where the overshoot/undershoot is calculated; Number of Points: Number of evenly spaced time points
uppercutoff	AC	Returns the upper 3dB frequency of the selected simulation channel in Hz.	Base Gain: Ref AC magnitude; Base phase: Ref phase angle
XAtYMax	Math	Returns the X value at maximum Y.	N/A
XAtYMin	Math	Returns the X value	N/A

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

		at minimum Y.	
XAtYVal	Math	Returns the X value at the first occurrence of Y value.	Y Value: Y value at which to find X

Copy and Paste of 2D and Circuit Report and Trace Definitions

You can copy and paste report and individual trace definitions within a single design or across designs. The report or trace definition is evaluated in the context of the target design or report.

> **Note:** If the report or trace definition contains properties that do not exist in the target design (e.g., a port name) an error is posted that indicates a solution does not exist for this trace.

> **Note:** You must copy and paste trace definitions between the same report types. For example, you cannot copy a trace from a Modal Solution Data report and paste it in a Far Fields report.

To Copy a Report Definition:

From the **Project Manager** window, expand the **Results** folder. Then right-click the report and select **Copy Definition**.

To Paste a Report Definition:

From the **Project Manager** window, right-click **Results** and select **Paste**. A new report is created and it contains the copied definitions.

To Copy an individual Trace Definition(s):

From the **Project Manager** window, expand the **Results** folder and the report. Then right-click the trace or traces and select **Copy Definition**.

To paste the Trace Definition(s):

Right-click the report in the target design to copy the trace or traces and select **Paste**.

A new trace(s) is added to the report and it contains the copied trace definition(s).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> If you copy and paste a report or trace definition to a design which contains a definition with the same name, then an incremented number is appended to the pasted report or trace name.

Copy and Paste 2D and Circuit Report and Trace Data

You can copy and paste report and individual trace data within a single design or across designs. The report and trace definitions and all underlying data in the report or trace are copied and pasted to the target design or report.

To copy all data from a report:

Right-click the report name in the **Project Manager** window and select **Copy Data**, or use the menu bar **Edit > Copy Data**, or right-click within a plot to display and select **Copy Data**.

To paste copied report data:

Right-click **Results** in the **Project Manager** window of the target design and select **Paste**.

To copy data from an individual trace(s) in a report:

Right-click the trace or traces under a report name in the **Project Manager** window and select **Copy Data**.

To paste copied trace data:

Right-click the report in the target design to copy the trace data to and select **Paste**.

Note: If you copy and paste report or trace data which contains the same name definition as a report or trace in the target design then an incremented number is appended to the pasted name.

Variables, Quantities, and Functions in 2D and Circuit Reports

The follow topics describes how to sweep variables, and select various quantities and functions for use in specifying values to be displayed in plots and reports.

Sweeping a Variable in a 2D or Circuit Report

In Ansys Electronics Desktop, a swept variable is a variable that typically has more than one value. You can plot any calculated or derived quantity against one or more of the swept variable’s values.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To specify the swept variable values to plot a selected quantity against:

1. In the **Report** window, select the variable on the X (Primary Sweep) drop-down menu.
2. To modify the values that is plotted for a variable:
   a. Click **[...]** on the **X (Primary Sweep)** line of the **Report** window to display a list of the possible values.
   b. Select **All Values** or click **Edited** to display a window that lets you specify the sweeps to use.

   All of the selected variable's values is plotted.

2D and Circuit Selecting a Function

The value of a quantity being plotted depends upon its mathematical function, which you select on the**Trace** tab **Function** group box in the **Report**window. The available, valid functions depend on the type of quantity (real or complex) that is being plotted. The function is applied to the quantity which is implicitly defined by all the swept and current variables. For example, "S (11)" is the value of the S-parameter for every swept combination of variables (e.g., "height", "frequency").

The following functions listed can be applied as **Range Functions** to previously specified Quantities and Functions using the **Set Range Function** window. Some of these functions can operate along an entire curve (min, max, integ, avg, rms, pk2pk, cang_deg, cang_rad). Their syntax is as follows:

- cang_deg(*quantity*) implicitly implies derivative over the primary sweep
- cang_deg(*quantity*, *SweepVariable*) explicitly means derivative over the sweep variable specified in the second argument (such as "Freq")

> **Note:** For all range functions, the second parameter is assumed to be a sweep variable, and if it is not, the following error message results: "**Second parameter to functions that apply to a range of values must be a sweep variable** ". You receive this message if you create a range function where the second parameter is a non-variable, such as deriv(dB(S_{11}),dB(S_{12})). Whereas deriv(dB(S_{11}),F) is acceptable.

You can select on the following functions in the **Trace** tab **Function** group box:

abs	Absolute value
acos	Arc cosine
acosh	Hyperbolic arc cosine
ang_deg	Angle (phase) of a complex number, cut at +/-180
ang_deg_val	Angle (phase of a complex number in unitless degree values. Returns

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	simple numbers.
ang_rad	Angle in radians
asin	Arc sine
asinh	Hyperbolic arc sine
atan	Arc tangent
atanh	Hyperbolic arc tangent
avg	Average of first parameter over the second parameter
avgabs	Absolute value of average.
cang_deg	Cumulative angle (phase) of the first parameter (a complex number) in degrees, along the second parameter (typically sweep variable). Returns a double precision value cut at +/-180.
cang_deg_val	Cumulative angle (phase) of the first parameter of the selected simulation quantity in unitless degree values. Returns simple numbers.
cang_rad	Cumulative angle of the first parameter in radians along a second parameter (typically a sweep variable) Returns a double precision value.
cmplx	Complex number with the first parameter as the real part and the second parameter as the imaginary part.
conjg	Conjugate of the complex number.
cos	Cosine
cosh	Hyperbolic cosine
crestfactor	Peak/RMS (root mean square) for the selected simulation quantity
dB(x)	20*log10(|x|)
dBm(x)	10*log10(|x|) +30
dBW(x)	10*log10(|x|)
db10normalize	10*log [normalize(mag(x))]
db20normalize	20*log [normalize(mag(x))]
deriv	Derivative of a given parameter.
even	Returns 1 if integer part of the number is even; returns 0 otherwise
exp	Exponential function (the natural anti-logarithm)
formfactor	Returns root mean square RMS/Mean Absolute Value for the selected simulation quantity.
iae	Returns the integral of the absolute deviation of the selected quantity from a target value that is entered via the additional argument. To use this function, you need to open the Add Trace Characteristics window and select the Error category.
im	Imaginary part of the complex number
int	Truncated integer function

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

integ	Integral of the selected quantity. Uses trapezoidal area
integabs	Absolute value of integral
ise	Returns the integral of the squared deviation of the selected quantity from a target value that is entered via an additional argument. To use this function, you need to open the Add Trace Characteristics window and select the Error category.
itae	Returns the time-weighted absolute deviation of the selected quantity from a target value that is entered via an additional argument. To use this function, you need to open the Add Trace Characteristics window and select the Error category.
itse	Returns the time-weighted squared deviation of the selected qty from a target value that is entered via an additional argument. To use this function, you need to open the Add Trace Characteristics window and select the Error category.
j0	Bessel function of the first kind (0^{th} order)
j1	Bessel function of the first kind (1^{st} order)
ln	Natural logarithm
log10	Logarithm base 10
lsidelobex	The 'x' value for the left side lobe: the next highest value to the left of the max value.
lsidelobey	The 'y' value for the left side lobe: the next highest value to the left of the max value.
mag	Magnitude of the complex number
max	Maximum of magnitudes.
max_swp	Maximum value of a sweep.
min	Minimum magnitudes.
min_swp	Minimum value of a sweep.
nint	Nearest integer
normalize	Divides each value within a trace by the maximum value of the trace. ex. normalize(mag(x))
odd	Returns 1 if integer part of the number is odd; returns 0 otherwise
overshoot	Obtains the peak overshoot over a point (double argument)
per	Calculates period.
pk2pk	Peak to peak. Difference between max and min of the first parameter over the second parameter. Returns the peak-to-peak value for the selected simulation quantity.
pkavg	Returns the ratio of the peak to peak-to-average for the selected

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	quantity.
pmax	Period max.
pmin	Period minimum
prms	Period Root Mean Square.
pulsefall9010	Pulse fall time of the selected simulation quantity according to the 90%-10% estimate.
pulsefront9010	Pulse front time of the selected simulation quantity according to the 10%-90% estimate.
pulsefront3090	Pulse front time of the selected simulation quantity according to the 30%-90% estimate.
pulsemax	Pulse maximum on the front and tail estimates for the selected simulation quantity.
pulsemaxtime	Time at which the maximum pulse value of the selected simulation quantity is reached.
pulsemin	Pulse minimum on the front and tail estimates for the selected simulation quantity.
pulsemintime	Time at which the minimum pulse value of the selected simulation quantity is reached.
pulsetail50	Pulse tail time of the selected simulation quantity on the virtual peak to 50%.
pulsewidth5050	Pulse width of the selected simulation quantity as measured on the 50% points on the pulse front and pulse tail.
PulseWidth Functions	
pw_plus	Pulse width of first positive pulse
pw_plus_max	Max. Pulse width of input stream
pw_plus_min	Min. Pulse width of input stream
pw_plus_avg	Average of the positive pulse width input stream
pw_plus_rms	RMS of the positive pulse width input stream
pw_minus_max	Max. Pulse width of input stream
pw_minus_min	Min. Pulse width of input stream
pw_minus_avg	Average of the negative pulse width input stream
pw_minus_rms	RMS of the negative pulse width input stream
polar	Converts the complex number in rectangular to polar
re	Real part of the complex number
rect	Converts the complex number in polar to rectangular
rem	Fractional part
ripple	Returns the ripple factor (AC RMS/Mean) for the selected quantity.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

rms	Returns total root mean square of the selected quantity.
rmsAC	Returns the AC RMS for the selected quantity.
rsidelobex	The ‘x’ value for the right side lobe: the next highest value to the right of the max value.
rsidelobey	The ‘y’ value for the right side lobe: the next highest value to the right of the max value.
sgn	Sign extraction
sin	Sine
sinh	Hyperbolic sine
sqrt	Square root
tan	Tangent
tanh	Hyperbolic tangent
Undershoot	Obtains the peak undershoot over a point (double argument).
XAtYMax	Threshold crossing time: report first time (x value) at which an output quantity crosses YMax.
XAtYMin	Threshold crossing time: report first time (x value) at which an output quantity crosses a user definable threshold
xdb10beamdwidth	Width between left and right occurrences of values ‘x’ db10 from max. Takes 'x' as argument (3.0 default). To use this function, you need to open the Add Trace Characteristics window and select the Radiation category.
xdb20beamwidth	Width between left and right occurrences of values ‘x’ db20 from max. Takes 'x' as argument (3.0 default) To use this function, you need to open the Add Trace Characteristics window and select the Radiation category.
y0	Bessel function of the second kind (0^{th} order)
y1	Bessel function of the second kind (1^{st} order)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: Remember that the evaluated value of an expression is always interpreted in SI units. However, when an angle quantity is plotted in a report, you have the option to plot values in units other than SI. If you want to plot the polar angle of a complex simulation result, S_{11} say, choose between ang_deg(S_{11}) and ang_rad(S_{11}). Both of these return the exact same angle quantity but in degree and radian units respectively.

Note that when used in expressions, some surprising outcomes might result. For example, the expression "1+ang_deg(S_{11})" represents an 'angle' and the number "1" is treated as "1 rad". The angle SI unit is attached to any unitless number that is added/subtracted from an angle value. If you want to treat "1" as degrees, make it explicit and use "1deg + ang_deg(S_{11})" instead.

If you are interested in unitless degree values, two additional functions exist: ang_deg_val(S_{11}) and cang_deg_val(S_{11}). These return simple numbers and are treated so by any expression. If the complex S_{11} lies on the positive Y axis say, ang_deg_val(S_{11}) is 90 and "1 + ang_deg_val(S_{11})" is 91.

Selecting Solution Quantities to Plot (2D and Circuit)

When you create a report of Modal or Terminal solution data, each trace in the report includes a quantity that is plotted along an axis. The quantity being plotted can be a value that was calculated by **Electronics Desktop** such as S_{11}, a value from a calculated expression, or an intrinsic (inherent) variable value such as frequency or theta. The valid categories available depend on the type of quantity (real or complex) that is being plotted, the setup, the solution type, and the plot domain.

To select an S-parameter quantity to plot:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. In the **Report** window, **Trace** tab, select one of the following categories:

Variables	Intrinsic variables, such as frequency or theta, or user-defined project variables, such as the length of a quarter-wave transformer.
Output Variables	user-defined expressions applied to derive quantities on the original field solution.
S-parameter	S-parameters on the S-matrix. For designs which include a Frequency Selective Surface (FSS)-referenced radiation boundary, S11 and S21 represent the extracted reflection and transmission coefficients, respectively.
Y-parameter	Admittance matrix parameters computed on the S-parameters and port impedances.
Z-parameter	Impedance matrix parameters computed on the S-parameters and port impedances.
Gamma	Propagation constants for the S-parameters.
Port Z_o	Characteristic port impedances.
VSWR	Voltage standing wave ratio, calculated on the equation $\frac{1+\lvert S_{ij}\rvert}{1-\lvert S_{ij}\rvert}$.

2. Select a quantity to plot on the **Quantity** group box. The available quantities depends upon the selected category and the setup of the design.

Selecting a Field Quantity to Plot (2D and Circuit)

When plotting field quantities, the quantity can be a value that was calculated by **Electronics Desktop** such as the magnitude of S_{11}, a value from a calculated expression, or an intrinsic (inherent) variable value such as frequency or phase.

To select a field quantity to plot:

1. When you create the report, specify the Report Type as "Fields."
2. In the **Report** window, select Geometry for the Context, unless you are plotting scalar (e.g., integration).
3. In the **Report** window, select one of the following categories:

Variables	Intrinsic variables, such as frequency or phase, or user-defined project variables, such as the length of a quarter-wave transformer.
Output Variables	user-defined expressions applied to derive quantities on the original field solution.
Calculator	Includes scalar and vector field quantities automatically calculated by

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Expressions Ansys Electronics Desktop, as well as derived field quantities that are defined by calculated expressions you set up in the Fields Calculator.

4. Select a quantity to plot on the **Quantity** group box. The available quantities depends upon the selected category and the setup of the design.

2D and Circuit Selecting a Far-Field Quantity to Plot

When plotting far-field quantities, the quantity can be a value that was calculated by **Electronics Desktop** such as antenna gain, a value from a calculated expression, or an intrinsic (inherent) variable value such as frequency or theta.

To select a far-field quantity to plot:

1. When you create the report, specify the Report Type as "Far Fields."
2. In the **Report** window, select one of the following categories for the field setup:

Variables	Intrinsic variables, such as frequency or theta, or user-defined project variables, such as the length of a quarter-wave transformer.
Output Variables	User-defined expressions applied to derive quantities on the original field solution.
Gain	Gain is 4π times the ratio of an antenna's radiation intensity in a given direction to the total power accepted by the antenna.
Axial Ratio	Axial ratio of the electric field.
Antenna Params	Ansys Electronics Desktop-calculated quantities that include peak directivity, radiated power, accepted power, radiation efficiency, max U, and array factors. For far-field setups, the decay factor for lossy materials is calculated as a constant for all far fields.
Radar Cross-Section (Bistatic RCS)	The radar cross-section (RCS) or echo area (σ) is measured in meters squared and represented for a bistatic arrangement (i.e., when the transmitter and receiver are in different locations). This is represented by: $\sigma = \frac{4\pi r^2 \lvert E_{\text{scat}} \rvert^2}{\lvert E_{\text{inc}} \rvert^2}$ where: • E_{scat} is the scattered E-field. • E_{inc} is the incident E-field. *RCS is supported for designs with Plane Incident Waves. RCS is not supported for other types of incident waves.*

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2D and Circuit Directive Gain

Directive Gain is the ratio of the radiation intensity at a specified observation angle to the average radiation intensity. For the observation angle (q,f), the directivity is:

$$D(\theta,\phi) = \frac{U(\theta,\phi)}{U_{ave}} = \frac{U(\theta,\phi)}{\frac{1}{4\pi}\oint\oint U(\theta,\phi)d\Omega}$$

where U is the radiation intensity, which is defined as:

$$U(\theta,\phi) = \frac{1}{2}\mathrm{Rc}(\vec{E}\times\vec{H})\cdot r^2\hat{r}$$

The average radiation intensity is related to the radiated power by:

$$U_{ave} = \frac{P_r}{4\pi}$$

Directivity

Directivity is the maximum value of Directive Gain, or:

$$D = \frac{U_{max}}{U_{ave}}$$

Reference

Warren Stutzman and Gary Thiele, *Antenna Theory and Design*, Wiley, 1981.

2D and Circuit Radiation Efficiency

The radiation efficiency is the ratio of the radiated power to the accepted power given by:

$$e = \frac{P_{\mathrm{rad}}}{P_{\mathrm{acc}}}$$

where:

- P_{rad} is the radiated power in watts
- P_{acc} is the accepted power in watts

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** Because the radiation efficiency is calculated on the accepted power, a port must be defined for radiation efficiency to be displayed.

Setting a Range Function (2D and Circuit)

To apply a range function to the Y, Z, or Mag component of a trace:

1. Click **Range Function** in the **Reports** window.

   This opens the **Set Range Function** window. The functions available are the same as described in Selecting a Function.

2. Click the Specified radio button on the Range function line.

   This enables the Range Function fields.

3. Select the **Category**, then an associated Function to apply. The available categories depend on the plot, and Category enables the display of associated functions.

Category	Functions for the Category
Math	max, min, pk2pk, rms, avg, integ, integabs, avgabs, rmsAC, ripple, pkavg, XatYMin, XatYMax, XatYVal
PulseWidth	pulsefall9010, pulsefront9010, pulsefront3090, pulsemax, pulsemaxtime, pulsemin, pulsemintime, pulsetail50, pulsewidth5050, pw_plus, pw_plus_max, pw_plus_min, pw_plus_avg, pw_plus_rms, pw_minus_max, pw_minus_min, pw_minus_avg, pw_minus_rms
Overshoot, Undershoot	overshoot, undershoot.
TR & DC	crestfactor, formfactor, distortion, fundamentalmag, delaytime, risetime, deadtime, settlingtime,
Error	iae, ise, itae, itse
Period	per, pmax, pmin, prms
Radiation	xdb10bandwidth, xdb20bandwidth, lSidelobeX, lSidelobeY, rSidelobeX, rSidelobeY
Eye Measurements	EyeLevelZero, EyeLevelOne, EyeAmplitude, EyeHeight, EyeSignalToNoise, EyeOpeningFactor, EyeWidth, EyeJitterP2P, EyeJitterRMS, EyeRiseTime, EyeFallTime

Given a selected Function, and Category, the **Set Range Function** window displays a field that explains the Purpose of the function. For a full list of functions and their definitions, see Selecting a Function.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Selecting a function causes the display of a description in the **Purpose** field. If the function requires a value (such as the XatYVal Math function or the pw_minus_max Pulse Width function), the following table the function field displays the name, editable value field, unit, and description.

The Eye Measurement functions have five editable parameters.

4. Click the **Over Sweep** drop-down menu to select from available sweeps.
5. To select from available Sweeps, or to edit them, click **[...]** and uncheck **Use All Sweeps**.

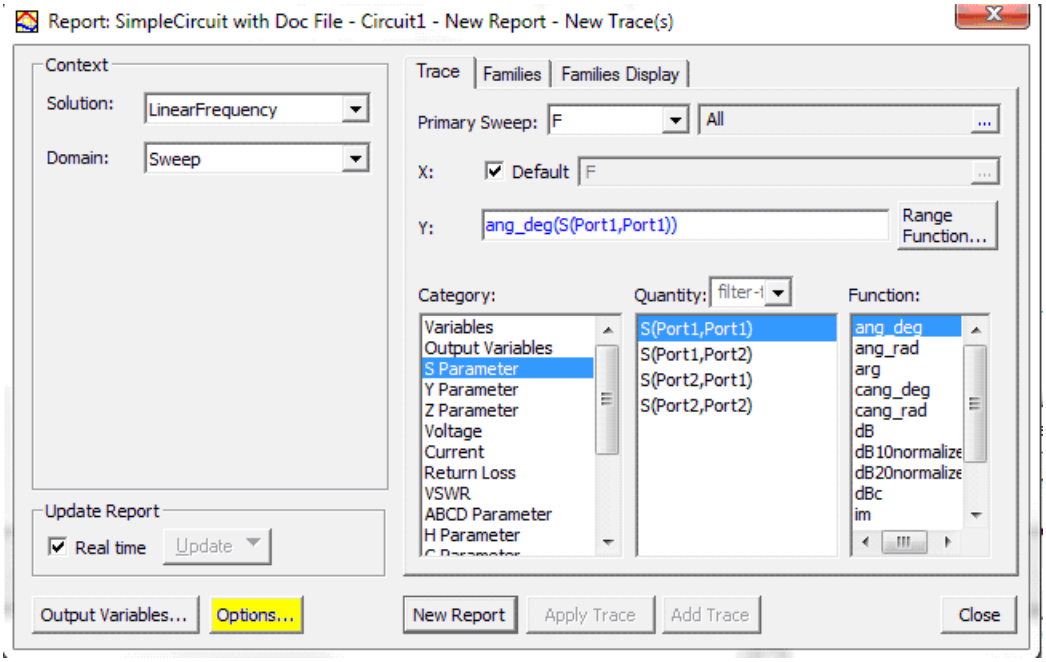
This enables a list of the sweeps. The sweep(s) you select is displayed on the Over Sweep line. You can use the buttons to **Clear All Selections** or **Select All** sweeps.

6. Select the Sweeps **Default** or **Edited** buttons to specify whether to accept the default or edited sweeps.
7. To edit the sweeps further, select **[...]** to open the **Edit Sweep** window.

For frequency variables, this lets you specify a single value, linear step, linear count, decade count, or octave count. You can **Add** legal values to the list of sweep values, **Update** the list for changes, or **Delete** selected entries.

8. Click **OK** to apply the range function.

Handling a Large Number of 2D or Circuit Ports



The tree view is only displayed when the following environment variables are configured.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- ANSYS_ENABLE_LARGE_PORTS = 1

  Required for Matrix parameters to display in tree view when the number of ports > 10.
- ANSYS_DISABLE_TREE_LIMIT = 1

  Required for Matrix parameters to display in tree view when the number of ports <= 10.

Working with Eye Diagrams

Eye diagrams are commonly used to analyze signal integrity issues with communications channels. The bits are superimposed at unit intervals representing the duration of each bit. For more information about setting up eye diagram report types, see the following topics:

- Eye Diagram Report
- Stacked Eye Diagram Report
- Statistical Eye Diagram Report

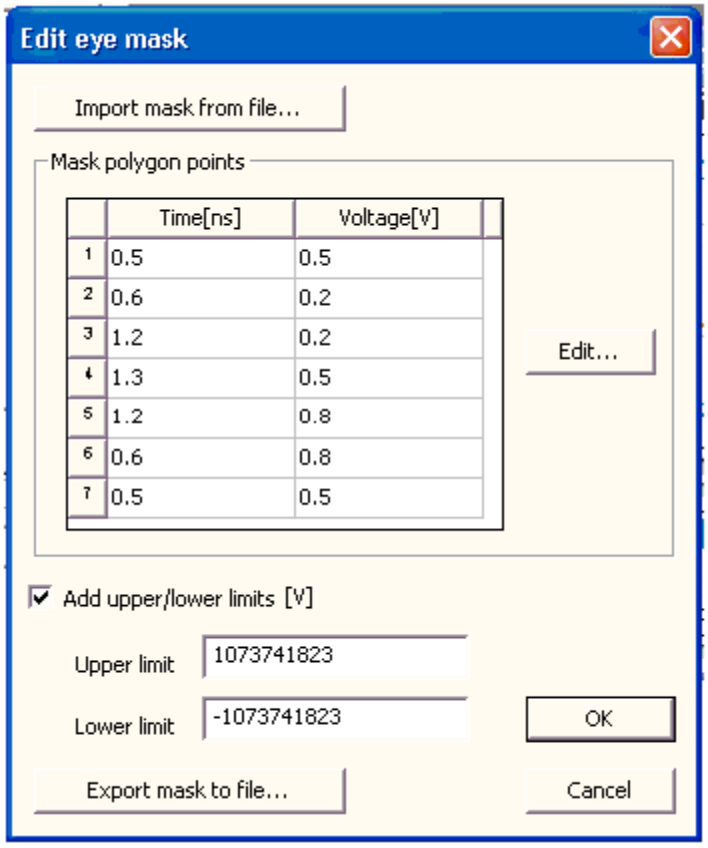
Modifying Circuit Eye Diagram Reports

Double-click the Report to open a Property window with several tabs.

- Click the **General** tab to set the background color, plot area, and other general parameters.
- Click the **Mask** tab to enable and define a mask or keep-out region that is overlaid on the eye diagram. Click **Show Mask** to enable the edit fields. You can specify the fill color, boundary color, and transparency.

Click **Edit** on the **Mask** tab to open the Edit Eye Mask window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

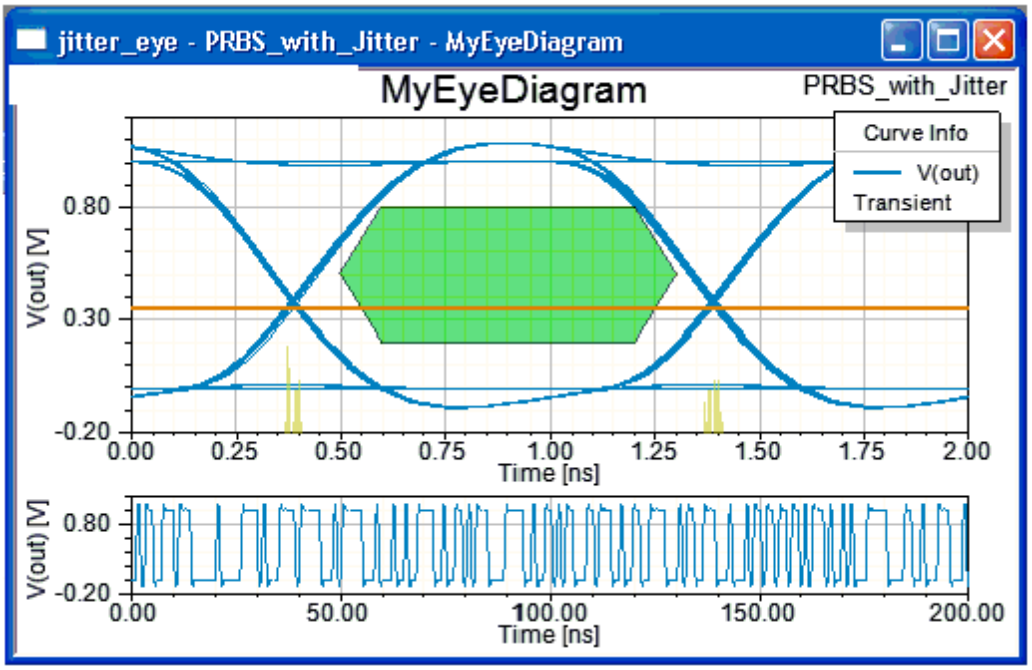


Use the window to specify edit points that define the mask polygon and upper and lower limits as applicable. If appropriate, save the mask setting to a file.

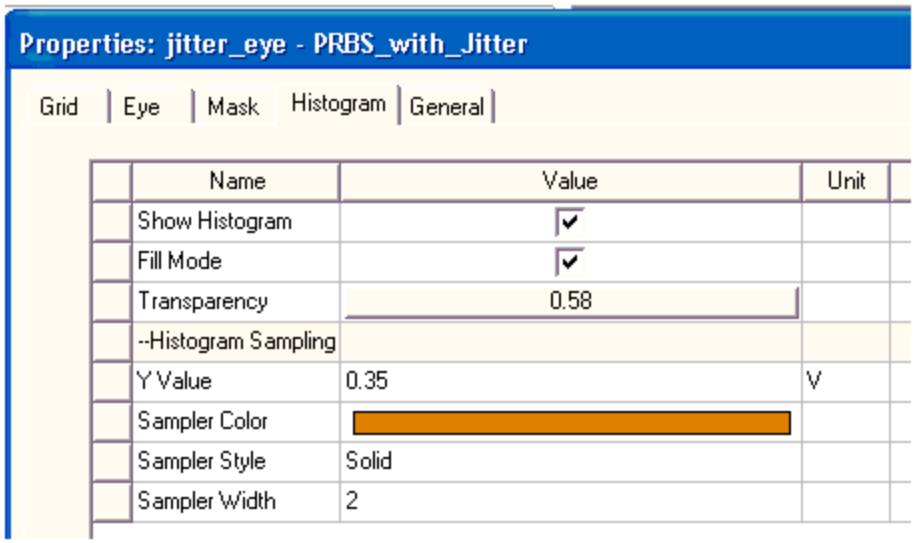
Click **OK** to open the mask on the eye diagram.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Here is how the mask appears on the graph:



- Click the **Histogram** tab to control the display of a histogram that counts the number of crossings of a specified Y-value. In the illustration above, the histogram is in yellow and the Y-value is the orange line. Here is the **Properties** page showing the histogram setup fields:

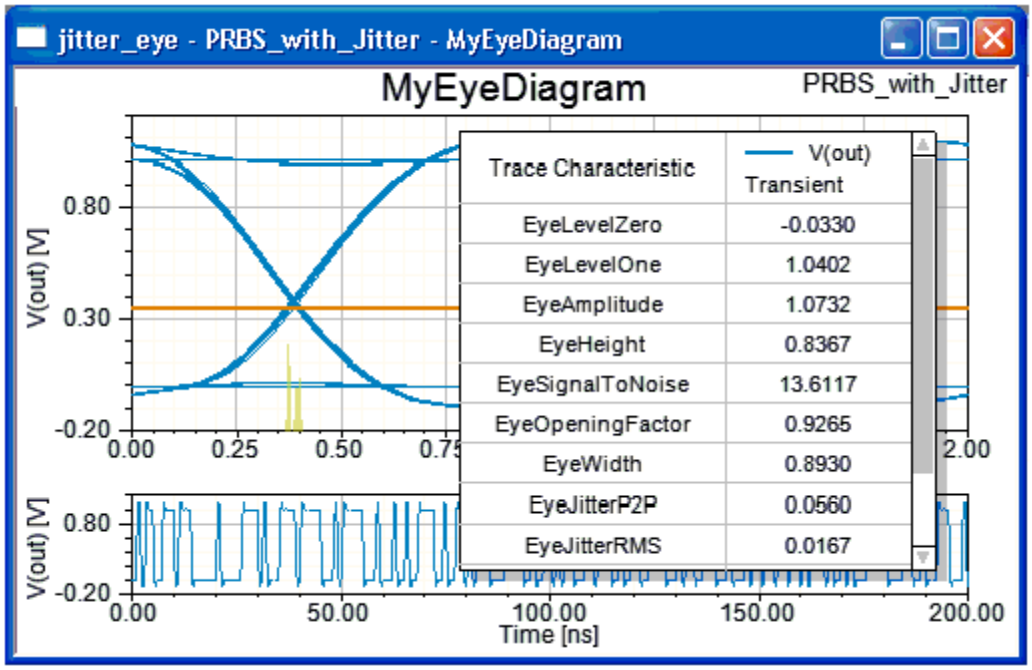


Adding Trace Data to the Eye Diagram Report

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Right-click the Report and select **Trace Characteristics > Add** to open the **Trace Characteristics** window. Select a **Category** of data, then select a **Function** within that category. Click **Add**. The value of the trace characteristic is added to the report display.

Right-click the Report and select **Trace Characteristics > AddAll Eye Measurements** on the menu to open the trace measurements in tabular format. Here is the result:



Eye Diagram References

Eye Measurements (2D and Circuit)

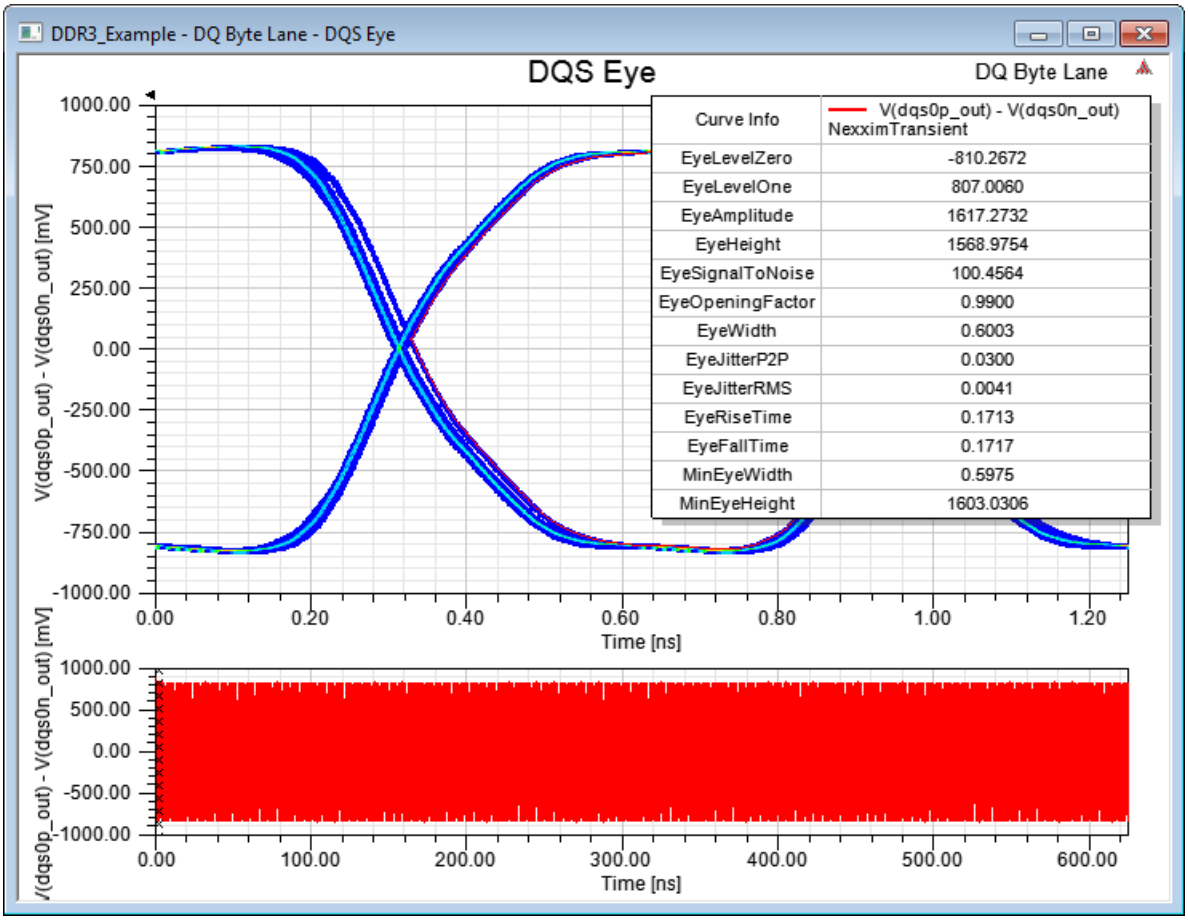
Several standard eye-diagram measurements are provided in **Electronics Desktop**. The following eye measurements are supported:

- EyeLevelZero
- EyeLevelOne
- EyeAmplitude

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- EyeHeight
- EyeSignalToNoise
- EyeOpeningFactor
- EyeWidth
- EyeJitterP2P
- EyeJitterRMS
- EyeRiseTime
- EyeFallTime
- MinEyeWidth
- MinEyeHeight

You can right-click the report and select **Trace Characteristics > AddAll Eye Measurements** to display all the eye measurements in tabular format.



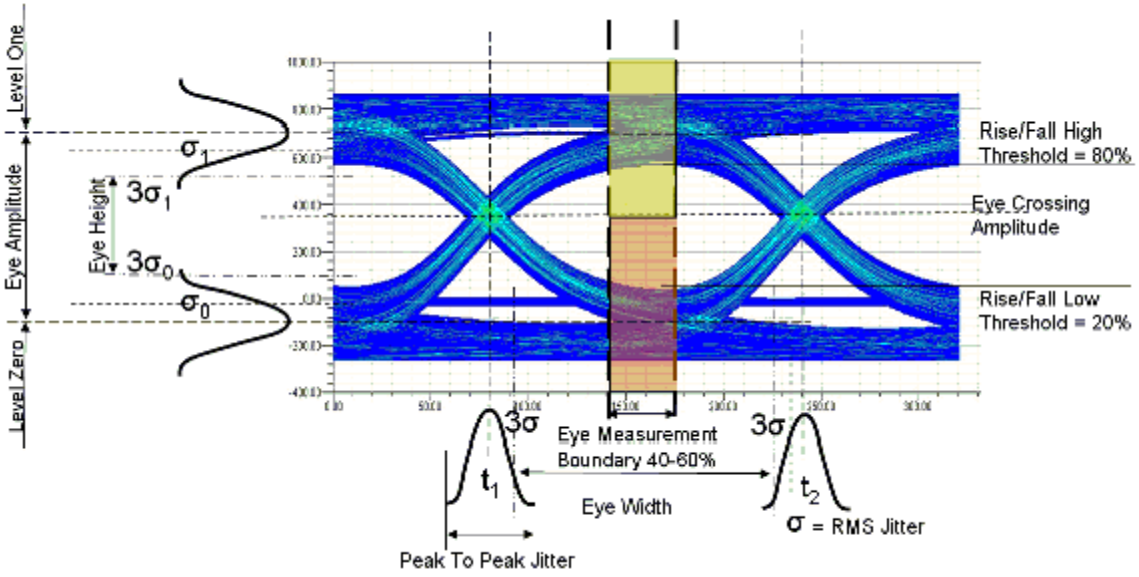
To add an eye measurement, right-click the eye diagram and select one of the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Select **Trace Characteristics/Add** to add eye measurements individually
- Select **Trace Characteristics/Add All Eye Measurements** to add all available eye measurements

To remove an eye measurement, right-click the eye diagram:

- Select **Trace Characteristics/Clear All**



Values in the Eye Measurements Table are Calculated as Follows:

- **EyeLevelZero** and **EyeLevelOne** are the mean values of the lower/upper vertical histograms in the 40-60% center region of the eye, where “center” is defined by the eye-crossing points t1 and t2. Vertical histograms are created above or below the eye-crossing point (represented as yellow/orange shaded regions in the preceding figure). The mean value of these histograms yields EyeLevelZero and EyeLevelOne.
- **EyeAmplitude** = (EyeAmplitude = EyeLevelOne - EyeLevelZero). This is the voltage value for the eye crossing point, which is computed by creating a vertical histogram at the eye crossing points. Eye Crossing Amplitude is computed as the mean of the histogram. A front group box eye diagram has two eye crossings. Eye Crossing Amplitude is calculated as being the mean of these crossing amplitudes, and is then used to compute other horizontal eye measurements, such as eye width, RMS jitter, and peak-to-peak jitter.
- **EyeHeight** = [(EyeLevelOne - $3\sigma_1$) - (EyeLevelZero + $3\sigma_0$)] where σ_1 and σ_0 are the standard deviations of the vertical histograms used to determine EyeLevelZero and EyeLevelOne.
- **EyeSignalToNoise** = [EyeLevelOne - EyeLevelZero] / (σ_1 + σ_0)
- **EyeOpeningFactor** = [EyeAmplitude - σ_1 - σ_0] / EyeAmplitude

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **EyeWidth** = [(t_2 - 3σ) - (t_1 + 3σ)] where σ is the standard deviation of the horizontal histograms used to determine eye-crossing points.
- **EyeJitterP2P** is the width of the horizontal histogram across the eye-crossing point.
- **EyeJitterRMS** is the standard deviation of the horizontal histogram across the eye-crossing point.
- **EyeRiseTime** and **EyeFallTime** are the differences in mean values of the horizontal histograms centered on the 20% and 80% threshold values. Horizontal histograms are created at the 20% and 80% amplitude thresholds for both rising and falling edges. The difference in the mean values of the histograms for rising edges yields EyeRiseTime, while the difference in mean values for falling edges yields EyeFallTime.
- **MinEyeWidth** is the minimum horizontal opening at the eye-crossing amplitude, typically at the center of the eye. Unlike statistical eye width, if different traces exist for different unit intervals, then MinEyeWidth represents the minimum width of all the traces.
- **MinEyeHeight** is the minimum vertical opening at the eye-measurement point, typically at the center of the eye. Unlike statistical eye height, if different traces exist for different unit intervals, then MinEyeHeight represents the minimum height of all the traces.

Additional Values Not Listed in the Eye Measurements Table:

- **AutoDelay** is the amount of time required to shift the eye diagram so it is centered. You can control this delay either by specifying Manual Delay or allow the system to automatically compute the delay via Auto Delay.
- **AutoComputeCrossAmplitude**

  With Auto Mode “on”, the eye width is calculated as the average of the two peaks of the vertical histogram. This is shown as the "Eye Crossing Amplitude" in the preceding figure. Both statistical and minimum eye widths is calculated at this amplitude.

  With Auto Mode "off", the user can manually set the crossing point voltage to raise/lower where the eye width calculations are performed. Both statistical and minimum eye widths is calculated at this amplitude. The user should enter the voltage value where he thinks the actual crossing point lies--that is, where eye width should be computed (both statistical and MinEyeWidth).
- **AutoComputeEyeMeasurementPoint**

  With Auto Mode “on”, the eye height is calculated as the average of the two eye-crossing points, t1 and t2, as shown in the preceding figure. This point is the Eye Measurement Point. Both statistical and minimum eye heights is calculated at this time point.

  With Auto Mode "off", the user can manually set the crossing point time in order to shift where the eye height calculations are performed. Both statistical and minimum eye heights is calculated at that time point.

  Auto Delay does not affect eye height if the Eye Measurement Point is selected according

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

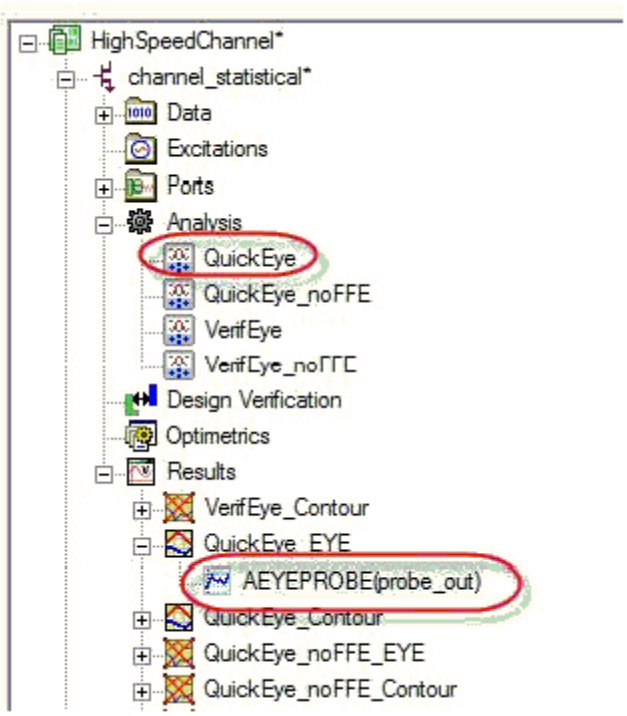
to the eye diagram that is currently displayed. For example, if the UI is 1ns, the front group box eye is drawn over 2ns. With Auto Delay “off”, assuming that the first crossing is at 0.3ns and the second is at 1.3ns, the user should enter 0.8ns as the eye measurement point. With Auto Delay “on”, the first crossing is shown at 0.5ns and second is shown at 1.5ns. In this case, the corresponding eye measurement approximation point is 1ns.

- **EyeCrossingTime** is calculated by creating a horizontal histogram across a small, narrow strip at the middle of the eye (eye-crossing points, t1 and t2). Eye Crossing Time is the mean of the histogram. The middle of the eye is computed as the middle of the vertical extremities of the eye--that is, the midpoint of max & min voltage values across the complete eye diagram. Later, an internal algorithm refines the crossing times by re-computing the crossing points based on a more accurate amplitude. The refined crossing time calculation is then used as the new middle of the eye. A front group box eye diagram has two eye crossings and two Eye Crossing Times.
- **EyeMeasurementPoint** (time) is calculated as the mean of the two eye crossing times in a front group box eye diagram. This value is then used to compute several vertical eye measurements, such as eye height, eye amplitude, level one, and level zero, etc. If Auto Mode is “off”, the user should enter the time value where he thinks the actual vertical eye measurements should be conducted (at present, only minimum eye height is measured).

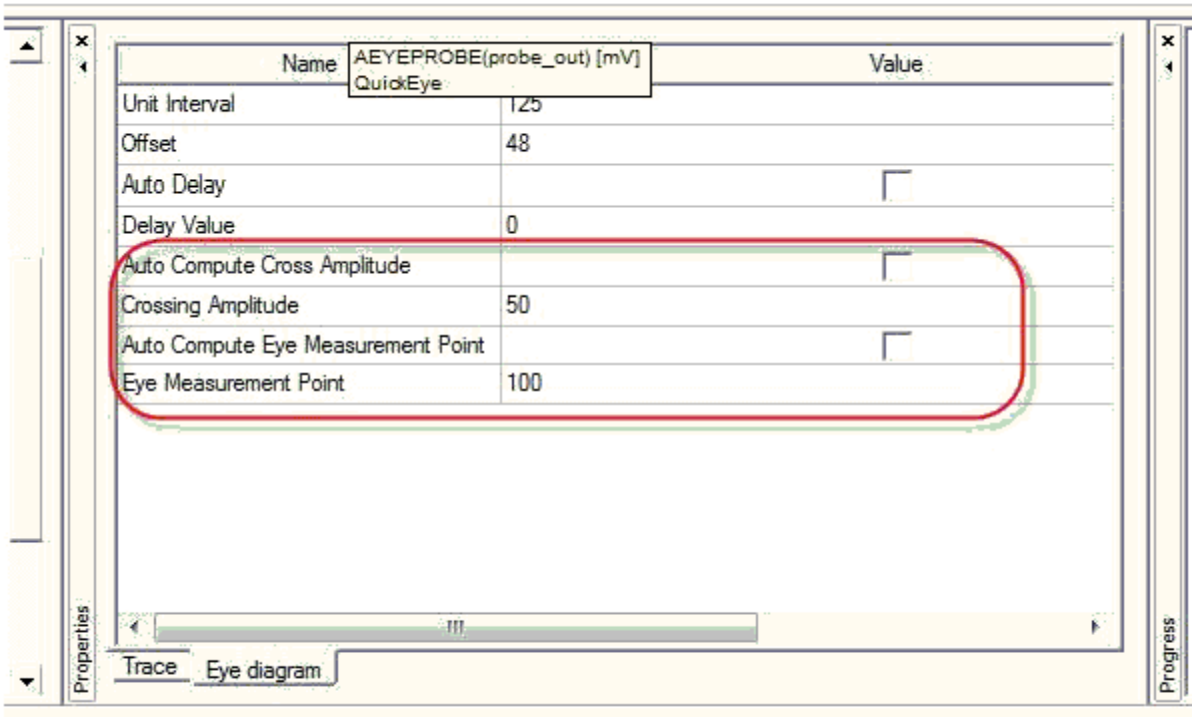
  Auto Delay does not affect this value if the user follows the eye diagram that is currently displayed. Consequently, the user should enter the diagram time value where he thinks the eye measurement point actually lies. For example, let 1ns be the unit interval (UI) and assume the front group box eye is drawn over 2ns. With Auto Delay “off”, if the first crossing is at 0.3ns and the second is at 1.3ns, the user should enter 0.8ns as the approximate eye measurement point. With Auto Delay “on”, the first crossing is shown at 0.5ns and the second is shown at 1.5ns, so the approximate eye measurement point is 1ns.

The eye measurements described above can be accessed by analyzing **QuickEye** simulation in HighSpeedChannel.adsn (Nexxim standard examples) and putting your cursor on **AEyeProbe**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The two check boxes are in the **Eye diagram** tab of the trace properties:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Eye Measurement Range Function Parameters (2D and Circuit)

The Eye Measurement category of range functions provide the means to evaluate several characteristics of eye diagrams. Each of the Eye Measurement functions includes the following parameters. Specify the Value by editing the Value field for the parameter name. Specify the unit for the parameter by selecting from the Unit drop-down menu.

Name	DefaultValue	Default Unit	Description
Unit Interval	0	ns	Unit interval of signal
Start Offset	0	ns	Offset at beginning of signal
End Offset	0	ns	Offset at end of signal
Autocrossing amplitude	1		Nonzero number means that crossing amplitude is calculated automatically.
Crossing amplitude	0	mV	Specify crossing amplitude used for eye measurement data computation.

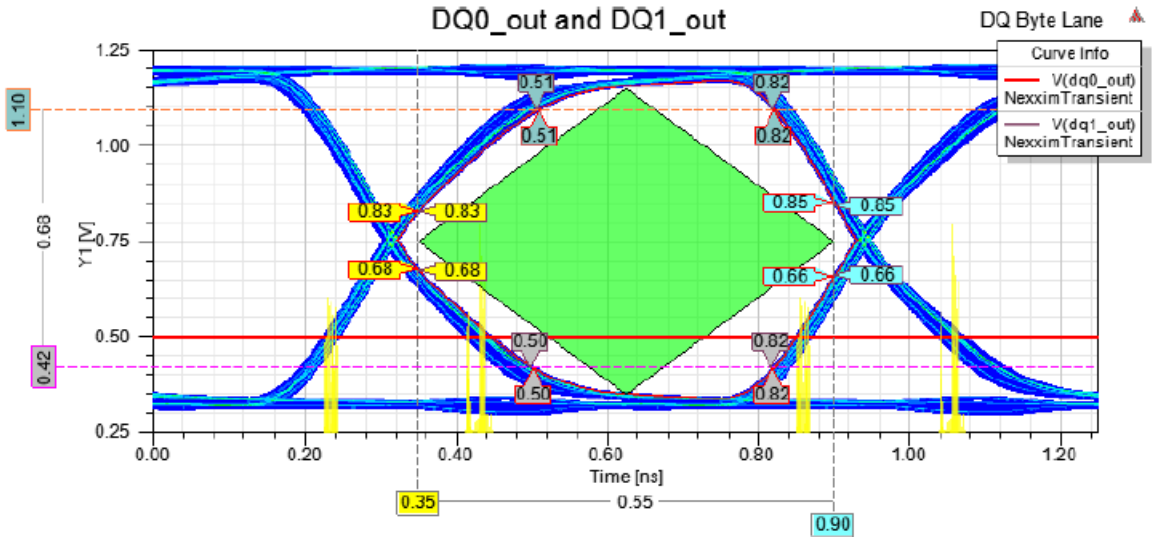
Using Stacked Eye Diagrams

The Rectangular Eye Diagram is optimized for viewing a single eye. But when multiple eyes are overlaid in the same Rectangular Eye Diagram, it is not very easy to compare the eyes. It is also very tedious to compare Y-marker and X-marker intersections. The Stacked Eye Diagram feature allows multiple eye plots to be stacked vertically for easy comparison. For details on the setup, see Stacked Eye Diagram.

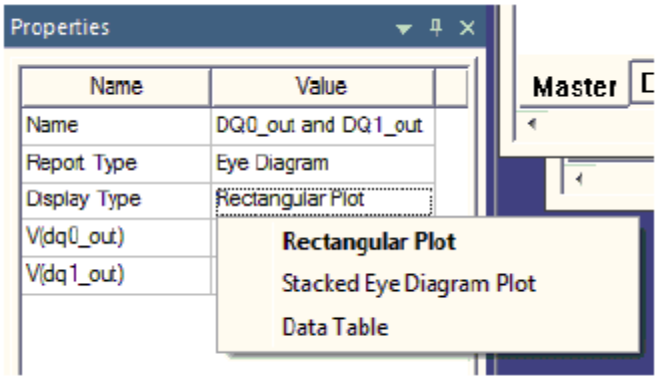
Converting a Rectangular Eye Diagram to Stacked Eye Diagram

The following Rectangular Eye Diagram has two eyes. This is not clearly evident from this plot, except on the legend, and hence the two eyes cannot be compared easily.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

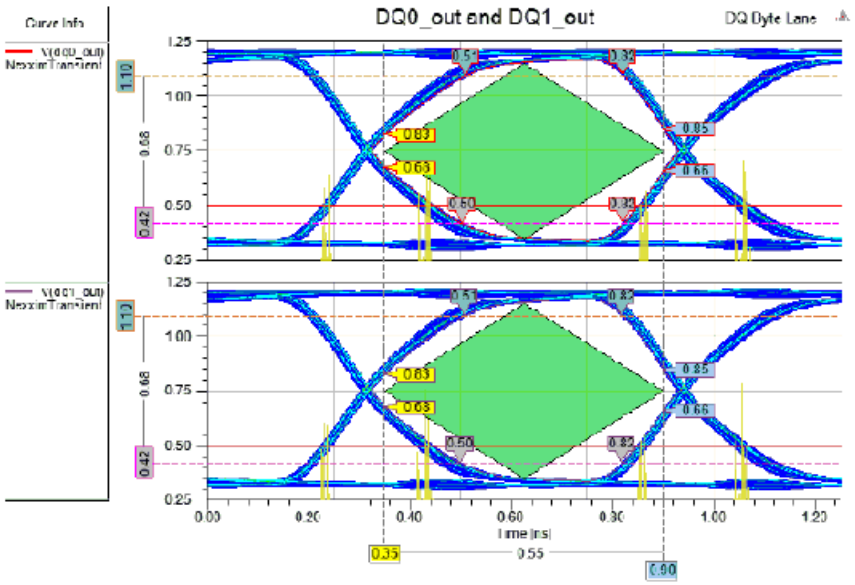


To convert this plot to a Stacked Eye Diagram, select the plot in the Results folder in the **Project Manager** window and change its **Display Type** property to **Stacked Eye Diagram Plot** as shown in the following screenshot.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

After conversion, the Eye diagrams are stacked as in the following view:



Only Rectangular Eye Diagram display types can be converted to Stacked Eye Diagrams. Statistical Eye Diagram Plots cannot be converted to Stacked Eye Diagrams.

In a Stacked Eye Diagram all the eyes are stacked over each other and are easily comparable in terms of X and Y data ranges, eye mask violations, histograms, X- and Y-marker intersections.

Histograms

Histograms can be enabled in a Stacked Eye Diagram by selecting any eye , then enabling the Show Histogram property under the Histogram tab in the Properties window, just as in Rectangular Eye Diagrams. The histograms are enabled for all eyes in the Stacked Eye Diagram, and are aligned as shown in the illustration above.

X and Y Markers

X-markers and Y-markers can be added to Stacked Eye diagrams on the **Report 2D > Marker** menu. X-markers align across all the stacked eyes.

Y-markers are specific to each eye. When you set up a Y-marker, select Current Stack to put the Y-marker only on the selected diagram, or All Stacks to add Y-markers to all diagrams. The Y-markers move up and down in tandem.

Eye Masks

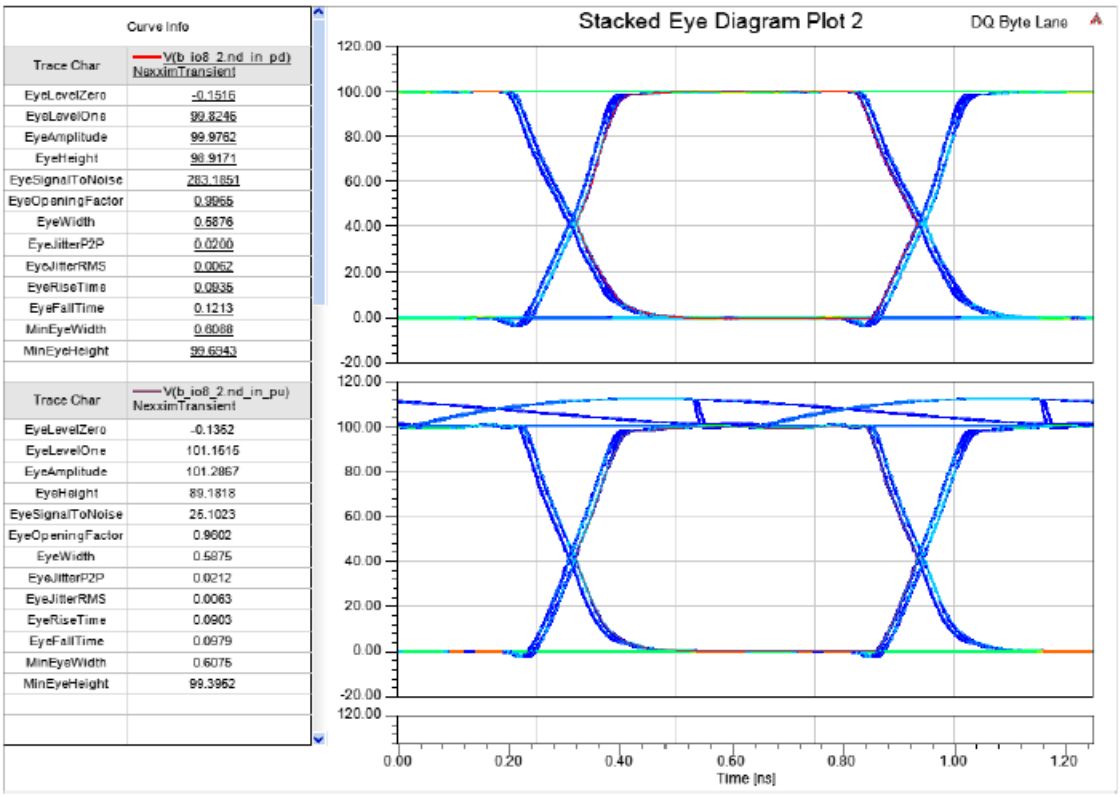
An Eye Mask can be enabled and specified just as in a Rectangular Eye Diagram. If enabled and specified, the same Eye Mask is shown for each eye in Stacked Eye Diagram.

Eye Measurements

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Eye measurements can be enabled through the shortcut menu selection **Trace Characteristics > Add All Eye Measurements**.

Eye Measurements are shown in a Legend window. To maximize plot area, Eye Measurements and other trace characteristics are shown in rows instead of columns for Stacked Plots, alongside each stack, as show in the following:



2D and Circuit PAM-4 Eye Plot

Eye diagrams created from PAM-4 voltage traces differ from regular (NRZ) eye diagrams because they have 4 symbol levels that create three distinct sub-eye openings between the three sequential pairs of symbol levels.

A PAM-4 modulation can be set up using any of the following:

- Transient Analyses
- Eye Source for QuickEye
- AMI Transmitter for AMI Analysis

For more information, see PAM-4 Transient Analysis.

After a successful analysis using PAM-4 modulation, to display an eye plot of the Transient, QuickEye, or AMI results:

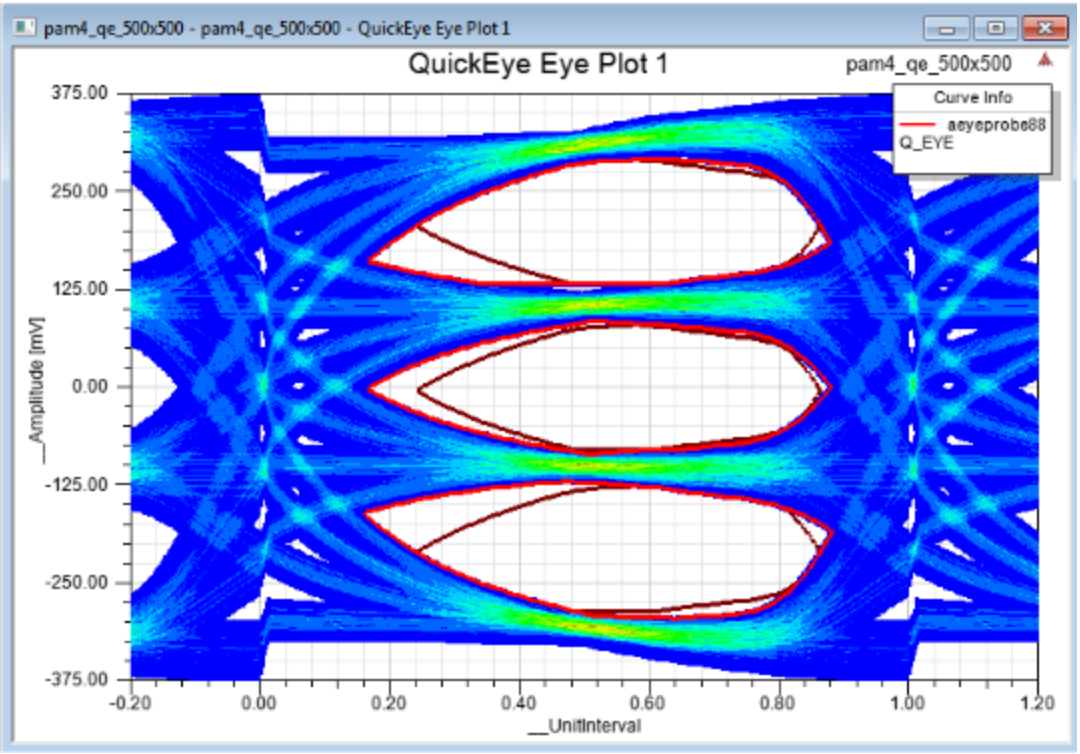
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Click **Product** > **Results** or, on the **Project Manager** window, expand the **Project Tree** and [*active design folder*], then right-click **Results**. Navigate to the appropriate **report type** . Then select **Statistical Eye Plot** or **Eye Diagram Plot** to open the **New Report** window.
2. Selections in the report window are context-sensitive. Whatever Eye Probe/Scope settings are chosen determine the relevant output quantities from which you may select. For example, setting the Eye Scope context to an existing Eye Probe result in the display of quantities that are relevant to the Eye Probe. Whereas choosing Others in the Eye Scope list box displays all other voltage, current and power quantities.

   Select the output quantities of interest and click **Add Trace**.
3. Click **Done**. A Report window opens to display a graph of the analysis results.

Statistical Eye Plots of PAM-4 Results

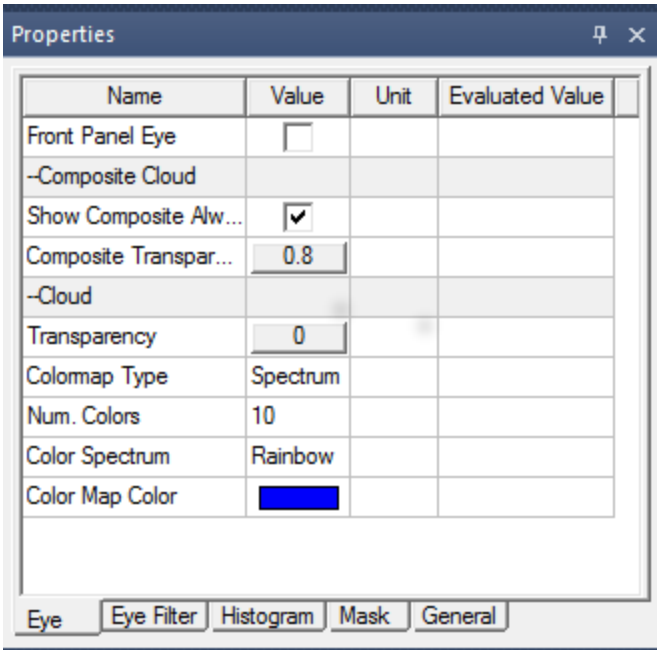
A Statistical Eye Plot of a PAM-4 transmission resembles the following:

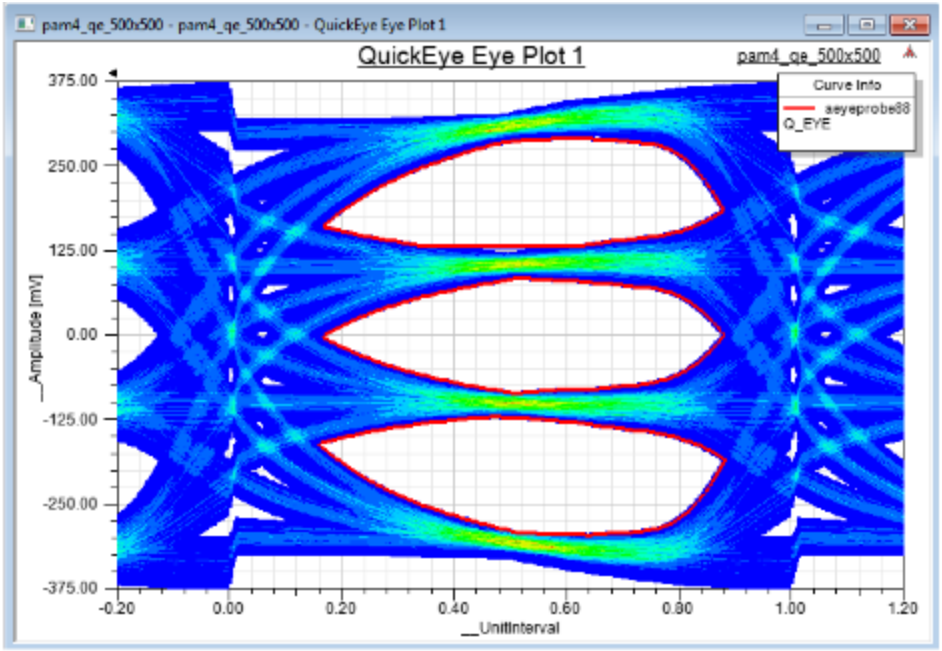


An additional “Consolidated” eye, is also displayed. The consolidated eye is created by superimposition of the three sub-eyes aligned along their voltage reference levels. The consolidated eye shows the worst-case eye opening and serves as a simplified measure of the goodness of the eye. The user chooses to use the visual and measurements on the consolidated or individual sub-eyes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The consolidated eye display is controlled by a trace property:



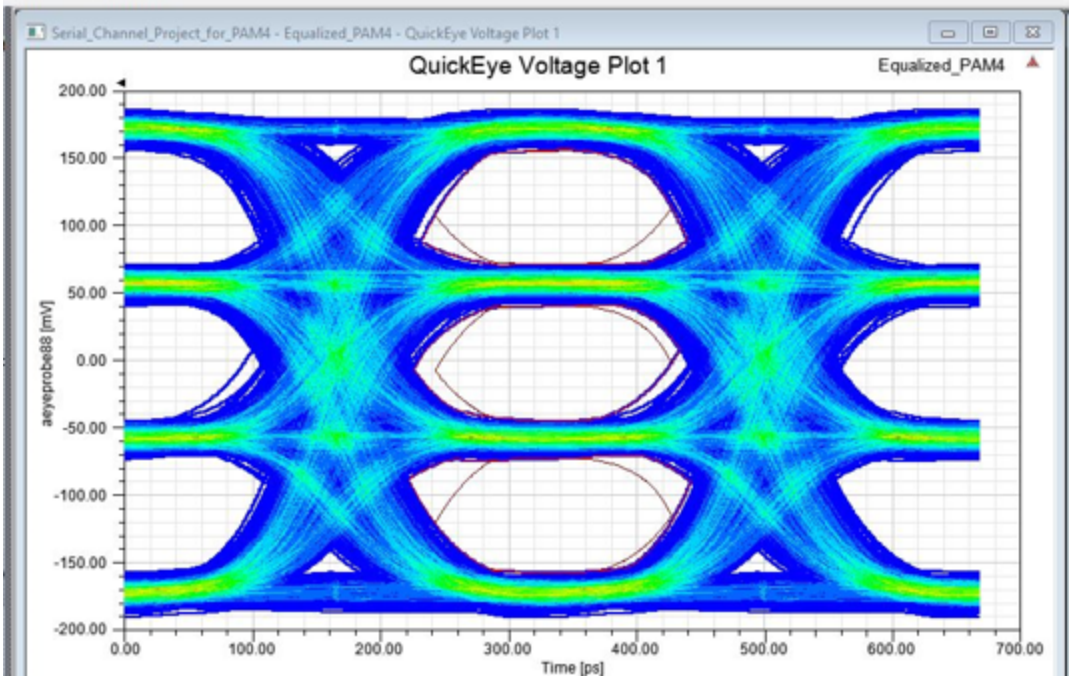


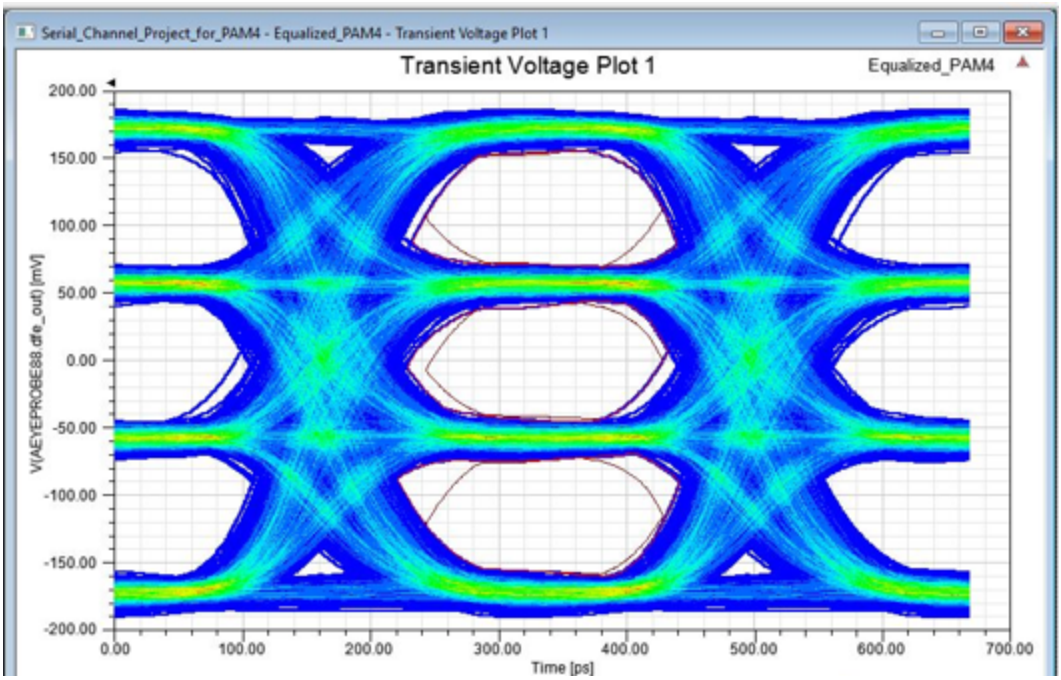
Voltage Plots of PAM-4 Results

When you generate a Rectangular Eye Diagram from PAM-4 data, the waveform sub-view can be zoomed in to show the boundaries of the unit intervals (black lines) and the inner-eye contour

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

overlay:

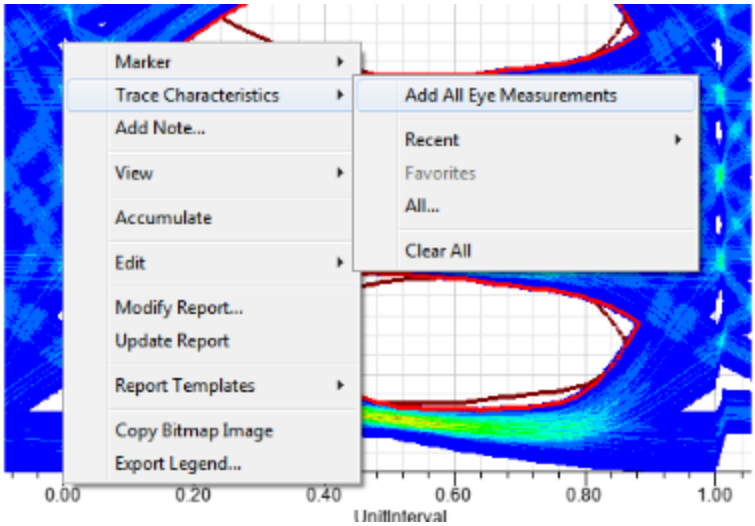




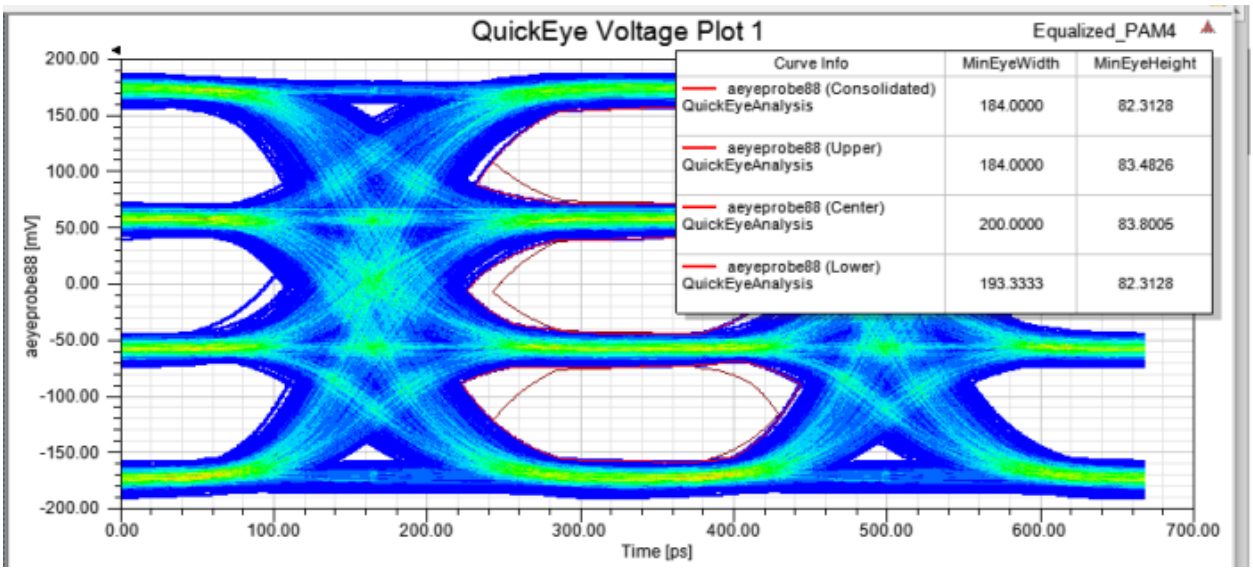
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Eye Measurements for PAM-4 Plots

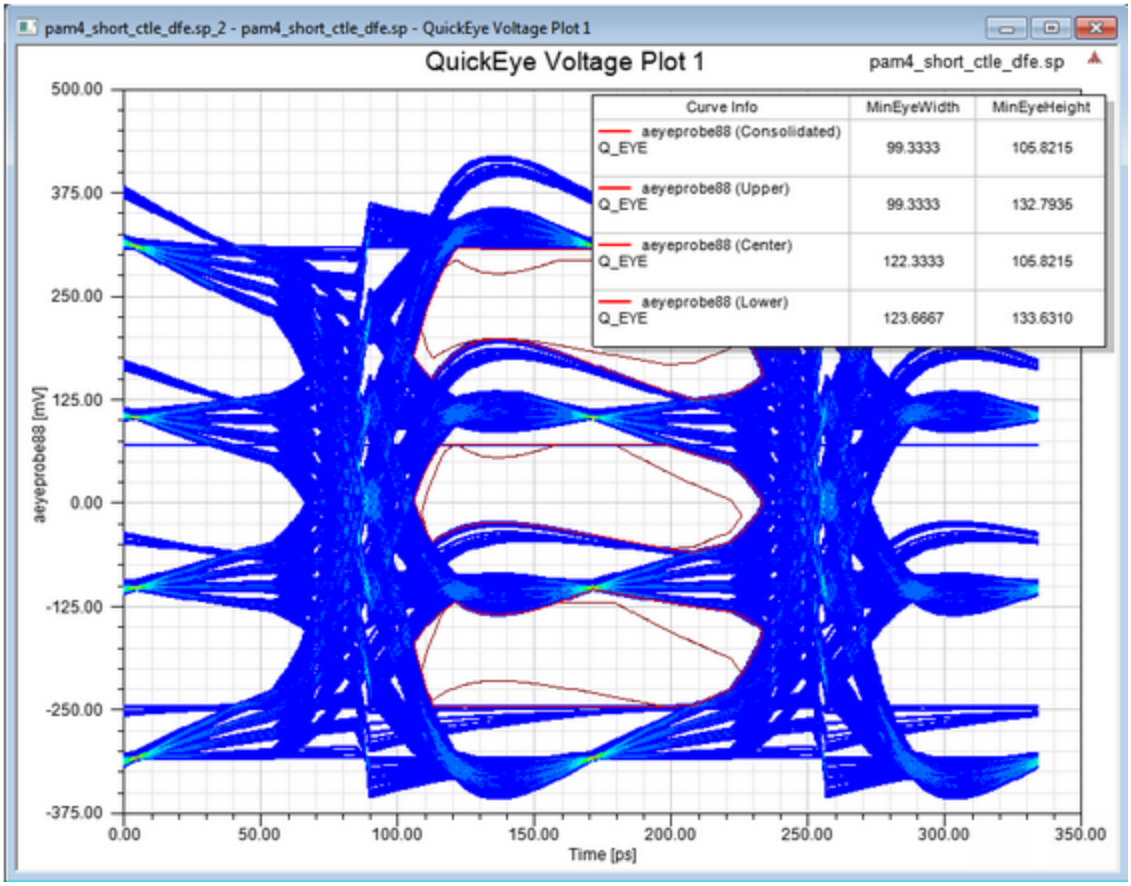
PAM-4 eye diagrams support only the MinEyeWidth and MinEyeHeight measurements. To add trace characteristics, right-click the plot and select on the following options:



When **Add All Eye Measurements** is clicked, only the supported MinEyeHeight and MinEyeWidth are added to the plot. Any other measurements display NaN if added.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



PAM-4 trace characteristics are displayed for each sub-eye and include the consolidated measurement. The sub-eye names and top-to-bottom sorting allow easy mapping of the numbers to the visual. When the Legend is exported (via the shortcut menu), the entire table along with the sub-eye name annotations is also exported.

> **Note:** Mask violations for transient analysis are not supported.

Modifying the Background Properties of a Report

Specifying Output Variables in 2D and Circuit Reports

The **Output Variables** window contains four group boxes:

- **Context —** Specify the Report type, the Solution, and for appropriate report types, the Domain and Show fields. Changing the Report type affects whether the Domain menu appears, and may affect the functions listed in the **Function** group box.
- **Output Variables —** Specify the name and expression for a new output variable.
- **Calculation —** Insert quantities into the **Expression** area of the **Output Variables** group box.
- **Function —** Insert completed expressions into the **Expression** field of the **Output Variables** group box.

2D and Circuit Adding a New Output Variable

To add an output variable:

1. Click **Product Menu** > **Results** > **Output Variables** or, in the **Project Manager** window, right-click **Results** and select **Output Variables** to open the **Output Variables** window. Variables defined using the **Product Menu** > **Results** > **Output Variables** command appear in the list at the top of the window.
2. In the **Output Variables** group box, enter a name for the new variable in the *Name* field.
3. To enter an expression, do one or both of the following:
    a. Type part or all the expression directly in the **Expression** field. Valid functions appear in blue. Invalid functions appear in red.
    b. Insert part or all the expression using the options in the Function group box.
4. Click **Add** to add the new variable to the list.
5. Repeat steps 2 through 5 to add additional variables.
6. When you are finished adding output variables, click **Done** to close the **Output Variables** window.

2D and Circuit Building an Expression Using Existing Quantities

When entering an expression for a new output variable, insert part or all the expression using the options in the **Function** group box in the **Output Variables** window.

To add an input variable by inserting part or all of the expression:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

From **Product Menu** > **Results** > **Output Variables** or, in the **Project Manager** window, right-click **Results** and select **Output Variables** to open the **Output Variables** window. In the **Output Variables** window, enter a name for the new variable in the *Name* field.

To insert a quantity:

1. From the **Report Type** drop-down list, select the type of report from which the user wants to select the quantity.
2. From the **Solution** drop-down menu, select the solution from which the user wants to select the quantity.
3. From the **Category** group box, select the appropriate type of quantity to enter.
4. From the **Quantity** group box, select the appropriate quantity or the geometry.
5. From the **Function** group box, select a ready-made function (this option is the same as inserting the function on the **Function** group box).
6. If applicable, on the **Domain** list, select the solution domain.
7. Click **Insert Into Expression**.

   The selected quantity is entered into the **Expression** area of the **Output Variables** window.

To insert a function:

1. From the **Function** group box, select a ready-made function on the drop-down menu.
2. Click **Insert Function into Expression.**

   The function appears in the **Expression** area of the **Output Variables** group box.

1. When the user is finished defining the variable in the **Expression** field, click **Add** to add the new variable to the list.
2. Repeat steps 2 through 6 to add additional variables.
3. When the user is finished adding output variables, click **Done** to close the **Output Variables** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: Remember that the evaluated value of an expression is always interpreted in SI units. However, when an angle quantity is plotted in a report, the user can plot values in units other than SI. If the user wants to plot the polar angle of a complex simulation result, S_{11} say, choose between ang_deg(S_{11}) and ang_rad(S_{11}). Both of these return the exact same angle quantity but in degree and radian units respectively.

Note that when used in expressions, some surprising outcomes might result. For example, the expression "1+ang_deg(S_{11})" represents an 'angle' and the number "1" is treated as "1 rad". The angle SI unit is attached to any unitless number that is added/subtracted from an angle value. If the user treats "1" as degrees, make it explicit and use "1deg + ang_deg(S_{11})" instead.

If the user are interested in unitless degree values, two additional functions exist: ang_deg_val(S_{11}) and cang_deg_val(S_{11}). These return simple numbers and are treated so by any expression. If the complex S_{11} lies on the positive Y axis say, ang_deg_val(S_{11}) is 90 and "1 + ang_deg_val(S_{11})" is 91.

Deleting Output Variables (2D and Circuit)

To delete output variables:

1. Remove all references to the output variable in the project.
2. Save the project to erase the command history.
3. Click **Product Menu > Results > Output Variables** or, in the **Project Manager** window, right-click **Results** and select **Output Variables**.

This opens the **Output Variables** window.

4. Select the variable and click **Delete**.
5. Click **OK** to close the window.

Viewing Matrix Data in 2D and Circuit Reports

To view matrices computed for the S-parameters, impedances, and propagation constants during each adaptive, non-adaptive, or sweep solution:

1. From the **Project Manager** window, right-click the solution setup of interest, then click **Matrix Data** to open the **Solution Data** window

The **Matrix Data**tab is selected.

2. In the **Design Variation** field, specify the design with the matrices you want to view.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Optionally, choose a design variation solved during an Optimetrics analysis on the **Set Design Variation** window. This lists all the solved variations in the design.

3. In the **Simulation** dropdown menu, select the solution setup and solved pass - adaptive, single frequency solution, or frequency sweep - for which you want to view matrices.
4. Select the type of matrix you want to view: **S-matrix**, **Y-matrix**, **Z-matrix**, **Gamma**, or **Z_o** (characteristic impedance.) The available types depend on the solution type.
5. Select the format in which to display the matrix information. The available formats depend on the matrix type being displayed.
6. Select the solved frequencies to display:

- to open the matrix entries for all solved frequencies, select **All Freqs**. It is selected by default.
- To show the matrix entries for one solved frequency, clear **All Frequencies**, then select the solved frequency for which you want to view matrix entries. For adaptive passes, only the solution frequency specified in the **Solution Setup** window is available. For frequency sweeps, the entire frequency range is available.
- To insert or delete one or more displayed frequencies, click **Edit Freqs**. This command is only available if the sweep type is Fast or Interpolating. If choose to export the matrix data for the Fast or Interpolating sweep after modifying the frequencies in the **Edit Frequencies** window, only those frequencies displayed under the **Matrix Data** tab is exported.

The data is displayed in the table. By default, wave ports are listed in alphabetical, then numerical order, just as they appear in the excitation tree. To change the port order, change setting for Default Matrix sort order in **Electronics Desktop** General options.

2D and Circuit Selecting the Matrix Display Format

Display matrix data in the following formats. The available formats depend on the type of matrix being displayed.

Magnitude, Phase (deg)	Displays the magnitude and phase (in degrees) of the matrix type.
Real, Imaginary	Displays the real and imaginary parts of the matrix type.
dB, Phase (deg)	Displays the magnitude in decibels and phase in degrees of the matrix type.
Magnitude	Displays the magnitude of the matrix type.
Phase (deg)	Displays the phase in degrees of the matrix type.
Real	Displays the real parts of the matrix type.
Imaginary	Displays the imaginary parts of the matrix type.
dB	Displays the magnitude in decibels of the matrix type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Renaming 2D and Circuit Matrix Data

From the **Project Manager** window, right-click a port excitation to rename it. When you rename a port excitation, the associated data is reordered so it can be presented in the same manner. The reordering is done to match the tree-sort order presented for the ports (renamed matrix data is reordered so alphabetic values appear before numeric values).

Exports of the matrix data is ordered in the same manner. This reordering is conducted as part of post-processing and does not force a re-solve.

Animation in 2D and Circuit Reports

The following topics describe how to post-process field overlay displays to create and view various animated reports. Any of the field overlay displays can be animated by cycling the overlays as a series of frames. See the following topics for details on creating the field overlays:

- Overlaying Surface Currents on a 3D View
- Overlaying Far Fields on a 3D View
- Overlaying Near Fields on a 3D View

There are two modes of animation: frequency-based and phase-based. Frequency-based animation creates a series of frames by calculating the field overlay at each of the swept frequencies. Phase-based animation creates a series of frames by calculating the field overlay at a fixed set of phase deviations around a selected frequency. The animation controls can also change the simulation design point.

Related Topics

2D Frequency Animation

2D Phase Animation

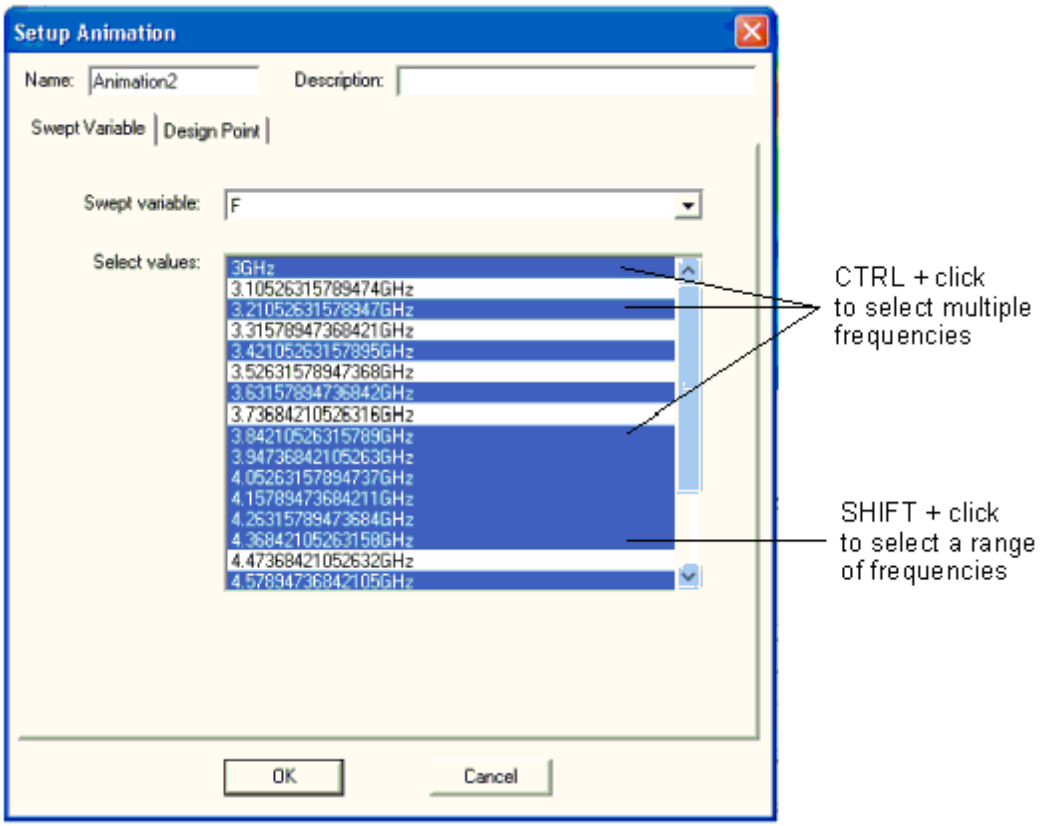
Changing the Design Point in 2D Animation

2D Frequency Animation

1. To initiate the animation of the overlay that is currently displayed, do one of the following:
   - Select **Animate** on the **View** menu.
   - Expand the **Results** icon in the Project window, right-click the overlay entry, and select **Animate** from the menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

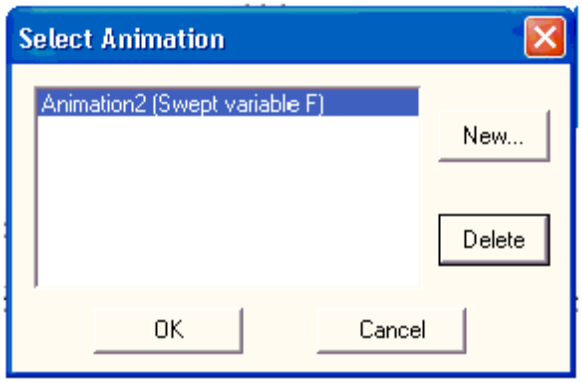
2. If no animations have been defined previously, the **Setup Animation** window opens:



- Specify a name in the **Name** field (or accept the default, **Animation***n*, where *n* is a numeral). Optionally, enter a description.
- For a frequency animation, select **F** as the **Swept Variable**.
- By default, all the frequencies are selected (highlighted). Hold down **Ctrl** to select multiple individual frequencies, or hold down **Shift** to select a contiguous range of frequencies. [These selection modes are illustrated in the window example above].
- Click **OK**.

If one or more animations have been defined, selecting **Animate** from one of the menus opens the **Select Animation** window:

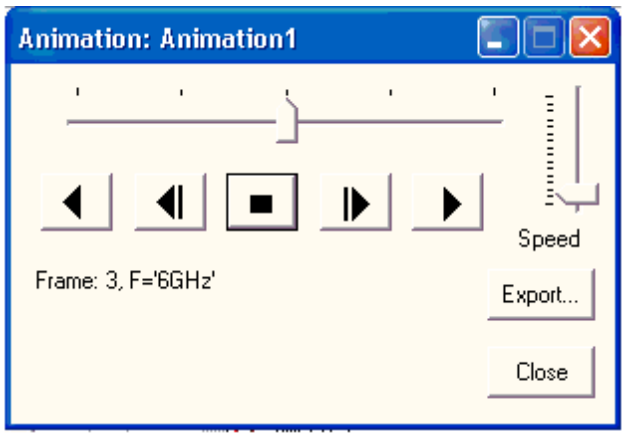
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Select Animation** window provides the following operations:

- Click to select one of the animations and click **OK** to start that animation.
- Click **New** to open the **Setup Animation** window described above, and close the **Select Animation** window.
- Select an animation and click **Delete** to delete the definition.

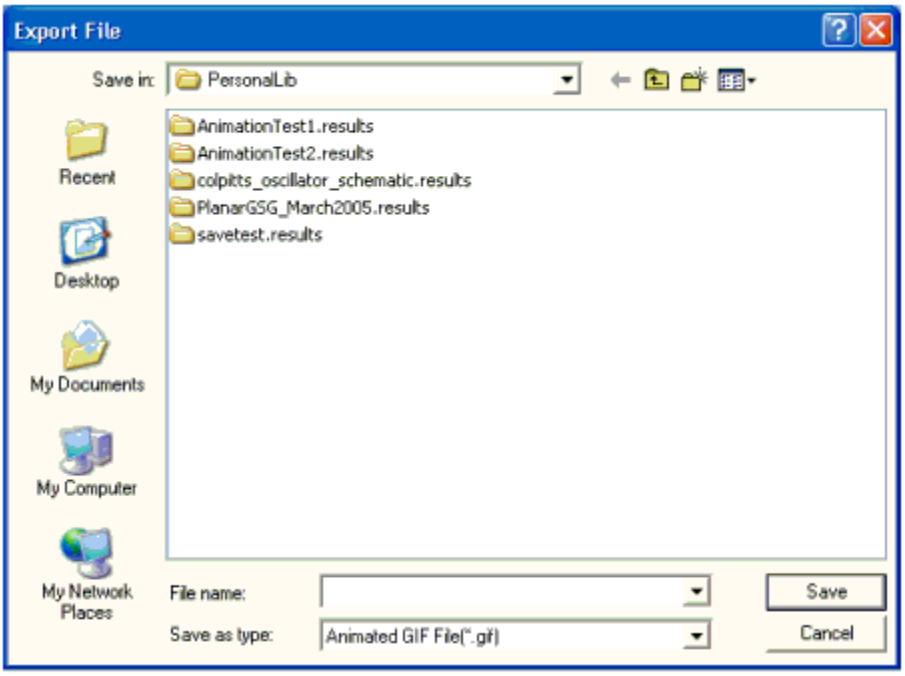
3. Electronics Desktop calculates the frame data. If the Progress window is displayed, monitor the progress of the calculation. When the frames have been calculated, the animation begins and the **Animation** control window opens:



- Click the playback buttons to play the animation. From left to right, the buttons are **Reverse**, **FastReverse**, **Stop**, **Fast Forward**, and **Forward**. The indicator at the top of the window shows the progress of the animation. Click the **Speed** slider to control the speed of the animation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To export the frame data to a file, click **Export**. The **Export File** window opens:



Specify the directory and file name. Click the **Save as type** menu to select the file format (Animated GIF or AVI). Click **Save** to save the data and close the window.

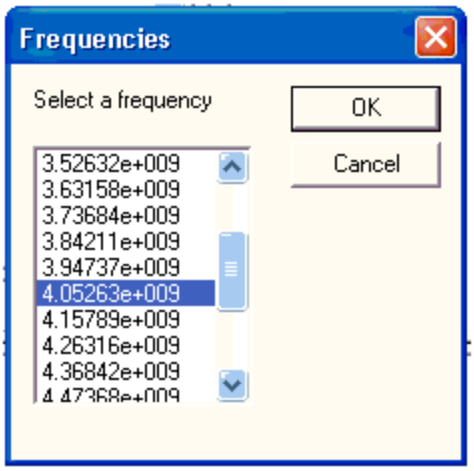
- Click **Close** on the **Animation** control window to stop the animation and close the window.

2D Phase Animation

1. To prepare for phase animation, you must select the base frequency.
- For surface current and far field overlays, expand the **Results** icon in the **Project Manager** window, right-click the overlay, and select **Frequency** on the menu. The

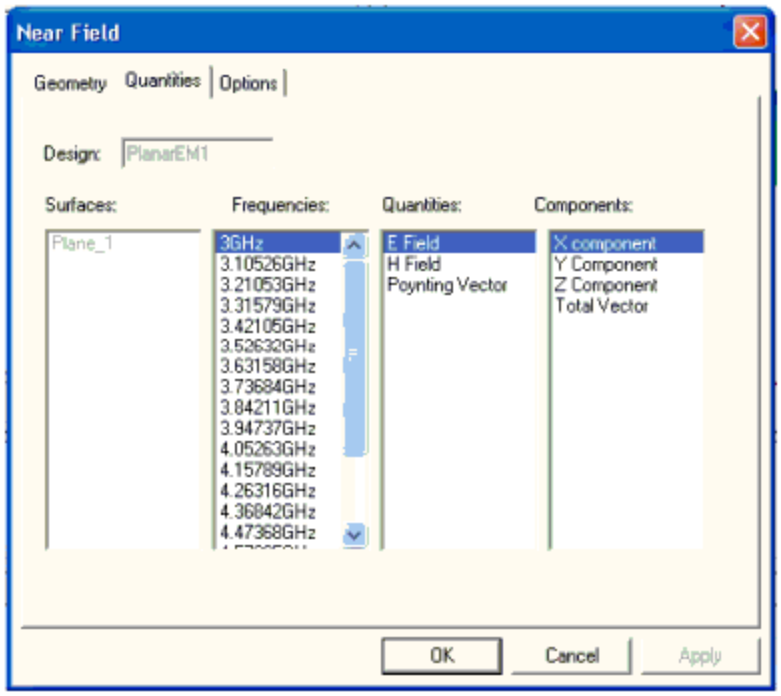
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Frequencies window opens:



The list displays the frequencies that are swept in the analysis. Select a frequency on the list; the overlay displays the field values calculated at that frequency. Click **OK** to leave the overlay at the selected frequency.

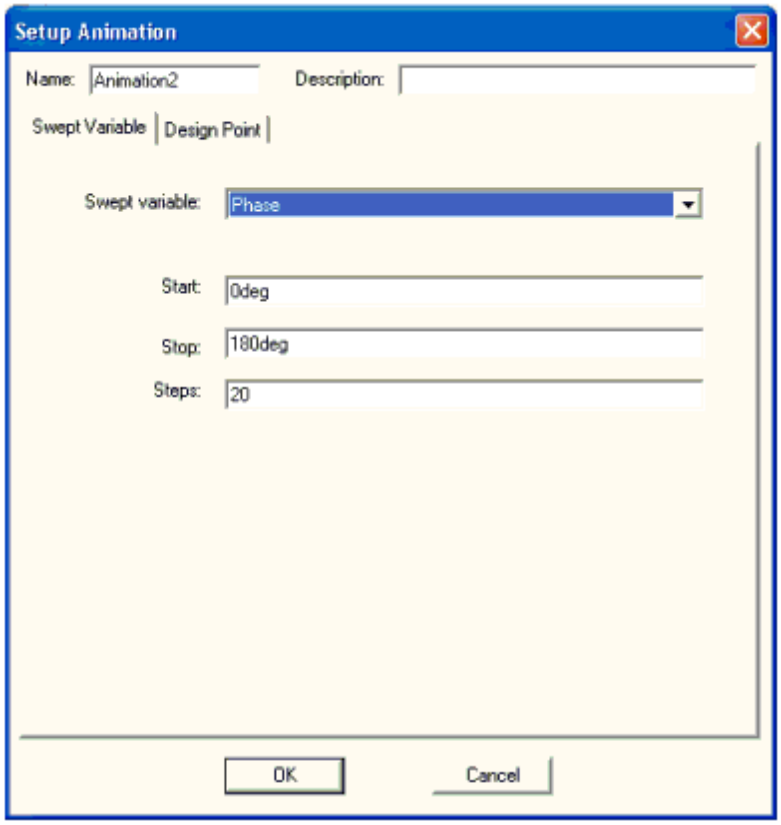
- For near field overlays, expand the **Results** icon in the **Project Manager** window, right-click the overlay, and select **Properties** on the menu. Click the **Quantities** tab to select a reference frequency for the phase animation:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click **OK** to apply the frequency and close the window.

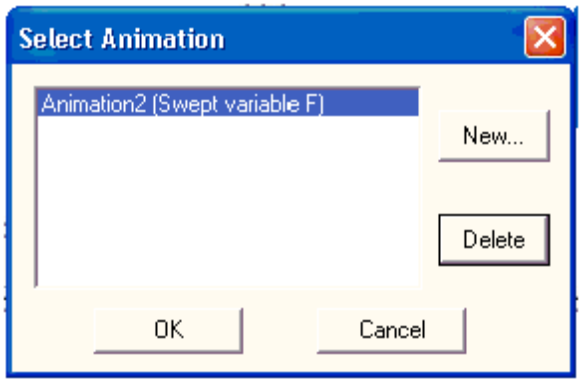
2. To initiate the animation of the overlay that is currently displayed, do one of the following:
   - Select **Animate** on the **View** menu.
   - Expand the **Results** icon in the Project window, right-click the overlay entry, and select **Animate** from the menu.
3. If no animations have been defined previously, the **Setup Animation** window opens:



- Specify a name in the **Name** field (or accept the default, **Animation***n*, where *n* is a numeral). Optionally, enter a description.
- For a frequency animation, select **Phase** as the **Swept Variable**.
- Select the Start and Stop phases in degrees.
- Click **OK**.

If one or more animations have been defined, selecting **Animate** from one of the menus opens the **Select Animation** window:

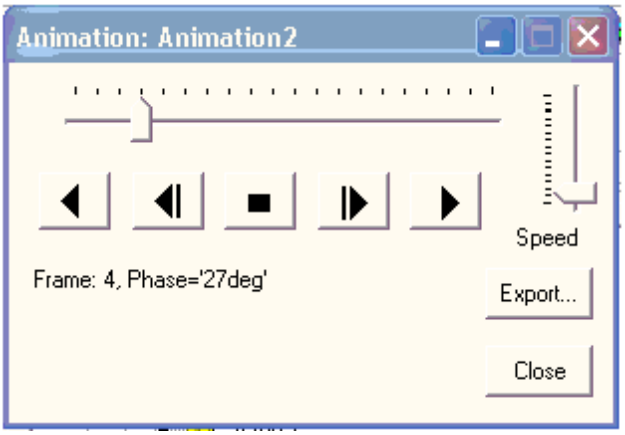
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Select Animation** window provides the following operations:

- Click to select one of the animations and click **OK** to start that animation.
- Click **New** to open the **Setup Animation** window described above, and close the **Select Animation** window.
- Select an animation and click **Delete** to delete the definition.

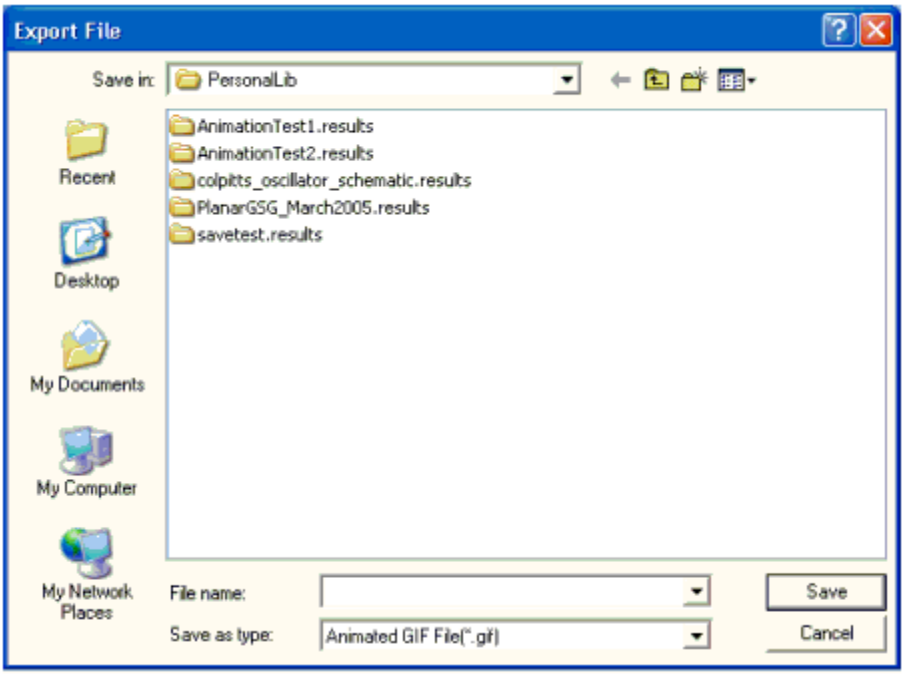
4. Electronics Desktop calculates the frame data. If the Progress window is displayed, monitor the progress of the calculation. When the frames have been calculated, the animation begins and the **Animation** control window opens:



- Click the playback buttons to play the animation. From left to right, the buttons are **Reverse**, **FastReverse**, **Stop**, **Fast Forward**, and **Forward**. The indicator at the top of the window shows the progress of the animation. Click the **Speed** slider to control the speed of the animation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To export the frame data to a file, click **Export**. The **Export File** window opens:



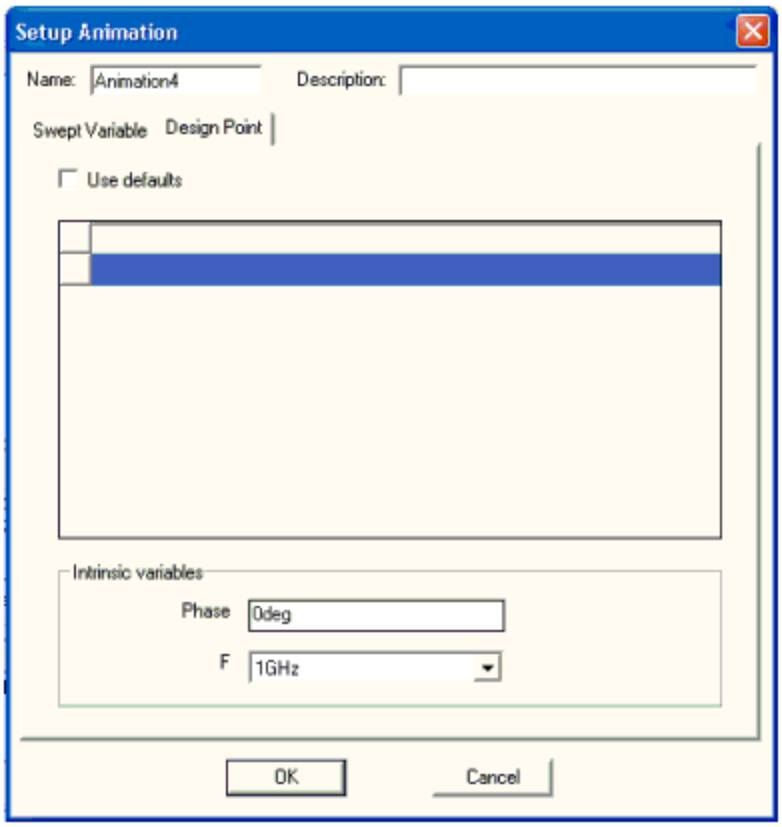
Specify the directory and file name. Click the **Save as type** menu to select the file format (Animated GIF or AVI). Click **Save** to save the data and close the window.

- Click **Close** on the **Animation** control window to stop the animation and close the window.

Changing the 2D Design Point

Calculating frames for an animation is equivalent to re-simulating the planar design. You can specify design point parameters for the animation calculations that are different on the ones used in the original simulation. From the **Animation Setup** window, select the **Design Point** tab and deselect the **Use defaults** option. The following fields are displayed:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Make any appropriate changes, then click **OK** to apply the changes and close the window. Clicking **Cancel** closes the window without making any changes.

User-Defined Outputs in 2D and Circuit Reports: Introduction

User-defined outputs (UDOs) allow users to define calculations through IronPython scripts or any .NET language (and used by the IronPython script). The UDO scripts need to be in the **UserDefinedOutputs** directory under either of **syslib**, **userlib** or **Personallib** with any directory structure needed for organization (the **Lib** directory name is special and its purpose is explained later on in the document)

The UDO scripts that are in syslib/UserDefinedOutputs, userlib/UserDefinedOutputs or Personallib/UserDefinedOutputs become available to the user to create "user-defined Solutions" through the **Results>Create user-defined Solution** menu. Use **Results>Create user-defined Solution>Update Menu** to refresh the menu to include the new UDO scripts that might have been copied to syslib, userlib or Personallib, or exclude them if they have been deleted, after the launch of desktop. Once the user-defined-solution is created, the solution and the calculations defined by UDO become available in Reporter as any other quantities in a new "user-defined" report type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Named Probes and Properties in user-defined Outputs

Computation of Traces Based UDO Calculations

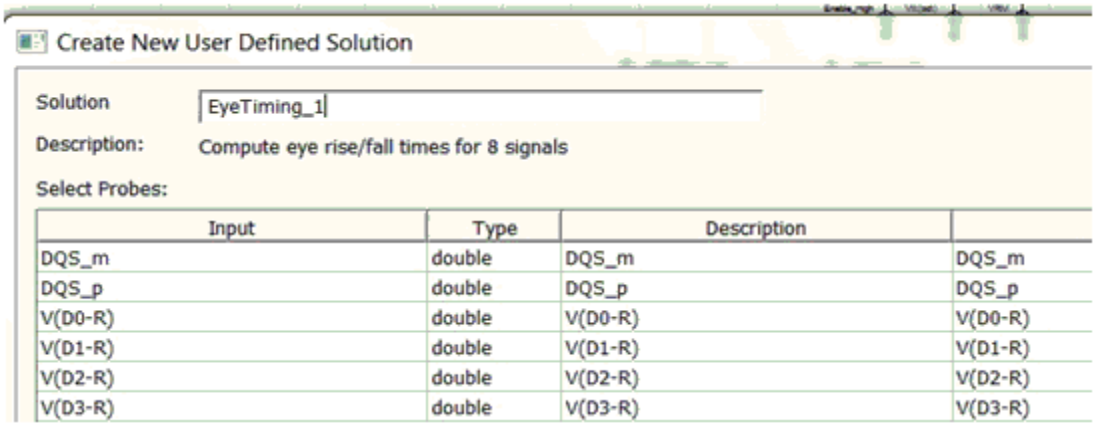
Dimensions Reduction by UDO Calculations

Dynamic Probes

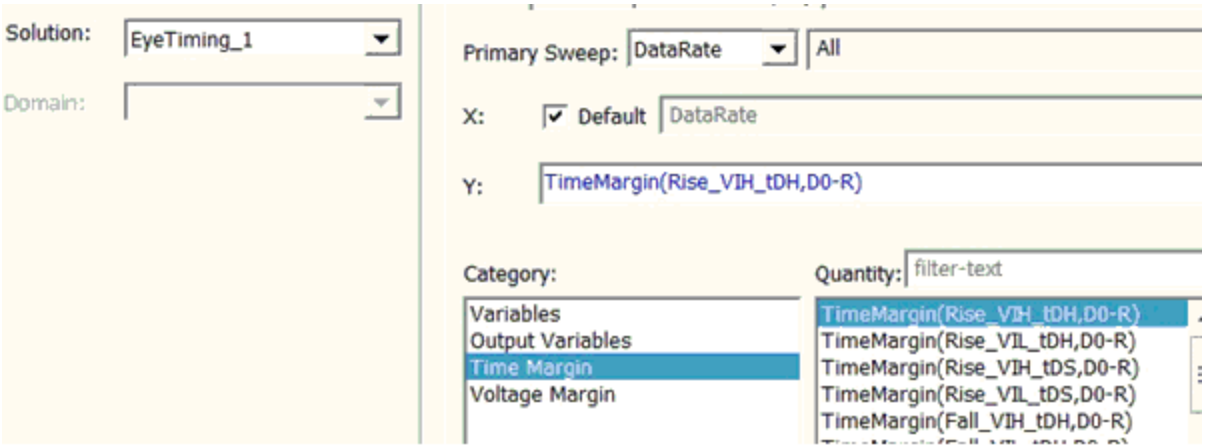
Named Probes and Properties in user-defined Outputs (2D and Circuit)

UDOs allow processing data across traces, solutions and report types. A UDO specifies the named probes and properties for which user selects/enters the values at the time of creation of user-defined solution. Probes are very similar to traces except that the user selects the values of only intrinsic variables for probes. The values of design/project variables are selected when a trace is created based upon the user-defined solution in reporter.

For example, you could create a user-defined solution called EyeTiming_1.



You can then access this solution in the Reporter.

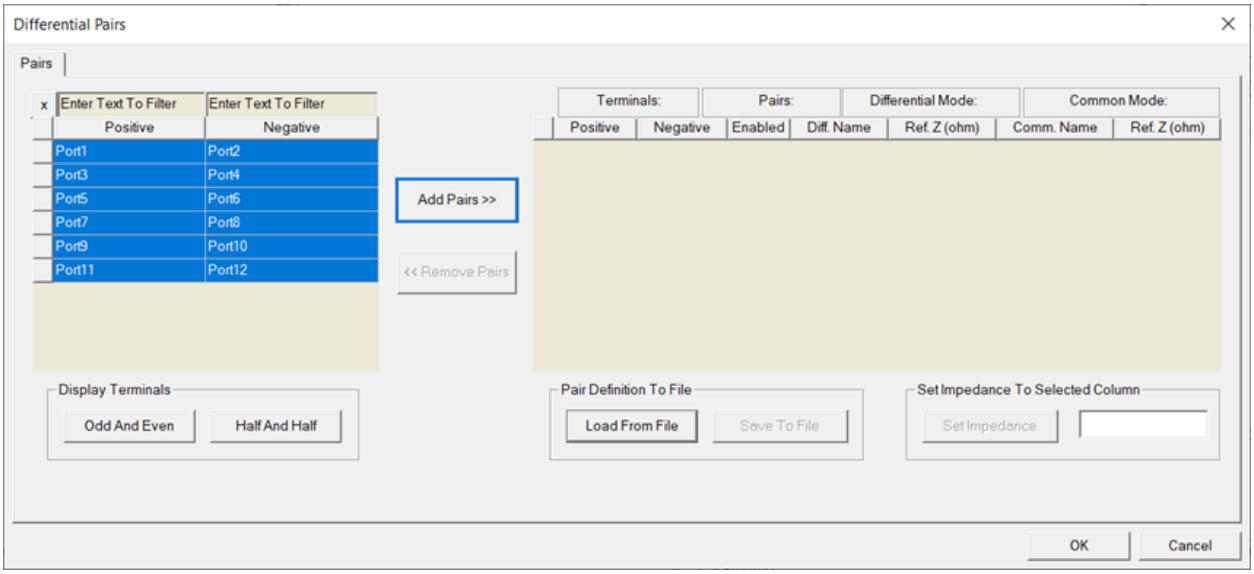


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Generate COM, or ERL, IDL, and ICN Calculations With A User Defined Solution.

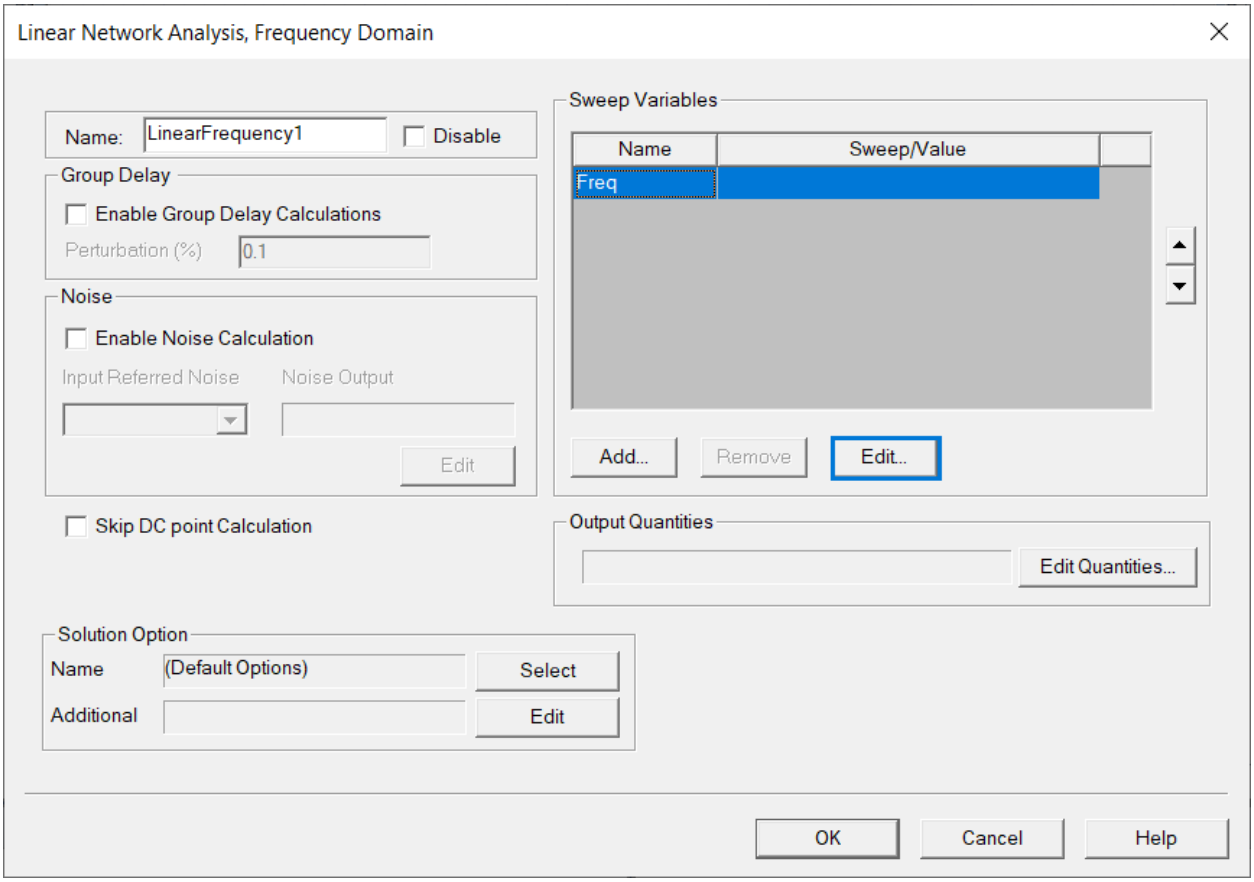
To generate Channel Operating Margin (COM), or Effective Return Loss (ERL), Insertion Loss Deviation (ILD), and Integrated Cross Talk (ICN) calculations individually within Circuit, have a circuit design ready to be analyzed with an n-port model. Additionally, a relevant config file(.cfg) is assumed in the following instructions.

1. In the **Project Tree**, expand the active project.
2. Right-click **Ports** and select **Differential Pairs**. The **Differential Pairs** dialog opens.
    i. From the **Pairs** tab, select the pairs, then click **Add Pairs**.
    ii. Click **OK** to close the dialog.



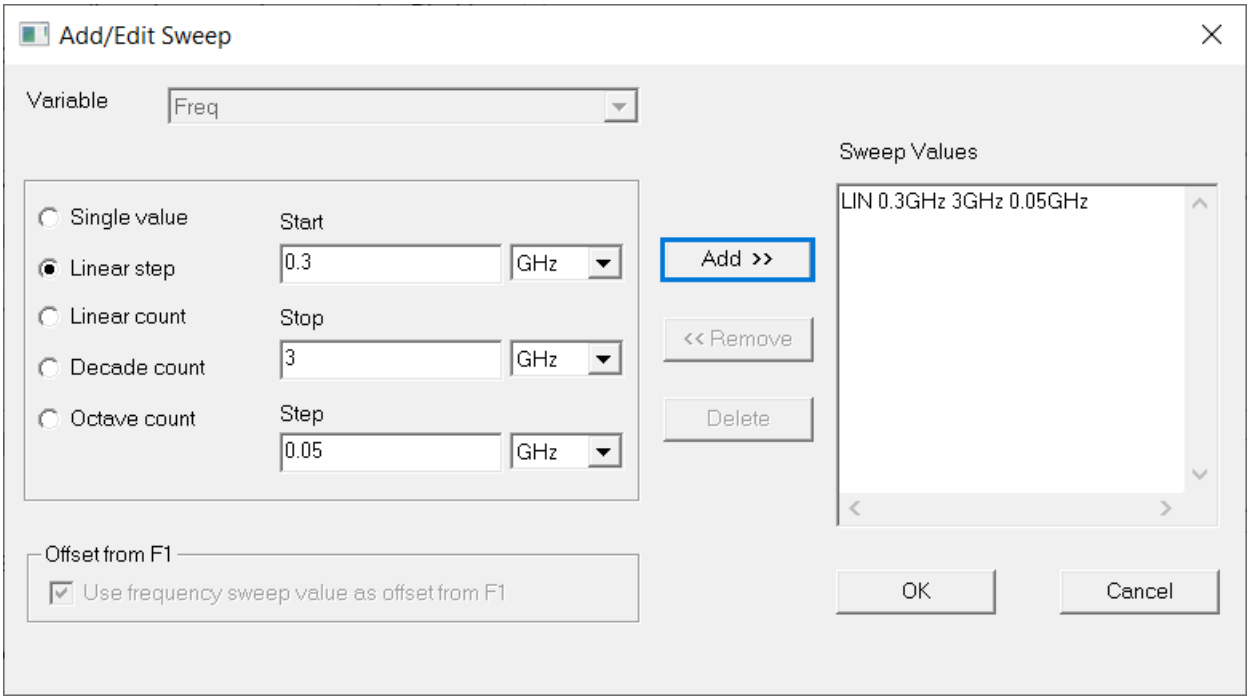
3. If an analysis solution is not yet set up, add an analysis solution. For example, a linear network analysis:
    i. From the **Project Tree**, right-click **Analysis > Add Nexxim Solution Setup... > Linear Network Analysis**.
    ii. In the **Name** field, enter a suitable name, such as LinearFrequency.
    iii. In the Sweep groupbox, select the **Freq** row, then click **Edit...** to open the **Add/Edit Sweep** dialog.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



iv. Enter the desired sweep values using the variable step/count options, then click **Add>>**. For example Start: 0.3 GHz ; Stop: 3 GHz ; Step: 0.05 GHz.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



v. Click **OK** to close the **Add/Edit Sweep** dialog, then click **OK** to close the **Linear Network Analysis** dialog.

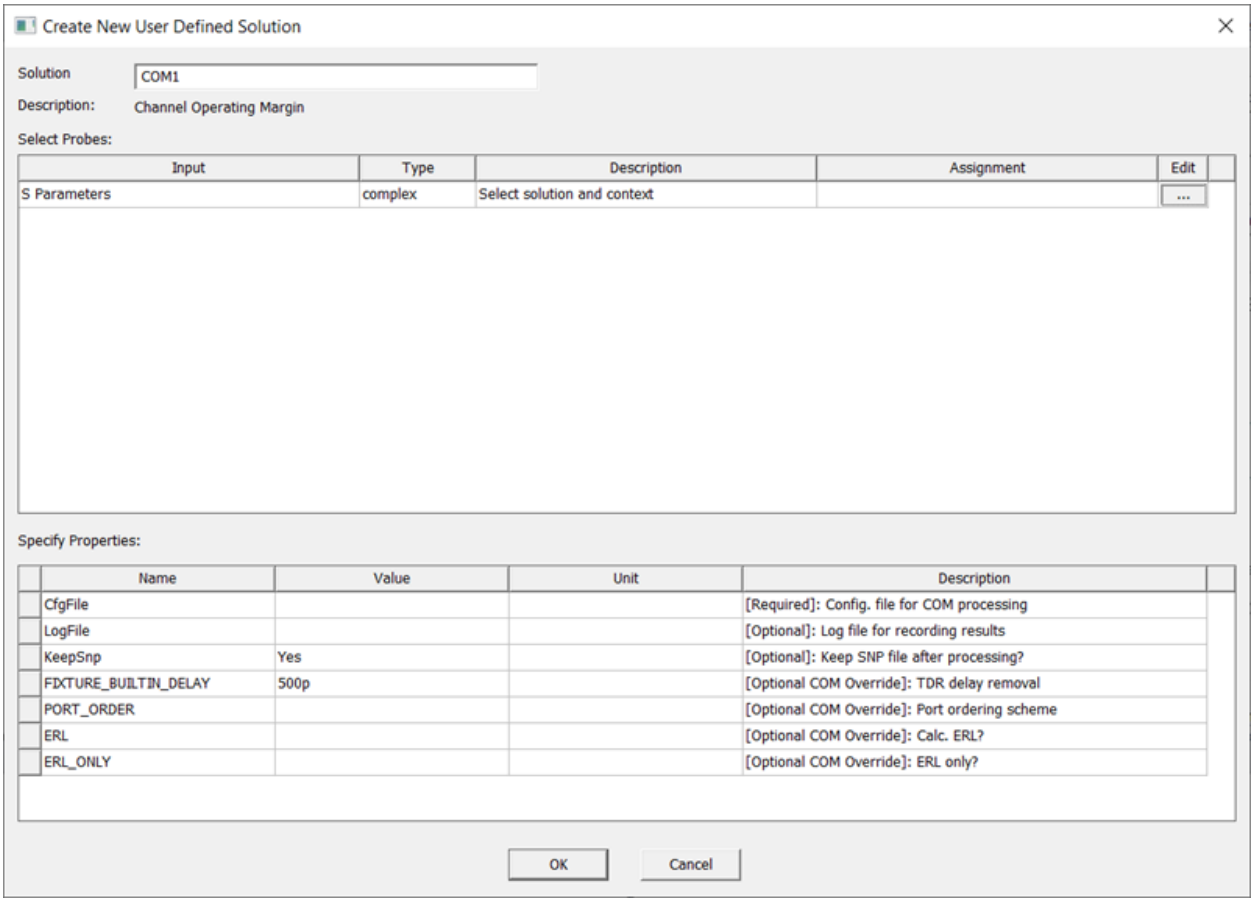
4. From the **Project Tree**, right-click **Analysis** then select **Analyze**. Wait for the design to be analyzed.

5. Create the new User Defined Solution. Select the calculation: COM, or ERL, IDL, ICN individually.

   For a COM calculation report:

   From the **Project Tree**, right-click **Results** and select **Create User Defined Solution> CircuitDesigns> COM** to open the **Create New User Defined Solution** dialog.

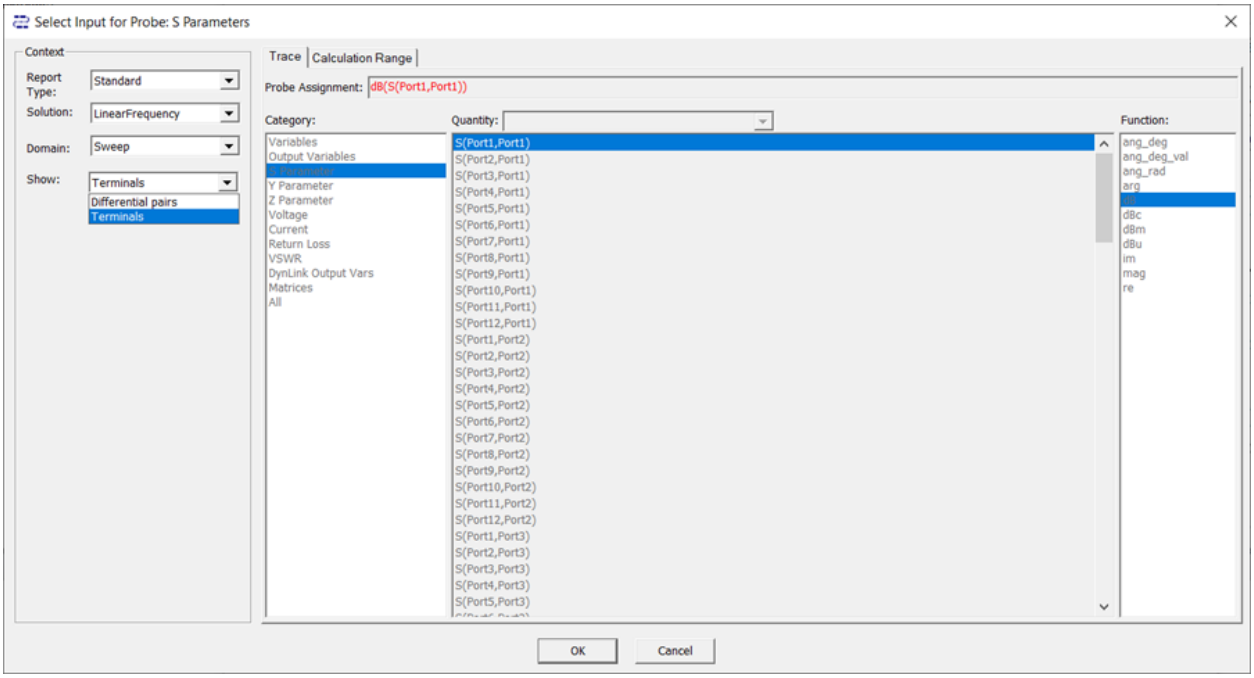
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



i. In the **Name** field, enter a suitable name, such as **COM1**.

ii. From the **Select Probes** table, in the **S Parameters** row, click **...** under the **Edit** column to launch the **Select Input for Probe: S Parameters** dialog.

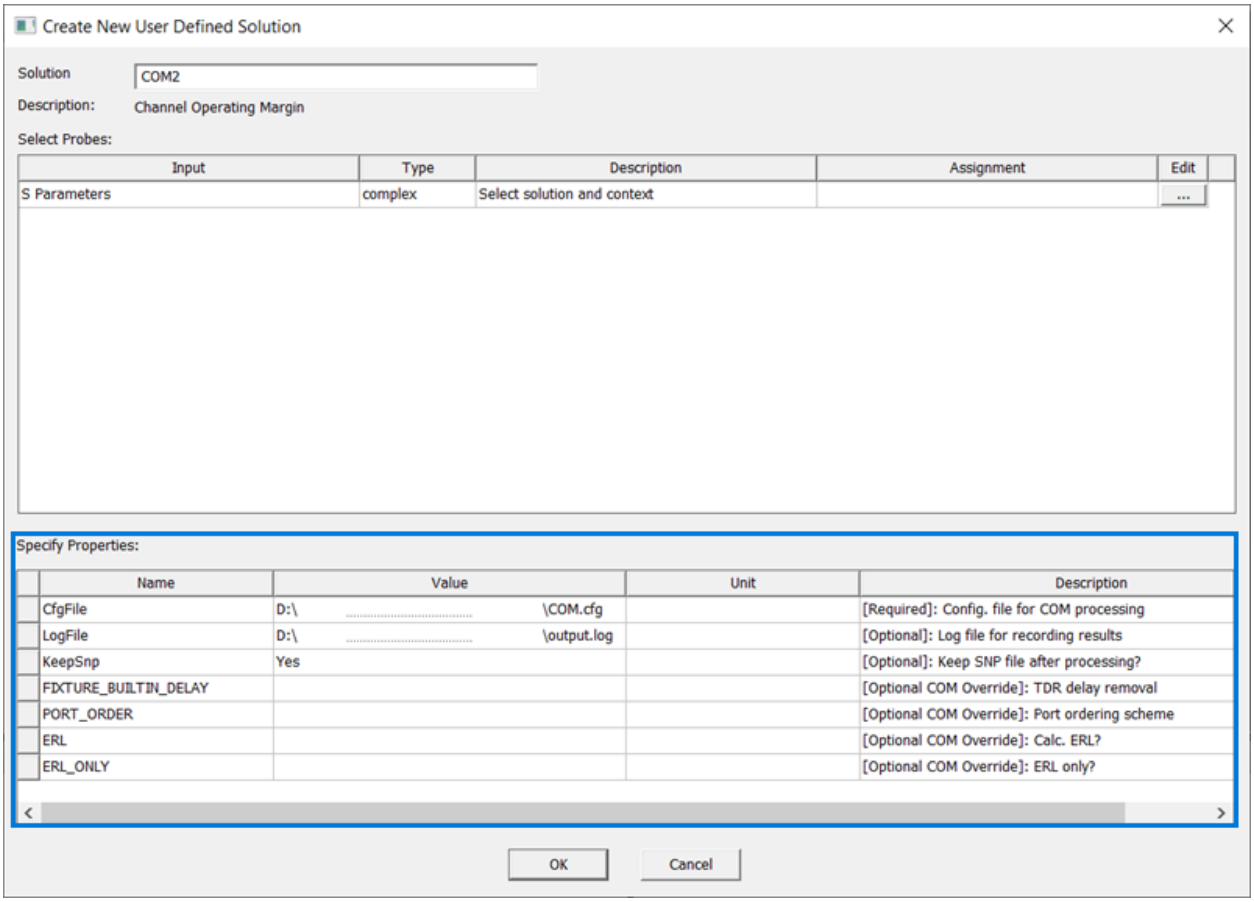
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. From the **Context** group box, expand the **Show:** drop-down menu and select **Terminals**.
2. Click **OK** to close and return to the **Create New User Defined Solution** dialog.

iii. In the **Specify Properties** table, enter the file path for the relevant Config file(.cfg) in the **CfgFile Value** field. Additionally, in the **Logfile Value** field, specify a log file (.log) path if desired.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



> **Note:** If other property values are updated in the **Specify Properties** table, such as **FIXTURE_BUILTIN_DELAY**, the table entered properties will override any corresponding properties specified in the config file.

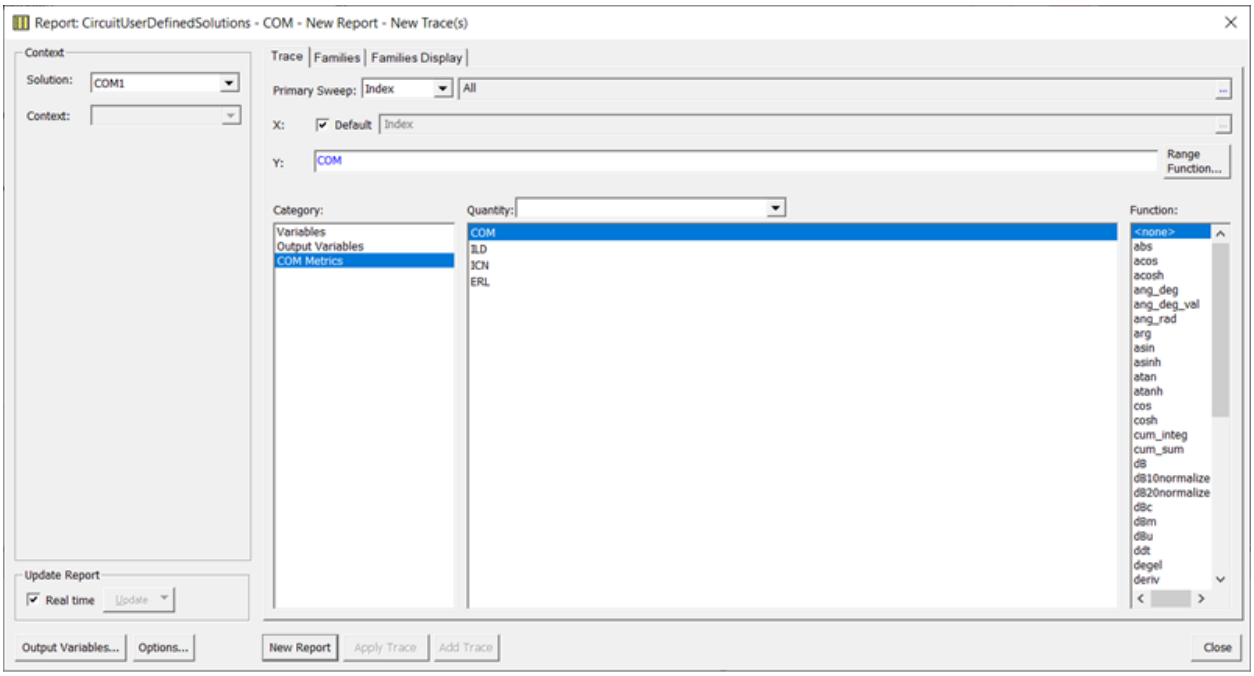
iv. Click **OK** to close the dialog.

6. From the **Project Tree**, right-click **Results**, then select **Create User Defined Report > Data Table to open the Report: CircuitDesign Solutions** dialog.

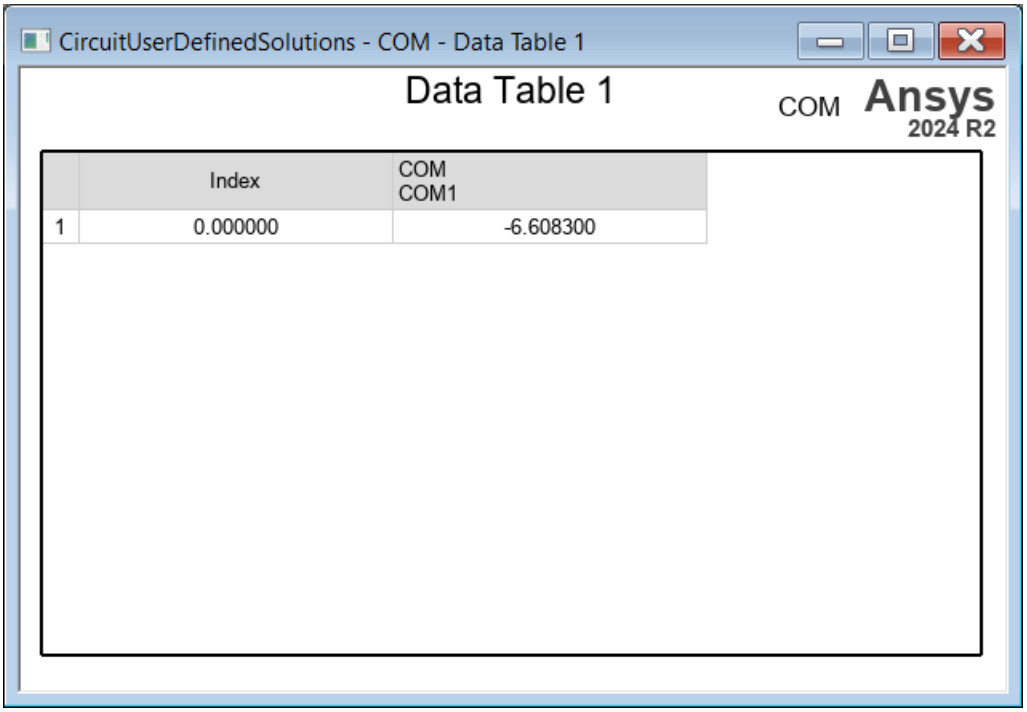
   i. In the **Context** group box, expand the **Solution:** drop-down menu and select the User Defined Solution, in this case COM1. Ensure only COM Metrics is selected in the **Catagory** list, and only COM is selected in the **Quantities** list to create a Data table with only the COM calculation. Alternatively, selecting any combination of COM, ILD, ICN, and ERL in the quantities list will generate a data table containing those calculation values.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ii. Click **New Report**, then **Close**.



The new report has been generated!



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: The UI process to create reports for ERL, ICN, and ILD is similar. Select ERL or ICN or ILD in step 5 and enter the relevant config file path in step 5iii. Additionally, note that to create a User Defined Solution for ICN calculations, the snp file must contain more than 4 ports.

Creating a Transient EMI Receiver Probe Report

The FFT-based (i.e., Fast Fourier Transform) virtual EMI receiver (i.e., Time Domain Scan) probe reduces EMI/EMC compliance test time.

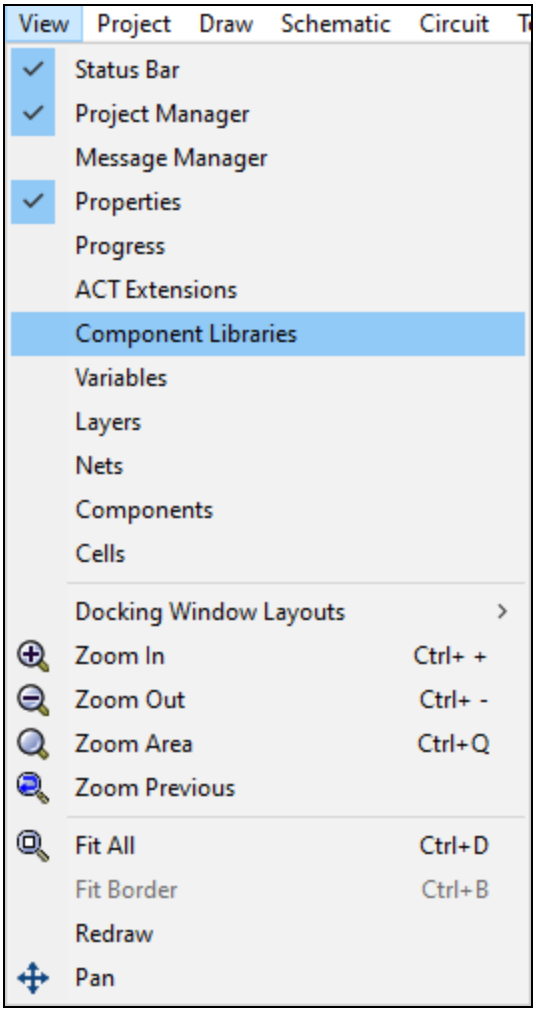
Note: The following instructions assume the user has created a new project or opened an existing project, and the project has a design ready to be analyzed. Refer to the "Circuit Getting Started Guides" on page 1-8 for more information.

Adding EMI Receiver Probes to the Design

Complete the following steps to add one or more EMI receiver probes to a circuit design.

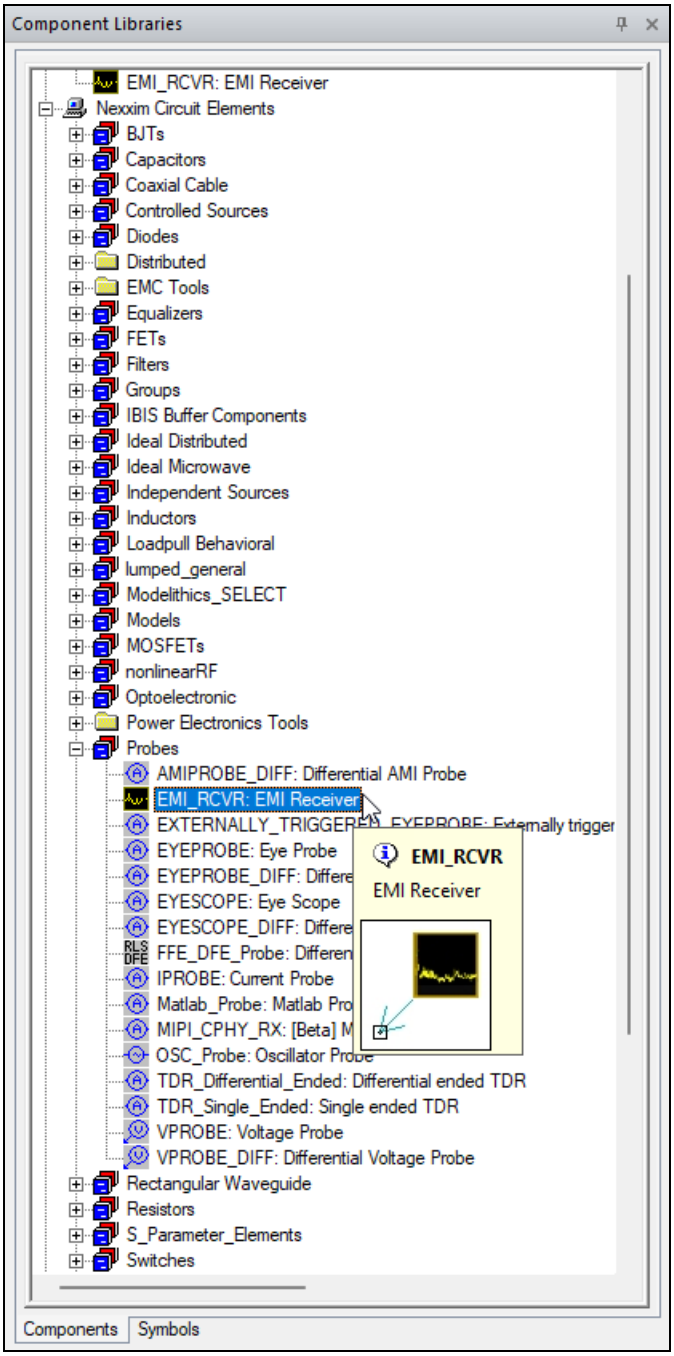
1. If necessary, open the **Component Libraries** window by navigating to View. A check appears adjacent to **Component Libraries** if the window is open.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



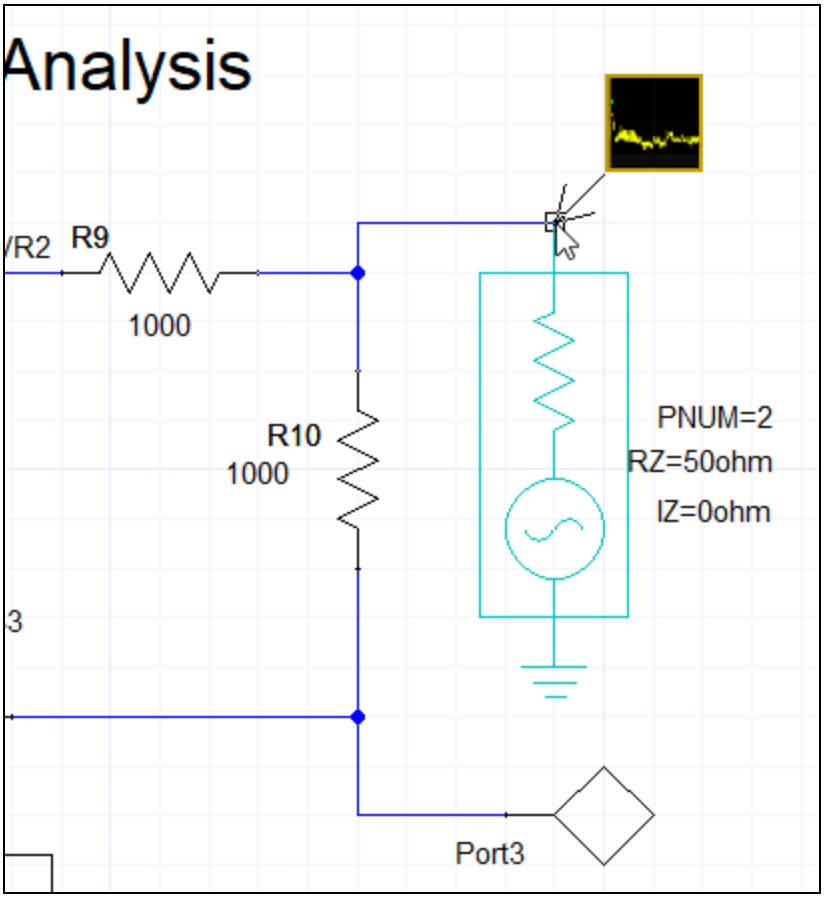
2. From the **Component Libraries** window, scroll to and expand **Nexxim Circuit Elements** > **Probes**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



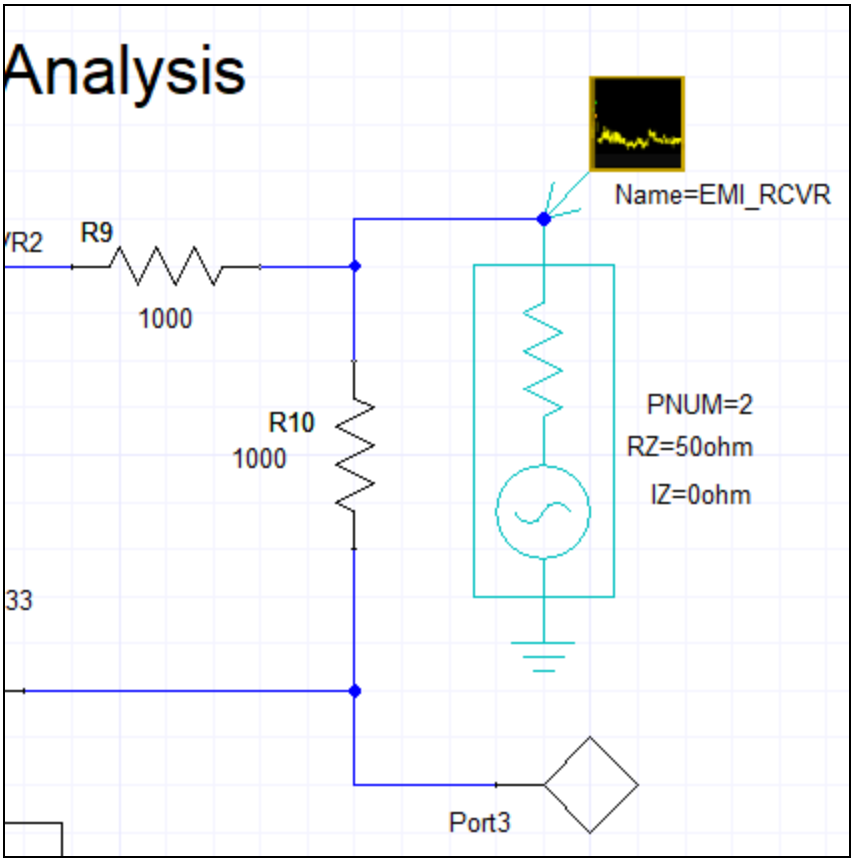
3. **Hold+click EMI_RCVR: EMI Receiver** to select the probe and attach it to the cursor. Then drag the probe to an appropriate place in the **Schematic Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. **Click** to drop the component at the chosen location.



5. To add multiple EMI receiver probes, repeat steps **4-5**, as necessary.
6. If the user has not already done so, perform a **Transient Analysis Simulation** before continuing. (Refer to "Circuit Transient Analysis " on page 12-19).

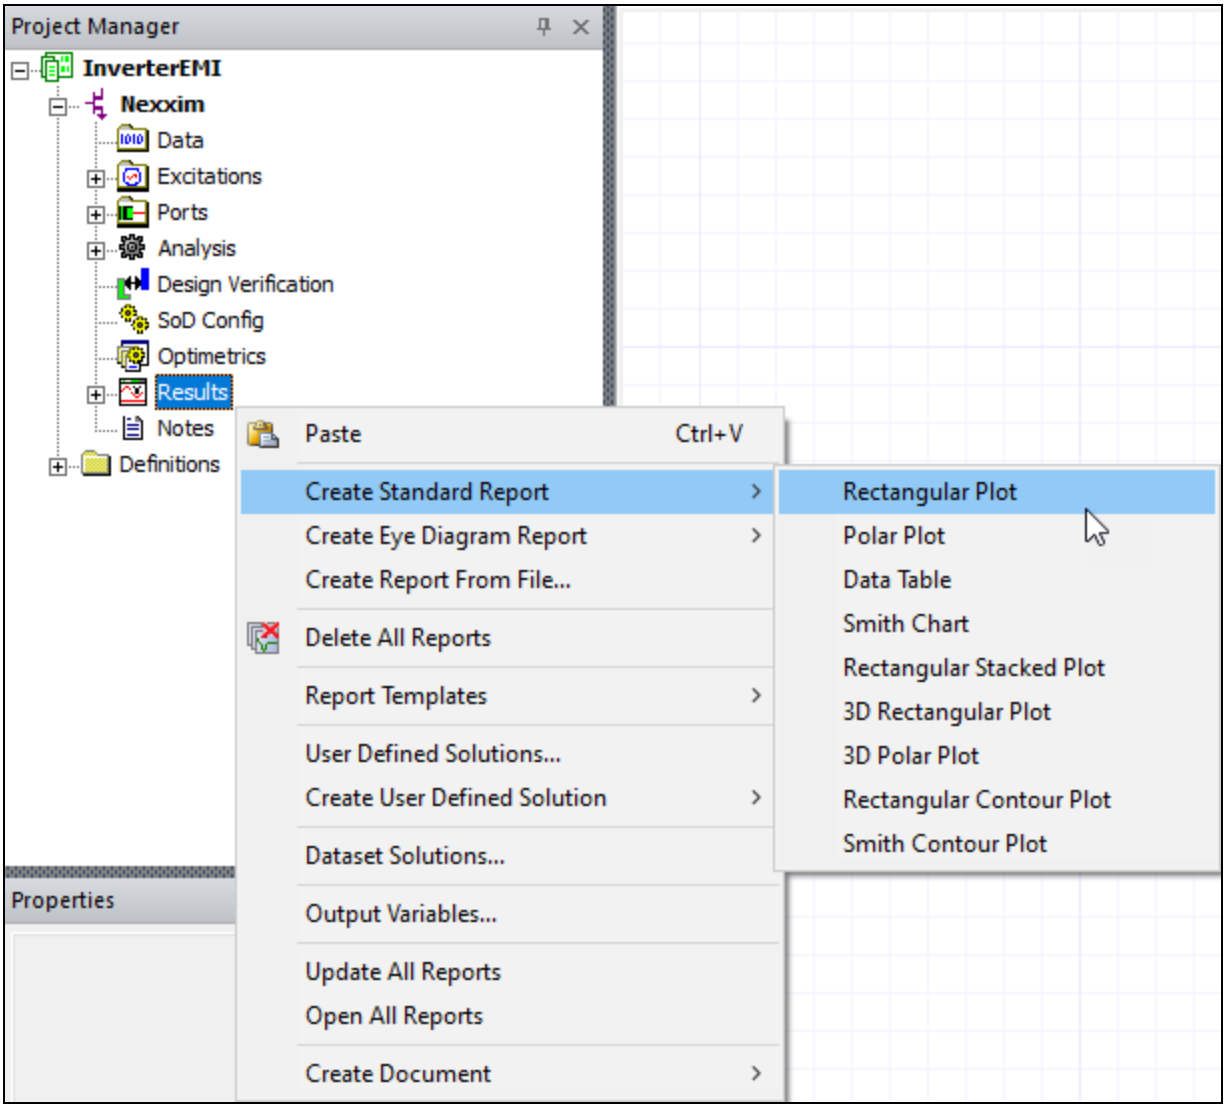
Creating a Transient EMI Receiver Plot

Complete the following steps to create a new transient EMI receiver plot report.

1. From the **Project Manager** window, expand **Project Tree** > **[*active design folder*]**. Then right-click **Results** and select **Create Standard Report** > **Rectangular Plot** to

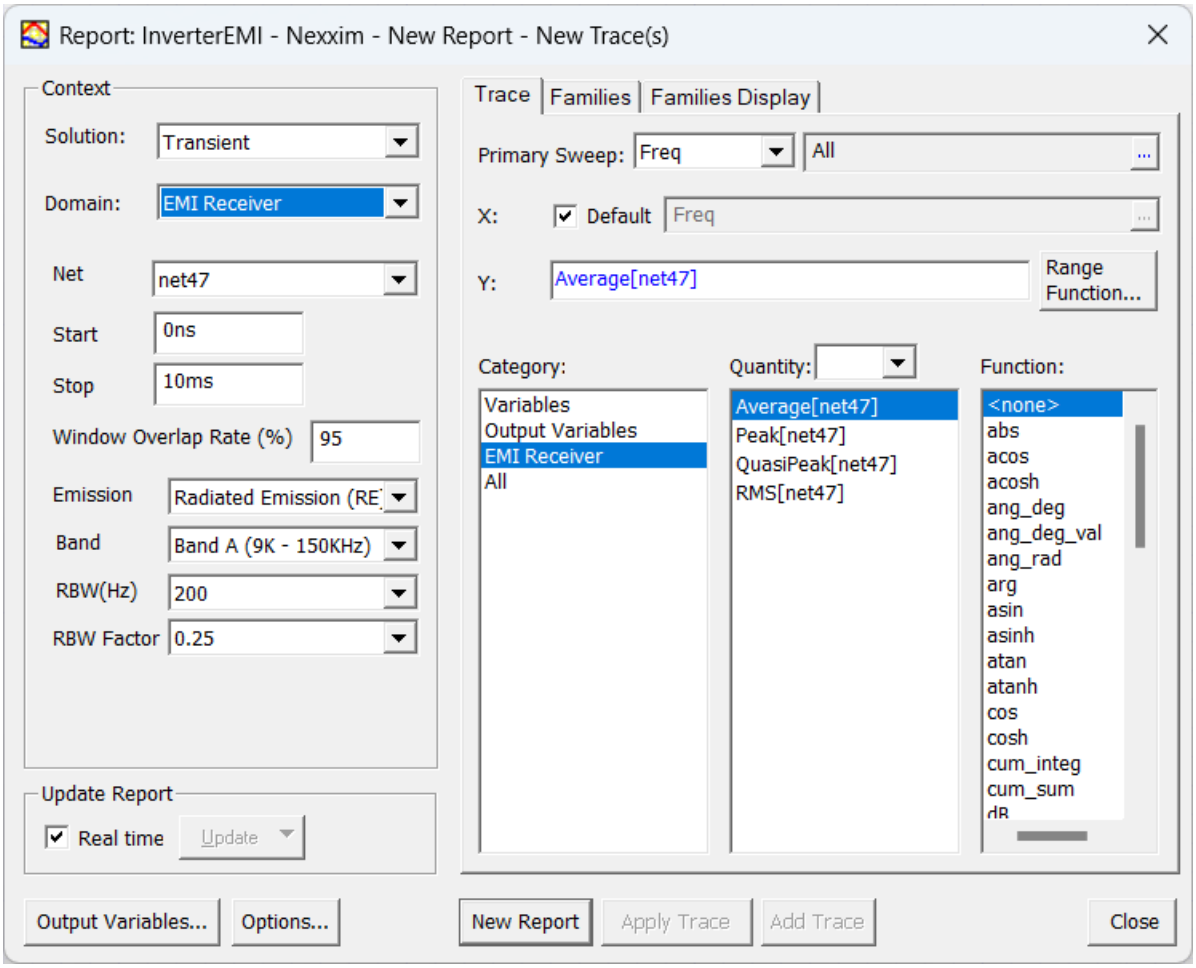
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

open the **Report** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

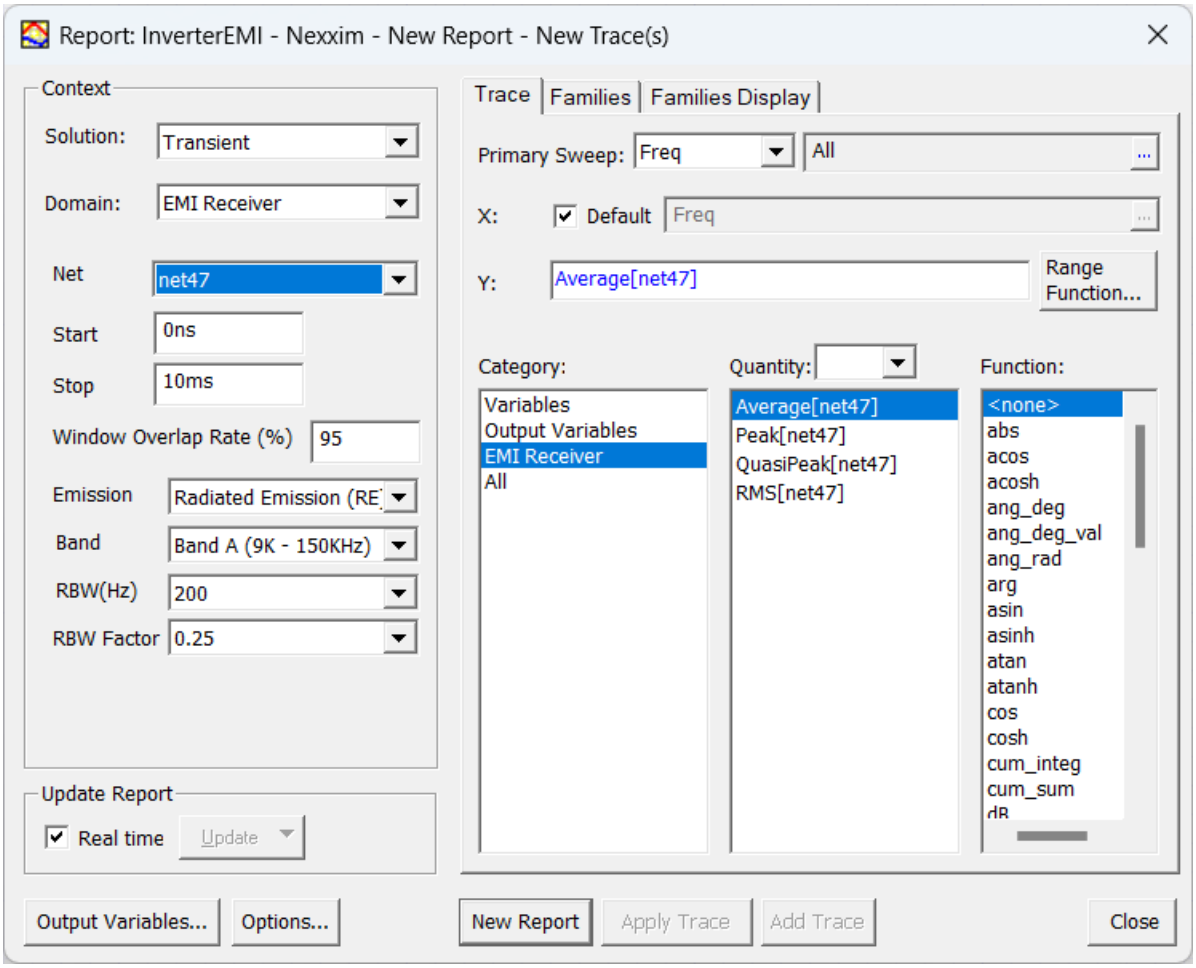
2. From the **Context** group box, select **EMI Receiver** from the **Domain** drop-down menu.



Choosing **EMI Receiver** reveals several new options beneath the **Domain** drop-down menu.

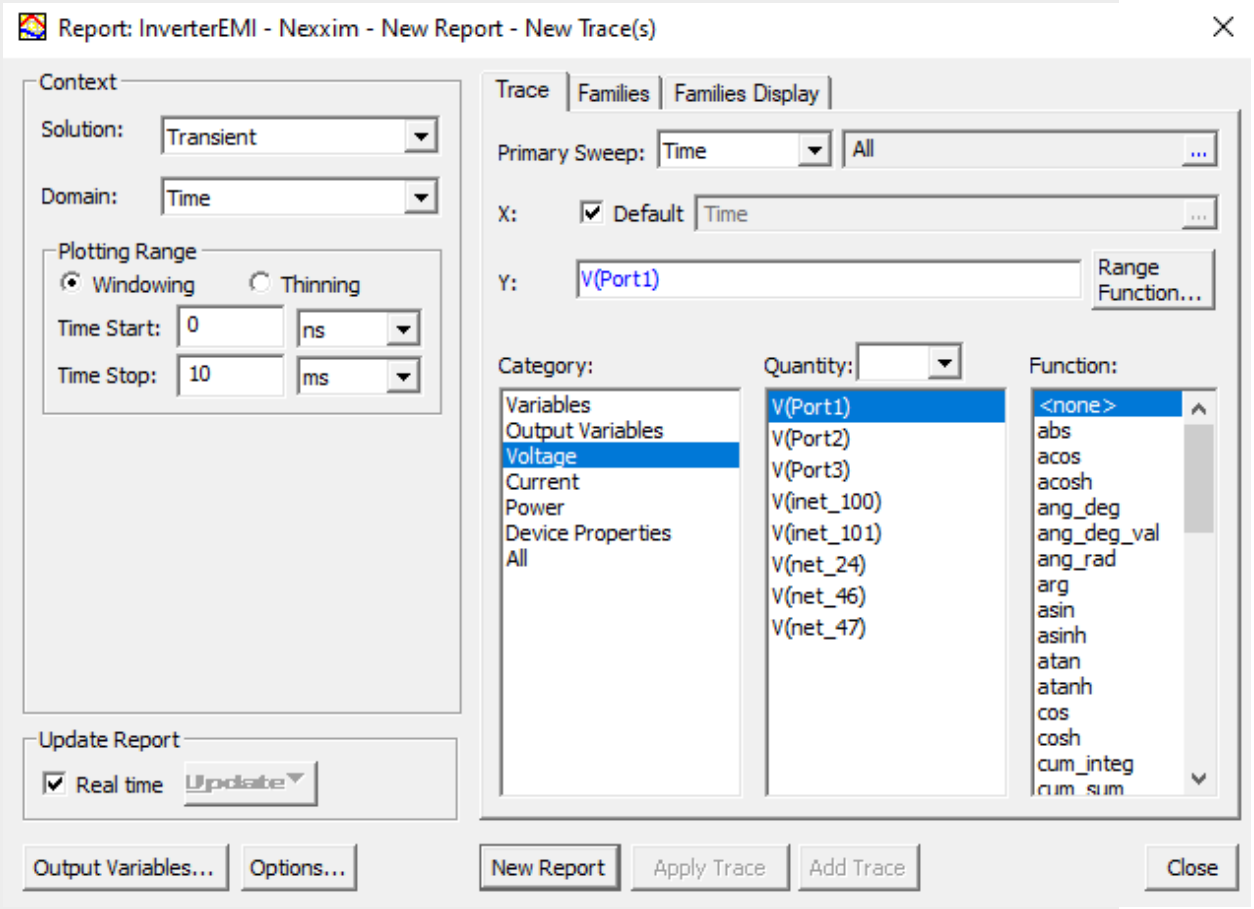
3. From the **Net** drop-down menu, select the net or port to which the appropriate EMI receiver component is connected (e.g., **net_47**). Selecting the net or port simultaneously changes the selections in the **Trace** tab > **Quantity** list.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



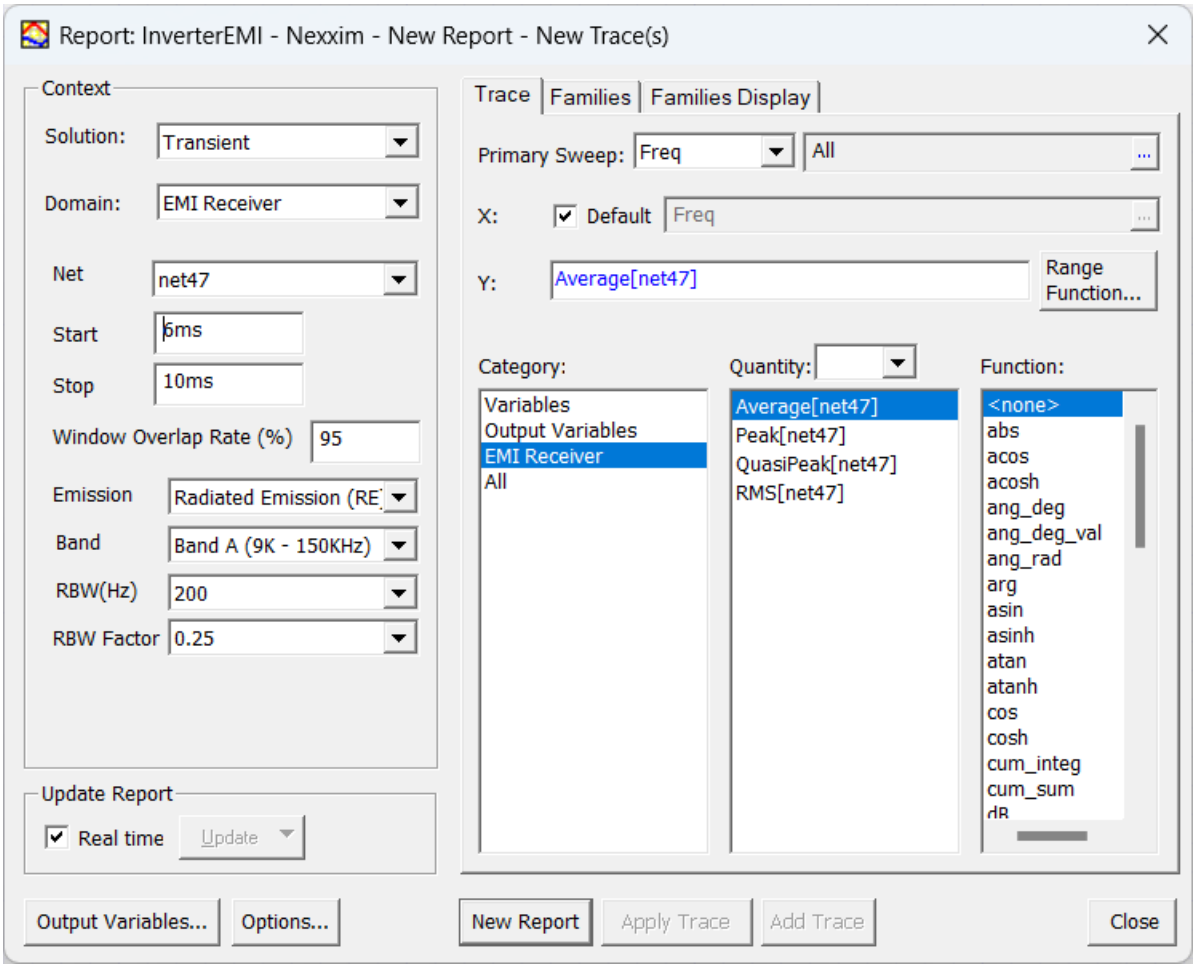
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: EMI Receiver Probe reports are generated from the available transient signals recorded during transient analysis. To ensure that an EMI receiver probe is connected to a signal recorded for post-processing, repeat **step 1** to open the **Report** window. Ensure **Transient** is selected in the **Solution** drop-down menu, and **Time** in the **Domain** drop-down menu (i.e., the default selections). The **Quantity** list will populate with all of the signals available for post-processing reports.



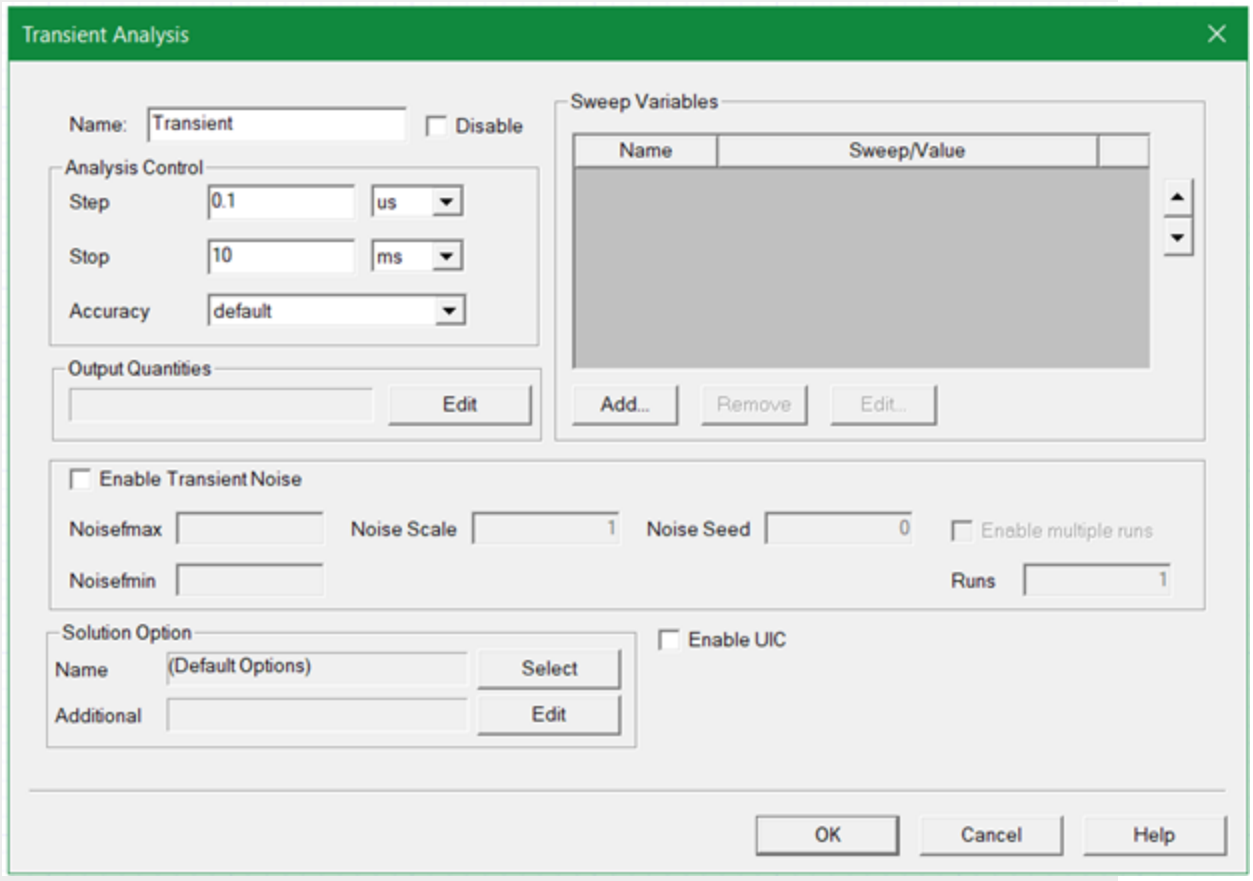
4. The **Start** and **Stop** fields allow the user to select specific time frames within the transient analysis for EMI receiver analysis. Enter the desired values in the **Start** and **Stop** fields.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

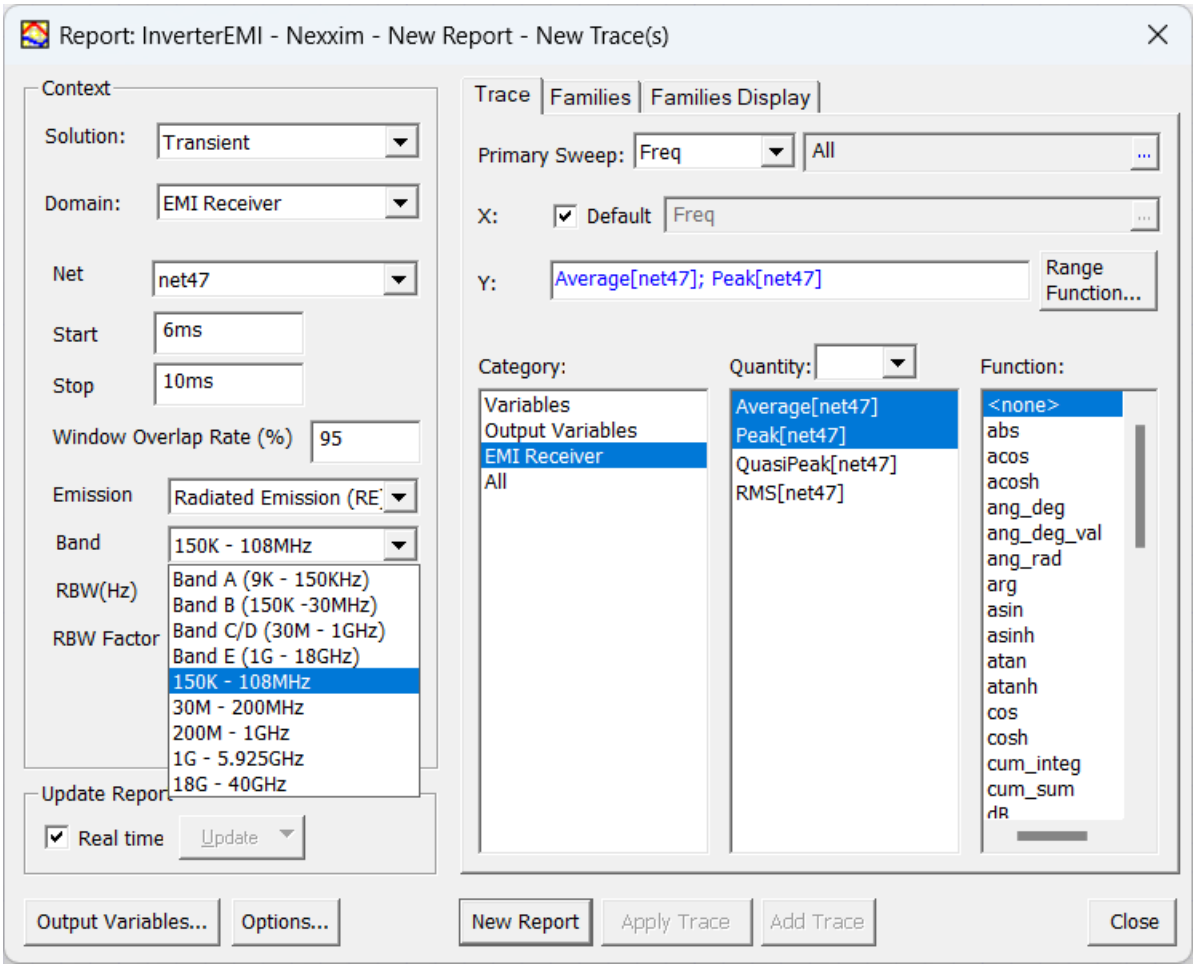
Note: The **Start**/**Stop** values should fall within the range entered in the **Step**/**Stop** fields during **Transient Analysis** setup.



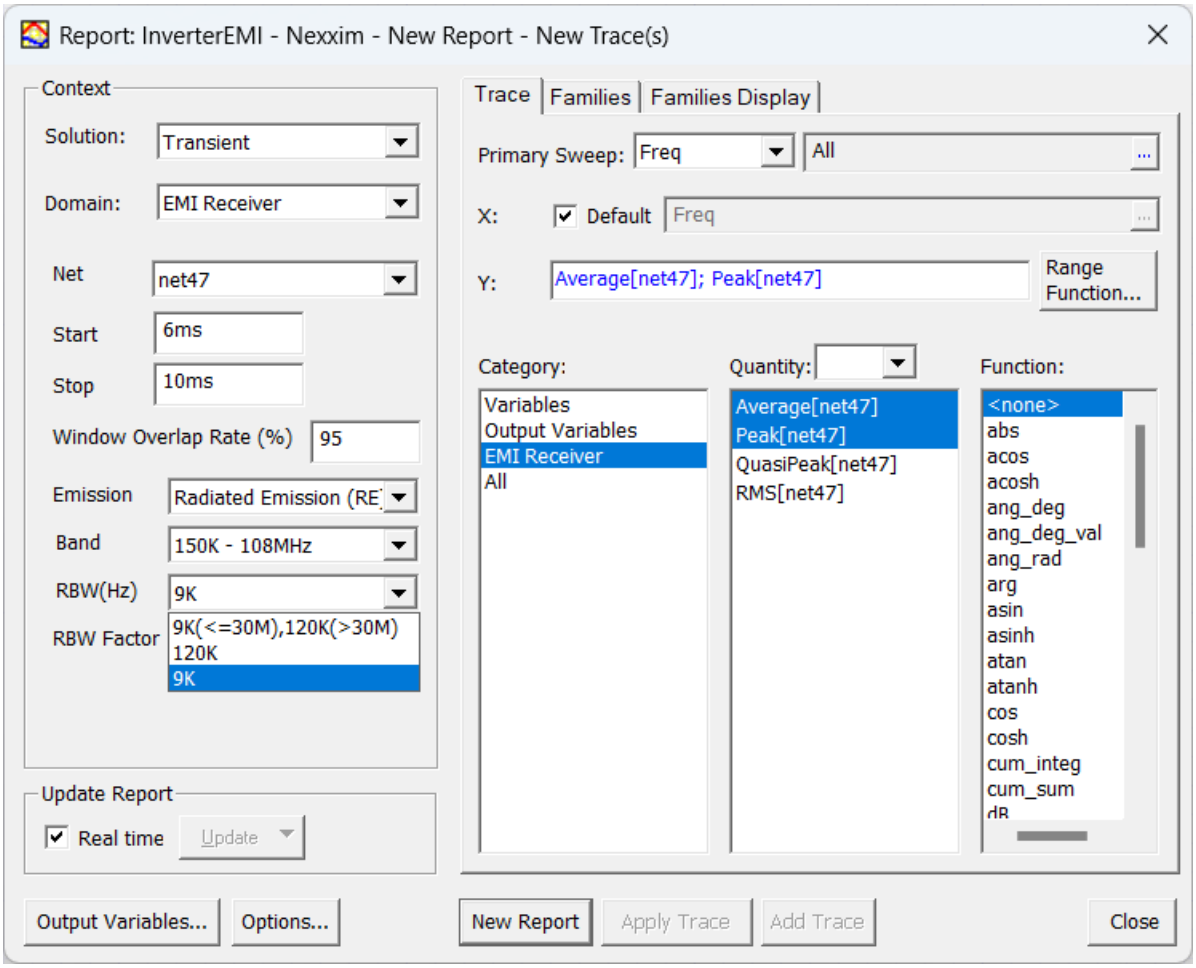
5. Gaussian window is the default window type as required in CISPR16-1-1 standard. If necessary, enter a different value between **50 - 97** in the **Overlap Rate (%)** field (default is **95**). The window overlap rate determines the time step of EMI analysis. A higher percentage will result in a smaller time step, at the cost of more computation and increased simulation time.
6. The field **Emission** has options **Radiated Emission (RE)** and **Conducted Emission (CE)** to choose from. The **Emission** information doesn't alter simulation settings or results, but shows up in plot name and title as part of a plot ID.
7. Select the appropriate band from the Band drop-down menu. Other than Band A, B, C/D and E as defined in CISPR16-1-1, CE or RE bands required for CISPR25 EMI/EMC analysis are included in the menu. Selecting a band simultaneously populates the **RBW**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

field and the selections in the **Trace** tab>**Quantity** list. For Band A, B, C/D and E defined in CISPR16-1-1, only one RBW value according to the standard is available. For other bands, multiple RBW values are available in pull down menu. Smaller RBW can improve detection accuracy and lower detection noise floor.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

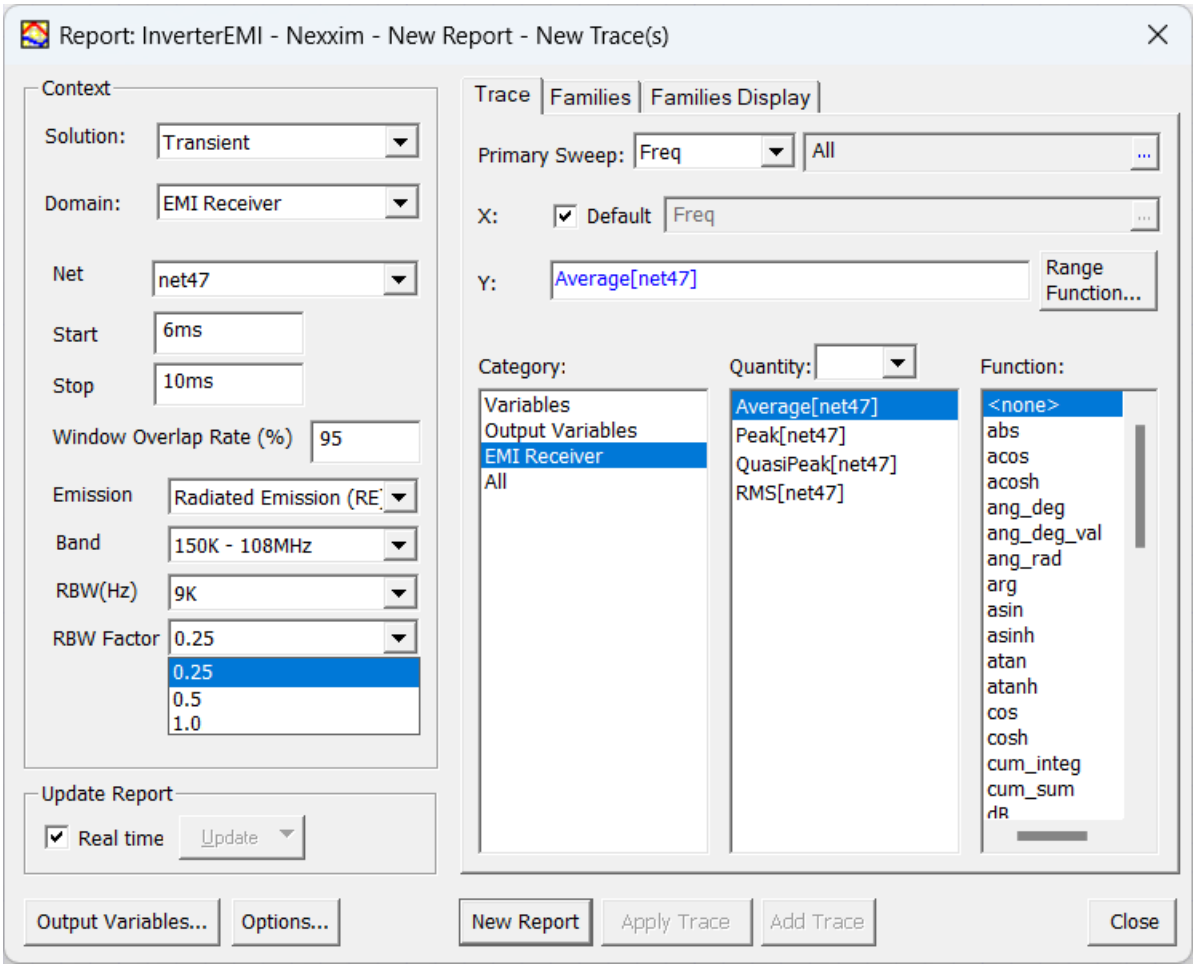
Note:
1.CISPR16 standard requires 200Hz, 9KHz, 120KHz, 1MHz as RBWs for Band A-E. A sub-band of a CISPR16 Band uses RBW of its super-band as the default value in RBW pull down menu. The next smaller CISPR16 RBW value is available in the menu for non CISPR16 bands. For example, Band 30M-200MHz is a sub-band of CISPR16 Band C/D. Hence,120KHz is the default RBW value, and 9KHz is an option in the RBW pull down menu.

2.Band 150k-108MHz crosses two CISPR16 Bands. RBW=9KHz for Band B (150K-30MHz) and RBW=120KHz for Band C/D (30M-1GHz) are set as default RBW. In the meantime, RBW = 120KHz and 9KHz can be chosen for the entire band.

3.For bands above 1GHz, RBW =1MHz is set as default following standards CISPR16-1-1 and MIL-STD-461. RBW=120KHz is available for selection.

8. **RBW Factor** determines the number of frequency samples per RBW. Pull down menu of 0.25, 0.5 and 1.0 allows users to choose 4, 2 and 1 samples per RBW, respectively. The resultant frequency step size = **RBW * RBW Factor**. Like RBW, smaller frequency step size helps to resolve frequency components that are closer to each other and reduce noise floor.

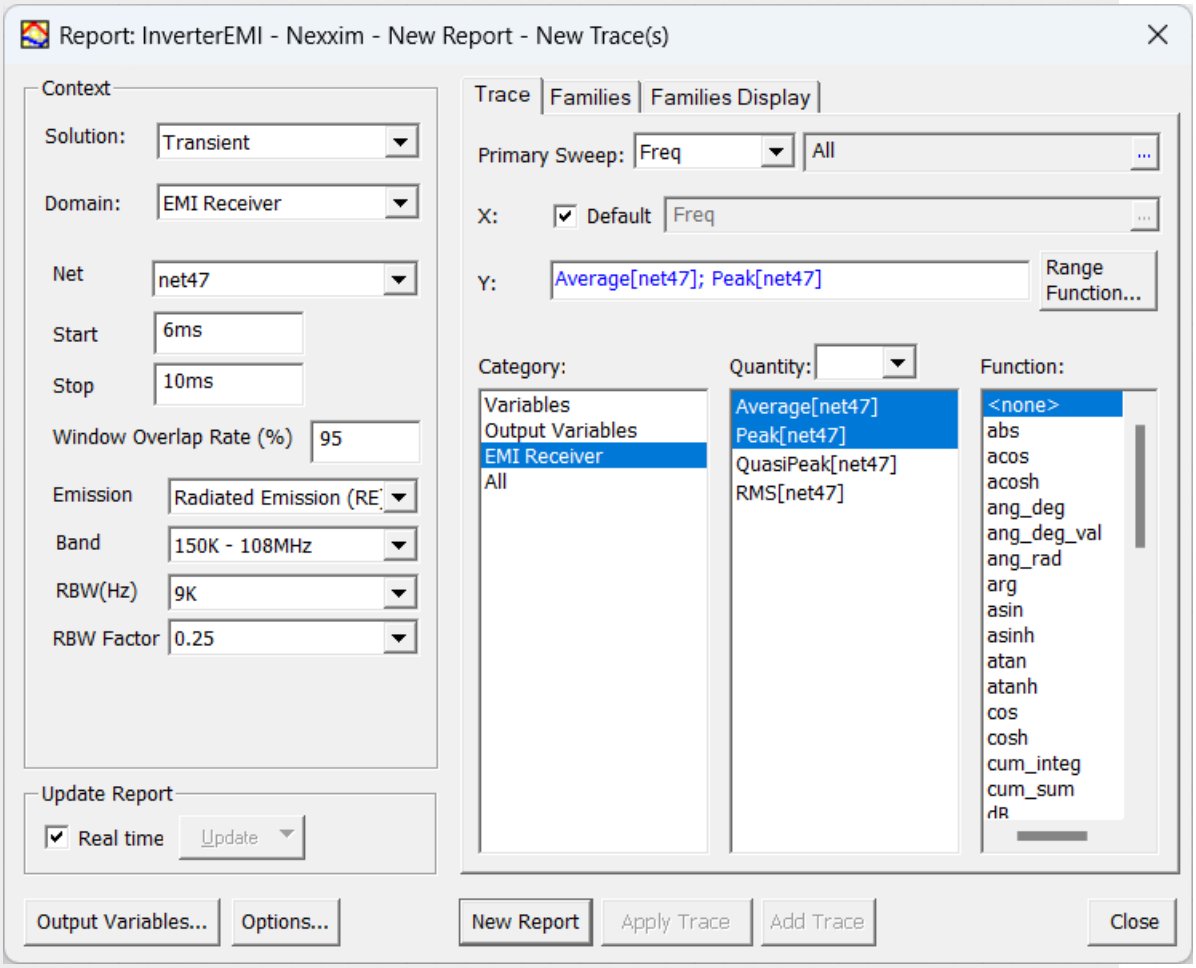
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



9. Ensure **EMI Receiver** is selected from the **Category** list (selected by Default).
10. From the **Quantity** list, select one or more detector options (i.e., **Average**, **Peak**, **QuasiPeak**, and/or **RMS**). It should be noted that for Bands above 1GHz, QuasiPeak detection is not supported.

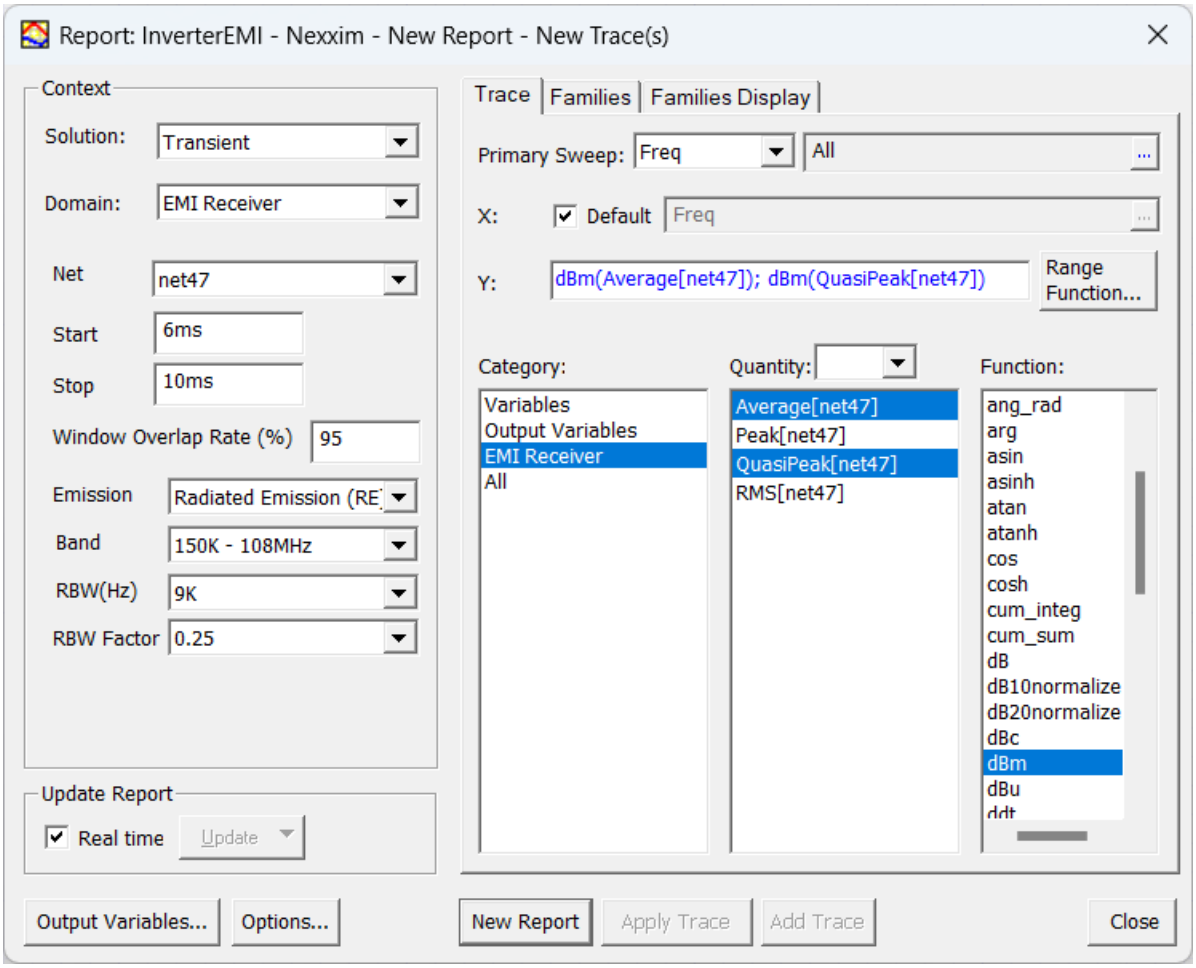
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: Select multiple options from the **Quantity** list by **Ctrl+clicking** them.

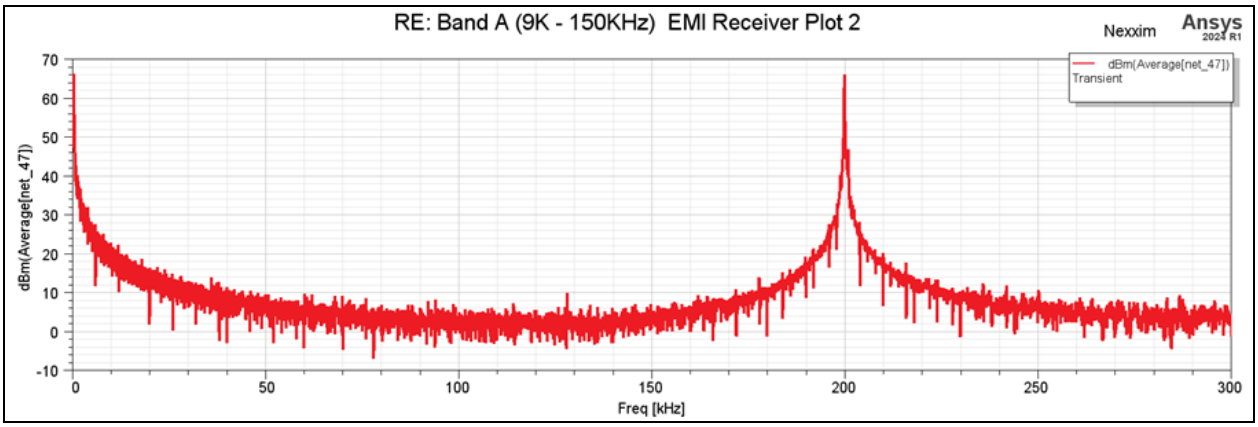


11. From the **Function** list, select **dBm** or **dBu**, typically, depending on signal strength (**<none>** is selected by default).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

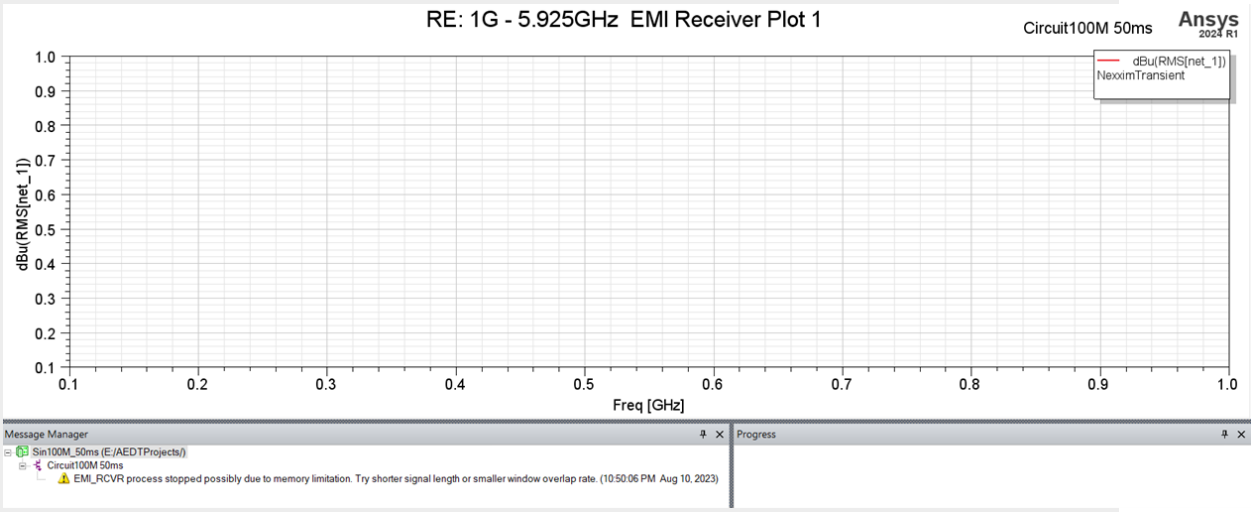


12. Click **New Report** to create the new **Transient EMI Receiver Plot *N***.

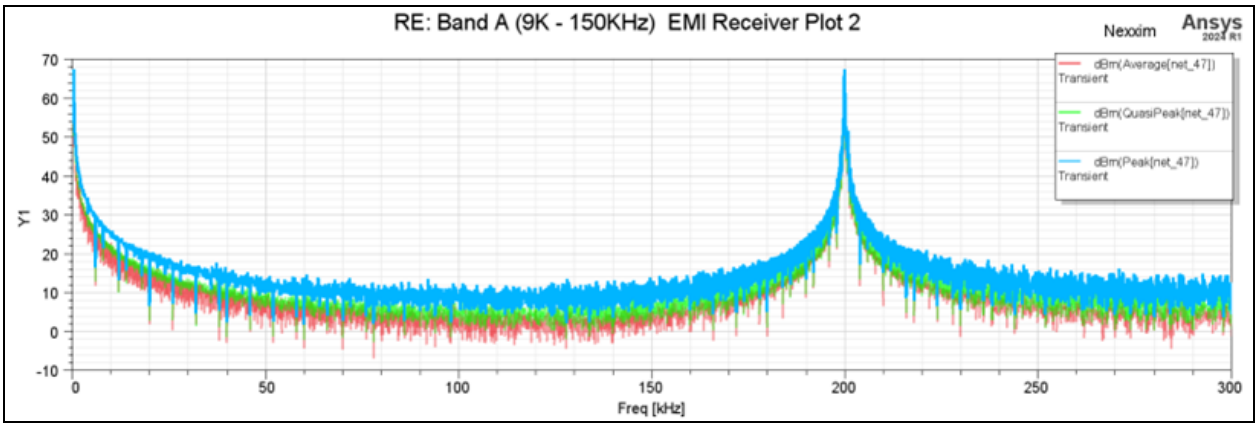


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: Band selection, signal length, and window Overlap Rate are directly related to the computation time and memory complexity of EMI analysis. When the required memory exceeds the available memory, post processing could terminate with an error message. Please follow the directions in the message and try again with lower overlap rate and/or shorter signal length.

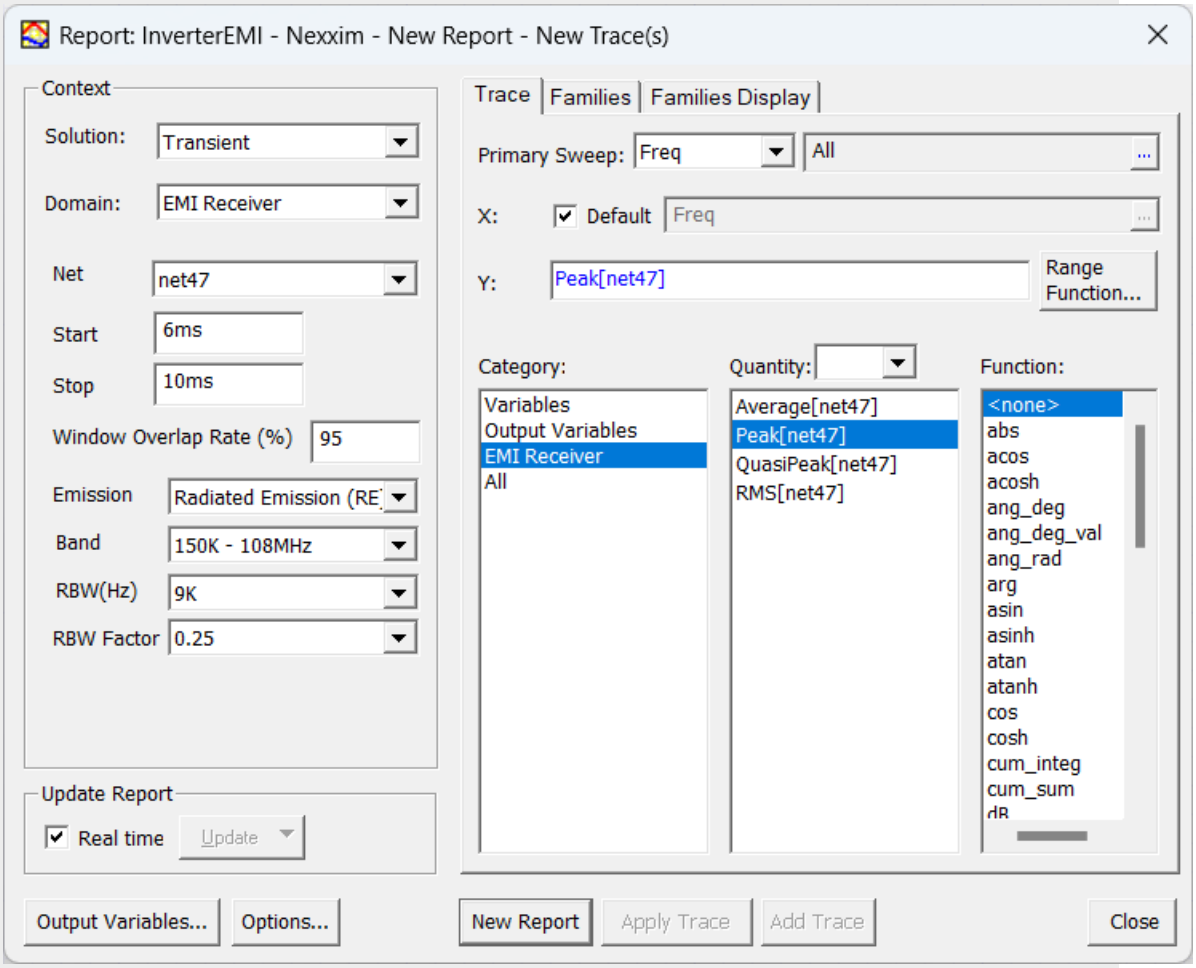


13. To close the **Report** window, click **Close**. If necessary, return to the **Report** window (i.e., from the **Project Manager** window, expand **Results**. Then right-click the appropriate report and select **Modify Report...**). Make changes to the selections in the **Report** window and click **Add Trace** to update the plot.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: After modifying the selections in the **Quantity** list, the **Function** list will revert to its default selection (i.e., **<none>**).

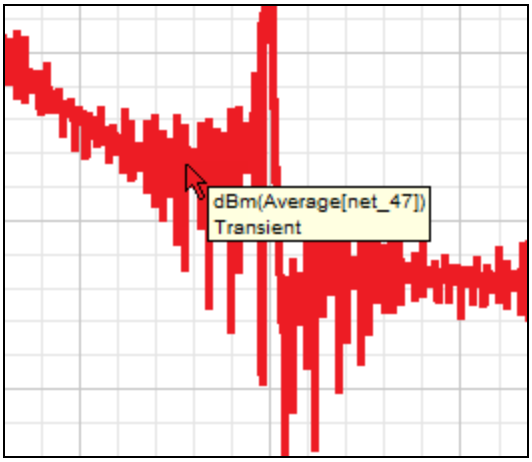


Selecting Log/Linear From the Properties Window

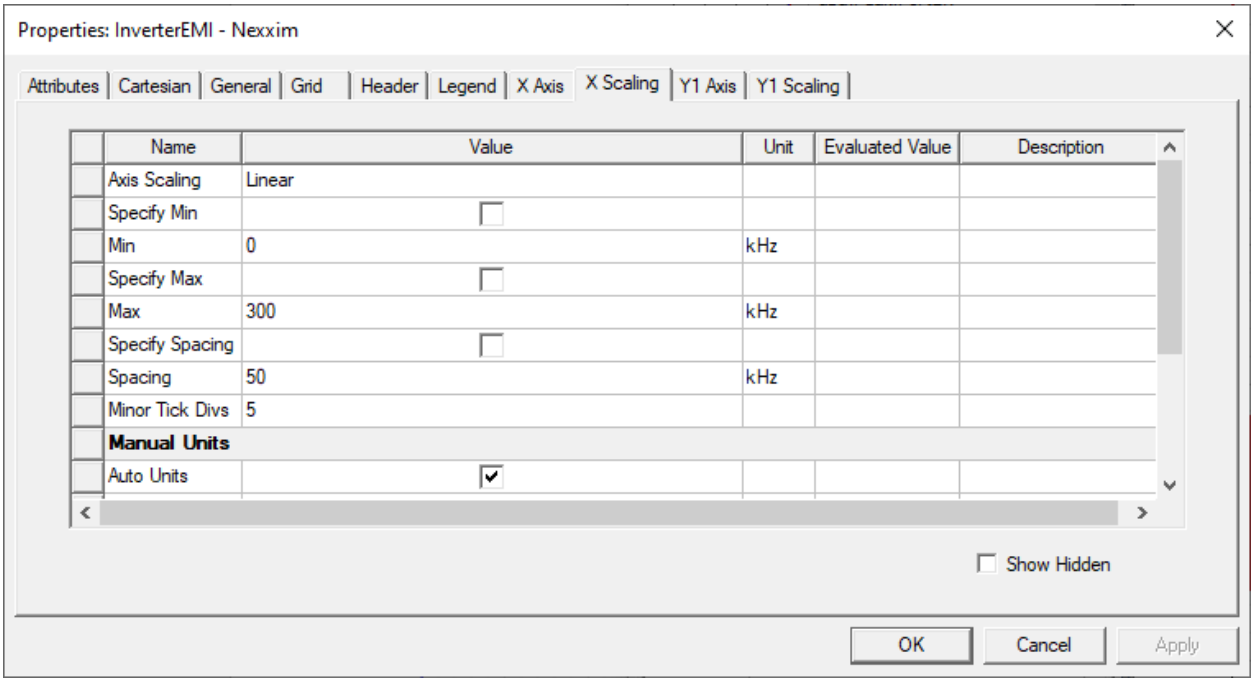
From the report's **Properties** window, users can change many settings. For example, complete the following steps to change **Axis Scaling** from **Linear** to **Log**.

1. Double-click anywhere within the **Schematic Editor** to open the report's **Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

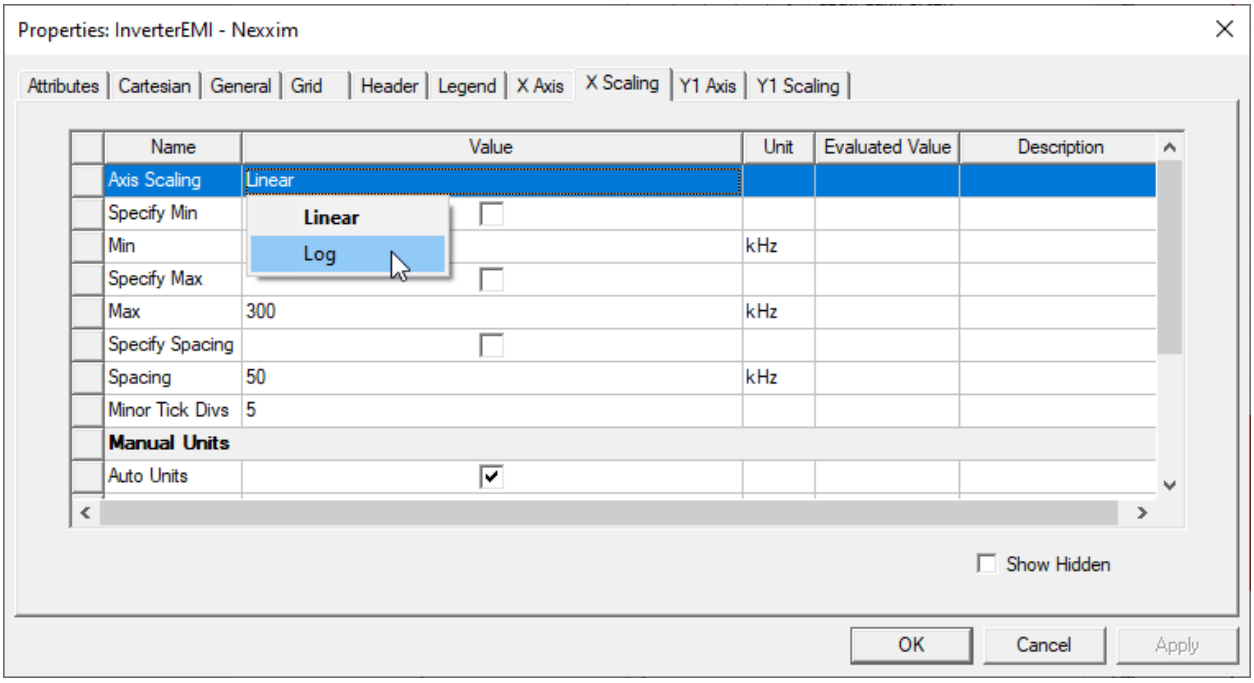


2. Navigate to the **X Scaling** tab.



3. From the **Axis Scaling** row, select **Log** from the **Value** drop-down menu (e.g., where **Linear** is currently).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

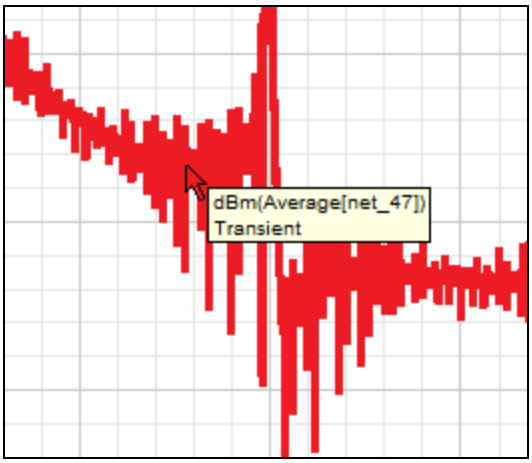


4. Click **Apply** to save the new parameters.
5. Click **OK** to close the **Properties** window.

Selecting a New Minimum/Maximum From the Properties Window

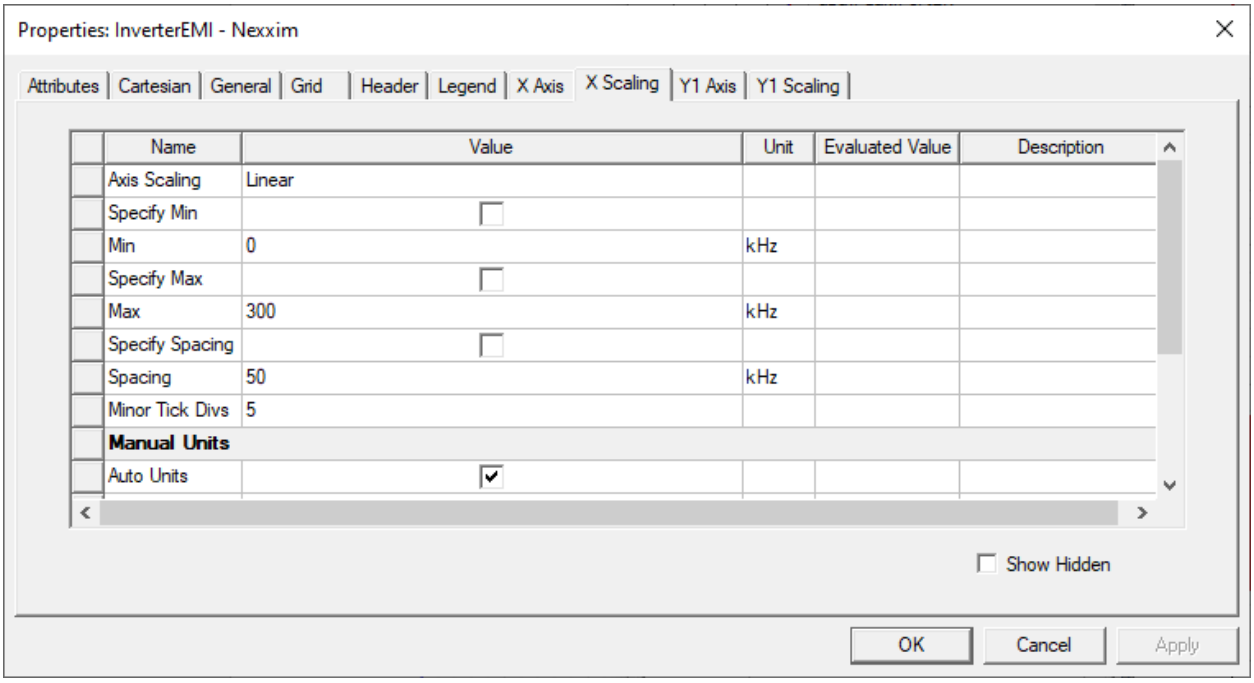
Complete the following steps to modify the report's minimum/maximum resolution.

1. Double-click anywhere within the **Schematic Editor** to open the report's **Properties** window.

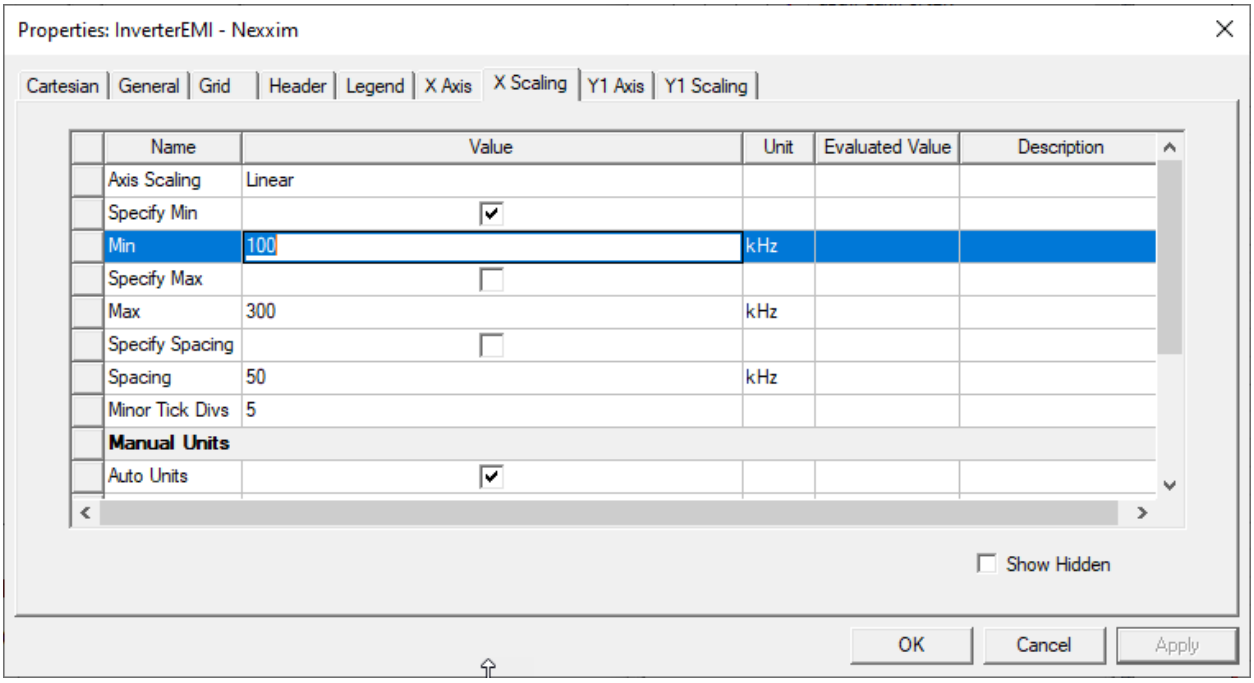


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Navigate to the **X Scaling** tab.



3. Enter a new value in either the **Min** field, **Max** field, or both. Then check the corresponding boxes in the **Specify Min**/**Specify Max** fields.



4. Click **Apply** to save the new parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Click **OK** to close the **Properties** window.

Computation of Traces Based UDO Calculations (2D and Circuit)

When traces that are based upon UDO outputs are computed, the data for probes is computed and passed to the UDO script for each design variation. Along with the probe data, the values of properties entered by user are also passed. The information about the UDO calculations that need to be computed is also made available. The UDO then performs the computation and passes the results to reporter. Note that UDOs can compute and pass back more calculations than have been requested at that point of time. This allows UDOs to compute a set of calculations that take almost same amount of computational resources as any one calculation in that set and cache that with reporter. *When those calculations are subsequently plotted by user, reporter uses the cached results instead of invoking the computation on UDO*.

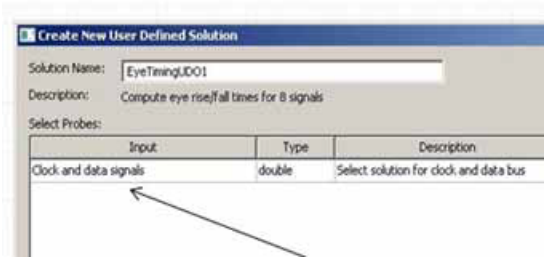
Dimensions Reduction by UDO Calculations (2D and Circuit)

The probes in a UDO can have heterogeneous dimensions of data (e.g., one probe in a UDO can have data that is function of *n* intrinsic variable, while another probe in same UDO can have data that is function of m intrinsic variables, with *n* and *m* potentially being different). UDOs allow reducing any number of these intrinsic variables. In the previous example UDO calculations can be function of any number of intrinsic variables including not being function of any intrinsic variable at all. UDO calculations can also be a function of an intrinsic variable that none of the probes is function of. **The only restriction is that Freq cannot be reduced if any of the probes are on a Fields report type.**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Dynamic Probes (2D and Circuit)

UDOs can also specify named dynamic probes. The difference between probes and dynamic probes is that while the end user of UDO specifies the complete trace definition for probe, the expression for dynamic probe is specified by UDO code itself and not by end user. This allows UDOs to access the data for probes without having end user to enter each individual probe. For example a UDO can access data for a huge S matrix for 100 port design without having end user to enter the probe information for each of those 10,000 quantities. Each dynamic probe is associated with a named probe that is entered by user, and information about solution, context and intrinsic variables is used from user selected probe, however multiple dynamic probes can be associated with same user selected probe. The dynamic probes are sampled from UDOs at the time of trace computation and not at the time of creation of user-defined solution.



This means that you select solution, context, values of intrinsic variables just once, and the same information is used (in this case) for all clock and data signals. The expression for those signals comes on the UDO code.

user-defined Outputs: Python Script API (2D and Circuit)

A user-defined Output (UDO) extension is implemented as an IronPython script that defines a class with a specific name: **UDOExtension** which derives from a specific base class **IUDOPluginExtension** and implements its abstract methods.

UDO Extension IMPLEMENTATION

Optional Functions in IDO Extension Abstract Class

Data Types Used in Python Script

Working With Properties for UDO

Other Application Specific Classes Used in Python Scripts

user-defined Outputs: Messaging Methods

Using .NET Collection Classes and Interfaces in Python Scripts

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDO Extension Implementation (2D and Circuit)

The purpose, argument list and expected return types for each of the **IUDOPluginExtension** abstract methods, which the UDO author is expected to implement are shown in the following diagram.

- Import Statements
- UDOExtension Class
- IUDOPluginExtension Abstract Class

Import Statements (2D and Circuit)

The base class to be used and the types it uses in turn are contained in .NET assemblies. The use of these requires that the assemblies be imported into the UDO script: the following import statements should be added to the top of the python script:

```
from Ansys.Ansys.ModulePluginDotNet.Common.API import *

from Ansys.Ansys.ModulePluginDotNet.Common.API.Interfaces import *

from Ansys.Ansys.ModulePluginDotNet.UDO.API.Interfaces import *

from Ansys.Ansys.ModulePluginDotNet.UDO.API.Data import *
```

Optional Functions in IDO Extension Abstract Class (2D and Circuit)

The following functions, while a part of the IUDOExtension abstract class, have meaningful default implementations and are therefore optional. However, they can be overridden to take advantage of advanced functionality.

Validate(List<string> errorStringList,

Data Types Used in Python Script (2D and Circuit)

There are several types that you must use while authoring the python script. Some of them are used to pass data from UI to python script and provide interface for working with this data. Some are used to pass data from python script to UI.

To pass data from python script to UI the objects of the C# class must be created in python script using their C# constructors. The objects can then be set as functions return values or set to the output parameters using their API.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Working With Properties for UDO (2d and Circuit)

A property is the unit for collecting and using input on the user that is used to influence the UDO's Compute method. These are initially set up when the UDOs **GetInputUDSParams** method is called and are retrieved in the compute method.

There are 3 supported property types that could be used in the UDO script:

- INumberProperty to specify number properties (with unit support).
- IMenuProperty to allow the user to select from a list of options.
- ITextProperty to allow the user to enter text.

The IPropertyList type implements a collection for these properties.

IPropertyList Abstract class

IProperty Abstract class

INumberProperty Abstract class

ITextProperty Abstract class

IMenuProperty Abstract class

Using .NET Collection Classes and Interfaces in Python Scripts (2D and Circuit)

Some of the API functions specified above use .Net collection classes and interfaces, that is, Array class, IList interface, IEnumerable interface, and IDictionary interface. The following topic

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

describes how to work with the .Net collection objects in python scripts.

.NET Array, IEnumerable, and IList objects can be indexed and iterated over as if they are Python lists. You can also check for membership using 'in'. To get .Net Array and IList sizes use python's 'len' or .Net 'Count'.

Example:

Getting size:

```
arraySize = doubleDataArray.Count
arraySize = len(doubleDataArray)

listSize = sweepsNamesList.Count
listSize = len(sweepsNamesList)
```

Iterating:

```
for sweep in sweepsNamesList:
        print sweep

for in xrange(listSize)
        print sweepsNamesList[i]
```

Checking for membership:

```
if 'Time' in sweepsNamesList:
        doThis()
else:
        doThat()
```

For .NET IDictionary, same as for Array and IList, you can get size with 'len' or 'Count' and check for membership of the keys using 'in'. Getting values for the keys also works the same way as in python 'dict'.

Example

Getting size:

```
varValuesSize = varValues.Count
varValuesSize = len(varValues)
```

Checking for membership:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
if ‘offset’ in varValues:
        print varValues[‘offset’]
```

Getting value:

```
if ‘offset’ in varValues:
        offsetValue = varValues[‘offset’]
```

As for iteration .NET Dictionary is different from python dict. While iterating, python dict returns keys, .Net Dictionary returns .Net KeyValuePair.

Example:

Iterating:

for .Net IDictionary:

```
for varPair in varValues: #varPair is of .Net KeyValuePair type
        varName = varPair.Key
        varValue = varPair.Value
```

for python dict:

```
for varName in varValues:
        varValue = varValues[varName]
```

You can use python types instead of .Net types if you prefer. For this you need to cast .Net Array and .Net iList to python list type and .Net Dictionary to python dict type.

Casting should not be used for data arrays – it can be extremely costly for the memory usage and time-consuming.

Example:

```
aPythonList = list(dotNetArray)
aPythonList = list(dotNetList)
aPythonDict = dict(dotNetDictionary)
```

user-defined Outputs: Messaging Methods (2D and Circuit)

Messaging methods are provided to convey additional information to the user from any of the UDOs methods. The Compute function is the one typically location where such use is

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

anticipated. Any message sent via these functions are displayed in the application's **Message Manager** window using the appropriate icon.

These functions can also be used for debugging purposes.

- **AddErrorMessage(string)**: Call this method to convey an error condition to the user.
- **AddWarningMessage(string)**: Call this method to convey a warning message: typically used for conditions that are not ideal but can be tolerated by the script.
- **AddInfoMessage(string)**: Call this method to convey an informational message to the user. This is the call to use when outputting messages for debugging purposes.

user-defined Outputs: Script Organization (2D and Circuit)

As described in the *Introduction* topic, the UDO scripts should all reside under the **UserDefinedOutputs** folder under either of the three library locations (system, user or personal).

Using Script Libraries

Additional .NET Assemblies

Using Script Libraries (2D and Circuit)

If you decide that you need base classes or additional data files to organize your UDOs better, do so. This type of library organization allows code reuse between similar UDOs and can be very helpful. There is special support provided for this type of script-library organization:

- **All script-library and other support files need to be in a *Lib* sub-directory under the UserDefinedOutputs directory**. Any *.py* files found in such **Lib** directories are ignored and not displayed in the GUI as a valid UDO choice.
- For a UDO script at any given directory depth, all Lib directories in its parent directories is automatically added to the system include path (any support script files from any Lib directory through the top level UserDefinedOutputs directory can be imported) .

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Using Additional .NET Assemblies (2D and Circuit)

Because the UDO functionality uses IronPython, the full .NET ecosystem is accessible. If needed, any subset of the UDO functionality can be implemented in any .NET language and used by the UDO script. There are simple rules to follow to achieve this.

1. Build your .NET assembly for .NET 2.0 runtime.
2. Drop the built assembly in any **Lib** directory upstream of the UDO script location: that is, if you have your UDO script in *C:\Users\x\PersonalLib\UserDefinedOutputs\a\b\c\myudo.py* and have a .NET assembly called *com.Acme.UDOLib* You can keep the .NET assembly under

- UserDefinedDocuments\Lib,
- UserDefinedDocuments\a\Lib,
- UserDefinedDocuments\a\b\Lib
- UserDefinedDocuments\a\b\c\Lib

3. Add the following line to your python script

- Import clr
- clr.AddReference("com.Acme.UDOLib")
- import com.Acme.UDOLib –or-- from com.Acme.UDOLib import * *etc*

If for some reason you cannot place the .NET assemblies into a Lib directory under UserDefinedDocuments, you need to do a couple more steps before step 3 listed above.

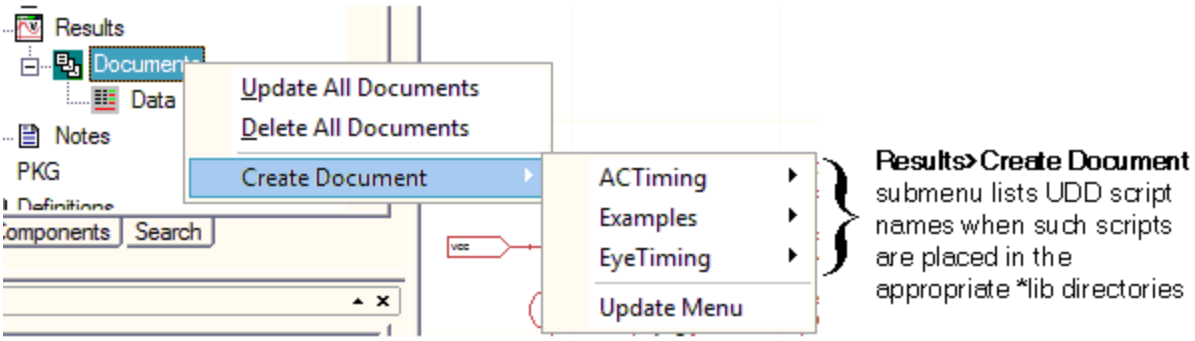
Import sys

sys.path.append("full path to your .NET assembly location")

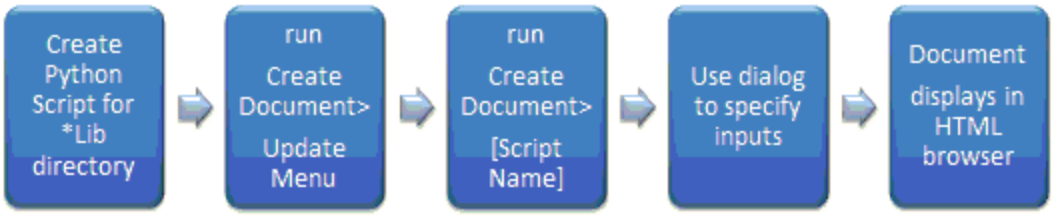
user-defined Documents (UDDs) (2D and Circuit)

user-defined documents (UDDs) are custom reports that you define through IronPython scripts. Once placed in a Lib directory, access the scripts via the **Create Document** command. The scripts describe a **Create User Defined Document** window that lets you specify trace and solution inputs. After you confirm your input selections, an xml, html and pdf document is generated. A web browser window opens to open the generated html file. The created document appears in the **Project Manager** window, under Results in the Documents folder.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The general UDD process flow is as follows.



The UDD python scripts must be placed in the **UserDefinedDocuments** directory under either of **syslib**, **userlib** or **Personallib** with any subdirectory structure needed. The Lib directory can contain python scripts that have common code that other scripts can use.

Use **Results>Create Document>Update Menu** to refresh the menu to include the new UDD scripts that have been copied to syslib, userlib or Personallib, or to exclude them if they have been deleted, after the launch of desktop.

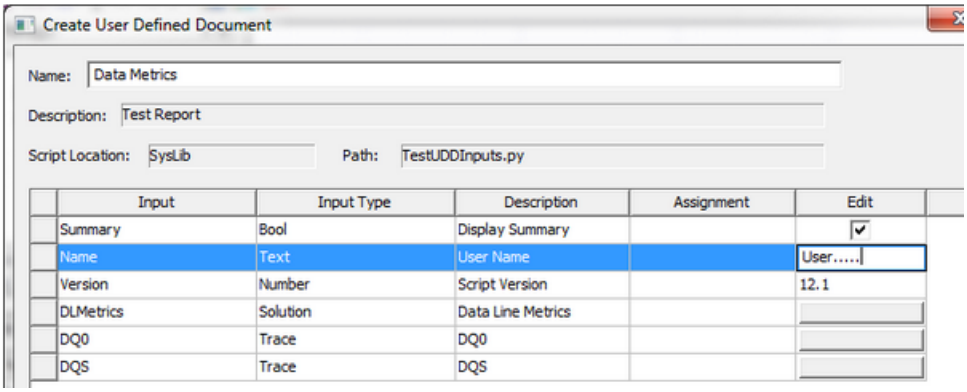
The UDD scripts that are in syslib/UserDefinedDocuments, userlib/UserDefinedDocuments or Personallib/UserDefinedDocuments become available through the **Results >Create Document** menu.

Create user-defined Document window Inputs (2D and Circuit)

user-defined documents allow data from traces, solutions and report types as inputs. A UDD can specify the named inputs for which you select or enter the values in the **Create user-defined**

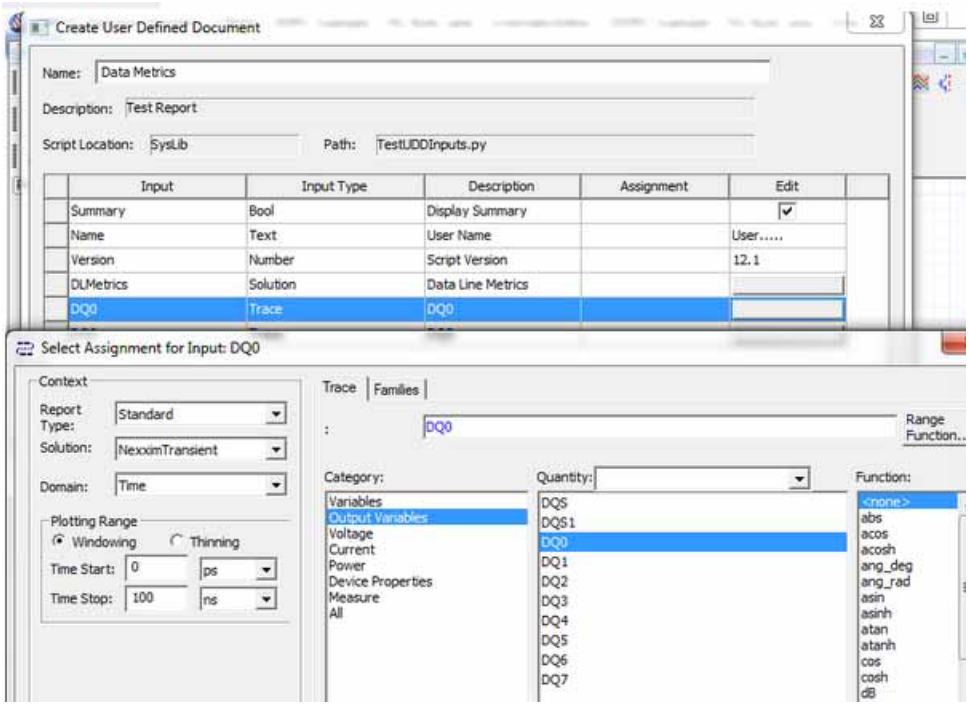
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Document window that displays when you run **Results>Create Document>** <*scriptName*>.



Input Types can be of Boolean, number, text, trace or solution type. The boolean, number and text type can be given a default value that can be interactively overriden when the document is created or modified. For example, select a trace when you create or modify a UDD document. The trace data is available to the user and can be accessed on the python script.

At the time of selection choose on the **Reporter** window, the report type (Standard, Eye Diagram, user-defined), solution name, context and the quantity for which you want the trace data.

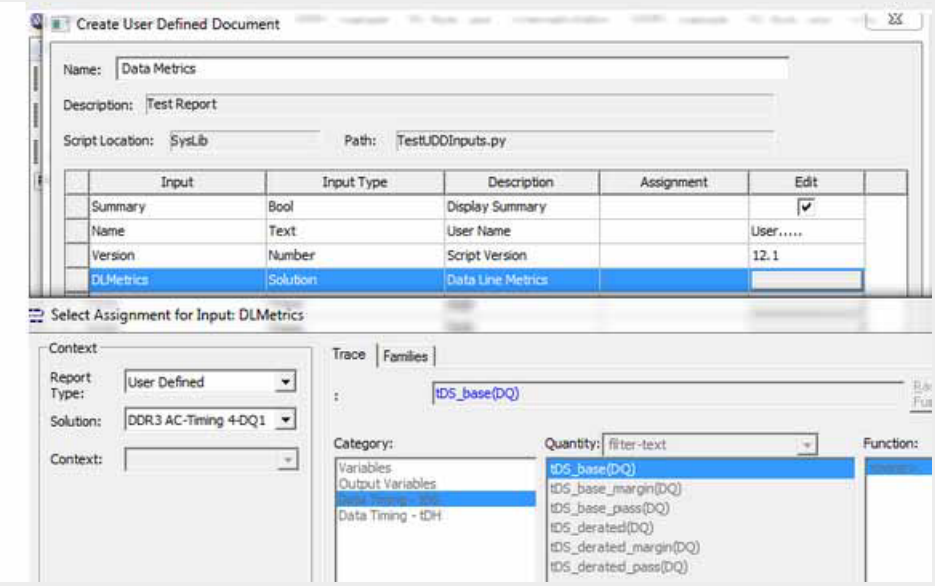


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Input Type can also be Solution. You can select an entire solution when the document is created or modified. The solution data in its entirety, is now available to the user and can be accessed on the python script.

At the time of selection choose on the reporter window, the report type (Standard, Eye Diagram, user-defined), solution name and context. A specific quantity cannot be selected since data for all quantities in the solution are available.

Note: The category/Quantity/Function portion of the window is unavailable for user input.

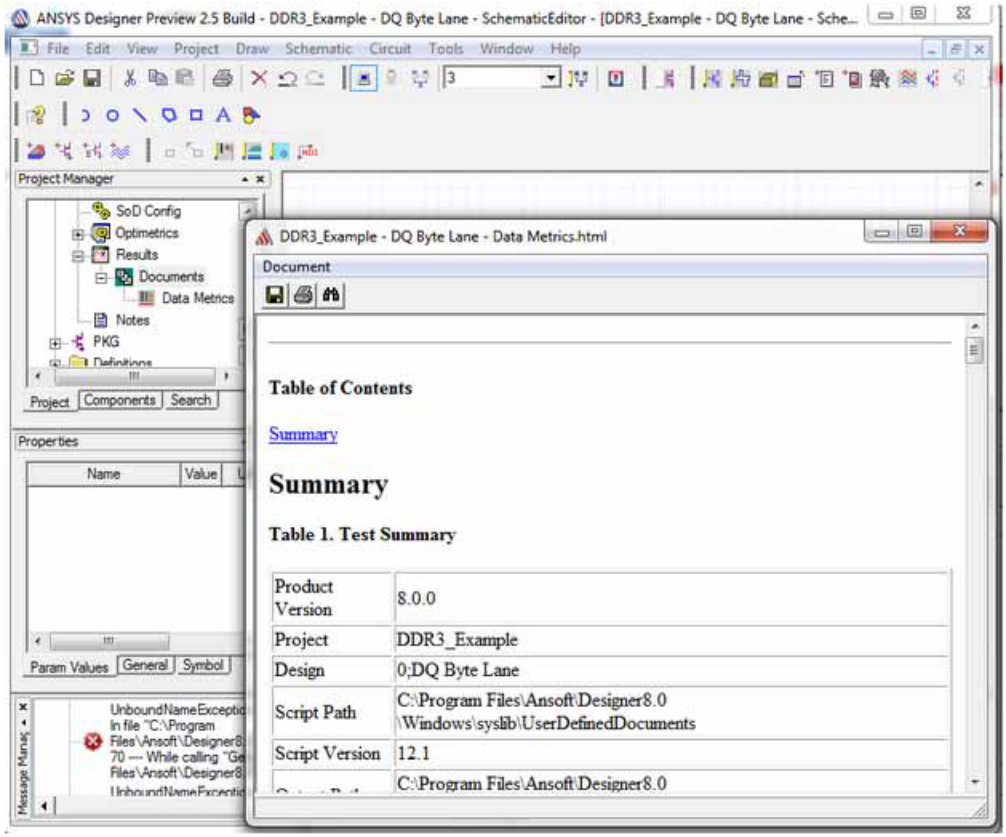


UDD Document Creation and Display (2D and Circuit)

After all the input selections for a UDD are confirmed, based on the script, an xml, html and pdf document is generated based on the inputs provided by the user. (The xml, html and pdf generation is based on specific calls in the python script, which are explain in a following topic). A web browser window also opens to open the generated html file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

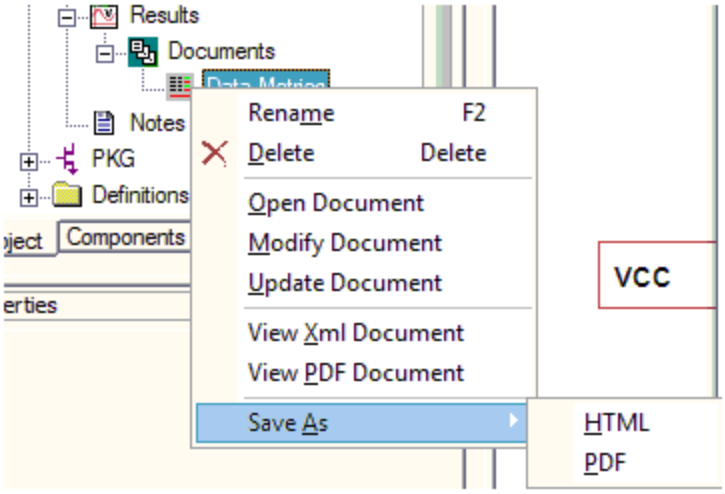
The created document is placed under a new folder named "Documents" under the "Results" folder. All documents that are created by the user for the design is placed under this folder.



Managing Documents Listed in the Project Manager window Under Results (2D and Circuit)

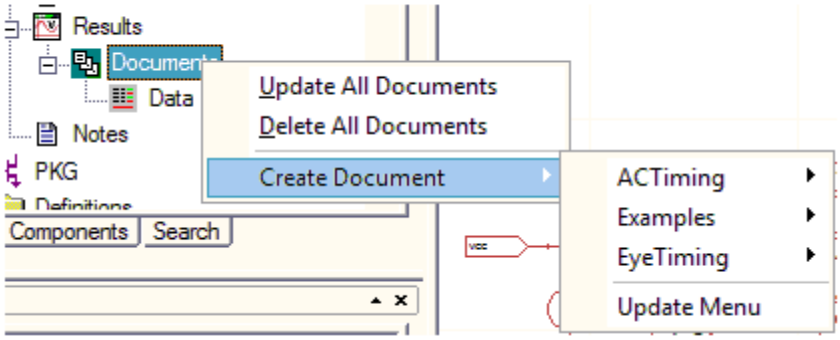
In the **Project Manager** > **Results** > **Documents** folder, right-click a user-defined document and select **Rename** and **Delete**, among other choices. **Open Document** opens the web browser with the html document. **Modify Document** opens the setup window where change the selections for the input. Click **View xml Document** or **View PDF Document** to view the document in the appropriate format, or choose **Save As** to save the document in a different location.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Documents Folder shortcut menu

Right-click the Documents folder to **Update All Documents**, **Delete All Documents**, or **Create Document**.

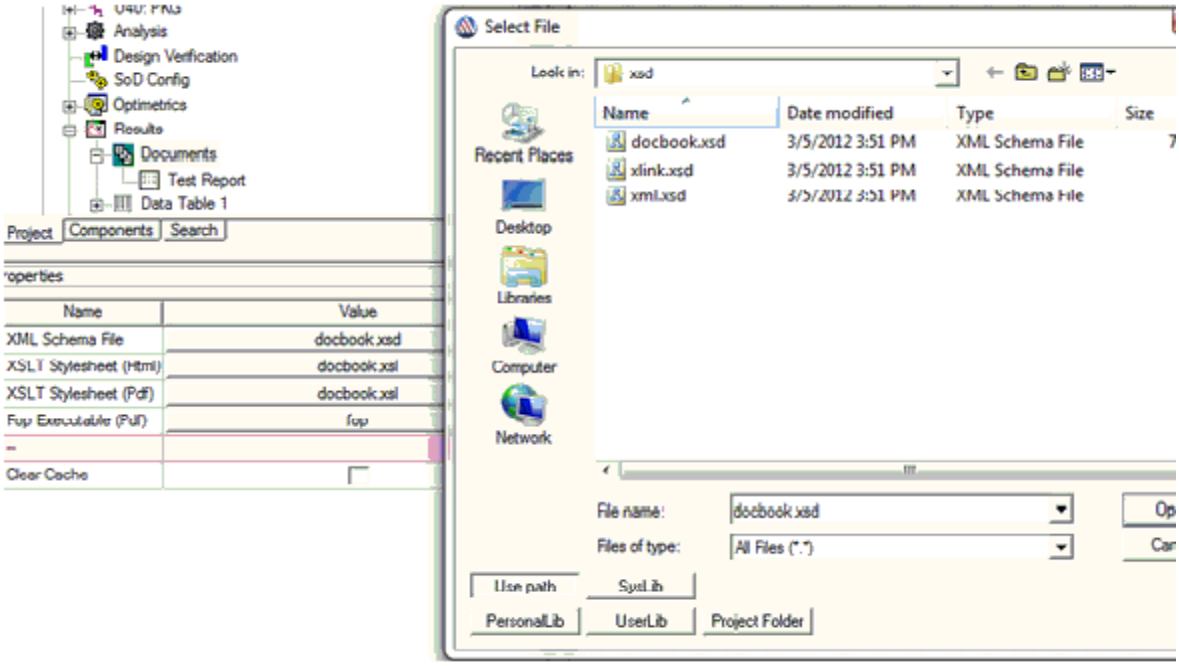


Document Folder Property window

When the documents folder is selected, the Property window shows the following properties

- xml Schema File - File path to the xml schema file.
- XSLT StyleSheet (Html) - File path to the XSLT stylesheet file used for Html generation.
- XSLT StyleSheet (Fo) - File path to the XSLT stylesheet file used for Pdf generation.
- Fop Executable (Pdf) - File path the Fop executable used for Pdf generation.
- Clear Cache - Clears the cached XSL transform object and forces creation of a new one. (The caching is done to save time during document generation, so subsequent generation or update of the document can use the cached transform object. But sometimes you may want to force a recompile of the document if you change the stylesheet).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The xml, HTML and PDF generation require the xml schema file and XSLT stylesheets to generate proper output. The PDF generation also requires a FOP executable. You can use the defaults provided in the installation or provide the file paths of your own preferred stylesheets and fop executable installed in his machine.

Viewing UDDs with an HTML Web Browser (2D and Circuit)

The xml and HTML documents can be viewed in a web browser with some basic functionality like printing the document, searching the document for a phrase or sentence and saving the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDD Script Libraries (2D and Circuit)

Base classes and data files shared between similar UDDs can be organized to reuse the code in a better way. All script-library and other support files need to be in a Lib sub-directory under the UserDefinedDefinitions directory. Any .py files found in such Lib directories are ignored and not displayed in the GUI as a valid UDD choice. For a UDD script at any given directory depth, all Lib directories in its parent directories is automatically added to the system include path (any support script files from any Lib directory through the top level UserDefinedDefinitions directory can be imported).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The UDD functionality uses IronPython to provide access to all the .NET assembles. If needed, any subset of the UDD functionality can be implemented in any .NET language and used by the UDD script. There are simple rules to follow to achieve this.

1. Build your .NET assembly for .NET 2.0 runtime.
2. Drop the built assembly in any Lib directory upstream of the UDD script location: that is, if you have your UDD script in C:\Users\x\PersonalLib\UserDefinedDefinitions\a\b\c\myudd.py and have a .NET assembly called com.Acme.UDDLib You can keep the .NET assembly under
   - UserDefinedDefinitions\Lib,
   - UserDefinedDefinitions\a\Lib,
   - UserDefinedDefinitions\a\b\Lib
   - UserDefinedDefinitions\a\b\c\Lib
3. Add the following line to your python script
   - Import clr
   - clr.AddReference("com.Acme.UDDLib")
   - import com.Acme.UDDLib –or-- from com.Acme.UDDLib import * etc

   If for some reason you cannot place the .NET assemblies into a Lib directory under UserDefinedDefinitions, you need to do a couple more steps before step 3 listed above.

```
Import sys
sys.path.append("full path to your .NET assembly location")
```

user-defined Definitions: Python Script API (2D and Circuit)

A user-defined Definition (UDD) extension is implemented as an IronPython script that defines a class with a specific name: **UDDExtension** which derives from a specific base class **IUDDPluginExtension** and implements its abstract methods.

Import Statements (2D and Circuit)

The base class to be used and the types it uses in turn are contained in .NET assemblies. The use of these requires that the assemblies be imported into the UDD script: the following import statements should be added to the top of the python script:

```
from Ansys.Ansys.DocGeneratorPluginDotNet.DocGenerator.API.Data
import *
from Ansys.Ansys.DocGeneratorPluginDotNet.DocGenerator.API.Interfaces
 import *
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDDExtension Class (2D and Circuit)

The UDD itself should be implemented as an IronPython class called **UDDExtension** which must derive on the **IUDDPluginExtension** abstract base class (on the **Ansys.Ansys.DocGeneratorPluginDotNet.DocGenerator.API.Interfaces** namespace).

Note that power users could derive a class hierarchy tuned toward a specific type of UDDs and that they can derive on their own base classes. The only requirement is that directly or indirectly, the UDD class must derive from **IUDDPluginExtension**.

Example:

```
def BaseClassUDD ((IUDDPluginExtension):
#base class implementation
…
def UDDExtension ((BaseClassUDD):
#UDD class implementation
…
```

> **Note:**
>
> All of the above text has been copied on the Help topic for the UDOs and modified for the UDDs. Since the UDDs are modelled after the UDOs, the usage is also similar.

IUDDPluginExtension Abstract Class (2D and Circuit)

Required functions:

The **IUDDPluginExtension** abstract class declares the following abstract methods that must be implemented in the UDDExtension class or one of its base classes. Not implementing any of these methods results in a run-time error and a non functioning UDD.

GetUDDName() : Return a string that is used as a prefix for all solution instances created using this UDD.

Example:

```
def GetUDDName(self):
return "MinMaxAvg"
```

GetUDDDescription() : Returns a description for the UDD, its purpose etc.

Example:

```
def GetUDDDescription(self):
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
return "Sample UDD”
```

ShowDefaultSetupwindow() : Returns True if the default window is to be shown. Return False if the user does not want the default window. In this case the user might want to implement/show a customized setup window.

Example:

```
def ShowDefaultSetupwindow(self):
return True
```

GetUDDInputParams(IUDDInputHelper inputHelper, List<UDDInputParams> uddInputs) : Returns the list of inputs parameters for the User Defined Document. Returns boolean: True on success, False on failure.

The supplied input parameters are used to populate details of the parameters to which the UDD user specifies value, specify the input names and their types.

inputHelper: This is the input helper object provides methods to gather information to define the inputs. This interface is explained in the Document Generator Interface document.

uddInputs: .NET list of UDDInputParams objects. The UDD script is expected to add one instance of UDDInputParams for each input definition it wants displayed. The UDD user can, when creating the UDD, assign a matching value to each such input.

Example:

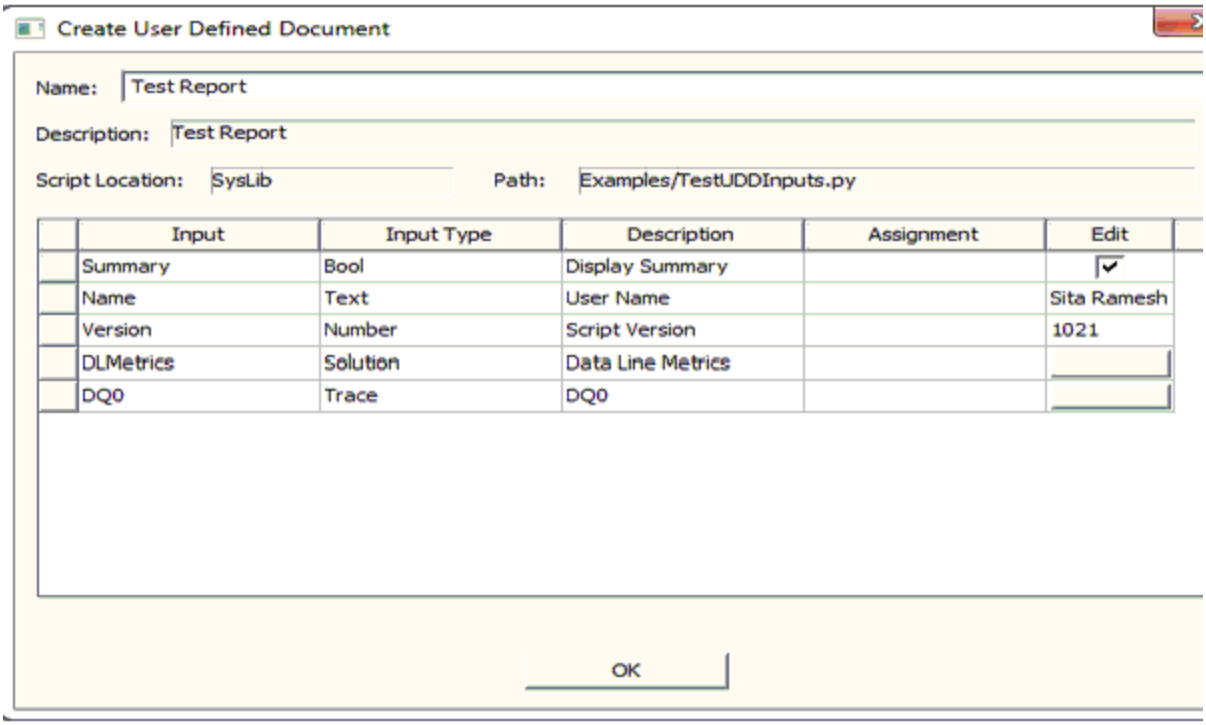
```
def GetUDDInputParams(self, inputHelper, uddInputs)
# Boolean input
param1 = UDDInputParams("Summary","Display Summary",
Constants.kBoolTypeStr, True)
uddInputs.Add(param1)
# Text input
param2 = UDDInputParams("Name","User Name", Constants.kTextTypeStr ,
"Sita Koresh")
uddInputs.Add(param2)
# Number input
param3 = UDDInputParams("Version","Script Version",
Constants.kNumberTypeStr, 1021)
uddInputs.Add(param3)
# Solution input
param5 = UDDInputParams("DLMetrics","Data Line
Metrics",Constants.kSolutionTypeStr)
uddInputs.Add(param4)
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
# Trace input
param5 = UDDInputParams("DQ0","DQ0",Constants.kTraceTypeStr)
uddInputs.Add(param5)

return True
```

Based on the input params the following window is displayed when you click **Reports>Create Document**. The name and description of the UDD are also displayed in this window.



Generate(List<UDDInputData> uddInputs, IUDDGenerator generator, IProgressMonitor progressMonitor) : This is the main method which accesses the data on the uddInputs and generates the document.

uddInputs: The list of inputs that the user setup in the window. They are now available to query for data.

generator: This is the document generator object used to create different elements of the document like titles, topics, tables, images and write the data too. This interface is explained in the Document Generator Interface document.

progressMonitor : IProgressMonitor object. This can be used to set progress for long running calculations, check for user initiated abort etc.

Example:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
def Generate(self, input, docgen, progMon):

# Gather data from inputs
boolinput = input[0].Data()
textinput = input[1].Data()
dblinput = input[2].Data()
# Get document root
docroot = docgen.GetDocumentRoot()

# Add Section
section1 = docroot.AddSection("Summary", "Overall Results ")

# Add a table
table1 = section1.AddTable("Test Summary")

#Add a table group with 2 columns
tgroup1 = table1.AddTableGroup(2)

# get desktop application
oApp = self.GetUDDAppContext()
if oApp != None:
oDesktop = oApp.GetAppDesktop()
if oDesktop != None:
# version number
version = oDesktop.GetVersion()
text1 = tgroup1.AddContent()
text1 .Add(0, "Product Version")
text1 .Add(1, version)

oProject = oDesktop.GetActiveProject()
if oProject != None:
projectname= oProject.GetName()
text1 = tgroup1.AddContent()
text1 .Add(0, "Project")
text1 1.Add(1, projectname)
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
oDesign = self.GetUDDDesignContext()
if oDesign != None:
designname = oDesign.GetName()
text1 = tgroup1.AddContent()
text1 .Add(0, "Design")
text1 .Add(1, designname)
# Provides a script path
scriptpath = docgen.GetScriptPath()
text1 = tgroup1.AddContent()
text1 .Add(0, "Script Path")
text1 .Add(1, scriptpath )

#Provides the script version
text1 = tgroup1.AddContent()
text1 .Add(0, "Script Version")
text1 .Add(1, str(dblinput ))

#Provides the output xml path
outputpath = docgen.GetOutputFilePath()
text1 = tgroup1.AddContent()
text1 .Add(0, "Output Path")
text1 .Add(1, outputpath )

#Provides the user information
text1 = tgroup1.AddContent()
text1 .Add(0, "User")
text1 .Add(1, textinput)

# Generate Xml output
docgen.Write(False)
# Generate Html output
docgen.WriteHTML()
# Generate PDF output
docgen.WritePDF()

return True
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Optional functions:

SetupUDDInputParams(IUDDInputHelper inputHelper, List<UDDInputParams> uddInputs) : Displays a customized window and returns the user choices for the input params.

inputHelper: This is the input helper object provides methods to gather information to define the inputs. This interface is explained in the Document Generator Interface document.

uddInputs– .NET list of UDDInputParams objects with values for each of them. These can be the user choice for each input obtained through a custom window or some other non graphical assignment.

There is no way of assigning solution data to the input without the invocation of the reporter window, so trace and solution types of input with a custom window cannot be processed.

Example:

```
def SetupUDDInputParams(self, inputHelper, uddInputs)
uddwindow = BaseExampleUDDwindow()
if uddwindow.Showwindow() == Forms.windowResult.OK:
  # Boolean input
  param1 = uddwindow.GetInput("Summary")
  uddInputs.Add(param1)

  # Text input
  param2 = uddwindow.GetInput("Name")
  uddInputs.Add(param2)

  # Number input
  param3 = uddwindow.GetInput("Version")
  uddInputs.Add(param3)
```

HandleUDDEvents(List<string> eventTags) : The tags associated with the event is received

by plugin using this abstract class.

This method is the event handler for all link events set by the SetEventLink() method on a IUDDText. (See the definition of the IUDDText object in the Document Generator Interface document).

Example:

```
def HandleUDDEvents(self, uddLinks):
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
if uddLinks[0] == “Open” Report”:
   # Get Design Name
   oDesign = self.GetUDDDesignContext()
   if oDesign != None:
     oDesign.OpenReport(uddLinks[1])
return True
```

GetUDDSchema() : Returns the file path of the schema to validate the xml. This overrides the default schema used. Return string containing the full file path of the schema.

```
def GetUDDSchema(self):
return "C:\\Program Files\\ANSYS
Inc\\v252\\AnsysEM\\common\\docbook\\schema\\xsd\\docbook.xsd"
```

GetUDDStyleSheetForHtml() : Returns the file path of the style sheet used to generate the html document. This overrides the default stylesheet for html. Returns string containing the full file path of the style sheet.

```
def GetUDDStyleSheetForHtml(self):
return "C:\\Program Files\\ANSYS
Inc\\v252\\AnsysEM\\common\\docbook\\"
```

GetUDDStyleSheetForPdf() : Returns the file path of the style sheet used to generate the pdf document. This overrides the default stylesheet for pdf. Returns string containing the full file path of the style sheet.

Example:

```
def GetUDDStyleSheetForPdf(self):
return "C:\\Program Files\\ANSYS
Inc\\v252\\AnsysEM\\common\\docbook\\xsl\\fo\\docbook.xsl"
```

GetFopExecutable() : Returns the file path of the fop executable used to generate the pdf document. This overrides the default stylesheet for pdf.Returns string containing the full file path of the fop executable.

Example:

```
def GetFopExecutable(self):
return "C:\\Program Files\\ANSYS
Inc\\v252\\AnsysEM\\common\\ApacheFOP\\fop-1.0\\fop"
```

GetUDDAppContext() : Returns the UDD Owner (if set). This is a Dispatch wrapper that is essentially a COM IDispatch implementation and corresponds to the IDispatch pointing to the **Electronics Desktop** (**Electronics Desktop**) app.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

GetUDDDesignContext() : Returns the UDD Owner (if set). This is a Dispatch wrapper that is essentially a COM IDispatch implementation and corresponds to the IDispatch pointing to the Design.

Data Types Used in Python Script (2D and Circuit)

There are several types that you must use while authoring the python script. Some of them are used to pass data from UI to python script and provide interface for working with this data. Some are used to pass data from python script to UI.

To pass data from python script to UI the objects of the C# class must be created in python script using their C# constructors. The objects can then be set as functions return values or set to the output parameters using their API.

Constants Class (2D and Circuit)

kTraceTypeStr : string constant used to specify an input of trace type

kSolutionTypeStr : string constant used to specify an input of solution type

kNumberTypeStr : string constant used to specify an input of number type

kTextTypeStr : string constant used to specify an input of text type

kBoolTypeStr : string constant used to specify an input of boolean type

kStandardReportStr : string constant to specify a standard report

kEyeDiagramReportStr : string constant to specify an eye diagram report

kUserDefinedReportStr : string constant to specify a user-defined report

kSweepDomainStr : string constant to specify the sweep domain

kTimeDomainStr : string constant to specify the time domain

UDDInputParams Class (2D and Circuit)

The objects of this class must be created in python script in the **GetUDDInputParams()** function and the **SetUDDInputParams()** function.

Attributes :

Input Name (string)

Input Description (string)

Input Type (Can be Boolean, Number, Text, Trace or Solution) (string)

BoolData (boolean)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DoubleData (double)

TextData (string)

ReportType (string)

SolutionName (string)

DomainName (string)

Constructors:

UDDInputParams(string name, string description, string type)

UDDInputParams(string name, string description, string type, bool data)

UDDInputParams(string name, string description, string type, double data)

UDDInputParams(string name, string description, string type, string data)

UDDInputParams(string name, string description, string type, string reportType, string solutionName, string domainName)

Property Accessors :

Name : Get/Set the name of an input

Description : Get/Set the description of an input

Type : Get/Set the type of an input

BoolData : Get/Set the data of a boolean input

DoubleData : Get/Set the data of a number input

TextData : Get/Set the data of a text input

ReportType : Get/Set the report type

SolutionName : Get/Set the name of the solution

DomainName : Get/Set the name of the domain

IProgressMonitor Abstract Class (2D and Circuit)

The object of this class is a progress monitor. It is used to display calculations progress in UI and check is the user has requested an abort of the computation.

When displayed in the application, each progress message has four items:

A task name

A sub-task name

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The progress amount

A button to abort the task in progress.

All of this functionality and abort interaction is achieved using the following functions.

SetTaskName (string taskName)

SetSubTaskName (string subTaskName)

BeginTask (string name)

SetTaskProgressPercentage(int progressPercent)

CheckForAbort(): If the quantities being generated are computationally expensive, the UDO author can periodically call this method , then call EndTask with Fail and return False.

EndTask (bool passFail)

Example:

```
progMon.BeginTask("Process DQS")
progMon.SetSubTaskName("Compute UI segments")
progMon.SetTaskProgressPercentage(33)
progMon.SetSubTaskName("Compute the rest")
progMon.SetTaskProgressPercentage(100)
progMon.EndTask(True)
```

UDD Input Interfaces (2D and Circuit)

The Generate function takes in a list of inputs. These input interfaces allow the user to access data on the design.

IUDDInputBool : This interface exposes 3 methods

Name() : Gets the inputs name.

Type() : Gets the input type.

Data() : Gets the boolean data, set by the user in the setup window.

IUDDInputDouble : This interface exposes 3 methods

Name() : Gets the inputs name.

Type() : Gets the input type.

Data() : Gets the double data, set by the user in the setup window.

IUDDInputText : This interface exposes 3 methods

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name() : Gets the inputs name.

Type() : Gets the input type.

Data() : Gets the text data, set by the user in the setup window.

IUDDInputTrace: This interface exposes 3 methods

Name() : Gets the inputs name.

Type() : Gets the input type.

DoubleData() : Method used to return x and y double data as a IDictionary<double, double>

DoubleData(IDictionary<string, string> variation) : Method used to return x and y double data as a IDictionary<double, double>, given a variation.

ComplexData() : Method used to return x data and y complex data as a IDictionary<double, double[]>

ComplexData(IDictionary<string, string> variation) : Method used to return x data and y complex data as a IDictionary<double, double[]>, given a variation.

TextData() : Method used to return x data and y data as a IDictionary<string, string>

TextData(IDictionary<string, string> variation) : Method used to return x data and y data as a IDictionary<string, string>, given a variation.

VariableValues() : Method used to get a list of variations as a IList<Dictionary<string, string>>

IUDDInputSolution: This interface exposes 3 methods

Name() : Gets the inputs name.

Type() : Gets the input type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DoubleData(string name) : Method used to return x and y double data as a IDictionary<double, double>, given a quantity name.

DoubleData(string name, IDictionary<string, string> variation) : Method used to return x and y double data as a IDictionary<double, double>, given a quantity name and a variation.

ComplexData(string name) : Method used to return x data and y complex data as a IDictionary<double, double[]>, given a quantity name.

ComplexData(string name, IDictionary<string, string> variation) : Method used to return x data and y complex data as a IDictionary<double, double[]>, given a quantity name and a variation.

TextData(string name) : Method used to return x data and y data as a IDictionary<string, string> given a quantity name.

TextData(string name, IDictionary<string, string> variation) : Method used to return x data and y data as a IDictionary<string, string>, given a quantity name and a variation.

CategoryNames() : Method to return a list of category names in the solution as an IList<string>

QuantityNames(string category) : Method to return a list of quantity names in the solution as an IList<string>, given a category.

VariableValues() : Method used to get a list of variations as a IList<Dictionary<string, string>>

Examples:

```
def Generate(self, input, docgen, progMon):
# Getting the boolean dataset by the user
boolinput = input[0].Data()
# Getting the double dataset by the user
dblinput = input[1].Data()
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
# Getting the text dataset by the user
textinput = input[2].Data()
# Getting the category names in a solution
categories = input[3].CategoryNames()
# Getting the quantity names based on a category
quantities = input[3].QuantityNames(categories[0])
# Getting the XY data on the trace
xydata = input[4].DoubleData()
```

user-defined Document Scripting Interface (2D and Circuit)

To access the UserDefineddocuments scripting object, use:

```
Set oModule = oDesign.GetModule("UserDefinedDocuments")
```

Once you have the scripting object, use the following methods:-

1. AddDocument ([in] VARIANT data, [in] VARIANT traces, [out, retval] BSTR* uniqueName)
    a. Takes a VARIANT data which defines the document.
    b. Takes a VARIANT trace data for the inputs in the document.
    c. Returns a unique name
2. EditDocument([in] BSTR originalName, [in] VARIANT modifiedData, [in] VARIANT modifiedTraces, [out, retval] BSTR* uniqueName)
    a. Takes the name of the original document.
    b. Takes a VARIANT data which defines the edited document.
    c. Takes a VARIANT trace data for the inputs in the document.
    d. Returns a unique name
3. RenameDocument([in] BSTR oldName, [in] BSTR newName)
    a. Takes the name of the original document.
    b. Takes the new name of the document.
4. DeleteDocument([in] BSTR name)
    a. Takes the name of the document to be deleted.
5. UpdateDocument([in] BSTR name)
    a. Takes the name of the document to be updated.
6. ViewHtmlDocument([in] BSTR name)
    a. Takes the name of the document to be viewed in HTML.
7. ViewPdfDocument([in] BSTR name)
    b. Takes the name of the document to be viewed as a PDF.
8. SaveHtmlDocumentAs([in] BSTR name, [in] BSTR saveTo)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

    a. Takes the name of the document to be saved.
    b. Takes the file path to save the document as.
9. SavePdfDocumentAs([in] BSTR name, [in] BSTR saveTo)
    a. Takes the name of the document to be saved.
    b. Takes the file path to save the socument as.
10. GetDocumentNames([in] BSTR separator, [out, retval] VARIANT* names)
    a. 'separator' is used to convey the directory "level"
    b. Returns the names of documents.
11. GetDocumentDefinitionNames([in] BSTR separator, [out, retval] VARIANT* names)
    a. 'separator' is used to convey the directory "level"
    b. Returns the (file) names of doc definitions according to the files in various installation directories.
12. DeleteAllDocuments()
13. UpdateAllDocuments()

For 6, 7, 8, and 9, the document must have an existing, generated HTML or PDF.

The UserDefinedDocument Data Format (2D and Circuit)

To define a document in Python script:

```

Document Generator Interfaces (2D and Circuit)

This document briefly describes the API interfaces available in the document generator plugin.

(Ansys.Ansys.DocGeneratorPluginDotNet.dll)

Scripting objects available in the script for the Generate function

- oApp = self.GetUDDAppContext(

  Gets the application context

  Usage:- Gets the active project ad the version of the product

```
oDesktop = oApp.GetAppDesktop()
```

if oDesktop != None:

vr = oDesktop.GetVersion()

oProject = oDesktop.GetActiveProject()

- oDesign = self.GetUDDDesignContext()

  Gets the design context

  Usage:- Gets the design name.

oDesign = self.GetUDDDesignContext()

if oDesign != None:

nm = oDesign.GetName()

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- IUDDGenerator interface

This interface available in the Generate method of the UDDPluginExtension.

This interface can be used to

1. Set the document output file path.

```
docgen.SetOutput("C:\\Examples\\DocumentOutput.xml")
```

2. Get the document root.

```
docroot = docgen.GetDocumentRoot()
```

3. Write out to the output file.

```
docgen.Write()
```

4. Write Html document

```
void WriteHTML();
```

5. Write PDF document

```
void WritePDF();
```

6. Load the Html transform object

```
void LoadHTMLTransform();
```

7. Load the cached PDF transform object

```
void LoadPDFTransform();
```

8. Get script path

```
string GetScriptPath();
```

9. Get output file path

```
string GetOutputFilePath();
```

- IUDDRoot interface

Calling GetDocumentRoot() on the IUDDGenerator interface provides you with the this interface. This interface can be used to

1. Add a new topic to the document. Provide a title.

```
section1 = docroot.AddSection("Section title")
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Add a new topic to the document. Provide a title and subtitle

```
section1 = docroot.AddSection("Section title", "Section subtitle")
```

3. Add a new title

```
section1 = docroot.AddTitle("Title")
```

4. Add a new subtitle

```
section1 = docroot.AddSubtitle("Subtitle")
```

- IUDDSection interface

Calling AddSection() on the IUDDRoot interface provides you with the this interface. This interface can be used to

1. Set an ID for the topic for internal links.

```
section1.SetID("id")
```

2. Add a new table to the document. Provide a table title.

```
table1 = section1.AddTable("Table title")
```

3. Add a new image to the document. Provide an image title and a file path to the image file.

```
image1 = section1.AddImage("Image title")
```

4. Add text to the document.

```
text1 = section1.AddText("Random text........")
```

- IUDDImage interface

Calling AddImage() on the IUDDSection interface provides you with the this interface. On this interface call the following methods

1. Set an ID for the image for internal links.

```
image1.SetID("id")
```

2. Set alignment information can be "center", "left" and "right".

```
image1.SetAligment("center")
```

3. Set the file path of the image file. Not necessary if image file path is set through the AddImage() method

```
image1.SetFileRef("Image path")
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Set the format of the image file. Can be "BMP", "PNG", "JPEG", "JPG", "DVI", etc.

```
image1.SetFormat("format")
```

- IUDDText interface

Calling AddText() on the IUDDSection interface provides you with the this interface. On this interface call the following methods

1. Set an ID for the text for internal links.

```
text1.SetID("id")
```

2. Set the emphasis attribute on the text

```
text1.SetEmphasis()
```

3. Set the quotes attribute on the text

```
Text1.SetQuotes()
```

4. Set the block quotes attribute on the text

```
text1.SetBlockquotes()
```

5. Set quotes on the text

```
Text1.SetQuotes()
```

6. Set the wordsize attribute on the text

```
text1.SetSize(size as an integer)
```

7. Set a link to an ID of any element to provide internal links

```
text1.SetLink("linkname")
```

8. Set an event link to handle an event. The HandleUDDEvents method should be implemented in the script to handle the event.

```
text1.SetEventLink("linkname")
```

- IUDDTable interface

Calling AddTable() on the IUDDSection interface provides you with the this interface. On this interface call the following methods

1. Set an ID for the table for internal links.

```
table1.SetID("id")
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Set alignment can be "center", "left" and "right".

```
table1.SetAlignment("center")
```

3. Set the background color of the table

```
table1.SetBgColor(string bgcolor)
```

4. Set the frame type. Can be "all", "bottom", "top,", "sides", "topbot"

```
table1.SetFrame(string frame)
```

5. Add a table group and specify the number of columns. A table can have multiple table groups.

```
IUDDTableGroup table1.SetTableGroup(int columns)
```

- IUDDTableGroup interface

Calling AddTableGroup() on the IUDDTable interface provides you with the this interface. On this interface call the following methods

1. Set an ID for the table group for internal links.

```
tgroup1.SetID("id")
```

2. Set alignment information can be "center", "left" and "right".

```
tgroup1.SetAlignment("center")
```

3. Set the column width of a column given the index of the column and the required width. Width can be set in 2 ways.
    - Width can be set relative to 1. E.g Setting it to "2*" makes the column width double the width of the others.
    - If the entire table width is considered to be 99.99 units. Width can be a number relative to this.

```
tgroup1.SetColumnWidth(int index, string width)
```

4. Add a header to the table group

```
IUDDTableRow tgroup1.AddHeader()
```

5. Add a header with multiple rows to the table group. Takes number of sub rows.

```
IUDDTableRow tgroup1.AddHeader(int rows)
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Add a row of content to the table group

```
IUDDTableRow tgroup1.AddContent()
```

7. Add content with multiple rows to the table group. Takes number of sub rows.

```
IUDDTableRow tgroup1.AddContent(int rows)
```

- IUDDTableRow interface

Calling AddHeader() & AddContent() on the IUDDTableGroup interface provides you with the this interface. On this interface call the following methods

1. Set an ID for the table row for internal links.

```
trow1.SetID("id")
```

2. Set alignment information; can be "center", "left" and "right".

```
trow1.SetAlignment("center")
```

3. Set cell text. Can be cell content or header text. Takes a column index and a text string. It is added to the first row.

```
IUDDTextElement trow1.Add(int column, string text)
```

4. Set cell text. Can be cell content or header text. Takes a column index, row index and a text string. Takes in a row number because a table row can have multiple sub rows.

```
IUDDTextElement trow1.Add(int column, int subrow, string text)
```

5. Set cell content. Takes a column index and an int value. It is added to the first row.

```
IUDDTextElement trow1.Add(int column, int value)
```

6. Set cell content. Takes a column index, row index and a int value.

```
IUDDTextElement trow1.Add(int column, int subrow, string text)
```

7. Set cell text. Takes a column index and a double value. It is added to the first row.

```
IUDDTextElement trow1.Add(int column, double value)
```

8. Set cell text. Takes a column index, row index and a double value.

```
IUDDTextElement trow1.Add(int column, int subrow, double value)
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9. Set cell text spanning 2 columns. Can be cell content or header text. Takes a sub row index , starting column index., ending column index and a text string.

```
IUDDTextElement trow1.AddSpanningcolumnst(int subrow, int
columnstart, int columnend, string text)
```

10. Set cell text. Can be cell content or header text. Takes a column index, starting sub row index, ending sub row index and a text string.

```
IUDDTextElement trow1.AddpanningRows(int column, int subrowstart,
int subrowend, string text)
```

Includes all the methods exposed by the IUDDText interface.

- IUDDInputHelper interface

The GetUDDInputParams() and SetUDDInputPrams provide this interface to gather information on the UI. On this interface call the following methods

1. Returns a list of user-defined solution names.

```
IList<string> inputHelper.UDSSolutionNames()
```

2. Returns the list context names for a given user-defined solution.

```
IList<string> inputHeper.UDSContextNames(string solutionname)
```

3. Returns the file path of the script corresponding to the user-defined solution.

```
string inputHelper.UDSScriptFileName(string solutionname)
```

4. Returns the parameters defined in the user-defined solution.

```
PropList UDSParameters(string solutionName)
```

5. Returns a dictionary of probe names and their corresponding expression, for a user-defined solution.

```
IDictionary<string, string> UDSProbes(string solutionName)
```

6. Returns a dictionary of variables and their nominal values.

```
IIDictionary<string, string> UDSVariableValues(string solutionName)
```

Technical Notes for 2D and Circuit Reports

Electronics Desktop post-processing allows you to define all types of plots for simulations prior to running an analysis. Using the reporter window, define plots prior to simulation for all types of

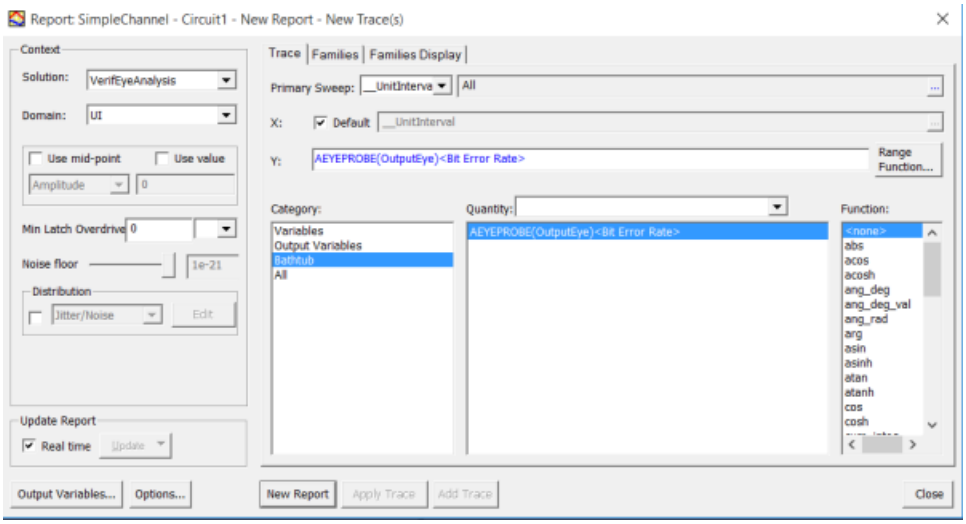
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

reports, including VerifEye, QuickEye, AMI, and Transient PMF. All reports are populated using the eye probes and AMI probes in a design, so set up all types of displays before an analysis.

The following topics describe how to take advantage of additional Electronics Desktop post-processing tools in order to generate various reports and view simulation results.

Unit Interval and Amplitude Values for Circuit Bathtub Curves

You can specify values for the Unit Interval or Amplitude while plotting bathtub curves for a QuickEye or VerifEye analysis. The controls allow you to choose between two check boxes for **Use mid-point** or **Use value**. The menu allows selection of **Amplitude** or **UI**.

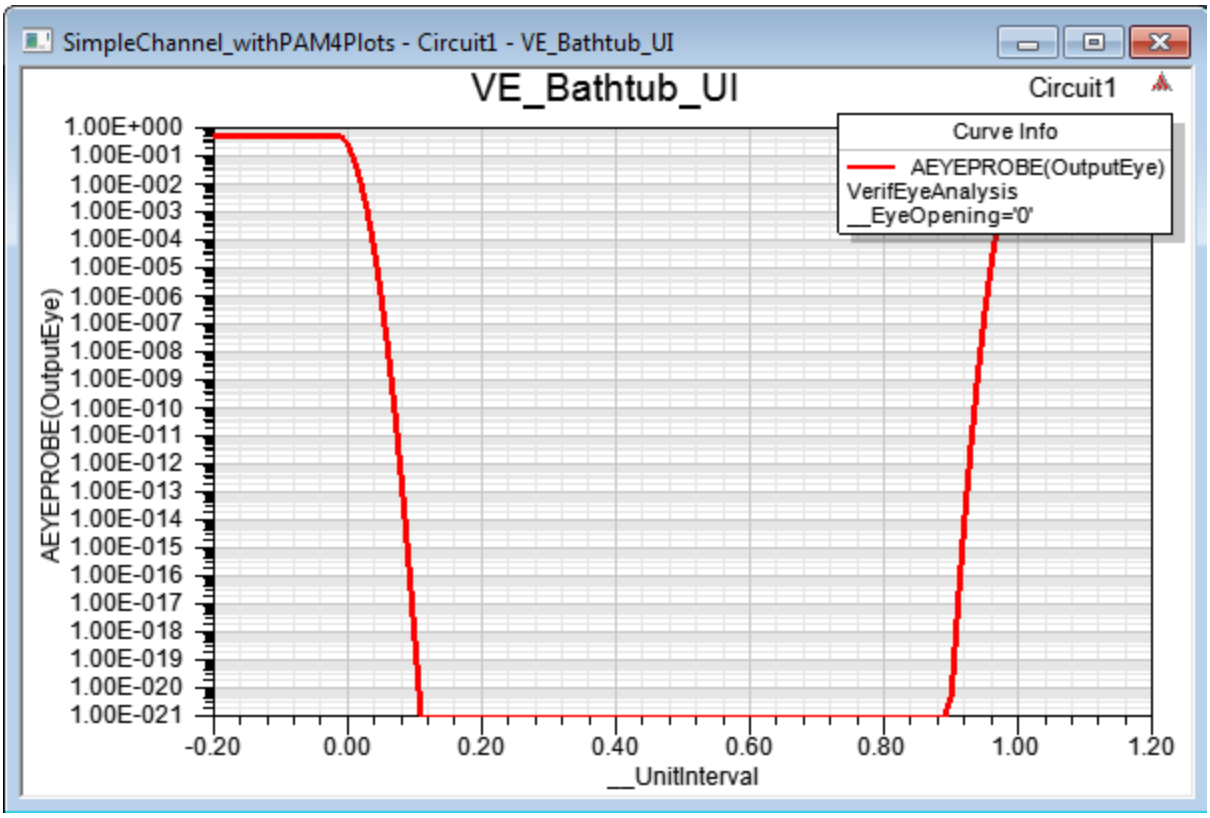


- When the **Use value** group box is checked, the edit window is enabled, allowing you to enter an Amplitude or UI value at which to see the bathtub curve. Electronics Desktop interpolates the data to plot a bathtub curve at that Amplitude or UI.
- The **Use midpoint** check box can also be enabled. Select **Amplitude** or **UI** on the menu.
- By default, the **Use midpoint** box is checked, and the midpoint of Amplitude is used as the default sweep value for the plot.
- Bathtub noise floor range is e-16 to ~ e-21.
- Default data length is set at 2^{18} or around $2.5x10^5$.
- BitPattern is PBRS and "random bit pattern generation".

> **Note:** With QuickEye, AMI, and Transient plots, when bathtub curves can be plotted and txrj is present, a warning message is displayed if the number of bits is less than 2.5e5.

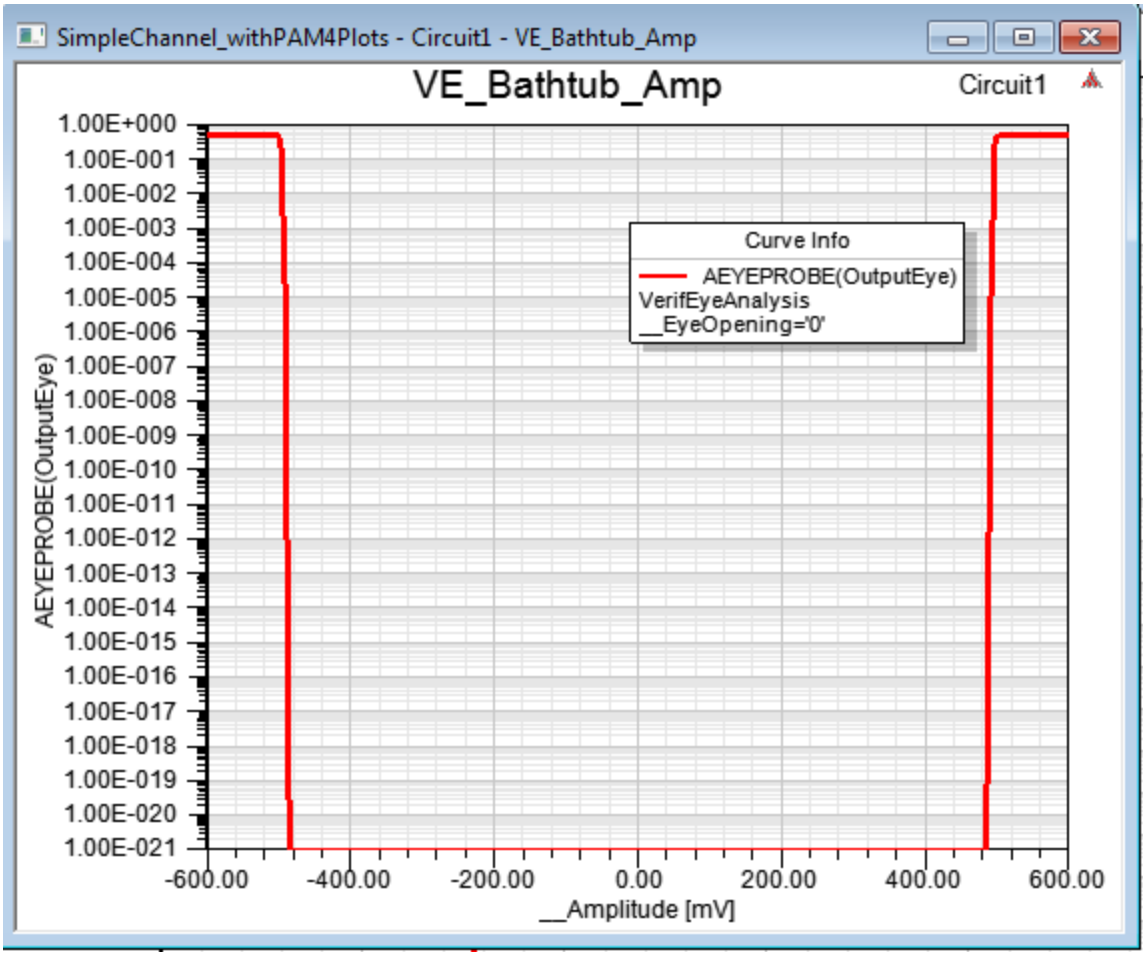
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The following shows a VerifEye plot with the default settings and NRZ transmission (X-axis is the UI):



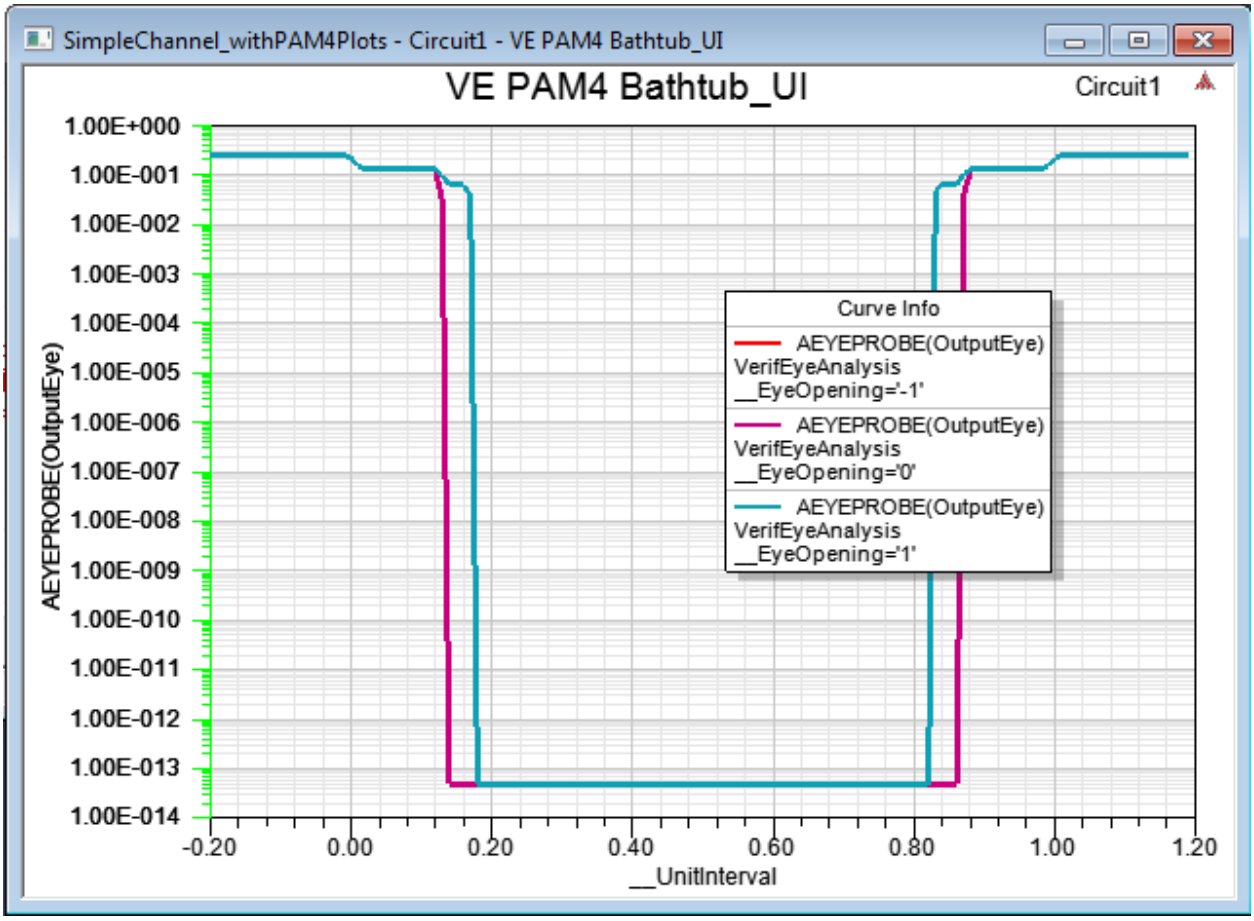
Following is a VerifEye plot centered on the UI with NRZ (X-axis is the Amplitude):

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Following is a VerifEye PAM-4 plot centered on the Amplitude (X-axis is the UI):

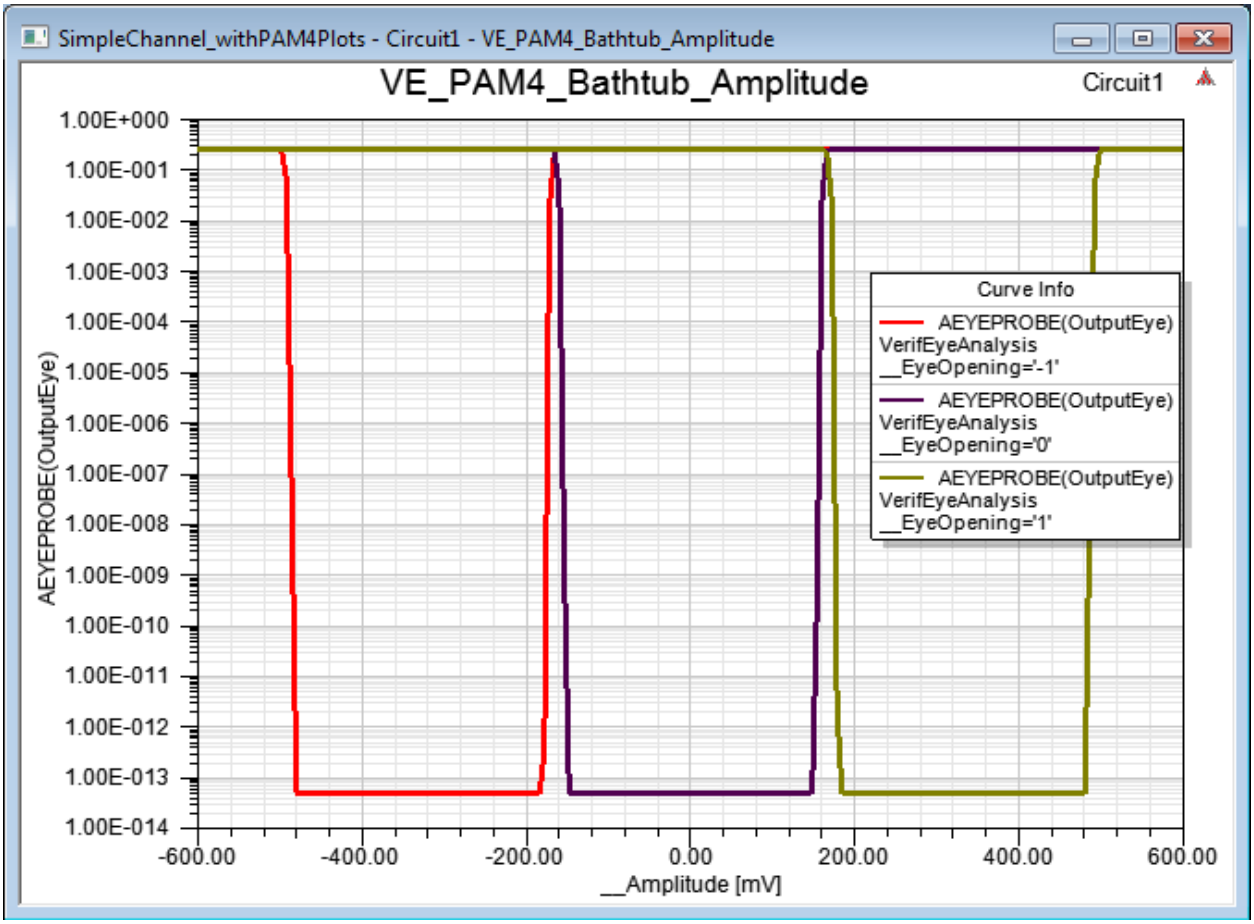
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- The PAM-4 eye has three levels. The Symbol error rates for each of the three sub-eyes is shown in a different trace.

Following is a VerifEye PAM-4 plot centered on the UI (X-axis is the Amplitude):

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

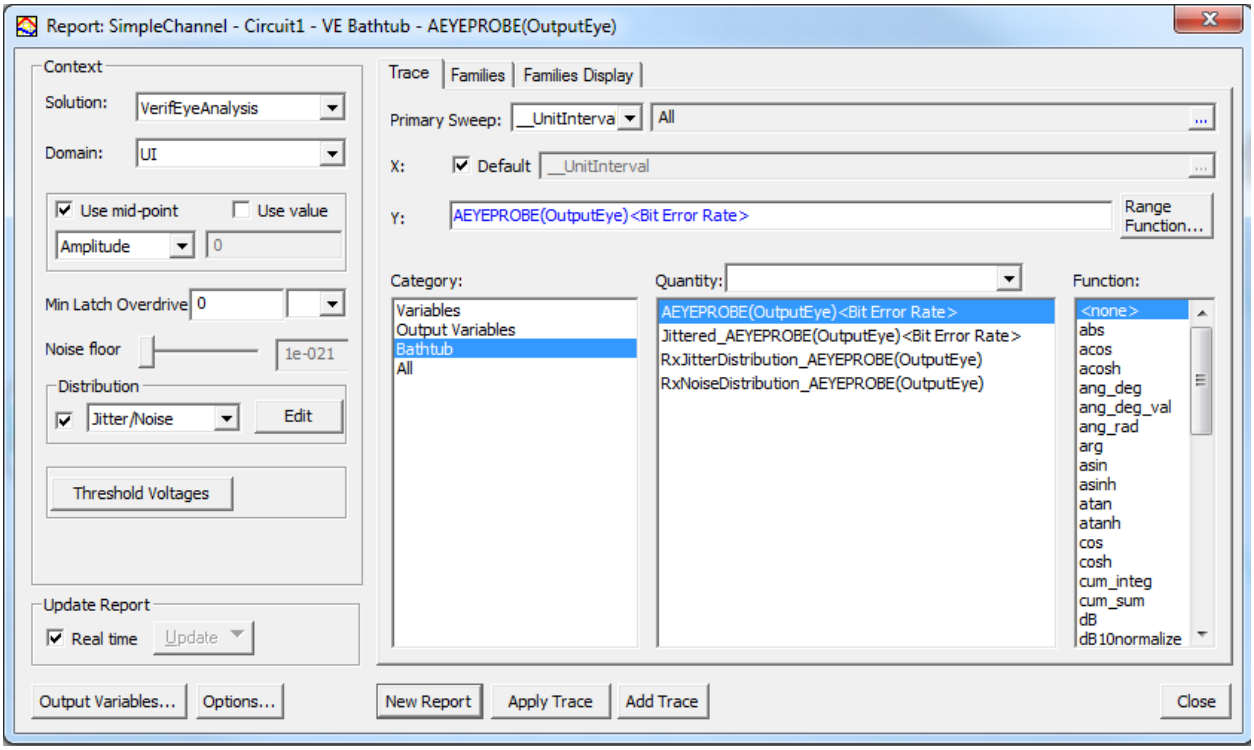


The above shows the symbol error rates for each of the three are depicted as three separate traces at different voltage levels.

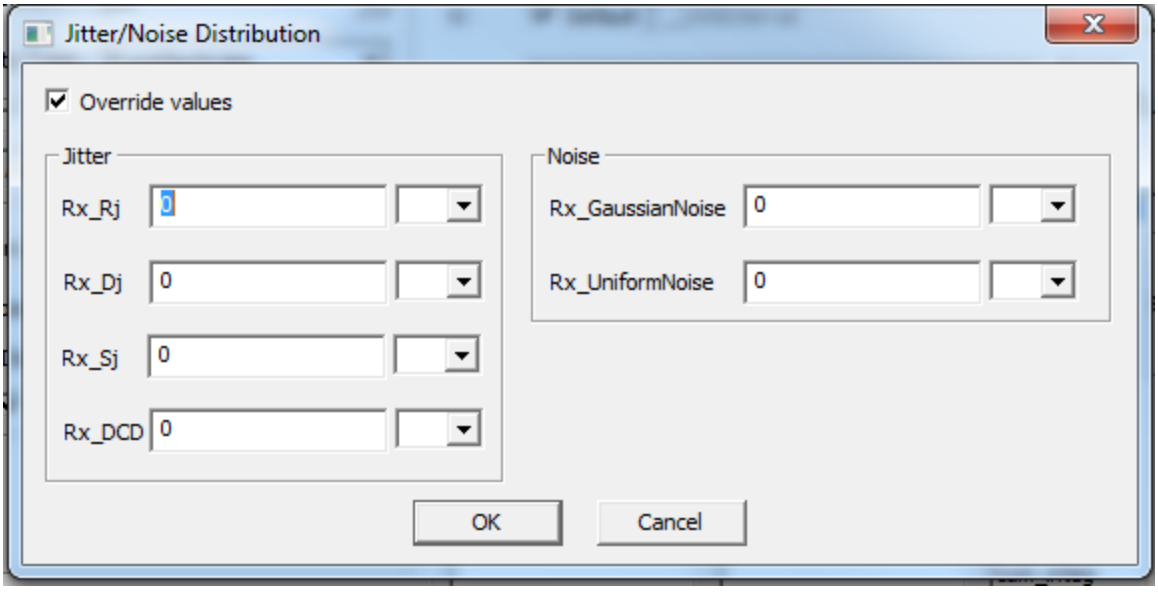
Apply Receiver Jitter and Noise Controls Simultaneously (2D and Circuit)

You can apply distributions of receiver jitter (variation in timing) and noise (variation in voltage) to the simulated data, using the controls in the **Distribution** group box of the reporter window. To view the added jitter or noise distribution, a VerifEye, QuickEye, or AMI bathtub plot is used. For AMI, the **Distribution** group box is available with the "Eye After Probe" quantity.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Click the check box in the **Distribution** group box and select **Jitter/Noise** on the drop-down menu. Then click **Edit** to open the **Jitter/Noise Distribution** window.



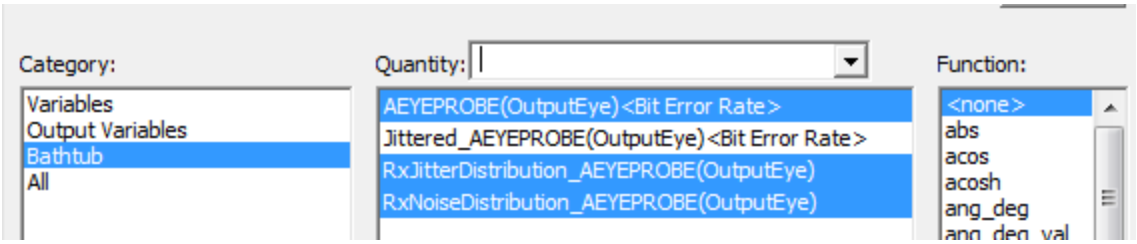
- Add a Gaussian Jitter distribution in the **Rx_Rj** field, giving the standard deviation. Specify the time units.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Add a Uniform Jitter distribution in the **Rx_Dj** field, giving the half-width of the distribution in time, and specify the time units.
- Add a sinusoidal jitter (**Rx_Sj**), giving the amplitude of the distribution in time units.
- Add a clock duty cycle distortion (**Rx_DCD**), giving one-half the peak-to-peak variation of the distortion in time units.
- Add a Gaussian Noise distribution in the **Rx_GaussianNoise** field, giving the standard deviation, and set the voltage units.
- Add a Uniform Noise distribution in the **Rx_UniformNoise** field, giving the half-width of the distribution, and specify the voltage units.
- Click **OK** to close the window.

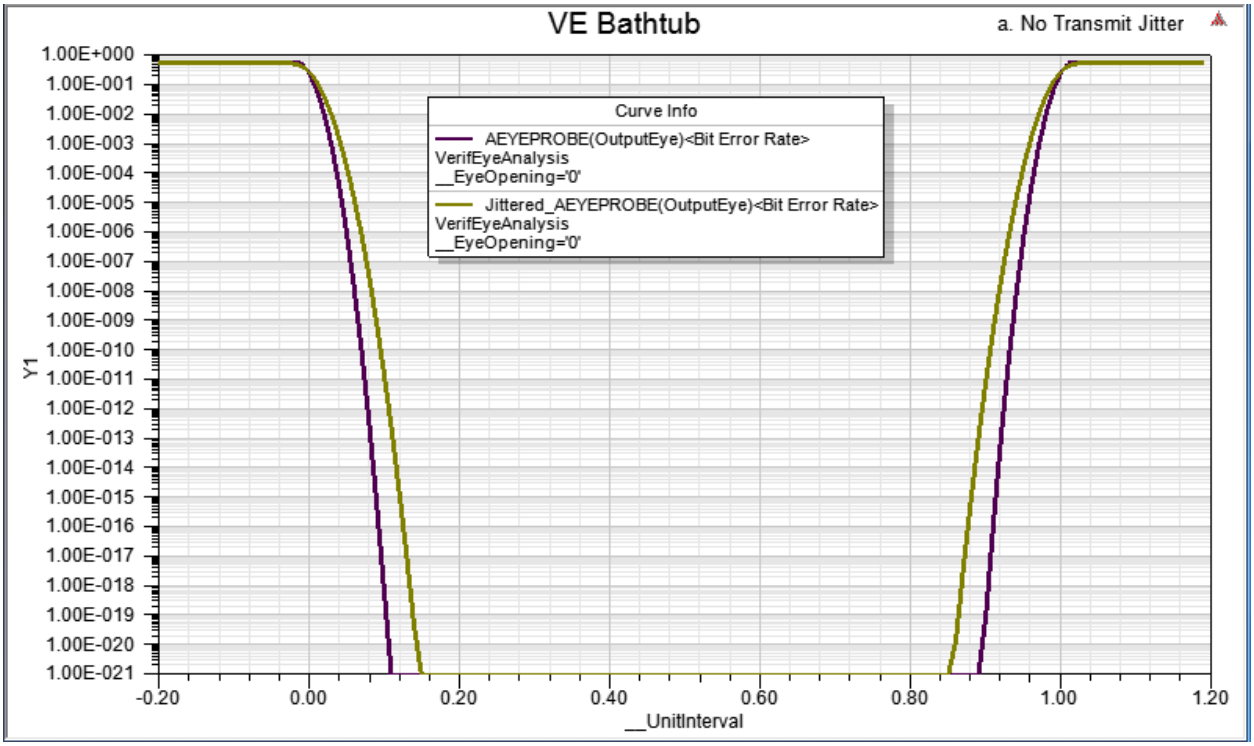
The parameter names and definitions are as defined in the IBIS specification. See "AMI Receive Jitter Parameters " on page 12-153.

When Jitter/Noise has been enabled, four quantities are available for plotting: the bathtub with no jitter (AEYEPROBE(OutputEye)<Bit Error Rate>), the bathtub with the jitter and noise applied (Jittered_AEYEPROBE(OutputEye), the distribution of the jitter (RxJitterDistribution_ AEYEPROBE(OutputEye), and the distribution of the noise (RxNoiseDistribution_AEYEPROBE (OutputEye).



The Bathtub plot shows some example results:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



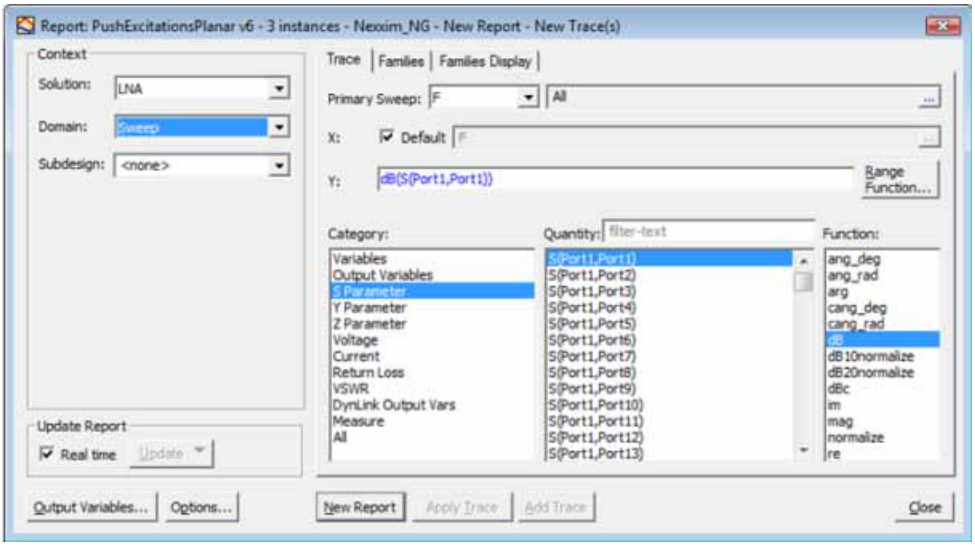
The AEYEPROBE(OutputEye) trace shows the BER curve before the jitter is applied (UI=1ns). The Jittered_AEYEPROBE(OutputEye) trace shows the BER curve after a random receive jitter (**Rx_Rj**) with standard deviation 100ps is applied.

EM Subdesign Plotting on the Top-Level Design (2D and Circuit)

For a Nexxim project with EM subdesigns, plot reports on the subdesigns directly on the top-level Nexxim design. When the reporter window is invoked on the top-level Nexxim design, it contains a drop-down menu in the **Context** group box that can specify the **Subdesign**. When the **Subdesign** selection is set to the <none> default, the domain, categories and quantities

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

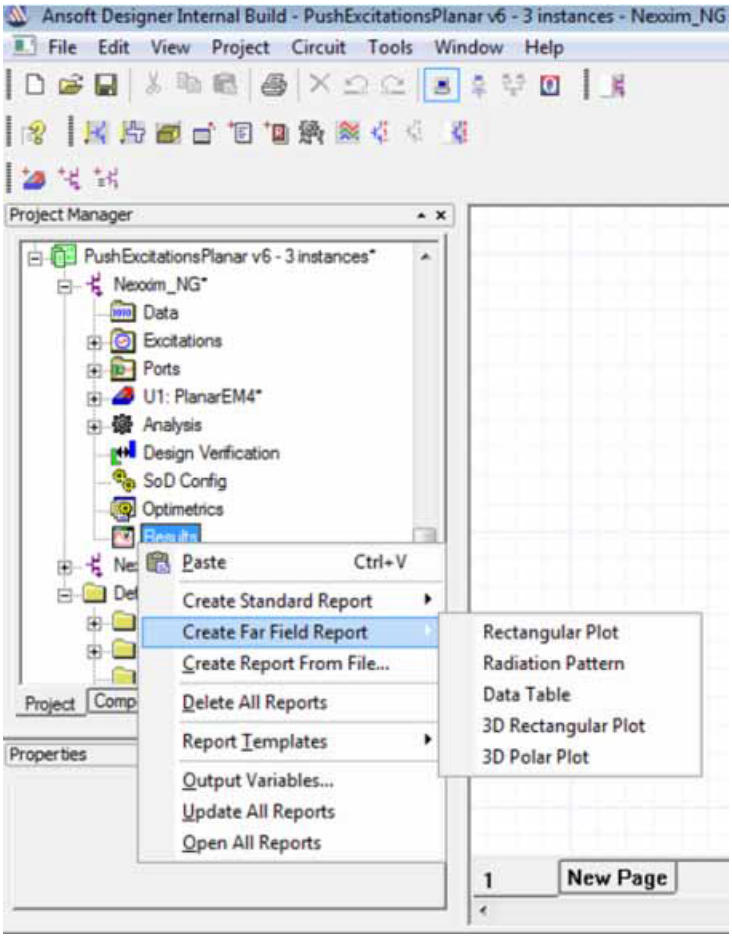
shown in the reporter window are related to the top level design.



But when the **Subdesign** selection is set, the reporter window populates with **Category** and **Quantity** values on the subdesign. This allows you to plot EM responses on the top-level reporter window, rather than editing the subdesign and opening the reporter window there.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

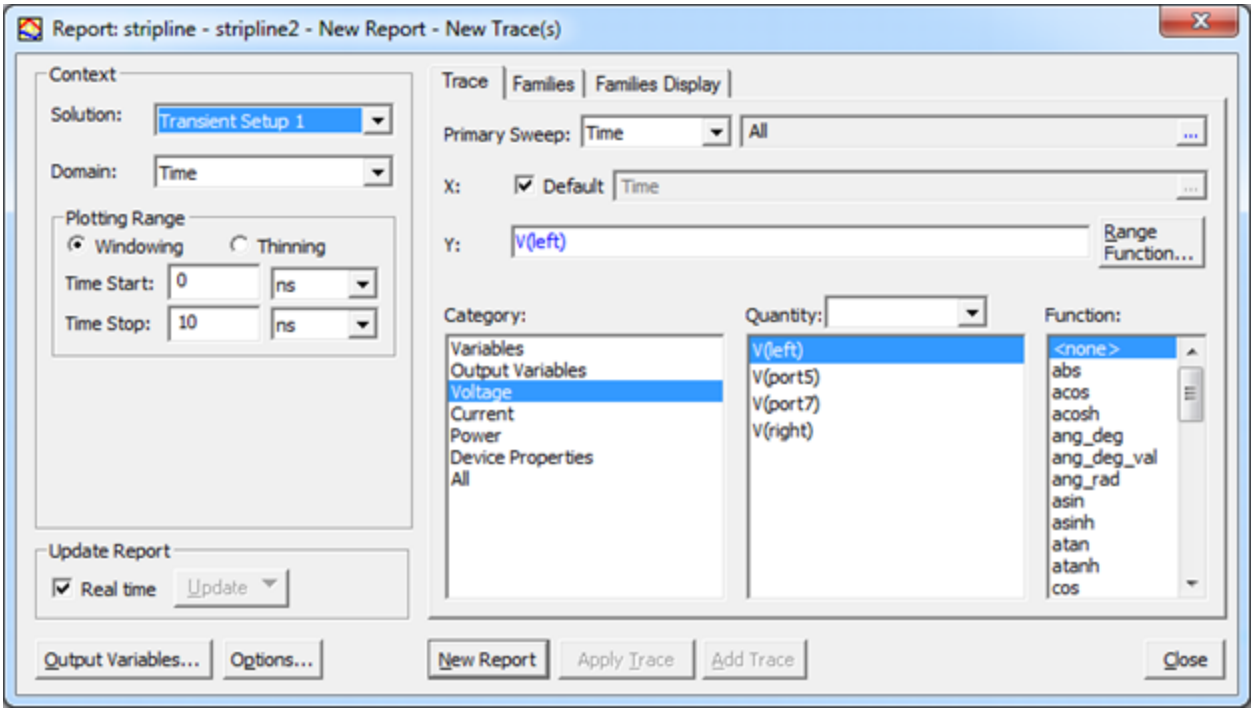
Additionally, plot far field reports from the subdesign.



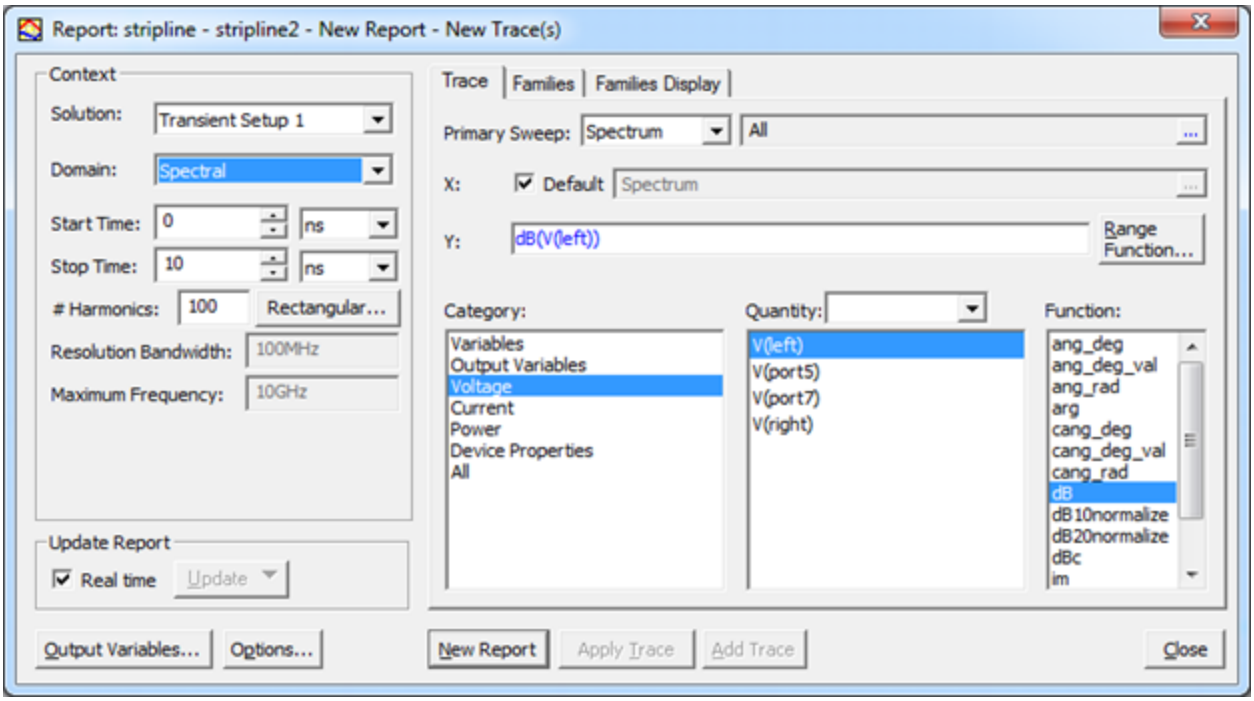
Post Processing for Transient in Layout

Transient results include voltage, currents, and power quantities in the Time domain and the Spectral domain. In the Time domain, the user can set a range to plot a window of the data or thin the data displayed in the plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

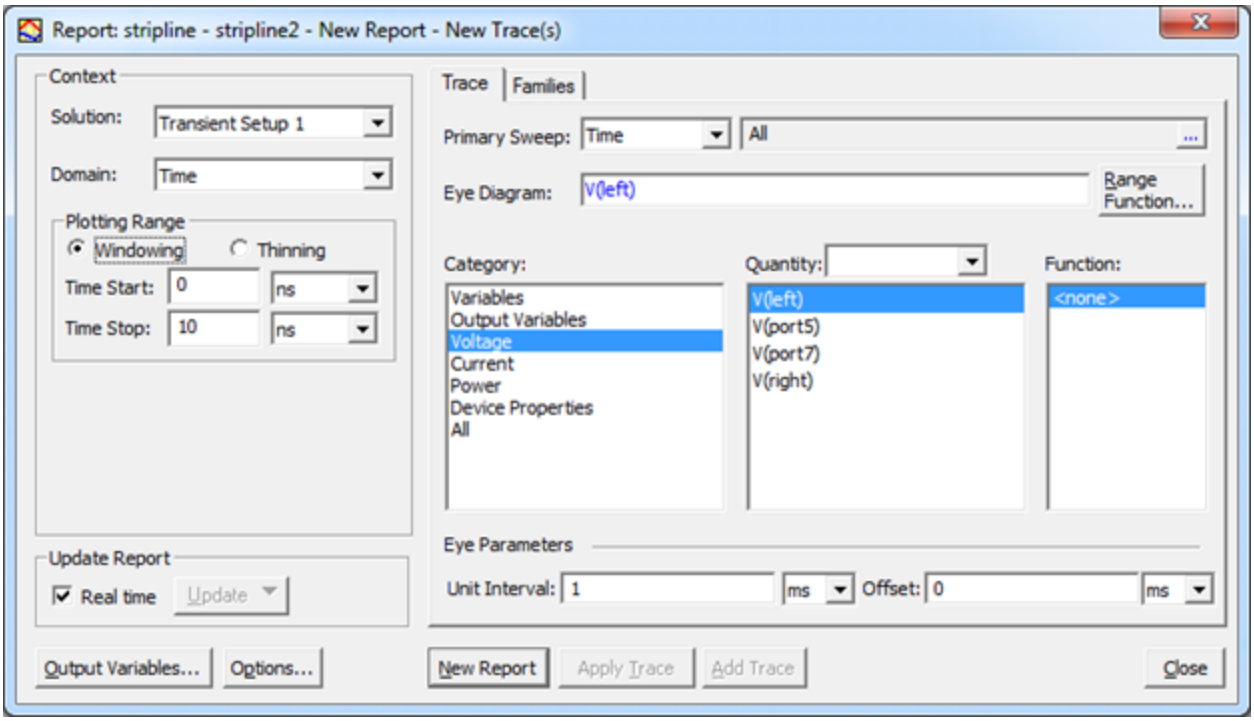


In the spectral domain, set the Start/Stop time and the number of harmonics, then plot spectral plots using the voltage, time, and power quantities.

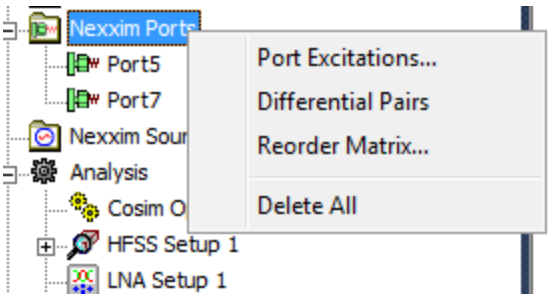


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can also plot eye diagrams in Time domain.



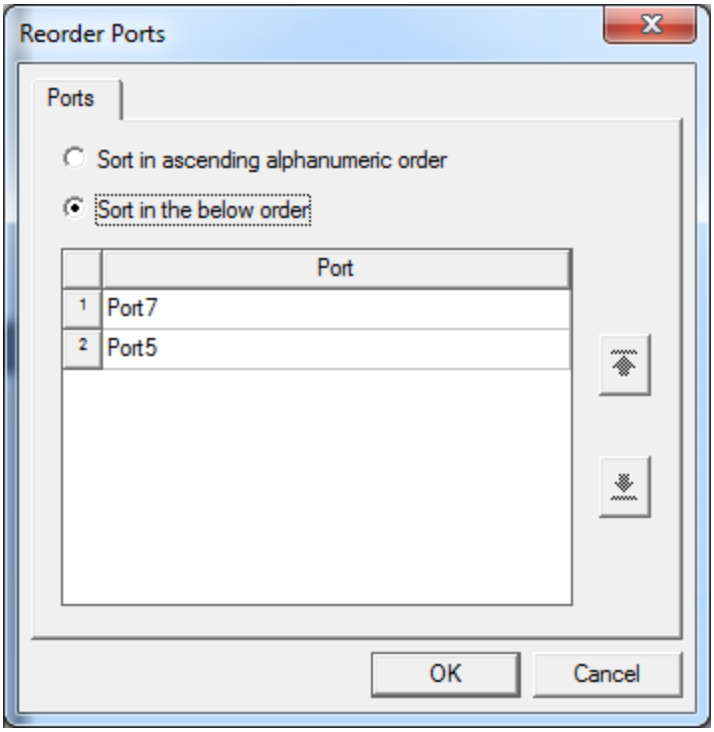
You can also use the post-processing window to reorder ports, set differential pairs, and port excitations for Interface Ports.



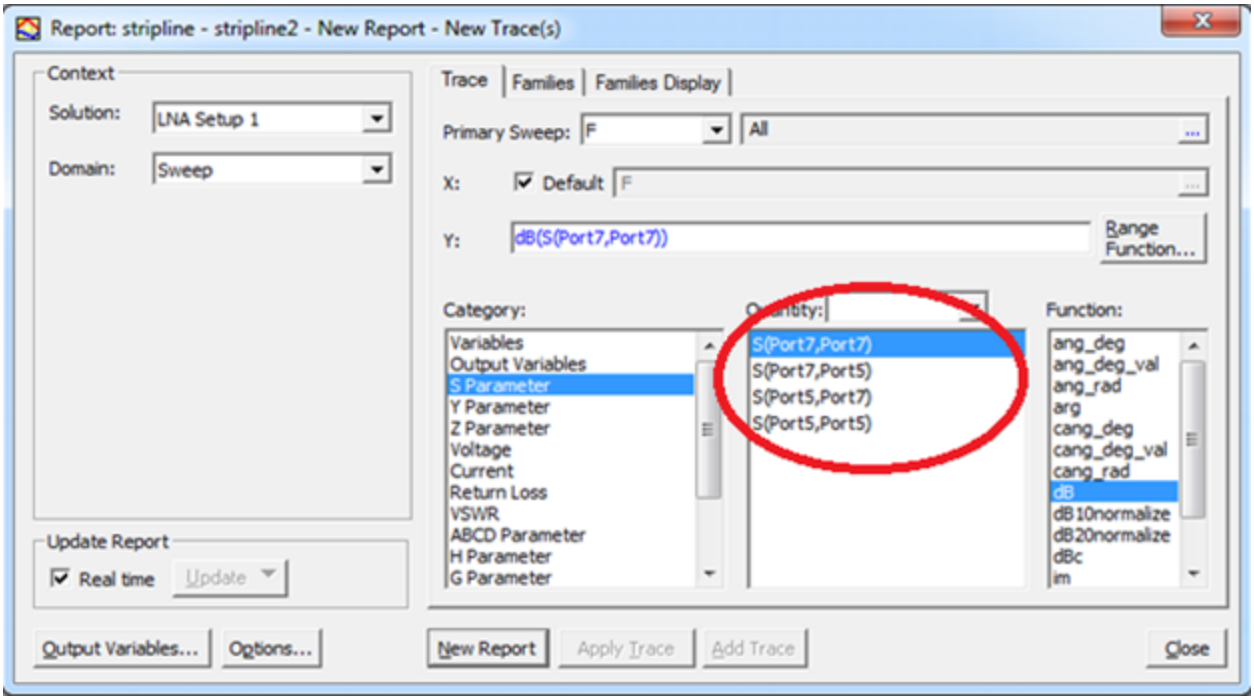
Reorder Nexxim Interface Ports

The user choose to reorder the ports in alphanumeric order or in any custom order of their choice. This order is used to reorder the results matrix and is displayed on the matrix data page, by the Network Data Explorer, and in the Reporter window.

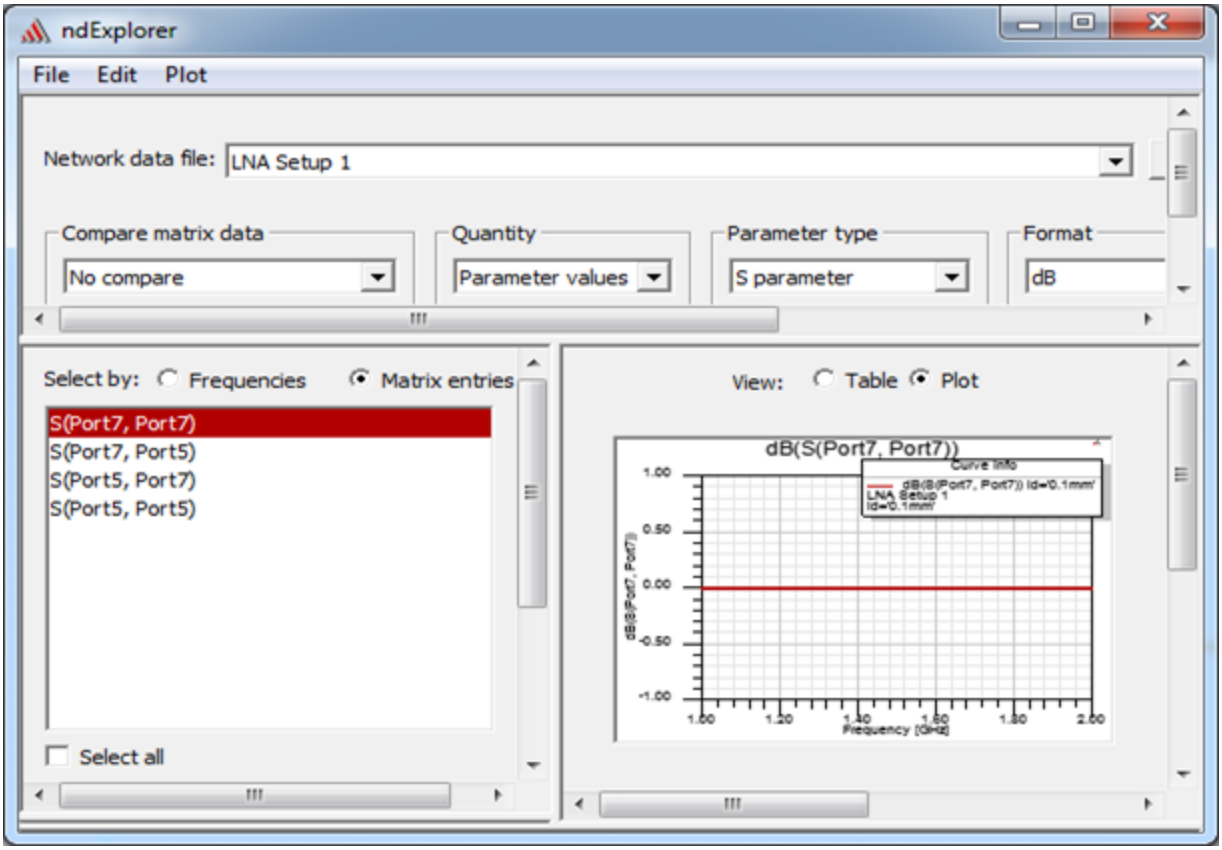
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Here is the order as it is displayed in the Reporter and the Network Data Explorer.



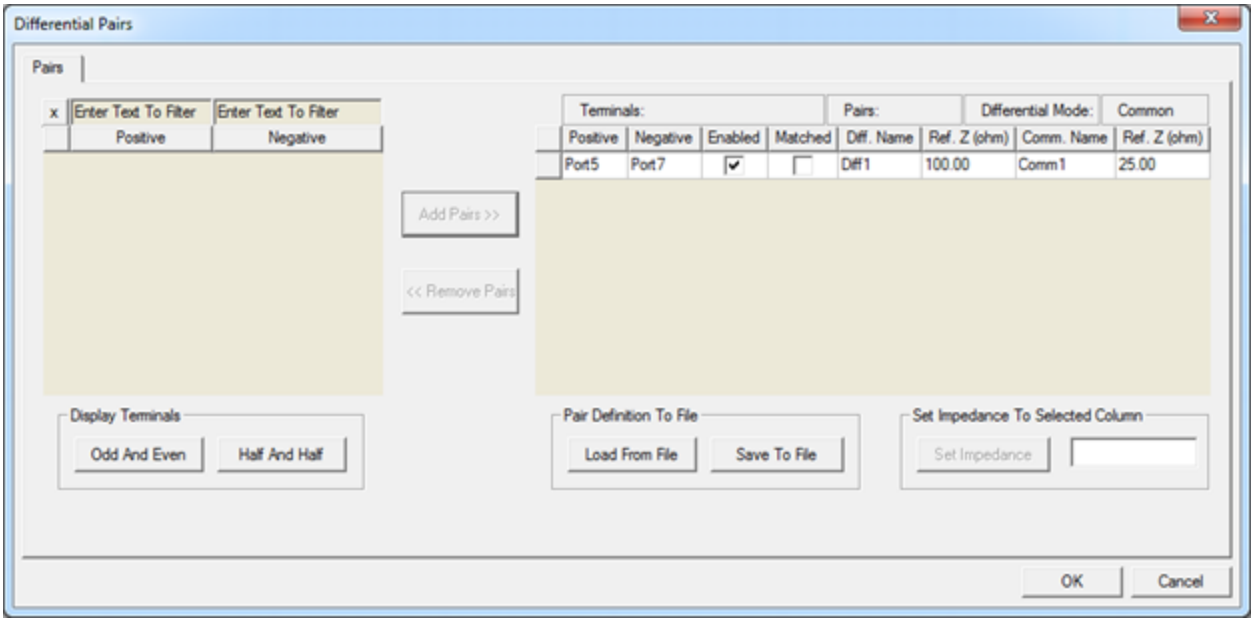
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



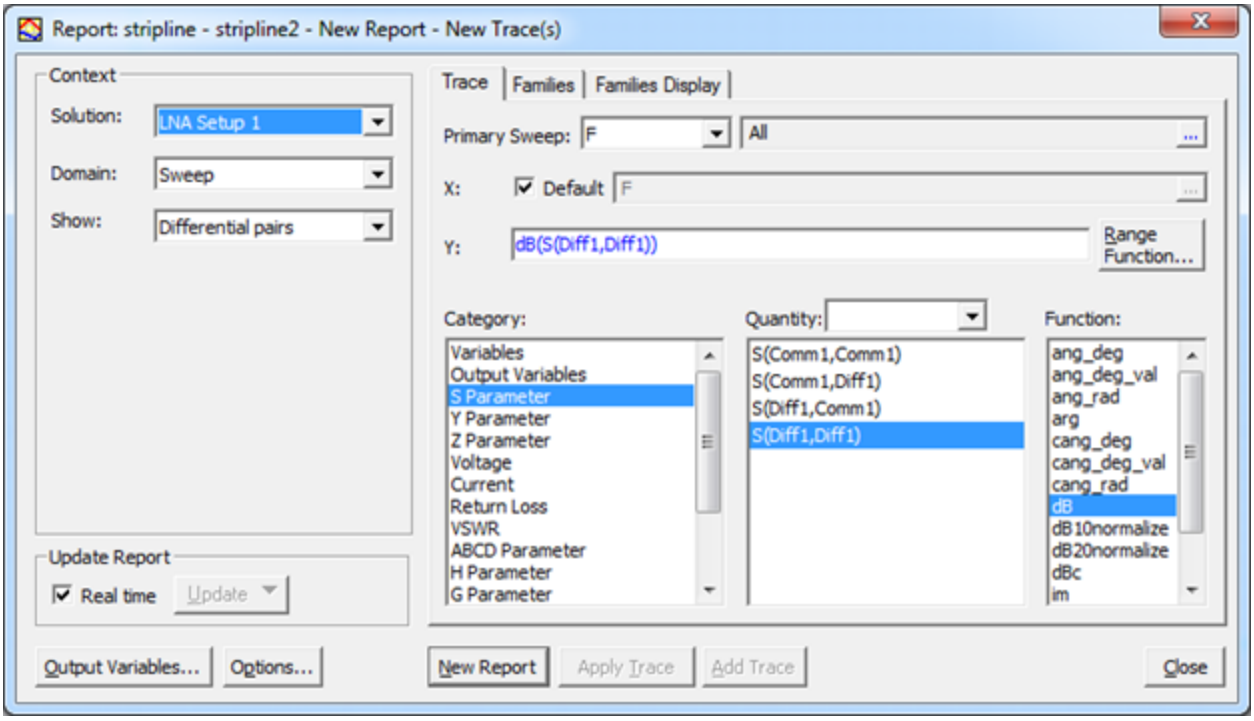
Differential Pairs window

You can set differential pairs for the Interface Ports through the Differential Pairs window. The values can then be accessed in the Reporter window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



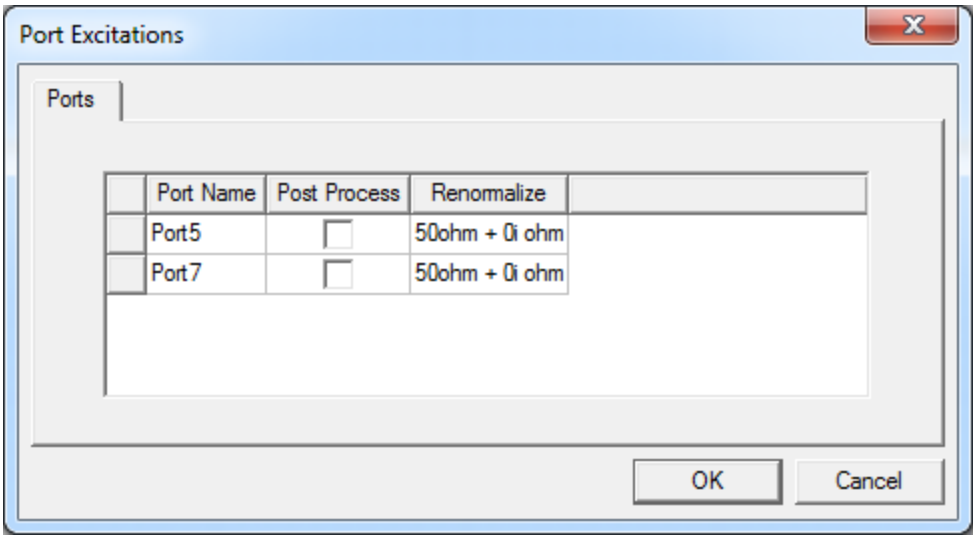
Here is the Reporter window with the differential quantities.



Port Excitations window

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can set the renormalization impedance for the Interface Ports using the Port Excitations window.



Chip Model Analyzer (CMA)

Ansys Chip Model Analyzer (CMA) is an advanced Chip Power Model (CPM) creation tool for performance checking and failure diagnosis of the Power Delivery Network (PDN). CMA can use either HSpice or Nexxim simulators. HSpice and external Nexxim require licenses, but the Nexxim Internal simulator does not.

CMA does not currently interact with Electronics Desktop. However, you can launch CMA from within Electronics Desktop by clicking **Tools** > **Chip Model Analyzer (CMA)**.

From there, you can import CPM files for analysis or create a pseudo CPM.

For more information about using CMA, consult the CMA training documentation by launching CMA and selecting **Help** > **Content**.

PinToPinUtility

The PinToPin utility can quickly extract HFSS or SIwave models for specified nets of package and PCB geometries. It establishes a repeatable process for robust geometry extraction, port configuration, and passive model assignment. Process execution can be done via the user interface (Windows only) or in non-graphical mode (Windows or Linux).

For more information, consult the SIwave and HFSS 3D Layout help.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

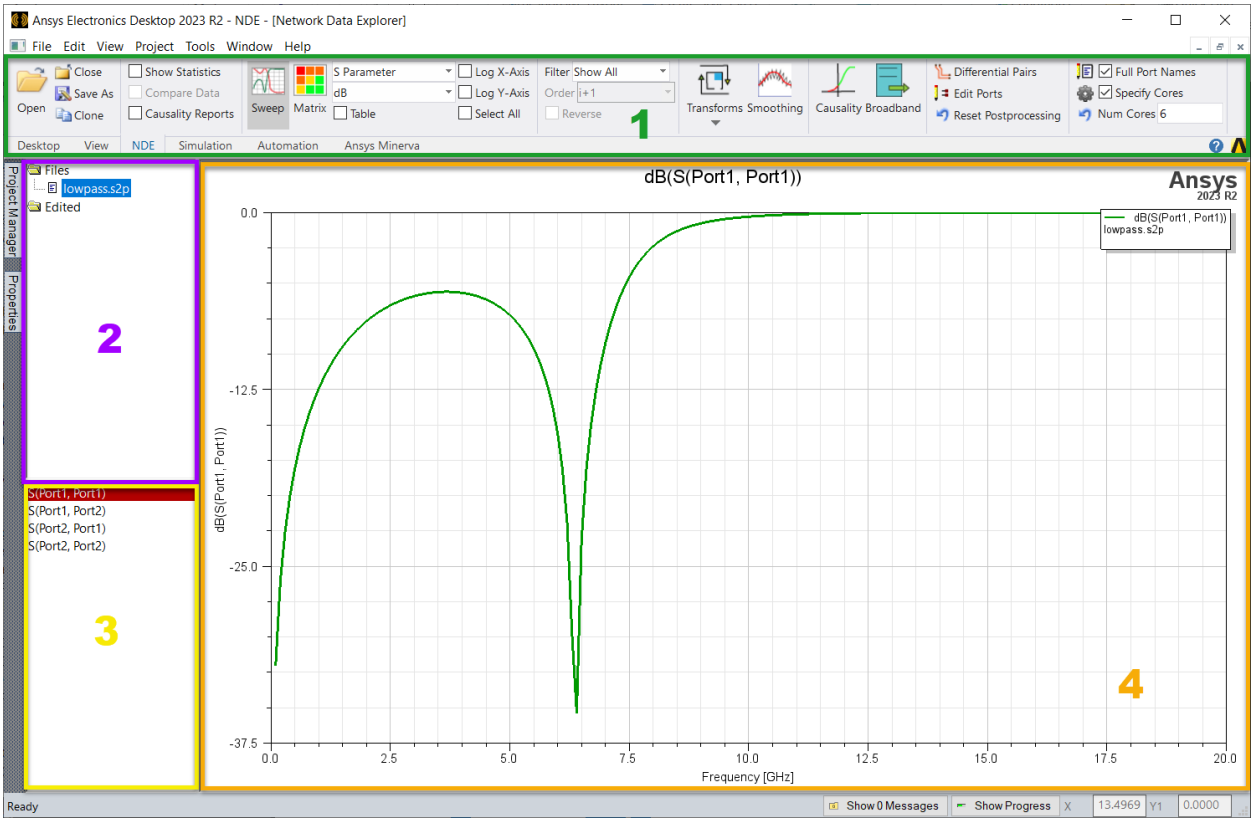
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

20 - Network Data Explorer

The Network Data Explorer provides visualization, analysis, and manipulation tools for network data.

To access Network Data Explorer, click **Tools** > **Network Data Explorer**.

The **Network Data Explorer** window appears.



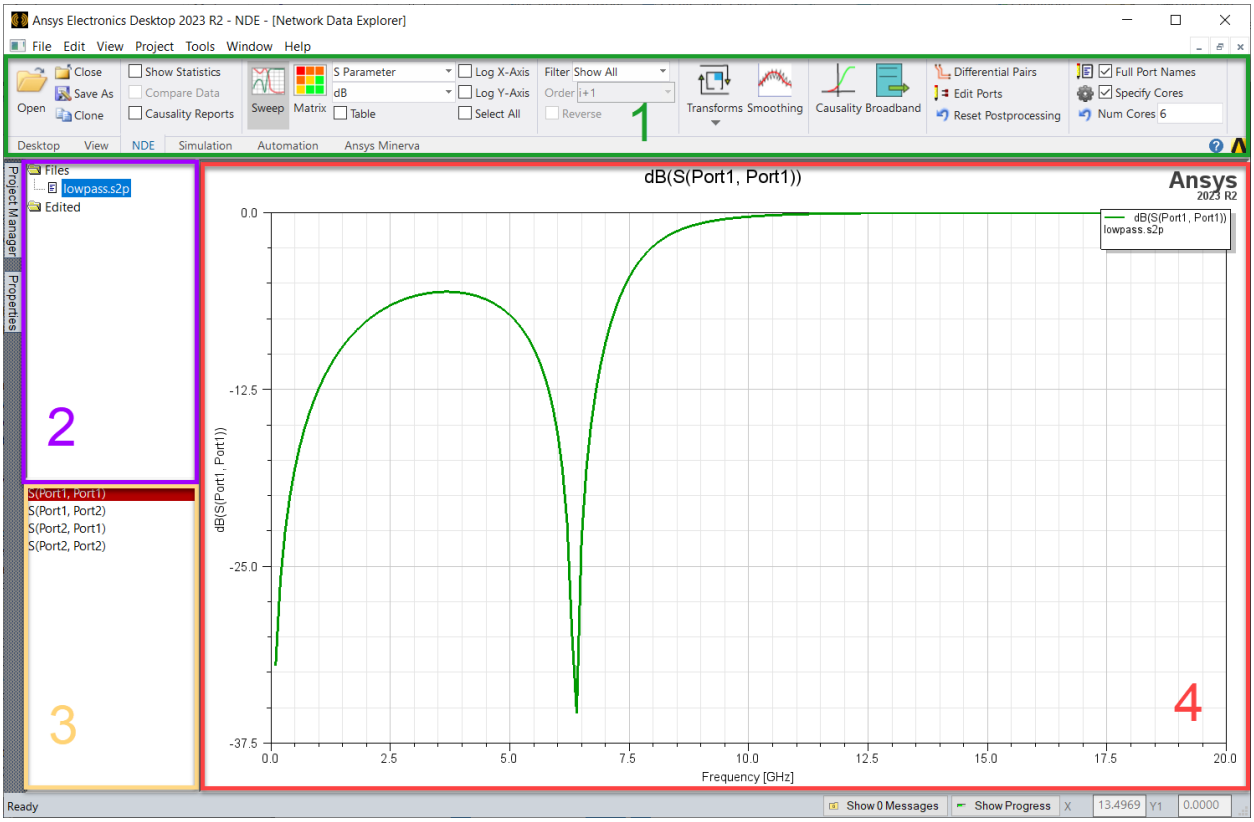
Network Data Explorer Overview

The Network Data Explorer window is divided into the following panes:

1. **NDE ribbon** – allows you to perform many functions of the Network Data Explorer.
2. **Network Data Selection pane** – allows you to select a network data file.
3. **Cell and Frequency Selection pane** – allows you to narrow your selection.
4. **Data View pane** – displays data in table or plot format.

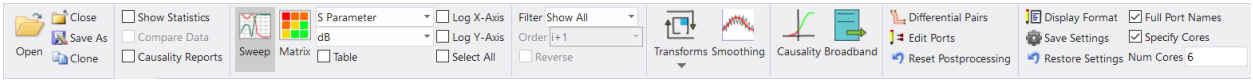
The panes are shown in the following figure. Additional information about each pane follows.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



NDE Ribbon

The ribbon provides access to many of the Network Data Explorer's functions and display options.



On this ribbon, you can control:

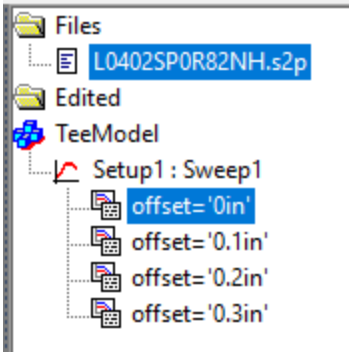
- Plotting - allows you to determine how the data is displayed.
- Quantity – allows you to select the type of quantity to display (parameter values, matrix statistics, or causality plots).
- Parameter Type – allows you to choose the parameter for display (S, Y, or Z parameters, Port Impedance, or Gamma).
- Format – allows you to decide the display function to apply to the data (e.g., magnitude, phase, dB, real, imaginary).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Export – allows you to export either SYZ data (*.s1p, *.ts, *.nmf, *.tab, *.m, *.cit) or Broadband data (*.sp).
- Check – allows you to check causality.
- Cores – allows you to enable or disable multithreading.
- Post-Process Selection – allows you to choose between Terminal Data and Differential Pairs, if your design includes Differential Pairs

Network Data Selection Pane

This pane allows you to view and compare various data sets. Original data sets appear under **Files**. Click one of these to see the data set as it was when it was opened. Altered data sets are listed under **Edited**. These data sets appear here when they have been smoothed, transformed, or changed in some way.



This pane also lists available variations for AEDT design solution data. Variations are listed under a setup name icon (for example “Setup1 : Sweep1”) that is listed under a design icon (“TeeModel”). Variations can be selected and displayed just like other data sets.

Use the **Shift** and **Ctrl** keys to select and display data sets from multiple files simultaneously. Multiple data sets can be selected to display multiple traces in sweep plots, but not in tables. Click the **Files** icon to select all data sets under **Files**. Click the **Edited** icon or a design/setup icon to do the same.

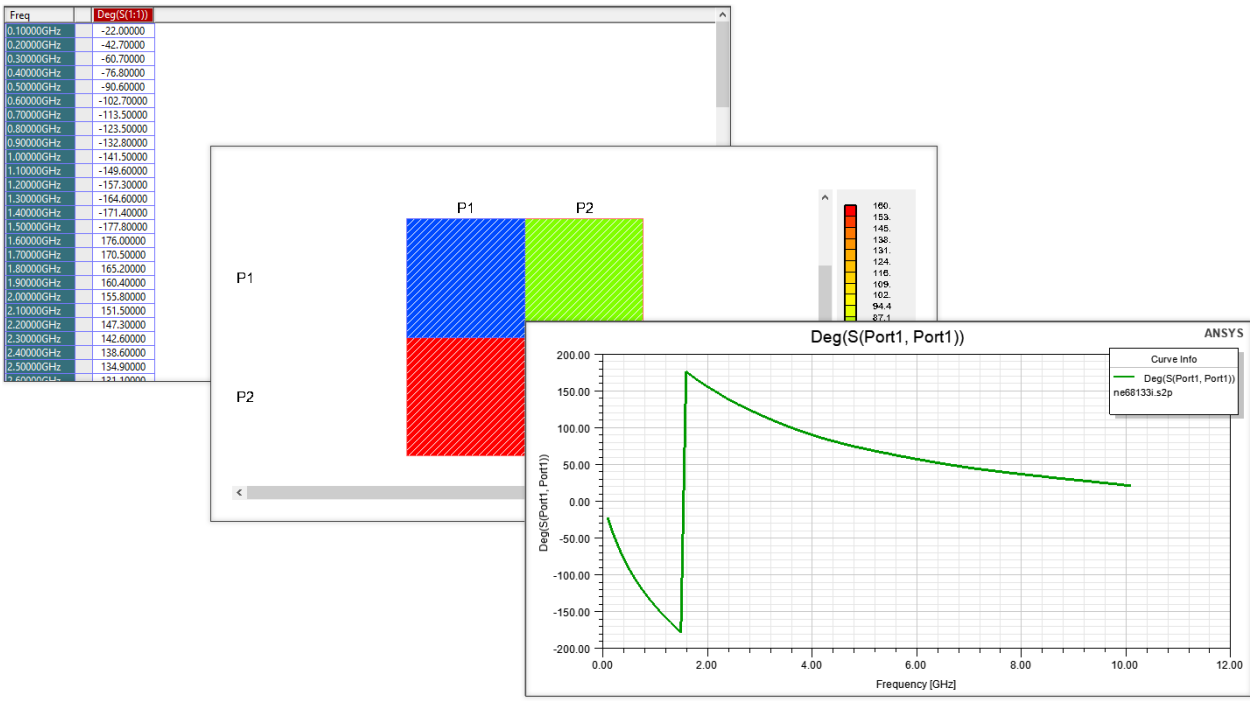
Cell and Frequency Selection Pane

Select the **Sweep** button on the NDE ribbon to display cell entries, for example S(1,1). Select the **Matrix** button to display frequencies. When displayed by frequency, the entire matrix is presented in the Data View pane for each selected frequency. When displayed by matrix cell, the data for the individually chosen cells is shown across all frequencies. Use the **Select All** check box to select all frequencies or cells.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Data View Pane

The Data View Pane displays data for **Sweep** or **Matrix** in either plots or a table, depending on your selection.



Loading Data into Network Data Explorer

You can launch **Network Data Explorer** from within several Ansys products. In the Project Manager, open <project> > **Analysis** > **Setup***n* > **Sweep***n*. Right click on the sweep and click **Network Data Explorer** in the shortcut menu. The current solution data is automatically loaded and ready for viewing. Otherwise, you must load a data file into Network Data Explorer.

> **Note:** When solution data that is loaded into NDE is modified and resimulated in another Ansys product, the NDE data automatically updates.

You can import the following file types:

- Touchstone Format (*.s*p)
- Touchstone 2 Format (*.ts, *.sp)
- Citifile (*.cit)
- Neutral Format (*.nmf)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- State Space File (*.sss)

> **Note:**
>
> When this type of file is loaded, Network Data Explorer regenerates s-parameter data based on the file.
>
> You can compare the regenerated s-parameters to the original data.

To import a file into Network Data Explorer, either drag and drop an analysis from the Project Manager into Network Data Explorer or

1. On the **NDE** ribbon, click **Open**. An **Open** window opens.
2. Navigate to and select a file.
3. Click **Open**. The file appears in the **Files** tree.

The file browser allows you to open multiple files at a time. However, the displayed data always corresponds to the data set indicated in the Network Data Selection pane. Click the file you want in that pane to switch between data sets.

Exporting Data from Network Data Explorer

Network Data Explorer allows you to export data to a variety of different file formats.

In this section, you will learn about:

Exporting SYZ Data

Exporting Macro Model

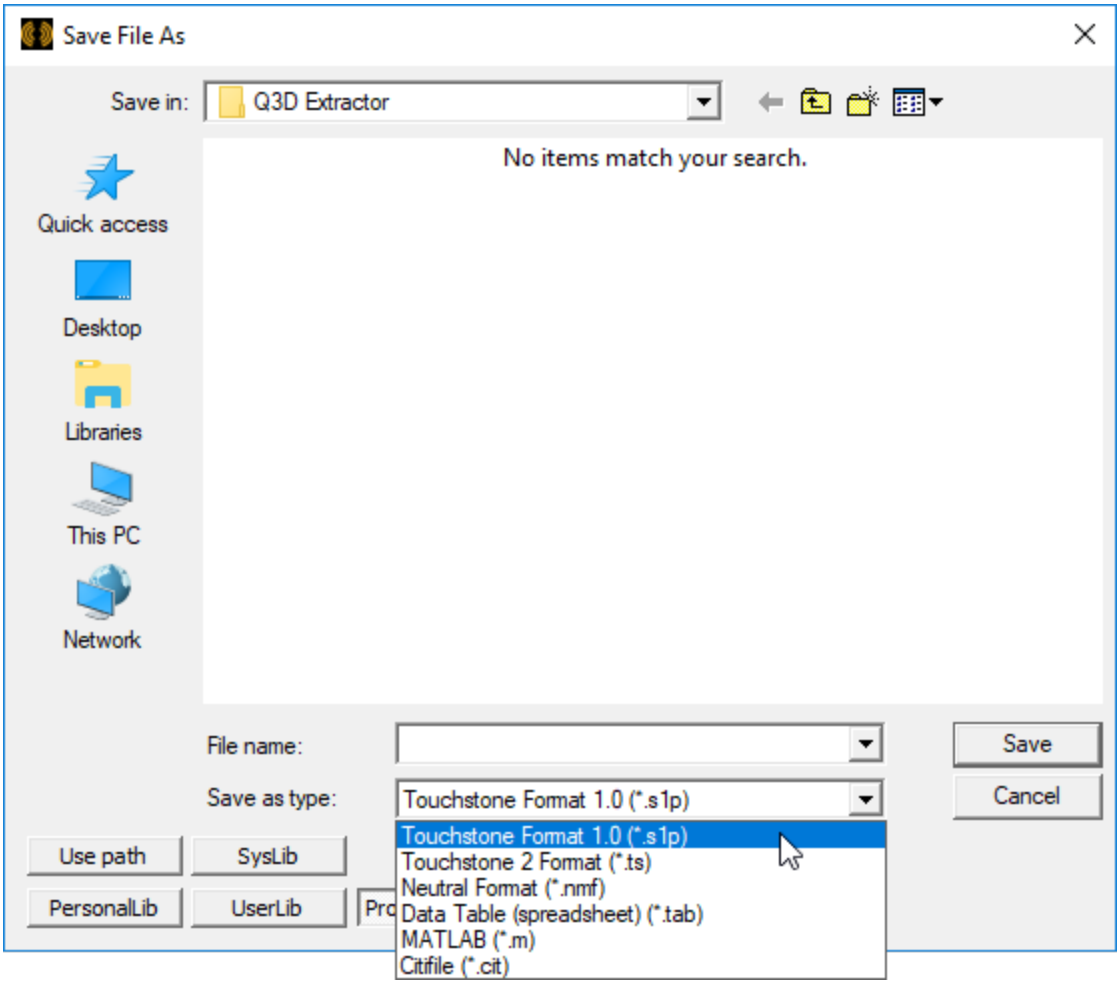
Creating an NPort Model

Scripting for Network Data Explorer

Exporting SYZ Data

To export SYZ data from within Network Data Explorer, click the **Save As** icon on the **NDE** ribbon. The **Save File As** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

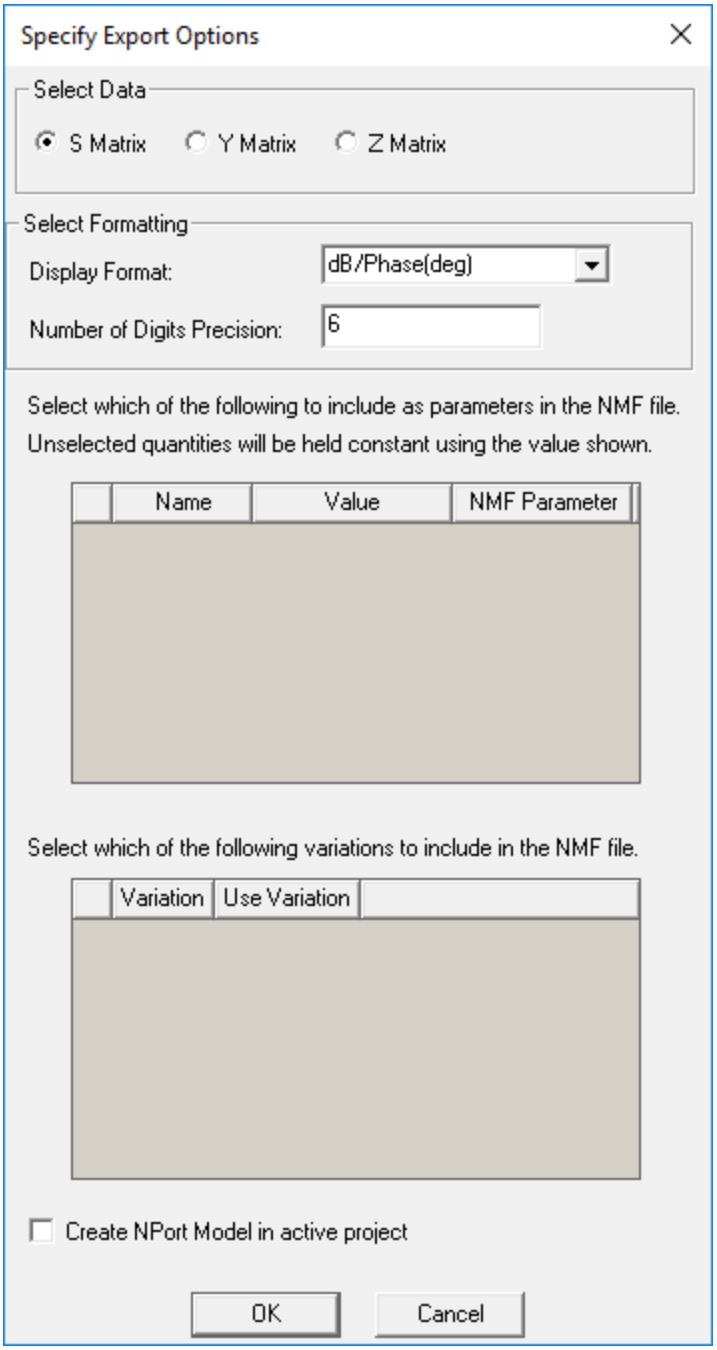


You can export data in any of six file types:

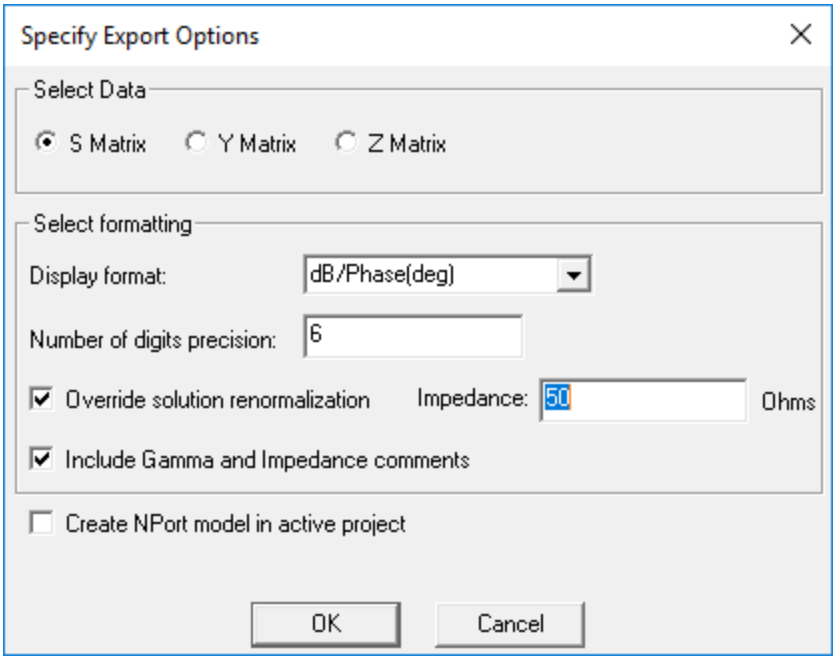
- Touchstone Format 1.0 (*.s*p)
- Touchstone 2 Format (*.ts)
- Neutral Format (*.nmf)
- Data Table Spreadsheet (*.tab)
- MATLAB (*.m)
- Citifile (*.cit)

Select a file type and name for export. A **Specify Export Options** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Depending on the type of export file, different options appear. However, all file types allow you to:

- Select from **S Matrix**, **Y Matrix**, and **Z Matrix** data.
- Select the **Display Format**.

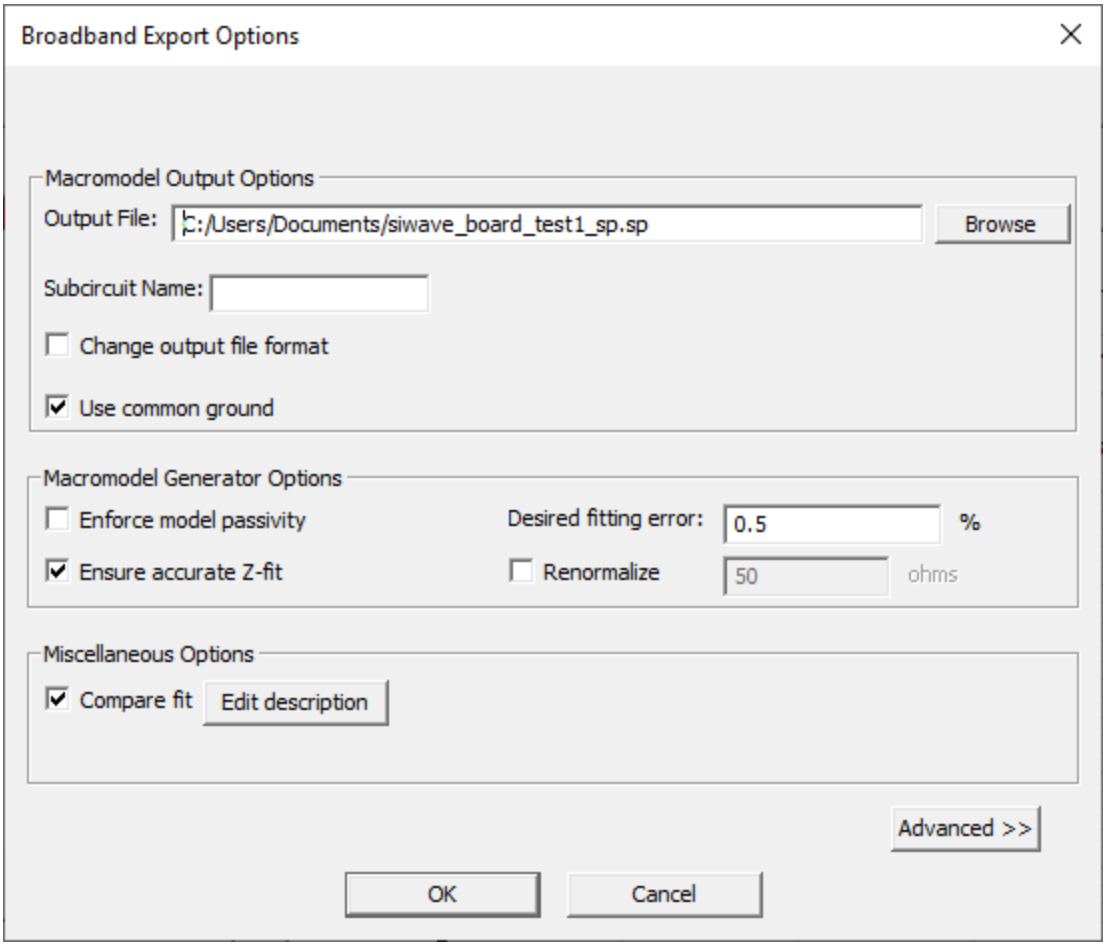
Some types allow you to create an NPort Model in the active project.

Exporting Macro Model

Network Data Explorer lets you export macro model data. To export data, click the **Broadband** icon on the **NDE** ribbon.

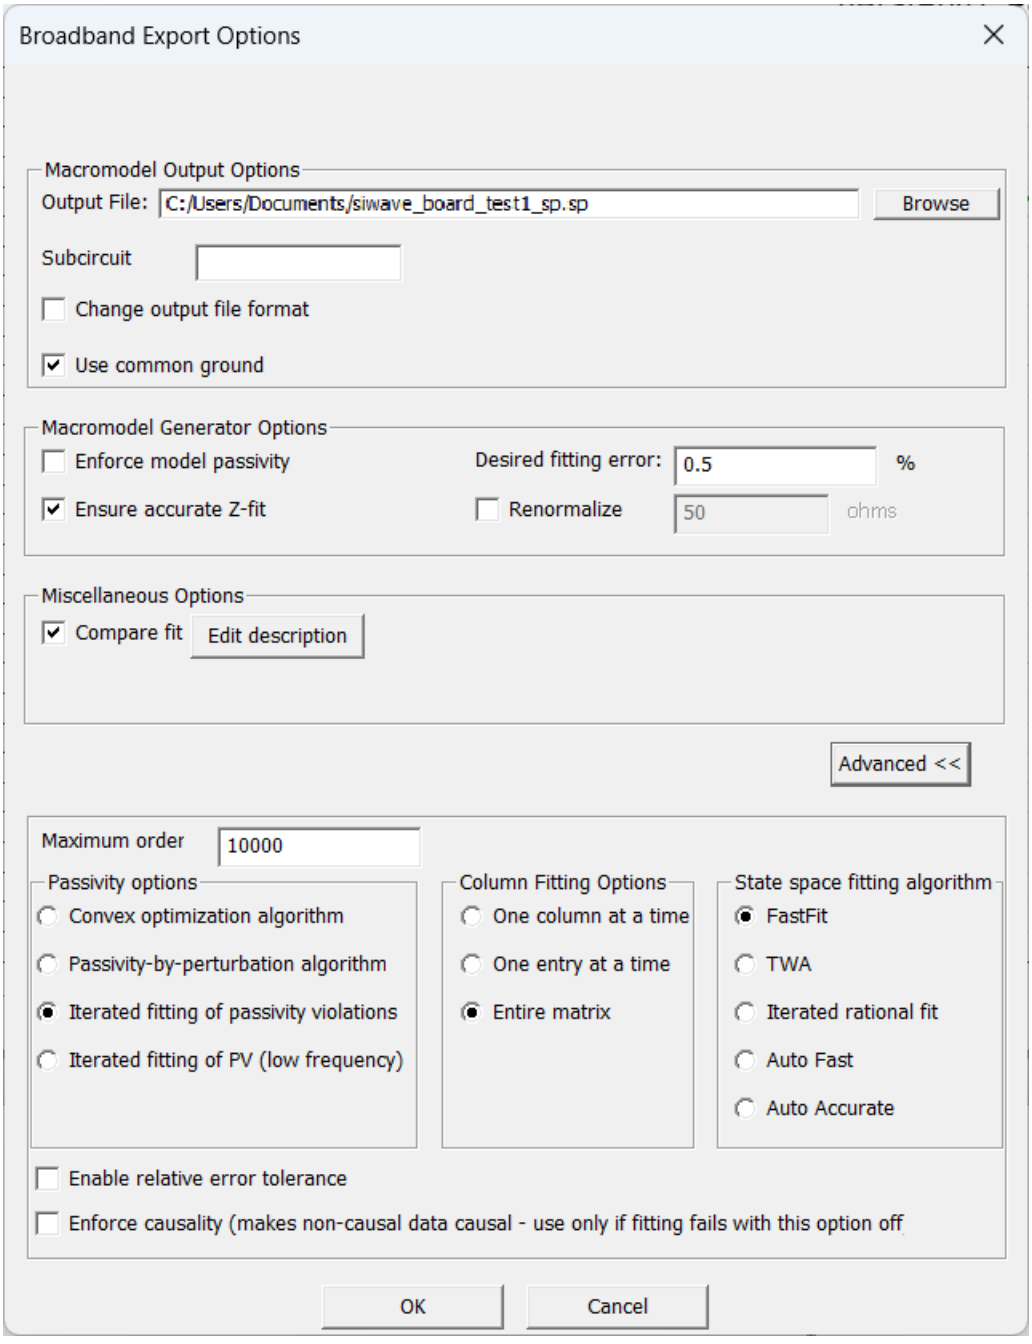
The **Broadband Export Options** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Click **Advanced >>** to view all options.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Macromodel Output Options include:

- **Output File** – Allows you to choose the name and location of the file.
- **Subcircuit Name** – Use this field to name the subcircuit.
- **Change Output File Format** – Check this box to open a submenu allowing you to select a new output format.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Use Common Ground** – Check this box to use common ground. When this option is on, ports are referenced to ideal ground (node 0). When this option is off, extra ports are generated to provide the reference levels. Common grounding is best when the pins are physically near to each other and ideal ground is suitable. For distant connections and circuits with non-ideal reference levels such as differential pairs, common grounding is not used.

  Note:

  - R and L values may be quite sensitive to the values of the S-parameters. This is an issue if the actual impedance value is much greater than or much less than the reference impedance of the S-parameters.
  - Since resistances of power cables is typically in the milliohms range at DC, using a reference impedance of 50 ohms is 5000 times higher. This causes any fitting errors in the state space model to get multiplied by 5000 times when the R and L values are computed.
  - As a general rule, for high power applications a reference impedance of 1 ohm is probably a better choice than 50 ohms.

Macromodel Generator Options include:

- **Enforce Model Passivity** – Check this box to enforce passivity.
- **Ensure Accurate Z-fit** – Check this box when state-space fitting of Y-parameters or Z-parameters does not produce an accurate fit.
- **Desired Fitting Error** – Allows you to select the value at which rational fitting fails (if the fitting error exceeds this value).
- **Renormalize** – Check this box to renormalize using the specified impedance item. 50 ohms is the default setting, but you can type a different value.

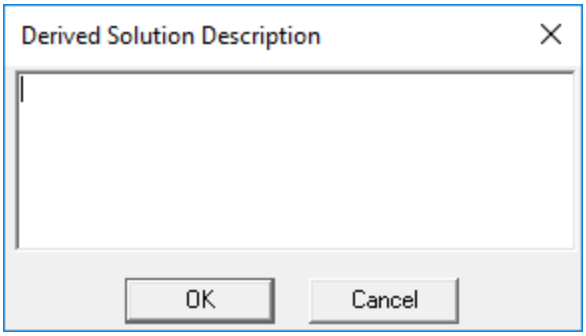
  Note:

  - R and L values may be sensitive to S-parameter values. This presents an issue if the actual impedance value is much greater than or much less than the reference impedance of the S-parameters.
  - Since resistances of power cables are typically in the milliohms range at DC, using a reference impedance of 50 ohms is 5000 times higher. This causes any fitting errors in the state space model to be multiplied by 5000 when the R and L values are computed.
  - For high-power applications, a reference impedance of 1 ohm is generally a better choice than 50 ohms.

Miscellaneous Options include:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Compare Fit** – When this box is checked, the original and derived solution will be available for comparison. You can click **Edit Description** to open the **Derived Solution Description** window and add a text description to better identify the export.



Advanced Options include:

- **Maximum Order** – Allows you to specify the number of poles. See Note below.
- Passivity Options – If you enabled **Enforce Model Passivity**, this area allows you to select the passivity enforcement method.
  - Convex optimization algorithm – guarantees a passive state-space realization, but is very slow and memory-intensive. Not practical for numbers of ports beyond ten.
  - Passivity-by-perturbation algorithm – designed for systems with a large number of ports. Less accurate than the Convex optimization method.
  - Iterated fitting of passivity violations (IFPV) (default) – less accurate than other algorithms but more suitable for larger numbers of ports.
  - Iterated fitting of PV (low frequency) – similar to IFPV while improving the fit to "Z" at DC and low frequencies. A better choice of passivity enforcement when the fit to corresponding "Z-data" is important such as power delivery, EMI/EMC applications.

> **Note:**
>
> For a more detailed explanation on any of the passivity options, see the technical note section of the Circuit help.

- **Column Fitting Options** – This area allows you to choose how poles are matched to columns:
  - **One Column at a Time** – The set of poles will be shared across all entries of a single column.
  - **One Entry at a Time** – Each entry will be fitted using a separate set of poles.
  - **Entire Matrix** – The set of poles will be shared across all entries of the matrix being fitted.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

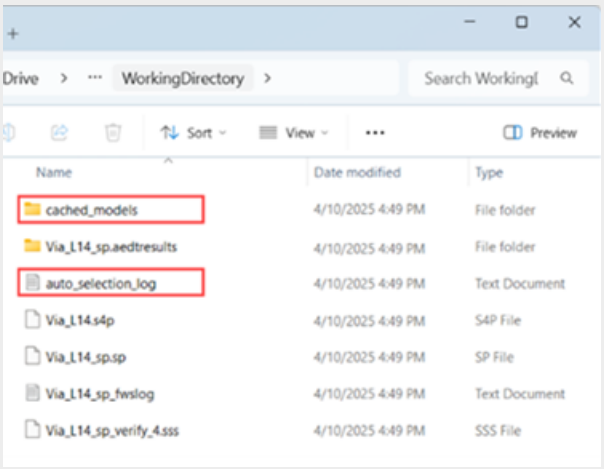
> **Note:**
>
> - Typically, using the same set for all entries is adequate, and yields the most compact models. However, if all the entries of the matrix have completely unrelated transfer functions, it may be better to fit them using separate pole sets.
> - The options **One column at a time** and **One entry at a time** do not work when either **Ensure accurate Z-fit** or FastFit is used.

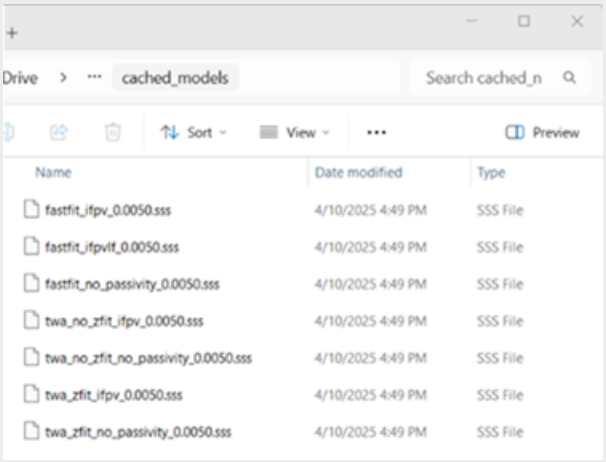
- **State Space Fitting Algorithm** – Allows you to select FastFit, TWA, Iterated rational fitting, Auto Fast, or Auto Accurate.
  - **FastFit** (default) – FastFit is the Ansys-proprietary method for state-space fitting. Network Data Explorer uses FastFit for calculating the state-space matrices from the network data. The FastFit algorithm for state-space fitting is an alternative to the Tsuk-White algorithm (TWA) and Iterated Rational Fitting (IRF) methods. FastFit is generally as accurate as TWA, but is significantly faster than both TWA and IRF. It also aims to fit the lower frequencies with higher fidelity.
  - **TWA** – The Tsuk-White Algorithm is an Ansys-proprietary method for fitting a state space model to extracted s-parameter data. It uses techniques based on Singular Value Decomposition (SVD) to quickly determine required number of poles for fitting a model.
  - **Iterated Rational Function** – The IRF fitting approach takes a matrix of S-parameter data and, for each matrix entry, tries a succession of different pole-zero approximations (increasing the number of poles used at each iteration) until it can find an acceptable fit to the data. For broad frequency sweeps and large numbers of excitations, this process can be time consuming because of all the iterations and is not guaranteed to produce a good fit to the data. It is retained as a fallback if the TWA algorithm fails.
  - **Auto Fast**- (Beta) To use the Auto Fast option, first enable **State Space Fitting Auto Selection** in the Beta Options dialog. The Auto Fast option runs all the fitting options in parallel and returns the first model that meets the user's specifications. It takes less time, however, the model may not be the one with the least fitting error.
  - **Auto Accurate** - (Beta) To use the Auto Accurate option, first enable **State Space Fitting Auto Selection** in the Beta Options dialog. The Auto Accurate option runs all the fitting options to completion, then returns the model with the least fitting error. This option may take longer but it is guaranteed to return the best fit model.

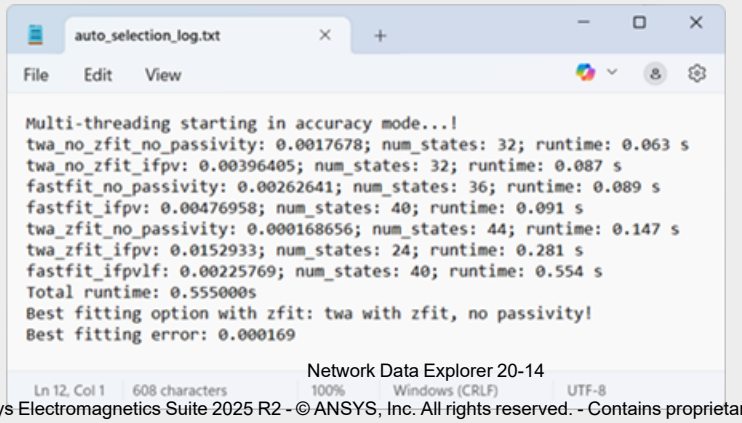
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

After a successful completion of Auto Fast or Auto Accurate, a new folder and a log file (.txt) is created in the working directory. The folder, named cached_models, contains the .sss files from the parallel runs of the different state-space fitting options. The log file, named auto_selection_log.txt, contains the status of each fitting thread.







Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

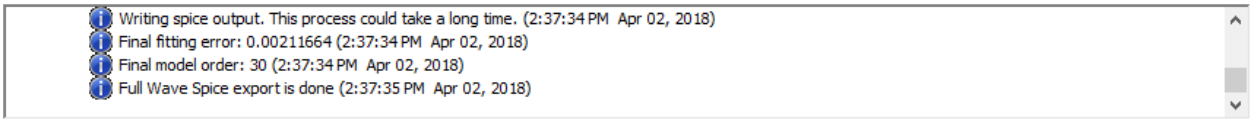
- **Enable Relative Error Tolerance** – Allows you to enable relative error tolerance, which works best with TWA fitting.

  > **Note:**
  >
  > The **Enable Relative Error Tolerance** option works best with the TWA fitting algorithm, is not recommended for use with iterated rational fitting, and is disabled when either FastFit or **Ensure accurate Z-fit** is used.

- **Enforce Causality** – Allows you to make non-causal data causal. Use this option only if fitting fails without it.

  > **Note:**
  >
  > Broadband models are built from a rational-function approximation of the data. The fidelity of this approximation can be controlled by setting the Maximum order (number of poles).

Click **OK** to begin the export. The **Messages** pane details the export process.



Comparing Original S-Parameters with Exported S-Parameters

If **Compare Fit** was checked during export, the **Data Selection** pane updates to list both the original and exported solution *and* the **Compare** checkbox is checked.

Creating an NPort Model

Touchstone, Neutral Format, and Citifile exports allow you to select an option to **Create NPort Model in active project**.

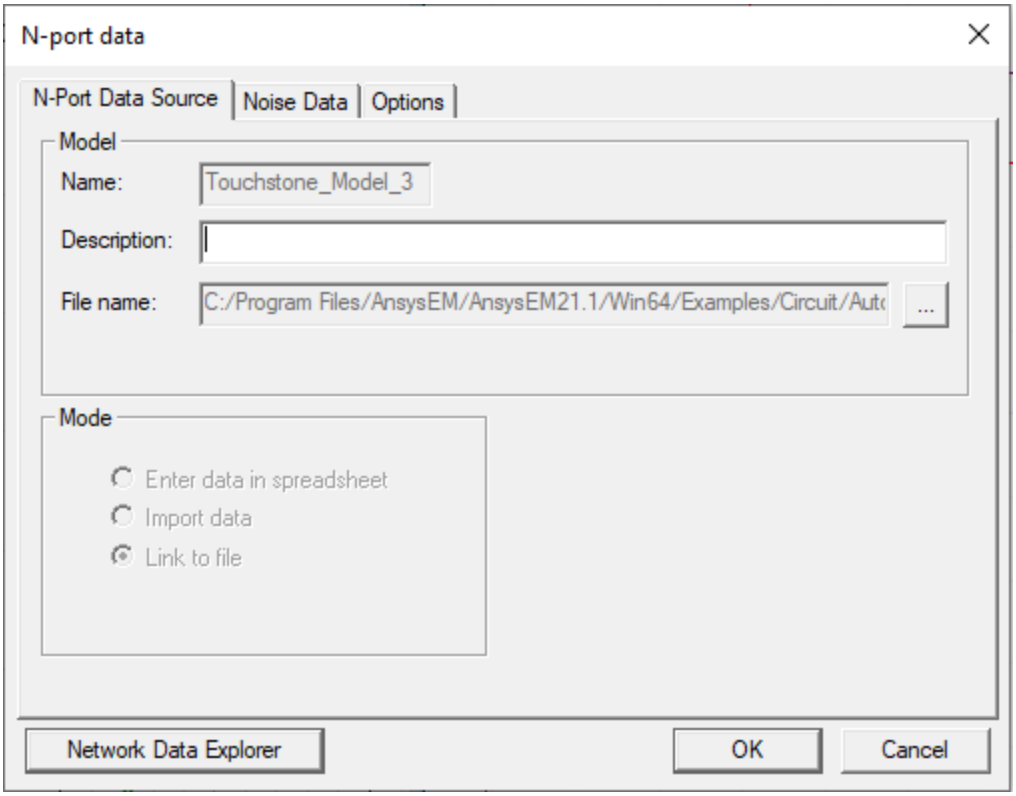
Creating an NPort Model exports the active data set back to the design, either as a static n-port model or as a parametric n-port model. If there are multiple variations, a parametric n-port model is automatically created containing all variations. When only a single variation exists, the user can create a static n-port model that either links to a file (the data is exported first) or stores the data itself. Linking to a file reduces the size of the ADSN file. The newly created model can be placed as a component in a circuit. This is particularly useful after reducing the number of ports via termination.

The import of the exported solution is done by reading the exported Touchstone file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

State Space N-Port Data Source Tab

The **N-Port Data Source** tab is used to name the N-port device and specify the source for the data, typically an external file.



- **Name** — Displays the name of the imported solution as it appears in the **Project Tree**.
- **Description** – Used to set or change the description of the imported solution. To change the description, click in the box , then type the description you want.
- **File Name** – Used to display or change the file name of the imported solution. To change the file name, browse (...) for a file.
- **Mode** – The network solution data is read from an external **Link to file** at analysis time.
- **Network Data Explorer** allows you to view solution data by opening the Network Data Explorer.

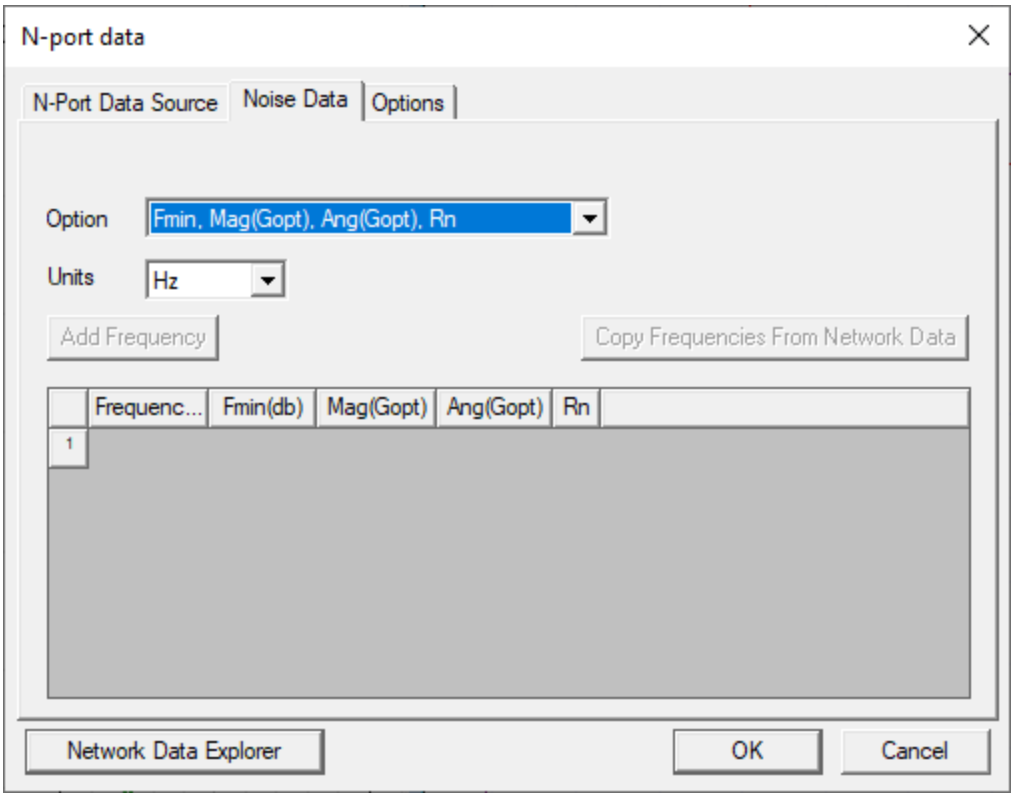
> **Note:**
>
> **Network Data Explorer** is not activated for State-Space models.

When the **N-Port Data Source** options have been entered, click **OK** or select another tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

State Space N-Port Data Noise Data Tab

Click the **Noise Data** tab to enter frequency-dependent noise parameters.



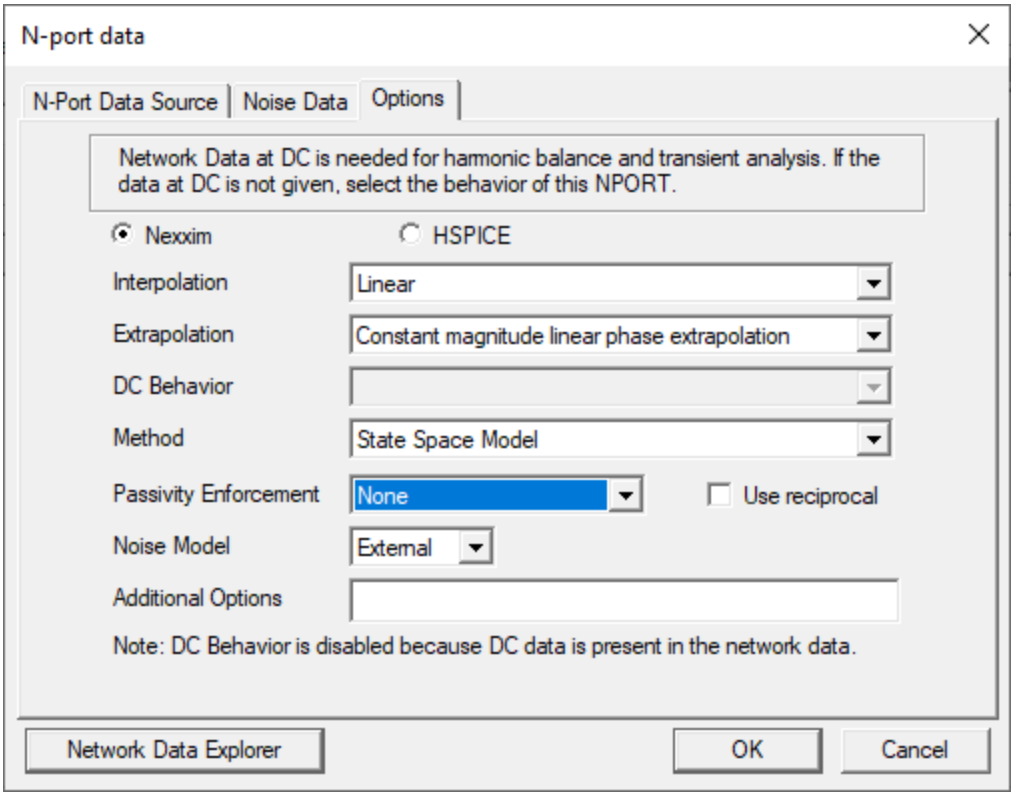
- The **Option** field selects the units for the noise parameters:
- The **Units** field selects the units of frequency: **Hz**, **KHz**, **MHz**, **GHz**, **THz**, or **rps**.
- click **Copy Frequencies from Network Data** to create a list of frequencies that correspond to the frequencies in the N-port data file.
- click **Add Frequency** to add a new frequency to the end of the list.

Enter the noise data for each frequency in the list, then click **OK** or select another tab.

State Space N-Port Data Options Tab

The **Options** tab is used to select the behavior of the selected NPort.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



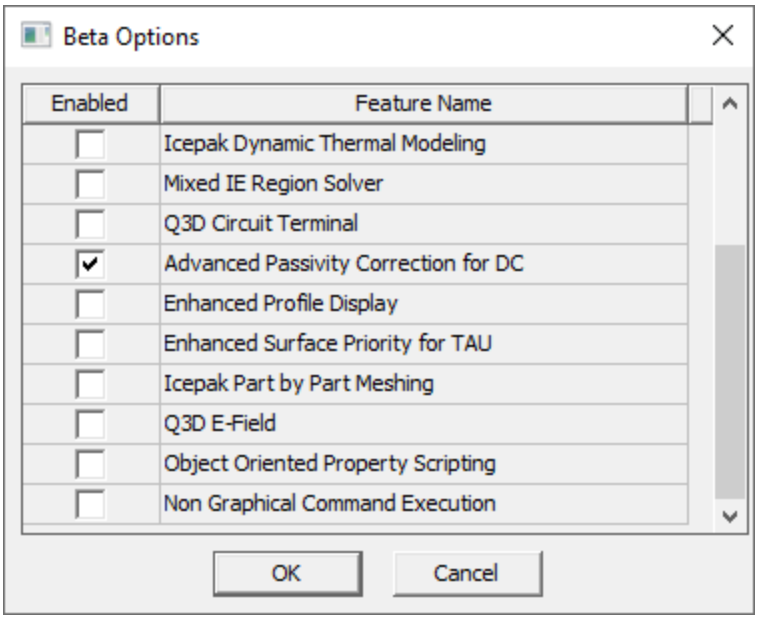
The following controls are available:

- **Nexxim/HSPICE** — Sets the NPort type. The selections for Interpolation, Extrapolation, DC Behavior, Method, and Passivity Enforcement depend on the NPort type selected.
- **Interpolation** — Specifies the interpolation method for data points in the frequency range of the Touchstone data.
- **Extrapolation** – Specifies the extrapolation method for data points outside the frequency range of the Touchstone data.
- **DC Behavior** — Specifies behavior of the N-Port at DC (zero frequency).
- **Method** – Specifies the method used to convert frequency domain data to the time domain. Choice of methods is available only for Nexxim Nports.
- **Passivity Enforcement** — Performs a passivity check on the S-parameter data and attempts to correct non-passive data. The options are None, IFPV, IFPVLF, Convex Optimization, and Passivity by Perturbation.

  Passive devices may dissipate or temporarily store energy, but never generate energy. Use the drop-down menu to select the method for enforcing passivity. Passivity enforcement is available only for Nexxim NPorts. See Passivity Checking and Enforcement. For details on passivity checking and enforcement, see S-Parameter Technical Notes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When applying IFPVLF, the passive DC fit to Scattering Parameter Data (S-data) can deteriorate to the point the inaccuracies of the (passive) fit to the corresponding Impedance Data (Z-data) at zero frequency (DC) and low-frequency may cause inaccurate time-domain steady state simulations. If preserving an accurate passive DC fit to S-data is important, like it is in power electronics applications, e.g., with DC-DC converters and power supply Voltage Regulator Module (VRM)), then click the **Advanced Passivity Correction for DC** beta option to enhance the passive DC fit to S-data using IFPVLF. The **Advanced Passivity Correction for DC** is located in the **Beta Options** in the Global Options.



- **Use reciprocal** – Computes the inverse, or reciprocal, at each frequency so the N-port can be used for de-embedding. See Deembedding S-Matrices.
- **Noise Model** – Specifies noise model for DC and frequency-domain analyses:
  - **None** – No noise analysis
  - **Internal** – Use internal noise model
  - **External** – Use noise data from Touchstone file if present, else use internal noise model
- **Additional Options** — Allows you to add model-level options for Nexxim or HSPICE.

When the N-port Options have been entered, click **OK** or select another tab.

- **Network Data Explorer** – Allows you to view solution data by opening the Network Data Explorer.

When the N-port Options have been entered, click **OK** or select another tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Scripting for Network Data Explorer

Scripting is available for each Network Data Explorer export method, which means a script can be recorded to duplicate the export process.

Network Data Explorer can be invoked in the following contexts, and scripting is available from the Project Context and the Design Instance Context (simulation setup):

- **Project Context** – In the context of a project, you can open a touchstone file and then export.
- **Design Instance Context** – In the context of a solution (RCM from the simulation setup in a design), you can export the corresponding network data solution.

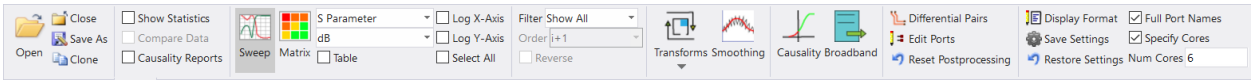
When there is no design available, export functionality and scripting are not available.

When there is no design available, export functionality and scripting are not available.

For more information, see Network Data Explorer Script Commands in the *Ansys Electronics Desktop Scripting Guide*.

Network Data Explorer Ribbon

The **NDE** ribbon provides access to many of the Network Data Explorer's functions.



In this section, you will learn about:

Data Sources

Setting Display Format

Displaying Full Port Names

Saving or Resetting Default Settings

Smoothing All Frequencies

Cell Filtering

Editing Port Properties

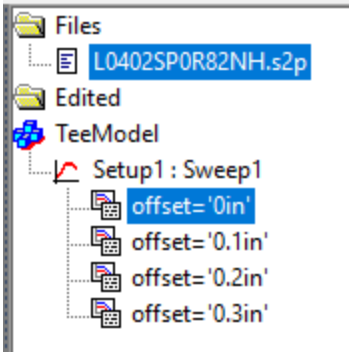
Defining Differential Pairs and Displaying Mixed Mode Parameters

Resetting All Port Properties

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Network Data Explorer Data Sources

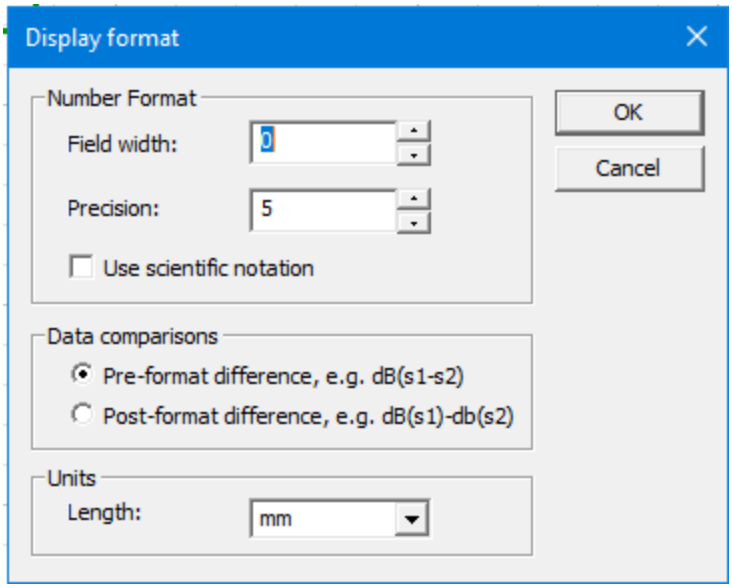
Network Data Explorer allows you to easily view all data sources in the **Network Data Selection** pane.



Network Data Explorer Display Format

The **Display Format** window affords additional control over the display of values in Network Data Explorer.On the **NDE** ribbon, click the **Display Format** icon.

The **Display Format** window appears.



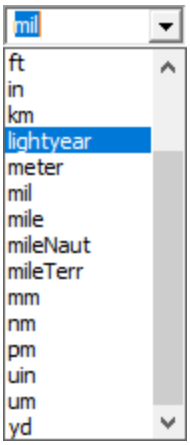
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **Number Format** options allow you to specify **Field Width** (the minimum number of characters used to display a number) and **Precision** (the number of decimals to display). You can also check the **Use scientific notation** check box, if desired.

The **Data comparisons** options allow you to choose Post-format difference or Pre-format difference.

- **Pre-format difference** – when comparing data sets, subtract values before applying the formatting function (e.g. dB, magnitude); the values displayed will be the magnitude, dB, etc., of the complex difference.
- **Post-format difference** – when comparing data sets, subtract values after applying the formatting function (e.g. dB, magnitude); the values displayed will be the difference between the magnitude, dB, and so on.

The **Units** option allows you to specify the **Length** unit (the unit used to display and interpret length values). The default is mm.

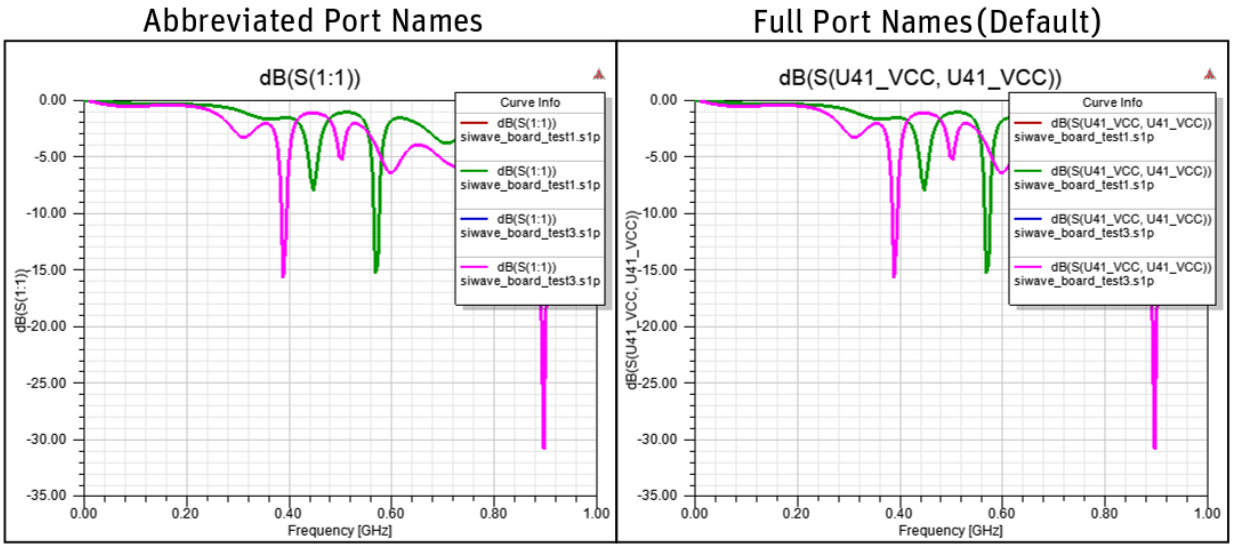


Network Data Explorer Display Full Port Names

By default, full port names are displayed. This applies to both the Data Selection pane and the Data View pane. To change this so that port names in Network Data Explorer are displayed in an abbreviated form (P1, P2, etc.), click the **Full Port Names** check box on the **NDE** ribbon.

The following figure shows the difference in display for a plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

Tool-tips always display the full port name.

Network Data Explorer Save or Reset Default Settings

To save field settings as the default, click the **Save Settings** icon on the **NDE** ribbon. The next time Network Data Explorer is opened, the chosen settings will be selected by default.

To restore the default settings (i.e. the settings previously saved using the **Save Settings** button), click the **Restore Settings** icon on the **NDE** ribbon. The next time Network Data Explorer is opened, the original settings will be selected by default.

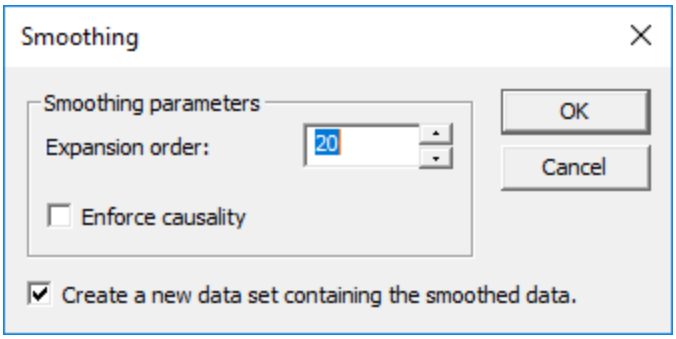
Smoothing

To access data smoothing options:

1. Click the **Smoothing** icon on the **NDE** ribbon.

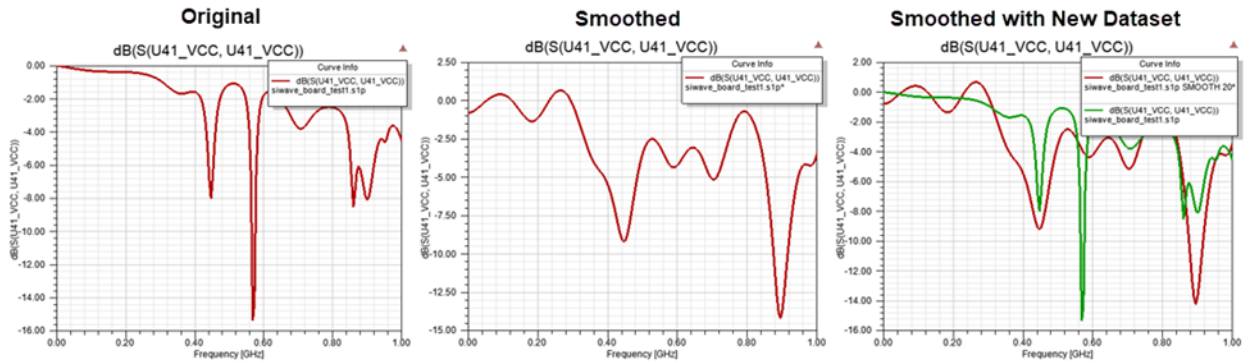
   The **Smoothing** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. The **Smoothing Parameters** area allows you to choose the **Expansion Order**. This can be any discrete value between 1 and 150.
3. If desired, check the **Enforce Causality** check box.
4. If desired, check the **Create a new data set containing the smoothed data** check box. If selected, the smoothed data appears alongside the original data.
5. Click **OK**.

The Data View Pane updates. The following image shows a plotted result with **Create a new data set containing the smoothed data** unchecked and checked.

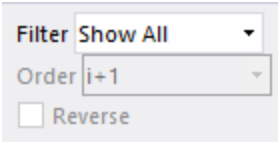


A least-squares polynomial fit of the specified order is used to interpolate new data points for the magnitude and phase components of the S-parameters.

Cell Filtering

The cells available in the data selection pane may be restricted using cell filtering. The **Cell Filtering** control are located on the **NDE** ribbon.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Cell filtering is modeless, and filters are immediately applied to the cell list. Filtering remains in effect when the window has been closed.

For an n-port model with a total of 2n pins in the standard arrangement, the choices are:

- **Show all** – display all available cells. There are n-squared choices.
- **Return loss** – show S(i, i). There are n choices.
- **Insertion loss** – show S(i, i+1). There are n choices.
- **Lower triangle** – show S(i, j) for all j < i. There are n(n-1)/2 choices.

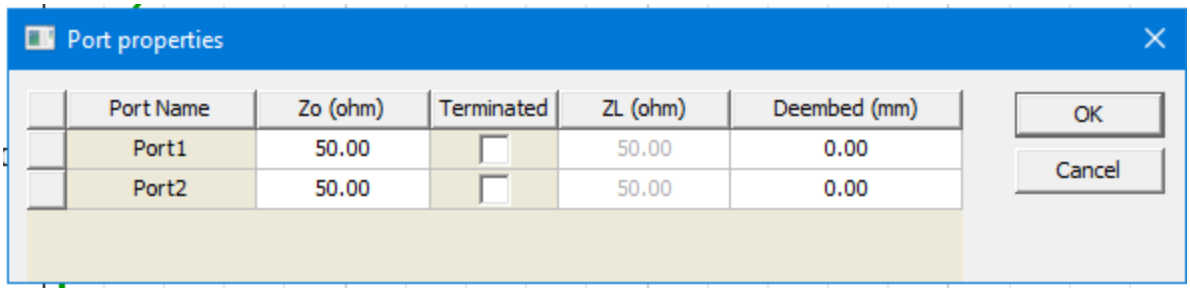
Three pin arrangements are recognized:

- S(i, **i+1**) and its **Reverse order**, S(i, i-1)
- S(i, **i+n**) and its **Reverse order**, S(i, i-n)
- S(i, **2*n-i+1**) and its **Reverse order**, S(i, 2*n-i-1)

Changing Port Properties and Reducing Matrix Size

The normalization impedance, termination, port order, gamma values, and de-embedding distance may all be edited from the **Port Properties** window.

To access these options, click **Edit Ports** 
on the **NDE** tab. The **Ports Properties** window opens.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** For HFSS Driven Terminal designs, selecting the solution data will disable this ribbon button. The user must make port/differential pair changes directly in the HFSS Design and re-import the solution.

Ports appear in a table. Click a column heading to sort by that column. Click within a cell to edit the port property:

- **Zo (ohm)** and **ZL (ohm)** – specify Impedance values. Accepted syntaxes are:
  - real (e.g., 50)
  - real + imag i (e.g., 50+5i)
  - imag i (e.g., 5i).
- **Terminated** – use the check box to terminate a port. Terminated ports are eliminated from the matrix, reducing the matrix size. Existing data sets with mismatching port numbers will no longer be available for data comparisons.
- **De-Embedding** – this column appears only if gamma values are available. Default units can be changed from the Set Display Format window.

To reorder ports, click and drag a row to a new location.

To save changes, click **OK**.

Displaying Mixed-Mode Parameters using Differential Pairs

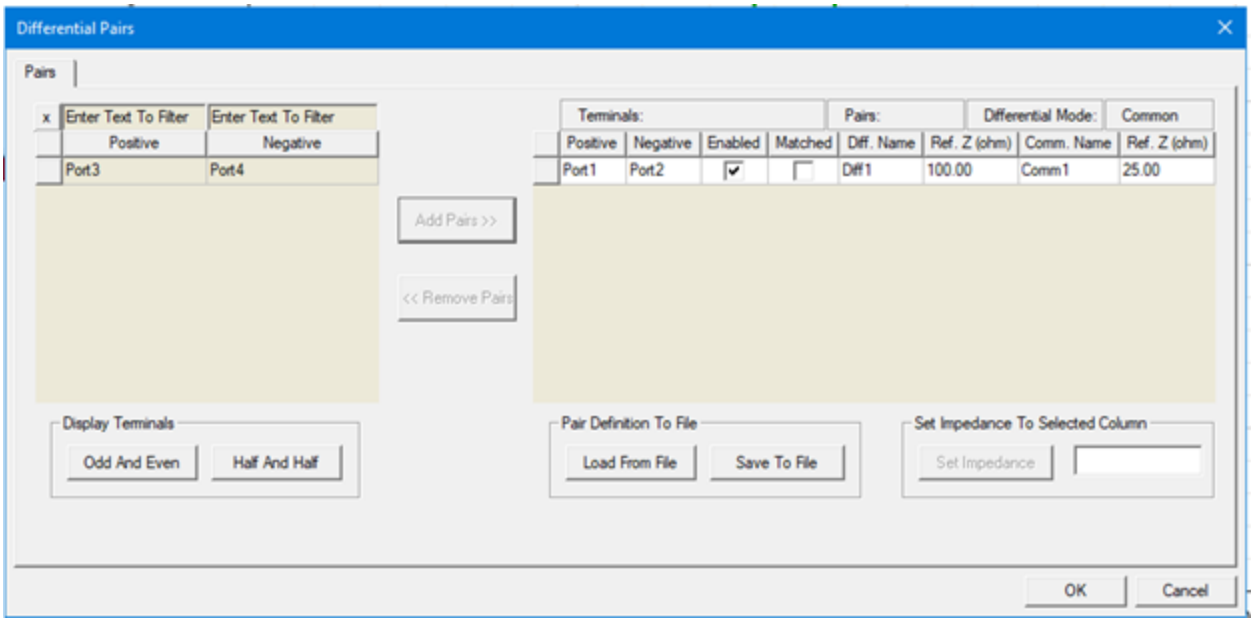
Network Data Explorer displays mixed-mode parameters when differential pairs are both defined and activated.

To define differential pairs:

1. Select existing ports.
2. Open Network Data Explorer (**Tools**>**Network Data Explorer**).
3. On the **NDE** ribbon, select **Differential Pairs**.

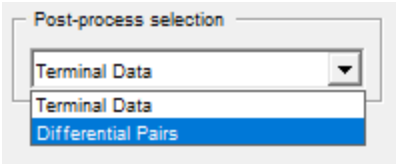
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **Differential Pairs** window appears.



4. Select a pair from the list on the left and click **Add Pairs**.
5. Click **OK**.
6. To disable all differential pairs, click the **Enabled** column header in the **Differential Pairs** dialog to deselect all pairs.

For HFSS Driven Terminal designs, selecting the solution data will disable this ribbon button. The user must make port/differential pair changes directly in the HFSS Design and re-import the solution. When the HFSS Driven Terminal Design has differential pairs defined, NDE shows this drop down menu and you can change between showing reports for Terminals or Differential Pairs.Select **Differential Pairs** from the **Post-process selection** field to view mixed-mode parameters.



Note:

The Network Data Explorer **Edit** menu option **Reset All Port Properties** deactivates all pairs, but it does not clear the differential pair settings. And since **Reset All Port Properties** also clears reference impedances and terminations, it should not be used when the user simply wishes to disable all differential pairs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reset All Port Properties

Reset All Ports resets all changes in the **Edit Ports** window. It also deactivates all differential pairs defined in the **Differential Pairs** window but does not remove the definitions.

> **Note:** For HFSS Driven Terminal designs, selecting the solution data will disable this ribbon button. The user must make port/differential pair changes directly in the HFSS Design and re-import the solution.

Data View Pane Context Menus

The Data View pane presents different right-click menu options, depending on the context. Some commands are the same as those on the NDE ribbon. Others appear only in the context menus.

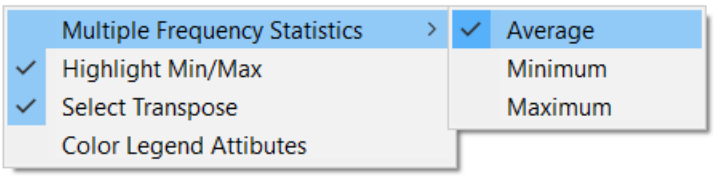
Network Data Explorer commands unique to the context menus are:

- Multiple Frequency Statistics
- Highlight Min/Max
- Select Transpose
- Color Legend Attributes
- Matrix Entries Plot Menu

Multiple Frequency Statistics

The **Multiple Frequency Statistics** menu option determines the statistical composite to display when multiple frequencies have been selected for the matrix display. The statistical data is always the first matrix displayed, followed by matrices for each individual frequency. The **Multiple Frequency Statistics** option also indicates the data used in the colored matrix plot when multiple frequencies have been selected.

This right click menu option appears in the **Matrix** plot, regardless of whether you are in Table or Plot view.



The menu options are:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

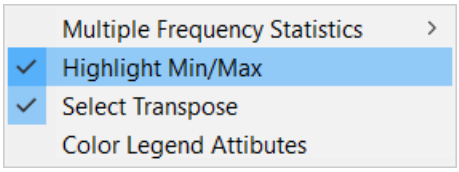
- **Average** – display the average of the matrix values across selected frequencies.
- **Minimum** – display the minimum matrix values across selected frequencies.
- **Maximum** – display the maximum matrix values across selected frequencies.

The selected information also appears in a tool-tip when you hover the cursor over a cell.

Highlight Min/Max

The **Highlight Min/Max** menu option determines whether the minimum and maximum matrix entries should be highlighted in the matrix table and color plot view.

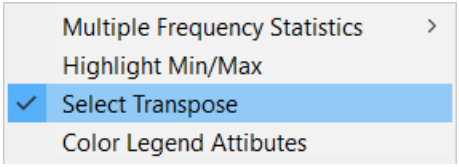
This right click menu option appears in the **Matrix** plot, regardless of whether you are in Table or Plot view.



Select Transpose

The **Select Transpose** menu option determines whether transpose cells are highlighted along with selected cells.

This right click menu option appears in the **Matrix** plot, regardless of whether you are in Table or Plot view.



Transpose cells are highlighted in Table or Plot view, as shown below.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

0.01000GHz	P1	-57.10340, -81.97841	-57.72581, 85.70836	-0.00213, -0.18916

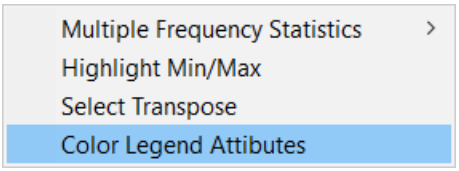
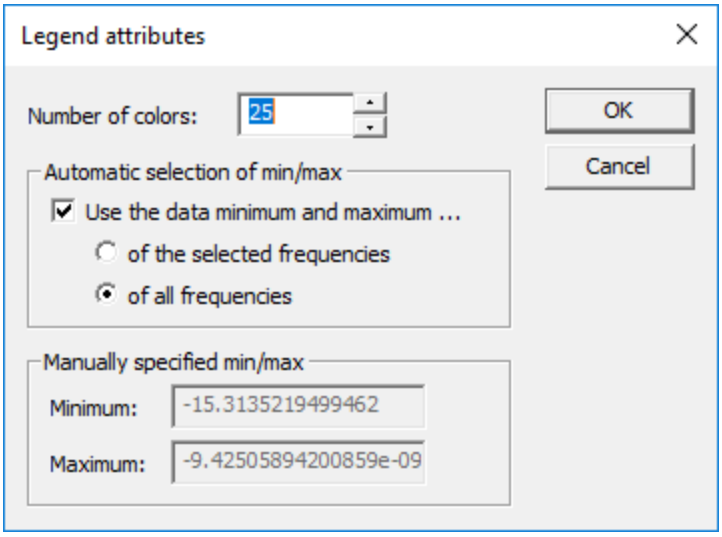
Color Legend Attributes

The **Color Legend Attributes** menu option allows you to change the granularity of the color scheme and the value range for plots. This right click menu option appears in the **Matrix** plot.



Alternatively, double-click the matrix plot's legend to open the **Legend Attributes** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



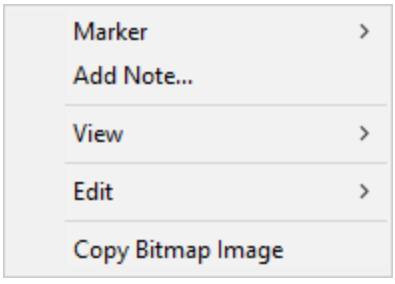
Options include:

- **Number of colors** – allows you to select number of color entries in the legend (the number of divisions between the start/end of the data range). This can be set to any discrete number between 1 and 50.
- **Automatic selection of min/max** – check the **Use the data minimum and maximum** check box to automatically select the data range using the minimum and maximum values from either selected frequencies or all frequencies in the data set.
- **Manually specified min/max** – when the when the range is not automatically determined, these fields permit the user to manually enter hard values. For example, for S parameter data magnitude data, you could enter a minimum of 0 and a maximum of 1.

Using a standard range across all frequencies permits you to quantitatively compare plots, and ndExplorer remembers legend settings for each data-type and display-format pair.

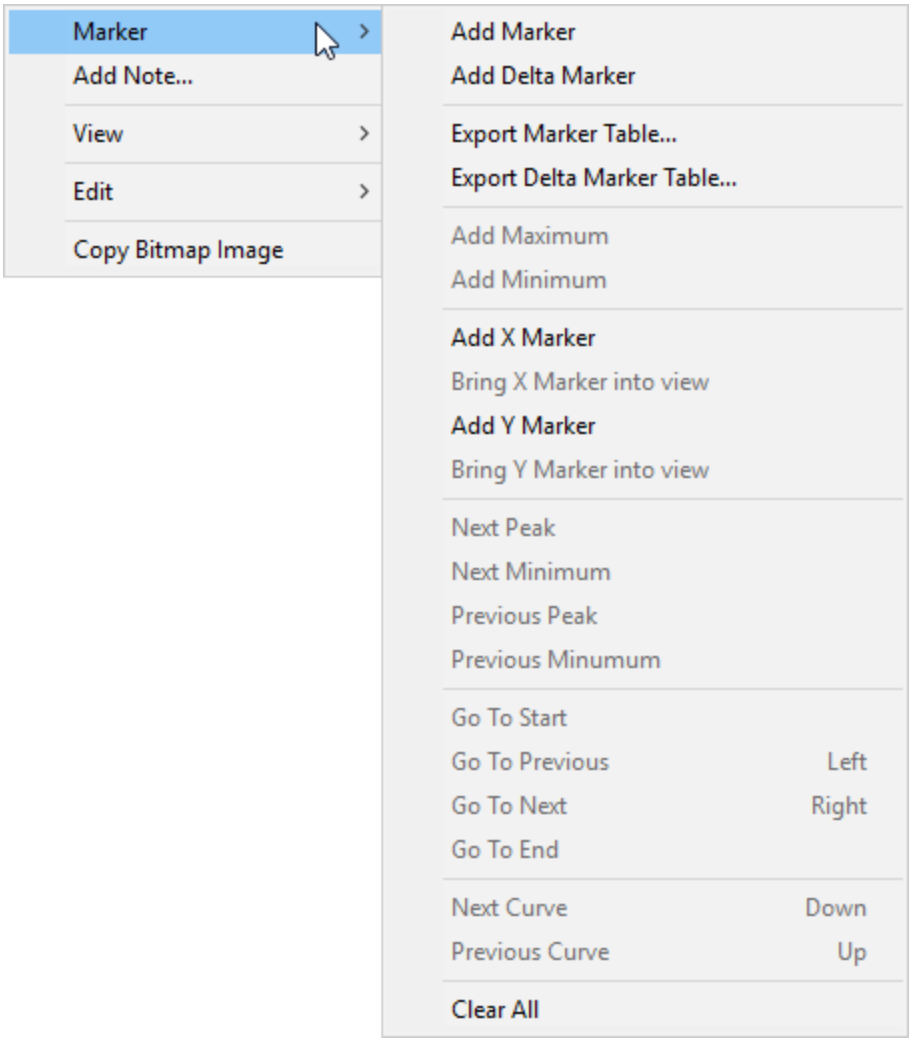
Matrix Entries Plot Menu

On the **Matrix** plot, several new right-click menu options appear.

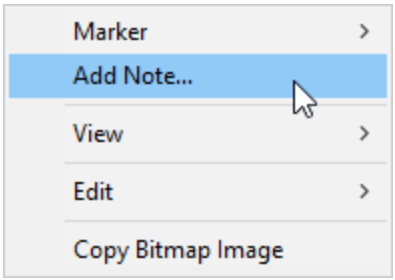


The **Marker** sub-menu provides commands for adding markers to plots.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

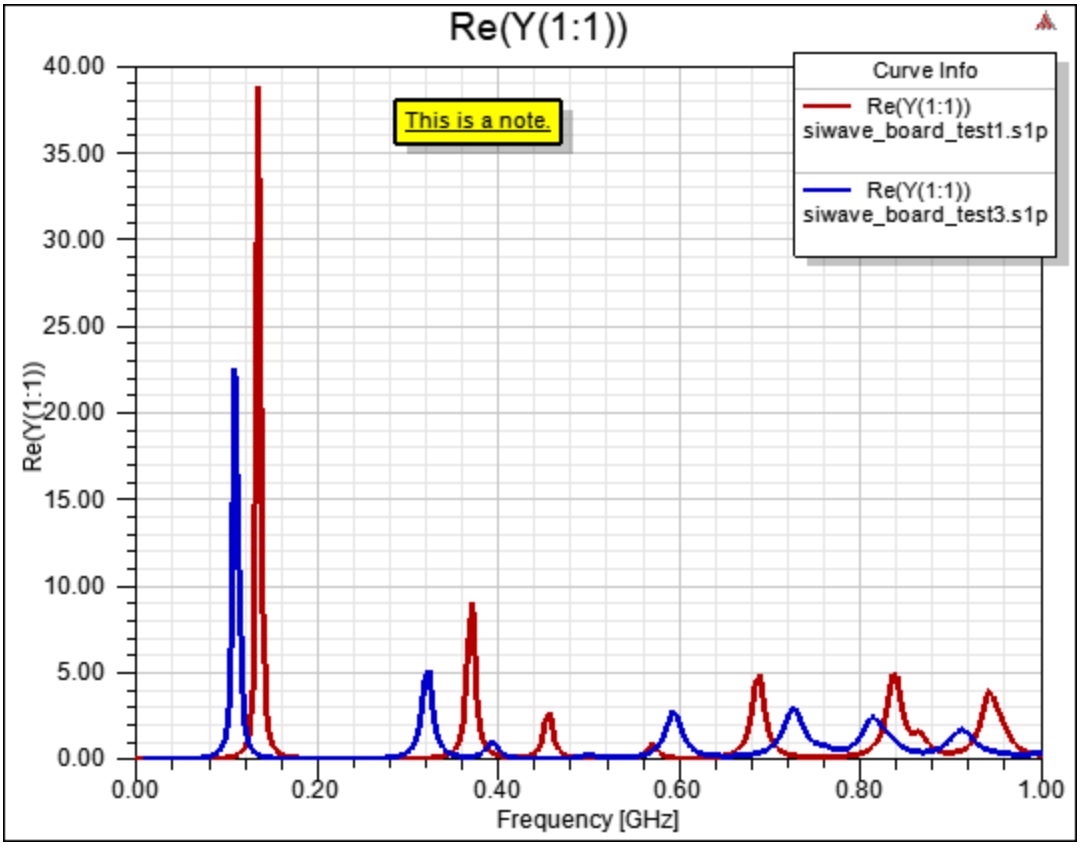


The **Add Note** menu option allows you to add a note to the plot.



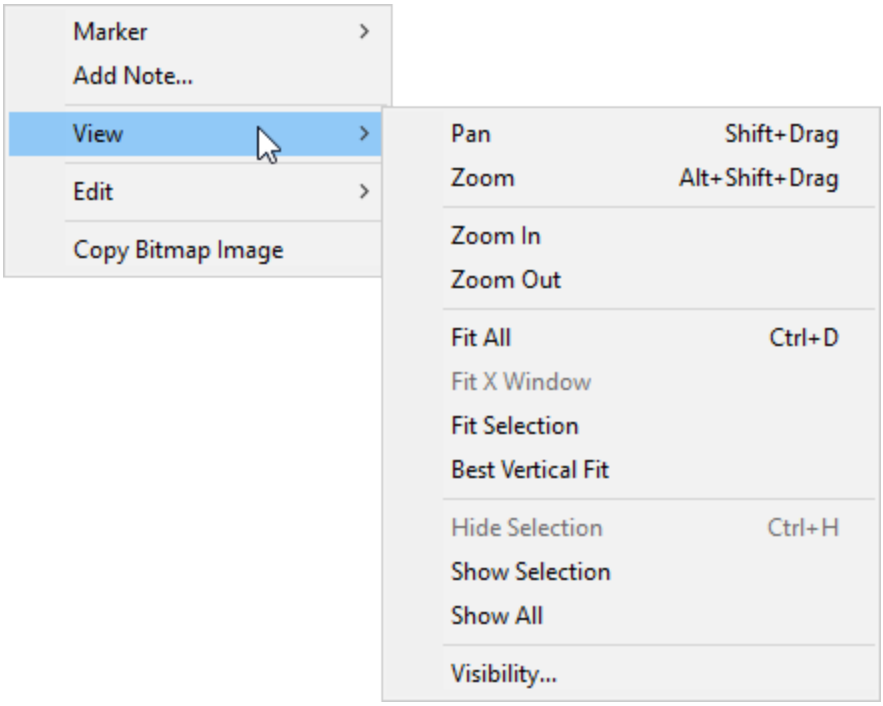
The note appears at the location you right-clicked. You can click and drag the note to a new location, or double-click the note to change its color and font.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



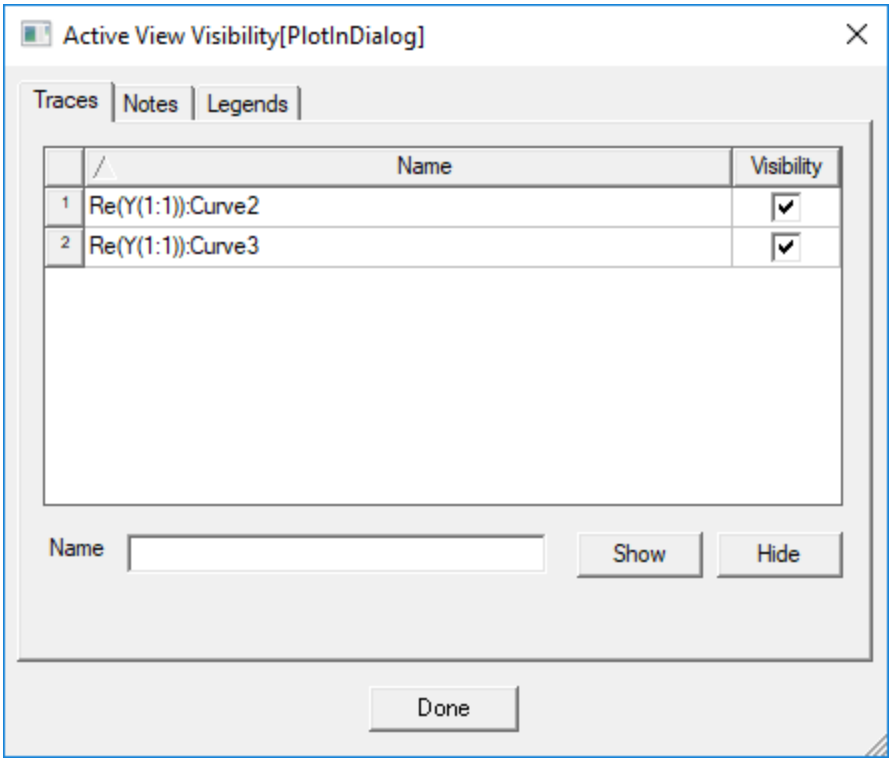
The **View** sub-menu provides commands for viewing, panning, zooming, and fitting elements to your plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

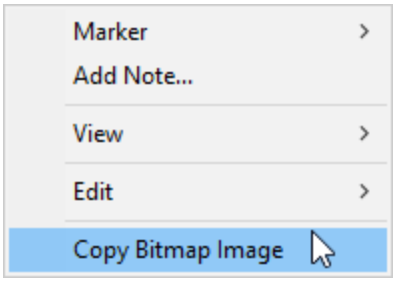


Click **Visibility** to open the **Active View Visibility** window, where you can select the visibility of traces, notes and legends.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Copy Bitmap Image** menu option copies the plot to your clipboard. You can then paste it into a graphics editor.



Exploring Network Data and Modifying the Display

Network Data Explorer allows you to view data and modify various aspects of the display, including color plots, color coding, viewing across frequencies, and displaying individual statistics. This section provides examples of Network Data Explorer capabilities:

- Viewing the S, Y, or Z Matrix for a Frequency
- Viewing a Color-coded Matrix Plot
- Displaying a Cell Graph Across All Frequencies

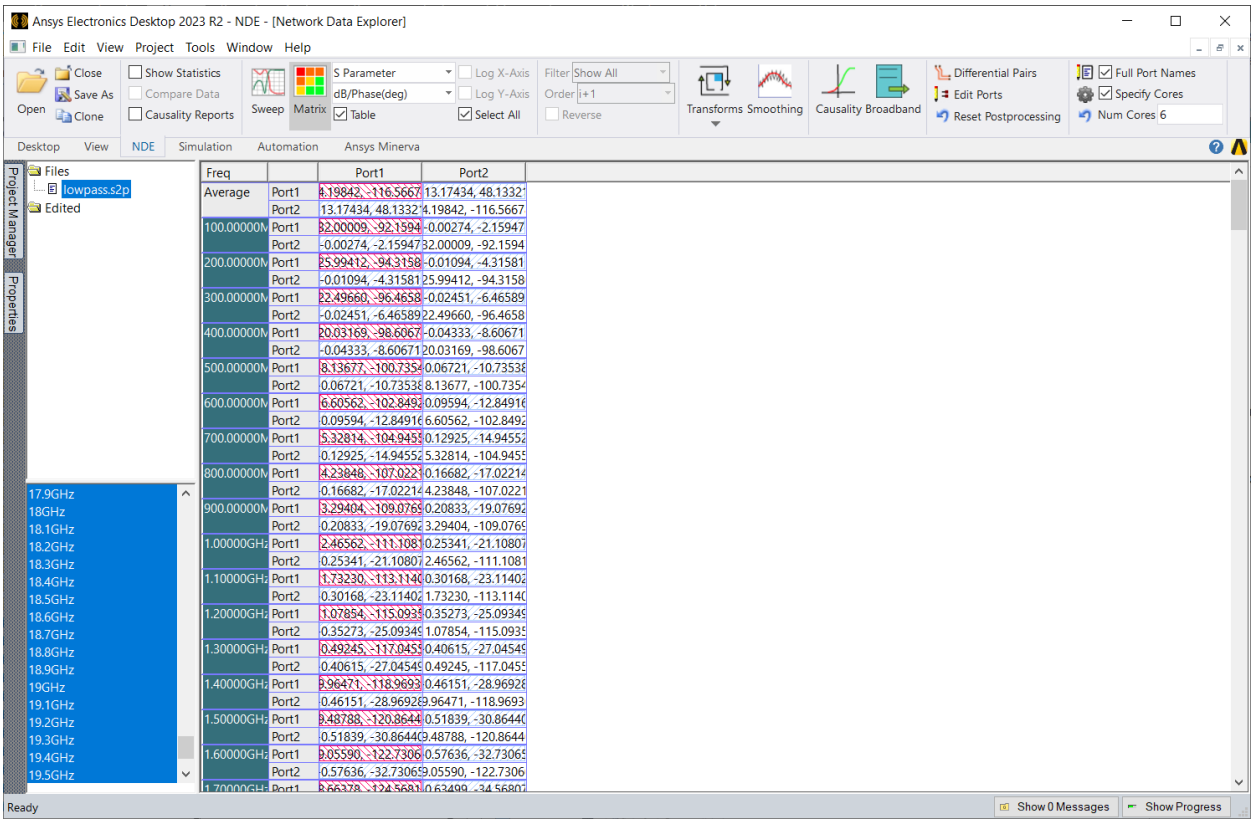
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Displaying Matrix Statistics by Frequency
- Displaying Individual Statistics for All Frequencies
- Creating a Statistics Plot
- Comparing Variations

Viewing a Matrix Table

To view the S, Y or Z matrix:

1. On the **NDE** ribbon, click **Matrix**.
2. Click the **Table** check box.
3. Use the **Parameter** type drop-down menu to select **S parameter**, **Y parameter**, **Z parameter**, or another choice.
4. Choose a format from the drop-down menu, for example dB or Mag.
5. In the Cell and Frequency Selection pane, select frequencies to display or click the **Select All** check box on the **NDE** ribbon to select all frequencies. The S, Y, or Z matrix displays.



6. Hover over a cell to see more information in a tool tip.
7. Right click to see a right click menu with other commands.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Maximum values are highlighted in red stripes. If Select Transpose is enabled, transposes are highlighted in red stripes as well.

Minimum values are highlighted in blue stripes.

Selected cells appear in solid blue. If Select Transpose is enabled, the transpose is highlighted in blue as well.

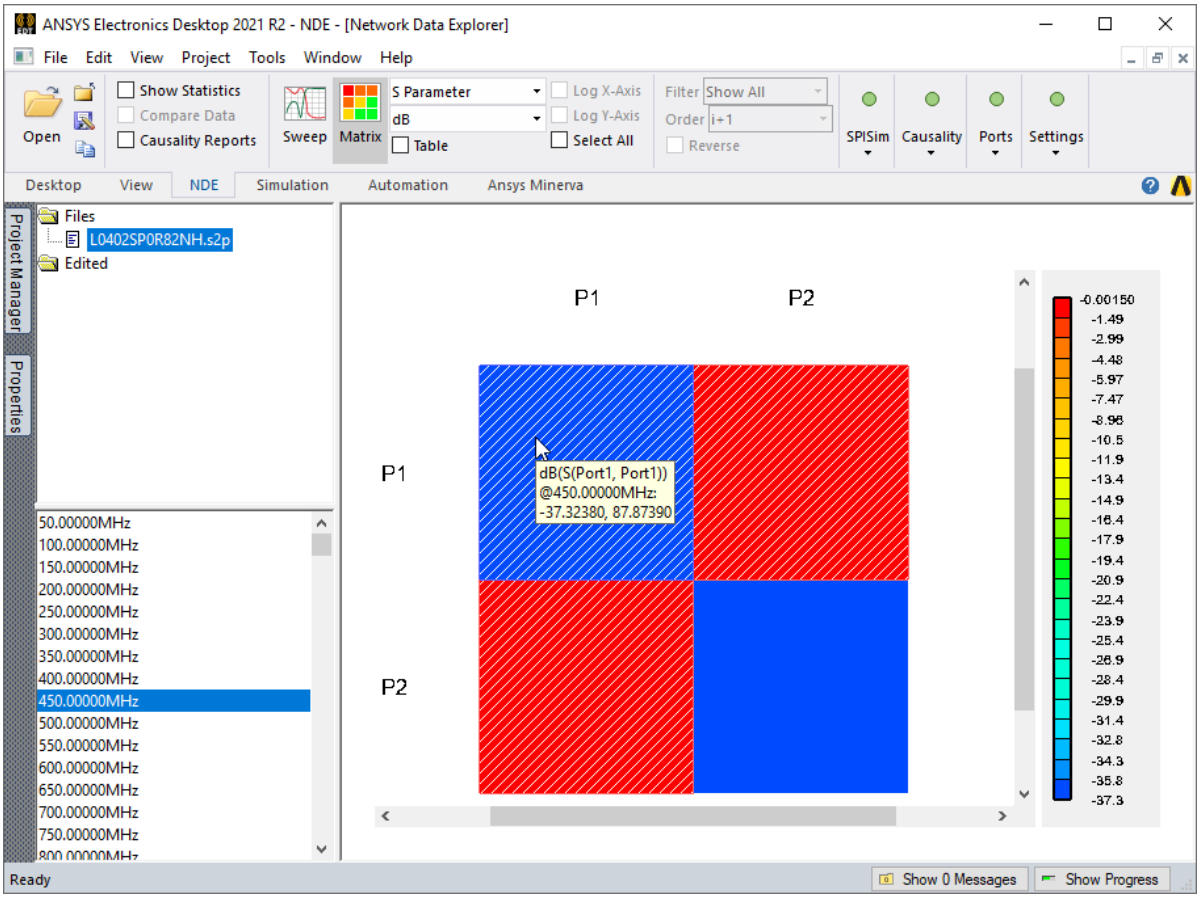
Double-clicking a cell switches to a matrix cell view, in which values for all frequencies for that cell are displayed. The double-clicked frequency is highlighted with solid red shading

Complex values are compared using their modulus. When multiple frequencies are selected, the data display depends on the Multiple Frequency Statistics setting.

Viewing a Color-Coded Matrix Plot

1. On the **NDE** ribbon, click **Matrix**.
2. Use the **Parameter** type drop-down menu to select **S parameter**, **Y parameter**, **Z parameter**, or another choice.
3. In the Cell and Frequency Selection pane, select the frequencies you want to plot or click the **Select All** check box on the **NDE** ribbon to select all frequencies.
4. Hover over a cell to see more information in a tool tip.
5. Right click to see a right click menu with other commands.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Matrix values display in a color-coded grid. If the selected **Format** is a complex value, only the real component is used to determine the display color. When multiple frequencies or variations are selected, the data display depends on the Multiple Frequency Statistics setting. Maximum values are highlighted in red. Minimum values are highlighted in dark blue.

Hover the cursor over any cell to view information about it.

Click any cell to select it. Selected cells appear with a pink outline. If Select Transpose is enabled, the transpose is selected in pink as well.

Double-click any cell to view a matrix cell plot in which all frequency values for that matrix cell are displayed as a graph.

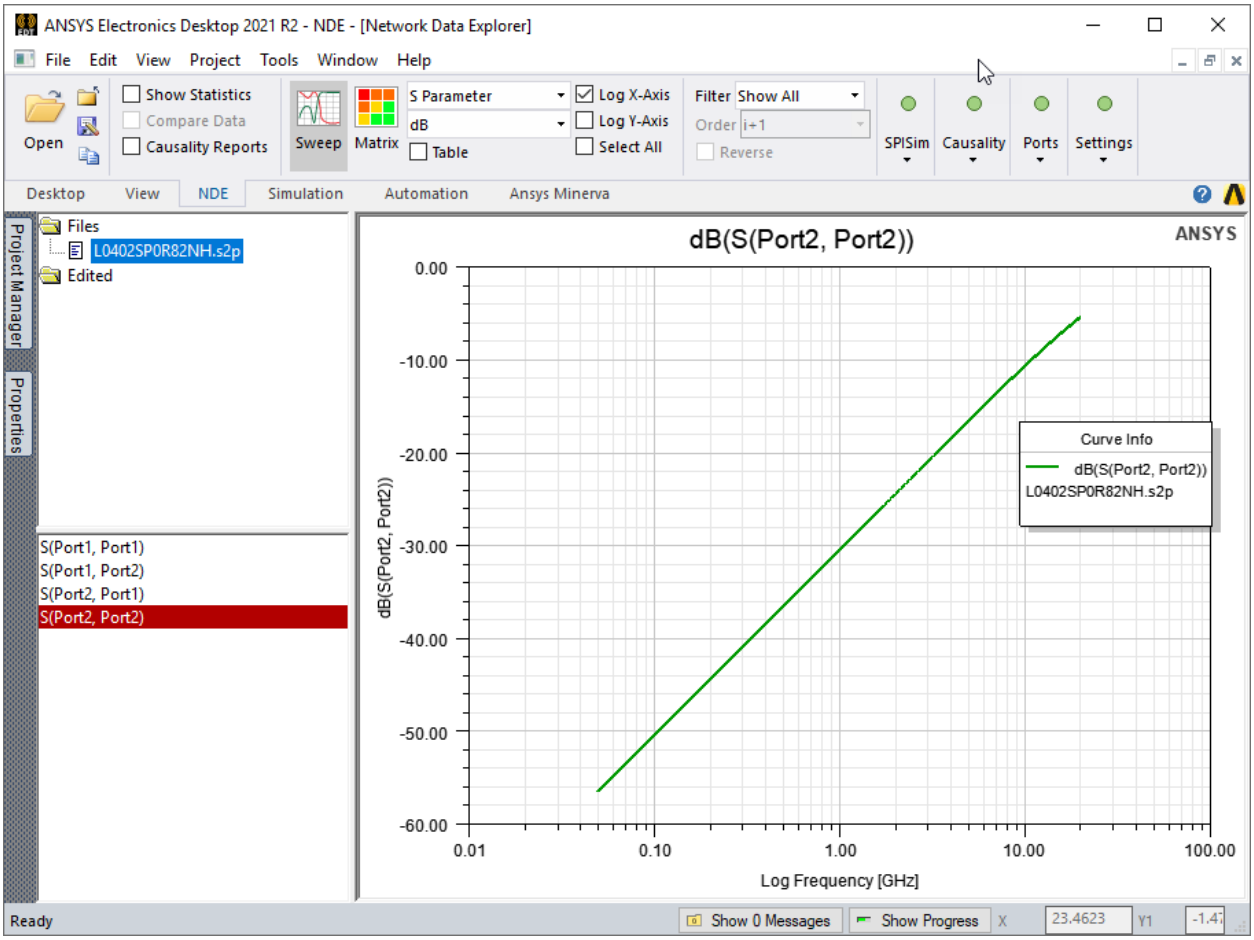
Displaying a Cell Graph Across All Frequencies

Network Data Explorer can plot a cell across all frequencies.

1. On the **NDE** ribbon, click **Sweep**. The Data View Pane updates if necessary.
2. Use the **Parameter** type drop-down menu to select **S parameter**, **Y parameter**, or **Z parameter**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. In the Cell and Frequency Selection pane, select cells to display or click the **Select All** check box on the **NDE** ribbon to select all cells.
4. To add a log scale to the X-axis, click **Log X-Axis** on the **NDE** ribbon.



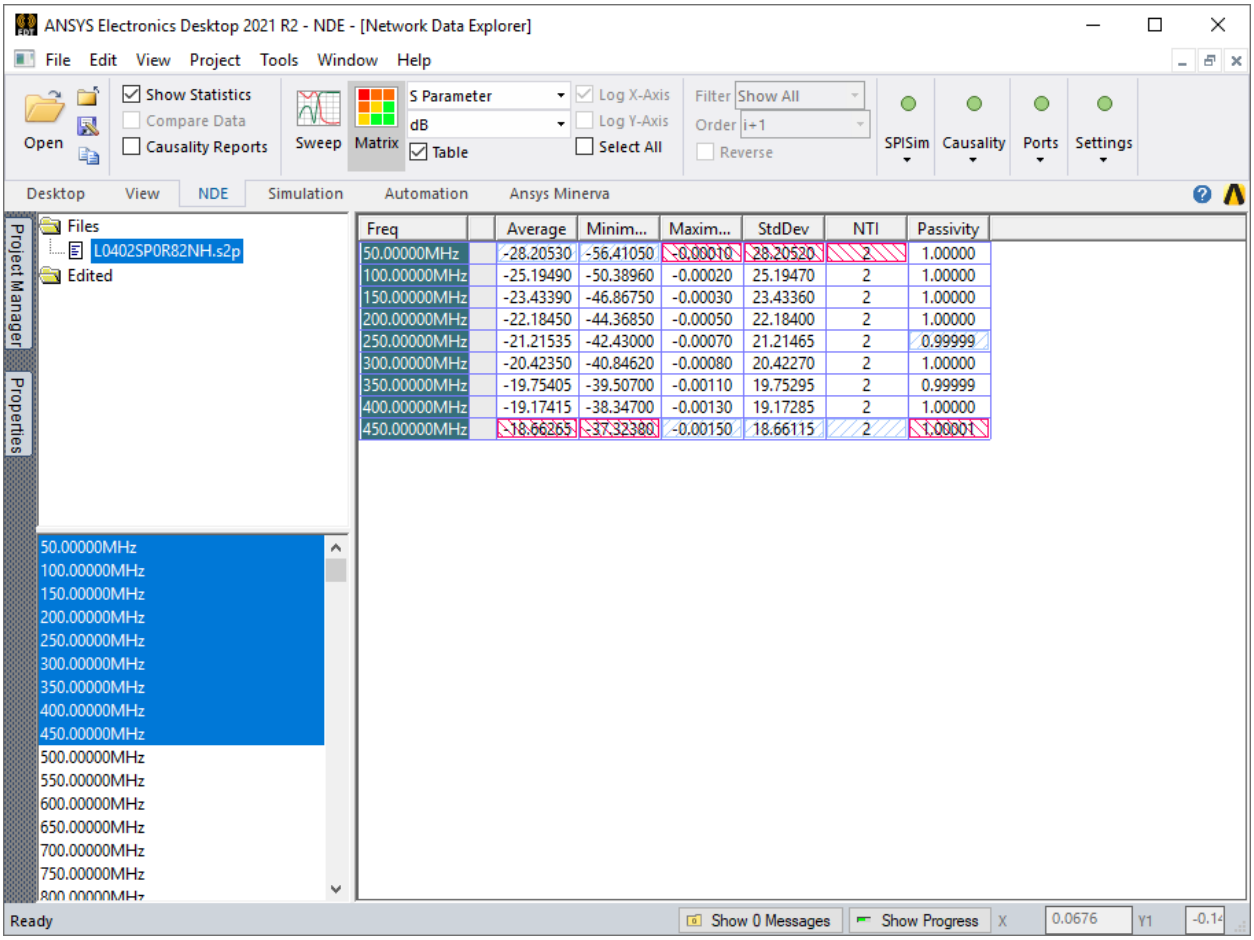
5. To add a log scale to the Y-axis, click **Log Y-Axis** on the **NDE** ribbon.
6. Right click to see a right click menu with other commands.

Displaying Matrix Statistics by Frequency

Network Data Explorer can display various statistical measurements.

1. On the **NDE** ribbon:
   a. Click **Matrix**.
   b. Click **Table**.
   c. Click **Show Statistics**.
2. In the Cell and Frequency Selection pane, select frequencies to display.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



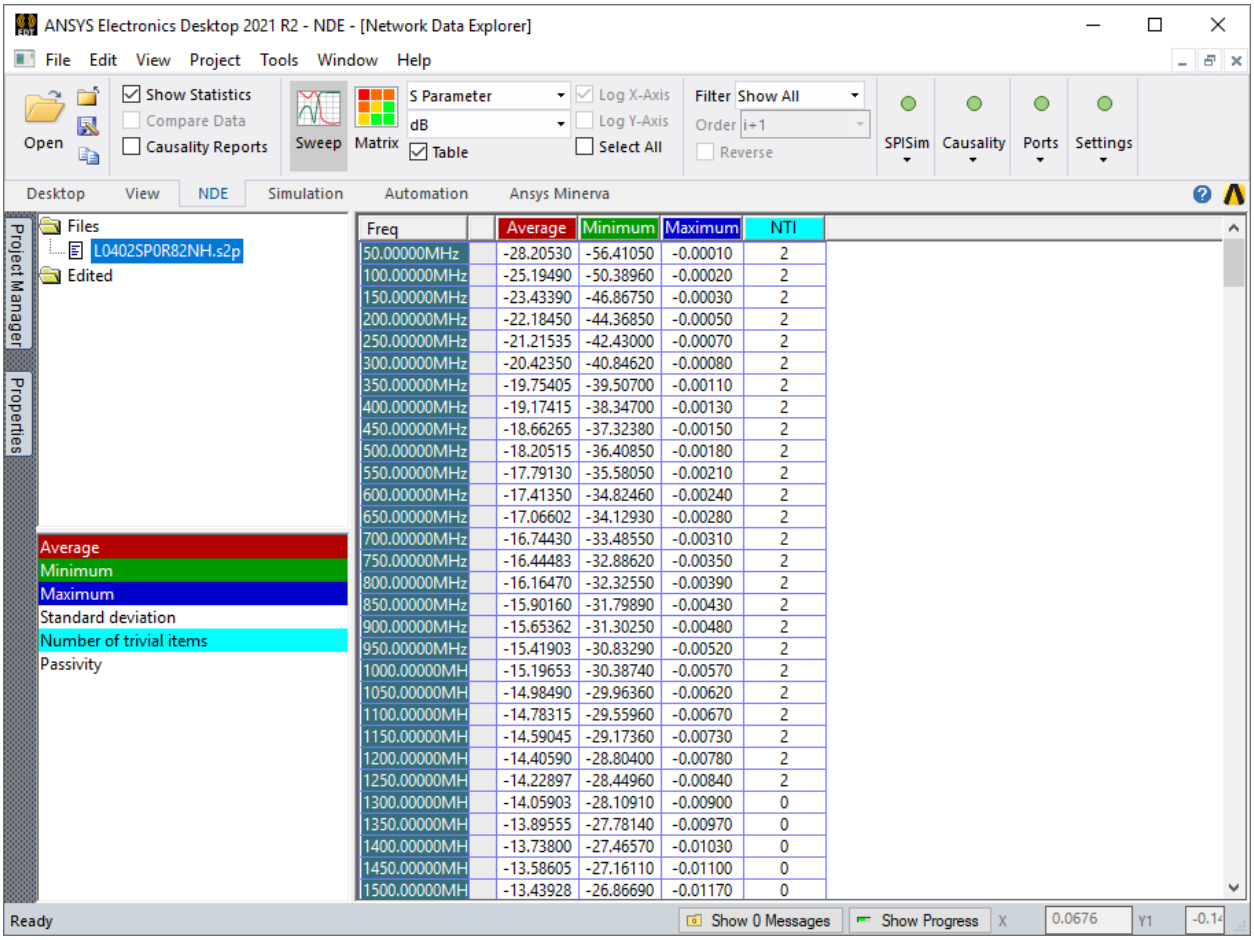
3. Click a column header to sort data by that column.
4. Hover the cursor over a cell to view information about it.

Only real (not complex) data formats are offered for statistical analysis. **Passivity** is only available for S-parameter data (comparisons inactive). **NTI** refers to the number of trivial items; for S-parameters, this includes all zeros and ones; for all other data (and data comparisons), only zeros are counted as trivial. The minimum value for each column is highlighted in blue; the maximum is highlighted in red.

Displaying Individual Statistics for All Frequencies

1. On the **NDE** ribbon:
    a. Click **Sweep**.
    b. Click **Table**.
    c. Click **Show Statistics**.
2. In the Cell and Frequency Selection pane, select statistics to display. The information displays in a table in the Data View pane.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Selected statistics are displayed for all frequencies.

Passivity is only available for S-parameters (comparisons inactive).

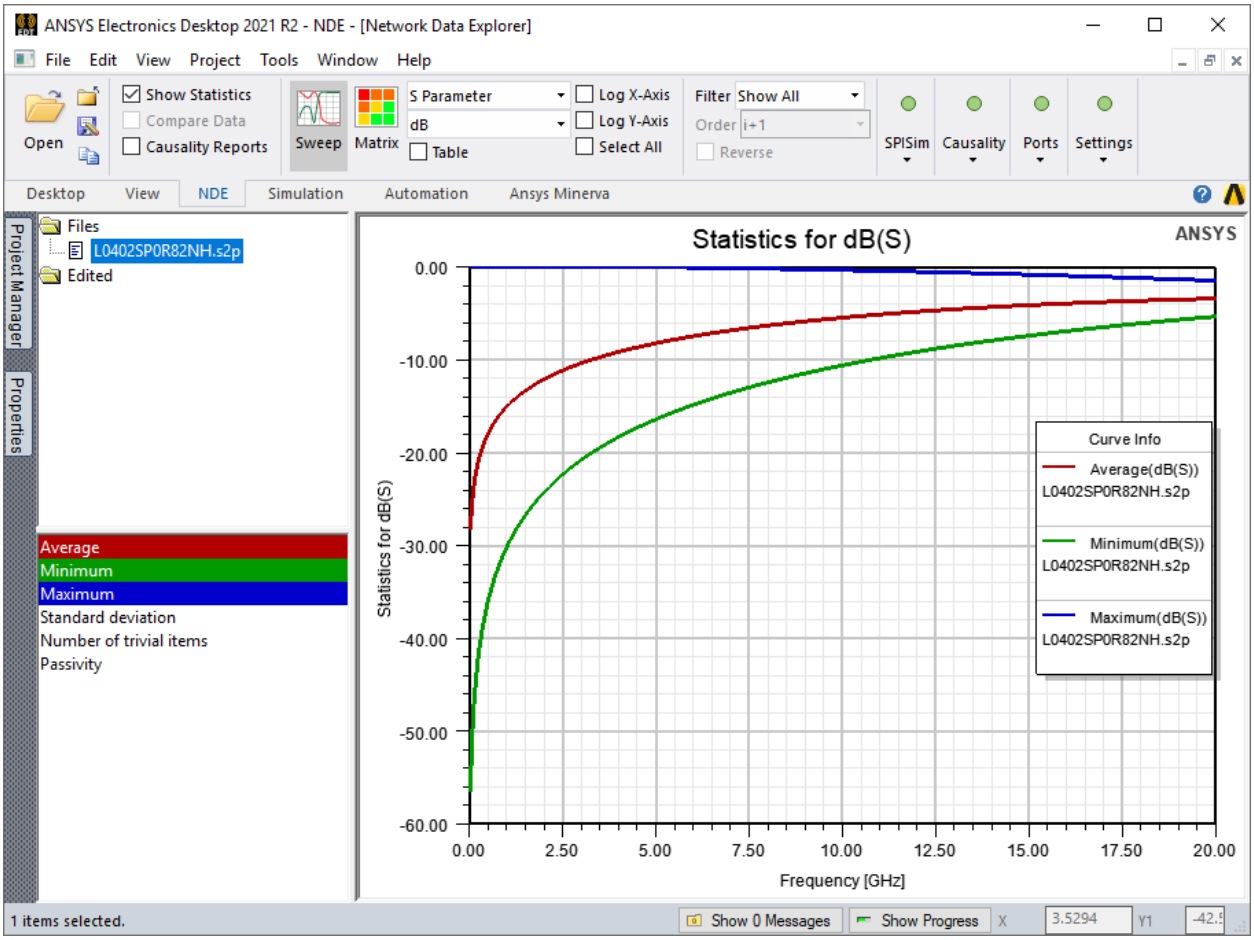
For S-parameters, the **Number of Trivial Items (NTI)** includes all values of 0 and 1. For other data and data comparisons, only values of 0 are counted as trivial.

Creating a Statistics Plot

Network Data Explorer can display a graph of selected statistical measures across all frequencies.

1. On the **NDE** ribbon:
    a. Click **Sweep**.
    b. Click **Show Statistics**.
2. In the Cell and Frequency Selection pane, select statistics to display. The selected statistics are plotted.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Hover the cursor over a statistic to view more information about it.

Passivity is only available for S-parameters (comparisons inactive).

For S-parameters, the **Number of Trivial Items (NTI)** includes all values of 0 and 1. For other data and data comparisons, only values of 0 are counted as trivial.

Comparing Network Data

Network Data Explorer can compare variations for two network data sets that are the same size.

1. On the **NDE** ribbon, click **Sweep**.
2. In the Network Data Selection pane, select exactly two data sets.
3. On the **NDE** ribbon, click **Compare Data**.
4. In the Cell and Frequency Selection pane, select which cells you want to compare . For each value along the X-axis, the Y-axis values are subtracted, one from the other, to create the comparison plot. The second selected data is subtracted from the first selected

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

data.

5. Optionally, check **Show Statistics** to show values applied to all cells and all frequencies

It is not possible to compare a data set against itself *unless the data set has been cloned.* Then, you can compare the original data set to the clone.

Traces for a given cell or statistical measure are displayed for all data sets; you can use tool tips to distinguish between them.

If a single cell or statistical measure is displayed, different colors are used for each data trace. If multiple cells or statistical measures are selected, a single color is used for all data traces for each cell or statistical measure.

In a data comparison, traces are shown for all selected data sets. This is true for both cell and statistical traces.

If **dB** format is shown, you can either subtract values before or after applying the dB function. See Display Format to make this choice.

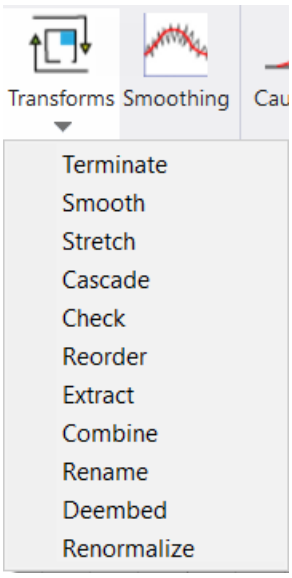
SPISim Transforms in Network Data Explorer

Network Data Explorer offers several transform functions to process s-parameters. These transform correspond to transforms available in SPISim.

NDE transforms are available for Microsoft Windows. Linux users can find similar functions in SPISim. To open SPISim, click **Tools** > **SPISim** on the toolbar.

To use a transform:

1. Click **Transforms** on the **NDE** ribbon.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Choose a transform:
    - **Terminate** - opens the termination dialogue. Choose which ports to terminate and enter the impedance to terminate them with.
    - **Smooth** - see Smoothing.
    - **Stretch** - stretches given *.snp files to a specified unit length. The given .snp must be “homogeneous”, e.g. a transmission line.
    - **Cascade** - cascades different stages’ *.snp files together into one *.snp files. Use this dialog to specify the correct source port ordering so that input files are properly reordered. If necessary, use **Reorder** first. Specified*.snp files can have different sampling points. Samples are synced automatically.
    - **Check** - checks s-parameter qualities, based on IEEE P370 TG3 S-Parameter quality checking algorithms.
    - **Reorder** - reorders s-parameter ports.
    - **Extract** - extracts subset of original s-parameter’s ports to form sub-matrices.
    - **Combine** - combines samples from various *.snp files of the same number of ports.
    - **Rename** - renames ports. In SPISim, the original file is directly overwritten.
    - **Deembed** - removes s-parameters though a reciprocal method.
    - **Renormalization** - renormalizes port impedance to different values. The same value can be given to multiple reference Z cells at once.
3. In the top panel of the transform window, specify the input data. Selected *.snp files from NDE are provided automatically. Drag and drop to add more files
4. In the lower panel, configure the transform's settings.
5. Click **OK**.

Causality Checking and Plots

Network Data Explorer can perform a causality check on S-parameter data from any source (solution or file), and provide plots of the results in various formats.

When S-parameter data is loaded into Network Data Explorer, the **Causality** button is enabled.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. On the **NDE** ribbon, click **Causality**. The **Causality Options** dialog opens.
