Release 2025 R2
July 2025

ANSYS, Inc. and ANSYS Europe, Ltd. are UL registered ISO 9001:2015 companies.

Copyright and Trademark Information

© 1986-2025 ANSYS, Inc. Unauthorized use, distribution or duplication is prohibited.

Ansys, Ansys Workbench, AUTODYN, CFX, FLUENT and any and all ANSYS, Inc. brand, product, service and feature names, logos and slogans are registered trademarks or trademarks of ANSYS, Inc. or its subsidiaries located in the United States or other countries. ICEM CFD is a trademark used by ANSYS, Inc. under license. All other brand, product, service and feature names or trademarks are the property of their respective owners. FLEXlm and FLEXnet are trademarks of Flexera Software LLC.

Disclaimer Notice

THIS ANSYS SOFTWARE PRODUCT AND PROGRAM DOCUMENTATION INCLUDE TRADE SECRETS AND ARE CONFIDENTIAL AND PROPRIETARY PRODUCTS OF ANSYS, INC., ITS SUBSIDIARIES, OR LICENSORS. The software products and documentation are furnished by ANSYS, Inc., its subsidiaries, or affiliates under a software license agreement that contains provisions concerning non-disclosure, copying, length and nature of use, compliance with exporting laws, warranties, disclaimers, limitations of liability, and remedies, and other provisions. The software products and documentation may be used, disclosed, transferred, or copied only in accordance with the terms and conditions of that software license agreement.

ANSYS, Inc. and ANSYS Europe, Ltd. are UL registered ISO 9001: 2015 companies.

U.S. Government Rights

For U.S. Government users, except as specifically granted by the ANSYS, Inc. software license agreement, the use, duplication, or disclosure by the United States Government is subject to restrictions stated in the ANSYS, Inc. software license agreement and FAR 12.212 (for non-DOD licenses).

Third-Party Software

See the legal information in the product help files for the complete Legal Notice for Ansys proprietary software and third-party software. If you are unable to access the Legal Notice, please contact ANSYS, Inc.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Table of Contents

Table of Contents **Contents-1**

1 - Welcome to HFSS 3D Layout Help **1-1**

Workflow of an HFSS 3D Layout Design 1-1

Recording a Script to a File 1-3

Inserting an HFSS 3D Layout Design 1-3

Inserting an EM Technology File 1-4

HFSS 3D Layout Options 1-7

Design Settings 1-10

Closing Projects ... 3-97
Example Projects ... 3-98
HFSS 3D Layout Example Projects ... 3-99
Exporting Options Files ... 3-100
Exporting Options Files Using the Desktop UI ... 3-100
Exporting Options Files Using a Script ... 3-100
Working with Variables ... 3-101
Working with Project Variables ... 3-103
Adding a Project Variable ... 3-103
Importing and Exporting Project Variables ... 3-107
Deleting a Project Variable ... 3-107
Editing a Project Variable ... 3-108
Adding a Project Variable Array ... 3-108
List of Intrinsic Variables ... 3-112
List of Constants ... 3-113
Working with Design Variables ... 3-114
Defining Local Variables at the Design Level ... 3-115
Adding a Local Variable ... 3-115
Deleting a Local Variable ... 3-119
Editing a Local Variable ... 3-119
Overriding a Local Variable ... 3-119
Defining Parameter Defaults at the Design Level ... 3-120
Adding a Parameter Default ... 3-120
Deleting a Parameter Default ... 3-122
Editing a Parameter Default ... 3-122
Overriding a Parameter Default ... 3-123

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Adding a Design Variable Array ... 3-123
Converting Variables and Parameter Defaults ... 3-128
Adding Variables and Parameter Defaults from Components ... 3-128
Fixed vs. Non-Fixed Variables ... 3-131
Non-Fixed Variable Sweeps ... 3-132
Orphaned Sweeps ... 3-132
Choosing a Variable to Optimize ... 3-133
Choosing a Variable to Tune ... 3-134
Including a Variable in a Sensitivity Analysis ... 3-135
Including a Variable in a Statistical Analysis ... 3-136
Copying and Pasting a Variables List ... 3-138
Working with Datasets ... 3-138
Adding Datasets ... 3-139
Importing Datasets ... 3-143
Editing Datasets ... 3-145
Cloning Datasets ... 3-147
Exporting Datasets ... 3-150
Removing Datasets ... 3-151
Changing Dataset Plot Properties ... 3-153
Using SheetScan ... 3-155
SheetScan Menus and Settings ... 3-156
SheetScan View Options ... 3-156
SheetScan Right-click Menu ... 3-157
SheetScan Settings ... 3-158
Loading a Datasheet Picture into SheetScan ... 3-158
Loading a Datasheet Picture Directly ... 3-158
Loading a Datasheet Picture Using the HTML Viewer ... 3-158
Defining a SheetScan Coordinate System ... 3-159

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Defining a Characteristic Curve in SheetScan ... 3-160
Performing Operations on SheetScan Curves ... 3-162
Checking for Monotonicity in X ... 3-163
Importing Characteristic Data into SheetScan ... 3-164
Exporting SheetScan Data ... 3-166
Defining an Expression ... 3-167
Defining Mathematical Functions ... 3-167
Valid Operators for Expressions ... 3-168
Using Intrinsic Functions in Expressions ... 3-168
clp Formula ... 3-170
Using Piecewise Linear Functions in Expressions ... 3-170
Using Dataset Expressions ... 3-172
Co-simulation of Circuit and Field Solver Designs ... 3-174
4 - Minerva Remote Storage Environment ... 4-1
5 - Layout and Circuit Import Export Operations ... 5-1
Importing Layout Design Data ... 5-1

1 - Welcome to HFSS 3D Layout Help

HFSS 3D Layout helps you design multi-layer structures such as millimeter-wave integrated circuits (IC), micro-wave integrated circuits, printed circuit boards, planar antennas, and more by simulating their layout geometry. HFSS 3D Layout simulates layer structures of high-frequency electromagnetic fields through an innovated meshing technology called Phi mesher. The Phi mesher is an advanced, layout-based meshing tool that is capable of rapidly generating an initial mesh. This initial mesh facilitates faster simulations that can be further enhanced and accelerated using many of the various available adjuncts of high performance computing. You can take advantage of a closer integration between the 3D Layout and external data sources by using Layout Links, Cadence APD, and SPB.

HFSS 3D Layout is suitable for aiding in the design of the following multi-layer structures:

- Millimeter-wave integrated circuits
- Micro-wave integrated circuits
- Printed circuit boards
- Planar antennas

Before using HFSS 3D Layout, you can become familiar with it through getting started guides that are provided with the Ansys Electronics Desktop and its software systems such as Layout Editor, HFSS, and other tools for circuit and system simulation. This chapter describes the basics of using HFSS 3D Layout to design and simulate multi-layer structures for various materials, models, and excitations.

HFSS 3D Layout has three getting started guides to help you learn this product:

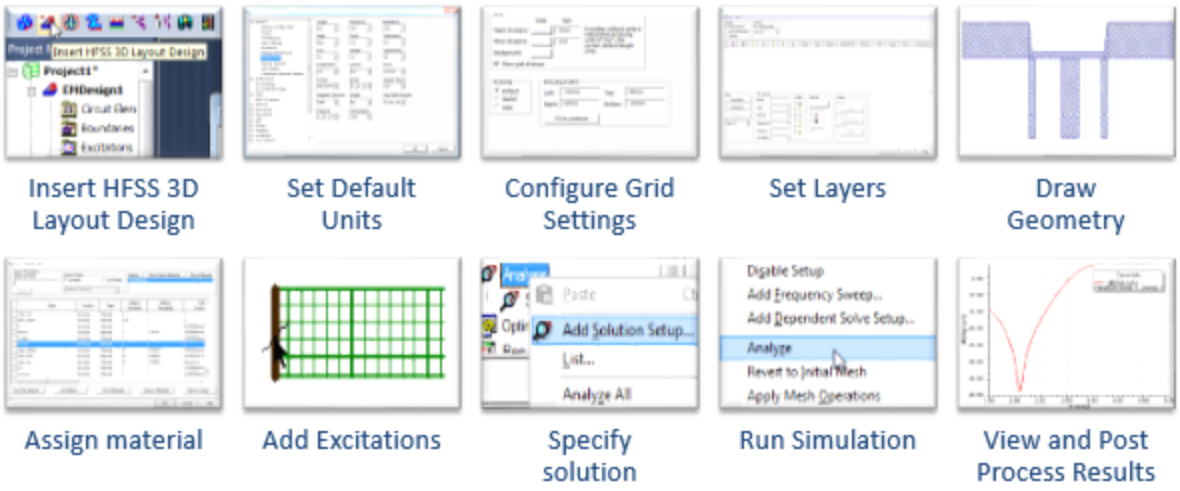
- *Getting Started with HFSS 3D Layout: Low Pass Filter*
- *Getting Started with HFSS 3D Layout: Microstrip Filter*
- *Getting Started with HFSS 3D Layout: Slot Fed Patch Antenna*

Workflow of an HFSS 3D Layout Design

Setting up an HFSS 3D Layout design is very similar to setting up an HFSS design or an HFSS-IE design. To set up an HFSS 3D Layout design, follow this general procedure. After you insert a design, you do not need to perform the intermediate steps sequentially, but you must complete them before you generate a solution.

Defining a solution setup enables HFSS 3D Layout to compute a solution for a design. You can define multiple solution setups for the same design. If you right-click in on the **Project Manager** window and select **Add Nexxim Solution Setup** , select a type of analysis to set up, which opens a solution setup window. You can specify multiple settings in the solution setup window for computing a solution for a design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. Insert an HFSS 3D Layout design into a project.
2. Draw the model geometry, specifically:
    a. Create the metal and dielectric layers of the design.
    b. Assign a thickness, roughness, elevation, and material to each layer.
    c. Draw the geometry of the signal layers.
3. Assign material characteristics
4. Define the ports or incident waves in the model.
5. If applicable, insert an external device, an *N-port*, with known *S*-parameters into your design.
6. Specify how to compute the solution by adding a solution setup.
7. (Optional) Set up any Optimetrics you want to run.
8. Run the simulation. HFSS 3D Layout computes the current inside the structure.
9. View the solution results, post-process results, and reports, and create field overlays.

Note:

Some of these tasks may not be applicable to your designs. Not all designs require *N*-ports.

Note:

After a period of idleness of 10 minutes, HFSS gives up its license. A renewal of activity automatically requests a license. Such idle notifications do not occur during simulations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Recording a Script to a File

Once users start to record a script, their subsequent actions are added to the script. Each interface command has one or more associated script commands that are recorded to the script. The script is recorded to a text file in .py (Python) format.

Follow these steps to record a script to a file.

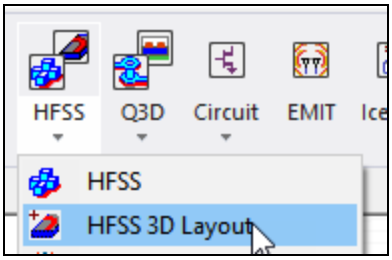
1. Click **Tools** > **Record Script** to open an explorer window.
2. Navigate to a selected directory to save the script. Then double-click the folder's name.
3. Type the name of the script in the **File name** text box.
4. Click **Save**.
5. The script is saved in the folder you selected by the file name (e.g., *filename*.py).
6. Perform the steps that you want to record.
7. When you have finished recording the script, click **Stop Script Recording** on the **Tools** menu.

Inserting an HFSS 3D Layout Design

This page briefly describes how to set up and run an HFSS 3D Layout design in the Ansys Electronics Desktop (AEDT)™ electronics systems design platform. The focus is on circuit and system analysis and the framework required to design RF-microwave, signal integrity, and printed circuit board applications. Before beginning, launch **Electronics Desktop** (**Electronics Desktop**), create a new project, and also enable the display of the **Choose Technology** window.

To insert an HFSS 3D Layout design:

1. From the **Project** menu, select **Insert HFSS 3D Layout Design** or in the **Desktop** ribbon, open the menu under the HFSS icon and select **HFSS 3D Layout** to open the **Choose Layout Technology** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

So long as the check box **Show this window on new design** is selected, this window appears when a new design is inserted into a project. If the check box is cleared, the next time that a new design is inserted, the window does not appear and a design is inserted using the selected technology on the last insertion.

1. Select an existing EM technology from the list or click **None** to manually add the model's metal and dielectric layers.

   A new design appears in the **Project Manager** window. The design is named HFSS3DLayout*n* by default, where *n* is the order of the design in a potential series of designs. Folders named **Data**, **Excitations**, **Analysis**, **Optimetrics**, and **Results** automatically appear under the design name. These folders store data about the design.

   To automatically insert an HFSS 3D Layout design when creating a new project, see **General Options** > **Desktop Configuration** to open the **Layout** view window. You can now create or edit the design layers in the **Edit Layers** window.

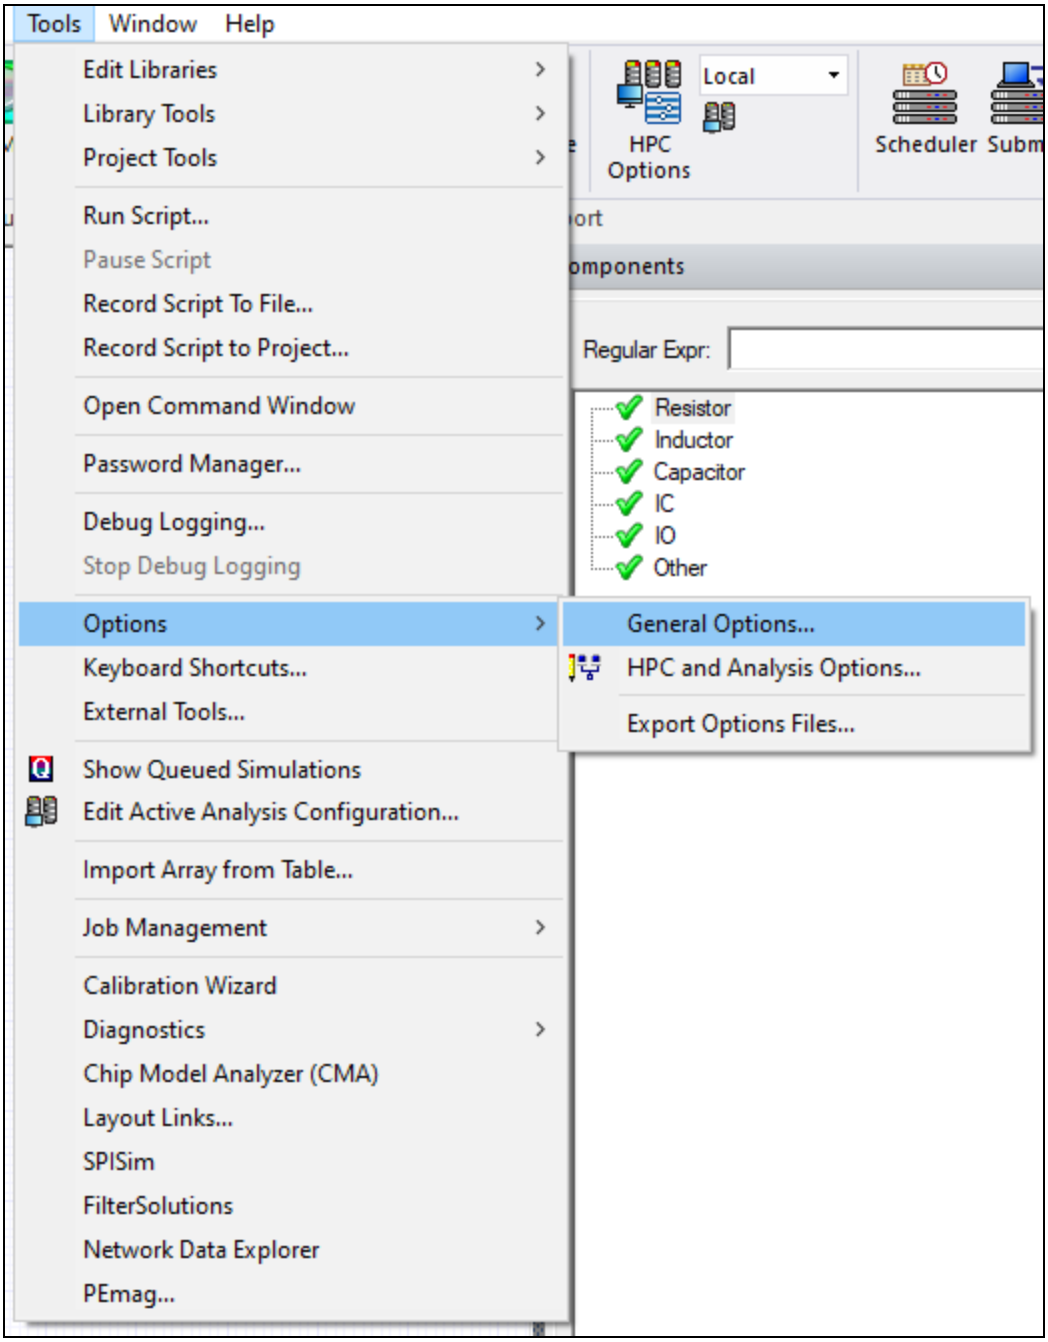
> **Note:**
>
> To expand the **Project Tree** and view specific data about the model such as its boundary assignments, click **+** to the left of the design icon in the **Project Manager** window.

Inserting an EM Technology File

HFSS provides default stackups for common structures — *technology files*. You can create and save your own stackup as a technology file so that it is available to every project. Each technology file you create includes the layers' attributes: material property, units, thickness, elevation, and roughness data. This information is stored in an .asty file in the **\userlib** folder. Follow these steps to enable the **Choose Technology** window and then select an EM technology.

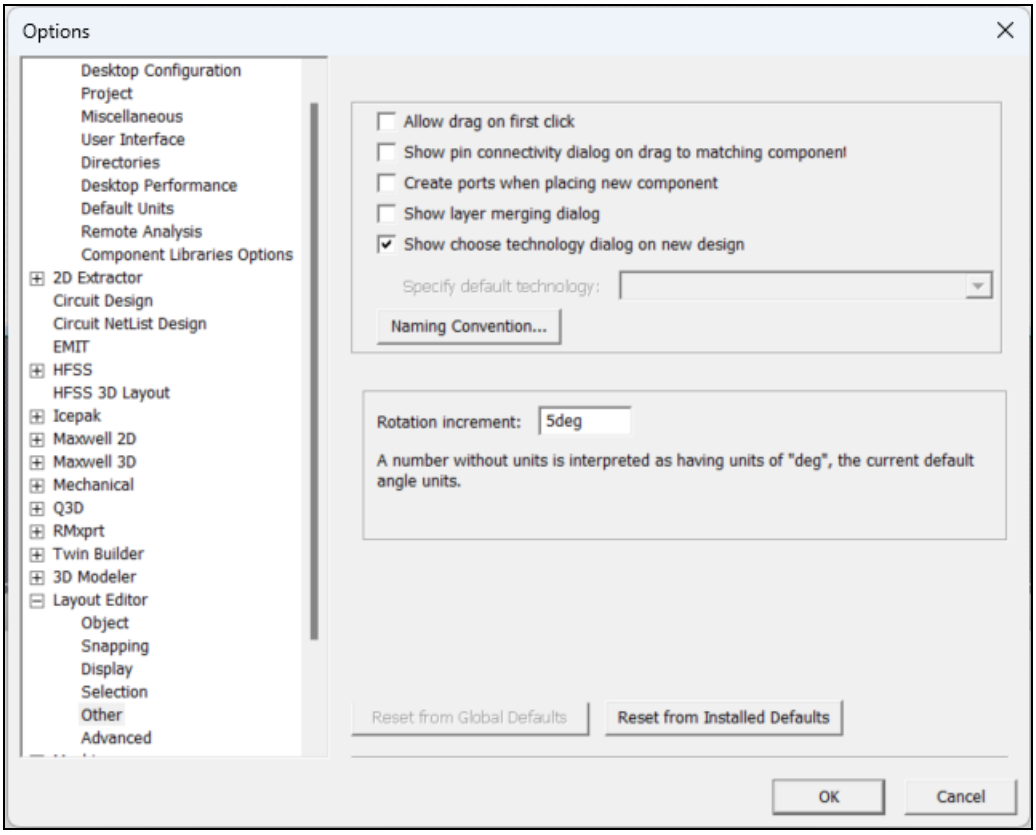
1. From the **Tools** menu, select **Options** > **General Options** to open the **Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Expand **Layout Editor** and select **Other**. Then check the **Show choose technology dialog on new design** box.

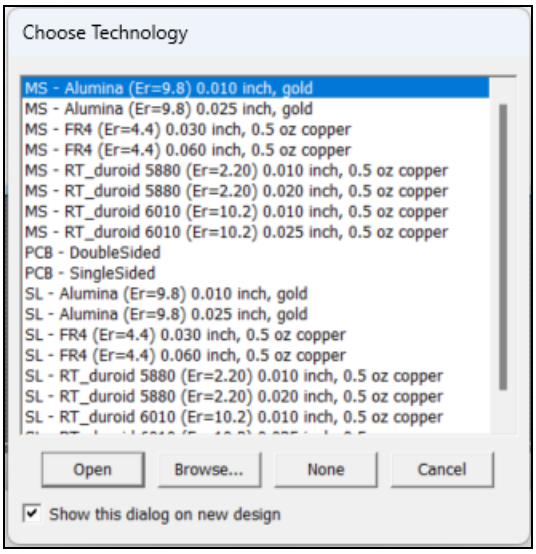
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Click **OK** to close the **Options** window.
4. Insert a new design **HFSS 3D Layout** design in a project to open the **Choose**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Technology window.



5. Select a structure from the list.

> **Note:**
>
> Alternatively, click **Browse** to search for an existing **.asty** technology file.

6. Click Open. The technology file you selected is listed in the **Project Tree** as EM*n* by default, where *n* is the order of the design in a potential series of designs. Sublevels named **Data**, **Excitations**, **Analysis**, and **Results** are automatically created underneath the design name in the **Project Tree**, storing data about the current project. The **Layout** view window also appears. You may now create or edit the design layers.

> **Note:**
>
> To import a technology definition from a technology definition file, refer to Adding a Technology Definition File to a Design (IC Mode only).

HFSS 3D Layout Options

Configure global changes to HFSS 3D Layout on the **Tools** > **Options** > **General Options** window. Make choices in the **General Options** window to create time-saving configurations for all projects at once. This greatly aids in the setup and execution of solution files and the data files which are produced. The specified options are used for all projects, unless explicitly overridden in a design.

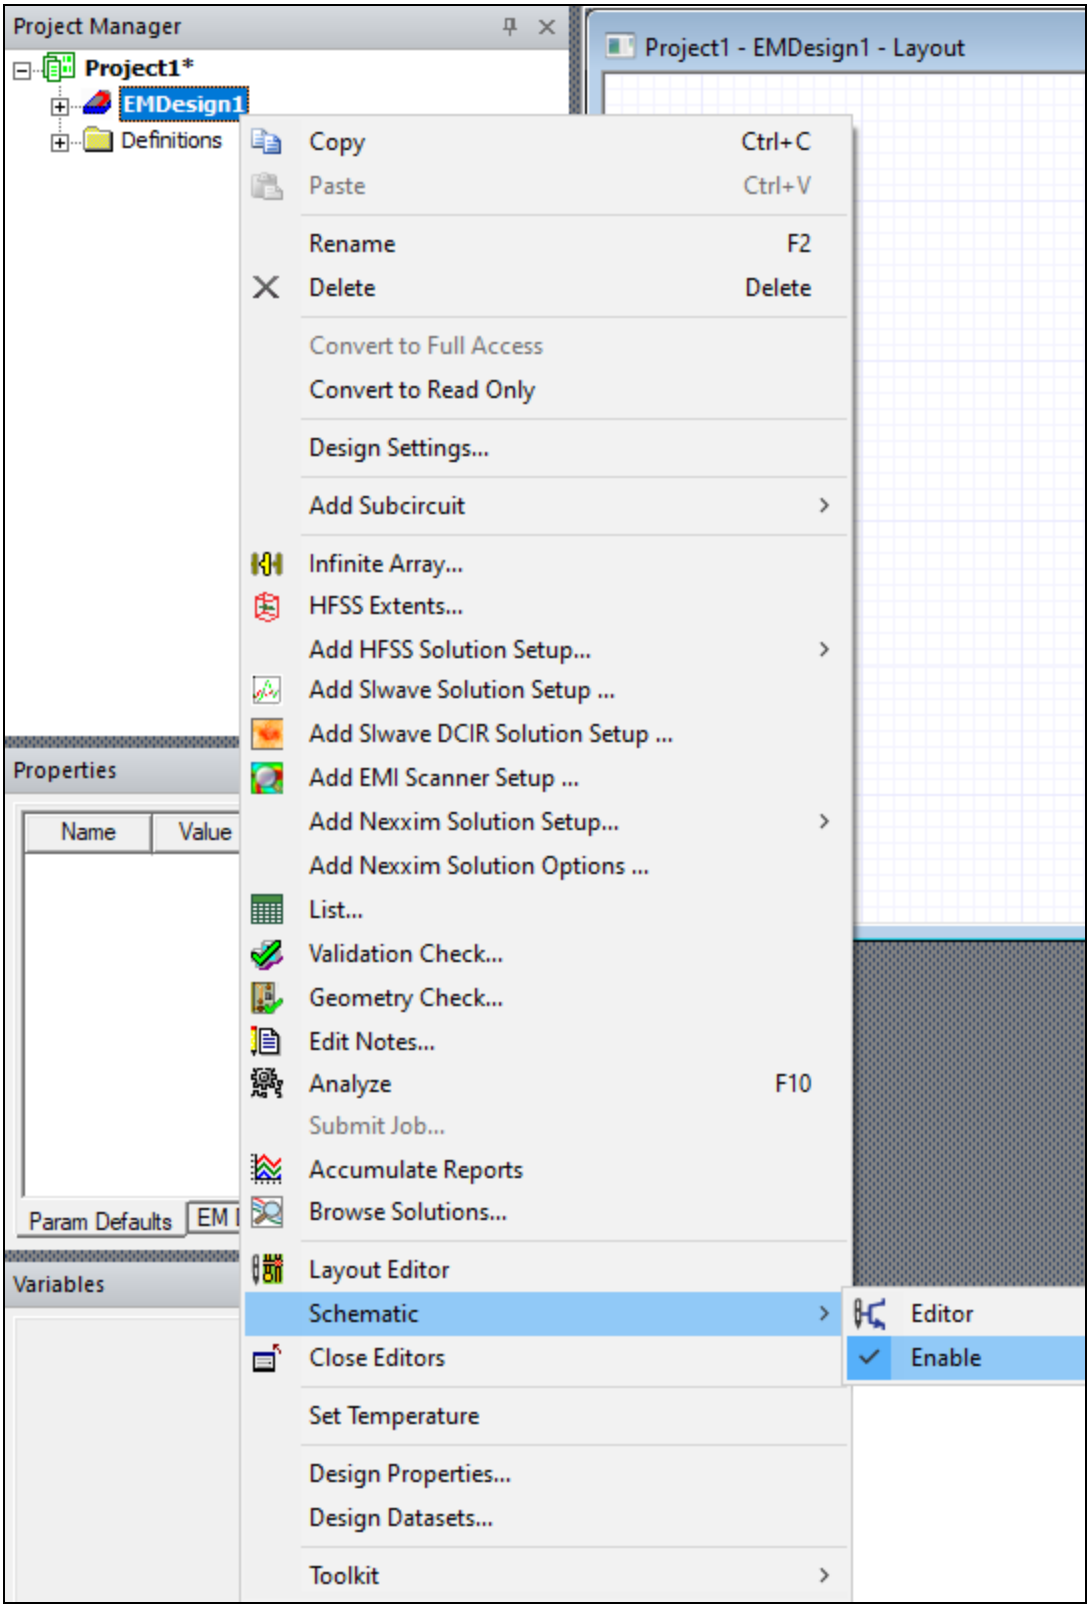
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

From the **General Options** window, select **HFSS 3D Layout** to configure the following options in the **Interface Options** area.

- Choose whether to **Save solution files in binary mode for new projects.** Enabled (checked) by default.
- **Enable Schematic** controls whether new HFSS 3D Layouts, and designs imported from ANF files, have schematics activated or deactivated. When **Enable Schematic** is unchecked (deactivated), all **Schematic Editor** menu/toolbar options are unavailable. Enabled (checked) by default.

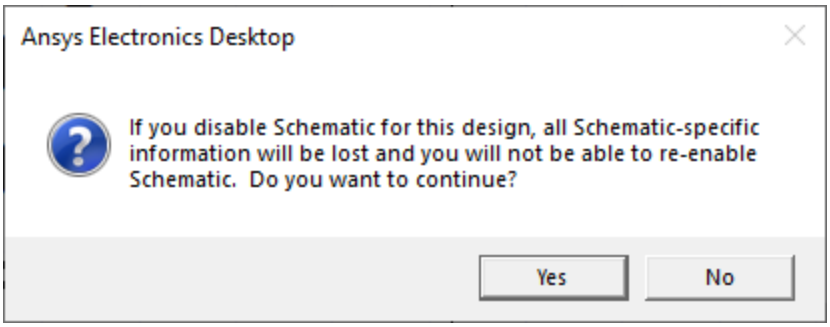
  To deactivate schematic options for an active design, first expand the **Project Tree** in the **Project Manager** window. Then right-click the active design and select **Schematic** > **Enable** to remove the check mark and deactivate schematic options.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If **Enable Schematic** is unchecked, the following warning message appears. Once it is deactived, **Enable Schematic** cannot be re-enabled for a design.



It is possible to have a project in which some designs have schematics enabled and other designs have schematics disabled. Objects **cannot** be copied from designs without schematics into designs with schematics. Objects **can** be copied in the opposite direction but the copy operation does not contain schematic-specific information, and the paste option is deactivated.

- Choose whether to **Save before solving**. Enabled (checked) by default.

  If **Save before solving** is checked (enabled), and a major edit is made, the project is saved if a solve is started. Also, if a new project is created and a solve is started, the **Save As** window opens automatically and prompts users to save the project before continuing. If this option is unchecked, the user is not prompted to save before a solve.

  > **Note:**
  >
  > If users do not have permissions to write to the project folder, or if one of the files in the project folder is read-only, then choosing **Save** or **Analyze** prompts users to save the project to another location. Canceling the **Save As** cancels the Analysis.

Design Settings

The tabs and settings within the *Design Settings* dialog box are dependent on the design type, and there is a product-specific topic for each applicable design type. Please click the appropriate link below for the product of interest:

- HFSS
- HFSS Transient
- HFSS 3D Layout
- Icepak

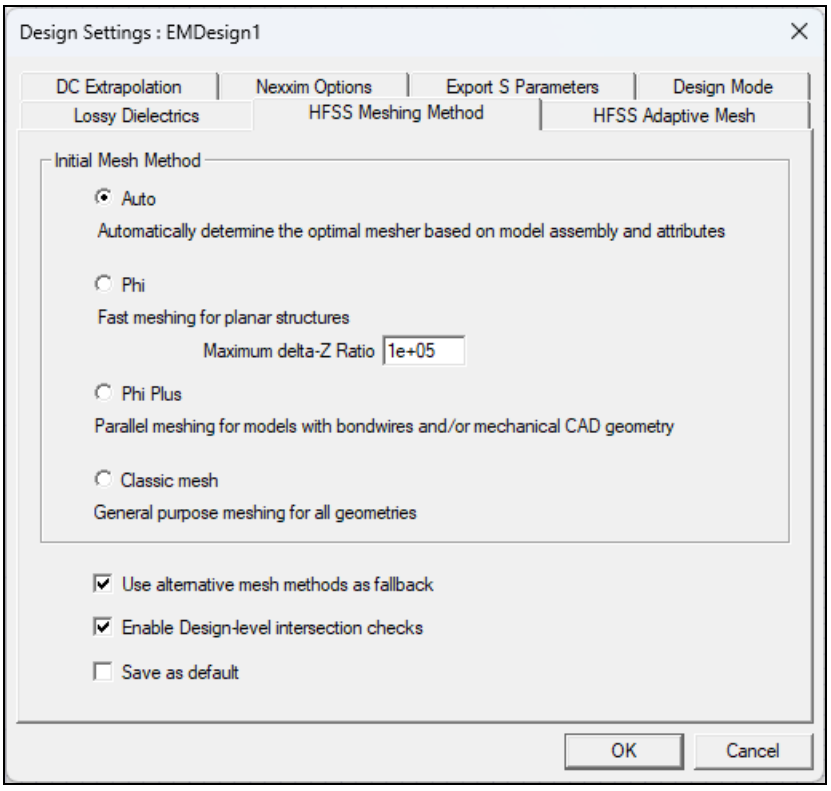
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Mechanical
- Q3D
- 2D Extractor

HFSS 3D Layout Design Settings

From the **HFSS 3D** menu, select **Design Settings** to display the **Design Settings** window for the active design. The Design Settings window has seven tabs:

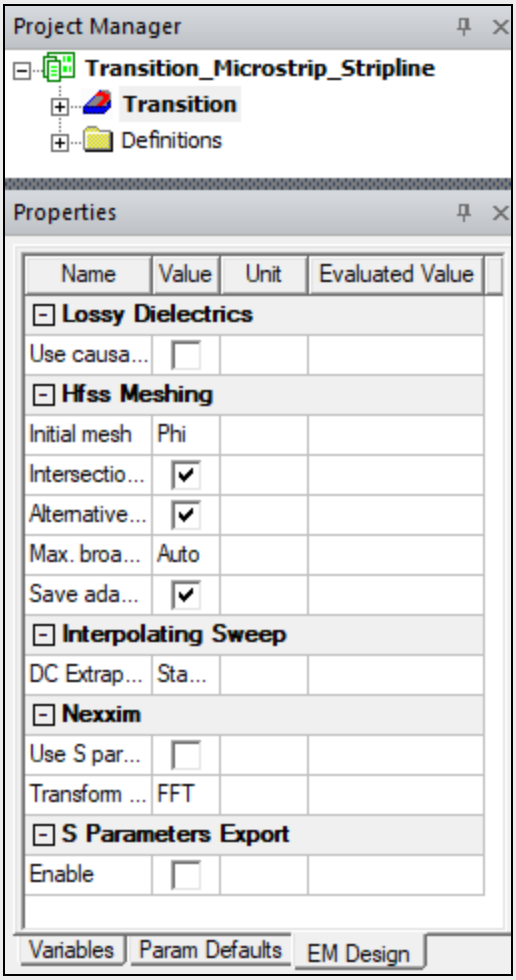
- DC Extrapolation
- Nexxim Options
- Export S-Parameters
- Design Mode
- Lossy Dielectrics
- HFSS Meshing Method
- HFSS Adaptive Mesh



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

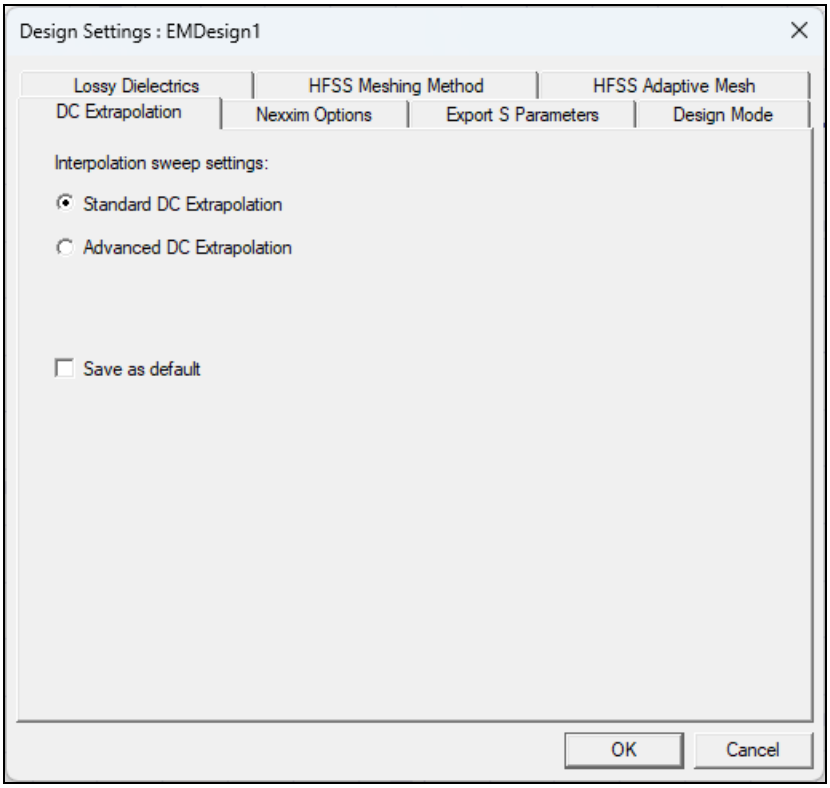
Selecting **[*Active Design Folder*]** in the **Project Tree** also displays **Design Settings** in **Properties** window under **EM Design** tab.



DC Extrapolation Tab

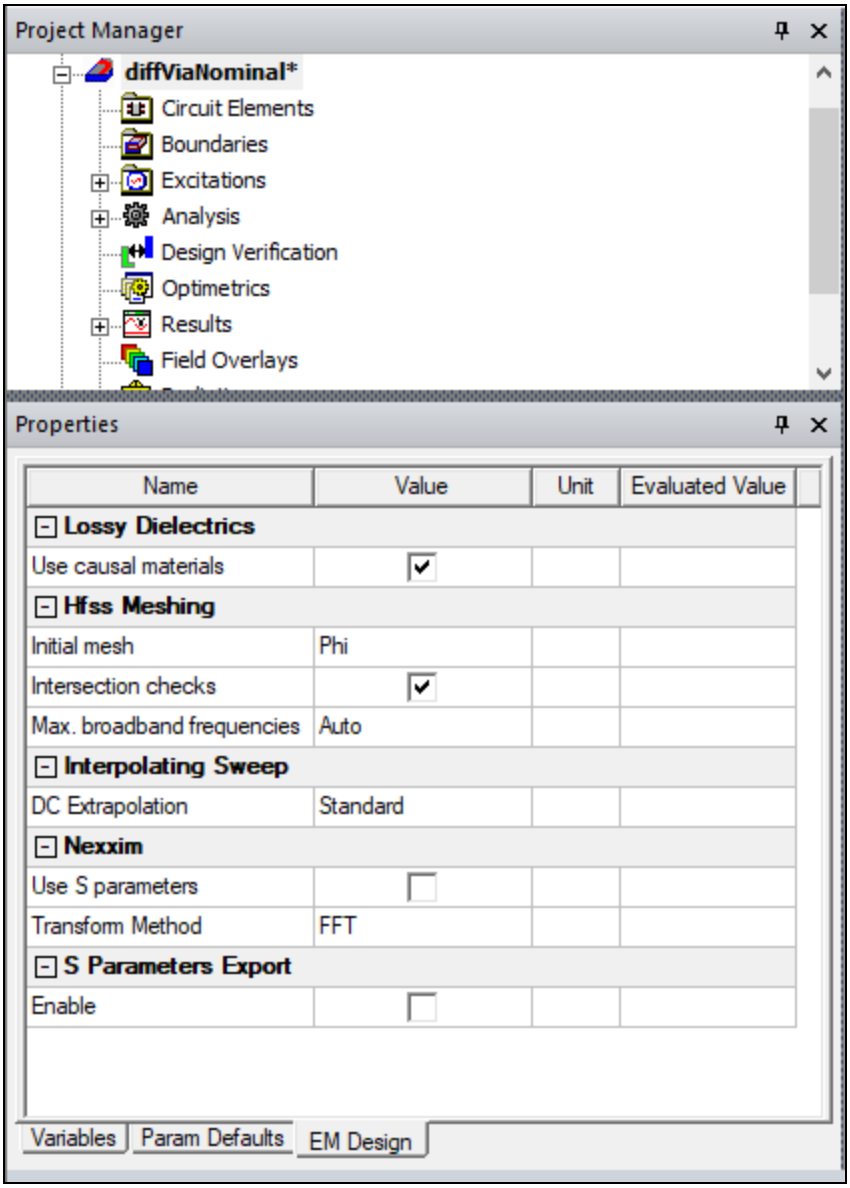
From the **Project Manager** window, right-click on a design and select **Design Settings** to open the **Design Settings** window and click the **DC Extrapolation** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Also view and edit design settings by selecting a design using the **EM Design** tab of the **Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **Standard DC Extrapolation** causes the software to compute values automatically and hides the **DC Extrapolation** tab in the **Interpolating Sweep** setup.
- **Advanced DC Extrapolation** allows users to set a **Minimum Solved Frequency**.

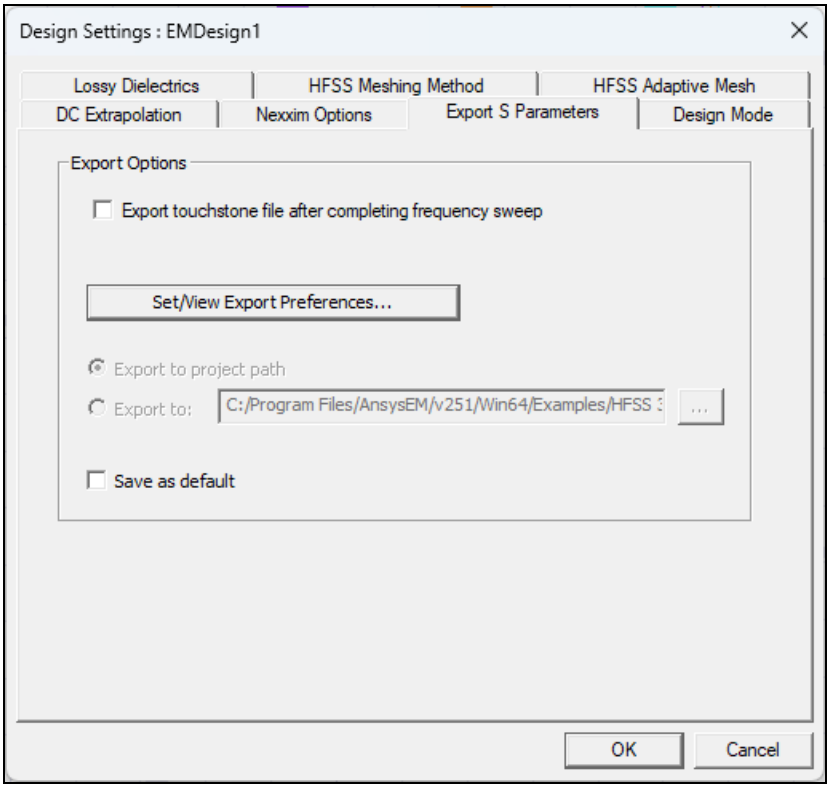
> **Important:**
>
> Selecting **Advanced DC Extrapolation** is **not** recommended by Ansys and exists to support legacy functions. Selecting **Advanced DC Extrapolation** may have unexpected results.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Select **Save as default** and click **OK** to save these setting to the registry.

Export S-Parameters Tab

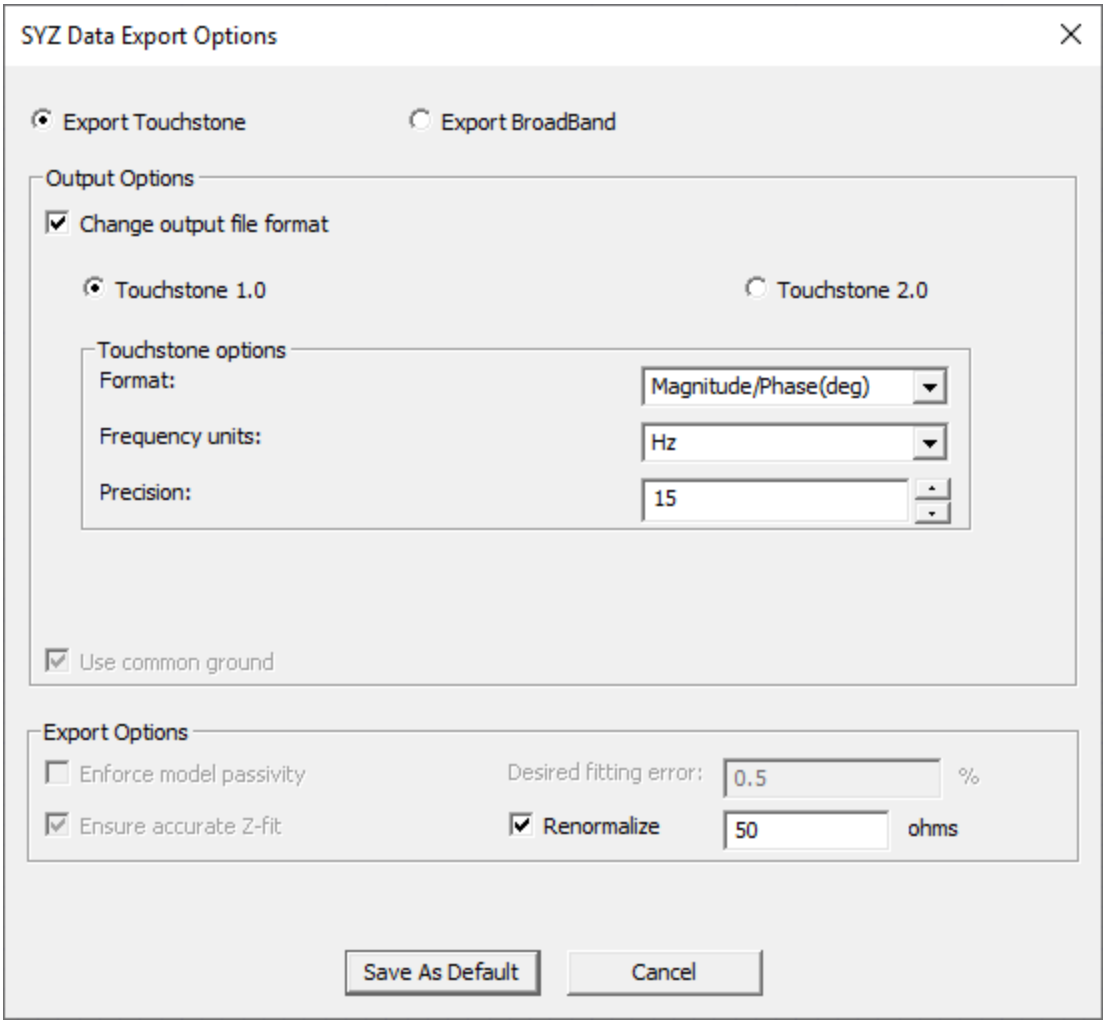
From the **Project Manager** window, right-click on a design and select **Design Settings** to open the **Design Settings** window and click the **Export S-Parameters** tab.



The **Export S-Parameters** tab lets you **Set/View Export Preferences** and specify whether to Export Touchstone file after completing frequency sweep.

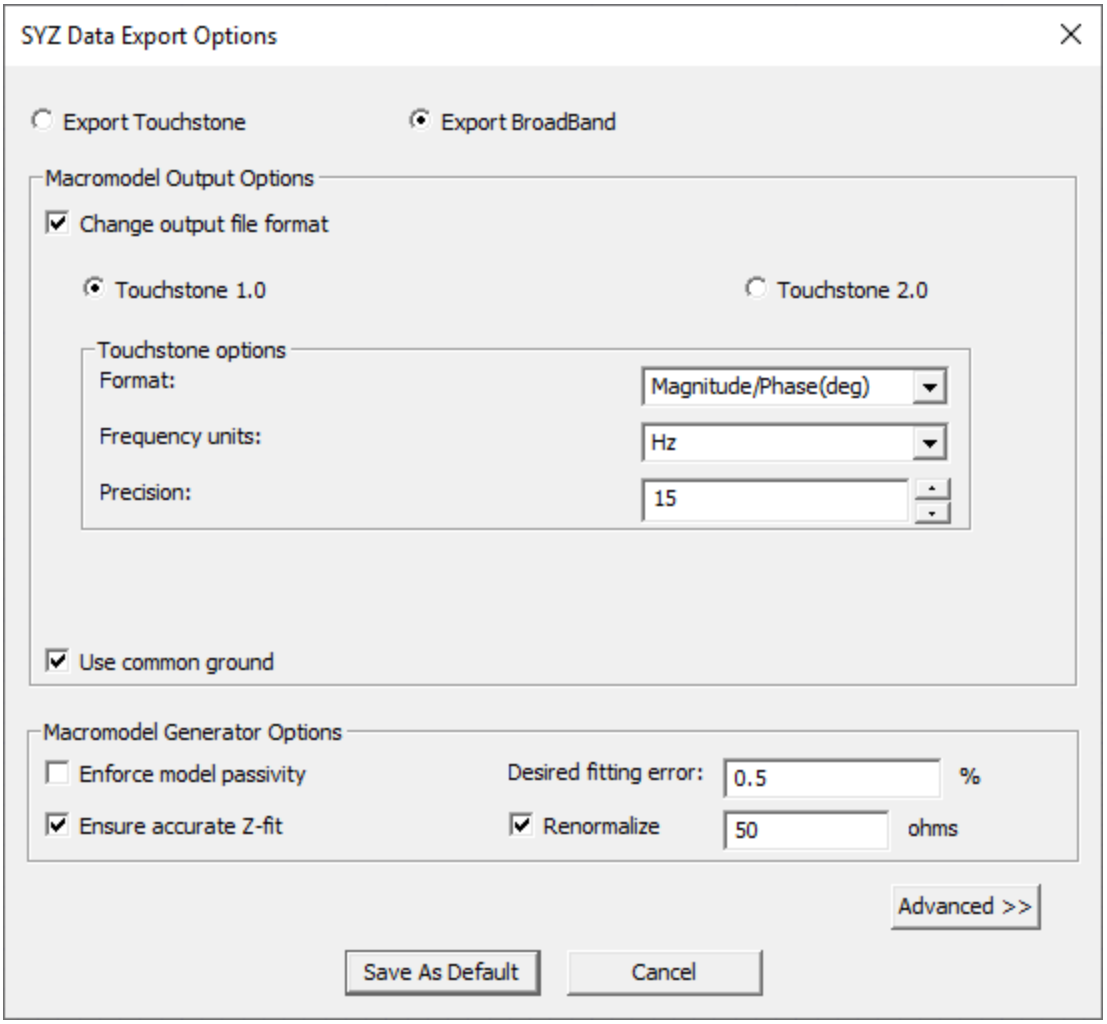
Click **Set/View Export Preferences** to open the **SYZ Data Export Options** window. This window contains a range of choices for output format, including advanced options. SYZ Data Export supports 2 types of export: touchstone export and broadband export.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



If you select the touchstone export option, at the end of a simulation raw s-parameter data is exported either in Touchstone 1.0 or Touchstone 2.0 as selected by the user.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

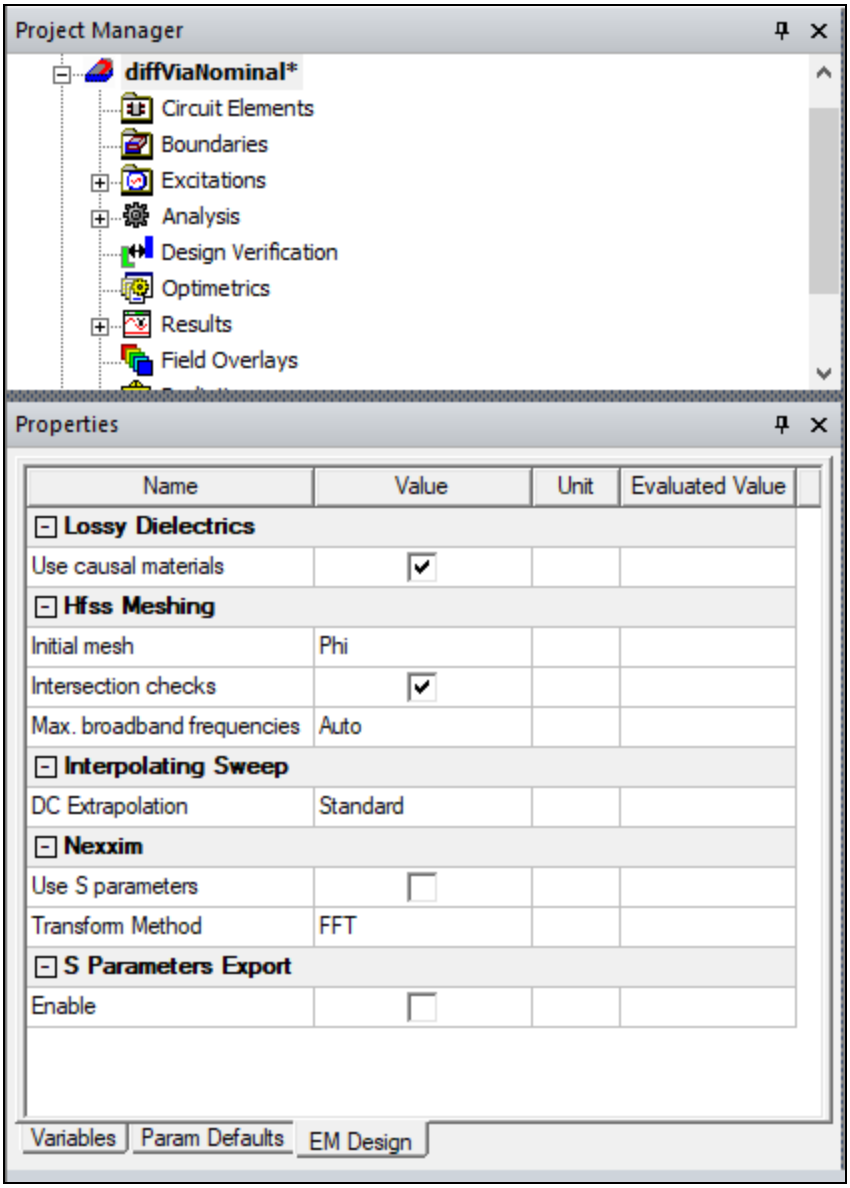


If you select the broadband option, at the end of a simulation the s-parameter goes through a fitting based on the export options selected and data is exported either in Touchstone 1.0 or Touchstone 2.0 as selected by the user.

Click **Save as default** to save the export settings to the registry.

Selecting a active design in the **Project Tree** also displays the **Design Settings** in **Properties** window under the **EM Design** tab.

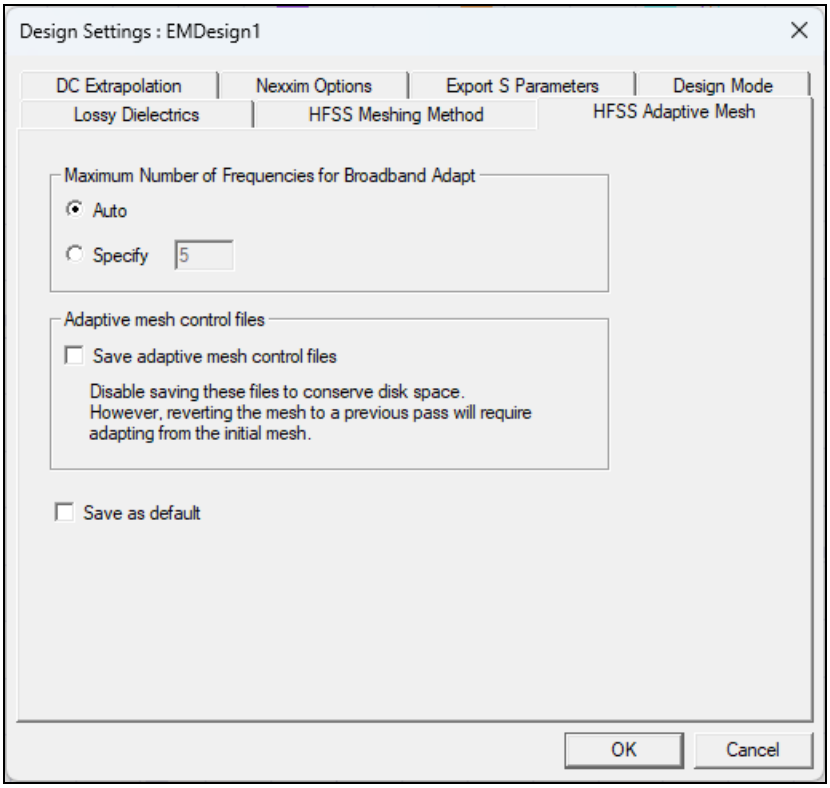
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



HFSS Adaptive Mesh Tab

From the **Project Manager** window, right-click on a design and select **Design Settings** to open the **Design Settings** window and click the **HFSS Adaptive Mesh** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

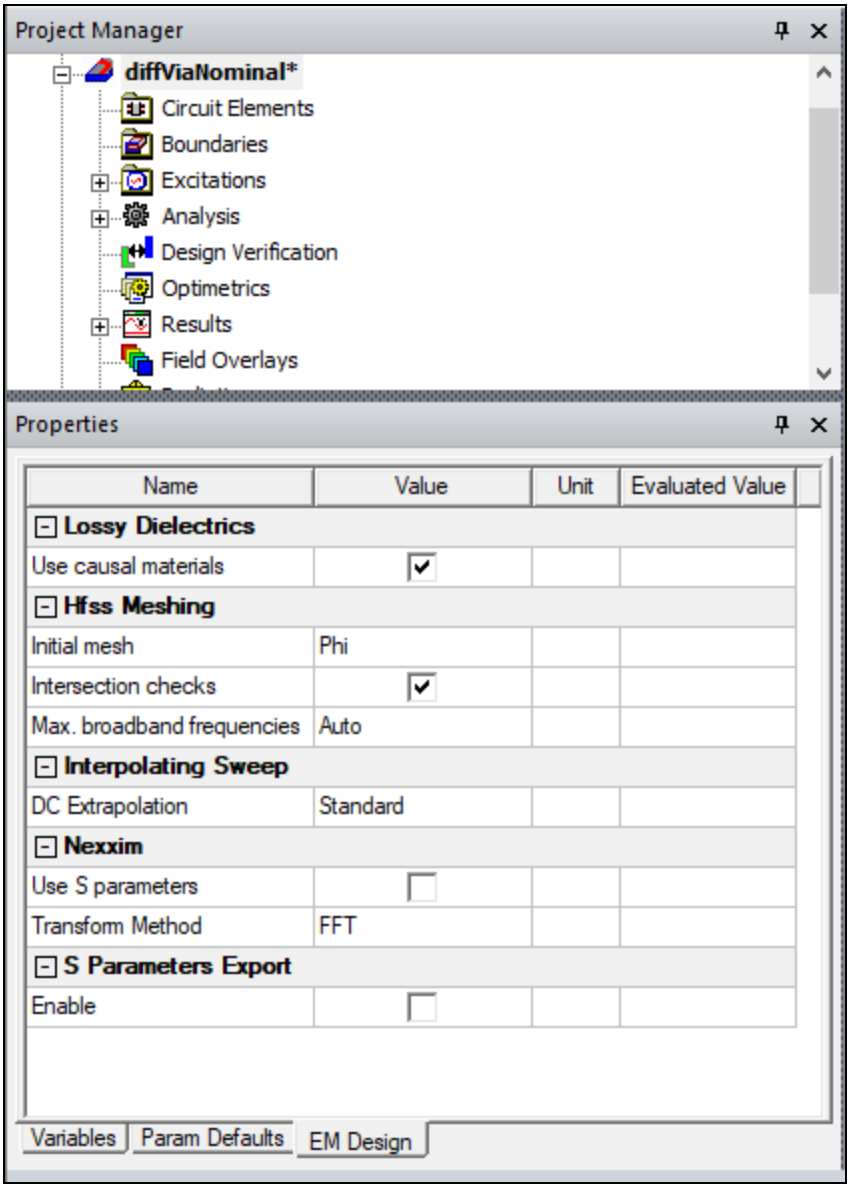


- **Maximum Number of Frequencies for Broadband Adapt**: Normally the decision for how many frequencies to use for is set automatically. Because the decision is not straightforward, this option is for advanced users to manually set the maximum number of frequencies to solve during broadband adaptive meshing. This feature works for both auto and advanced HFSS solution setups.
- **Save adaptive mesh control files**: Allows you to deactivate saving adaptive mesh control files to save disk space. However, if unchecked, reverting the mesh to a previous pass requires adapting on the initial mesh. Changing the setting reverts to the initial mesh.

- Select **Save as default** and click **OK** to save the setting to the registry.

Also view and edit design settings by selecting a design using the **EM Design** tab of the **Properties** window.

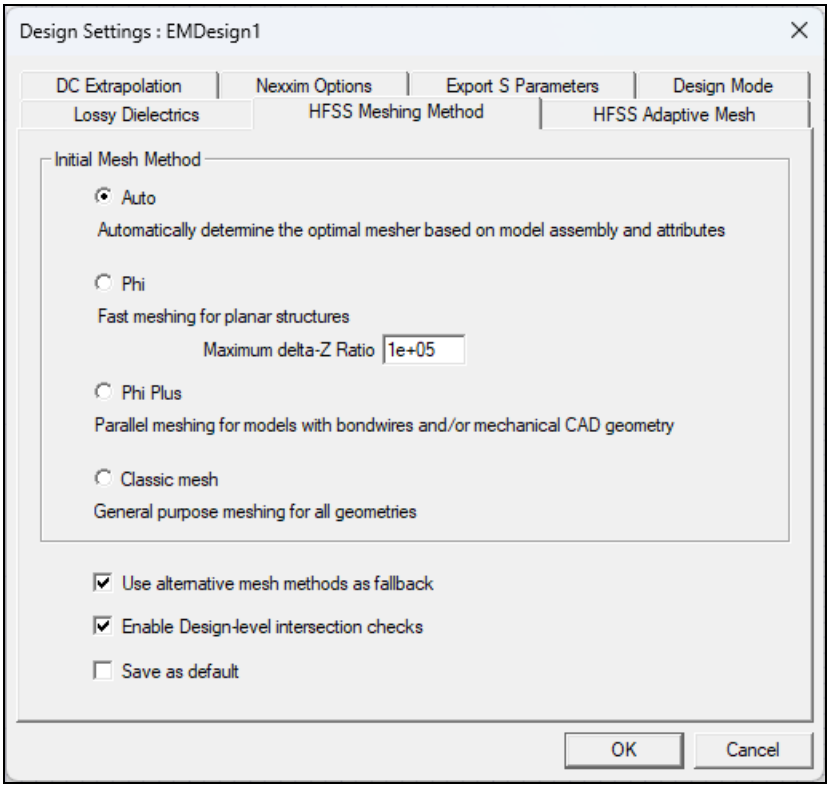
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



HFSS Meshing Method Tab

From the **Project Manager** window, right-click on a design and select **Design Settings** to open the **Design Settings** window and click the **HFSS Meshing Method** tab. Change the following settings, as necessary.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

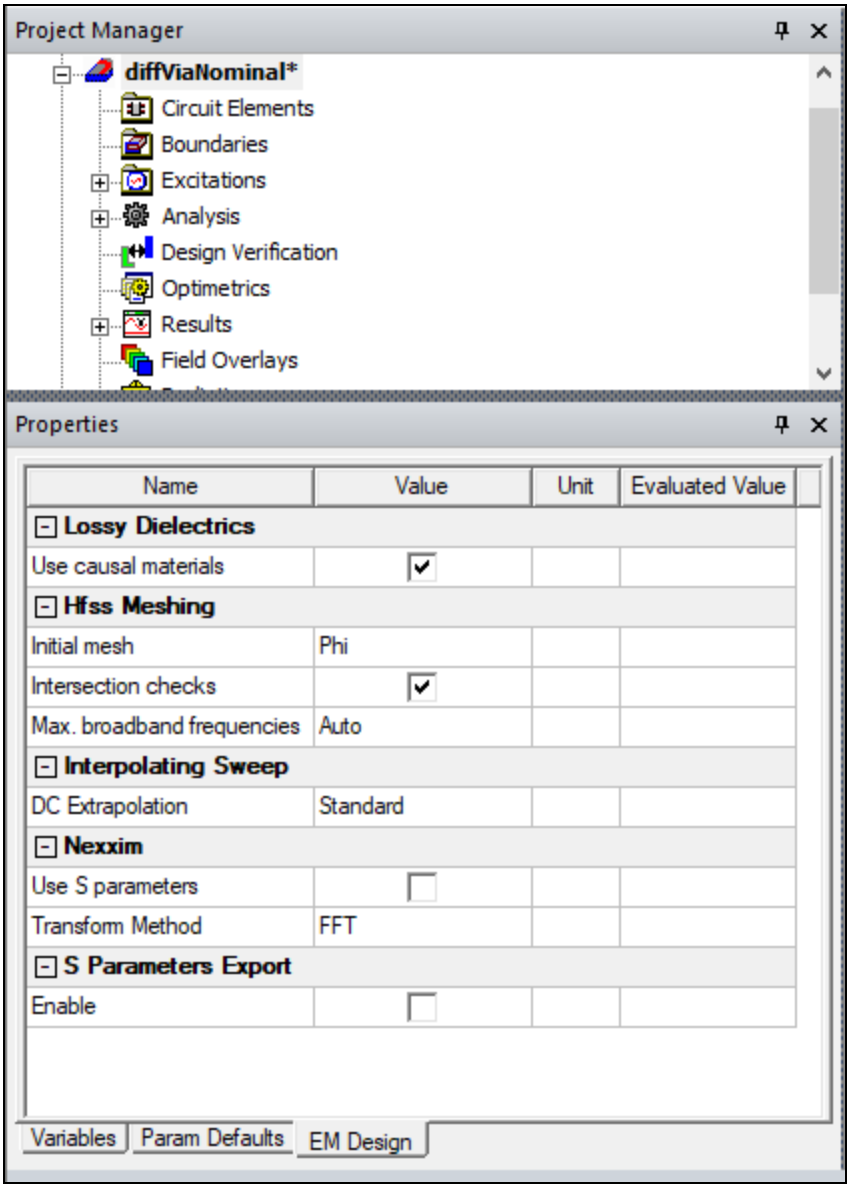


- From the **Initial Mesh Method** area, select one of the following mesh methods:
  - **Auto** — automatically selects a suitable mesh method for the design based on geometry characteristics (e.g., if the design contains bondwires, **Phi Plus** is selected).
  - **Phi** — a layout-based meshing technology, available in the HFSS 3D Layout interface. This advanced meshing technology is capable of rapidly generating an initial mesh ensuring faster simulations that can be further accelerated and enhanced by using high performance computing.
  - **Phi Plus** — works with all types of layout models, particularly those containing bondwires, solder balls, or 3D Components (MCAD). Phi Plus generates an initial mesh using high performance computing (HPC).
  - **Classic mesh** — uses a Bowyer algorithm to create compact meshes for the model with very large length scales. It represents the model very accurately.
- Check the **Use alternative methods as fallback** box to allow the solver to use an alternative mesh method if the selected mesh method (e.g., Phi) fails to generate an initial mesh. Enabled by default.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Check the **Enable Design-level intersection checks** box and the Ansys Electronics Desktop (AEDT)™ electronics systems design platform automatically searches for and notifies the user when a design has intersecting geometries.
- Check the **Save as default** box and click **OK** to save the causal material setting to the registry.

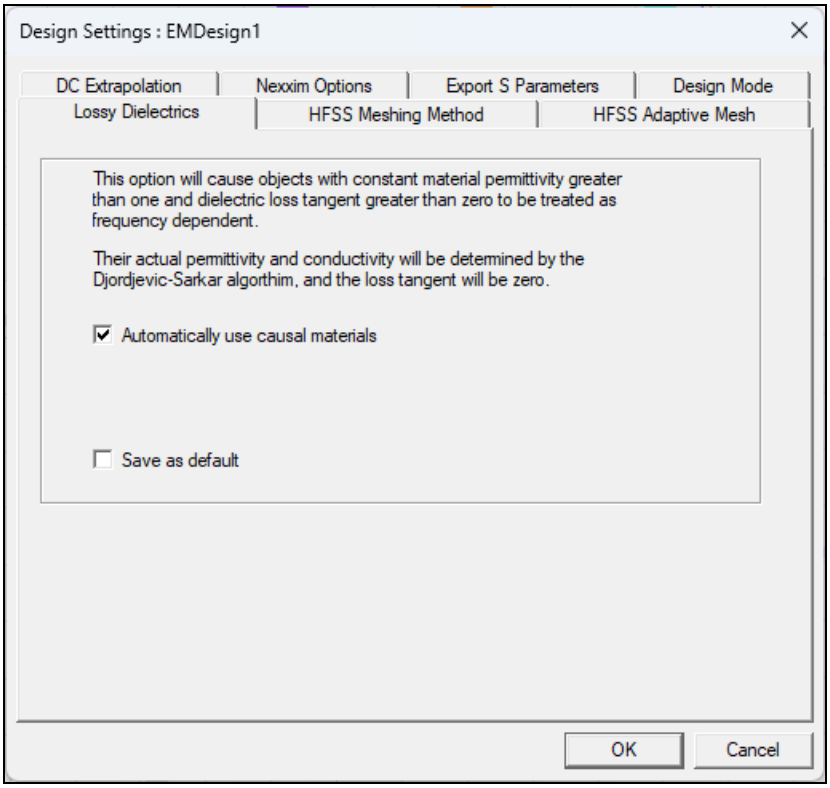
Also view and edit design settings by selecting a design using the **EM Design** tab of the **Properties** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lossy Dielectrics Tab

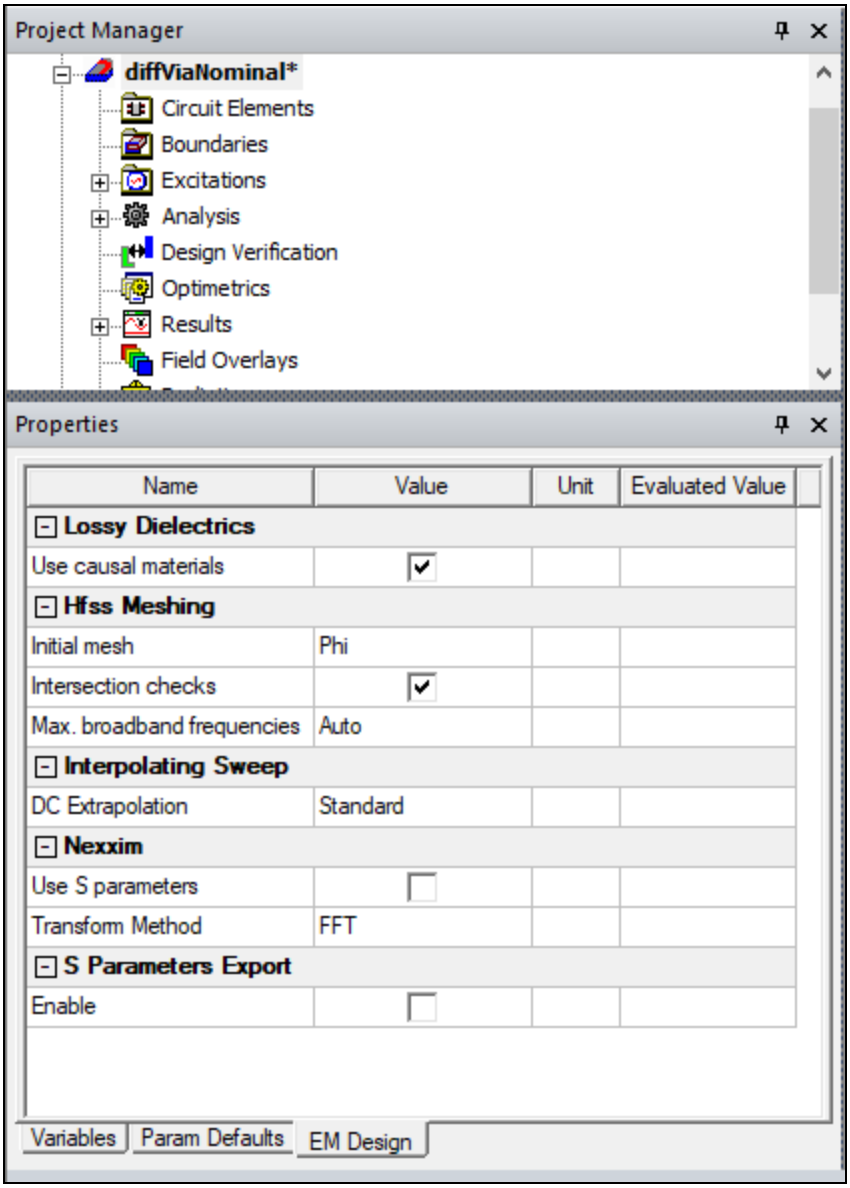
From the **Project Manager** window, right-click on a design and select **Design Settings** to open the **Design Settings** window and click the **Lossy Dielectrics** tab.



- **Automatically use causal materials** causes some objects to be treated as frequency dependent.
- Select **Save as default** and click **OK** to save the causal material setting to the registry.

Also view and edit design settings by selecting a design using the **EM Design** tab of the **Properties** window.

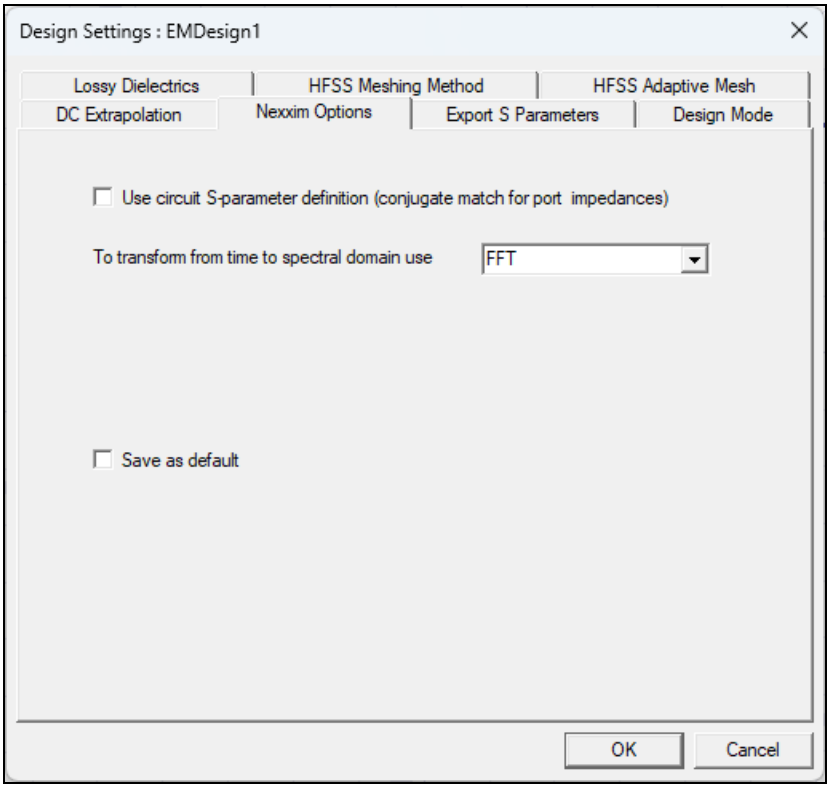
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Nexxim Options Tab

From the **Project Manager** window, right-click on a design and select **Design Settings** to open the **Design Settings** window and click the **Nexxim Options** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Nexxim Options** tab allows you to configure options for Nexxim setups.

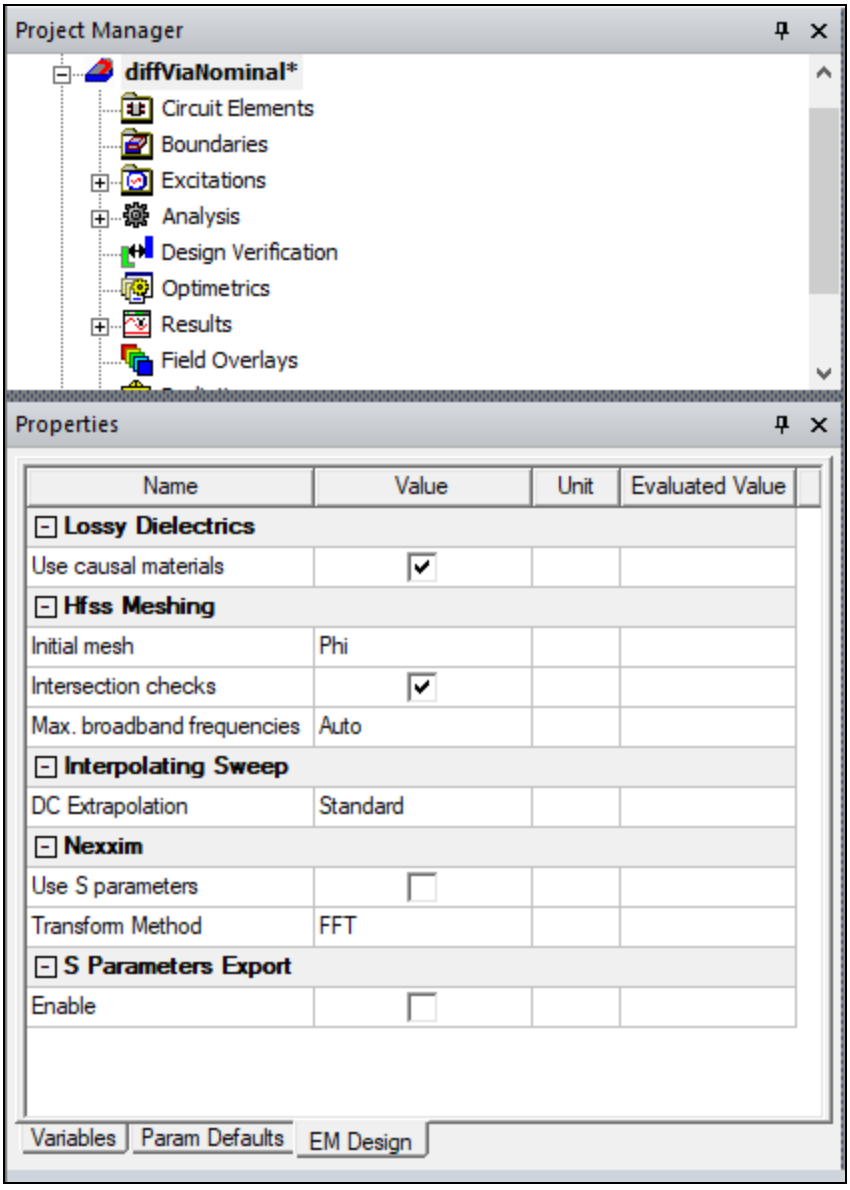
- **Use circuit S-parameter definition** — Controls the definition for port impedances. For HFSS 3D Layout, this option should typically be unselected (check box unchecked). The definition of a “matched port” depends on the application. In applications that deal mostly with circuit quantities (including the Nexxim simulator), a “matched port” has a characteristic impedance that maximizes the power transfer. This is also called a “conjugate match.” In applications that deal mostly with electromagnetic quantities (including HFSS), a “matched port” has a characteristic impedance that maximizes the transfer of the voltage wave. The two definitions differ only by the conjugate of the characteristic impedance of the port. For real port impedances, there is no difference.
- **To transform from time to spectral domain use** – Allows you to select the method used to transform on the time domain to the spectral domain for all projects.
    - **Fourier Integration** is very accurate but may be time-consuming for large datasets. The Fourier Integration method computes the projection of the signal on each of the requested harmonics via integration of the inner-product integral.
    - **FFT** (Fast Fourier Transform, the default) achieves faster conversion with a slight reduction in accuracy. The FFT method samples the signal at 2*(maximum harmonic number) points, and outputs the FFT of the sampled signal. The FFT

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

method may not be robust enough to avoid aliasing while converting some time-domain signals to the frequency domain.

- Select **Save as default** and click **OK** to save the causal material setting to the registry.

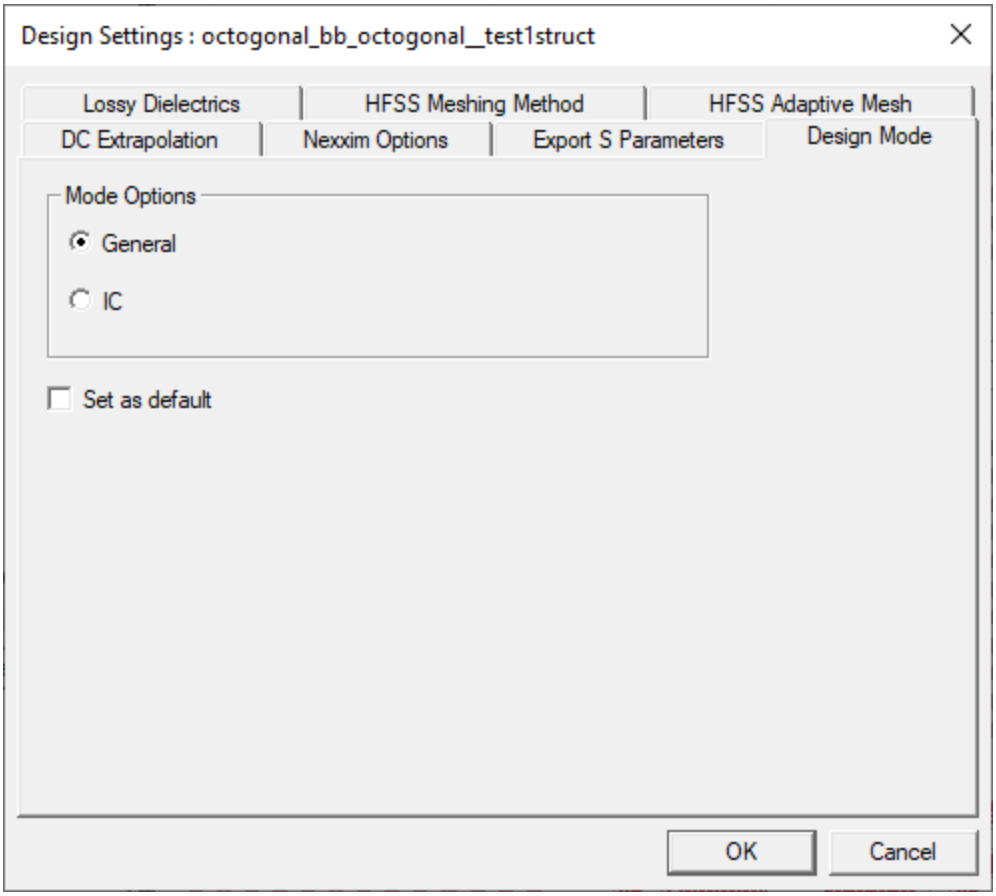
Selecting a active design in the **Project Tree** also displays the design settings in **Properties** window under **EM Design** tab.



Design Mode Tab

From the **Project Manager** window, right-click on a design and select **Design Settings** to open the **Design Settings** window and click the **Design Mode** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

Refer to Layout Editor and Switching to IC Mode for more information.

Editing Distributed Machine Configurations in HFSS 3D Layout

You can create a new distributed machine configuration, or edit an existing machine configuration, for Ansys SIwave™ and/or Ansys HFSS™.

Distributed Machine Configurations for HFSS 3D Layout

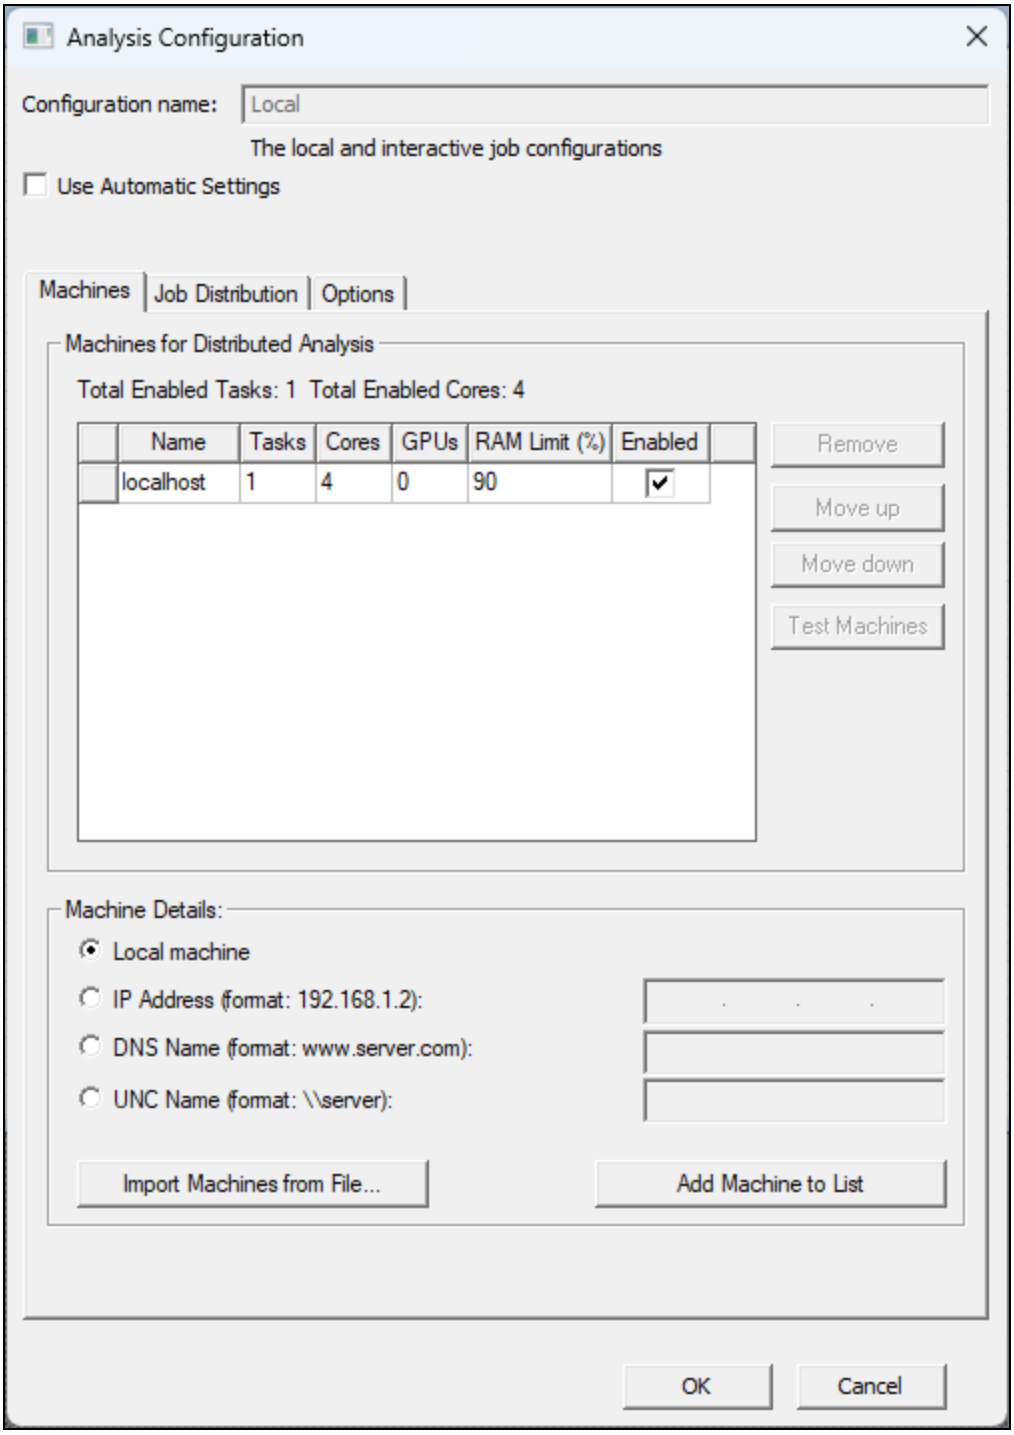
To create a new distributed machine configuration, or edit an existing machine configuration, for HFSS 3D Layout, see High Performance Computing: Distributed Analysis: Editing Distributed Machine Configurations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Distributed Machine Configurations for Ansys SIwave™ in HFSS 3D Layout

To create a new distributed machine configuration, or edit an existing machine configuration, click **Tools** > **Edit Active Analysis Configuration** to open the **Analysis Configuration** window directly or click the **Analysis** settings icon on the toolbar.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Job Distribution Tab

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When Level 2 is enabled for Ansys SIwave™ printed circuit board (PCB) and package electromagnetics simulation software parametric setups, the first level distributes variations and the second level (SIwave solver) distributes frequencies.

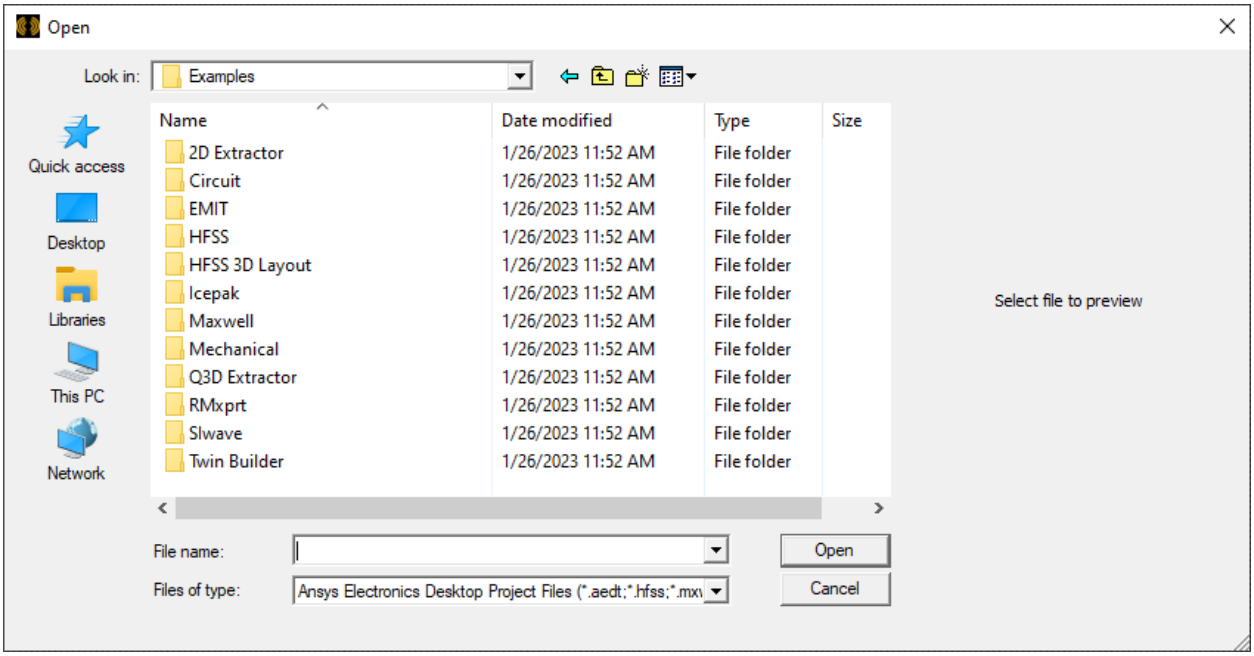
Example Projects

Your Ansys Electronics Desktop installation includes an example directory containing projects folders for several kinds of designs.



Example projects are organized by the design type. The examples under Circuit, HFSS, and HFSS 3D Layout include subfolders, organizing the projects according to different applications:

- Circuit has subfolders for Automation, High Speed Digital, Low Noise Amplifier, RF Microwave, and Signal Integrity examples. The High Speed Digital folder has further subfolders for PCIe and USB projects. And the RF Microwave folder has further subfolders for Amplifiers, DC-IV, Filters, Misc, Mixers, Oscillators, and System projects.
- HFSS has subfolders for ADAS, Antennas, EMI EMC, Filters, Metamaterial, RCS, RF Microwave, Signal Integrity, and Transmission Lines.
- HFSS 3D Layout has subfolders for Antennas, Component, Filters, FSS, and Signal Integrity.

Several of these projects are associated with detailed getting started guides.

- HFSS 3D Layout Example Projects

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

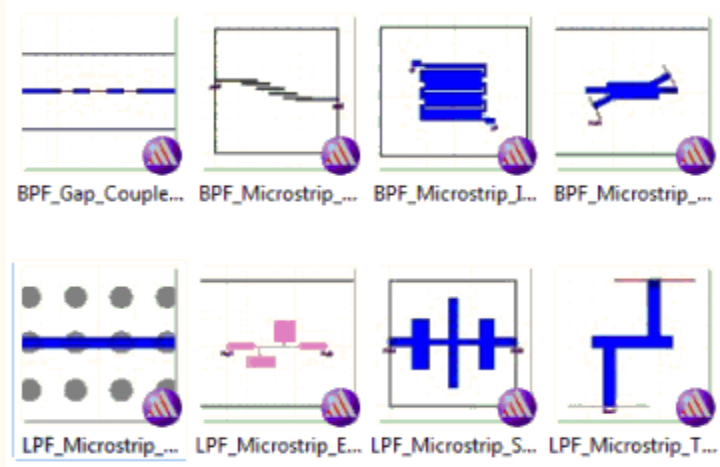
HFSS 3D Layout Example Projects

The examples directory for HFSS 3D Layout has subdirectories for Antennas, Component, Filters, FSS and Signal Integrity.

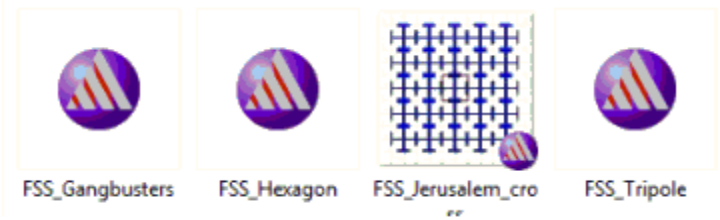
- Antennas

- Components

- Filters

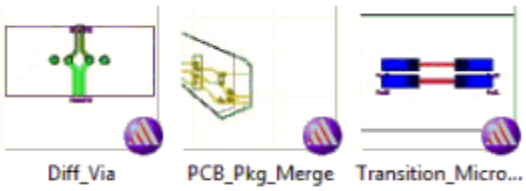


- FSS



- Signal Integrity

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Finding Information in the Online Help

The help system provides different ways to find information and navigate quickly:

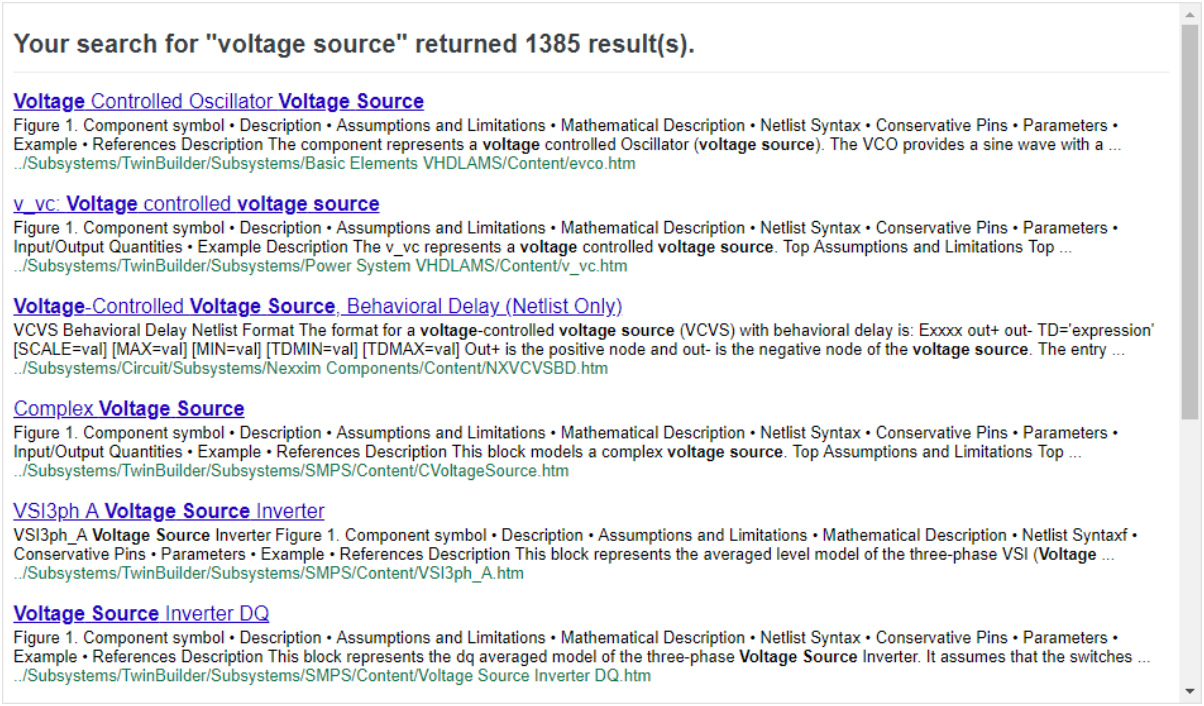
- Press **F1** on any open dialog box to open the relevant help topic.
- *A hierarchical table of contents* – Contents – Browse through the table of contents, expand entries, and close entries. Click an entry to see it in the content area.
- *A full text search* – To locate occurrences of a word or phrase that may be contained in the help, use the search function.

> **Note:**
>
> Ansys Electronics Desktop Student includes access to PDF documentation only.

Using the Search Function in the Help

When you enter words or strings to search for in the help, the search engine lists all topics in which any of the words occur. For example, if you enter “voltage source” without the quotation marks, the results show all topics that contain “voltage” or “source.”

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

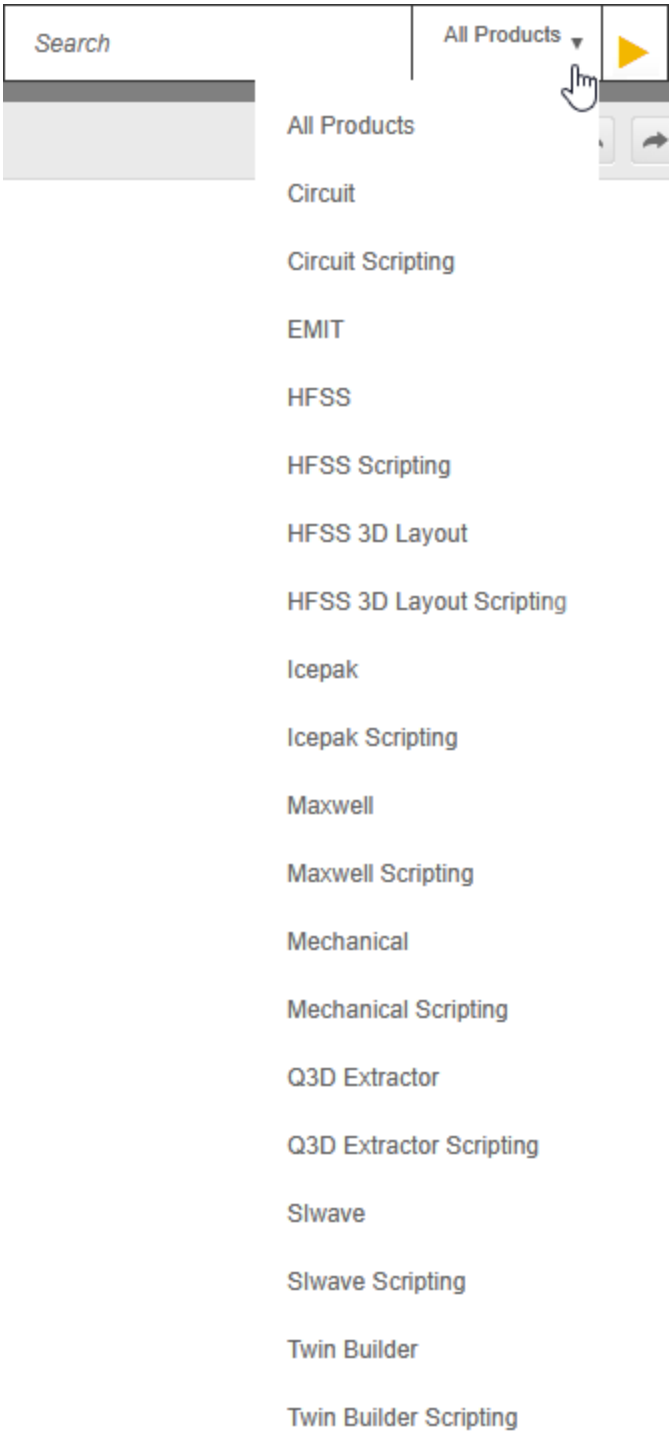


This method probably provides more hits than you want. The search function in the help provides several methods for making searches more specific.

Performing a Basic Search

1. Type the words or string in the search box.
    - If you are searching within the full Electronics help system, you see a search box that includes a drop-down filter for specifying a product, a product's scripting guide, or searching across all products. When you change the filter, the results dynamically reflect the selected filter.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



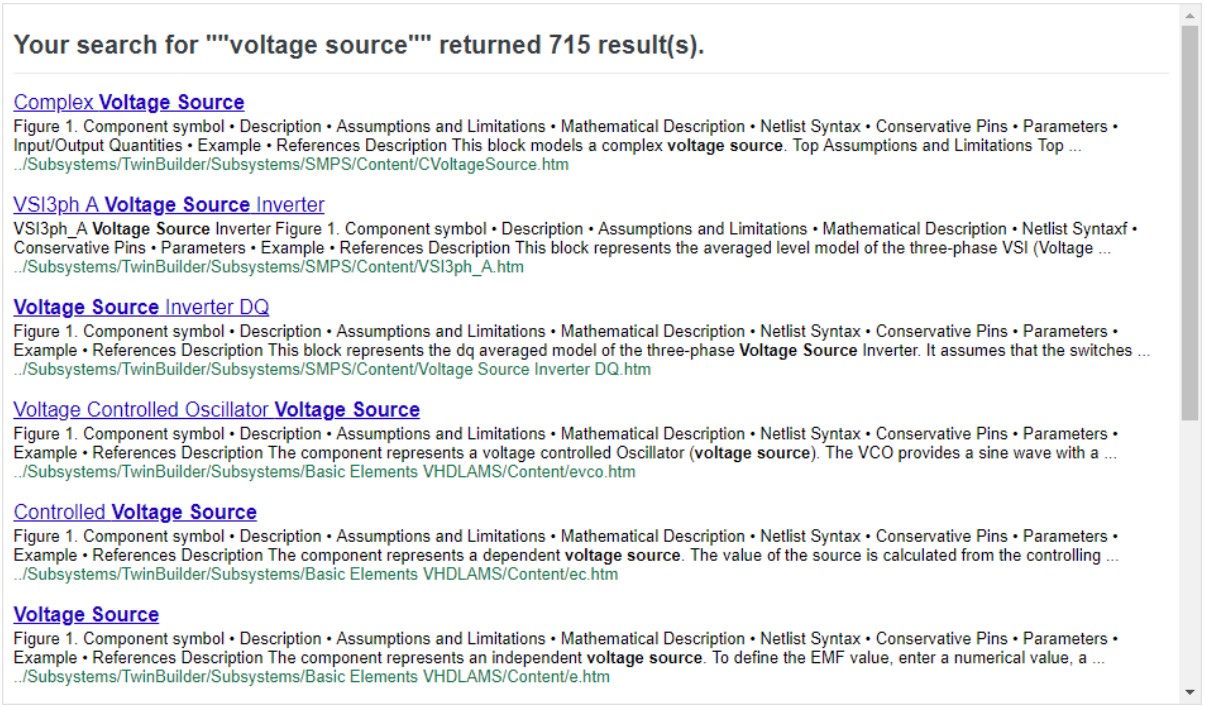
- If you accessed the help for a specific product by pressing **F1** in Electronics Desktop, the search box will have preselected that product. You can change the selection to a different product, a product's scripting guide, or all products.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Click on the topic you want in the results list.
    - Some topics in different products share the same title. When searching "All Products," check the URL below each link. The URL indicates the product under which the topic falls.
    - After clicking a topic, if you want to view a different topic, click your browser's back button to return to the results list.
    - To turn off highlighting on the page you are viewing, click the Remove Highlights icon ( ).

Searching with Quotation Marks

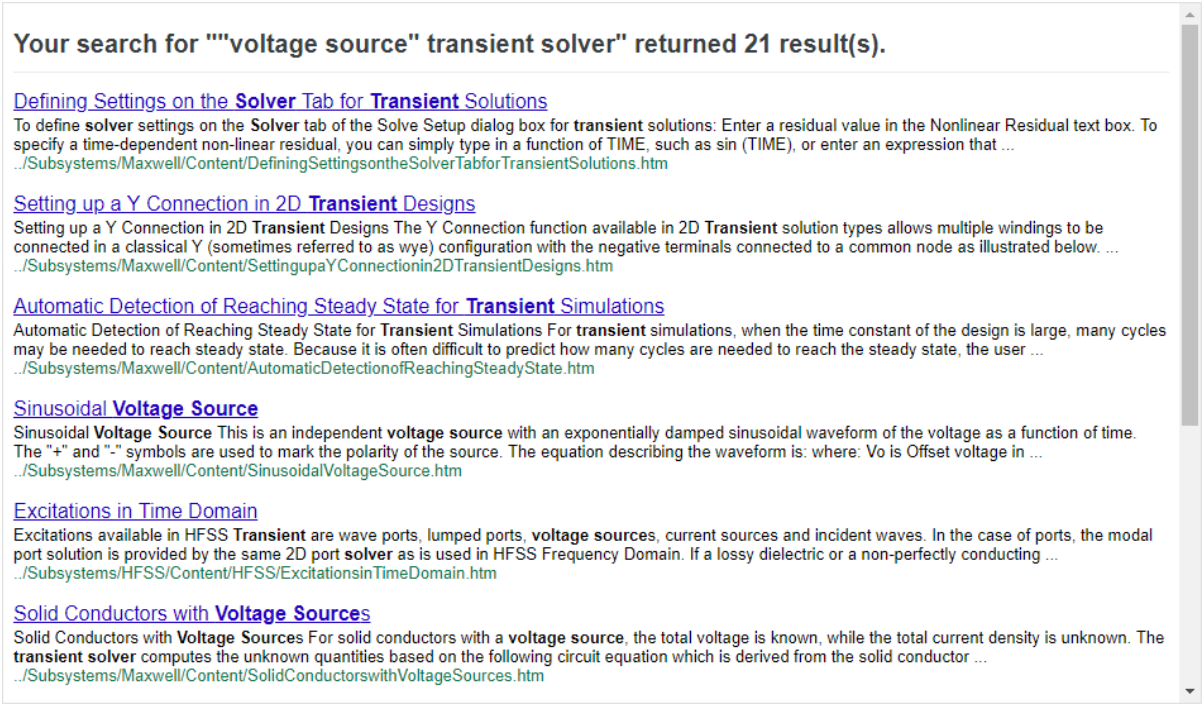
If you enter “voltage source” with quotation marks, the results show all topics that include the phrase.



As you can see, this returns far fewer results than the basic search.

To further limit the results, you can enter additional words, such as: “voltage source” transient solver

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

- Searches are not case sensitive, so you can type your search in uppercase or lowercase characters.
- You may search for any combination of letters (a-z) and numbers (0-9).
- Punctuation marks (period, colon, semicolon, comma, hyphen) are ignored during a search.
- When searching for a file name with an extension, group the entire string in quotation marks (for example, "filename.ext").

Using Boolean Operators

Note:

Functionality featured in the example(s) in this section applies to multiple design types.

You can also use boolean operators to affect the number of topics listed.

Operator(s)	Usage	Example(s)
AND	Lists all topics that contain all of the terms.	Net AND Selection

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Operator (s)	Usage	Example(s)
+		Net + Selection
&		Net & Selection
OR	Lists all topics that contain any of the terms.	Net OR Selection
|		Net | Selection
NEAR	Lists all topics that contain the terms near the other terms.	Net NEAR Selection
NOT	Lists all topics that contain the first term but not the second.	Net NOT Selection
!		Net ! Selection
^		Net ^ Selection

Use parentheses to group terms and operators. For example:

- solver AND (Circuit) NOT HFSS NEAR dynamic
- solver AND (HFSS OR Circuit) NOT (Q3D OR 2d) NEAR dynamic
- “dynamic link” ! (HFSS | circuit)

> **Important:**
>
> Because the characters +, &, |, !, and ^ are used as operators, you cannot search for them in the help. Doing so will result in an error.

Help Conventions

Please take a moment to review how instructions and other useful information are presented in this documentation.

- Procedures are presented as numbered lists. A single bullet indicates that the procedure has only one step.
- Bold type is used for the following:
  - Keyboard entries that should be typed in their entirety exactly as shown. For example, “**copy file1**” means you must type the word **copy**, then type a space, and then type **file1**.
  - On-screen prompts and messages, names of options and text boxes, and menu commands. Menu commands are often separated by greater than signs (>). For example, “click **HFSS** > **Excitations** > **Assign** > **Wave Port**.”
  - Labeled keys on the computer keyboard. For example, “Press **Enter**” means to press the key labeled **Enter**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Italic type is used for the following:
  - Emphasis
  - The titles of publications
  - Keyboard entries when a name or a variable must be typed in place of the words in italics. For example, “**copy** *filename*” means you must type the word **copy**, then type a space, and then type the name of the file.
- The plus sign (+) is used between keyboard keys to indicate that you should press the keys at the same time. For example, “Press Shift+F1” means to press the **Shift** key and, while holding it down, press the **F1** key also. You should always depress the modifier key or keys first (for example, Shift, Ctrl, Alt, or Ctrl+Shift), continue to hold it/them down, and then press the last key in the instruction.

Accessing Commands: *Ribbons, menu bars,* and *shortcut menus* are three methods that can be used to see what commands are available in the application.

- The *Ribbon* occupies the rectangular area at the top of the application window and contains multiple tabs. Each tab has relevant commands that are organized, grouped, and labeled. An example of a typical user interaction is as follows:

  "Click **Draw** > **Line**"

  
  This instruction means that you should click the **Line** command on the **Draw** ribbon tab. An image of the command icon, or a partial view of the ribbon, is often included with the instruction.

- The *menu bar* (located above the ribbon) is a group of the main commands of an application arranged by category such File, Edit, View, Project, etc. An example of a typical user interaction is as follows:

  "On the **File** menu, click the **Open Examples** command" means you can click the **File** menu and then click **Open Examples** to launch the dialog box.

- Another alternative is to use the *shortcut menu* that appears when you click the right-mouse button. An example of a typical user interaction is as follows:

  “Right-click and select **Assign Excitation> Wave Port**” means when you click the right-mouse button with an object face selected, you can execute the excitation commands from the shortcut menu (and the corresponding sub-menus).

Getting Help: Ansys Technical Support

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For information about Ansys Technical Support, go to the Ansys corporate Support website, http://www.ansys.com/Support. You can also contact your Ansys account manager in order to obtain this information.

All Ansys software files are ASCII text and can be sent conveniently by e-mail. When reporting difficulties, it is extremely helpful to include very specific information about what steps were taken or what stages the simulation reached, including software files as applicable. This allows more rapid and effective debugging.

Help Menu

To access help from the Help menu, click **Help** and select from the menu:

- **[product name] Help** – opens the contents of the help. This help includes the help for the product and its *Getting Started Guides*.
- **[product name] Scripting Help** – opens the contents of the *Scripting Guide*.
- **[product name] Getting Started Guides** – opens a topic that contains links to Getting Started Guides in the help system.

Context-Sensitive Help

To access help from the user interface, press **F1**. The help specific to the active product (design type) opens.

You can press **F1** while the cursor is pointing at a menu command or while a particular dialog box or dialog box tab is open. In this case, the help page associated with the command or open dialog box is displayed automatically.

Getting Help from Ansys Technical Support

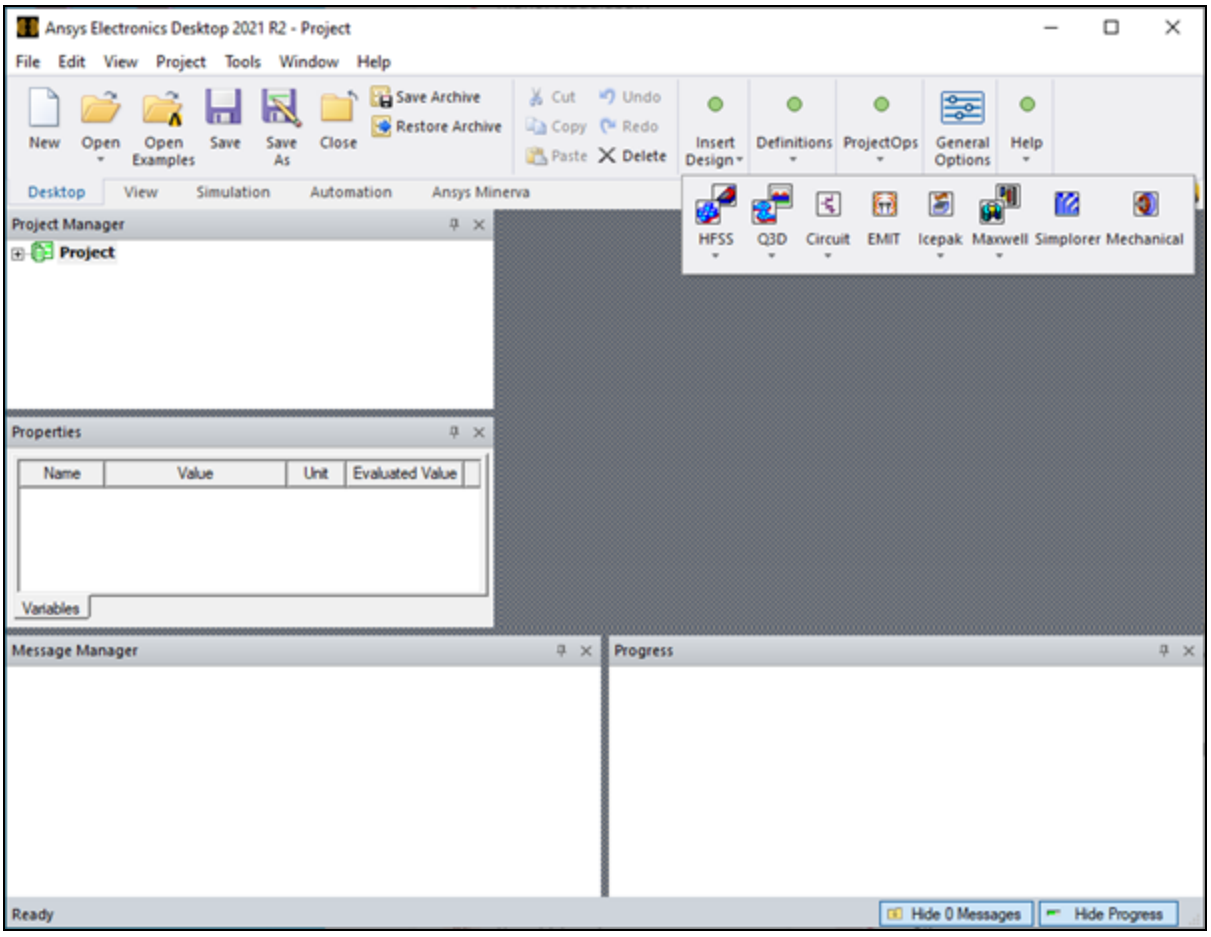
To contact Ansys technical support staff in your geographical area, please log on to the Ansys corporate website, ansys.com/support. You can also contact your Ansys EM account manager in order to obtain this information.

E-mail can work well for technical support. All Ansys EM software files are ASCII text and can be sent conveniently by email. When reporting difficulties, it is extremely helpful to include very specific information about what steps were taken or what stages the simulation reached. This allows more rapid and effective debugging.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2 - Getting Started with Ansys Electronics Desktop

The Ansys Electronics Desktop, shown in the following figure, provides a comprehensive environment for designing and simulating various electronic components and devices. The Electronics Desktop consists of a unified user interface where electromagnetic designs, thermal designs, and circuits can be created. Typically, you can create or import a design, set up the simulation, validate your design, run the analysis, and post process the results.



The desktop includes the following design types:

- **HFSS** – a general purpose 3D interface for the design, analysis, and simulation of electromagnetic components.
- **HFSS 3D Layout** – a full-wave, layout-based electromagnetic simulator with a specialized interface for geometries created in layout.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Q3D Extractor** – a quasi-static 3D solver for extracting lumped RLGC parameters and Spice models.
- **2D Extractor** – a 2D solver for extracting per-unit-length RLGC parameters of transmission lines.
- **Circuit** – a schematic-based interface to the Nexxim circuit simulator.
- **Circuit Netlist** – a netlist (text-based) interface to the Nexxim circuit simulator.
- **EMIT** – system simulation for predicting and mitigating radio frequency interference (RFI) in electronic devices.
- **Maxwell 3D** – uses finite element analysis (FEA) to solve three-dimensional (3D) electrostatic, magnetostatic, AC magnetic (eddy current), and transient problems.
- **Maxwell 2D** – uses finite element analysis (FEA) to solve two-dimensional (2D) electrostatic, magnetostatic, AC magnetic (eddy current), and transient problems.
- **RMxprt** – a template-based electrical machine design tool that provides fast, analytical calculations of machine performance and 2-D and 3-D geometry creation for detailed finite element calculations in Maxwell.
- **Maxwell Circuit** – sets up external circuit designs to supply excitations to coil terminals for Maxwell 2D and 3D AC Magnetic and Transient designs.
- **Simplorer** – an integrated, multi-domain, mixed-signal simulator for complex technical systems. Simplorer is a subset of the Twin Builder standalone product. Please see the Twin Builder help for more information.
- **Icepak** – a fluid and thermodynamic simulator for electronic systems and components.
- **Mechanical** – perform modal analyses to determine natural vibration frequencies and thermal analyses to determine temperatures and heat flux.

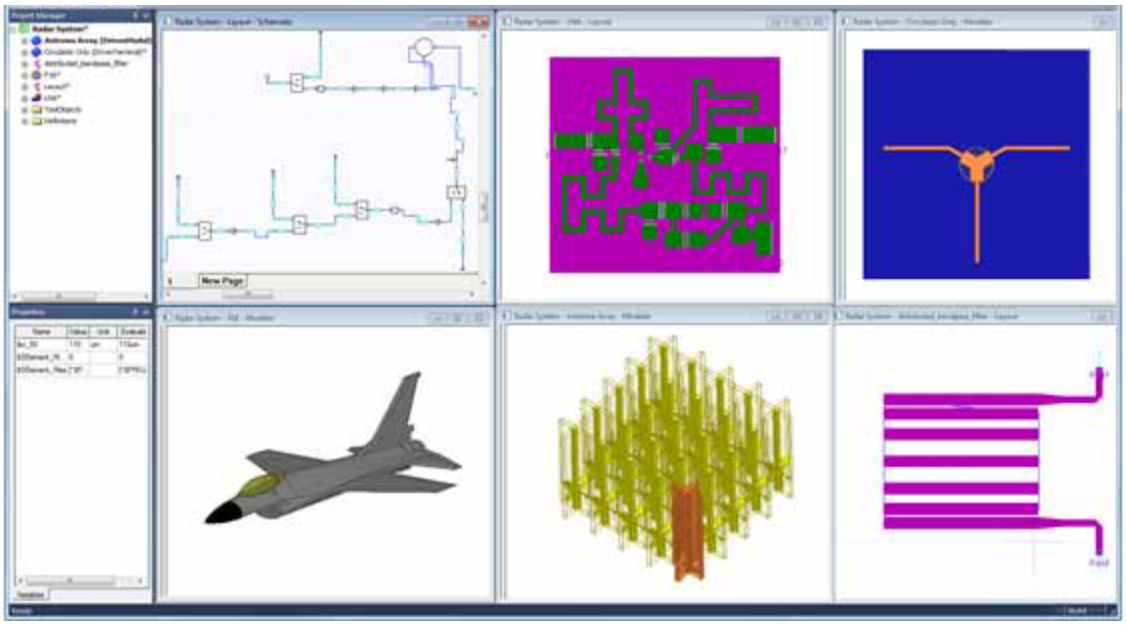
You can access all of these design types and features from the **Project** menu, and any combination of design types can be inserted into a single project file. The schematics can be used to wire up the different field solver models and create a model of a high-level system. Ansys Electronics Desktop provides an efficient way to manage complicated projects that require several different analysis tools to model all of their pieces. Designs can also be parameterized. With the help of the Optimetrics feature, the best design variations can be made available to other modules when the designs are linked into a higher-level simulation. This lets you study the effect of varying a design parameter on the behavior of the entire system.

You can access these design types and features from the Windows launcher. You can use the ACT Toolkit for HFSS-EMA3D Datalink to launch and use this tool.

The following illustration shows how the Ansys Electronics Desktop can be used to model different components for radar system analysis. An antenna array created in HFSS is linked to an IE design of an F16 aircraft. The low noise amplifier and bandpass filter are two important components in the receiver part of the radar module circuit design. The low noise amplifier and the filter can be modeled in HFSS 3D Layout and linked together in a circuit simulation, along with other components of the radar module connected to the antenna array. The outputs of the radar module can be used to drive the antennas using the push excitation feature, whereby the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

voltages on the antenna array ports can be automatically set to correspond to those of the driving circuit. The push excitation feature enables the user to view electromagnetic fields when the array is driven by the radar module circuit.



Ansys Electronics Desktop Student

> **Important:**
>
> Do not install the same release version of Electronics Desktop and Electronics Desktop Student on the same machine.

Ansys Electronics Desktop Student is a free Windows version of the Electronics Desktop that allows you to model, mesh (if applicable), solve, and post-process in HFSS, Q3D Extractor, 2D Extractor, Circuit, Maxwell 3D and Maxwell 2D, RMxprt, and Icepak. The following list of limitations applies to all supported design types in Ansys Electronics Desktop Student.

> **Note:**
>
> Unsupported design types (e.g., Mechanical) do not open in Electronics Desktop Student.

- Geometry export not supported
- Import of DXF and STEP files only

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Local solve only (remote configuration not supported)
- High Performance Computing limited to 4 cores
- optiSLang and LSDSO not supported
- Integration with Ansys Workbench not supported
- Beta features not supported
- Linux version not supported

Refer to the following sections to review limitations specific to the supported design types in Ansys Electronics Desktop Student.

HFSS Student Limitations

- SBR+ not supported
- Mesh assemblies not supported
- Mesh element count limit (analysis and post-processing)
    - 3D volume: 64,000 elements
    - 3D surface: 8,000 elements
    - 2D: 2,000 triangles
- Circuit model generation from S-parameters not supported

Q3D Extractor and 2D Extractor Student Limitations

- Mesh element count limit (analysis and post-processing)
    - 3D volume: 64,000 elements
    - 3D surface: 8,000 elements
    - 2D: 2,000 triangles
- Circuit model generation from S-parameters not supported

Circuit Limitations

- Netlist design type not supported
- Component limit: 50 components
- Command line analysis initialization not supported
- Device data generation not supported
- Access to layout functionality not supported
- Circuit model generation from S-parameters not supported

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Maxwell and RMxprt Student Limitations

- Mesh element count limit (analysis and post-processing)
  - 3D volume: 64,000 elements
  - 3D surface: 8,000 elements
  - 2D: 2,000 triangles
- 3D and 2D Transient simulations

Icepak Student Limitations

- Mesh element count limit (analysis and post-processing): 512,000 elements
- Classic Icepak files (.tzr) with ECAD not supported

System Requirements

Ansys Electronics Desktop supports certain versions of Windows and Linux. For supported platforms and system requirements, go to the Platform Support website and select the following document:

Ansys 2025 R2 **- Platform Support by Application / Product (PDF)**

This document covers all Ansys products. Refer to the **Electronics Applications** section.

Limitations of Linux Installations:

While the majority of the Ansys Electromagnetics Suite applications and features are supported on both Windows and Linux platforms, some are not supported on Linux. For up-to-date platform support by product:

1. Go to the Ansys Platform Support website.
2. From the list of documents, click the link, Ansys 2025 R2 - Platform Support by Application / Product (PDF).
3. This document includes platform support information for all Ansys products. Refer to the section labeled Electronics Applications.

Launching Ansys Electronics Desktop

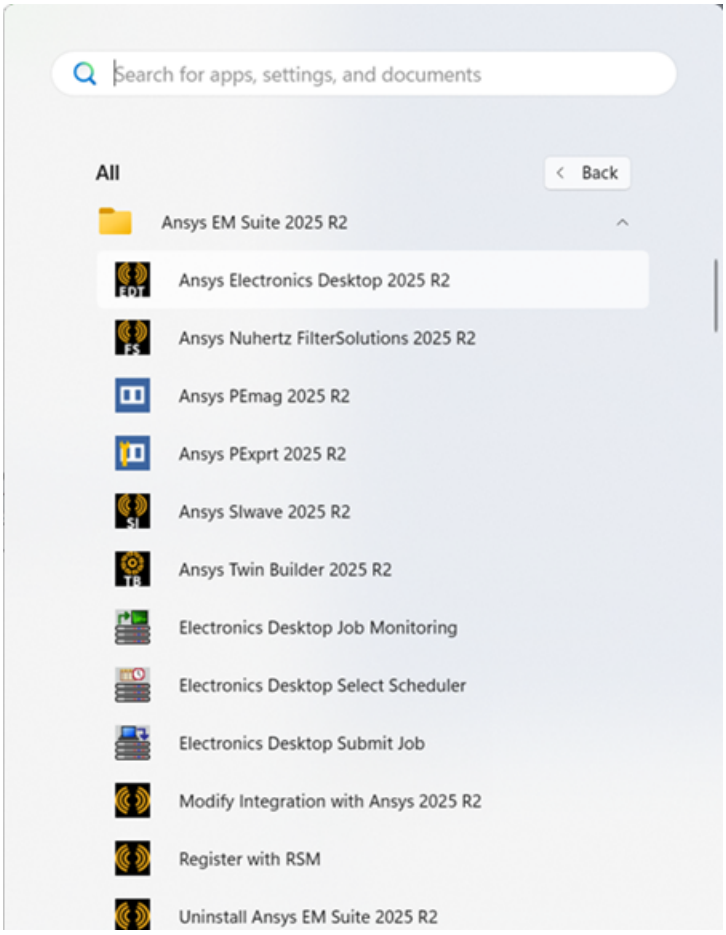
Follow the instructions below to launch Ansys Electronics Desktop in either Windows or Linux.

Windows:

Once you have installed Ansys Electronics Desktop, start the program using one of the following methods:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the Start menu, select **Ansys EM Suite 2025 R2** > **Ansys Electronics Desktop 2025 R2**.



If the program fails to start, ensure that:

- You have installed the licensing option provided to you. For detailed information on installing the software and licenses, see: Ansys EM Suite Installation. This topic provides links to the Ansys installation guides (Windows and Linux) and product-specific platform support information.
- Ansys QA Services are not enabled. To disable, change the value of the ENABLE_ANSYS_QA_SERVICES environment variable to 0.

Linux:

On Linux systems, an interactive Ansys Electronics Desktop session can be launched either from the command line, or from a GNOME-compliant desktop environment. The graphical session must be running directly on the machine's console or via a remote connection like VNC.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Launching AEDT from the command line:

When AEDT is installed, a sub-directory is created under the installation directory: /v252/AnsysEM/. This directory contains the software executable files and wrapper scripts.

To launch AEDT from the command line, invoke it via its wrapper script. If, for example, AEDT has been installed in the /opt/ansys_inc/ directory, the wrapper would be:

- /opt/ansys_inc/v252/AnsysEM/ansysedt

When this command is run for the first time on a machine, messages will be printed to the terminal as the software automatically configures itself. AEDT will then launch.

> **Note:**
>
> The installation directory contains a file named ansysedt.exe. Do not attempt to run this directly. The corresponding wrapper scripts perform essential environment setup tasks that the software needs to function properly.

Starting from GNOME desktop:

- Click the Activities button on the GNOME panel to show installed applications:

- Click the icon for Ansys EM:

Ansys Product Improvement Program

This product is covered by the Ansys Product Improvement Program, which enables ANSYS, Inc., to collect and analyze anonymous usage data reported by our software without affecting your work or product performance. Analyzing product usage data helps us to understand customer usage trends and patterns, interests, and quality or performance issues. The data enable us to develop or enhance product features that better address your needs.

How to Participate

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The program is voluntary. To participate, select **Yes** when the Product Improvement Program dialog box appears. Only then will collection of data for this product begin.

How the Program Works

After you agree to participate, the product collects anonymous usage data during each session. When you end the session, the collected data is sent to a secure server accessible only to authorized Ansys employees. After Ansys receives the data, various statistical measures such as distributions, counts, means, medians, modes, etc., are used to understand and analyze the data.

Data We Collect

For all products that offer the Ansys Product Improvement Program, we only collect anonymous data such as session statistics, hardware information, types of loading, solution types, solution statistics, and similar data. The specific data collected varies from product to product.

For Ansys Electronics, we collect the following information:

- Application
    - Build information
    - System information
        - Country
        - Country code
        - CPU architecture
        - CPU brand
        - CPU identifier
        - Graphics card
        - Operating system
        - Operating system version
        - Processor count
        - Time zone
        - Total RAM value
- Session
    - Workbench session
    - Total CPU time
    - Execution mode
    - Start method
    - Number of processes
    - Number of compute nodes (HPC)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

    - Session begin
    - Session end
- Mesh
    - Number of nodes
    - Number of elements
    - Number of zones
    - Number of faces

Data We Do Not Collect

The Product Improvement Program does not collect any information that can identify you personally, your company, or your intellectual property. This includes but is not limited to names, addresses, file names, part names, geometry- or design-specific inputs, material property values, etc. We make no record of where we collect data from.

Opting Out of the Program

You may stop your participation in the program any time you wish. To do so, select menu item **Help > Ansys Product Improvement Program** or ribbon item **Help > Ansys > Ansys Product Improvement Program**. This activates the **Ansys Product Improvement Program** dialog box. On this dialog select the **No I am not willing to participate** radio button to opt out of the program. Select the **Yes, I am willing to participate in the Ansys Product Improvement Program** radio button to opt in to the program. Click the **OK** button to accept the radio button selection. Data is no longer collected or sent if you opt out.

> **Note:**
>
> You can disable the Ansys Product Improvement Program for all users so that each user is not prompted to enable the Program when they first start Electronics Desktop. After installing the software, run the following command as a user with permissions to modify the installed file set:
>
> ```
> UpdateRegistry.exe -set -ProductName ElectronicsDesktop2025.2 -
> RegistryKey
> Desktop/Settings/ProjectOptions/ProductImprovementOptStatus -
> RegistryLevel install -RegistryValue 1
> ```

The ANSYS, Inc., Privacy Policy

All Ansys products are covered by the ANSYS, Inc., Privacy Policy, which you can read here.

Frequently Asked Questions

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. *Am I required to participate in this program?*

   No, your participation is voluntary. We encourage you to participate, however, as it helps us create products that will better meet your future needs.

2. *Am I automatically enrolled in this program?*

   No. You are not enrolled unless you explicitly agree to participate.

3. *Does participating in this program put my intellectual property at risk of being collected or discovered by ANSYS?*

   No. We do not collect any project-specific, company-specific, or model-specific information.

4. *Can I stop participating even after I agree to participate?*

   a. Select the menu item **Help** > **Ansys Product Improvement Program** or ribbon item **Help** > **Ansys** > **Ansys Product Improvement Program**. This will activate the **Ansys Product Improvement Program** dialog box.

   b. Select the **No I am not willing to participate radio** button to opt out of the program.

   c. Click the **OK** button to accept the radio button selection.

   d. Data will no longer be collected or sent.

5. *Will participation in the program slow the performance of the product?*

   No, the data collection does not affect the product performance in any significant way. The amount of data collected is very small.

6. *How frequently is data collected and sent to Ansys servers?*

   The data is collected during each use session of the product. The collected data is sent to a secure server once per session, when you exit the product.

7. *Is this program available in all Ansys products?*

   Not at this time, although we are adding it to more of our products at each release. The program is available in a product only if this Ansys Product Improvement Program description appears in the product documentation, as it does here for this product.

8. *If I enroll in the program for this product, am I automatically enrolled in the program for the other Ansys products I use on the same machine?*

   Yes. Your enrollment choice applies to all Ansys products you use on the same machine. Similarly, if you end your enrollment in the program for one product, you end your enrollment for all Ansys products on that machine.

9. *How is enrollment in the Product Improvement Program determined if I use Ansys products in a cluster?*

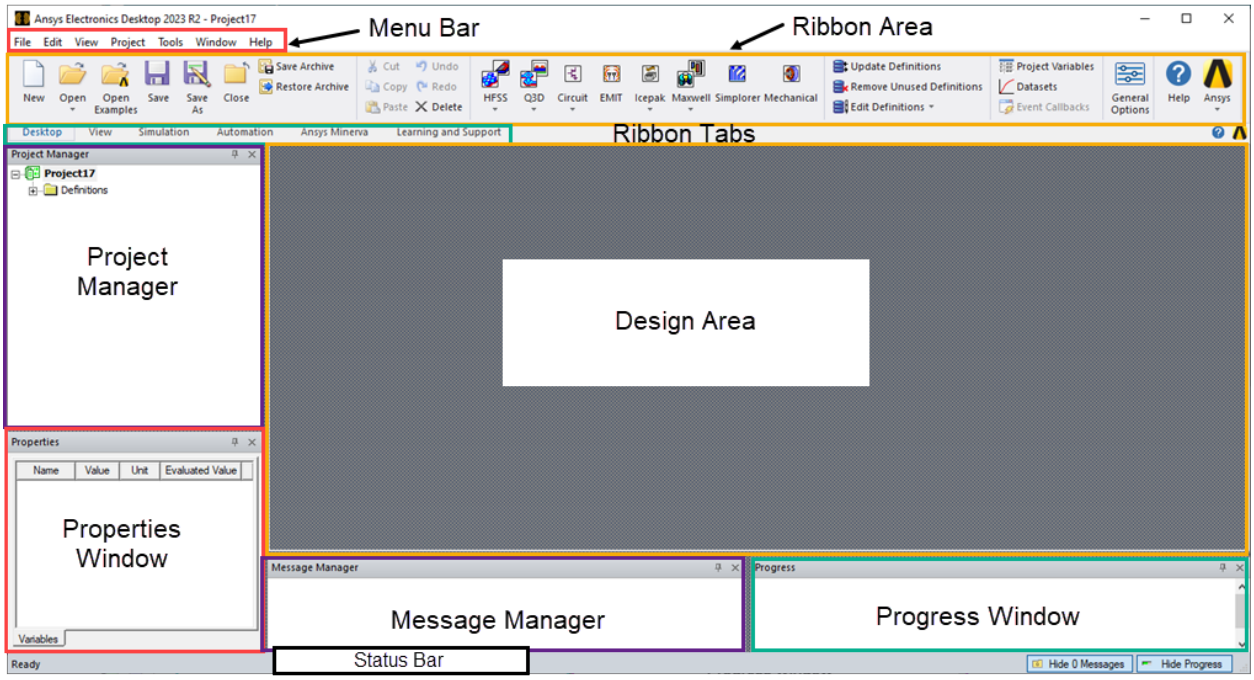
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In a cluster configuration, the Product Improvement Program enrollment is determined by the host machine setting.

Ansys Electronics Desktop Overview

The Ansys Electronics Desktop consists of several windows, a menu bar, multitab ribbon, and a status bar. You can customize the appearance of the desktop by moving, hiding, or showing windows. Some menus, and other features, change depending on the type of project that is loaded and the editor that is active in the Design Area.

> **Note:**
>
> To ensure that all Electronics Desktop dialog boxes are visible on your monitor, it is recommended to not scale the display resolution above 100%.

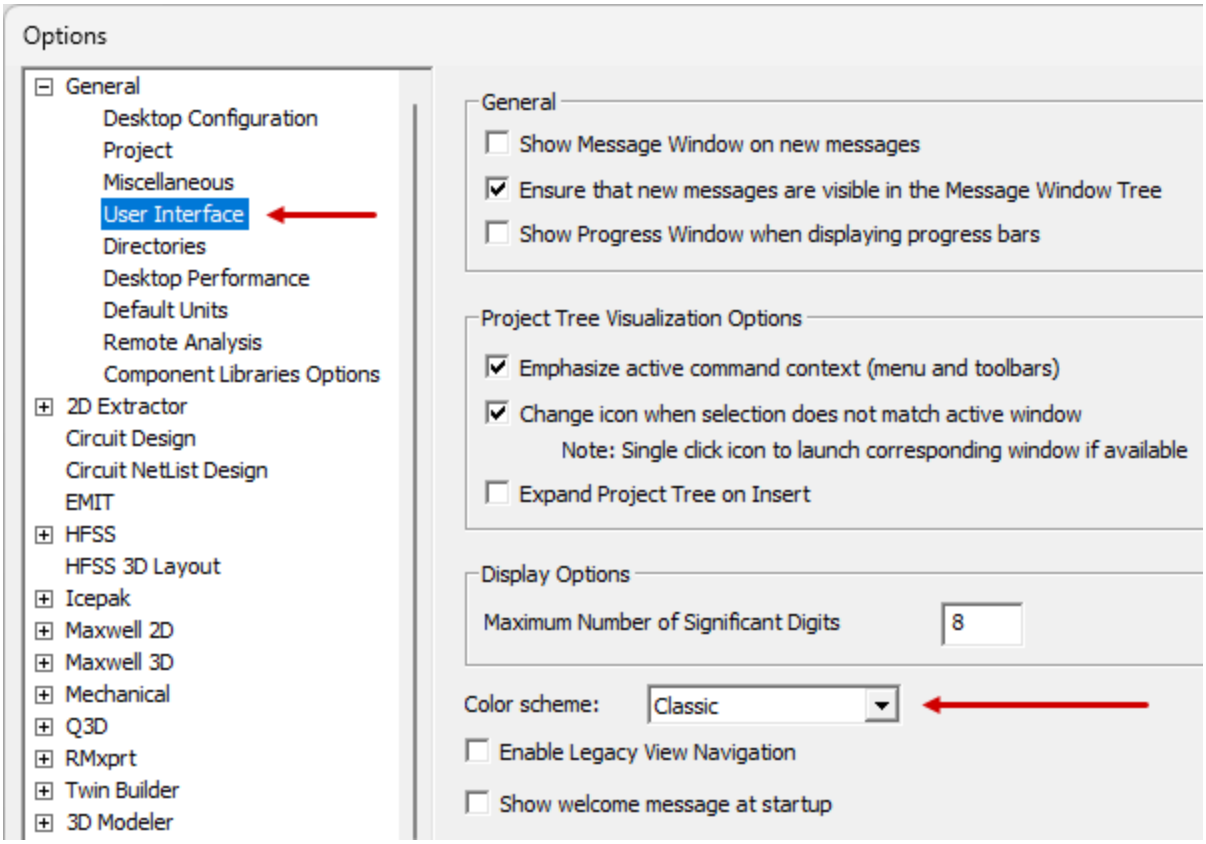


Choosing a Color Scheme [Beta]

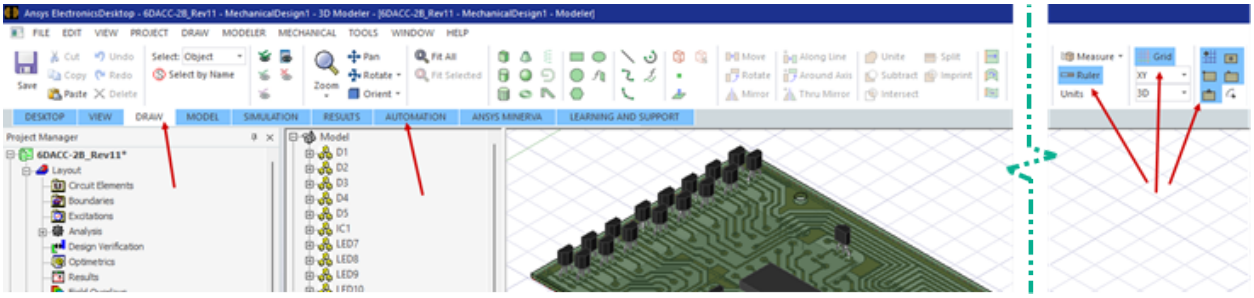
In addition to the classic Ansys Electronics Desktop color scheme, two additional color schemes are now available as beta features. Choose the desired color scheme as follows:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Access the *Options* dialog box using one of the following two methods:
   - On the **Desktop** ribbon tab, click **General Options**.
   - From the menu bar, click **Tools** > **Options** > **General Options**.
2. In the tree at the left side of the dialog box, expand **Desktop Configuration** and select **User Interface**:

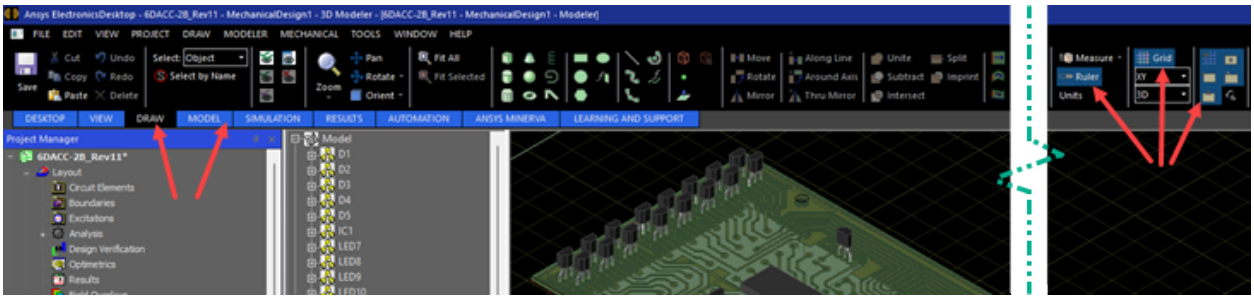


3. From the **Color scheme** drop-down menu, choose one of the following three options:
   - **Light (beta):** A light gray and white scheme with light blue highlighting for selected ribbon icons and for inactive ribbon tabs. The active ribbon has a white background (including the tab):

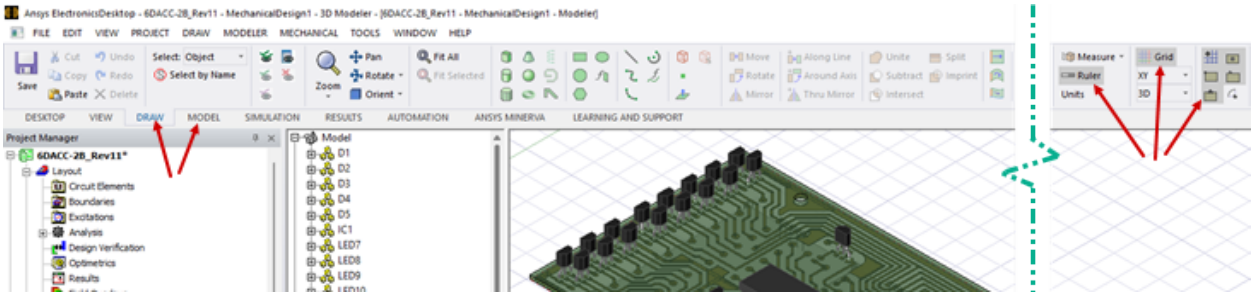


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Dark (beta):** A dark gray and black scheme with medium blue highlighting for selected ribbon icons and for inactive ribbon tabs. The active ribbon has a black background (including the tab):



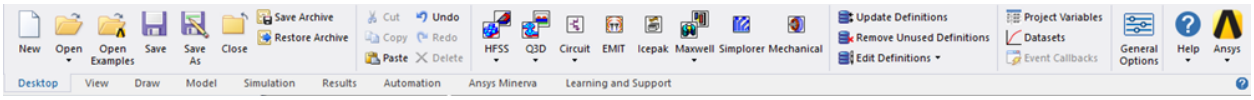
- **Classic:** A light gray and white scheme with medium gray highlighting for selected ribbon icons. The ribbon background is light gray. The name of the active ribbon tab has a blue font. A dark gray font is used for the inactive ribbon tab names:



4. Click **OK** to close the *Options* dialog box.

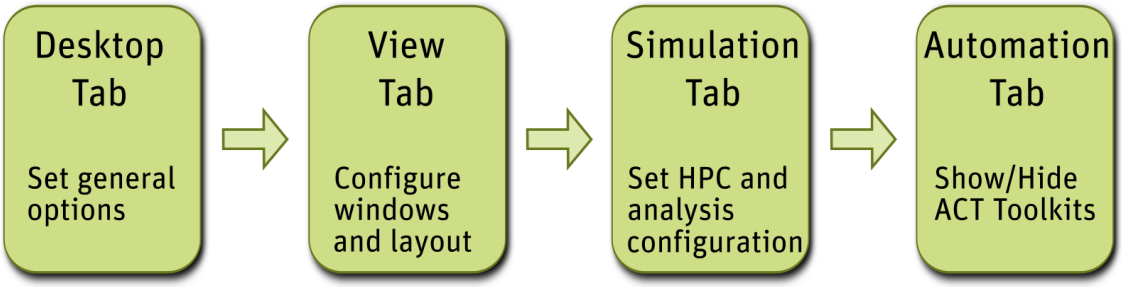
Working with Ribbons

The ribbon is the rectangular area across the top of the application. It comprises various tabs, each one representing a subset of commands available from the menus. The initial set of tabs (Desktop, View, Simulation, Automation) offers commands for adding and opening projects, selecting solvers, configuring the Desktop display (window choice, size, and position), configuring the simulation environment, setting scripted Event Callbacks or General Options, and showing Automation features for recording and using scripts.



The initial workflow for local configuration and personal customization is:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Available ribbon tabs depend on the design type. After you open or add a project and insert a design, you see additional ribbon tabs appear. The visible tabs and features are those that are appropriate for the design type and solver.

The **Desktop, View, Simulation, Automation, Minerva** and **Learning and Support** tabs appear for all design types. Additional tabs appear as follows:

- For HFSS, Icepak, Maxwell, Mechanical, and Q3D designs, the **Draw**, **Model**, and **Results** tabs also appear:

- For an HFSS 3D Layout design, the **Layout** and **Results** tabs also appear:

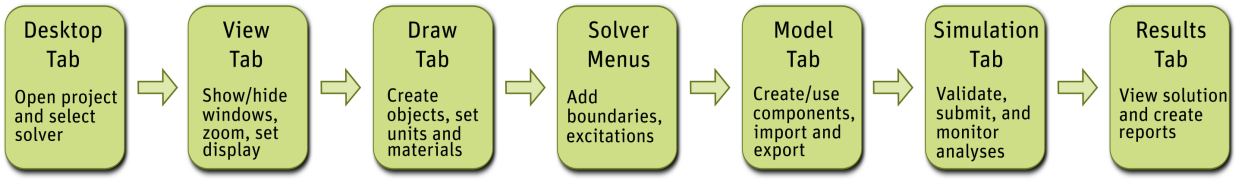
- For Circuit and Simplorer designs, the **Schematic** and **Results** tabs also appear:

In addition to **Desktop**, **View**, **Minerva** and **Learning and Support** the ribbon tabs that are applicable to HFSS 3D Layout designs are described as follows:

- **Simulation Tab** – contains tools that allow you to run simulations, perform validation checks, and schedule and monitor tasks.
- **Results Tab** – contains tools for creating reports and viewing solution data.
- **Automation Tab** – contains tools that allow you to run and record scripts, show or hide ACT extensions (Windows only), and install PyAEDT (Beta).

Each tab contains features specific to the design type, and the general workflow is from left to right.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

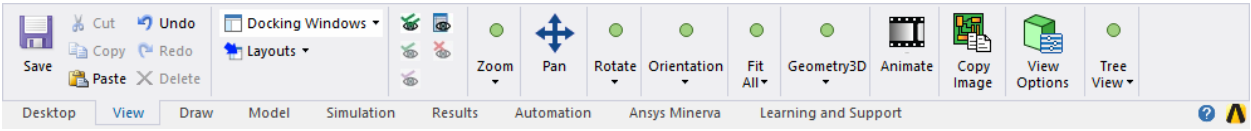


Note that workflow can vary depending on tasks at hand. For example, if you open a completed model in HFSS or use 3D components or the ACT Antenna Design toolkit (Windows only), you may not need the features of the **Draw** tab. If Validation on the **Simulation** tab identifies problems in a model, you may need to use the **Modeler** menu commands for Analysis and Heal, or use the Discovery link feature. For some tasks, such as assigning excitations or boundaries in HFSS, you must use the command menus, rather than the tabs.

Sizing the Ansys Electronics Desktop window affects the icons displayed on each tab, with priority given to the most used features.

For example, If you have inserted an HFSS project, the **View** tab displays commands appropriate for the active editor:

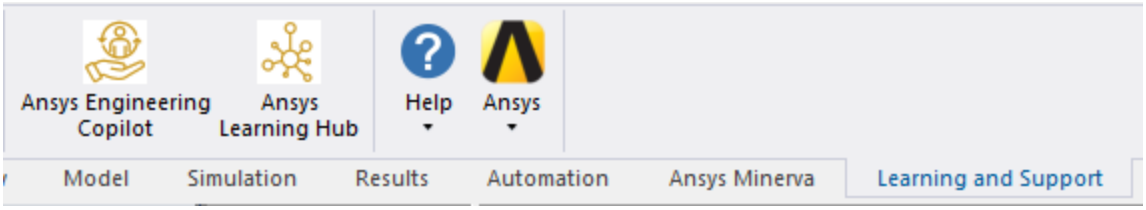
If you reduce the size of the Desktop window, the ribbon tabs become compressed. Fewer icons are shown, and available features are moved into drop-down menus rather than shown separately. The following example shows the **View** tab in a compressed state:



Other ribbon tabs are similarly compressed when the window size does not support the fully expanded arrangement of features.

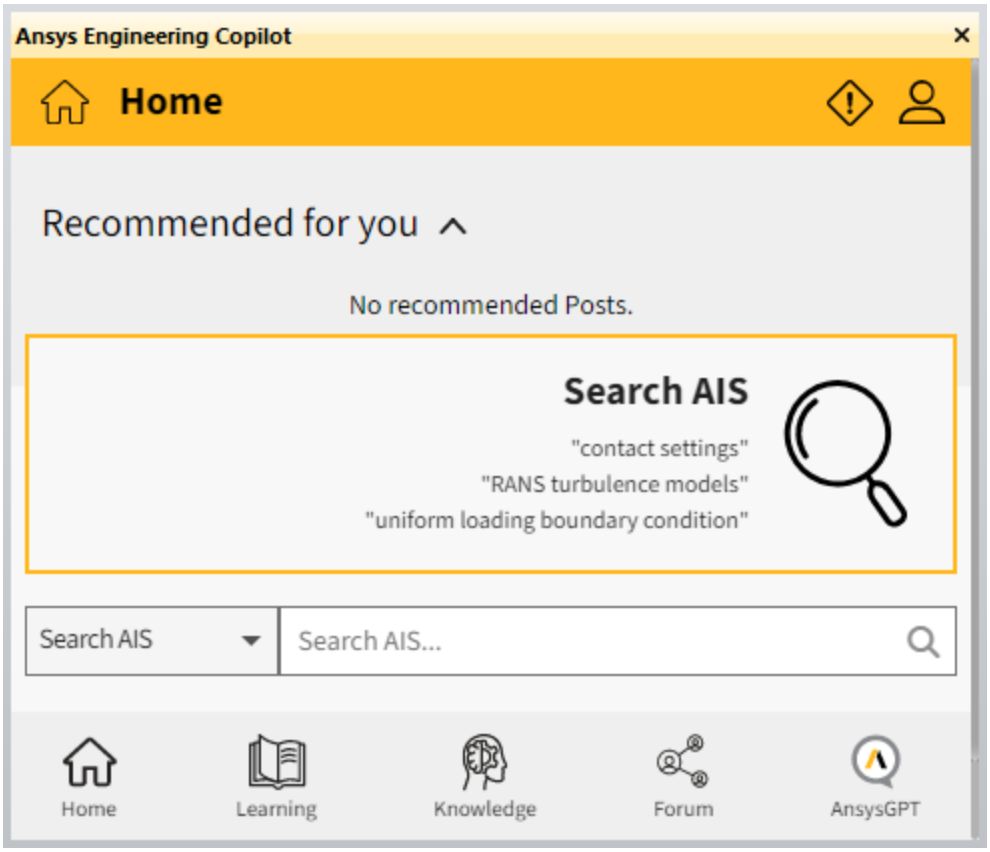
The **Learning and Support** tab provides easy access to Technical advice, instruction, and examples on Ansys websites.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Engineering Copilot – Single point access to Ansys Innovation Space resources, such as AnsysGPT, Support Cases, Courses, Knowledge, Forum, and more.

You first login to your account. Then you are provided with a new window.



- **Ansys Innovation Courses** – Provide a wide range of Ansys Electronics Engineering courses using on-demand, self-paced video training and quizzes.
- **Ansys Knowledge** – Provides expert curated knowledge materials from FAQs to tutorials on simulation topics.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

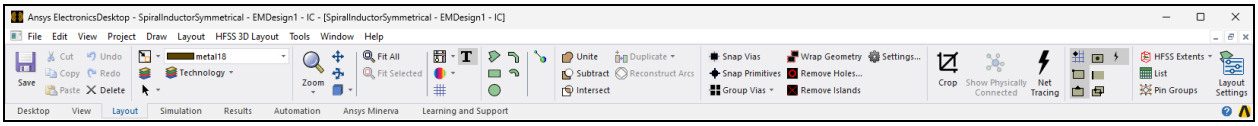
- **Ansys Learning Forum** – Provides Ansys blog containing discussion and presentations from Ansys experts, partners and customers.
- **AnsysGPT** – AnsysGPT is a Machine Learning (ML) Large Language Model (LLM) which has been trained in Ansys company information, including online help contents.

Ansys Learning Hub – opens a web page with subscription based access to, virtual and self-paced learning across the Ansys Software portfolio.

About Electronics Desktop - opens a dialog with version and release information, Ansys Electronics Desktop installed components, and licensing information.

IC Mode Layout Ribbon

In addition to exclusive tabs, HFSS 3D Layout contains two potential environments (i.e., General mode and IC mode). General mode typically opens by default. Different commands and options are available in each mode (e.g., after opening a GDSII file or selecting the **IC** layout from the **Design Settings** window (i.e., **HFSS 3D Layout** > **Design Settings** > **Design Mode** tab), the **Layout** tab will reconfigure to match the following screenshot).



The general workflow remains the same in both environments. Refer to Switching to IC Mode.

Ansys Electronics Desktop Windows

Ansys Electronics Desktop contains the following windows:

- Project Manager
- Message Manager
- Progress
- Properties
- Measure

You can toggle the display of each window, auto-hide windows, or move and resize windows. Additionally, you can toggle the status bar or add ACT Extensions (Windows only).

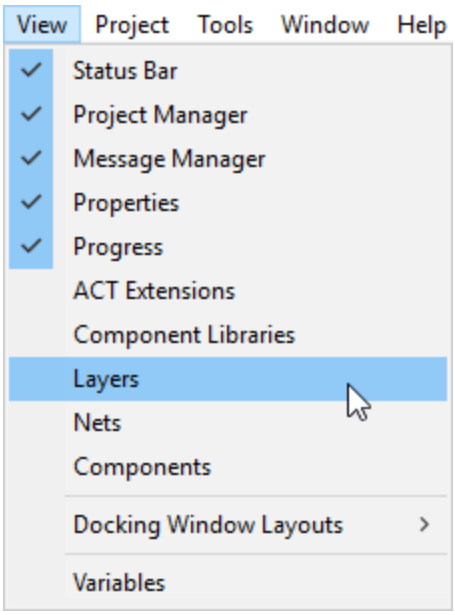
Showing and Hiding Windows

To toggle the windows that comprise Ansys Electronics Desktop, use the **View** menu or the **View** tab on the ribbon.

From the **View** menu:

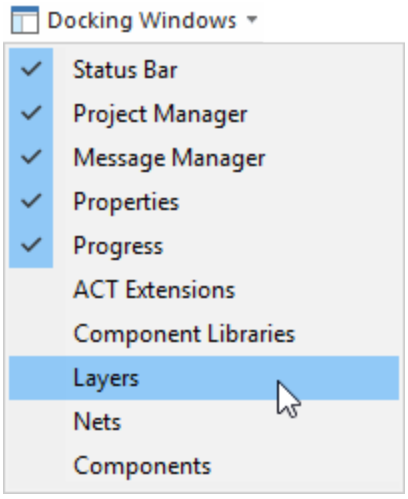
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click a window to show or hide it.



From the **View** tab:

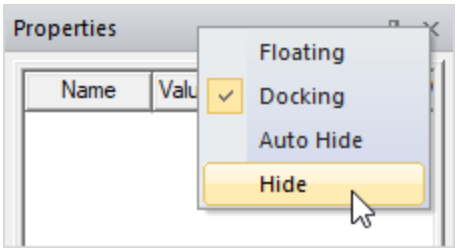
- Use the **Docking Windows** drop-down menu to show and hide windows.



You can also hide a window directly from the window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click the X in the window title bar, or
- Right-click in the window title bar and select **Hide**.



The visibility setting of a window is retained from one desktop session to the next.

Auto Hiding Windows

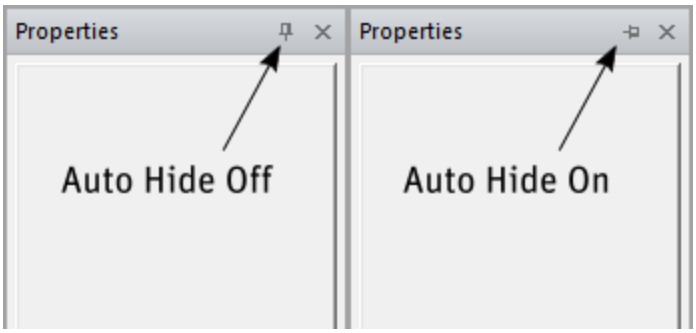
Windows can be moved out of the way so that only their title bars show. When you hover over this title bar, the window appears. This mode is called Auto Hide.

To automatically hide a window until the cursor is hovered over it:

- Click the pin icon in the window title bar, or
- Right-click in the window title bar and select **Auto Hide**.

> **Note:** If a window shares vertical or horizontal space with another window, the first click will expand it to take up the entire area while hiding all other windows. Click the pin again to hide the window.

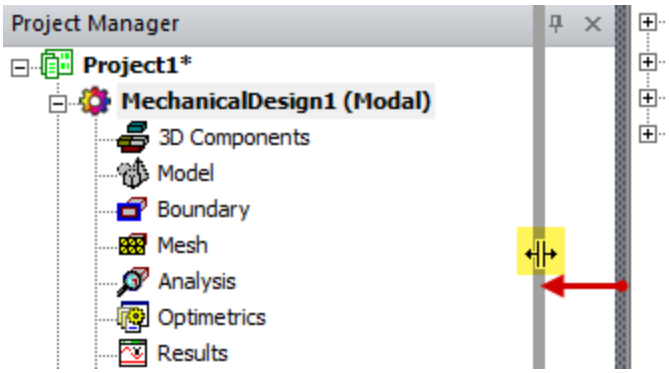
When a window is in Auto Hide mode, the pin icon flips on its side. Click the icon again to disable Auto Hide.



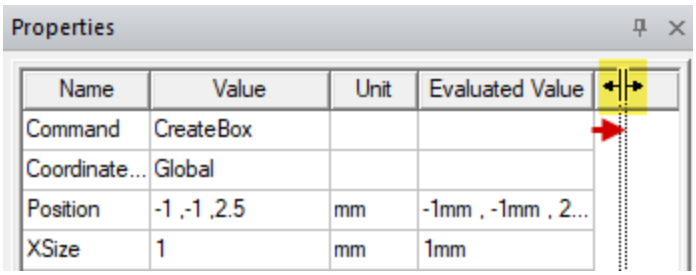
Moving and Resizing Windows

You can resize a window by clicking and dragging a vertical or horizontal window border. The cursor appearance changes to indicate when you're over a movable window border (as highlighted in yellow below):

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can also click and drag the borders of columns within certain windows containing tabular data, such as the **Properties** window:



Major Ansys Electronics Desktop windows can be docked in various locations or can float over other windows. To move a window, click and drag the window's title bar. While dragging a window's location, several docking position icons appear on the screen.

By releasing the mouse button over the following icons, you can dock a window in the following four locations along the perimeter of the user interface:

Left edge of user interface:

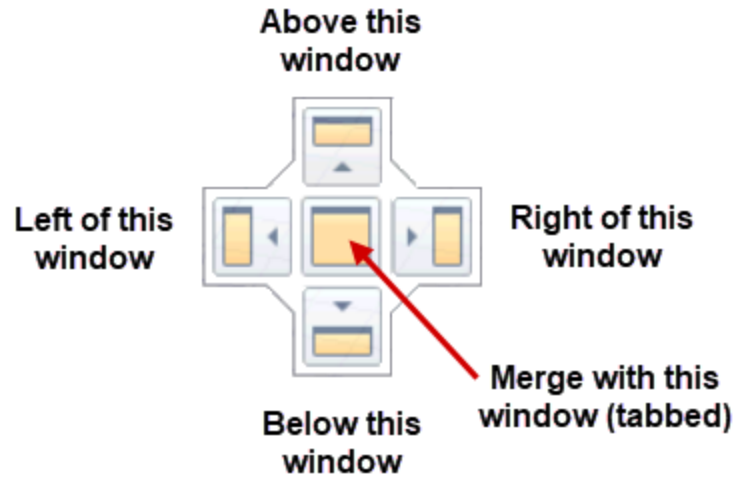
Right edge of user interface:

Top of user interface:

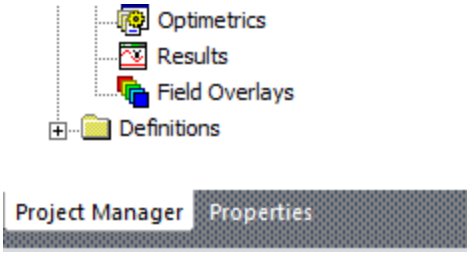
Bottom of user interface:

Additionally, you can use the following group of five docking locations to position the window relative to another window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



When you release the mouse button over the middle icon, the two windows are merged, with tabs at the bottom to select which one to view:



If the middle icon does not appear, it's because tabbed windows are not supported by one of the windows. For example, you cannot merge any window with the Modeler window.

If you release the mouse button while not over any of the above nine icons, the window stays in its current dragged location as a floating window.

Project Manager Window

The **Project Manager** window displays the open project's structure, which is referred to as the project tree.

The **Project Manager** window displays details about all open Ansys Electronics Desktop projects. The tree display is specific to the design type. For example:

To show or hide the **Project Manager** window, do one of the following:

- Click **View** > **Project Manager**.

A check box appears next to this command if the **Project Manager** window is visible.

- Right-click in the toolbars area on the desktop, and then click **Project Manager** on the shortcut menu.

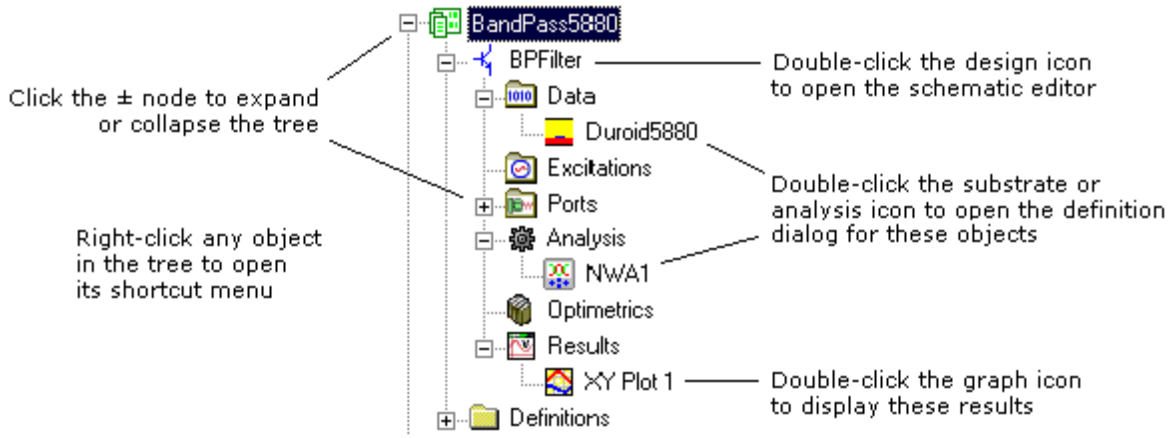
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A check box appears next to this command if the **Project Manager** window is visible.

Project Manager Window for Circuit Designs

The Project Manager window of the Ansys Electronics Desktop for circuit designs shows the projects loaded into the desktop. Each project may consist of one or more product designs.

Each design's model data, ports, excitations, solution setup, and results are displayed as entries in a separate subtree on the **Project** tab in the **Project Manager** window of the Ansys Electronics Desktop.



To help facilitate the easy copying of design materials, Ansys Electronics Desktop allows you to drag and drop designs and components from the **Project Manager** window to the **Schematic Editor**.

- You can drag and drop one or more copies of a component from the Components folder in the project tree to a schematic. Alternately, you can select Copy from the **Project** tree right-click menu and then select Paste from the schematic right-click menu (or use the Ctrl+C and Ctrl+V keyboard commands).
- If **Multiple Placement** is turned on for components in Ansys Electronics Desktop's Schematic Options dialog box, you can place multiple instances of a component in the schematic by clicking at multiple locations. To stop placing components during multiple placement, do either of the following:

  — Press **Enter**, the spacebar, **Backspace**, or **Esc** on your keyboard.

  — Right-click, and then select **Place and Finish**, **Finish**, **Cancel**, or **Back**.

Project Manager Tree Organization

Information contained in the design is organized into folders in the Project manager tree:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Data**—Substrate data, library references, netlist fragments, and so on
- **Excitations**—Sources in the circuit
- **Ports**—Ports in the circuit
- **Analysis**—Setup information to perform various analyses
- **Optimetrics**—Setup information to perform optimization, statistical analysis, and so on
- **Results**—Collection of graphs and tables for the design
- **Definitions**—The collection of components, symbols, footprints, and so on, accessible from Ansys Electronics Desktop

Double-clicking an item in these folders typically opens a dialog used to set the properties of that item.

Right-click Shortcut Menu

Right-clicking a folder or item pops up a shortcut menu that allows you to perform various operations. Virtually all project editing and management can be done from the **Project Manager** window using the right mouse button shortcut menus. Many of these menus are also available from the main menu bar in the various Ansys Electronics Desktop **product** menus.

Dockable Project Manager Window

The **Project Manager** window is a dockable window. It can be moved and sized any way you want it and it can attach itself to any edge of the Ansys Electronics Desktop.

Dragging and Dropping

To help facilitate the easy copying of design materials, Ansys Electronics Desktop allows you to drag and drop (or copy and paste) designs and components from the **Project Manager** window to the **Schematic Editor**. In particular, in the **Project** tab of the **Project Manager** window, you can select and drag:

- A *design* from the Project Tree to a schematic
- A *component* from the Definitions folder to a schematic

You can also drag and drop (or copy and paste) designs in the Project Window onto a Circuit Design icon in the Project window.

Dragging and dropping (or copying and pasting) an HFSS, Q3D, 2D Extractor, or SIwave design onto a Circuit Design or schematic creates a new dynamic link. Note If you hold the Ctrl key down while dropping or pasting, the appropriate Dynamic Link dialog will open, which allows you to make choices such as using an HFSS dynamic link in Transmission Line Model mode.

Closing the Project Manager Window

You can turn off the **Project Manager** window display by deselecting the **Project Manager** check box on the **View** menu in the Top Menu Bar. For more information, see the View Menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Working with the Project Tree

The project tree is located in the **Project Manager** window and contains details about all open Ansys Electronics Desktop projects, as shown below:

The top node listed in the project tree is the project name. It is named Project*n* by default, where *n* represents the order in which the project was added to the current session of Ansys Electronics Desktop. Expand the project icon to view all the project's design information, material definitions, and 3D Components (if any).

By default, the Project tree icon for the active window is highlighted. See General Options: Miscellaneous for options.

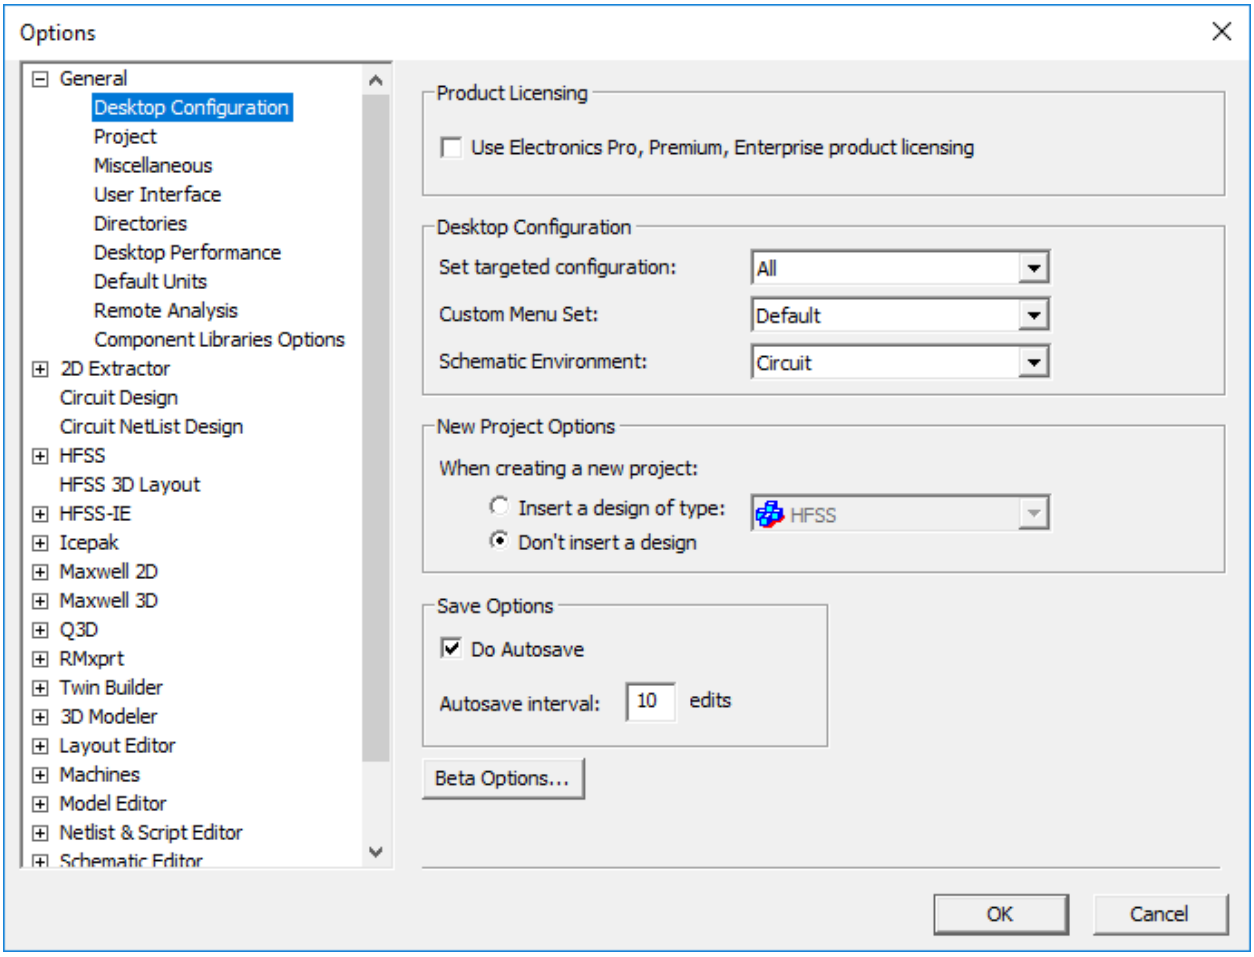
Setting the Project Tree to Expand Automatically

You can set the project tree to automatically expand when an item is added to a project.

1. Click **Tools** > **Options** > **General Options**.

   The **Options** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

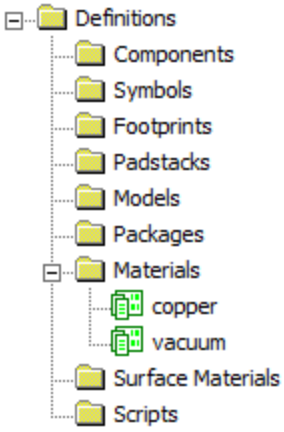


2. Click **User Interface**.
3. In the **Project Tree Visualization Options** area, check the **Expand Project Tree on Insert** check box.
4. Click **OK**.

Viewing Material Definitions

The definitions node is listed at the bottom of the project tree and displays all of the material definitions that are assigned to the objects in the active model.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Viewing Ansys Electronics Desktop Design Details

When you insert an Ansys Electronics Desktop design into a project, it is listed as the second node in the project tree. It is named Ansys Electronics DesktopModel*n* by default, where *n* represents the order in which the design was added to the project. Expand the design icon in the project tree to view all of the specific data about the model, including its boundary conditions and material assignments, and field solution and post-processing information.

The Ansys Electronics DesktopModel*n* node contains the following project details:

3D Components	Displays any 3D Components added to the design.
Model	Displays the model geometries in the design.
Analysis	Displays the for an Ansys Electronics Desktop design. A solution setup specifies how Ansys Electronics Desktop will compute the solution.
Optimetrics	Displays any Optimetrics setups added to an Ansys Electronics Desktop design.
Results	Displays any that have been generated.
Field Overlays	Displays fields, which are representations of basic or derived field quantities on surfaces or objects. Plot folders are listed under **Field Overlays.** These folders store the project's plots and can be customized. See Setting Field Plot Defaults for information on how to customize the plot folders.
Documentation	Displays files you have added as documentation.
Definitions	Displays definitions for HFSS 3D Layout, including Components, Materials, and more (as applicable).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

To edit a project's design details:

- In the project tree, double-click the design setup icon that you want to edit.

A window appears with that setup's parameters, which you can then edit.

Message Manager Window

The **Message Manager** window displays informational messages about various processes in Ansys Electronics Desktop, including messages related to simulations and any errors they may have produced.

Display or hide the **Message Manager** in one of two ways:

- Click **View** > **Message Manager**
  A check box appears next to this command if the **Message Manager** is visible.
- On the status bar, click **Show Messages** or **Hide Messages**.

Messages in the **Message Manager** window are organized first by project, then by circuit. Because a design can contain multiple circuits and subcircuits, sometimes with multiple analyses for each, this organization helps you to quickly determine where errors have occurred. The following icons appear next to a message to indicate information, warnings, errors, or actions:

Indicates an informative message.

Indicates a warning message that may require your attention.

Indicates an error message that may require your attention.

Indicates the existence of an action that is associated with the message. Click on the message to invoke the action (the cursor will change to a hand icon when it is placed over the action message).

Right-click in the **Message Manager** window to open a pop-up menu with the following options:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Clear messages** for the current model.
- **Copy messages** to the clipboard. This can be helpful for sending messages to application engineers.
- **Details** – opens an information dialog that contains the project and design data for the specified message.
- **Go to Reference** – allows you to right-click on an intersection error message after running a validation check. This selects intersecting objects in the current design being validated.

Setting the Message Manager to Open Automatically

You can set the **Message Manager** to open automatically to show new messages and errors and warnings.

Showing New Messages

You can set the **Message Manager** to automatically open when a new message appears.

1. Click **Tools** > **Options** > **General Options**.

   The **Options** window appears.

2. Expand **General** and click **User Interface**.
3. In the **General** area, check the **Show Message Window on new messages** check box.
4. Click **OK**.

Automatically Expanding the Message Manager Tree

You can set the **Message Manager** Tree to automatically expand when a new message is added.

1. Click **Tools** > **Options** > **General Options**.

   The **Options** window appears.

2. Expand **General** and click **User Interface**.
3. In the **General** area, check the **Ensure that new messages are visible in the Message Window Tree** check box.
4. Click **OK**.

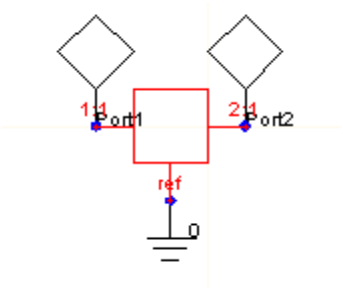
Action Messages

Messages displayed in the **Message Manager** can be associated with actions that can be invoked in order to address a condition you are alerted to by the message. If a message has an associated action, a magnifying-glass icon will be present to the left of the message icon. When the cursor moves over a message with an action, the cursor changes to a hand.

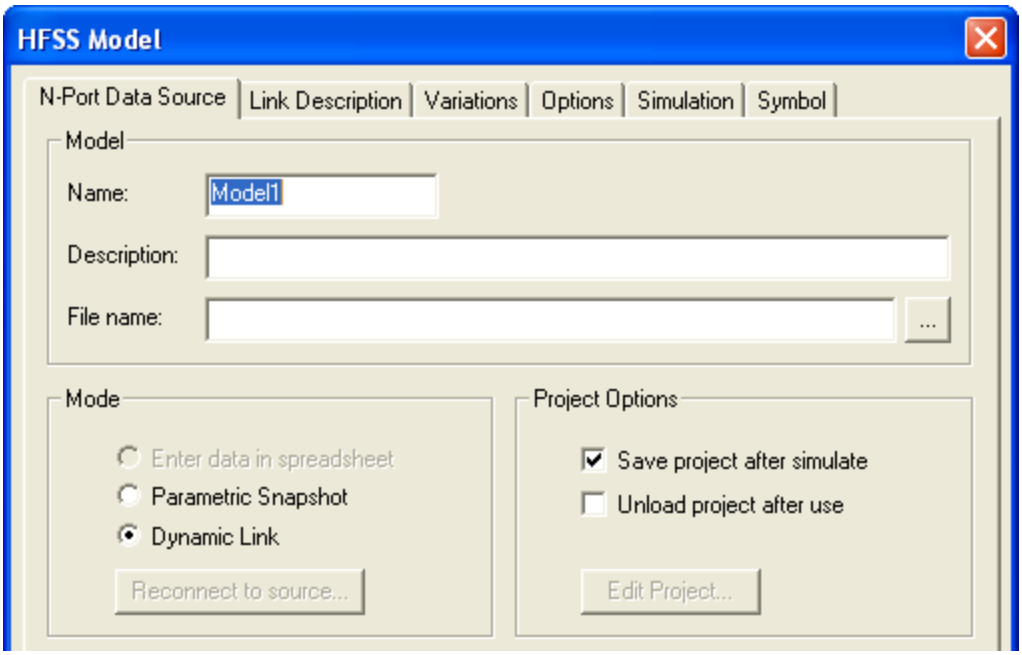
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can invoke a message action by clicking the magnifying glass icon, by double-clicking the message, or by right-clicking the message and selecting **Go To Reference** from the pop-up menu.

One example of a message-associated action is the selection of an associated object:



Another example is the opening of a related window:



Clearing Messages

The **Message Manager** clears at the start of each analysis. To manually clear messages for a project, right-click the message tree and select **Clear Messages for <*ProjectName*>**.

Hiding the Message Manager Window until Messages Appear

If you prefer to hide the Message Manager until a message is added:

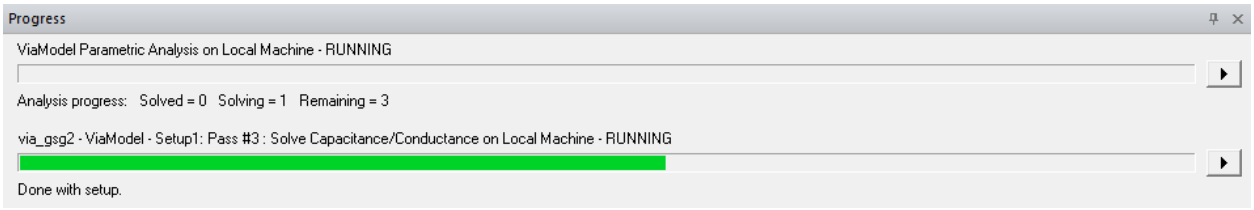
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select **View** > **Progress Window** to hide the window. For more information see the View drop-down menu.
2. Click **Tools** > **Options** > **General Options**.
3. Check the **Show message window on new messages** check box.

The **Message Manager** window will re-open when Ansys Electronics Desktop reports errors, warnings, or successful completion of any simulation.

Progress Window

The **Progress** window monitors a simulation while it is running. Each simulation has its own progress bar. Right-clicking the bar allows you to abort the simulation or view simulation details.



To display or hide the **Progress** window, click **Show Progress** or **Hide Progress** on the status bar.

A check box appears next to this command if the **Progress** window is visible.

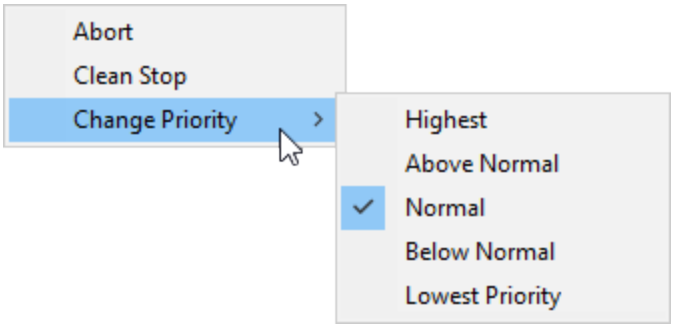
When more than one progress bar is active, the top progress bar is represented on the status bar with a progress indicator.

The progress window is also dockable, so you can reposition it.

Stopping or Aborting Simulation Progress

- To abort progress, right-click in the **Progress** window and select **Abort**.
- To stop the simulation cleanly between time steps, right-click in the **Progress** window and select **Clean Stop**.
- To change priority, right-click. From the **Change Priority** submenu, select from Highest, Above Normal, Normal, Below Normal, and Lowest.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

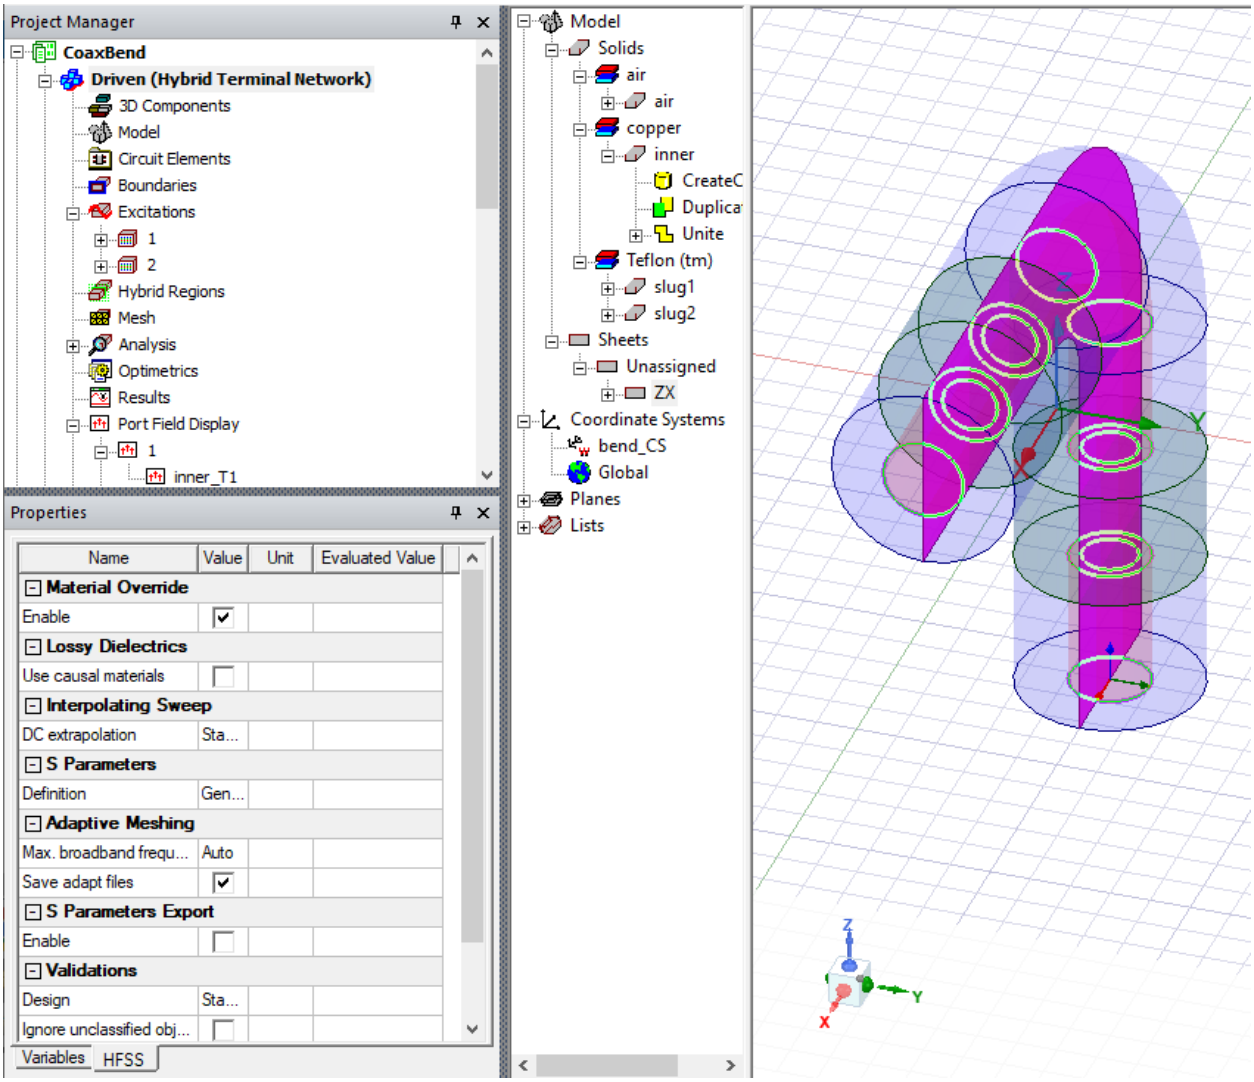


Properties Window

The **Properties** window displays and allows you to edit the properties of an item selected in the project tree or the **3D Modeler** window. The properties shown and their editability vary depending on the type of item selected.

You can choose to show or hide a docked **Properties** window as part of the desktop.

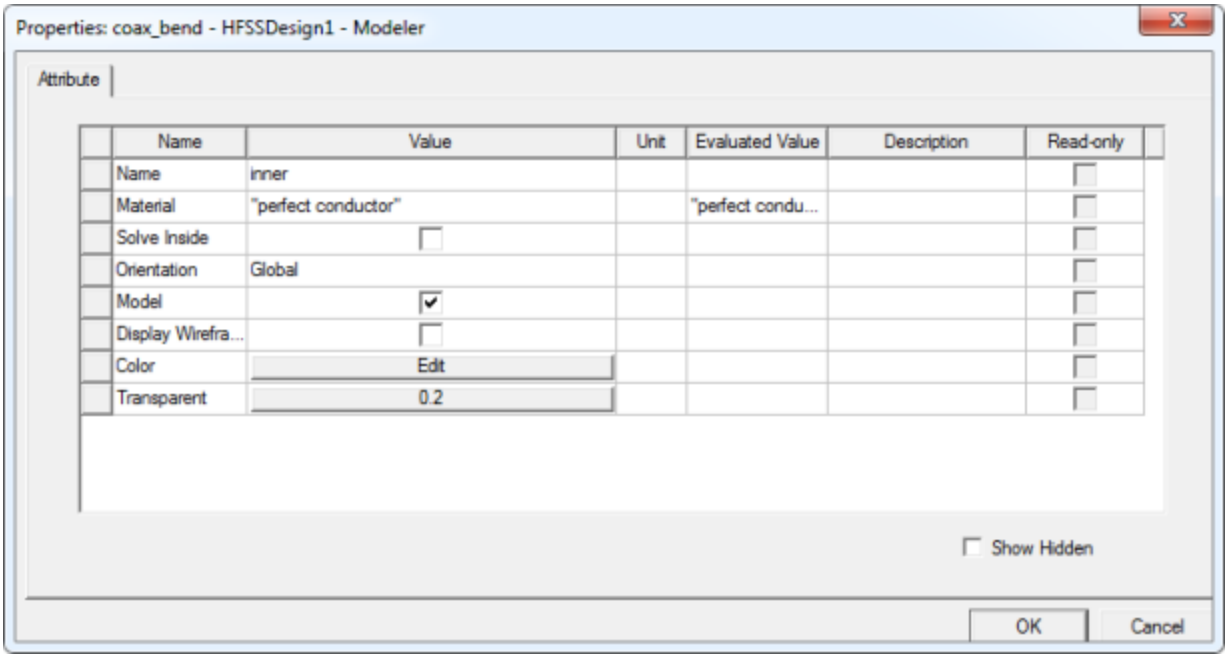
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can move and resize the docked **Properties** window within the desktop to suit your work style. When the **Properties** window is docked, it displays the properties of any item you select in the Project tree, or the 3D Modeler window. Select **View** > **Properties** to remove the docked properties window.

Regardless of whether or not you display a docked **Properties** window on the desktop, you can open an undocked **Properties** window for any item in the project tree by double-clicking the item.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Opening the Properties Window

1. Select the object whose properties you want to view.
2. Click **Edit** > **Properties**.

   The **Properties** window for that object appears.
3. When you are finished making changes, click **OK**.

Rather than opening a separate window, you can have the **Properties** window displayed within the desktop.

Setting the Properties Window to Open Automatically

To set the **Properties** window to open after an object is drawn, do the following:

1. Click **Tools** > **Options** > **General Options**.

   The **Options** window appears.
2. Expand **3D Modeler** and select **Drawing**.
3. Check the **Edit property of new primitives** check box.

Hereafter, when you draw an object in point mode the **Properties** window opens. However, if you draw an object in Dialog mode, this setting is ignored.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Showing and Hiding the Properties Window

To show or hide the **Properties** window on the desktop, do one of the following:

- Click **View** > **Properties**.

A check box appears next to this command if the **Properties** window is visible.

- Right-click in the toolbars area at the top of the desktop, and then click **Properties** on the shortcut menu.

A check box appears next to this command if the **Properties** window is visible.

Modifying Object Attributes Using the Properties Window

1. Select the object for which you want to edit attributes by clicking it in the view window.
2. Under the **Attribute** tab in the **Properties** window, edit the object attribute.

Depending on the attribute type, you can edit it by doing one of the following:

- Select the check box to apply the attribute; clear the check box to disable the attribute.
- Click in the field and edit the numeric values or text, and then press **Enter**. You can modify names, but names must include only letters, numbers and underscores. Illegal names are not accepted and generate a message in the Message Manager window.
- Click the button and edit the current settings in the window that appears.
- Click the attribute and select a new setting from the menu that appears.

Modifying Object Command Properties Using the Properties Window

The **Command** tab in the **Properties** window displays information about an action selected in the history tree that was performed either to create an object (such as the **Draw** > **Box** command) or to modify an object (such as the **Edit** > **Duplicate** > **Mirror** command).

Not all command properties can be modified. In general, command properties you can typically modify are numeric values, such as position values, size values, and various other coordinate values. You can also modify many of the unit settings for a command property. You can modify names, but names must include only letters, numbers and underscores. Illegal names are not accepted and generate a message in the Message Manager window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. In the history tree, select the command for which you want to edit properties.

   Tip:

   Press and hold **Ctrl** to select multiple commands. If you select multiple commands, only the common (shared) properties will display under the **Command** tab.

2. Under the **Command** tab in the **Properties** window, edit the command's properties.

Depending on the property type, you can edit it by doing one of the following:

- Select the check box to apply the property; clear the check box to disable the property.
- Click in the field and edit the numeric values or text, and then press **Enter**.
- Click the button and edit the current settings in the window that appears.
- Click the attribute and select a new setting from the menu that appears.

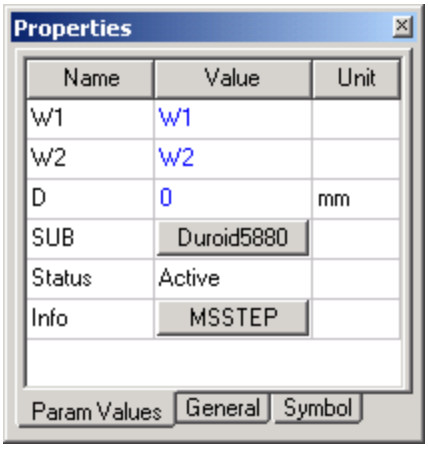
Property Window for Schematic and Layout Editors

The **Property** window shows the properties or parameters of objects selected in the schematic and layout editors, and objects in the **Project Manager** window. It allows you to modify property values. The **Property** window has three tabs:

- The Param Values Tab

Param Values Tab

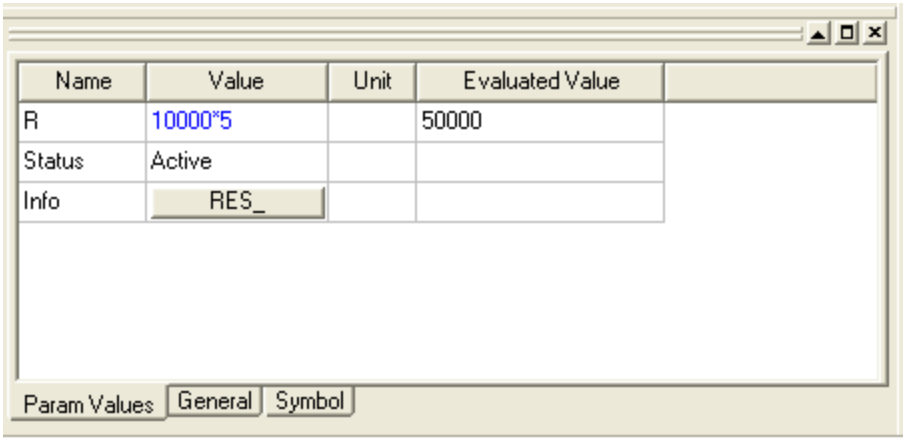
The **Param Values** tab in the **Property** window of the Ansys Electronics Desktop lists the simulation parameters of the component or components selected.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To set or change the value of a component parameter, click on the **Value** field and enter the new value. If the value requires a multiplier unit (such as **K** for 1000) click on the **Unit** field to select the multiplier unit. The Evaluated value shows the resulting number.

You can specify a parameter value using an expression that evaluates to a constant. The expression is retained in the **Value** field, while the **Evaluated Value** field shows the constant resulting from evaluation the expression. This allows you to identify and modify the expression in the future.



Launching Help from the Property Window

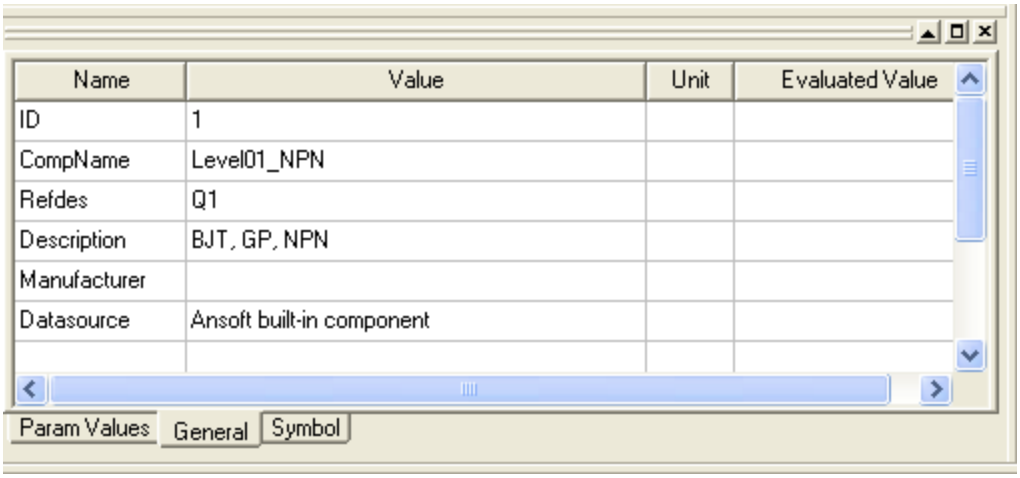
You can launch the online help for a component from the **Property** window. To do this:

1. Click the **Param Values** tab.
2. Scroll down to the **Info** parameter entry, and then click the button in its **Value** cell.

General Tab

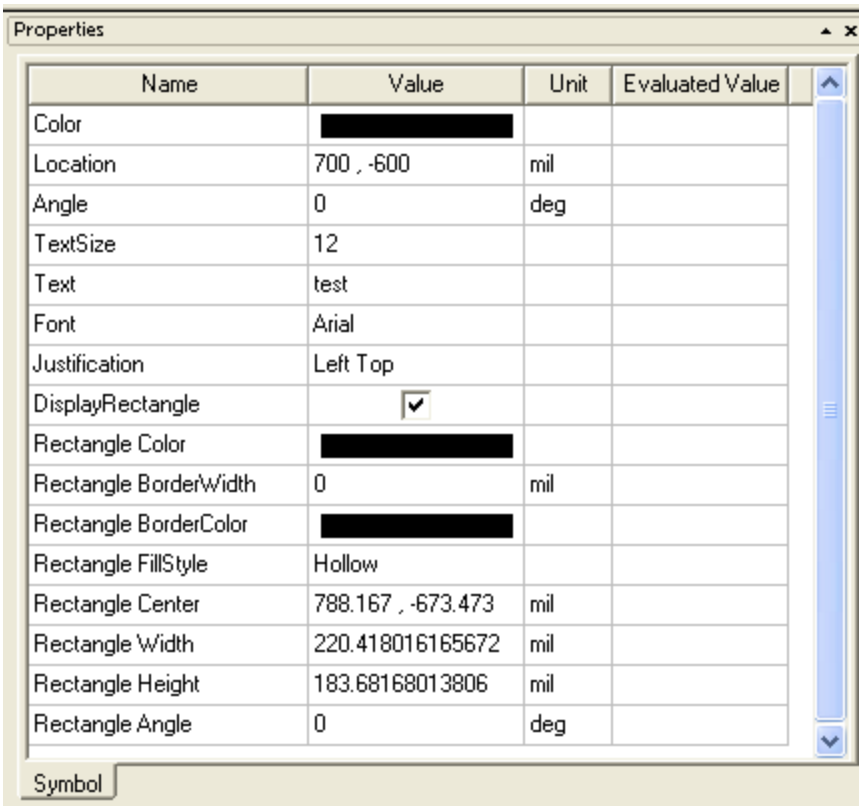
The **General** tab in the **Property** window of the Ansys Electronics Desktop lists the selection's name, symbol name, reference designator, and other data. These are generally not editable.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



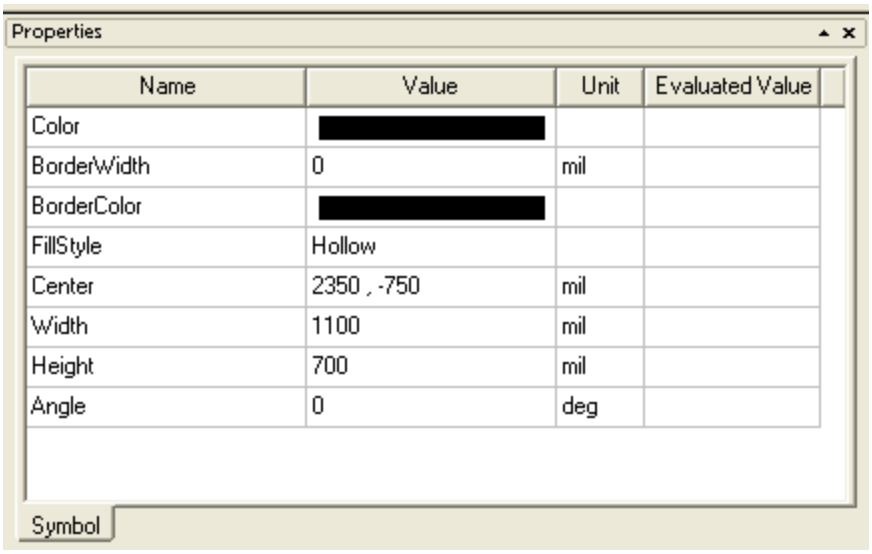
Symbol Tab

The **Symbol** tab in the **Property** window of the Ansys Electronics Desktop provides information on a number of modifiable attributes of components and symbols displayed in the schematic.

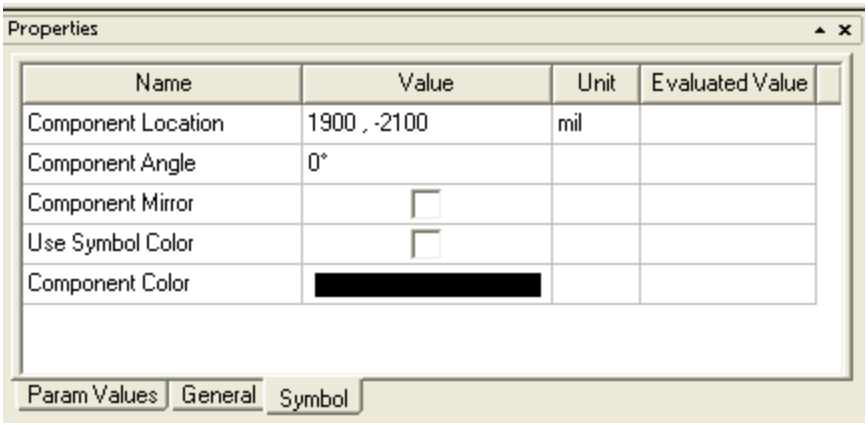


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The contents of the **Symbol** tab varies depending upon the number and type of components or symbols selected in the schematic.



But whatever components or symbols are selected, each field displayed in the **Symbol** tab is modifiable.



Symbol tab Value fields can be modified using the following guidelines:

- Click in the **Value** field for **Component Location** to enter a new set of X,Y coordinates for the symbol. Press **Return** to move the symbol to the new location.
- Click in the **Value** field for **Component Angle**, and select an angle from the drop-down menu (choices are 0, 90, 180, and 270 degrees). The symbol rotates as you select an angle.
- Click in the check box in the **Value** field for **Component Mirror** to flip the component left-to-right. The mirror operation is performed as soon as you check the box. Uncheck the box to return the symbol to its original orientation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click in the **Value** field to enter a new value for whatever symbol attribute you wish to change. Press **Return** to move the symbol to the new location.
- Click the colored bar displayed in the **Value** field to open a palette from which to select a new color for the symbol. The new color is applied when the symbol is unselected.

Properties Dialog Box

Like the **Property** window, the **Properties** dialog box shows the properties or parameters of selected objects, and, where appropriate, allows editing the values of these properties. It extends **Property** window functions with additional editing commands, and with settings for tuning, optimization, sensitivity, and statistical analysis, that are not available through the **Property** window. It is also used to define project variables. The **Properties** dialog box has the following tabs:

- General

Opening the Properties Dialog Box

You can open the **Properties** dialog box in two ways:

- To open the **Properties** dialog for a component, double-click the component.
- Right-click the component and select **Properties**.

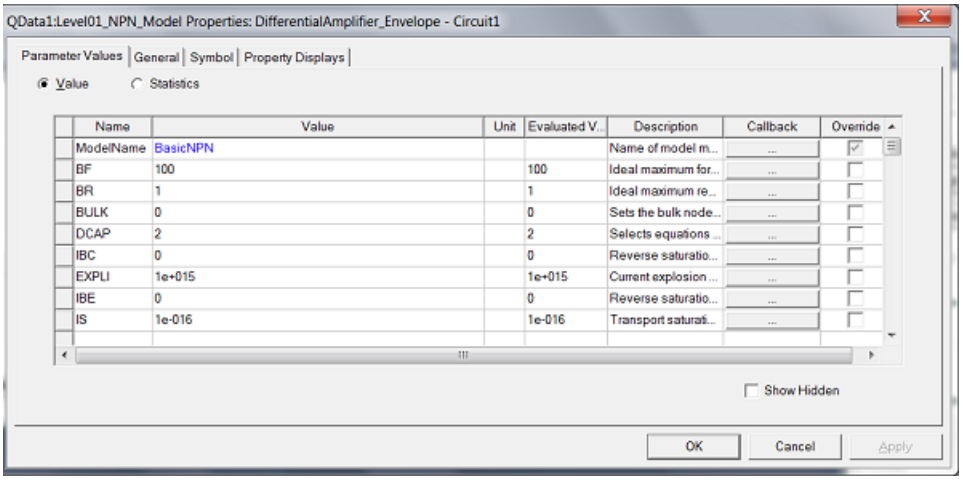
You can manipulate the **Properties** dialog box in the following ways:

- Close the **Properties** dialog box by clicking the **Esc** key.
- Resize the **Properties** dialog box by dragging its edges.
- Change the relative widths of adjacent columns by dragging the header separators between them.

Parameter Values Tab

The **Parameter Values** tab in the Properties Dialog Box lists the simulation parameters of the component or components selected.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



To set or change the value of a component parameter, click on the **Value** field and enter the new value. You can enter the units in the value field, or you can click on the **Unit** field to enter the units.

You can specify a parameter value using an expression that evaluates to a constant (as shown in the picture above). The expression is retained in the **Value** field, while the **Evaluated Value** field shows the constant resulting from evaluation the expression. This allows you to identify and modify the expression in the future. The Property Displays Tab allows you to display the expression, the evaluated value, or both.

When the **Properties** dialog box is opened for a design (**Design Properties**), the **Parameter Values** tab is initially empty. You can add properties to the design by clicking the **Add** button. Note that the **Add** button does not appear on the **Properties** dialog box for a component.
See: Project Variables.

> **Note:**
>
> Clicking the **Show Hidden** check box allows you to view hidden properties of a component, and may result in the display of complex-value computations upon which some calculated values are based. Hidden properties contain system-defined values and rules for interpreting predefined component parameters. Modifying hidden properties requires specialized knowledge of the component, and is not needed for normal operation.

General and Symbol Tabs

The **General** tab in the Properties Dialog Box lists the selection's name, symbol name, reference designator, and so on. These are generally not editable. The information is identical to that on the General tab of the Property Window.

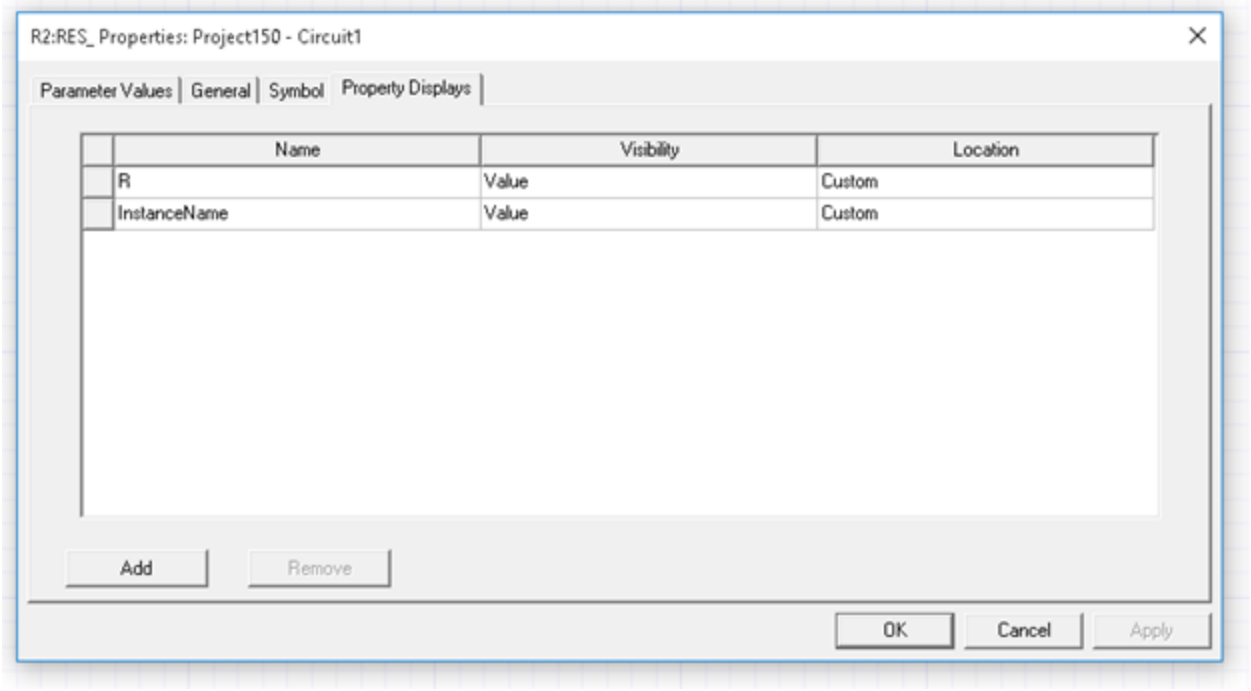
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **Symbol** tab provides information on the location of the component symbol in the schematic. The information is identical to that on the Symbol tab of the Properties Window.

When the **Properties** dialog box is opened for a design (**Design Properties**), both the General and Symbol tabs are initially empty.

Property Displays Tab

The **Property Displays** tab in the Properties Dialog Box controls how the properties of the component appear on the schematic.



Click in the **Visibility** field for a parameter to select how the information for that parameter is displayed:

- **None** – results in no label being shown.
- **Name** – displays the parameter name (e.g., R).
- **Value** – displays the component value, which can be a single value (e.g., 10000) or an expression (e.g., 10000*5).
- **Both** – displays the parameter name and its value (e.g., R = 10000, R=10000*5).
- **Evaluated Value** – displays the evaluated value of an expression that has been used for the value of a parameter (e.g., 50000 for the expression 10000*5).
- **Evaluated Both** – displays the parameter name and the Evaluated Value (e.g., R = 50000 for the expression 10000*5).

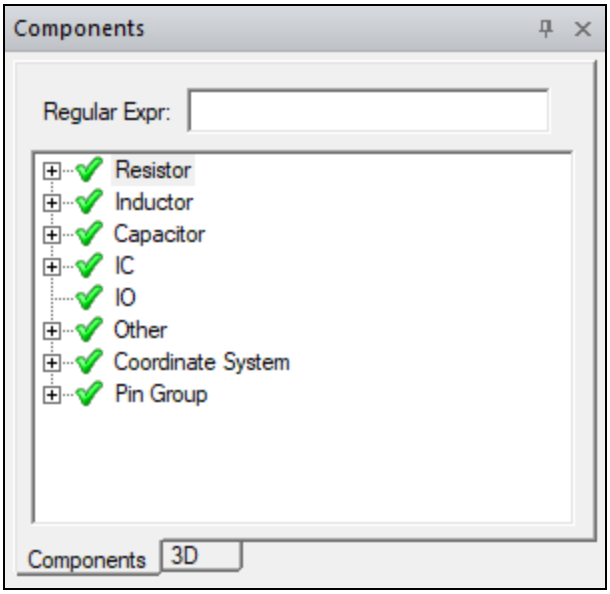
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click in the **Location** field for a parameter to specify the location for the display. The locations are: **Left**, **Top**, **Right**, **Bottom**, **Center**. When you have set the location with the cursor in the schematic, the **Location** field has the entry **Custom**.

- To add a parameter to the display, click the **Add** button. Click on the **Name** field and select the parameter to add from the drop-down menu.
- To delete a parameter from the display, select it in the **Property Display** list and click **Remove**.

Working with the Components Window

The **Components** window is a dockable window that is used to view and configure various component settings for Layout components. Use the **Components** window to select a component or a component class, add ports to a component, and configure multiple ports across components. You can also select multiple components in the Layout editor to configure pins and ports for each simultaneously. The window can be resized and relocated.



To show or hide the **Components** window on the desktop, click **View** > **Components**. A check box appears next to the command if the **Components** window is visible.

With a component selected, the following configuration controls are available from the right-click menu:

- **Type** – reclassifies the component type to **Resistor**, **Inductor**, **Capacitor**, **IC**, **IO**, or **Other**.
- **Enable**/**Disable** - enables or disables the component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Model** – opens the Component Model window, where you can change the component model definition, including die, solder ball, and port properties. Changing the model scope will update every reference designator that belongs to the model definition.
- **Create Ports on Component** – adds ports for the component
- **Remove Ports on Component** – removes ports for the component.
- **Fit Selected** – fits the selected component in the active view window.

> **Note:** When a component classification is selected, any changes are applied to all components within the class.

For more information, see Layout-based Component Encapsulation.

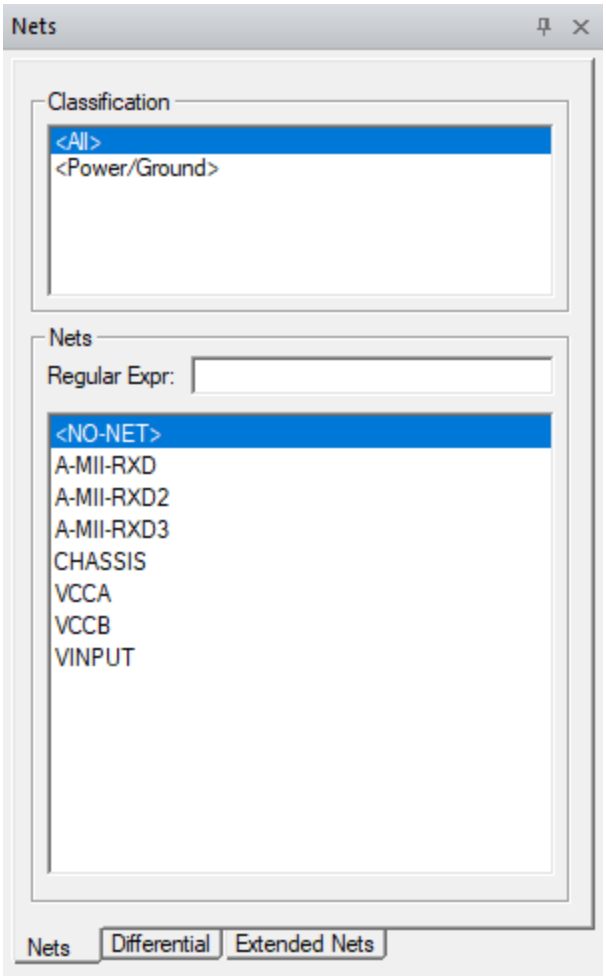
Working with the Nets Window

The **Nets** window is used to view and configure nets and collections of nets. It is a dockable window that can be resized and relocated. The **Nets** window is divided into three tabs:

- **Nets** – lists net and net classes.
- **Differential** – lists coupled positive and negative nets.
- **Extended Nets** – lists extended nets for use for SIwave SYZ with HFSS Regions simulations.

To show or hide the **Nets** window, click **View** > **Nets**. A check box appears next to this command if the **Nets** window is visible.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Nets Tab

The **Nets** tab contains two panes: an upper **Classification** pane and a lower **Nets** pane.

Classification Pane

A net classification (also called a class) is a collection of nets. Classifications are designed to group and organize nets by a common characteristic. A net can be in multiple classes at once. By default, there are two classifications: All and Power/Ground net class.

The **Classification** pane lists and manages net classes. When you select a class in the **Classification** pane, the nets assigned to that class are listed in the **Nets** pane.

The **Classification** pane's shortcut menu offers the following actions:

- **New** – opens the **Add Net Class** window for net class creation (see below).
- **Edit** – opens the **Net Class Properties** window for net class modification (see below).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Delete** – deletes the selected net class(es).
- **Select** – in the layout editor, selects the net classes selected in the classification pane.
- **Show** – in the layout editor, shows the net classes selected in the classification pane.
- **Show (Hide All Other)** – in the layout editor, shows the net classes selected in the classification pane and hides all other net classes.
- **Hide** – in the layout editor, hides the net classes selected in the classification pane.
- **Create Ports** – creates ports on all nets in the selected net classes.
- **Remove Ports** – removes ports from all nets in the selected net classes.

Nets Pane

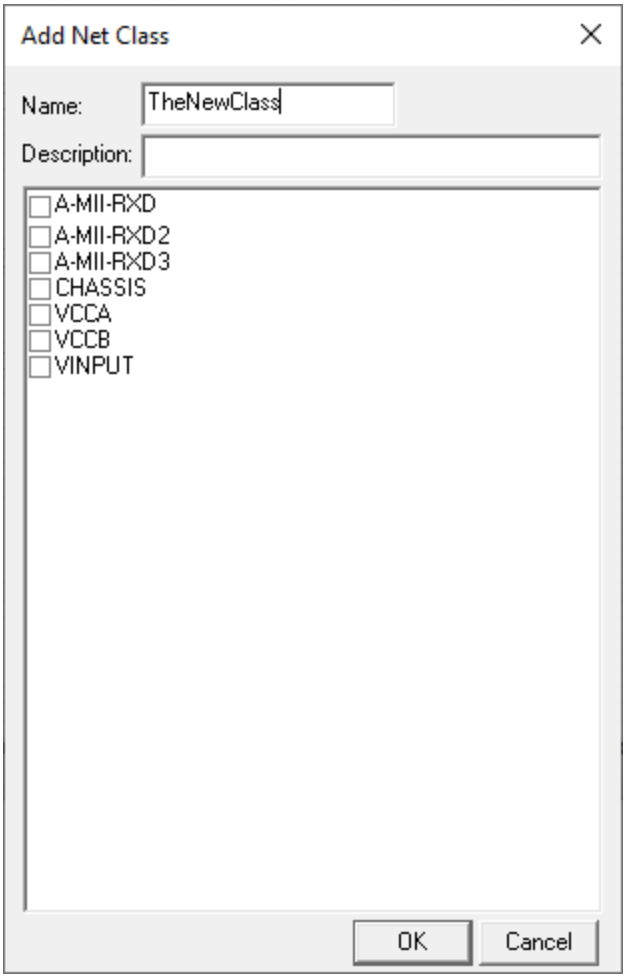
The displayed nets may be filtered using Perl Regular Expression syntax. In the **Nets** pane, the right-click menu contains additional options:

- **Add to Power/Ground** – adds one or more selected nets to Power/Ground.
- **Delete** – deletes the selected net(s).
- **Lists** – opens a list of all nets in the Design List window.
- **Remove from Power/Ground** – removes one or more selected nets from Power/Ground.
- **Create Differential Pair** – with two nets selected, groups them as a differential pair (see below).

Add Net Class

Selecting **New** from the right-click menu opens the **Add Net Class** window. Enter a name and description (optional) for the new net class and click **OK**.

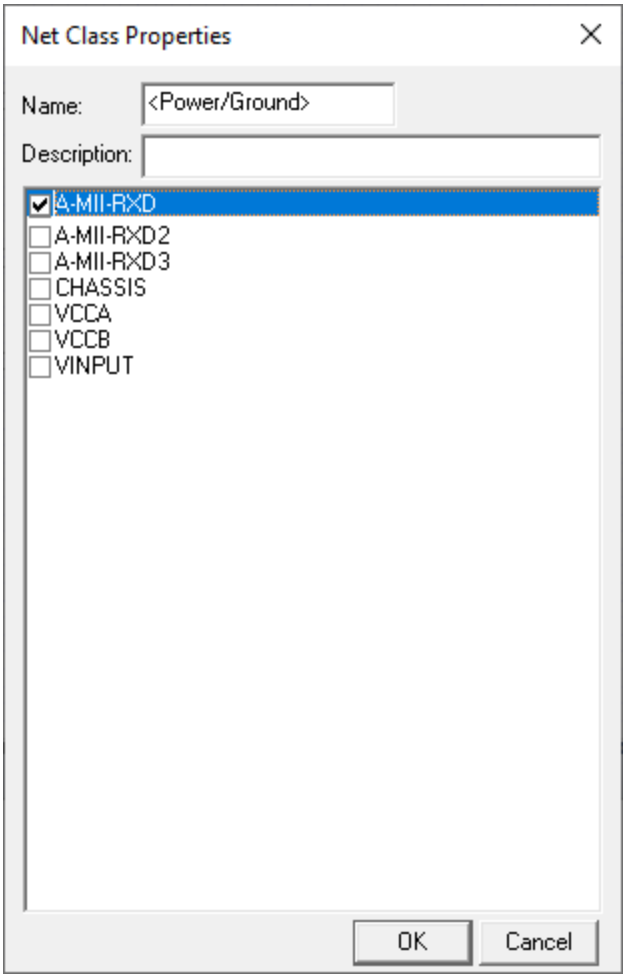
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Net Class Properties

Selecting **Edit** from the right-click menu opens the **Net Class Properties** window. Use this window for net class modification.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



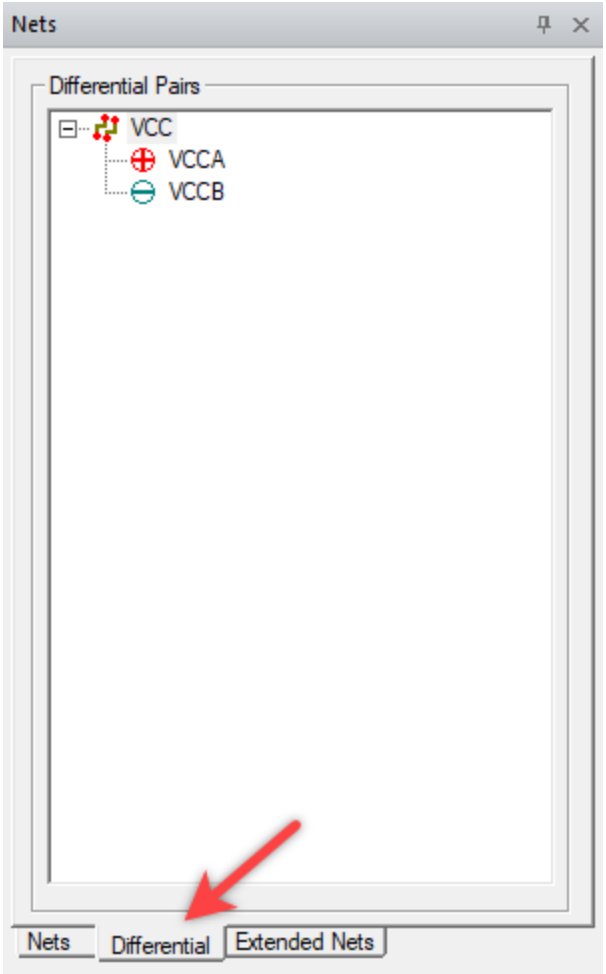
Differential Pairs

Each Differential Pair is composed of a positive net and a negative net. From the **Nets** window, you can view and create Differential Pairs.

Viewing Differential Pairs

Click the **Differential** tab to display a list of Differential Pairs.

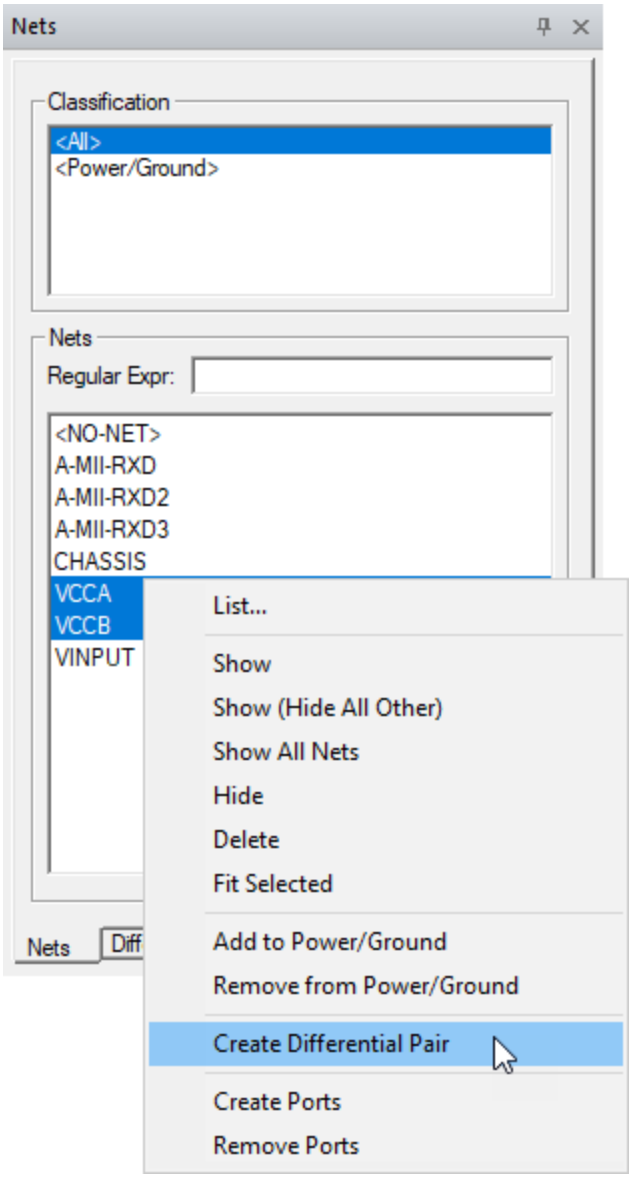
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Creating Differential Pairs

Select two nets in the **Nets** list and right-click to create a new Differential Pair.

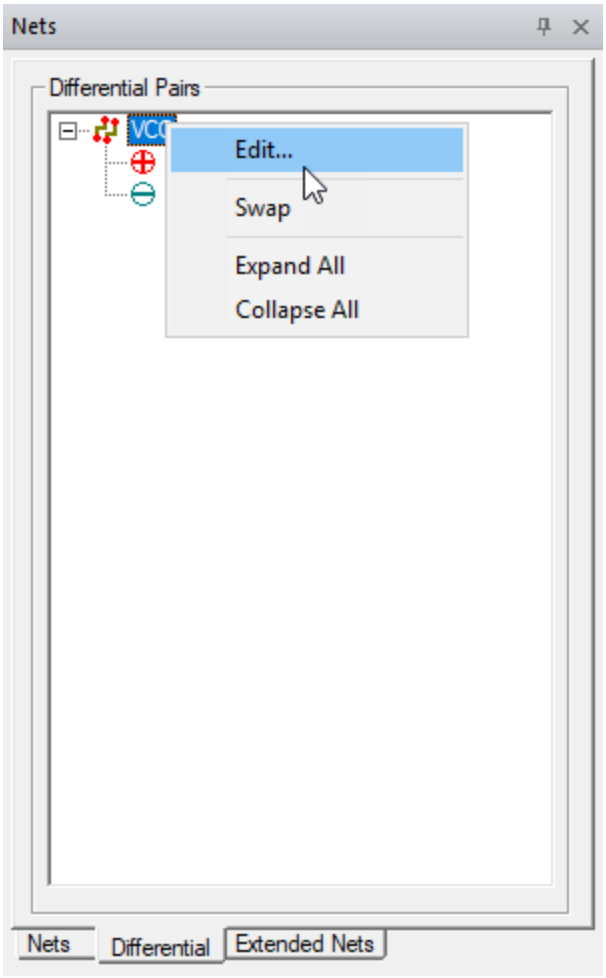
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



From the **Differential Pairs** list, you can select a pair, open the right-click menu and select:

- **Swap** – swaps the positive and negative net.
- **Edit** – opens the **Edit Differential Pairs** window.
- **Expand All** – expands all Differential Pairs.
- **Collapse All** – collapses all Differential Pairs.

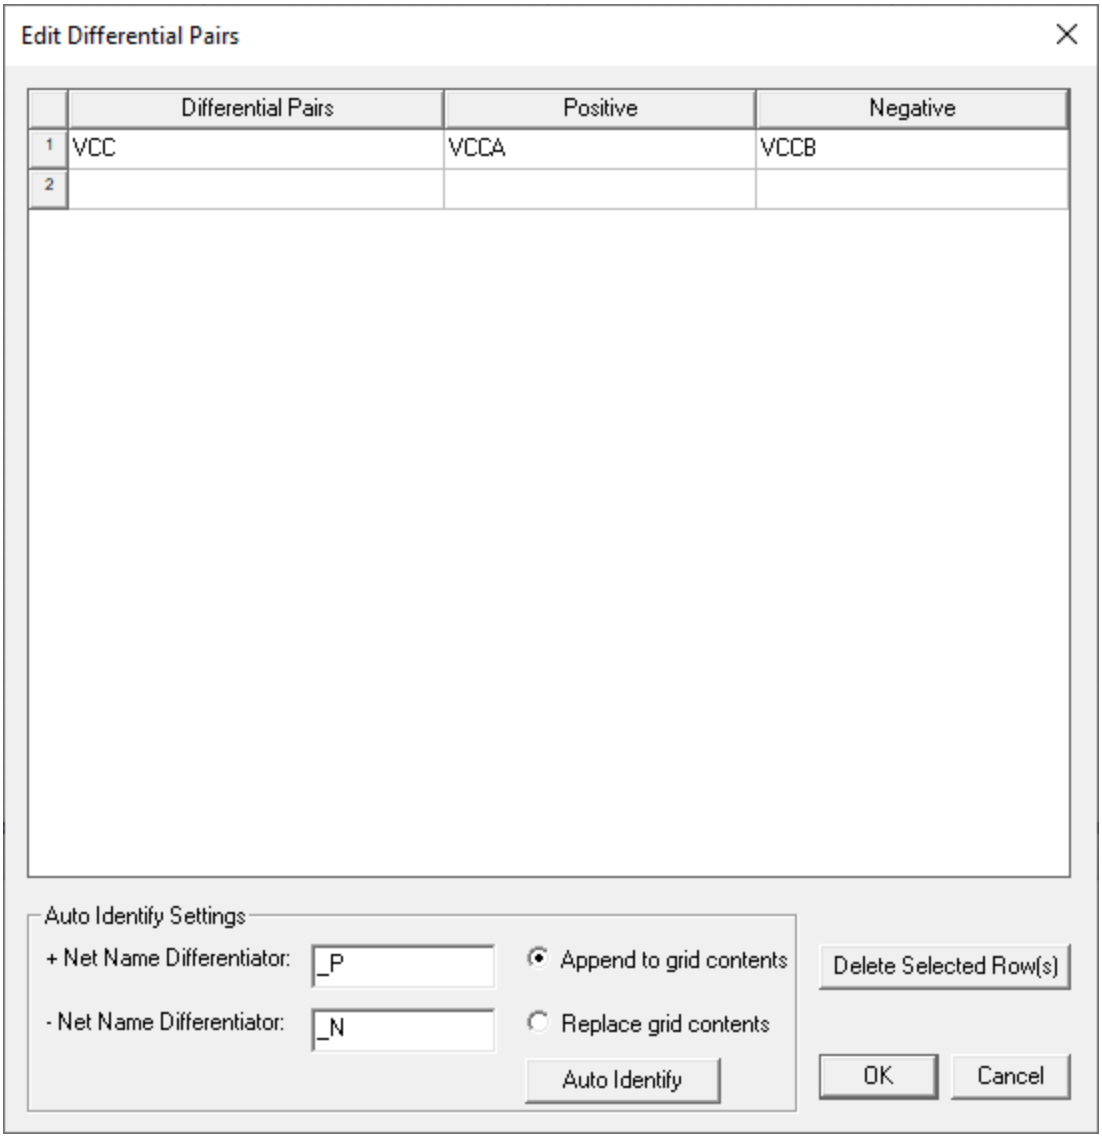
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Edit Differential Pairs Window

From the **Edit Differential Pairs** window, you can delete pairs or auto detect Differential Pair with postfixes of the positive and negative nets that are provided. Enter differentiators to identify the positive and negative parts of pairs. Use **Append to grid contents** to add any new pairs to the list in the grid and **Replace grid contents** to replace existing pair with newly identified pairs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Extended Nets Tab

Extended nets are used to indicate a logical equivalence among multiple nets. This is useful when two nets can be considered electrically equivalent, but are not physically connected. For example, routing for a data signal may have a short trace between a series termination resistor and pin. While the net assignment for traces on either side of the resistor are different, logically they are equal and can therefore be grouped into an extended net.

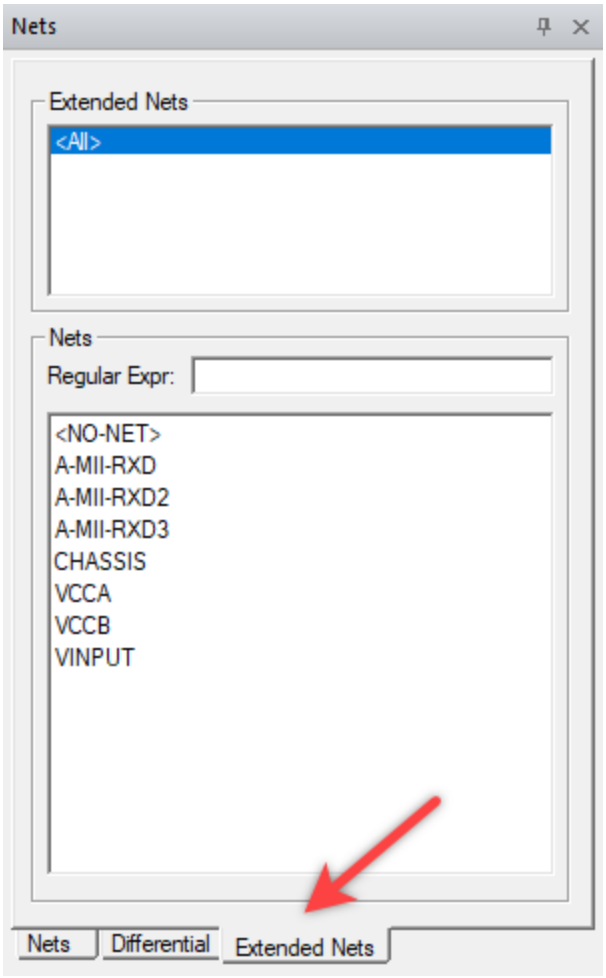
Extended nets are collections of nets that are similar to net classifications but with subtle differences. A net can be in only one extended net at a time, in contrast to being in multiple

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

classifications simultaneously. There are also no default extended nets and no ports are associated with extended nets.

Extended nets are used for SIwave SYZ with HFSS Regions simulations. If an HFSS region contains capacitors, inductors, or resistors that connect two different signal nets, these signal nets must be defined as extended nets. SIwave needs this definition to know how to pull in required nets and auto generate ports in the region.

The **Extended Nets** tab contains two panes: an upper **Extended Nets** pane and a lower **Nets** pane.



Extended Nets Pane

The **Extended Nets** pane lists all extended nets. Use it manage the extended nets. When an extended net is selected in the **Extended Nets** pane, the nets assigned to that extended net appear in the **Nets** pane. The entry <All> lists all nets in the **Nets** pane including entities not in a

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

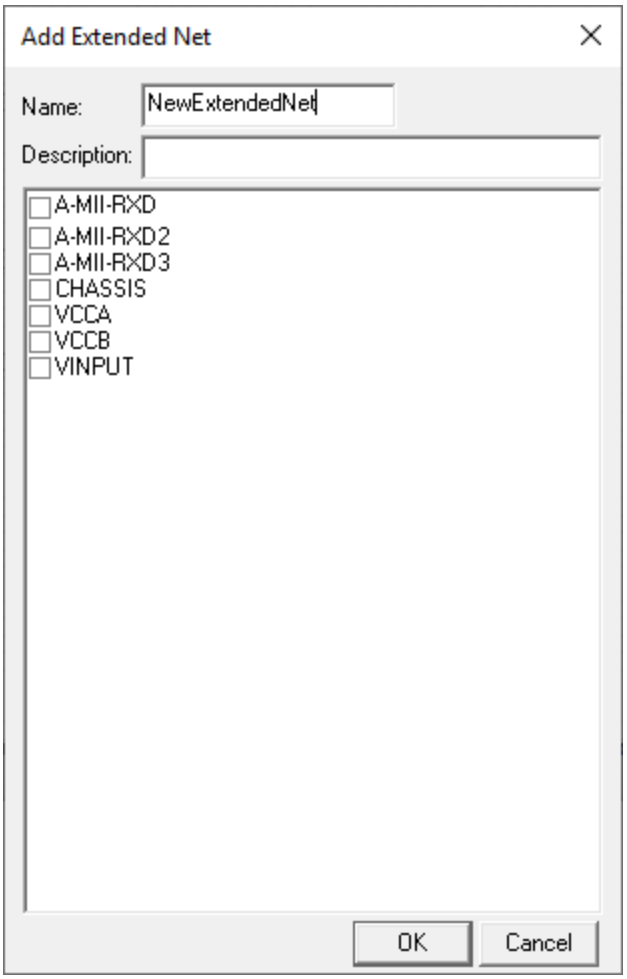
net. <All> is not an extended net. The **Extended Nets** pane's shortcut menu offers the following actions:

- **New** – creates a new extended net.
- **Auto Identify** – automatically identifies new extended nets in the **Auto Identify Settings** window.
- **Edit** – changes the selected extended net.
- **Delete** – deletes the selected extended nets.
- **Select** – selects the members of the extended nets in the Layout editor.
- **Show** – shows the members of the selected extended nets in the Layout editor if hidden.
- **Show (Hide All Other)** – shows the members of the selected extended nets in the Layout editor while hiding all other nets.
- **Hide** – hides the members of the selected extended nets in the Layout editor.

Create an Extended Net

1. In the **Extended Nets** pane, right click and click **New** to open the **Add Extended Net** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

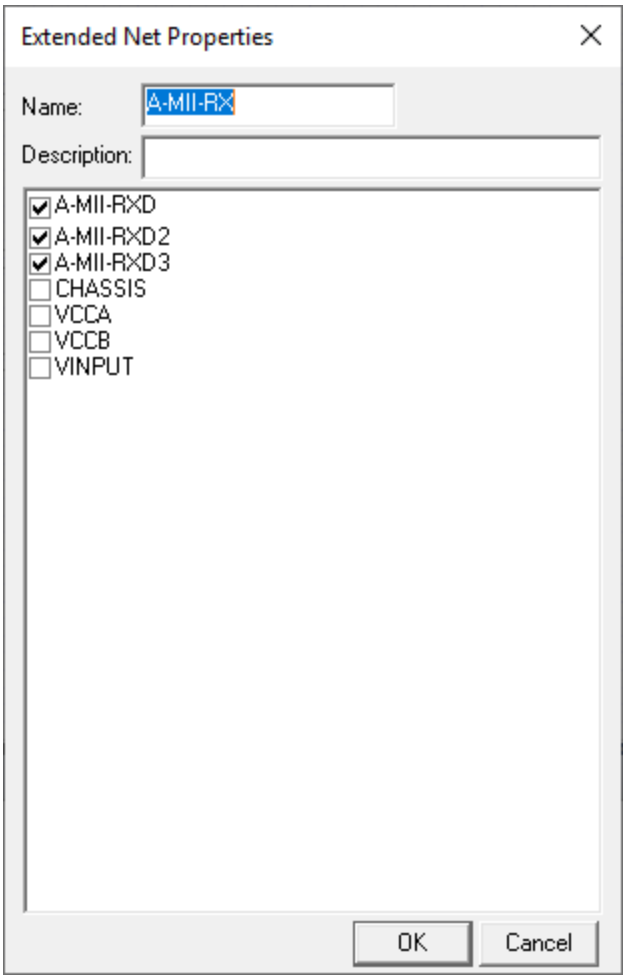


2. Enter a name and optional description.
3. Select the nets that will make up the extended net.
4. Click **OK**.

Editing an Extended Net

1. In the **Extended Nets** pane, right click and select **Edit** to open the **Extended Net Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

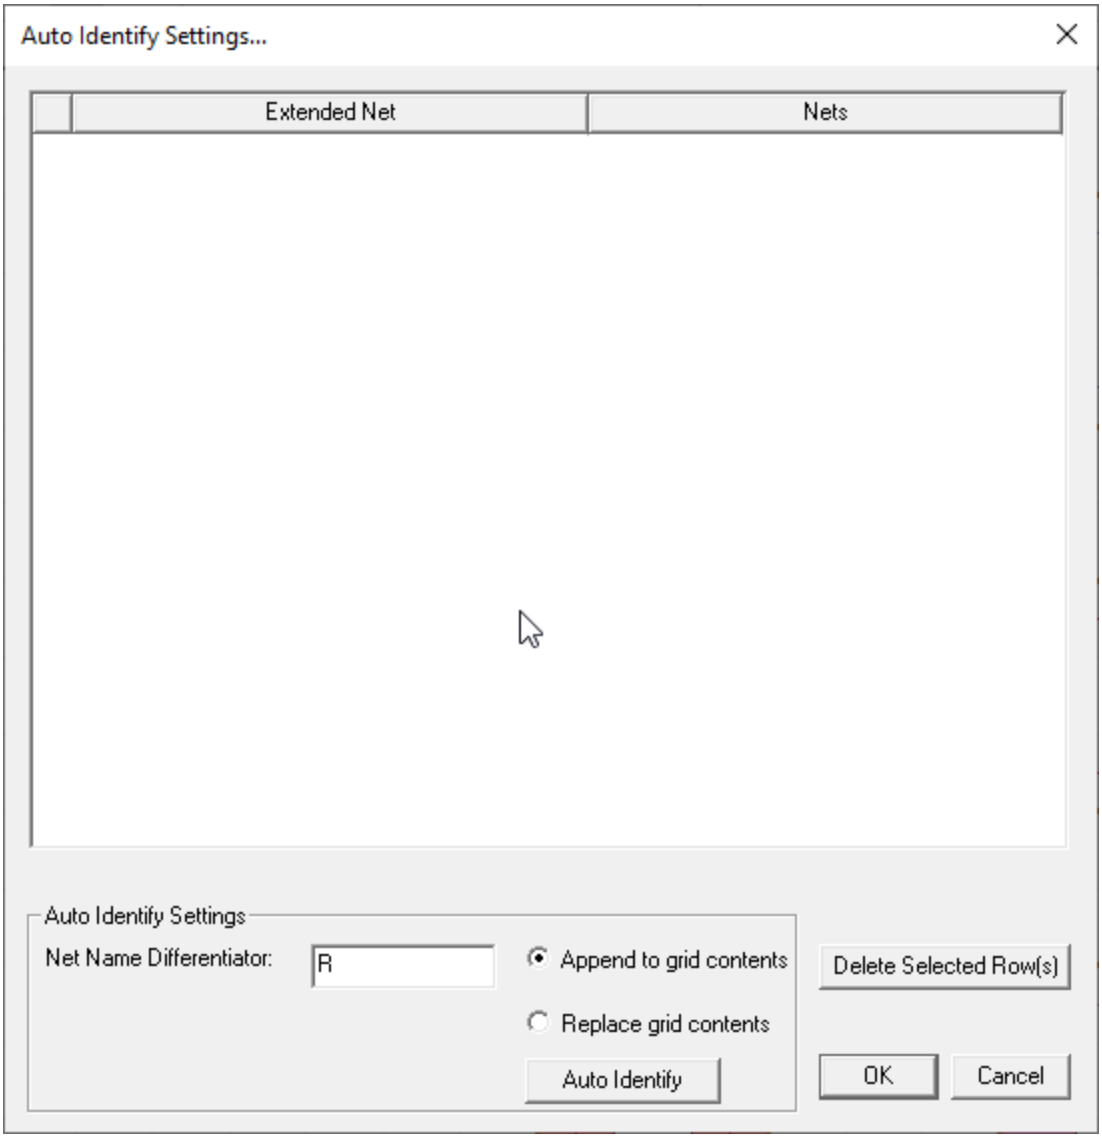


2. Change the name and optional description.
3. Select the nets that will make up the extended net.
4. Clear the nets that should not be in the extended net.
5. Click **OK**.

Auto Identify Settings window

From the **Auto Identify Settings** window, you can automatically detect and create extended nets, rename extended nets, or delete extended nets. Existing nets are listed in the grid. Enter a differentiator to identify extended nets. Use **Append to grid contents** to add any new extended nets to the list in the grid and **Replace grid contents** to replace existing extended nets with newly identified ones.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Nets Pane

The **Nets** pane displays the members of the extended nets that are selected in the **Extended Nets** pane. These nets can be filtered using regular expressions. In the **Nets** pane, the short menu offers these actions:

- **Show** – shows the selected nets in the Layout editor if any are hidden.
- **Show (Hide All Other)** – shows the selected nets in the Layout editor while hiding all other nets.
- **Show all nets** – shows all nets in the Layout editor.
- **Hide** – hides the selected nets in the Layout editor.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

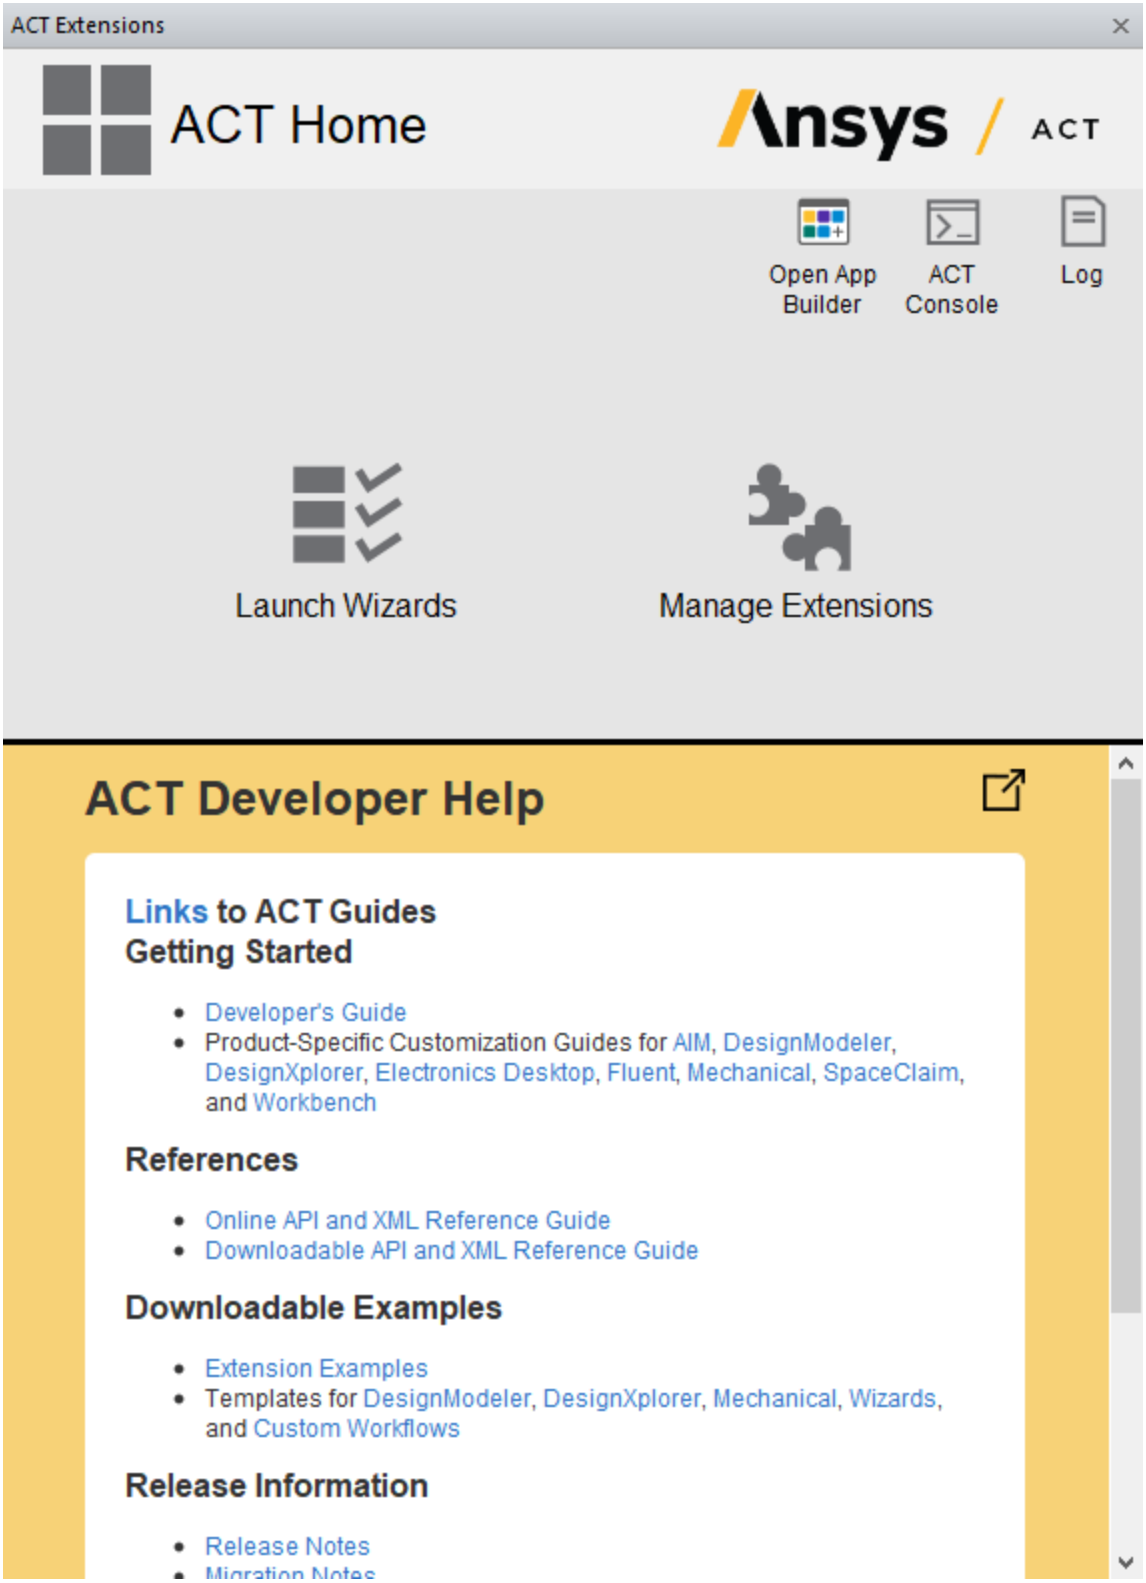
- **Delete** – deletes the selected nets from the project. Members of the net remain in the project.
- **Fit Selected** – zooms the Layout editor into show the selected nets.

ACT Extensions Window

> **Note:**
>
> The **ACT Extensions** window and the design wizards it contains (*5G Wizard, HFSS Antenna Design Toolkit, HFSS-EMA3D Link,* and *Maxwell Eccentricities*) are only available for the Windows version of the Ansys Electronics Desktop software. These items are not available when the software is installed on a Linux platform.

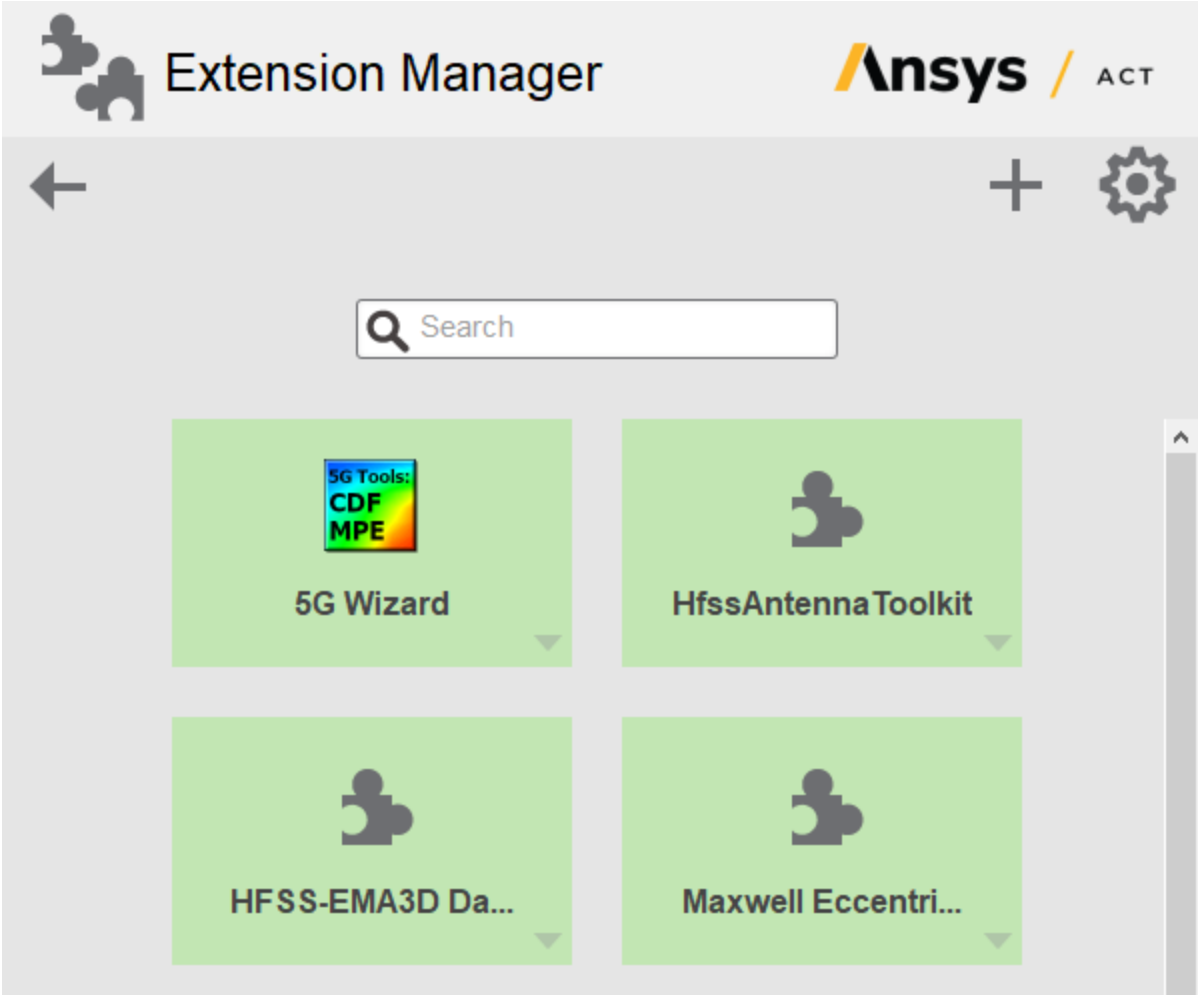
The **View** > **ACT Extensions** command opens the ACT Extensions window for toolkit extensions implemented via Ansys ACT. Depending on how you size and arrange the desktop, the appearance may vary. You may choose to detach and size the window to suit your needs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



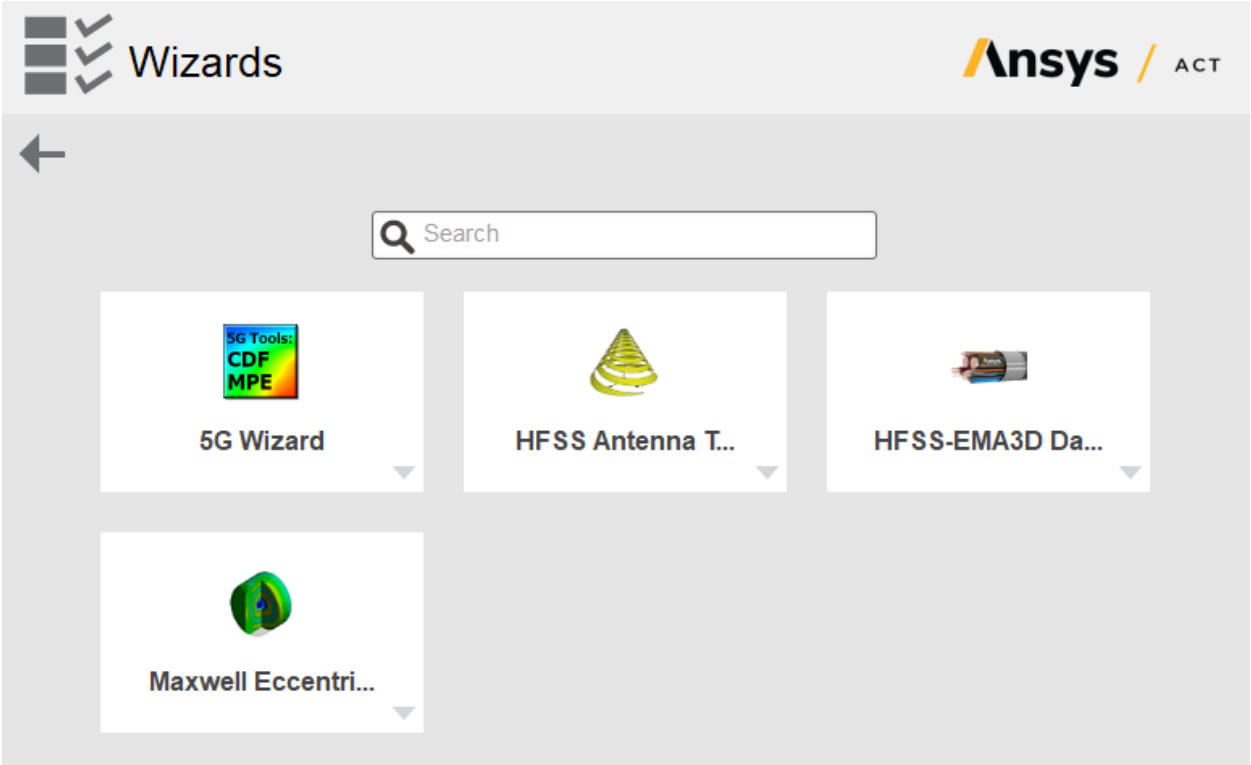
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click the **Manage Wizards** icon to load the **Extension Manager** to select from available extensions. Active extensions are highlighted. Selectable extensions show while. Scroll bars and window sizing lets you view addition extensions. You can search, or access the Ansys App Store.



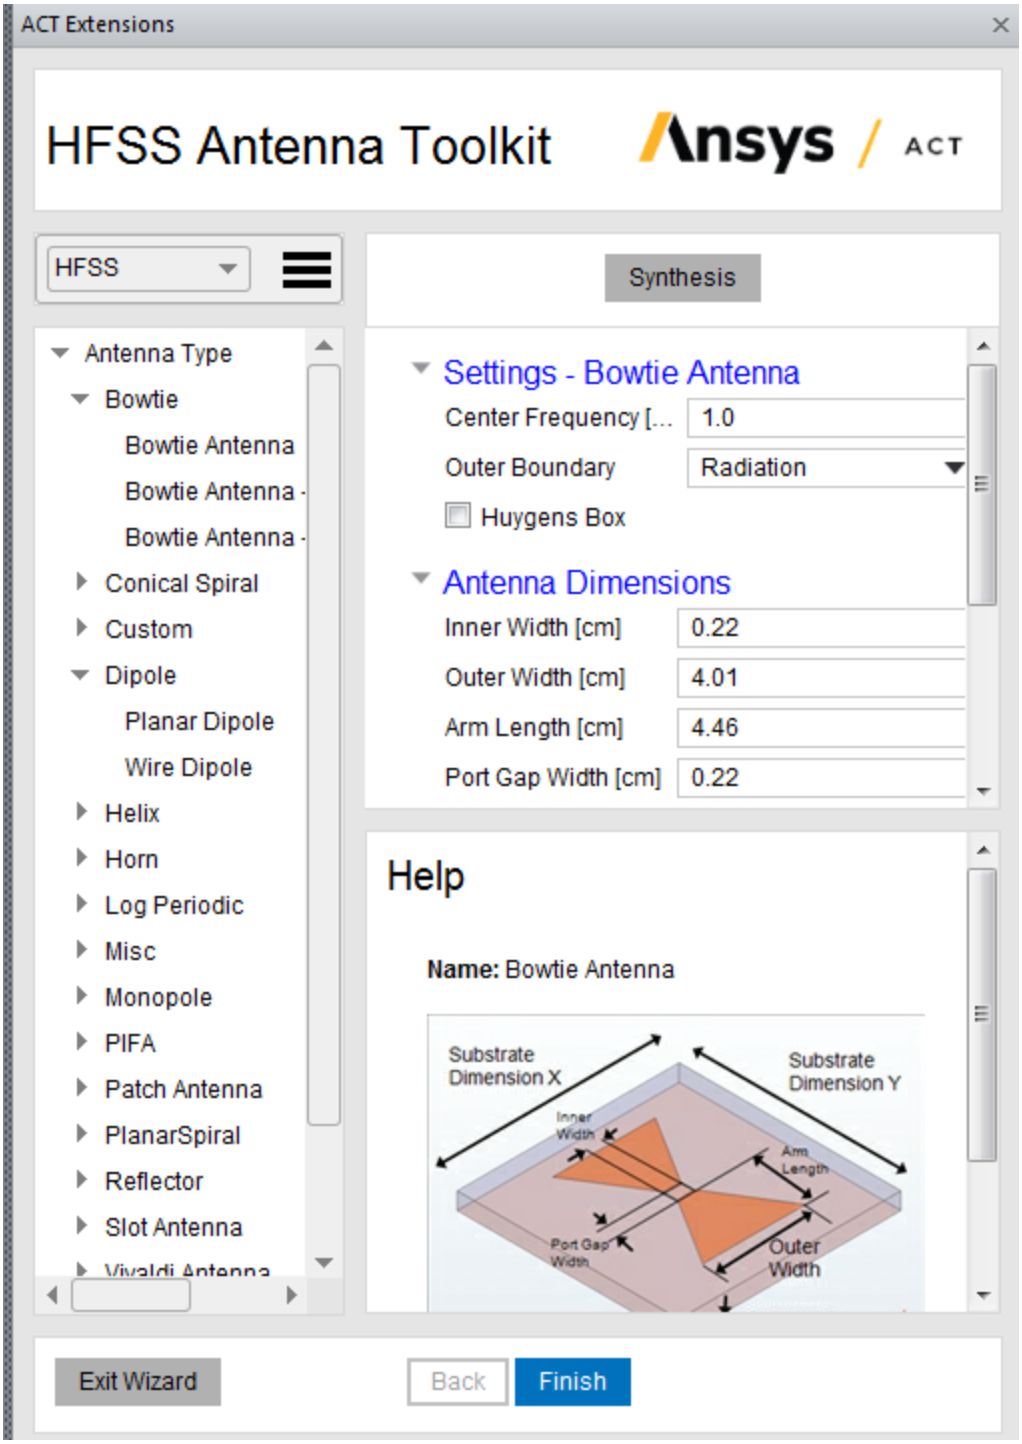
Click the **Launch Wizards** icon to load existing toolkits for activation. If there are many available extensions, you can use the **Search** bar. Search is not case sensitive.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Click the desired ACT extension to load it. The selected Wizard operates in the window.

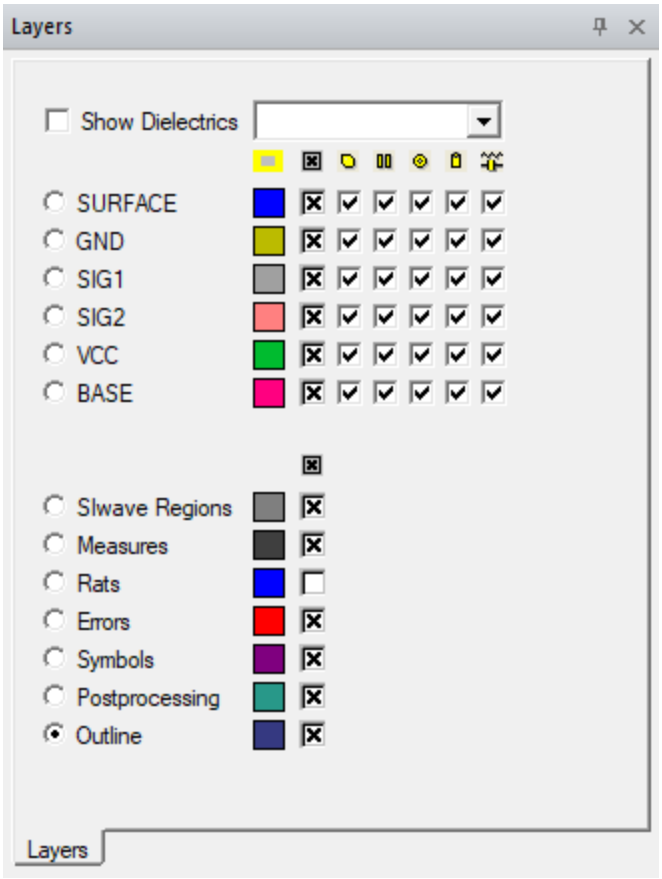
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Working with the Layers Window

In the **Layers** window, you can select the working layer and the visibility of layout objects on specific layers, objects such as shapes, pads, components, nets, and the layers themselves. The **Layers** window is divided into three sections: stackup layers, non-stackup layers, and a pre-process mesh section. This dockable window can be resized and relocated.



- To show or hide the **Layers** window on the desktop, click **View** > **Layers**. A check box appears next to this command if the **Layers** window is visible.
- To select a working layer, click the radio button of the layer you want to work on.
- To view specific items on different layers, use **Show Dielectrics**, **Zone Filter**, the layers check boxes, and View Name drop-down menu.

If the stackup is a multizone stackup, select a zone from the **Zone Filter** to see the available layers.

The **Show Dielectrics** check box controls whether dielectric stackup layers are shown. If unchecked, dielectric layers are hidden and holes (vias and pins) are rendered continuously visible from the top-most visible signal layer to the bottom most visible layer. If checked,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

dielectric layers appear and hole visibility can be finely controlled by each layer (but not necessarily continuously visible).

The View Name drop-down menu lists user-defined views and their controls. You can configure how layers and nets are displayed and then save this visibility as a view. Later, select that view from the drop-down menu to reset the **Layout** window to it. The view controls and default options are:

- **<Surface>** shows the top and bottom conducting layers of the layer stackup and hides all other layers. This is the default view.
- **Save Current View** opens a dialog that allows you to save the current setting of layers and nets to a new layout view.
- **Delete View** opens a dialog that allows you to delete saved layout views.

Check boxes control what is displayed in a layer. Icons at the top of a column control the entire column. Individual check boxes control the item visibility for the layer corresponding to the check box's row. Hover over an icon to see what the column controls:

Name	Icon	Controls the visibility of	Appears
Fill/Unfill All		Color in the object	Always
Show/Hide All		All objects	Always
Shapes		Shapes	Always
Lines		Lines and paths	Always
Pads		Pads	Always
Holes		Holes	Always
Components		Components	Always
Mesh		Mesh of signal layers	When a pre-process mesh is displayed
Background Dielectric Mesh		Mesh of dielectric layers	When a pre-process mesh is displayed with a laminate stackup

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A pre-process mesh section may appear below the non-stackup layer section. It controls design-wide visibility of:

- Airbox non-mesh and mesh
- Hole, solderball, and bondwire mesh

The visibility of these objects is not restricted to their layers. Also, layer visibility check boxes cannot control these mesh visibilities. Non-mesh visibilities are controlled by the layer check boxes.

Working with the Measure Window

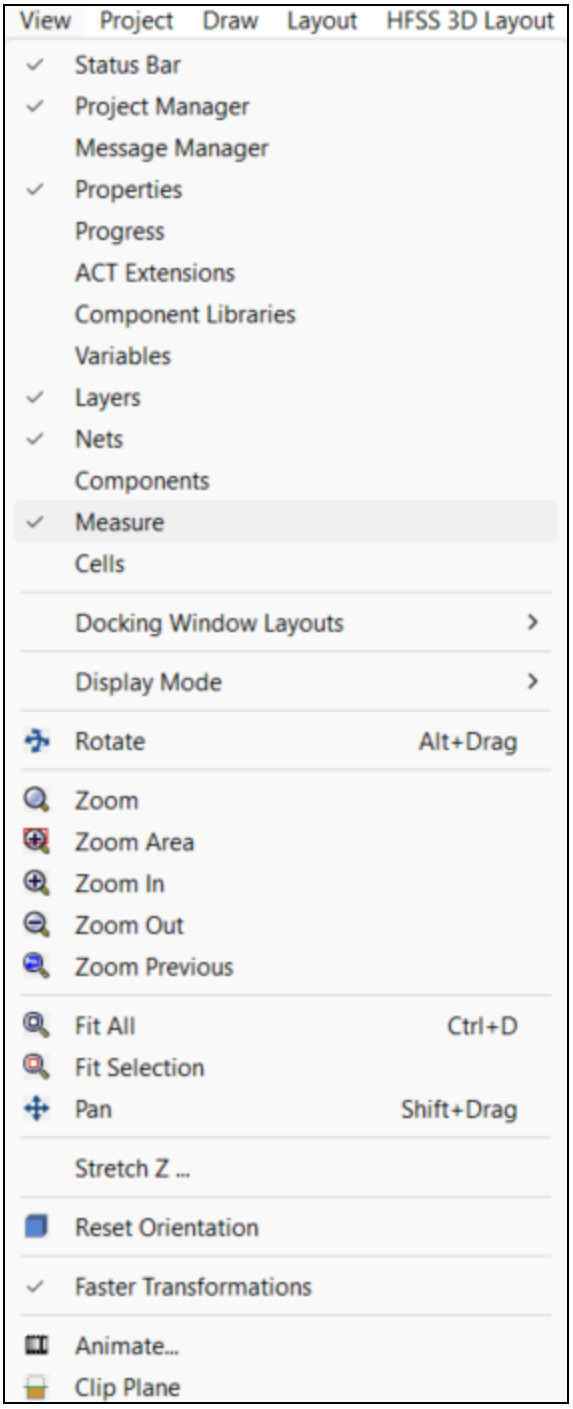
Use the **Measure** window to measure the position, length, and area of elements in an HFSS 3D Layout design.

> **Note:**
>
> Refer to the steps below to use the Measure window toolset. Users will not be able to gather measurement data from encrypted components. Certain parameters of encrypted technologies will also be obfuscated.

Accessing Measure mode and Viewing Measured Data

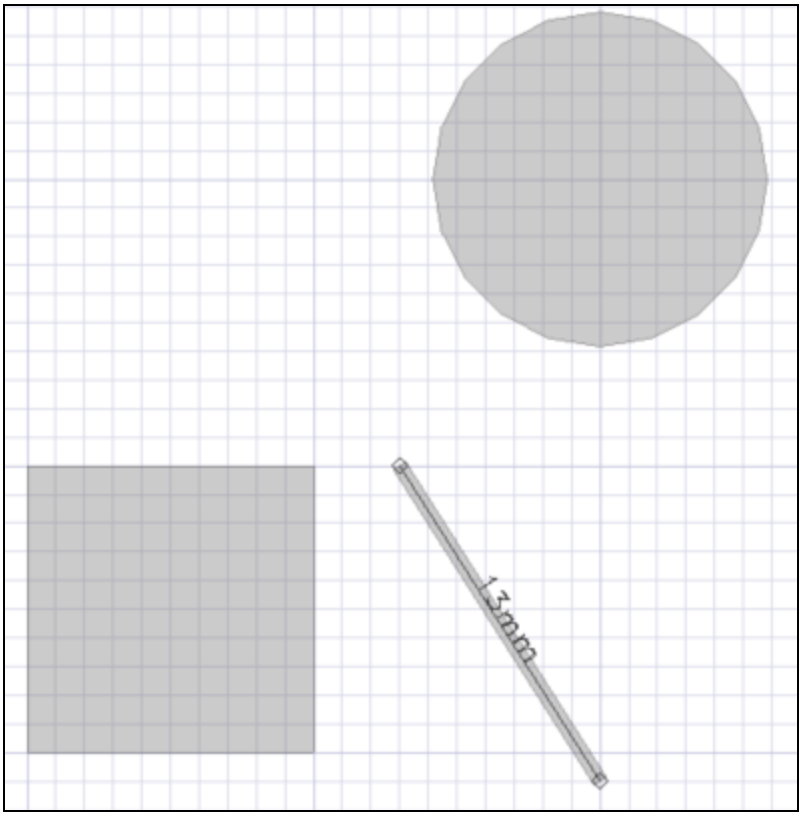
To show or hide the **Measure** window, click **View** > **Measure**. A check box appears next to **Measure** if the **Measure** window is visible.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



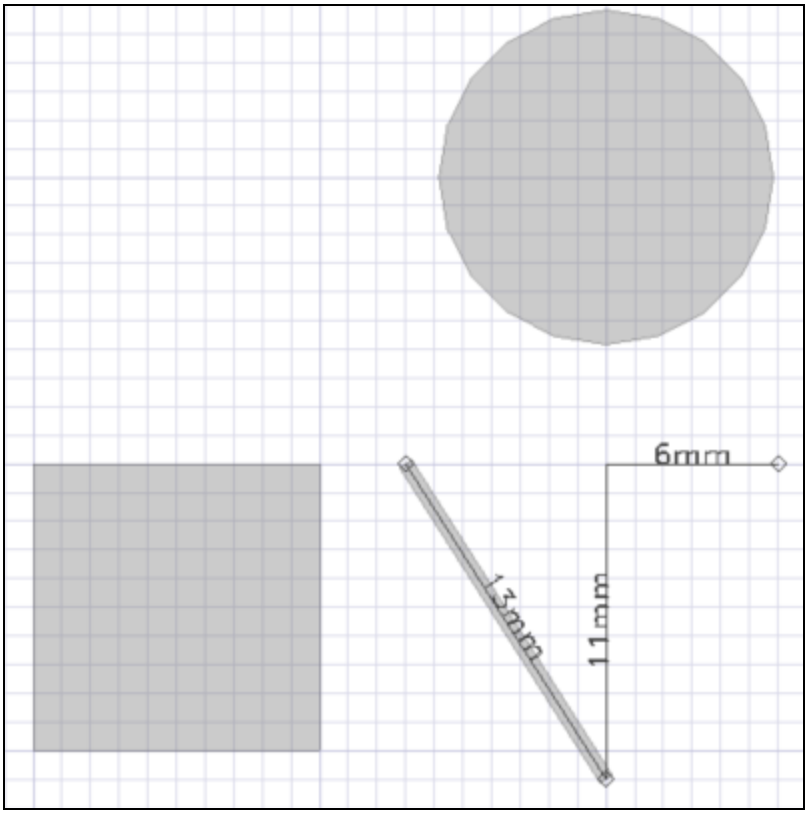
Measure mode allows users to select any two grid points in the **Layout Editor** to define as a segment and display the linear distance between them (i.e., the grid points become end points). The subsequent measurements are displayed beside the segment.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



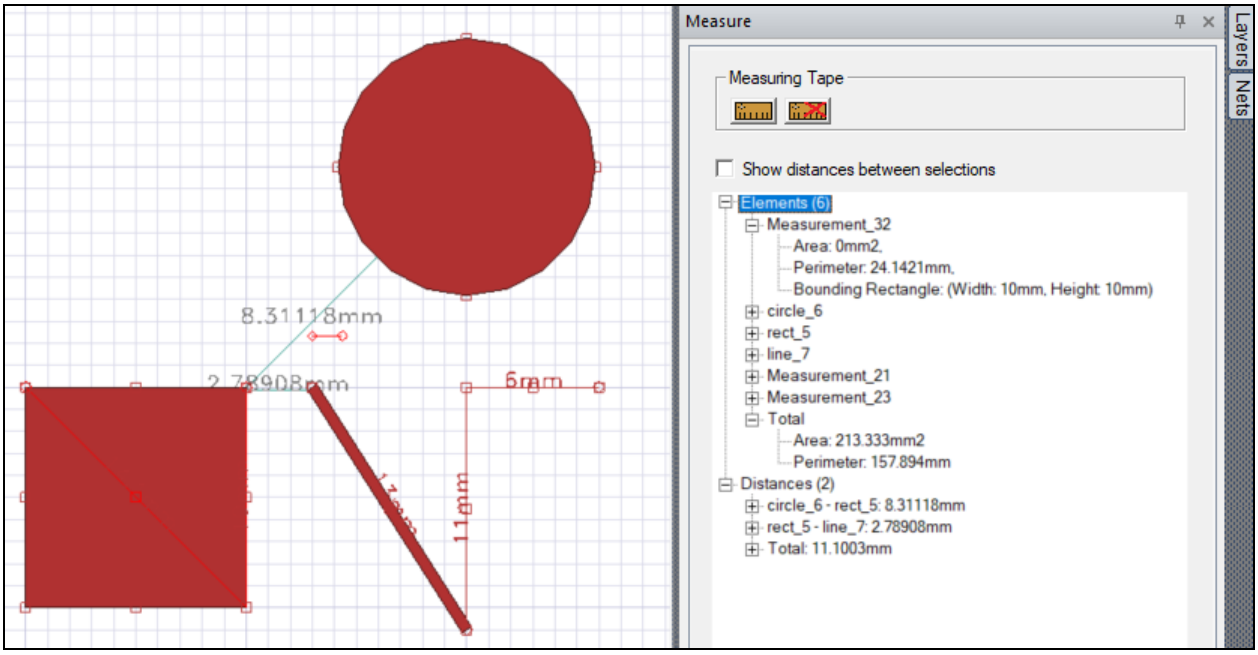
Users can add more grid points to define multiple segments. The distance between each point is measured separately. The individual measurements are displayed beside each segment in the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

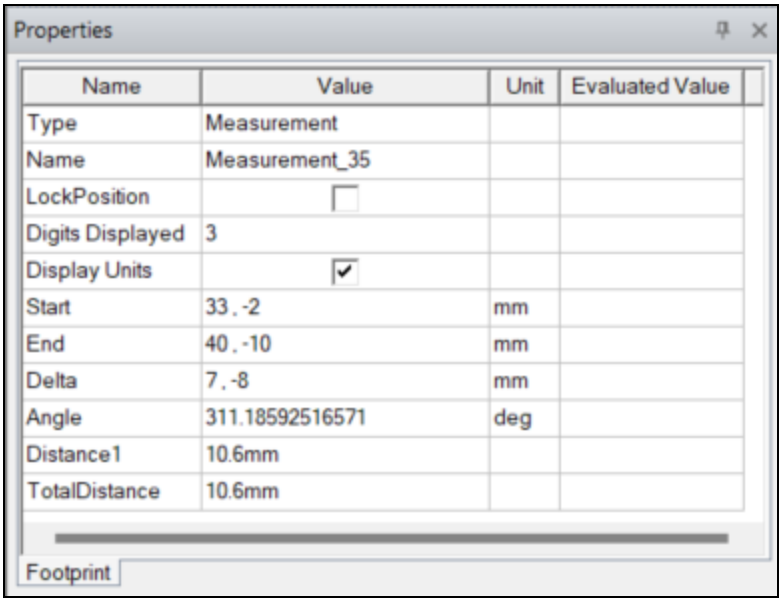


Highlighted (i.e., selected) measurements are also displayed in a parameter tree in the **Measure** window, separated by **Element(s)** and measured **Distance(s)**, and then by individual measurement. Each measurement is described by a combination of area, perimeter, and length, and any bounding device by width and height.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Selecting measurements also populates the **Properties** window with the following parameters:



- **Type** — designates the types of values shown (i.e., **Measurement**(s))
- **Name** — identifies the specific measured element or segment (e.g., **Measurement_35**)
- **LockPosition** — check the box to activate Position Locking (unchecked by default)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Digits Displayed** — enter a value to set the number of significant digits displayed (default is **3** significant digits)

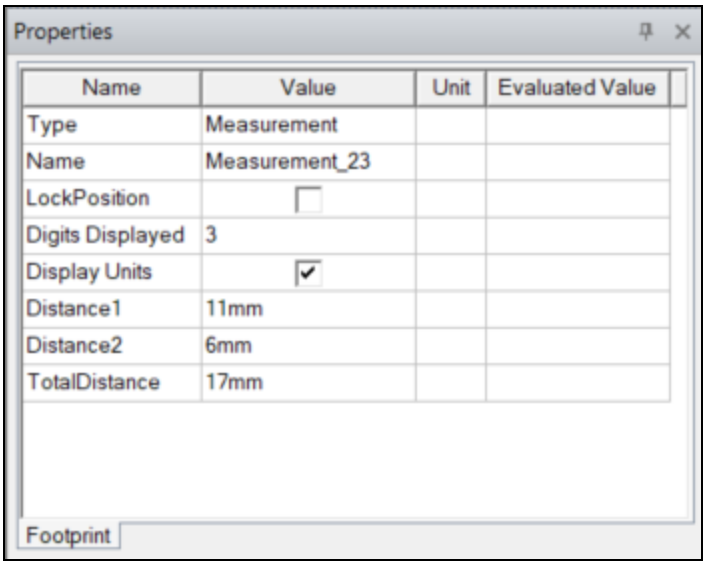
> **Note:**
>
> **Measurement Distance Displays** can be configured from the **Layout Options** window > **Object** tab.

- **Display Units** — check the box to display measurement distances in the **Layout Editor** (unchecked by default)

> **Note:**
>
> Default display units can be configured from can be configured from the **General Options** window > **Default Units** tab.

- **Start**, **End**, **Delta**, and **Angle** — editable position values which display/alter the measured segment in the **Layout Editor**
- **TotalDistance** — displays the length of the segment (e.g., **10.6mm**)

Multi-segment measurements are displayed in the **Properties** window as separate uneditable parameters (e.g., **Distance1**, **Distance2**, **Distance3**, et cetera).



Using Measure mode

Complete these steps to use **Measure** mode.

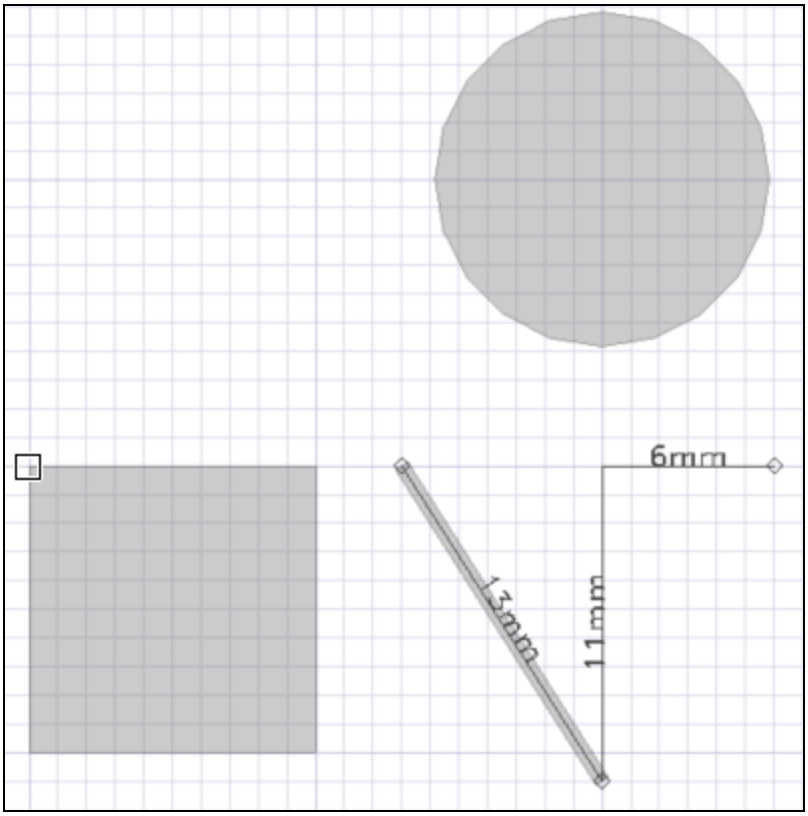
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Options displayed in menus differ depending on whether **Electronics Desktop** is configured for **General Mode** or **IC Mode**. Refer to **Switching to IC Mode**.

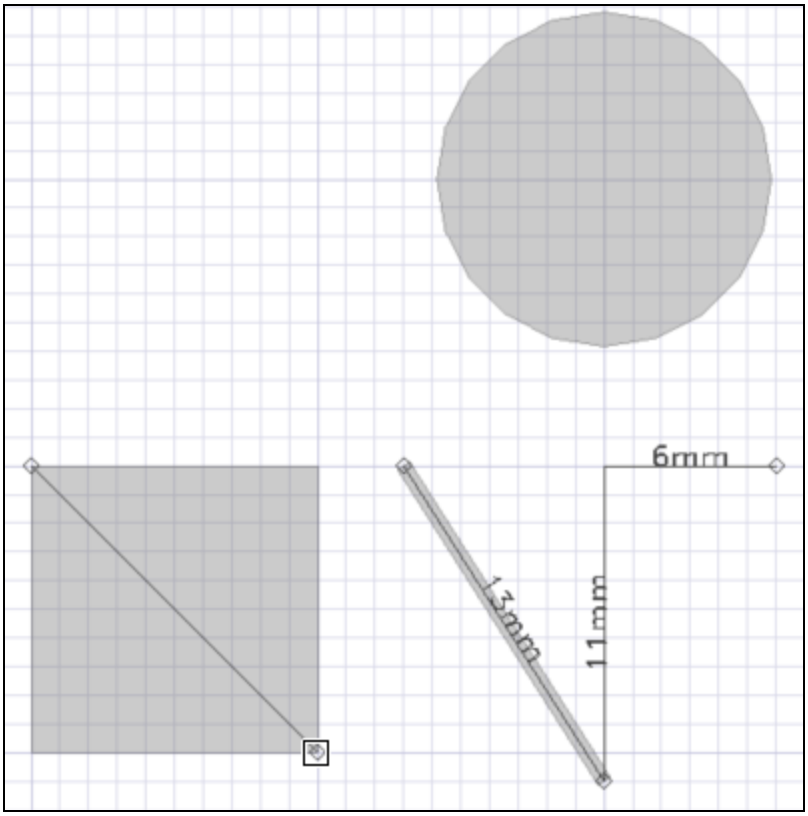
1. From the **Measuring Tape** area, click the **Measuring Tape** icon.

The cursor automatically changes shape in the **Layout Editor** when **Measure** mode is active.



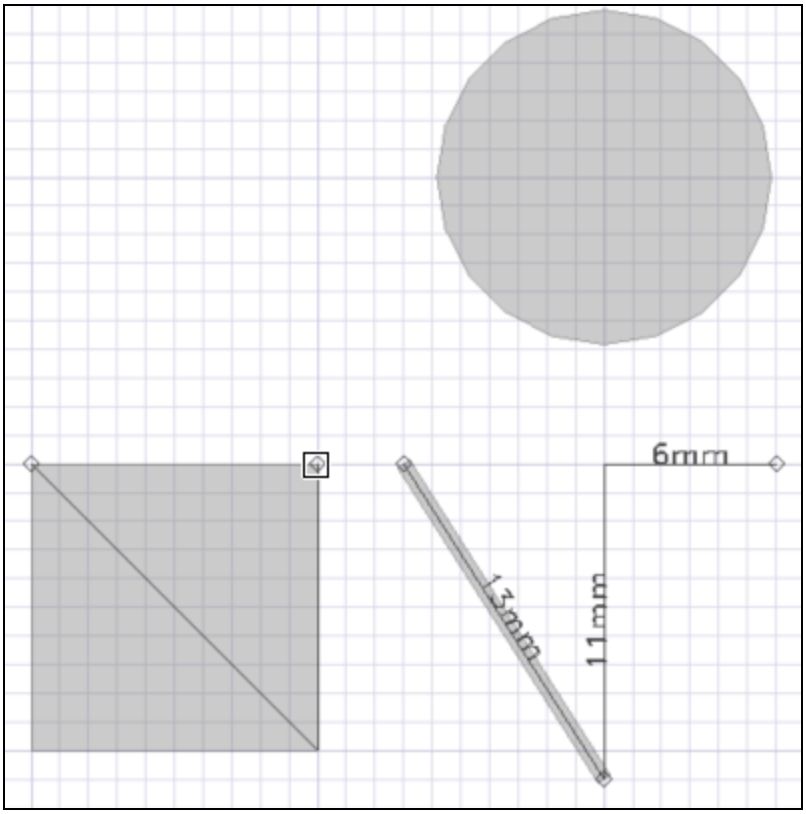
2. Click twice to select two points in the **Layout Editor** to define a segment.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Select more points, as appropriate.

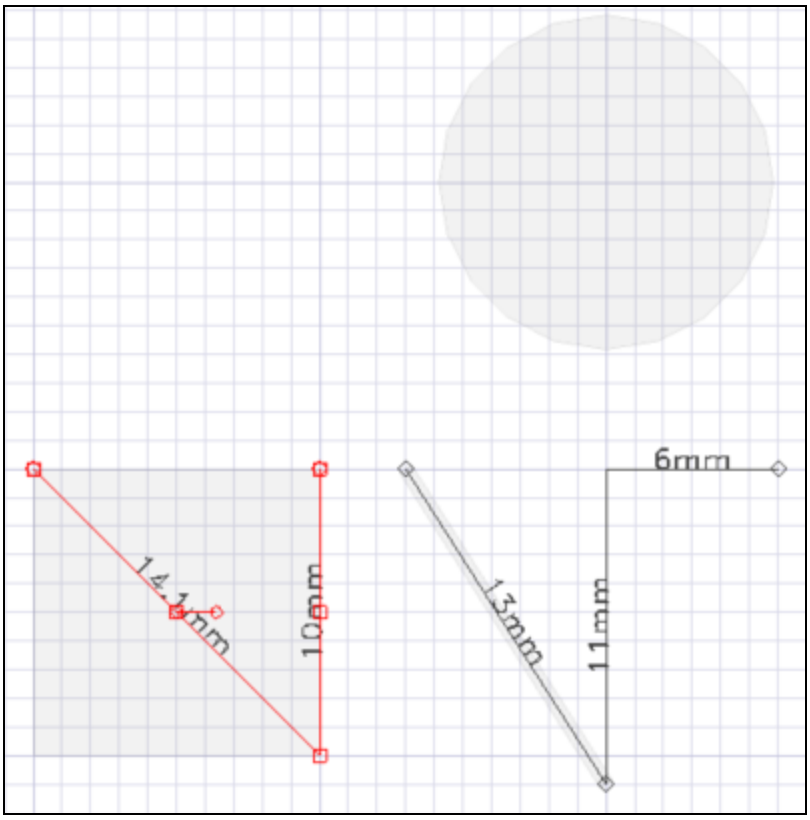
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. To complete the measurement and measure new segments without exiting **Measure** mode, do one of the following:

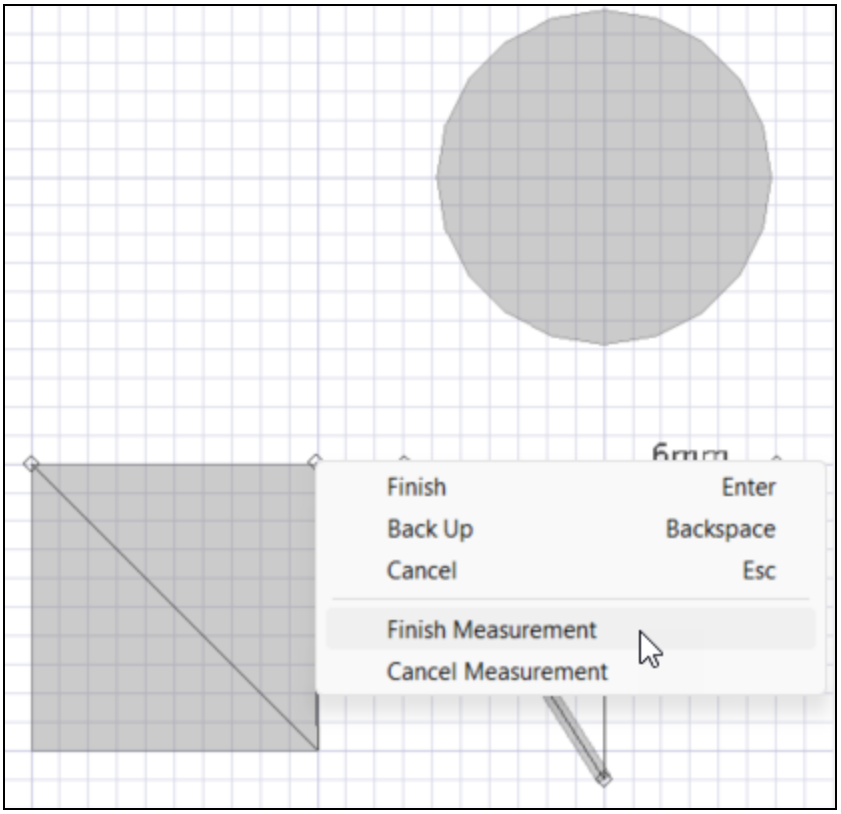
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Double-click the last point to complete the current measurement.



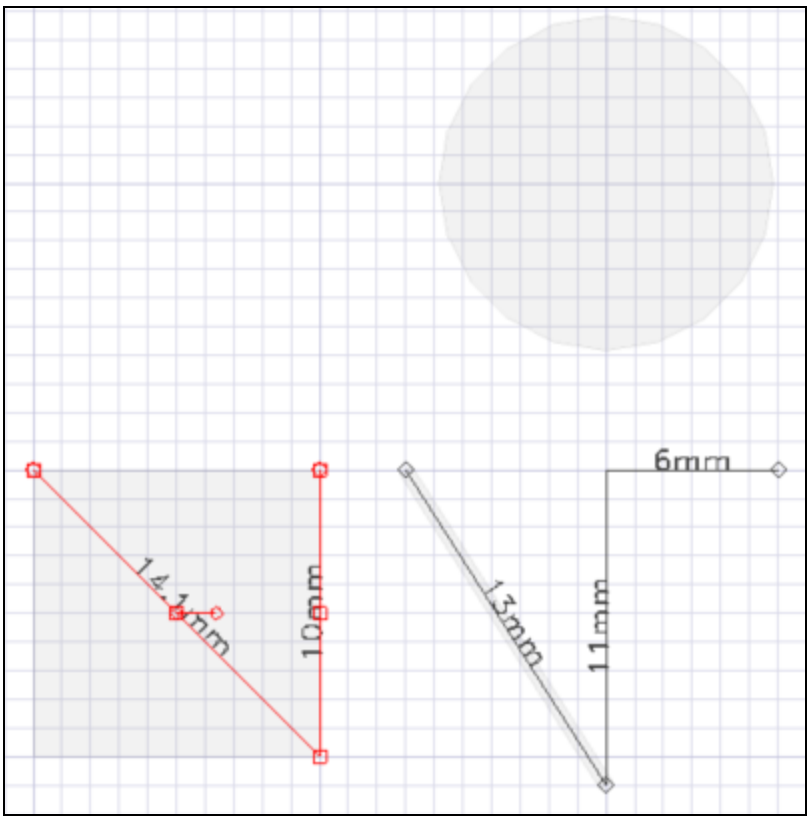
- Right-click within the **Layout Editor** and select **Finish Measurement**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



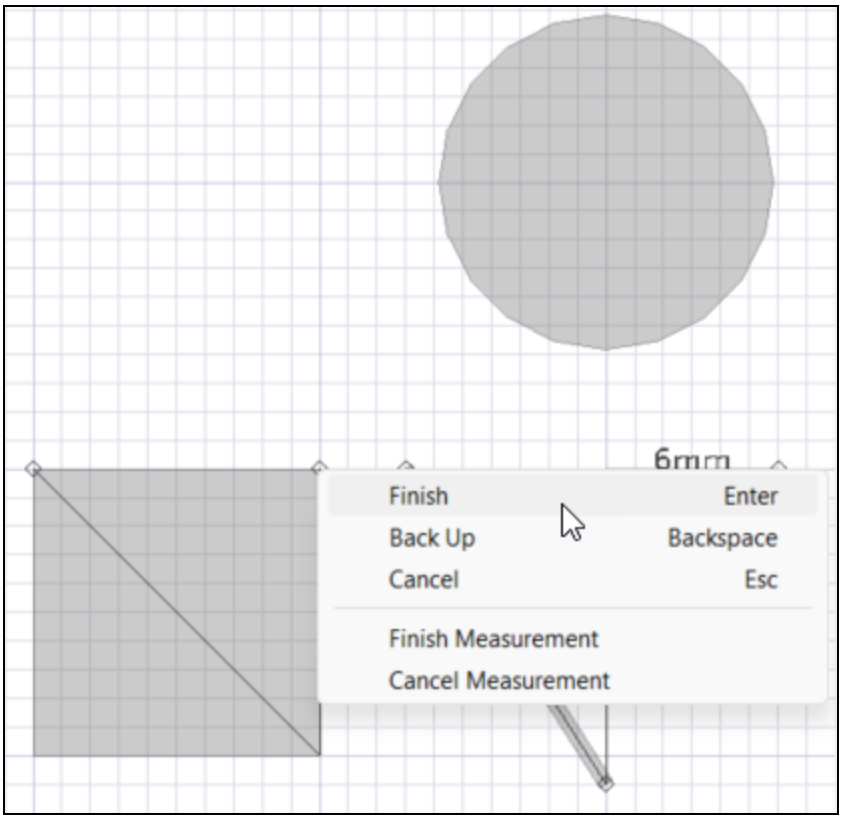
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. To complete the measurement and exit **Measure** mode, do one of the following:
   - Click **Enter** to complete the segment(s) and view their measurements.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Right-click within the **Layout Editor** and select **Finish**.



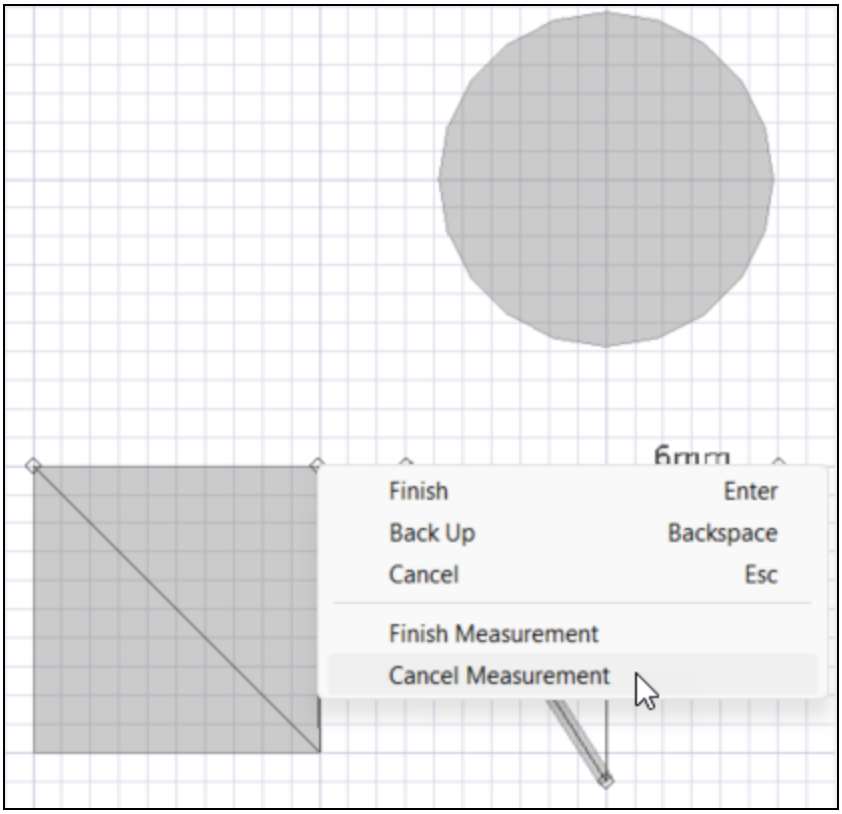
The new segment (or multi-segment) length(s) display in the **Layout Editor** and the **Properties** window.

> **Note:**
>
> While segment measurements are displayed in the **Layout Editor**, they can be moved, rotated, or flipped. Measurement handles may be edited, but measurements can not be copied or pasted.

Canceling Measurements

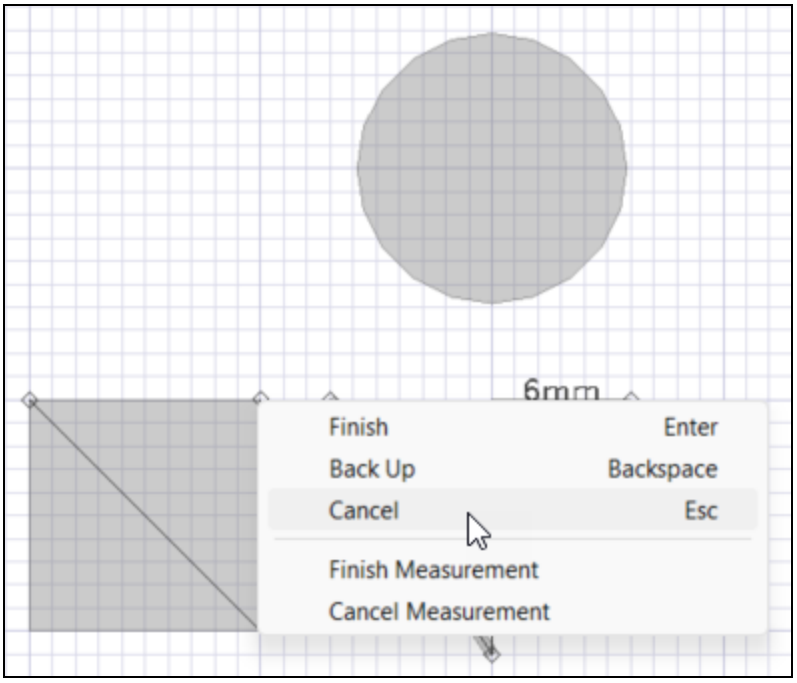
To cancel a measurement without exiting **Measure** mode, right-click in the **Layout Editor** and select **Cancel Measurement**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



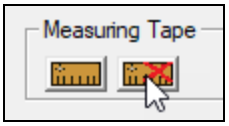
To cancel a measurement and exit **Measure** mode, right-click in the **Layout Editor** and select **Cancel**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Erasing Measurements

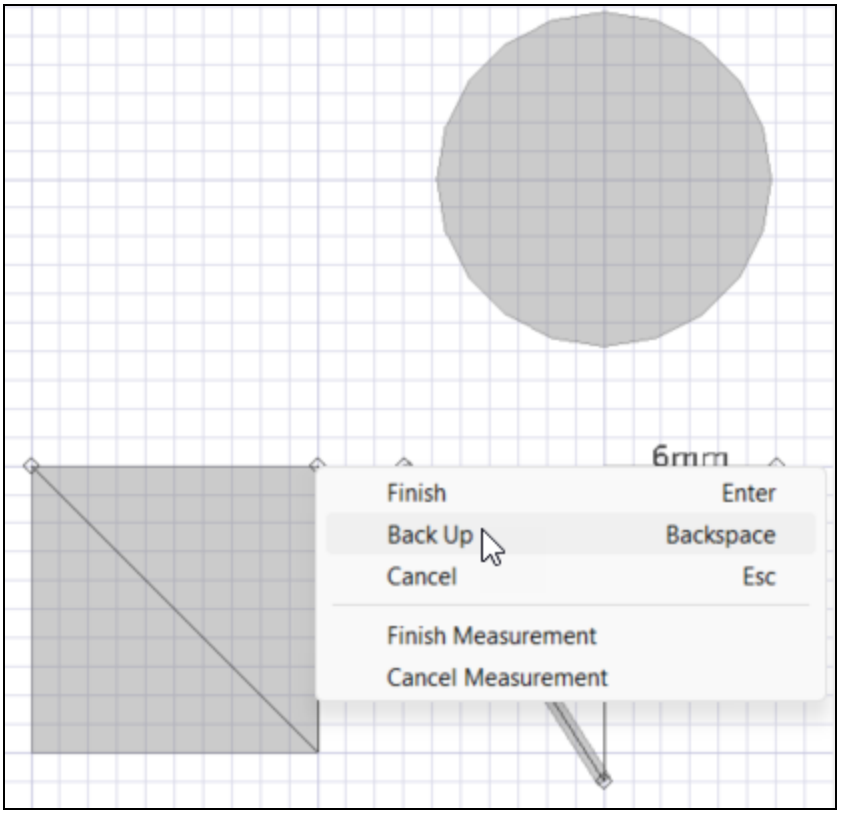
To clear the measurements from the **Layout Editor**, click the **Erase Measurements** icon.



Backing Up Measurements

To back up the current measurement, right-click in the **Layout Editor** and select **Back Up**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electronics Desktop Menus

The menu bar enables you to perform all Ansys Electronics Desktop tasks, such as managing project files, customizing the desktop, drawing objects, and setting and modifying project parameters.

Ansys Electronics Desktop contains the following menus, which appear at the top of the desktop:

File	Contains commands to manage Ansys Electronics Desktop project files and printing options.
Edit	Contains commands to modify the objects in the active model and undo and redo actions.
View	Contains commands to display or hide desktop components and model objects, modify 3D Modeler window visual settings, and modify the model view.
Project	Contains commands to add a specific design type to the active project; view and define datasets, project variables, and event callbacks.
Tools	Contains commands to modify the active project's material library, arrange

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	the material libraries, run and record scripts, update project definitions from libraries, customize the desktop's toolbars, and modify many of the software's default settings.
Window	Contains commands to rearrange the 3D Modeler windows and toolbar icons.
Help	Contains commands to access the help system and view the current Ansys Electronics Desktop version information.

Once you have inserted a design type, the menu bar also includes menus specific to that type. These may include:

Draw	Contains commands to draw one-, two-, or three-dimensional objects, and sweep one- and two-dimensional objects.
Modeler	Contains commands to import, export, and copy 2D Modeler files and 3D Modeler files; assign materials to objects; manage the 3D Modeler window's grid settings; define a list of objects or faces of objects; control surface settings; perform boolean operations on objects; and set the units for the active design.
Ansys Electronics Desktop	Contains commands to set up and manage all the parameters for the active project. Most of these project properties also appear in the project tree.

Menu Bar

The **Menu Bar** appears at the top of the screen immediately beneath the Ansys Electronics Desktop title bar. It contains menus used for controlling the application and the various editors and viewers used to construct the models, set up the analyses, and postprocess the simulation results. The menu bar and the command ribbon contain many of the same commands and options. However, the menu bar provides the more comprehensive set of commands and options. The ribbon is more visual and generally requires fewer mouse clicks to navigate, but you can navigate the menu bar without using a mouse.

Click on a **Menu Bar** entry to open its menu. Alternatively, the **Alt** key makes it easy to access the menus without using a mouse, as follows:

- You can select a menu in the **Menu Bar** by pressing the **Alt** key and then pressing the underlined letter of the menu you wish to activate (the underlines appear when the **Alt** key is pressed). Background highlighting indicates which menu is selected. Finally, press **Enter** to open the menu.
- After pressing the **Alt** key, you can change the selected menu by pressing the left (⇐) and right (⇒) arrow keys. Again, press **Enter** to open the desired menu.

Once a menu is open, you can press additional letters to drill down within the menu. Alternatively, use the down (⇓) and up (⇑) arrows to change the selection. Use the right (⇒)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

arrow key to open a subordinate menu for the selected command. As always, press **Enter** to execute the selected command.

Order of Menus

When a project is loaded, the Ansys Electronics Desktop drop-down menus (from left to right) are:

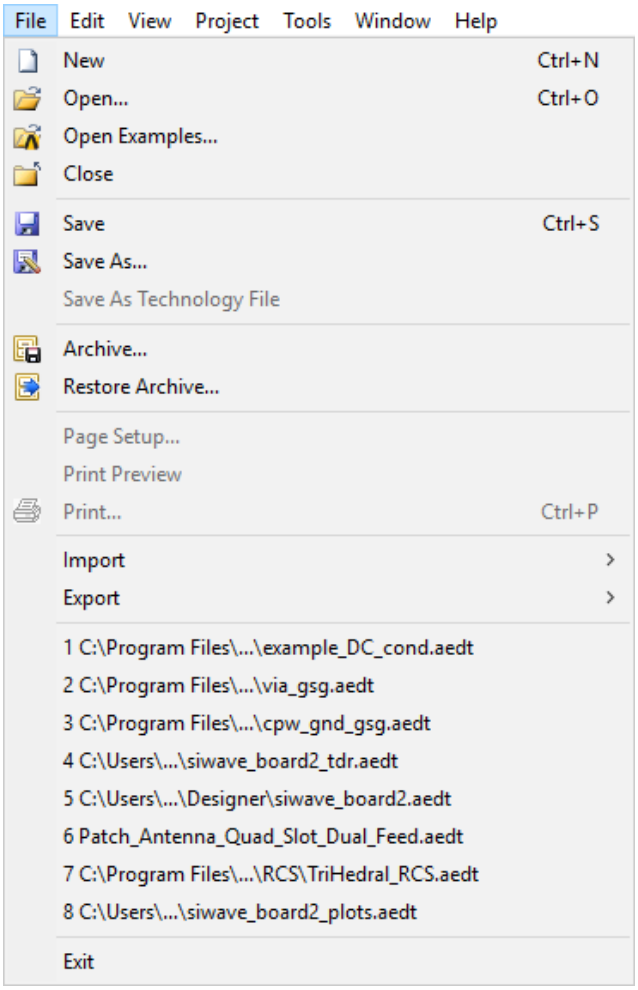
File Edit View Project Draw [Modeler | Layout | Schematic](1) <*Design-Type*>(2) Tools Window Help

> **Note:**
> 1. These three menu bar entries depend on the active design type:
>   - **Modeler** appears for all designs that use the *Modeler* window (including all 3D types, 2D Extractor, and Maxwell 2D).
>   - **Layout** appears only for HFSS 3D Layout designs.
>   - **Schematic** appears for Circuit and Maxwell Circuit designs.
> 2. The name of the active *Design-Type* appears in this position, and the menu contains the design-type-specific commands.

These menus are described in the following sections.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

File Menu



File menu items are common operations on files and projects. You can search the Help to find information on any of the commands that appear on Ansys Electronics Desktop menus.

- Click **New** (or type **n**) to set up a new project.
- Click **Open** (or type **o**) to open an existing project.
- Click **Open Examples** to open an example project.
- Click **Close** (or type **c**) to close the selected project. If the project has changed since the last save, you will be prompted to save the project before closing.
- Click **Save** (or type **s**) to save the selected project.
- Click **Save As** (or type **a**) to save the selected project under a different name or in a different directory.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **Save As Technology File** (or type **t**) to save the selected top-level design as a technology file (*.asty). You must have a design selected to activate this menu item. You cannot export a technology file from a project or from a subcircuit.
- Click **Archive** to archive the selected project and any selected additional files. If the project has changed since the last save, you will be prompted to save the project before closing.
- Click **Restore Archive** (or type **r**) to restore a previously archived project.
- Click **Page Setup** (or type **u**) to set up formatting to print the active window in the Design Area.
- Click **Print Preview** (or type **v**) to display a preview of the print job.
- Click **Print** (or type **p**) to print the active window.
- Click **Import** to open a submenu and select a file for import.
- Click **Export** to open a submenu and select a file for export.
- Click the name of a project (or type its number) to open a project from the listing of recently opened projects.
- Click **Exit** (or type **x**) to exit Ansys Electronics Desktop. If any project has unsaved changes, you will be prompted to save the project before closing.

Edit Menu

The **Edit** menu changes, depending on the active window in the Design Area.

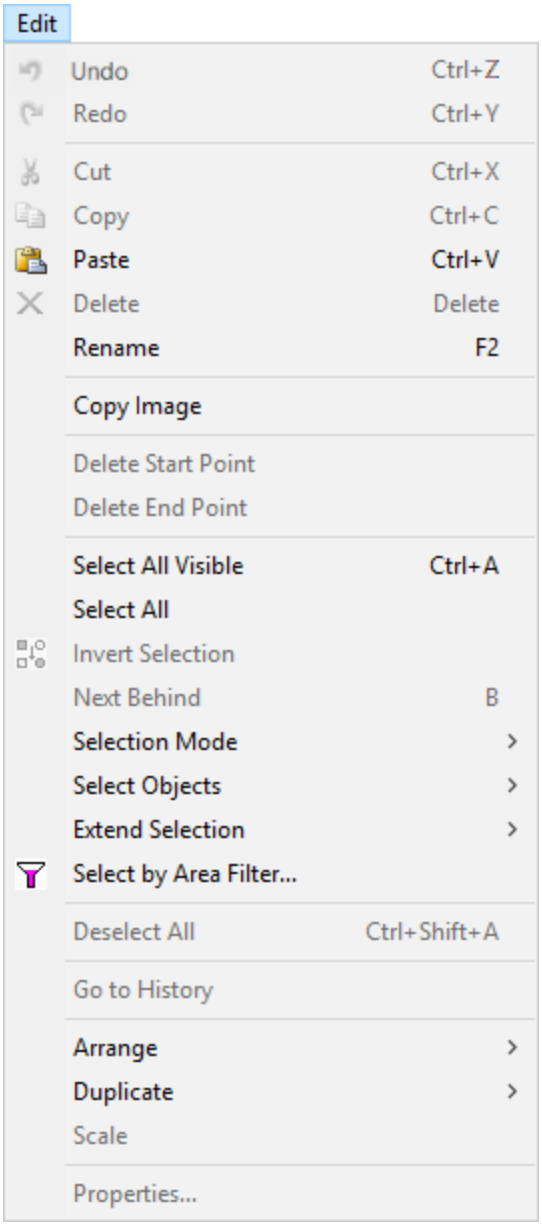
These menus include:

- 3D Modeler

Edit Menu for 3D Modeler

When a Modeler window is active in the Design Area, the **Edit** menu is similar to the following image:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

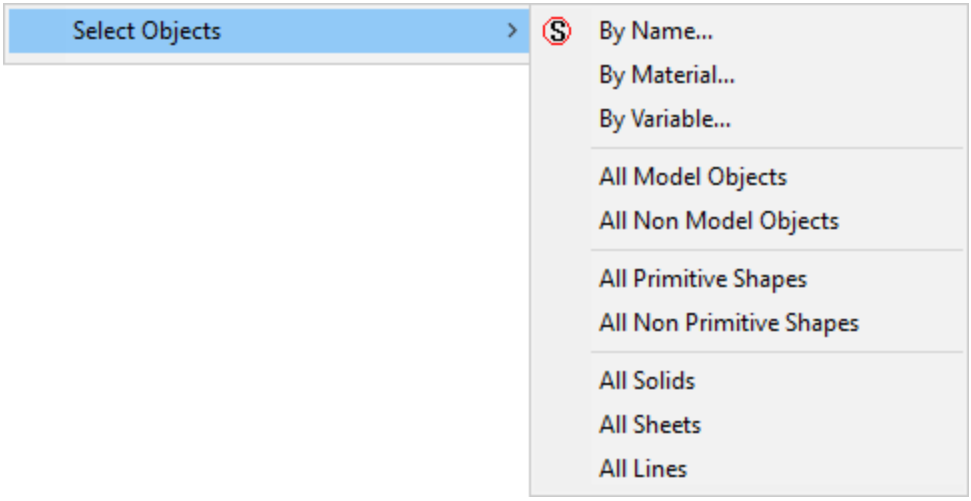


Comands will be available or not available for clicking depending on what is currently selected or on whether any operations have been performed, undone, or redone. The 3D Modeler's Edit menu contains the following options:

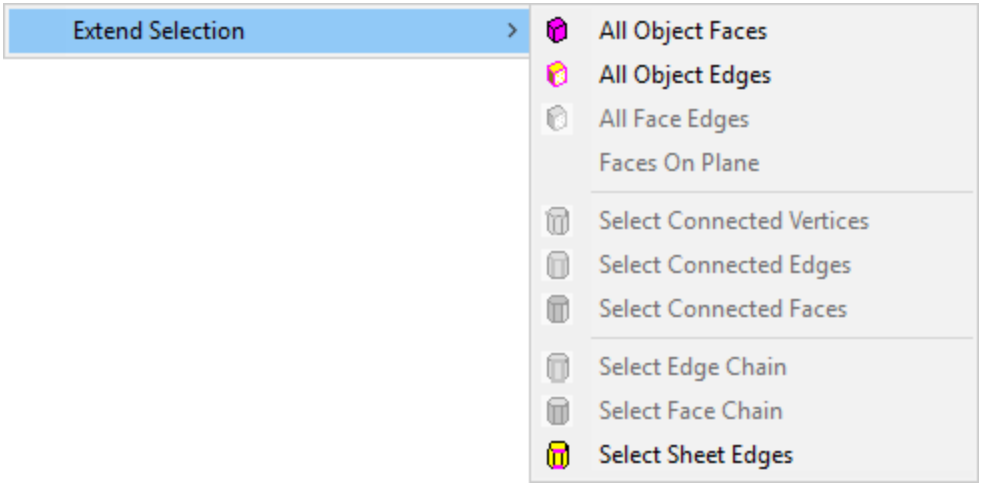
- **Undo** – allows you to undo the last action, which is specified after the word "Undo."
- **Redo** – allows you to redo an undone action, which is specified after the word "Redo."
- **Cut / Copy / Paste** – allows you to copy and paste elements.
- **Delete** – deletes a selected element.
- **Rename** – renames a selected element.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Copy Image** – copies the visible design area to the clipboard, in bitmap format.
- **Delete Start Point / Delete End Point** – allows you to delete start points and end points.
- **Select All Visible / Select All** – selects either all objects or all objects visible in the design area.
- **Invert Selection** – selects the opposite of the current selection.
- **Next Behind** – selects the object behind a selected face, edge, vertex, or object.
- **Selection Mode** – changes the selection mode.
- **Select Objects** – opens a submenu that allows you to select objects and shapes by name, material, and type.



- **Extend Selection** – opens a submenu that allows you to extend your current selection.



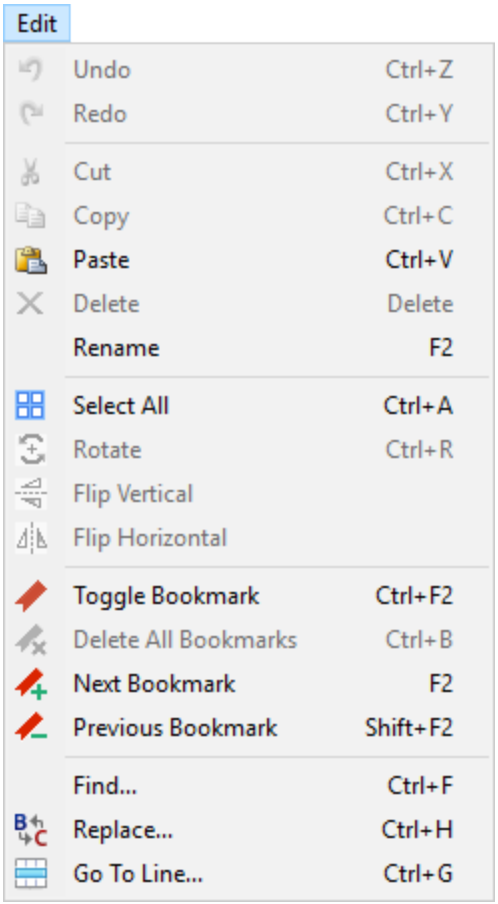
- **Select by Area Filter** – opens the **Select By Area Filters** window.
- **Deselect All** – deselects all selected objects.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Go To History** – selects the History Tree entry for the selected object.
- **Arrange** – allows you to move, rotate, or mirror the selected object.
- **Duplicate** – allows you to duplicate the selected object along a line, along an axis, or mirrored to the selection.
- **Scale** – allows you to scale the selected object.
- **Properties** – opens the relevant Properties window for the selected object.

Edit Menu for Netlist Editor

When the Netlist Editor is the active window, the **Edit** menu appears similar to the following:



The Netlist Editor Edit menu contains the following options:

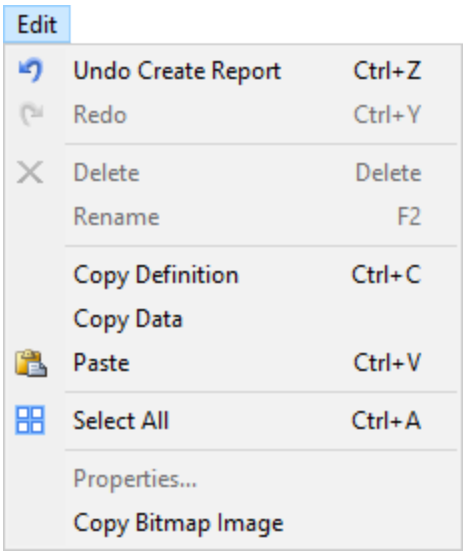
- **Undo** – allows you to undo the last action, which is specified after "Undo."
- **Redo** – allows you to redo an undone action, which is specified after "Redo."
- **Cut / Copy / Paste** – allows you to copy and paste netlist elements.
- **Delete** – deletes a selected element.
- **Rename** – renames a selected element.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Select All** – selects the entire netlist.
- **Rotate / Flip Vertical / Flip Horizontal** – deactivated options.
- **Toggle Bookmark** – toggles the display of bookmarks.
- **Delete All Bookmarks** – deletes all bookmarks.
- **Next Bookmark / Previous Bookmark** – allows you to navigate between bookmarked lines.
- **Find** – searches the netlist for a string of text.
- **Replace** – searches the netlist for a string of text and replaces it with different text that you specify.
- **Go To Line** – allows you to enter a line number and jump to that line.

Edit Menu for Report Window

When the Report Window is the active window, the **Edit** menu appears similar to the following:



The Report Window Edit menu contains the following options:

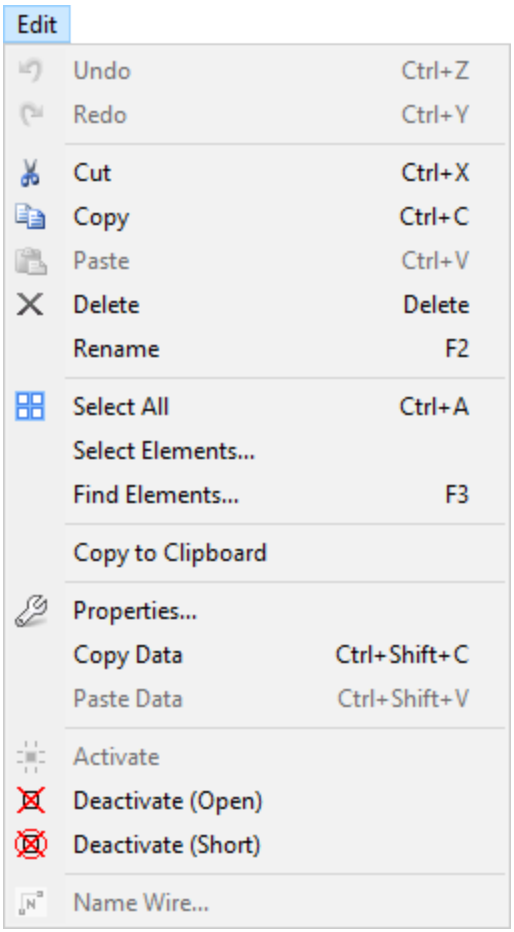
- **Undo** – allows you to undo the last action, which is specified after "Undo."
- **Redo** – allows you to redo an undone action, which is specified after "Redo."
- **Delete** – deletes a selected report element.
- **Rename** – renames a selected report element.
- **Copy Definition** – copies the report definition.
- **Copy Data** – copies report data.
- **Paste** – pastes the copied information at your selected location.
- **Select All** – selects everything in the report window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Properties** – opens the relevant Properties window for the selected report element.
- **Copy Bitmap Image** – copies the entire report window as a bitmap image that can be pasted into another program or document.

Edit Menu for Schematic Editor

When the Schematic Editor is active in the Design Area, the **Edit** menu appears similar to the following:



The Schematic Editor Edit menu contains the following options:

- **Undo** – allows you to undo the last action, which is specified after "Undo."
- **Redo** – allows you to redo an undone action, which is specified after "Redo."
- **Cut / Copy / Paste** – allows you to copy and paste schematic elements.
- **Delete** – deletes a selected element.
- **Rename** – renames a selected element.
- **Select All** – selects everything in the design area.

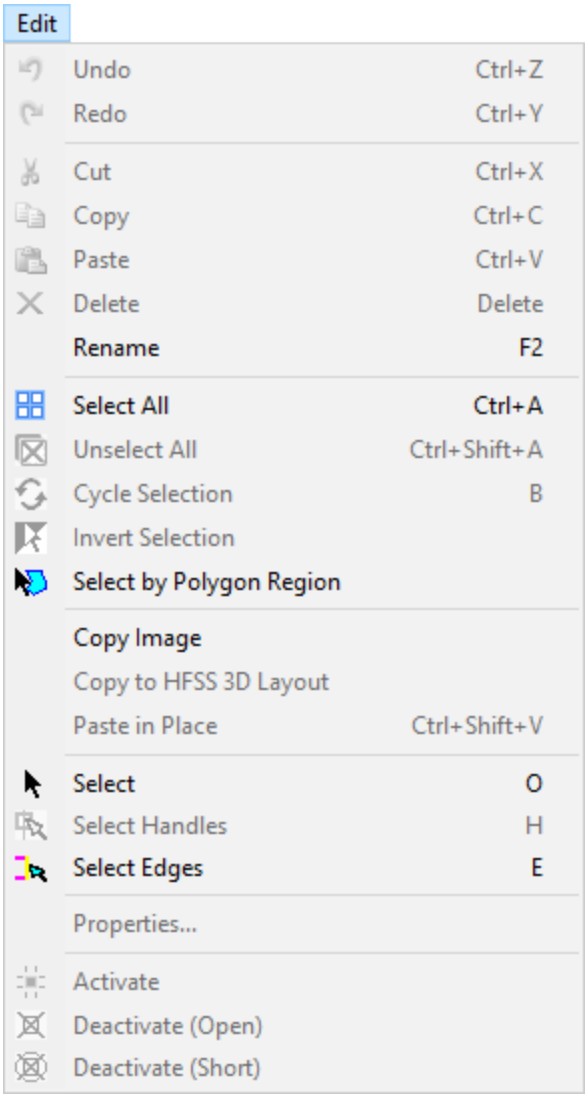
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Select Elements** – allows you to select certain nets or components.
- **Find Elements** – opens the **Find Elements** window, where you can search for elements by property name and value.
- **Copy to Clipboard** – copies the visible design area to the clipboard in bitmap format, for pasting into another program or document.
- **Properties** – displays the relevant properties window for the selected object.
- **Copy Data** – copies properties data for the selected object.
- **Paste Data** – pastes properties data into a selected object.
- **Activate** – causes the activation of one or more selected components.
- **Deactivate (Open)** – temporarily converts the component into an open circuit.
- **Deactivate (Short)** – temporarily converts the component into a short circuit.
- **Name Wire** – allows you to rename a selected wire.

Edit Menu for Layout Editor

When the Layout Editor is active in the Design Area, the **Edit** menu appears similar to the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The Layout Editor Edit menu contains the following options:

- **Undo** – allows you to undo the last action, which is specified after "Undo."
- **Redo** – allows you to redo an undone action, which is specified after "Redo."
- **Cut / Copy / Paste** – allows you to copy and paste layout elements.
- **Delete** – deletes a selected element.
- **Rename** – renames a selected element.
- **Select All / Unselect All** – selects or deselects the entire layout.
- **Cycle Selection** – rotates through a selection of objects.
- **Invert Selection** – selects the opposite of the current selection.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Select By Polygon Region** – allows you to draw a polygon in the design area and selects all elements within that polygon.
- **Copy Image** – copies the design area display in bitmap format, for pasting into another program or document.
- **Copy to HFSS 3D Layout** – copies the design into an HFSS 3D Layout and adds that layout to the current project.
- **Paste in Place** – duplicates an object without any X / Y offset or displacement.
- **Select** – puts the cursor in "Select" mode (the default).
- **Select Handles** – puts the cursor in "Select Handles" mode; the cursor will only select handles.
- **Select Edges** – puts the cursor in "Select Edges" mode; the cursor will only select edges.
- **Properties** – opens the relevant Properties window for the selected object.
- **Activate** – causes the activation of one or more selected components.
- **Deactivate (Open)** – temporarily converts the component into an open circuit.
- **Deactivate (Short)** – temporarily converts the component into a short circuit.

View Menu

The **View** menu changes, depending on the active window in the Design Area.

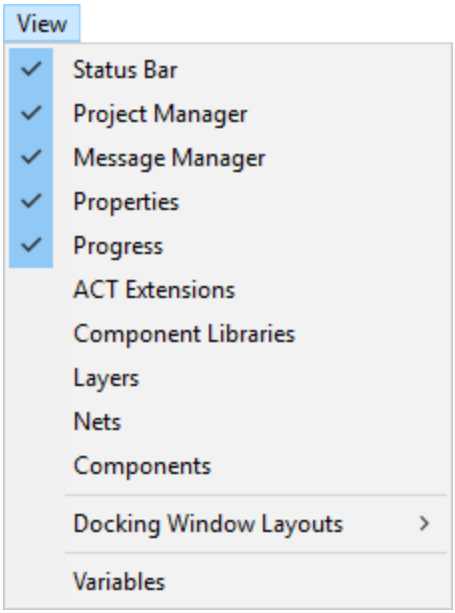
These menus include:

- Basic View Menu
- Layout Editor's View Menu

Basic View Menu

When no editor is open in the design area, or when the Netlist Editor or Report Window is active, the **View** menu appears similar to the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

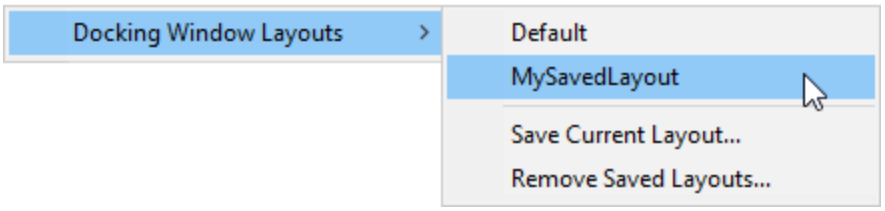


- The check boxes toggle the display of the **Status Bar**, **Message Manager Window**, **Project Manager**, **Properties Window**, and **Progress Window**. You can enable the display of **Component Libraries**, **Layers**, **Nets**, **Components** and **Variables** windows.
- The **ACT Extensions** command opens the *ACT Extensions* window, which lets you work with ACT integration tools. For more information, see the ACT Extensions Window section.

> **Note:**
>
> The **ACT Extensions** window and the design wizards it contains (*5G Wizard, HFSS Antenna Design Toolkit, HFSS-EMA3D Link,* and *Maxwell Eccentricities*) are only available for the Windows version of the Ansys Electronics Desktop software. These items are not available when the software is installed on a Linux platform.

- The **Docking Window Layouts** submenu lets you select from the **Default** and any saved window layouts, **Save Current Layout**, or **Remove Saved Layouts** by selecting them from a list.

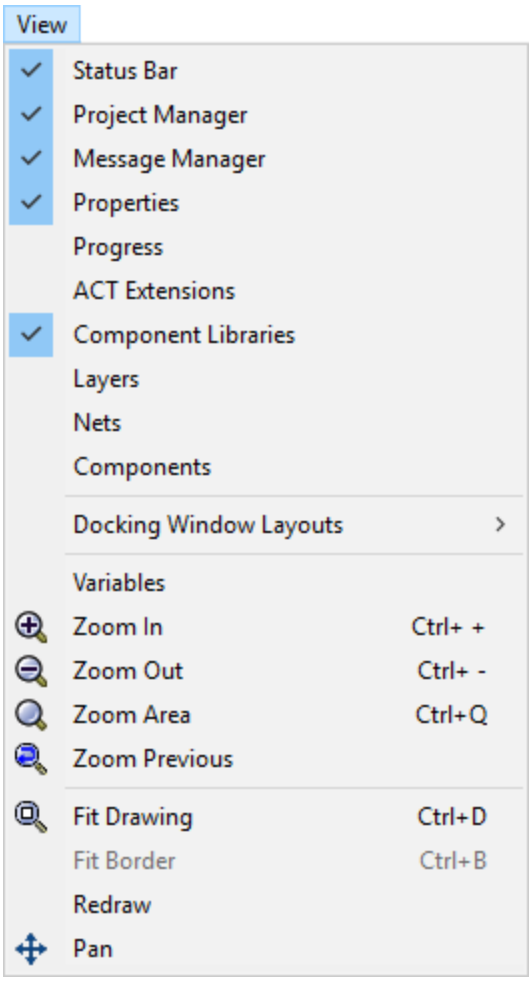
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- The **Variables** option opens the **Project** and **Design** **Variables** window, allowing you to set variables.

Schematic Editor View Menu

When the Schematic Editor is active, the **View** menu appears similar to the following:



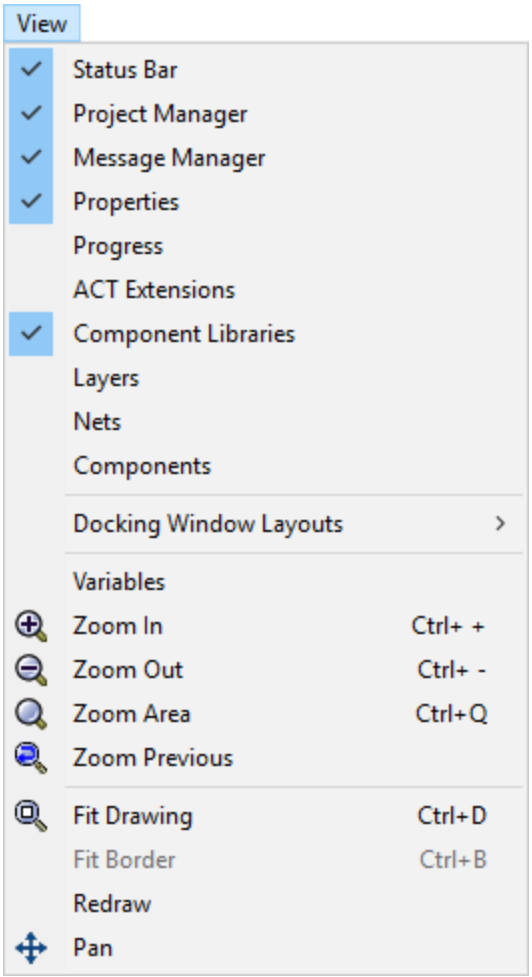
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In addition to the options available on the Basic View Menu, the Schematic Editor View Menu contains the following:

- **Zoom In** / **Zoom Out** / **Zoom Area** / **Zoom Previous** – control the portion of the design displayed in the design area.
- **Fit Drawing** – changes the display so that the entire drawing fits to the edges of the design area.
- **Fit Border** – when a border has been added to a drawing, scales the bordered contents to fit within the bounds of the window.
- **Redraw** – redraws the current design.
- **Pan** – allows you to pan across the drawing.

Layout Editor View Menu

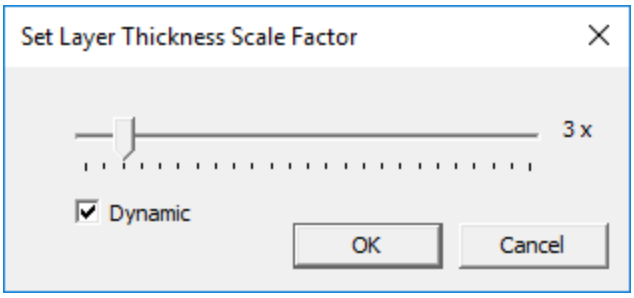
When the Layout Editor is active in the design area, the **View** menu appears similar to the following:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

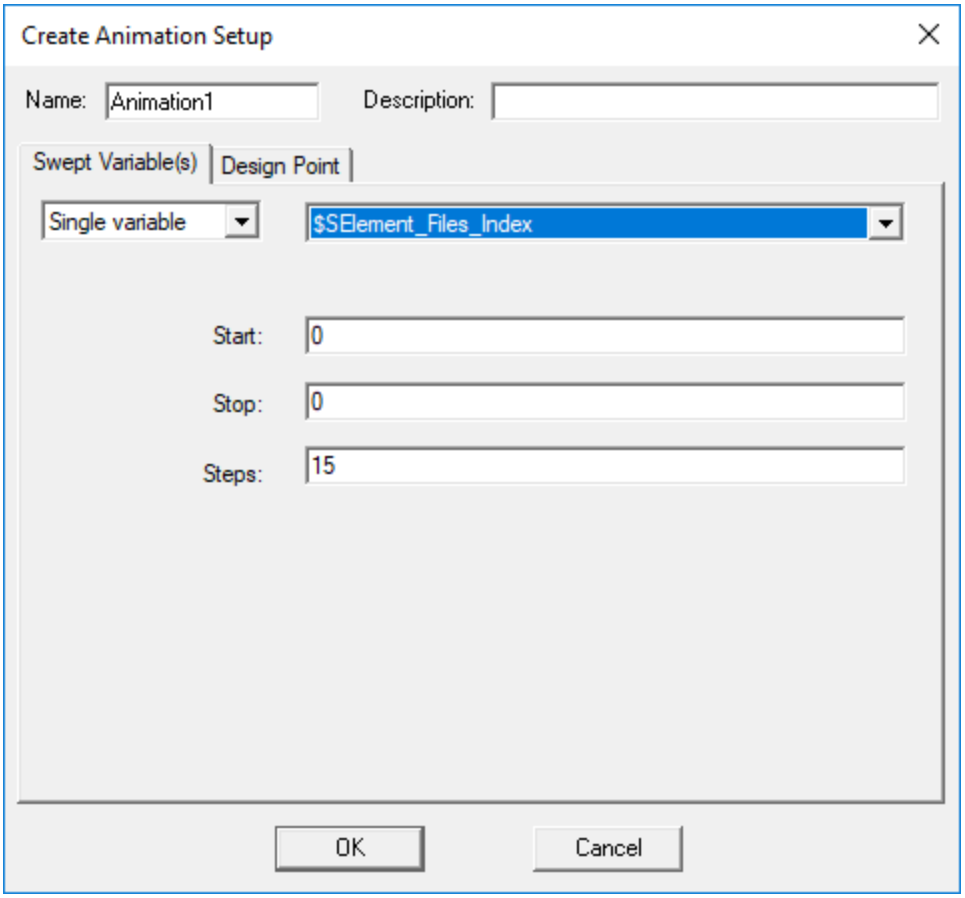
In addition to the options available on the Basic View Menu, the Layout Editor View Menu contains the following:

- **Zoom In** / **Zoom Out** / **Zoom Area** / **Zoom Previous** – control the portion of the design displayed in the design area.
- **Fit Drawing** – changes the display so that the entire drawing fits to the edges of the design area.
- **Fit Border** – when a border has been added to a drawing, scales the bordered contents to fit within the bounds of the window.
- **Redraw** – redraws the current design.
- **Pan** – allows you to pan across the drawing.
- **Stretch Z** – opens the **Set Layer Thickness Scale Factor** window, allowing you to change layer thickness.



- **Reset Orientation** – restores the design area to its default view.
- **Faster Transformations** – offers a simplified model during rotate, zoom, and pan operations to speed up performance.
- **Animate** – opens the **Create Animation Setup** window, so that you can begin creating animations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



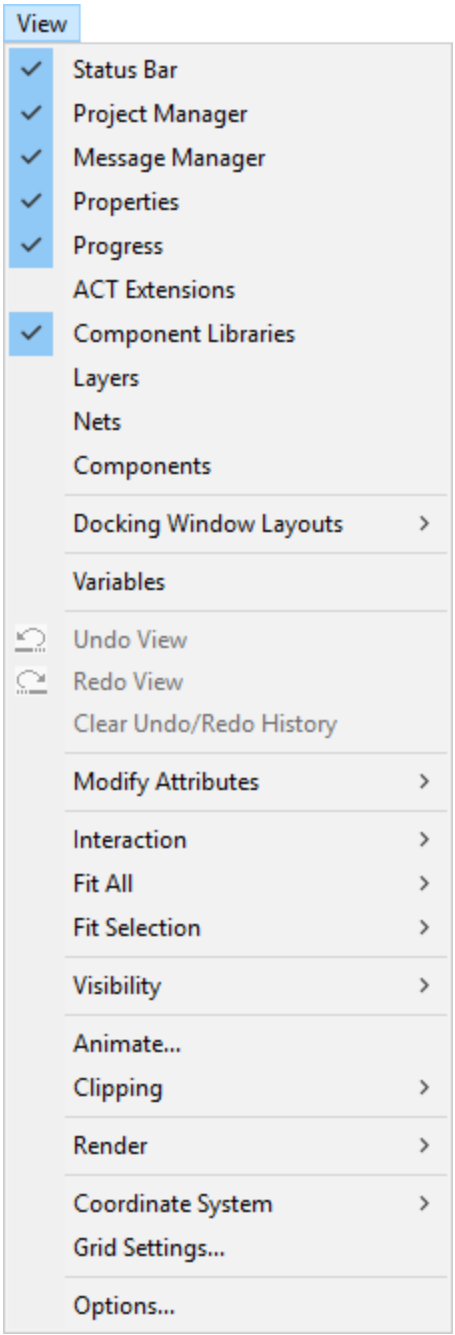
- **Clip Plane** – places a 3D coordinate system manipulator in the design area so that you can define clip planes.

See: Layout Editor.

3D Modeler View Menu

When a Modeler window is active in the design area, the **View** menu's appearance is similar to the following image:

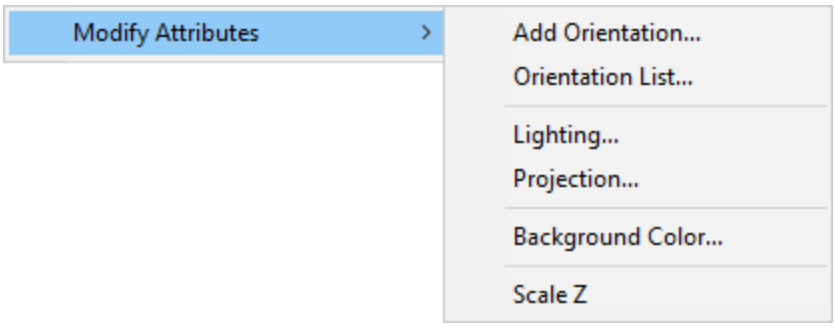
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



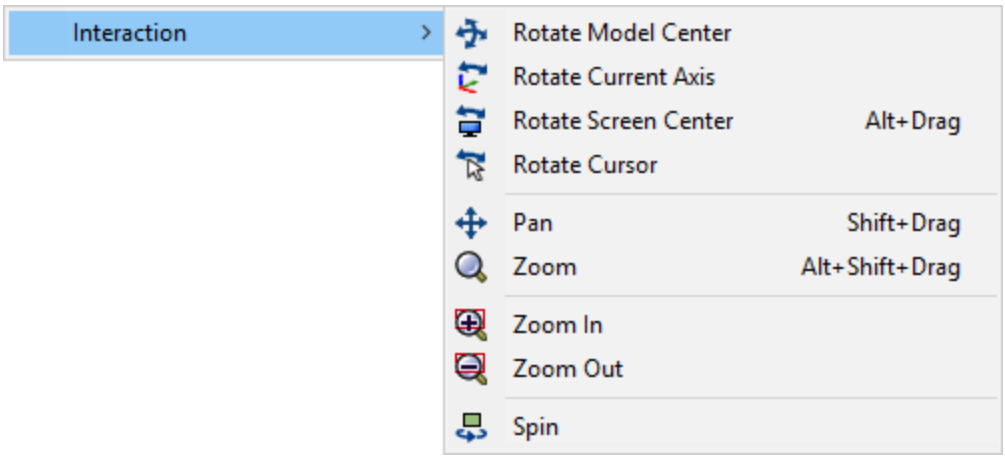
Thi View menu includes the options available on the Basic View Menu. The following additional options are available when a *Modeler* window is active. Note that a number of these options also appear in the View branch of the shortcut menu that appears when you right-click in the Modeler window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Undo View** / **Redo View** / **Clear Undo/Redo History** – allow you to change the view in the design area, based on view history.
- **Modify Attributes** – offers options to **Add Orientation**; view the **Orientation List**; change **Lighting**, **Projection**, or **Background Color**; and **Scale Z**.



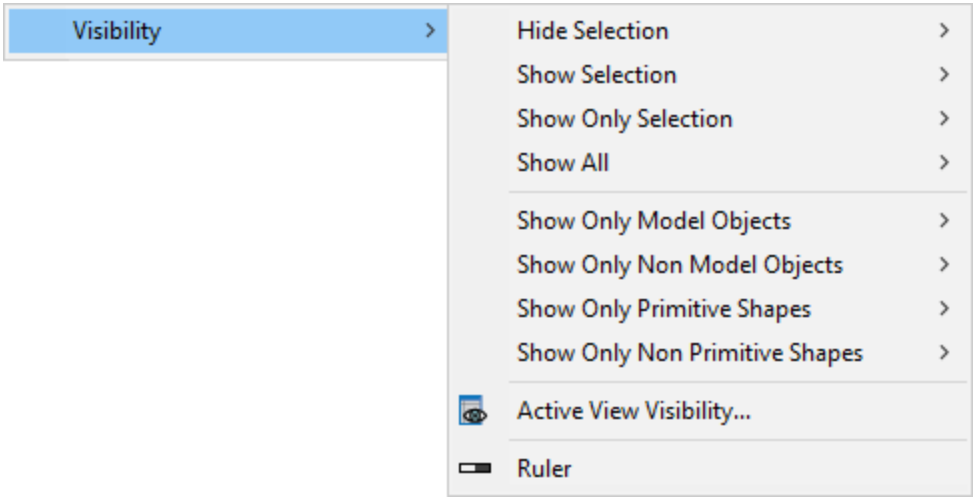
- **Interaction** – offers options to rotate, pan, zoom, and spin the drawing in the design area.



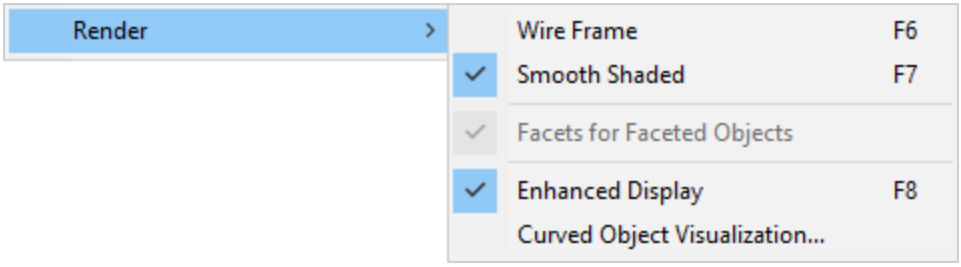
- **Fit All** – allows you to fit all objects to the view window.
- **Fit Selection** – allows you to fit selected objects to the view window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Visibility** – offers options to show and hide selections, objects, shapes, and the ruler.

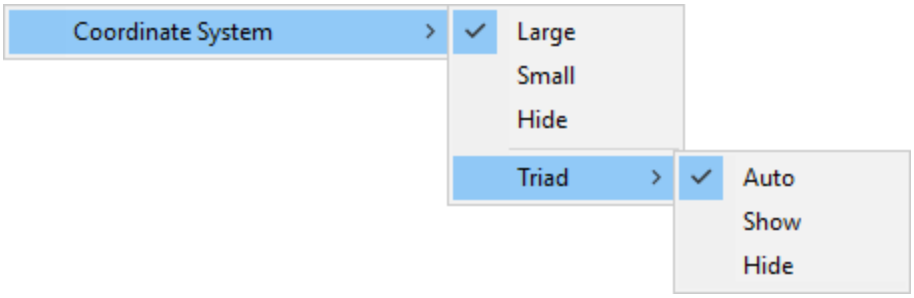


- **Animate** – opens the **Create Animation Setup** window, so that you can begin creating animations.
- **Clipping** – allows you to place a 3D coordinate system manipulator in the design area so that you can define clip planes.
- **Render** – offers options to switch between wire frame and smooth shaded render, toggle enhanced display, and change how curved objects are visualized.

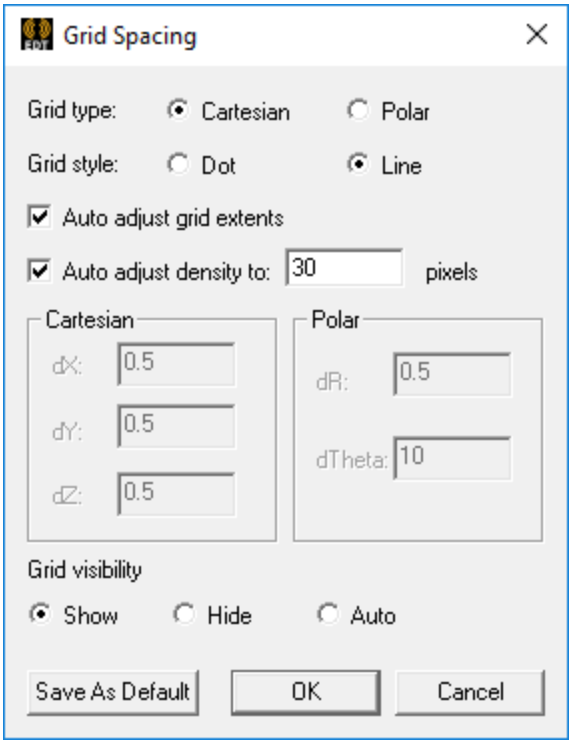


- **Coordinate System** – offers options to change how the coordinate system displays in the design area.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

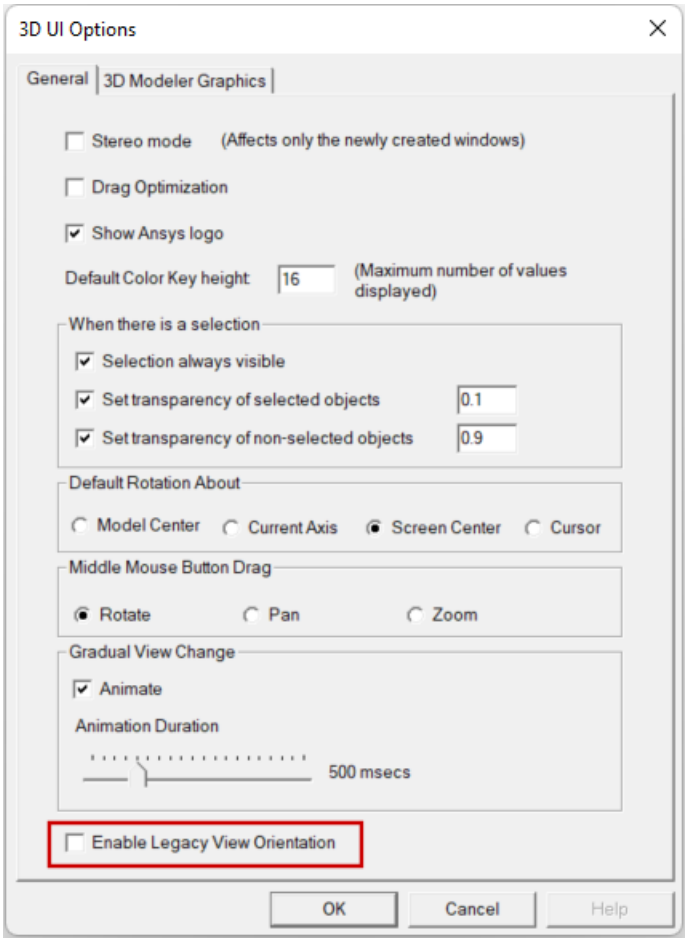


- **Grid Settings** – opens the **Grid Spacing** window, where you can adjust spacing.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

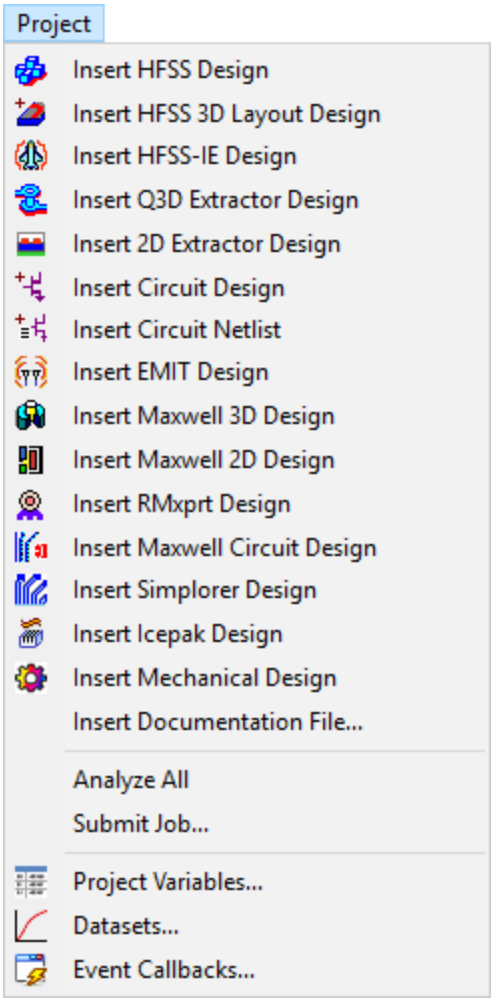
- **Options** – opens the **3D UI Options** window, where you can change additional settings.



Project Menu

To create (insert) a new design, you must first open a new project folder by selecting **New** from the **File** menu. Then select a project to insert from the Project menu. Or you can click the icon corresponding to the type of design you wish to create.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



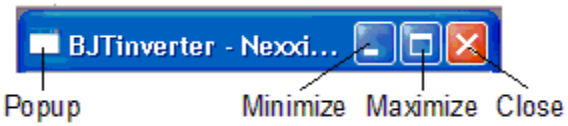
Editor and Design Specific Menus

The Top Menu bar contains editor and design menus that are specific to the editor or viewer that is active in the Design area. The specific menus correspond to the type of design that is inserted using the Project menu.

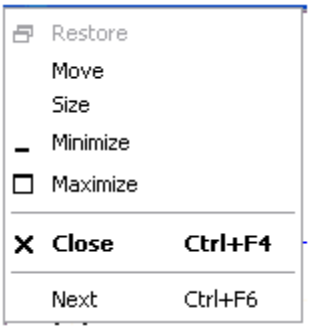
Working with Editor Windows

Each editor window in the Design Area has size controls in its top bar:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

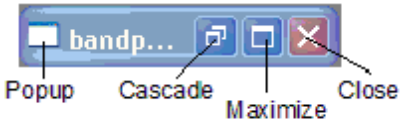


Clicking the white rectangle on the left opens a pop-up:



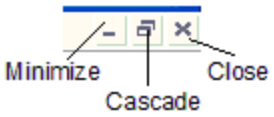
The **Move** and **Size** operations are not needed. To move an editor window, drag it by the top bar into the desired location. To resize an editor window, position the cursor at an edge or corner, and drag the border in or out.

- Click **Minimize** (or use the Minimize icon) to collapse the design window into an icon:



- Clicking the white rectangle on an iconized window opens the same pop-up as the one shown above. To restore an iconized window to its previous size (cascaded or maximized), click the white rectangle, then select **Restore** on the pop-up. Alternatively, use the Cascade or Maximize buttons on the icon to restore the window to the desired configuration. Use the Close button to close the iconized editor window. Reposition the icons anywhere in the Design area by dragging them with the left mouse button. To restore the icons to a neat row at the bottom of the Design Area, use the **Arrange Icons** command on the Window pulldown.
- To relocate an iconized window in the Design Area, drag it with the left mouse button.
- Click **Maximize** (or use the Maximize icon) to enlarge the editor window to fill the entire Design Area. In this configuration, Minimize, Cascade, and Close icons appear at the upper right of the Ansys Electronics Desktop, on the same level as the Top Menu bar:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

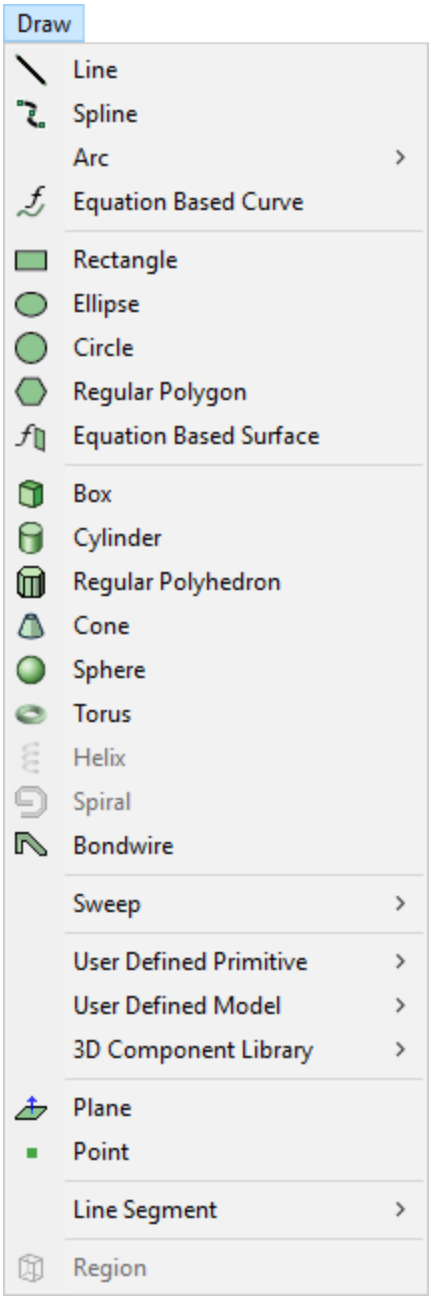


- To restore a maximized window to its initial size and top bar, use the **Cascade** operation.
- Click **Close** (or use the Close icon) to close an editor window.
- Click **Next** to move the active focus to another editor window.
- See Design Area for a summary of the available editor windows.

Layout Editor Draw Menu

The **Draw** menu for the **Layout Editor** is context sensitive and appears slightly different depending on the type of design that is loaded.

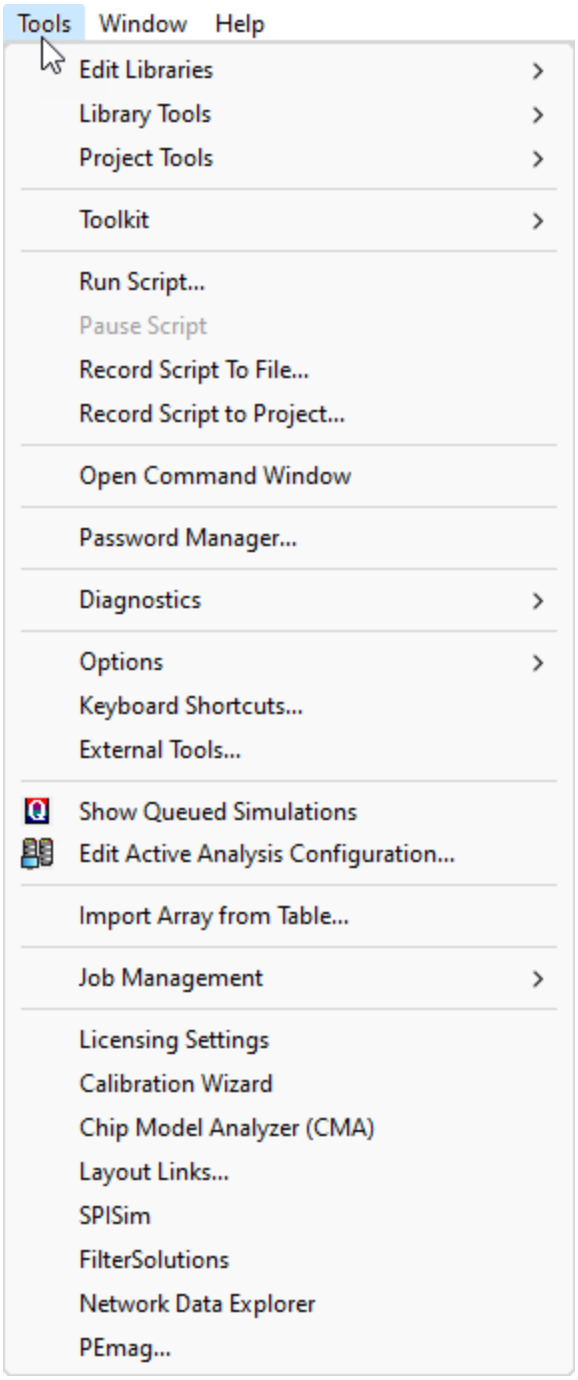
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Tools Menu

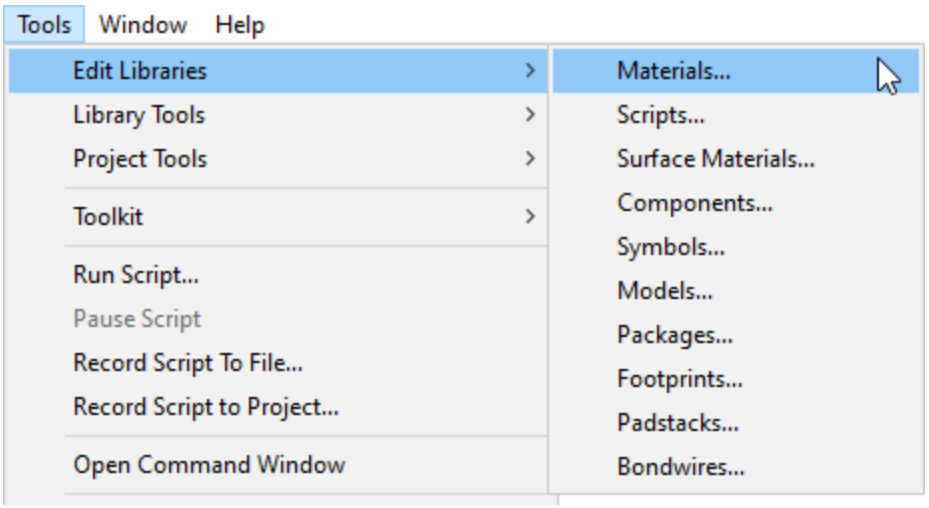
The **Tools** menu contains operations that are common to all design types:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

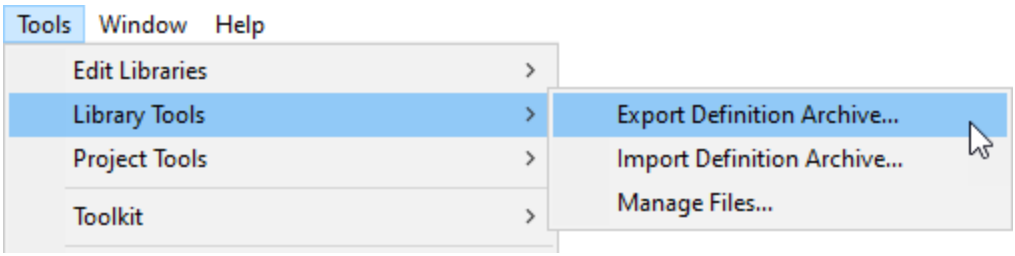


- Click **Tools** > **Edit Libraries** to view commands allowing access to the libraries available for the various Ansys Electronic Desktop solves, such as Materials, Scripts, and Components, Symbols and Models for Simplorer, Icepak, and Circuit.

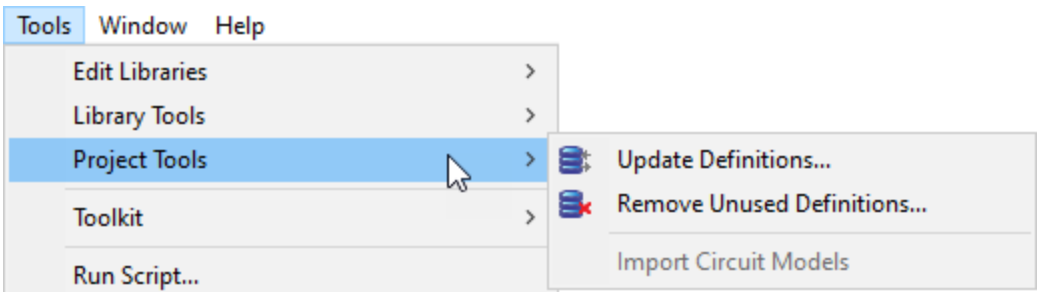
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Click **Tools** > **Library Tools** to view tools for importing or exporting definition archives for UserLib and Syslib and to manage files relevant for various solver libraries.



- Click **Tools** > **Project Tools** to manage definition libraries relevant to various solvers.



- Click **Tools** > **Toolkit** to install PyAEDT or update product menus to show any added Python-based toolkits.
- Click **Tools** > **Runscript...** to run scripts that you have recorded. A Pause command is available. You can also **Record Script to File...** or **Record Script to Project...**. See the Scripting Help for more information.
- Click **Tools** > **Open Command Window...** to open an IronPython command window. See the Scripting Help for more information.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **Tools** > **Password Manager...** to open the *Password Manager* window to control access to resources.
- Click **Tools** > **Diagnostics** to access the following diagnostics commands:

  - Click **Debug Logging** to enable debug logging via an environment variable.
  - Click **Stop Debug Logging** to end debug logging. This option is only available while debug logging is active.
  - Click **Dump Registry Files** to make a copy of all user, administrator, and default-settings configuration files, placing them in the folder you select.
- Click **Tools** > **Options** to set General Options and HPC options.

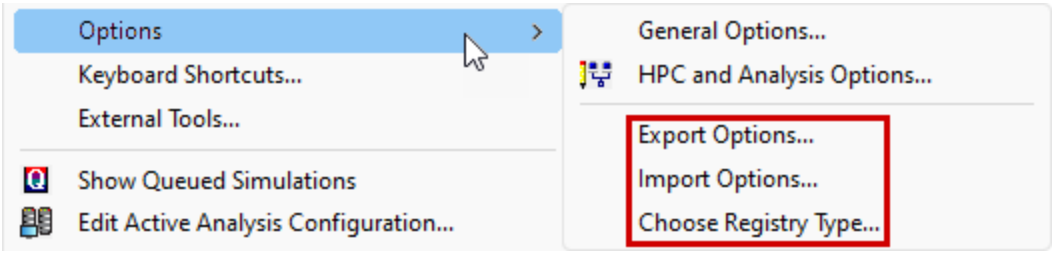
  Other available commands in this fly-out menu are **Export Options**, **Import Options**, and **Choose Registry Type**. See Understanding Registry Tools for more information on these three commands.

- Click **Tools** > **Keboard Shortcuts...** to manage your keyboard shortcut behavior.
- Click **Tools** > **External Tools...** to manage menu access to external tools.
- Click **Tools** > **Show Queued Simulations** to view a dialog listing simulations in a queue and providing tools to manage the queue.
- Click **Tools** > **Edit Active Analysis Configuration** to view a dialog that lets you view and manage the current configuration.
- Click **Tools** > **Import Array from Table** to import an array definition from a .csv file.
- Click **Tools** > **Job Management...** to select a scheduler, and to submit and monitor remote simulations.
- Click **Tools** > **License Settings** to launch the Licensing Settings tool.
- Additional Tools listed include Calibration Wizard, and Network Analyzer, and other tools used to help you with Ansys Electronics Desktop projects and solvers.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

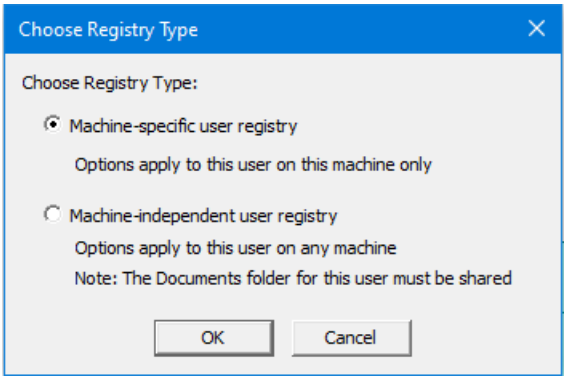
Understanding Registry Tools

In the context of this topic, when we say *"Registry"* we are referring to the files where the various Ansys Electronics Desktop application options are stored. We are not referring to the Windows registry. Specifically, this topic discusses the **Export Options**, **Import Options**, and **Choose Registry Type** commands that are listed in the fly-out menu that appears when you click **Tools** > **Options** from the menu bar.



Choose Registry Type:

Click **Choose Registry Type** to switch between two available options. The following dialog box appears:



The choices are summarized as follows:

- **Machine-specific user registry:** This is the default type. You must set up the configuration manually for each user account on each machine where the Ansys Electronics Desktop software is run. You can do so by exporting and importing options (see below), setting the options in the user interface on each machine, or copying configuration files between machines and renaming them. The hostname of the computer is part of the filename for machine-specific registries.
- **Machine-independent user registry:** Allows you to share a single user configuration file among multiple machines. This choice has the advantage of keeping the options synchronized between all the user's machines.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> The term "host" is frequently used to refer to any computer used to run a particular application. In the Ansys Electronics Desktop Help, the terms *"host-specific"* and *"machine-specific"* are used interchangeably, as are *"host-independent"* and *"machine-independent."*

When you switch registry types, the settings from the currently active registry are copied into the new registry, which then becomes the active one. The filenames for user registries are as follows:

- Machine-specific: **<*hostname*>_user.xml**
- Machine-independent: **user.xml**

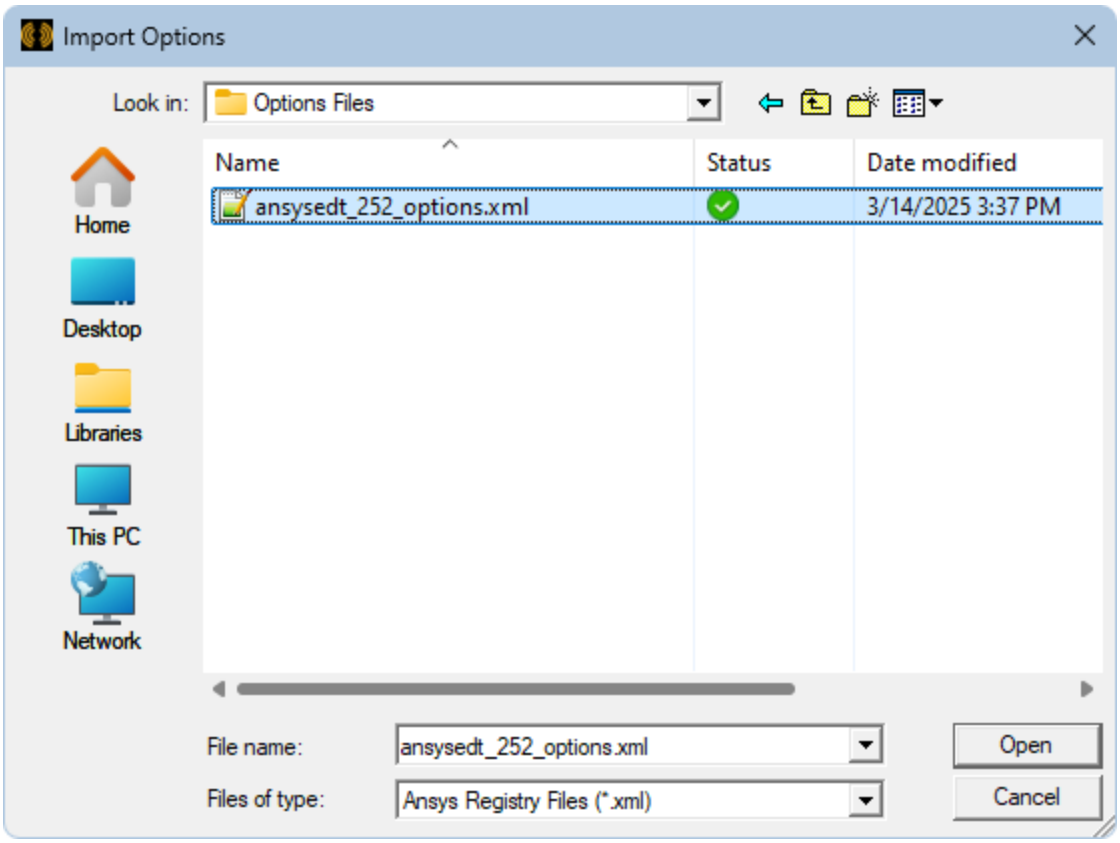
> **Note:**
>
> For a machine-independent user registry to work, the *Documents* folder must be shared by all machines on which you run the software, and you must log into the same account on each machine. The user registry file is stored in the path, ...Documents\Ansoft\ElectronicsDesktop20*yy.m*, where *yy* is the last two digits of the version year, and *m* is the minor release number. The Documents folder must be mapped to a network folder accessible to all machines or to an online folder (such as OneDrive, for example). Otherwise, you would have to copy the registry file to each machine, and they would *not* remain synchronized, defeating the purpose of the machine-independent registry.

Exporting and Importing Options:

You can export options to an XML file, which can then be imported into the registry. This capability is useful if you want to use one set of options for a given situation and a different set for another. Simply export the options for each different configuration you use. Then, import the file that is applicable to your current work. You can also use this capability to transfer options to a different user or machine.

When you click **Import Options**, the following dialog box appears, in which you can navigate to the option file folder and select the desired file to import:

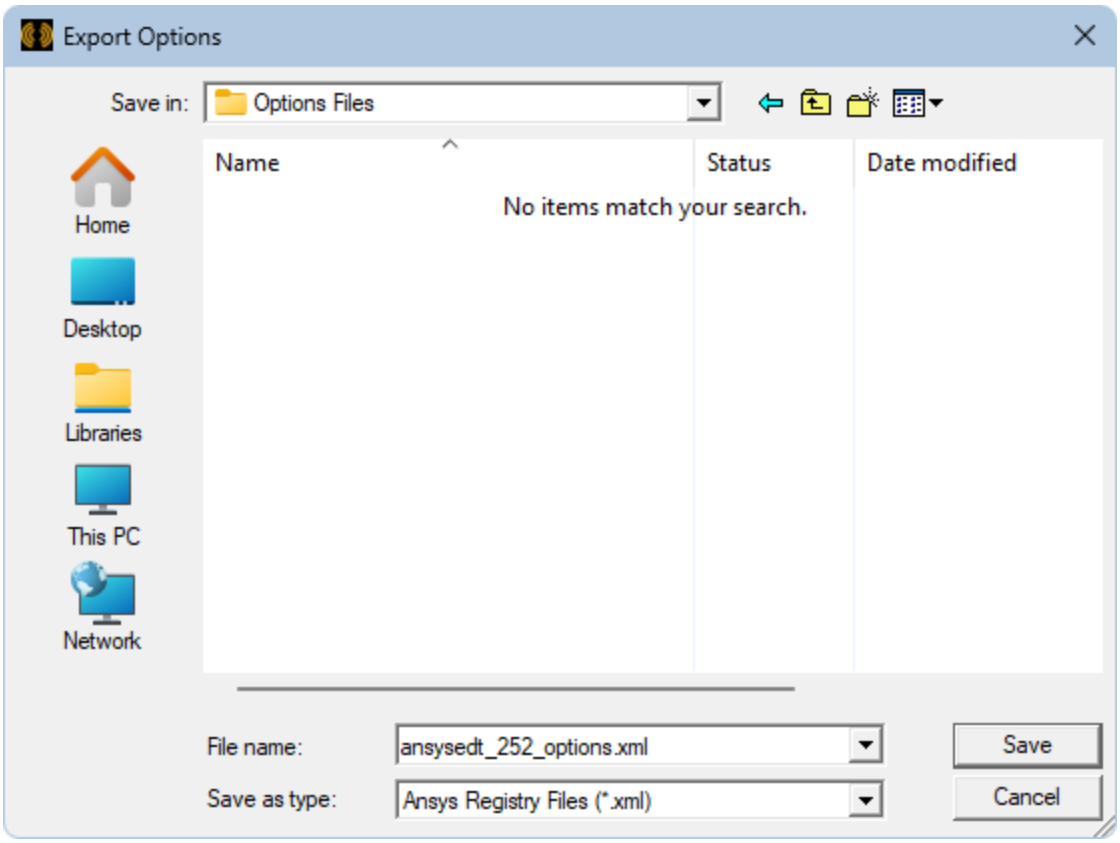
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



When you import an options file, the currently active registry type (specified using the **Choose Registry Type** command) determines to which registry file the options are written. After importing an options file, you will be prompted to restart the application, which is recommended.

When you click **Export Options**, the following dialog box appears, in which you navigate to the folder where you want to place the file and specify the filename:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Options are always exported from the currently active registry. The usual precedence rules apply when getting the value to export. For example, if the current registry being exported is machine-specific, and a particular value is missing, the value in the machine-independent registry will be used (if available). See the **Note** at the bottom of Setting Options via Configuration Files for more information on the order of precedence.

> **Note:**
>
> An exported user options file contains only the settings that are exposed in the general options (that is, the *Options* dialog box) and view options (*3D UI Options* dialog box). So the exported file contains a subset of the configuration settings. HPC and other settings (such as window locations and window size data) are *not* included in the exported options.

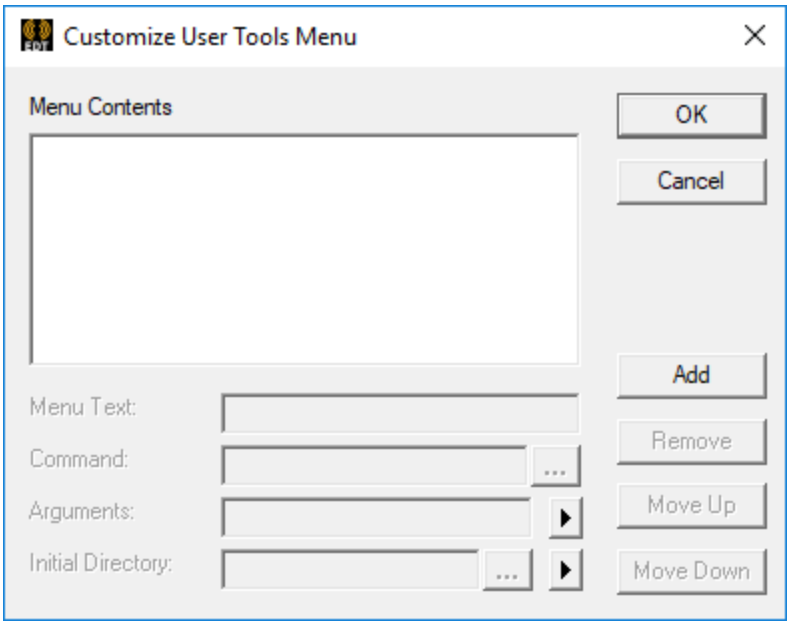
Adding External Tools to the Tools Menu

To add an executable to the Tools menu:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Click **Tools** > **External Tools**.
2. This displays the **Customize User Tools Menu** dialog box.

   If a **User Tools** menu item has been defined, its contents are displayed. Command buttons let you Add new commands and Delete selected commands, and Move Up and Move Down commands. You can specify the command line arguments to the program and the directory from which it will run.



3. To add a custom Tools menu entry, click **Add**.

   This enables the following fields:

   Menu Text field – displays [new tool] as text you will replace with the text you want to appear in the User Tools menu.

   Command field – displays the external executable. An ellipsis button [...] lets you navigate to the file location.

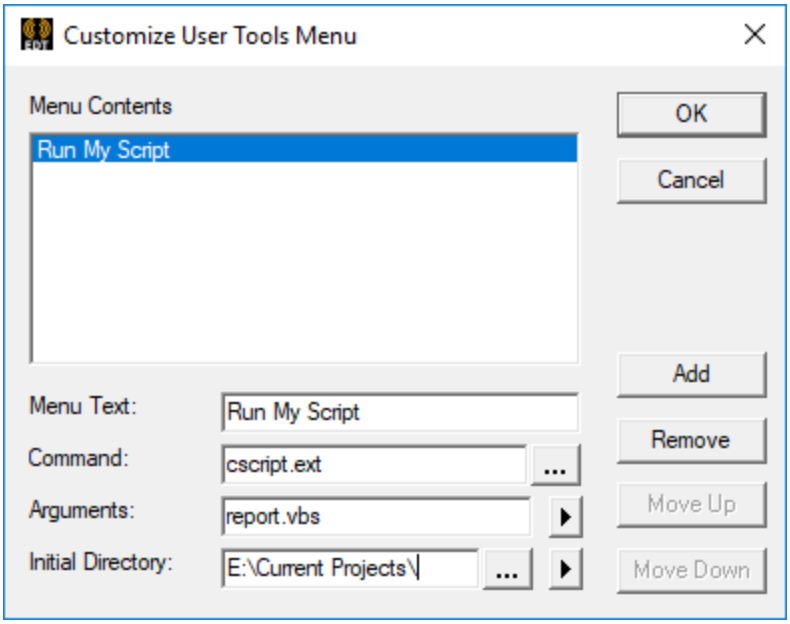
   Arguments field – accepts command arguments from the **>** button menu selections for File Path, File Directory, File Name, File Extension, Project Directory, or Temp Directory.

   Initial Directory – specifies the initial directory for the command to operate. The ellipsis button {...] displays a dialog that lets you navigate folders in your desktop, or across the network.

4. Click **OK** to add the External Tools menu to HFSS 3D Layout or Cancel to close the dialog without changes.

   You can also add scripts to the **Tools** menu. Assuming you have a script to generate custom reports called report.vbs, use the cscript.exe program to execute your script.

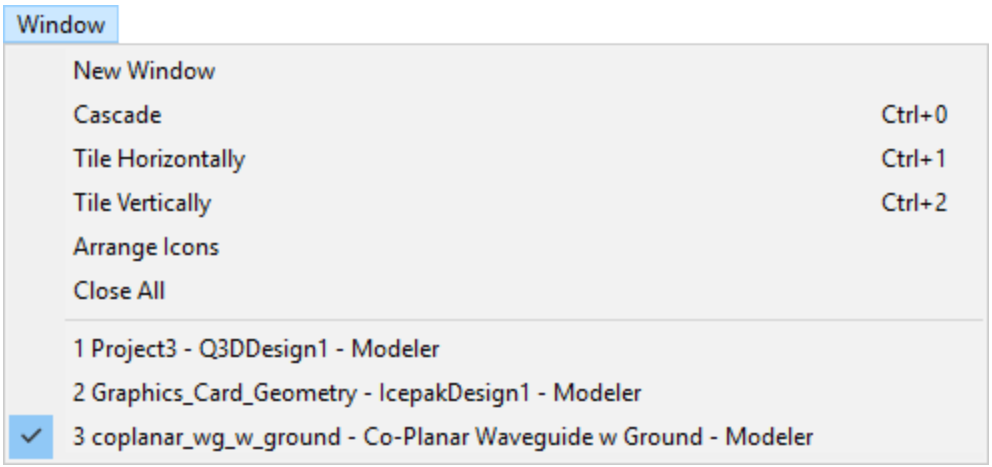
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This example shows the cscript.exe program added to the **Tools** menu as **Run My Script**. The command line argument to the csscript.exe program is report.vbs. You can also name the directory in which it will be run.

Window Menu

The **Window** menu contains common window control operations, as well as a list of projects that are currently open.



- Click **New Window** (or type **n**) to open a new window in the Design Area. The new window will show the active design.
- Click **Cascade** (or type **c**) to arrange the open design windows in overlapping sequence:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can use the **Cascade** operation to restore all windows to their default sizes after one or more of them have been maximized (enlarged to fill the entire Design Area).

- Click **Tile Horizontally** (or type **h**) to arrange the open design windows in a top-to-bottom sequence:
- Click **Tile Vertically** (or type **v**) to arrange the open design windows in a side-to-side sequence:

> **Tip:**
>
> You can use the shortcut key sequences Ctrl+0, Ctrl+1, and Ctrl+2 to execute the Cascade, Tile Horizontal, and Tile Vertical operations, respectively. The shortcuts can be used at any time, bypassing the Window menu.

- Click **Arrange Icons** (or type **a**) to restore iconized windows to a neat row at the bottom of the Design Area, after the icons have been repositioned manually.
- Click **Close All** (or type **l**) to close all the editor windows in the Design Area.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Help Menu

Ansys Electronics Desktop features extensive help documentation, including text search and context-sensitive help items. To access the main help system, click **Help** on the top menu bar.

The Help Menu displays different selections depending upon the type of design inserted to the active project. The basic selections for HFSS 3D Layout are:

> **Note:** Ansys Electronics Desktop Student includes access to PDF documentation only.

- **HFSS 3D Layout Help** – opens the HFSS 3D Layout help within the Electronics help system. You can also access PDF versions from within the help system.
- **HFSS 3D Layout Scripting Help** – opens the HFSS 3D Layout scripting help.
- **Ansys Customer Support** – opens a browser page to the Ansys Customer Portal. At the website you can learn more about Ansys products and services and log on to contact Ansys technical support staff.
- **What's New in this Release** – opens a PDF that describes *What's New in Ansys Electronics Desktop* for 2025 R2.
- **Ansys Product Improvement Program** – opens a window describing the Product Improvement Program option.
- **License Settings** – opens help for the License Settings tool.
- **Ansys Engineering Copilot** – opens a feature for learning and support within select Ansys products. This feature displays in an independent window within supported applications. It retrieves content from various sources, including the Ansys Innovation Space (AIS), Ansys documentation and learning resources, and the AnsysGPT™ virtual AI assistant.
    - **Home** – includes a search function that will search the courses, knowledge base, and learning forum for information relevant to the search term you have entered (searches the entire Ansys Innovation Space (AIS)). The Search AIS field also provides filters to narrow your search in a particular information category; however, this feature does not automatically filter based on physics type or the product you are using.
    - **Ansys Innovation Courses** – the Search function can be used to access a wide range of Ansys Electronics Engineering courses that include on-demand, self-paced video training and quizzes.
    - **Ansys Knowledge** – provides access to Ansys expert knowledge articles. The search filter is preset based on the application you are using, but you can change the filter as desired.
    - **Ansys Learning Forum** – provides access to discussions and presentations from Ansys experts, partners and customers. Users can also post questions to the forum, which is moderated by Ansys employees.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **AnsysGPT** – is a multilingual Ansys Artificial Intelligence (AI) Virtual Assistant. The AnsysGPT™ assistant takes your query and produces answers based on internal and external expert knowledge of the product. It draws upon information from Ansys Knowledge articles, Ansys Innovation Courses, Ansys Learning Hub courses, the Ansys Learning Forum, Ansys documentation, Ansys.com, and the official Ansys YouTube channels, as well as other Ansys information sources.

  To use the Copilot tool:

  - You must have a current AnsysGPT™ AI+ license. Ansys Engineering Copilot is a licensed product at no additional cost.
  - You must be registered on Ansys Customer Support Space (ACSS).

  For more information on Ansys Engineering Copilot, see the Ansys Engineering Copilot User Guide.

- **Ansys Learning Hub** – opens a web page with subscription-based access to virtual and self-paced learning across the Ansys Software portfolio.
- **About Ansys Electronics Desktop** – opens a dialog box that displays the Ansys Electromagnetics Suite release number and contains tabs that show information about the **Installed Components** and **Client License Settings**.

Context-Sensitive Help

To access context-sensitive help from the Ansys Electronics Desktop user interface, press **F1** while your cursor is on an item. The help system specific to the product opens.

Obtaining Information about the Software and Release

To obtain information about the software and release:

1. Click **Help** > **About Ansys Electronics Desktop**.
   The **About Ansys® Electromagnetics Suite [release number]** dialog box appears, listing information about the product.
2. Click the **Installed Components** tab to view a list of software installed.
3. Click the **Client License Settings** tab to view information about the following:
   - Provider Name
   - Ansys License Version
   - FlexNet Publisher Servers
   - Admin Directory
   - Customer Number
   - FLEXlm Version
   - Redirect Info

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. To export the software information:
    a. Click **Export**.
    The **Save As** dialog box appears.
    b. Browse to the location where you want to save the information as a text file.
    c. Type a name for the file in the **File name** text box. The **Save as type** drop-down menu is already specified as **Export (*.txt)**.
    d. Click **Save**.
5. Click **OK** to close the **About Ansys® Electromagnetics Suite [release number]** dialog box.

Shortcut Menus

A variety of shortcut menus — menus that appear when you right-click a selection or in a window — are available in the **3D Modeler** window, in the **Project Manager** window, in the **History Tree**, and in the **Progress** window.

Shortcut menu in the 3D Modeler window	Use the shortcut menu in the **3D Modeler** window to select, magnify, and move objects (zoom, rotate, etc.); change the view; perform boolean operations; assign materials, boundaries, excitations, or mesh operations to objects; and work with field overlays.
Shortcut menus in the Project Manager window	Use the shortcut menus in the **Project Manager** window to manage Ansys Electronics Desktop project and design files and design properties; assign and edit boundaries, excitations, and mesh operations; add, analyze, and manage solution setups; add Optimetrics analyses; create post-processing reports; insert far- and near-field radiation setups; edit project definitions; and run Maxwell SPICE.
Shortcut menus in the History Tree	Use the shortcut menus in the **History** tree to expand or collapse groupings. If you select particular objects in the history tree, the shortcut menu lists the commands that you can apply to the selected object (s).
Shortcut menus in the Progress window	Use the shortcut menus in the **Progress** window during a simulation to **Abort** or **Clean Stop**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

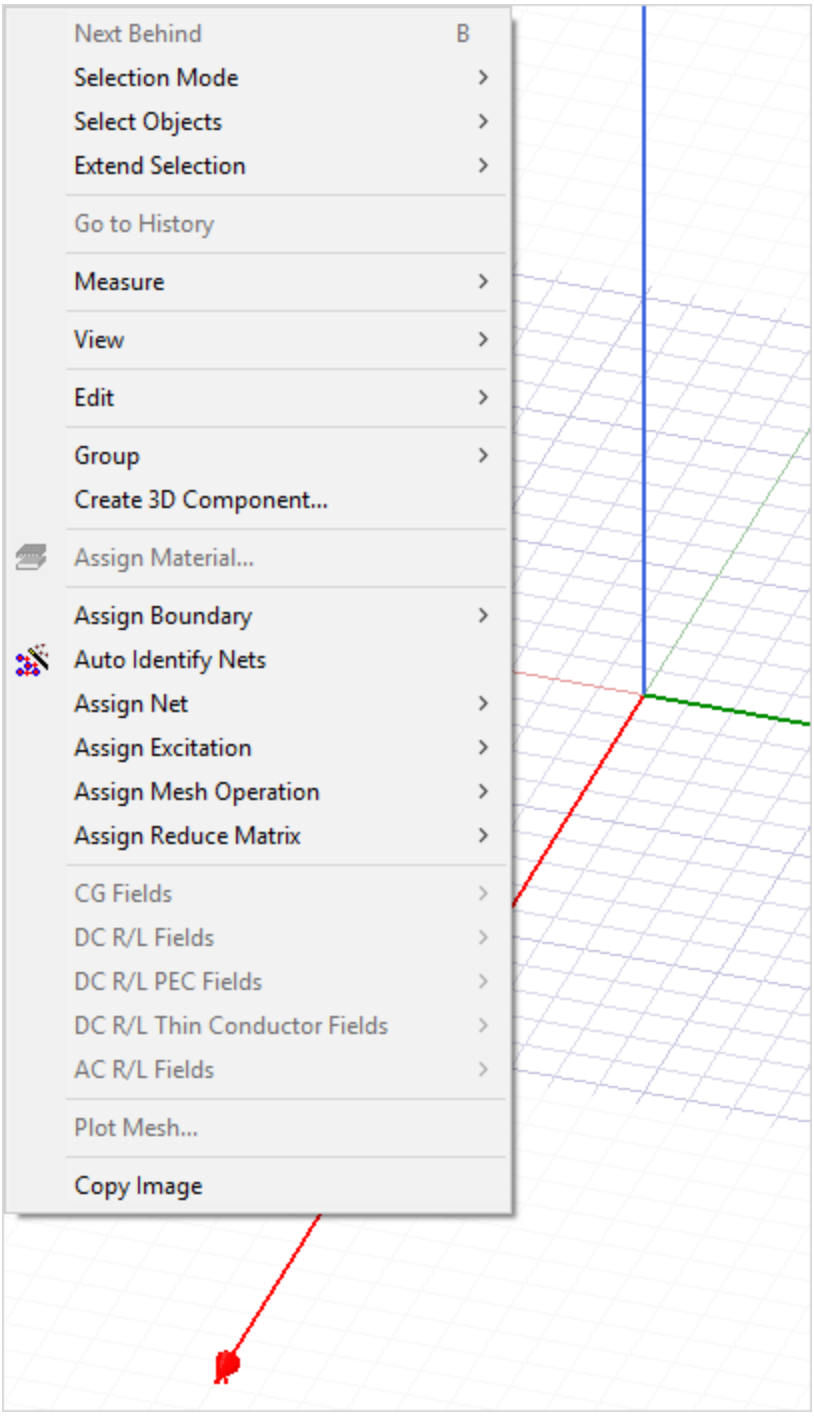
> **Note:**
>
> All commands available on shortcut menus are also available from the menu bar.

Shortcut Menu in the 3D Modeler Window

Use the shortcut menu in the **3D Modeler** window to select, magnify, and move objects (zoom, rotate, etc.); change the view; perform boolean operations; assign materials, boundaries, excitations, or mesh operations to objects; and work with field overlays.

To access the shortcut menu, right-click in the 3D Modeler window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Shortcut Menus in the Project Manager Window

Each node, or item, in the project tree has a shortcut menu.

Other nodes have shortcut menus appropriate for the context.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For example, the following figure shows the shortcut menu when you right-click the design.

Customizing Ansys Electronics Desktop Menus

Ansys Electronics Desktop comes with a Menu Bar. You can modify the menu bar by using customized User Interface (UI) setups to add, remove, rename, and relocate commands. You can also add commands that execute external scripts or configure right-click shortcut menus for folders and items in the Project Tree, which allows for extensive customization of the Ansys Electronics Desktop Menus.

Customized setups are implemented using named subfolders that contain XML files used to configure customized menu settings. The subfolders included with the Ansys Electronics Desktop application are:

- config/UI/ElectronicsDesktop/EM
- config/UI/ElectronicsDesktop/RF
- config/UI/ElectronicsDesktop/RF.0
- config/UI/ElectronicsDesktop/SI
- config/UI/ElectronicsDesktop/SI1.0
- config/UI/ElectronicsDesktop/SI2.0
- config/UI/ElectronicsDesktop/Twin Builder

Each customized UI type has its own subfolder. Within these subfolders, XML files hold the menu configurations as well as the right-click menus for that UI type.

Select Different UI Types

To change the menu display from the default UI to a different UI type:

- Click **Tools** > **Options** > **General Options** > **General** > **Desktop Configuration**.
- Choose the UI type that you wish to use from the **Custom Menu Set** drop-down menu and click **OK**.

To switch from a customized UI type to the default UI:

- Click **Tools** > **Revert To Default UI**.

Add a New Customized UI Type

A new folder needs to be added to the config/UI/ElectronicsDesktop folder for any new customized UI type. All XML files for this UI type must go in this folder. The new UI type will appear in the **Custom Menu Set** drop-down menu (**Tools** > **Options** > **General Options** > **General** > **Desktop Configuration**).

For any UI type, Ansys Electronics Desktop displays the default UI menus for any products/contexts that are not in the xml files. If there is error processing any XML file, the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

default UI menu is displayed for that product. Check the message window for the names of problematic XML files and suggestions on how to fix them.

XML files are only processed once when you first switch to that UI type. After you make changes to any XML file, in order for it to be reprocessed, navigate to **Tools** > **Options** > **General Options** > **General** > **Desktop Configuration** and reselect the UI type from the **Custom Menu Set** drop-down menu. Then click **OK**.

Names of the XML Files

Below is the list of XML files that can be placed in a folder for a new UI Type. If any of these XML files does not exist in this folder, the default menu setting displays for that product.

- 2D Extractor.xml – used for 2D Extractor projects.
- Circuit Design.xml – used for Circuit Design projects.
- Circuit Netlist.xml – used for Circuit Netlist projects.
- EMIT.xml – used for EMIT projects.
- HFSS 3D Layout Design.xml – used for HFSS 3D Layout Design projects.
- HFSS.xml – used for HFSS projects.
- HFSS-IE.xml – used for HFSS-IE projects.
- Icepak.xml – used for Icepak projects.
- Maxwell 2D.xml – used for Maxwell 2D projects.
- Maxwell 3D.xml – used for Maxwell 3D projects.
- Maxwell Circuit.xml – used for Maxwell Circuit projects.
- NoDesignUI.xml – used for menu settings when no project is selected.
- Q3D Extractor.xml – used for Q3D projects.
- RightClickMenu.xml – used for all right-click menu settings.
- Twin Builder.xml – used for Twin Builder projects.

Valid XML Elements and Attributes

1. Root Element is **DesignerMenu**:
    - **xmlns** – required attribute which needs to be set to the following:

      <DesignerMenu xmlns="http://www.ansys.com/uiConfigMenu">

    - **UseProjectWindowSelectionContext** – child of DesignerMenu, appears zero or one time.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> This is only meaningful if it is used in NoDesignUI.xml. If this is set to true, then clicking in the Project Window on the Project icon or the Definitions icon (or a subitem) will show “Project” context in NoDesignUI.xml instead of active design context. No setting or setting this to false makes this UI type behaves the same as the default behavior of Ansys Electronics Desktop. The menus and toolbars are always shown for the active design unless there’s no design at all.

- **Context** – child of DesignerMenu. It appears at least one time and has a required “name” attribute. For details on setting the context name, see the “Context Name” section below.

2. Child elements of **Context**:
   - **TopMenu** – For RightClickMenu.xml, do not use this element. You can specify child elements of TopMenu listed below under Context. For any other xml files, you need at least one TopMenu child element for any Context.

     Child elements of TopMenu:

     - **MenuName** – required, appears only one time.
     - **popupMenu** – may appear one or multiple times; child elements are the same as those of Topmenu.
     - **LeafMenu** – may appear one or multiple times.

       Child elements of **LeafMenu**:

       - **MenuName** – optional string.

         Pay attention to the character reference "&" in XML. In order for the name of the menu to be displayed as “Tools”, the XML syntax must be:

         <MenuName>&Tool</MenuName>

         “&“ is the character reference for ”&” in XML, while “&Tool” tells Ansys Electronics Desktop that Alt+T is the shortcut key for this menu.

       - **MenuID** – optional number.

         For a list of valid MenuIDs, please see ***Command IDs for Customizing AEDT Menus.xlsx*** under <*install_dir*>/v<*release_number*>/[Win64 or Linux64]/Help.

       - **ShowBitMap** – optional, “Yes” or “No” (default)
       - **Accelerator** – optional string (Example: Ctrl+N)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> To add a new LeafMenu, both “MenuName” and “MenuID” are required.

- **CustomMenu** – may appear one or multiple times; used to add a customized menu to run an external script (vbs or python).

  Child elements of **CustomMenu**:

  - **MenuName** – see LeafMenu for Usage
  - **ShowBitmap** – see LeafMenu for Usage
  - **Accelerator** – see LeafMenu for Usage
  - **ScriptPath** – required string; used to supply path to the script (use of $PROJECTDIR, $PERSONALLIB, $USERLIB, $SYSLIB variables is also allowed).

    Example:

    <ScriptPath>C:/Users/jwei/Python/HelloWorld.vbs</ScriptPath>

    or

    <ScriptPath>$PERSONALLIB/HelloWorld.py</ScriptPath>

> **Note:**
>
> To add a new CustomMenu, both MenuName and ScriptPath are required.

- **Separator** – may appear one or multiple times; has no child element.

3. All elements have an optional attribute of **action**.

   Valid values are:

   - **add** – can be applied to all elements other than “DesignerMenu” or “Context” . This element and all its child elements will be added to its parent. An optional attribute of “position” can be followed here to specify the position of this newly added menu. Position starts from 1. If no position is specified, this menu will be appended to its parent menu.
   - **useDefault** – default menus will be used for this menu(matched by MenuName or MenuId). Any of it’s child menu will be processed according to its action setting.
   - **delete** – can be applied to all elements other than “DesignerMenu” or “Context” . This menu (matched by MenuName or MenuID) will be deleted from its parent.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

- For “DesignerMenu” and “Context”, only no action setting or “useDefault” is valid.
- The “DesignerMenu” action setting is significant because it is how you specify whether you want to construct your own menus or modify existing default menus. If this is set to “useDefault”, default menu settings are used for any menus not listed in your XML files. If no action is set, only the “File”, “Window” and “Help” menus display; no other default menus display. Menus listed in the XML file display after the “File” menu and before the “Window” menu. In this case, no action is needed for any other elements in the XML file. If any action is specified for any element, you will receive an error message and a default menu will be displayed for that context. A “Revert To Default” menu will be appended to the “Tools” menu. If no “Tools” menu is specified as a TopMenu, a “Tools” menu is created before the “Window” menu with one “Revert To Default” menu item.
- For any other elements, a missing action setting means that the parent action will be used.
- If any element’s action is set to “add”, then no action is needed for any of its child elements. If any action is specified, it will be ignored. This menu and all of its child menus will be added to the default menu.
- If any TopMenu or pop-upMenu’s action is set to “delete”, you don’t need to list any of its child menus. The menu will be deleted with all child menus.

Context Name

1. The “name” attribute specifies the name of the context for this product. You can have an "All" context if you set the action of DesignerMenu to UseDefault to specify a menu setting that you want to apply to all contexts for that product.
2. Valid context name for different xml files:
    - 2D Extractor.xml — “All”, “3d modeler”, “report2d”
    - CircuitDesign.xml — “All”, "SchematicEditor", “Layout”, “Netlist”, “report2d”
    - Circuit Netlist.xml —“All”, “Design”, “Netlist”
    - HFSS.xml — “All”, “3d modeler”, “report2d”
    - HFSS 3D Layout Design.xml — “All”, “Design”, “Layout”, “Layout3D Editor”, “report2d”
    - HFSS-IE.xml — “All”, “3d modeler”, “report2d”
    - NoDesignUI.xml — “All”, “No Context”, “project”, “FilterDesign”
    - Q3D Extractor.xml — “All”, “3d modeler”, “report2d”

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- RightClickMenu.xml — the following figure illustrates valid context names and how they display in Ansys Electronics Desktop.

  - **Project Folder** – "Project"; in the above figure, “Project” represents the “Linckt_Export” project folder.
  - **Design Instance Folder** – “Circuit Design”, “HFSS 3D Layout Design”, “HFSS”, “Q3D Extractor”, “Circuit Netlist”, “HFSS-IE”, “2D Extractor”
  - **Definitions Folder** – “Definitions”; in the above figure, the Definitions folder is highlighted.
  - For any Folder or Item under the Design Instance or Definitions folder, use the “/” notation to specify the path to the Folder or Item for context name. In the above figure: Use “Circuit Design/Results” for the Results folder. Use “Circuit Design/Design Verification” for the Design Verification folder.
    - For any folder or item under this, use the context name for the folder appended with “/Item”. In the above figure, “Circuit Design/Optimetrics/Item” represents ParametricSetup1.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> For the Report folder under Results, please use the context name for the Results folder appended with "Report"; for example: "Circuit Design/Results/Report".
>
> For the Trace folder under Report, please use the context name for the Report appended with "Trace"; for example: "Circuit Design/Results/Report/Trace"

Sample XML Files

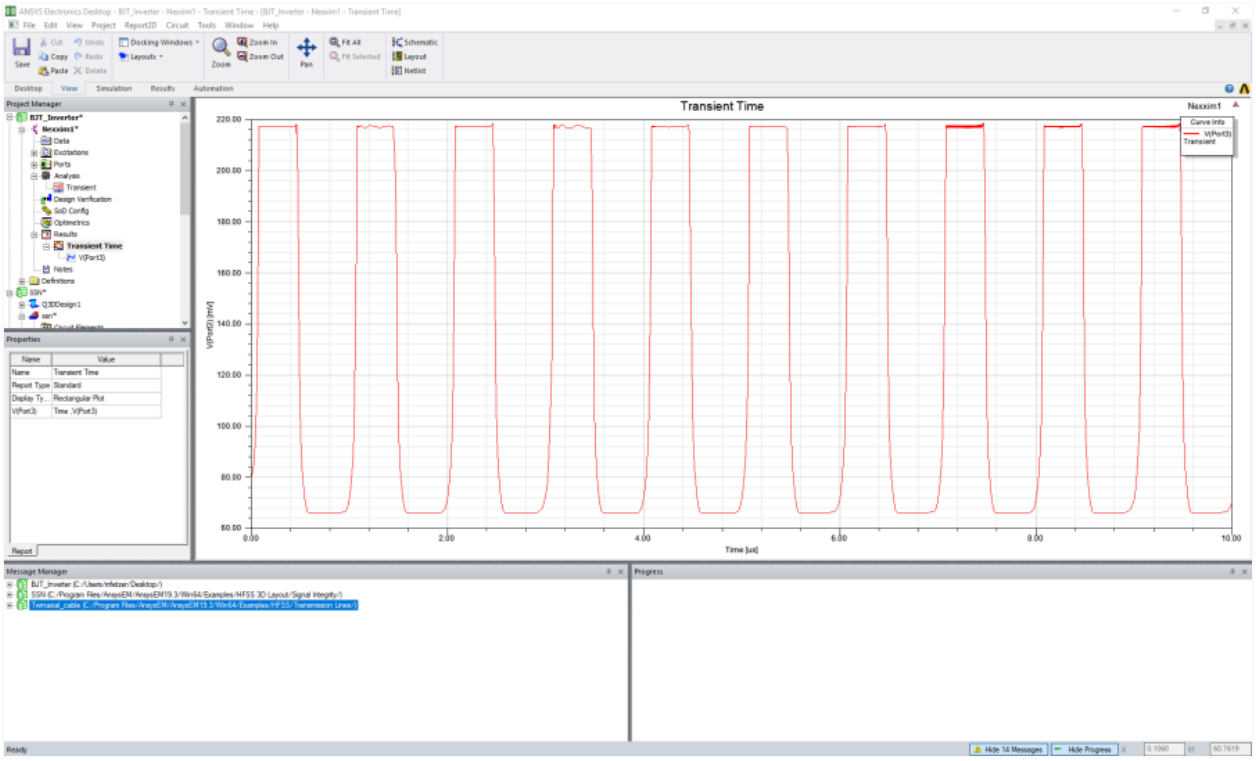
Ansys Electronics Desktop Design Area

The Design Area of the desktop can display one or more editor windows and report windows, depending on the type of designs you create or load. See the Desktop Windows topic for ways to manipulate the windows in the Design Area.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Report Window

When a design has been successfully simulated, you can generate a report of results in a wide variety of forms, including XY graphs, polar graphs, 3D graphs, Smith charts, and data tables. Various attributes of each can be customized to your liking. The following shows a 2D report window in Electronics Desktop:



For more information, see Postprocessing and Generating Reports.

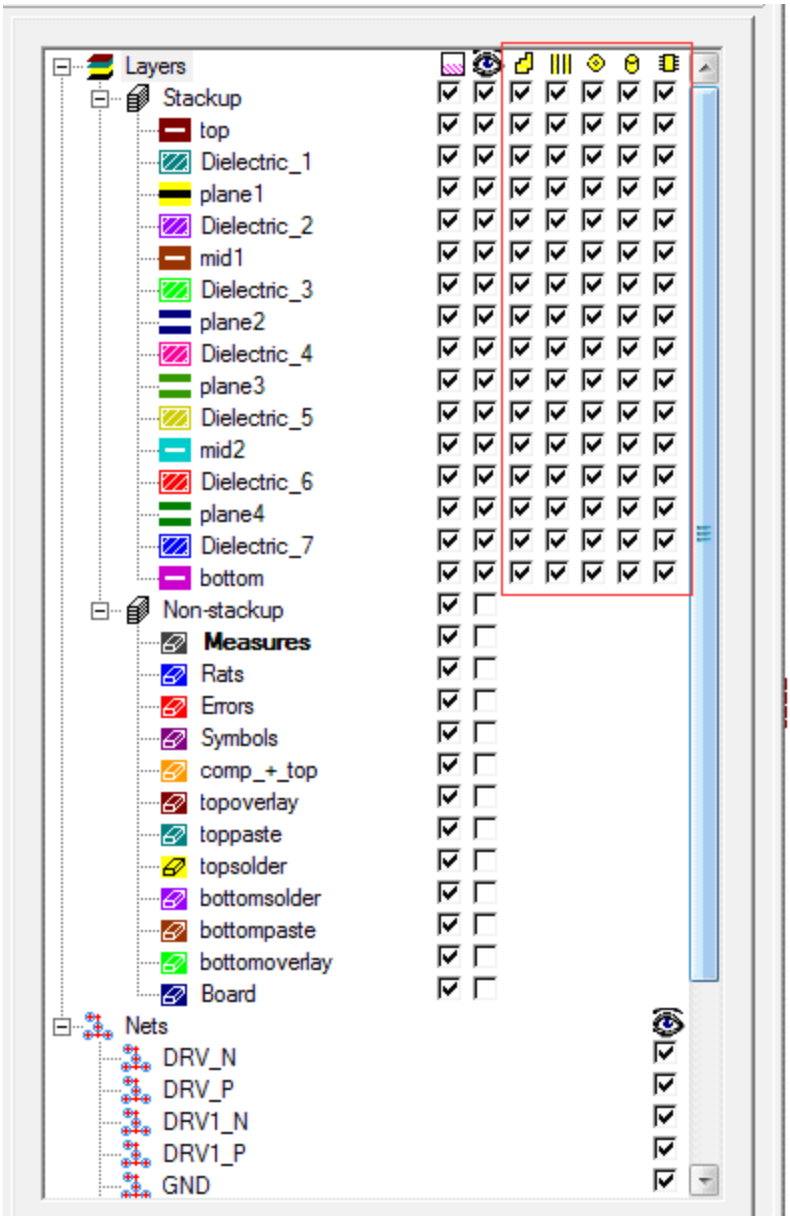
Layout Window

The Layout Window is a dockable Ansys Electronics Desktop window that can be resized and relocated, and can be used to view and configure various layout settings. Use the right-click menu of the Layout Window to configure the following:

- **Set Active** – makes the current layer the active layer.
- **Show This Layer Only** – makes the current layer the only visible layer.
- **Show All Dielectrics** – makes all Dielectric layers visible.
- **Hide All Dielectrics** – makes all Dielectric layers invisible.
- **Show All Signals** – makes all Signal layers visible.
- **Hide All Signals** – makes all Signal layers invisible.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use the **Layout** window to alter the following controls for setting visibility by layout-object type.



The following controls are available:

Controls the visibility of shapes

Controls the visibility of lines (paths)

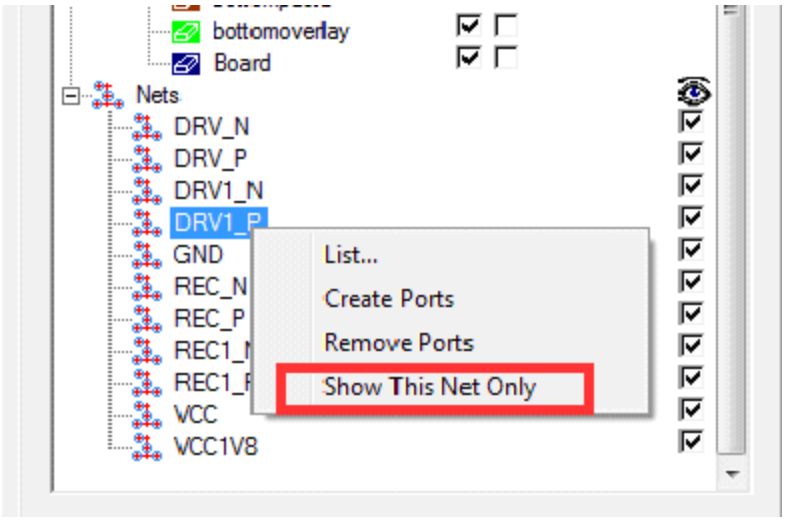
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls the visibility of pads

Controls the visibility of holes

Controls the visibility of components

You can also turn visibility off for all nets but the selected net by right-clicking and selecting **Show This Net Only**.



Ansys Electronics Desktop Status Bar

The status bar is located at the bottom of the application window. By default, it contains buttons to Show or Hide the Message window and Progress window.

Note that the Show Messages button indicates the number of messages.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When more than one progress bar is active, the top progress bar is represented on the status bar with a progress indicator:

The status bar also displays helpful information about the current selection or command.

Directions for inputs appear on the left side of the status bar:

Depending on the command being performed, the status bar can display the following:

- **X**, **Y**, and **Z** coordinate boxes
- A drop-down menu for entering absolute, relative, cartesian, cylindrical, or spherical coordinates
- The model's units of measurement which is set individually for each design in a project

These coordinate boxes and drop-down menus appear on the right side of the status bar:

To toggle status bar display:

- Click **View** > **Status Bar**.

A check mark next to this command indicates that the status bar is visible.

Working with the Status Bar and the Layout Editor

The **Status Bar** is located at the bottom of the application window. It displays information about the command currently being performed at lower left, and also displays the following editable values that pertain to the display and positioning of objects selected or drawn in the Layout Editor.

Depending on the command being performed, the status bar can display the following editable values:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- X and Y coordinates
- Delta X and Delta Y
- Distance
- Default Units drop-down menu – used to set the unit of measurement individually for each design in a project
- Angle

You can turn off the status bar display by de-selecting the **Status Bar** check box on the View Pulldown Menu. For more information, see Ansys Electronics Desktop.

Keyboard Shortcuts

The following keyboard shortcuts apply to HFSS 3D Layout in general:

F1	Help (context-sensitive)
Ctrl + F4	Close window
Alt + F4	Close program
Ctrl + C	Copy
Ctrl + N	New Project
Ctrl + O	Open
Ctrl + P	Print
Ctrl + V	Paste
Ctrl + X	Cut
Ctrl + Y	Redo
Ctrl + Z	Undo
Ctrl + 0	Cascade windows
Ctrl + 1	Tile windows horizontally
Ctrl + 2	Tile windows vertically

See the subtopics in this Help branch for additional information concerning shortcuts and view navigation.

To customize the shortcut assignments, use **Tools** > **Keyboard Shortcuts**. Not all shortcuts are customizable.

Desktop Shortcuts

Modifier + key	Hold down the modifier, such as Shift or Ctrl, and press the key.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The following Ansys Electronics Desktop shortcut key combinations are available at any time:

Ctrl + N	New
Ctrl + O	Open
Ctrl + P	Print
Ctrl + S	Save
Ctrl + 0	Cascade windows
Ctrl + 1	Tile windows horizontally
Ctrl + 2	Tile windows vertically
Delete	Delete
F1	Open help

Layout Shortcuts

Modifier + key	Hold down the modifier (such as Shift or Ctrl) and press the key.

The following shortcut key combinations are available when the **Layout** window is active:

Ctrl + A	Select all
Ctrl + Shift + A	Unselect all
Ctrl + C	Copy
Ctrl + D	Fit drawing
Ctrl + "+"	Zoom in
Ctrl + "-"	Zoom out
Ctrl + K	Cross-probe for selected components in schematic editor
Ctrl + M	Align microwave ports
Ctrl + Q	Zoom area
Ctrl + R	Rotate
Ctrl + V	Paste
Ctrl + W	Add connection
Ctrl + X	Cut
Ctrl + Y	Redo
Ctrl + Z	Undo
Delete	Delete
MMB + drag	Rotate (see note below)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ctrl + MMB + drag	Pan (see note below)
Shift + MMB + drag	Zoom (see note below)

Note:

For view navigation shortcuts (last three rows of the table above):

- **MMB** = Middle Mouse Button.
- These are the default view navigation assignments for 2025 R2. Optionally, you can choose to use the legacy shortcuts that were appliable to 2023 R2 and earlier versions. See Choosing the View Navigation Options for more information.

Report Shortcuts

Modifier + key	Hold down the modifier (such as Shift or Ctrl) and press the key.

The following shortcut key combinations are available when a Report window is open:

Ctrl + A	Select all traces
Ctrl + C	Copy selected trace
Ctrl + V	Paste
Ctrl + X	Cut selected trace
Ctrl + Y	Redo insert report
Ctrl + Z	Undo insert report
Delete	Delete

Choosing the View Navigation Options

New mouse button and modifier key assignments (hotkeys) have been added for navigating the model view (rotate, pan, and zoom functions). Simultaneously, legacy hotkeys for these functions continue to be supported by default. Optionally, you can choose to disable the legacy view navigation shortcuts that were applicable to version 2023 R2 and earlier, as follows:

1. Access the *Options* dialog box using one of the following two methods:
   - From the menu bar, click **Tools** > **Options** > **General Options**.
   - From the **Desktop** ribbon tab, click **General Options**.
2. In the tree at the left side of the dialog box, select **General** > **User Interface**. Then:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To use either the legacy or current view navigation buttons and hotkey combinations, select **Enable Legacy View Navigation**. This option is selected by default.
- To use only the current view navigation behavior and disable legacy button/hotkey support, ensure that **Enable Legacy View Navigation** is cleared.

3. Click **OK**.

   The navigation option change becomes effective immediately (no program restart required).

Current vs. Legacy View Navigation

The following table summarizes changes in mouse-button and hotkey assignments between the current scheme (version 2024 R1 and newer) and the legacy scheme. "*Legacy*" assignments are applicable to version 2023 R2 or earlier and when the *Enable Legacy View Navigation* option is selected in newer versions):

> **Note:**
>
> The *"Current"* assignments are available whether or not the *Enable Legacy View Navigation* option is selected:

Function	Key / Mouse Button Assignment	
	Current	**Legacy**
Pan (all contexts)	Ctrl + MMB + drag or Ctrl + *arrow keys*	Shift + LMB + drag or Ctrl + *arrow keys*
Rotate (3D contexts)	MMB + drag or Alt + *arrow keys*	MMB + drag or Alt + LMB + drag or Alt + *arrow keys*
Zoom (all contexts)	Wheel or	Wheel or

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

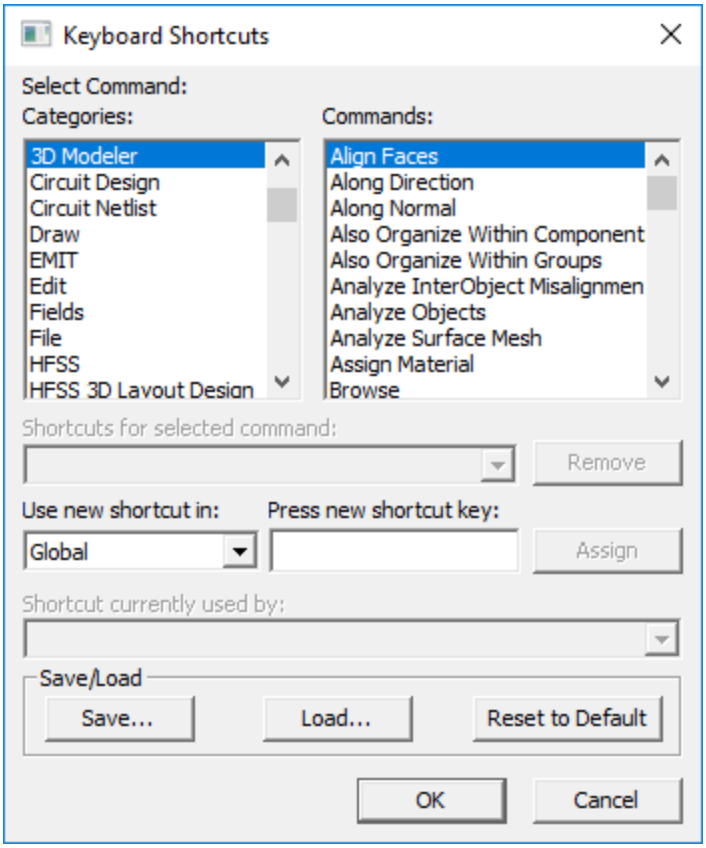
Function	Key / Mouse Button Assignment	
	Current	**Legacy**
	Shift + MMB + drag or Ctrl + "+", Ctrl + "-"	Alt + Shift + LMB + drag or Ctrl + "+", Ctrl + "-"

- "**LMB**" = Left Mouse Button
- "**MMB**" = Middle Mouse Button
- "**Wheel**" refers to rotation of the mouse wheel.
- In some 2D contexts, where rotation is not applicable, you can use **MMB + drag** to pan the view for either scheme.
- For **Alt +** ***arrow keys***, rotation is about a vertical or horizontal axis, regardless of the model view orientation.
- For zooming, if using the "=\+" key, instead of the "+" key on the numeric keypad, do **not** press Shift.

Custom Keyboard Shortcuts

Click **Tools** > **Keyboard Shortcuts** to open the **Keyboard Shortcuts** window. Here, you can view existing assignments, create new shortcuts, and save or load assignment files.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Selecting a **Command Category** populates the **Commands** list with the available commands for that category. If the command has an assigned shortcut, it is displayed in the **Shortcuts for the selected command** field. You can use the **Remove** button to disable the shortcut for the selected command. If the selected command does not have an assigned shortcut, the **Shortcuts for selected command** field and the **Remove** button are unavailable.

To create a new shortcut key:

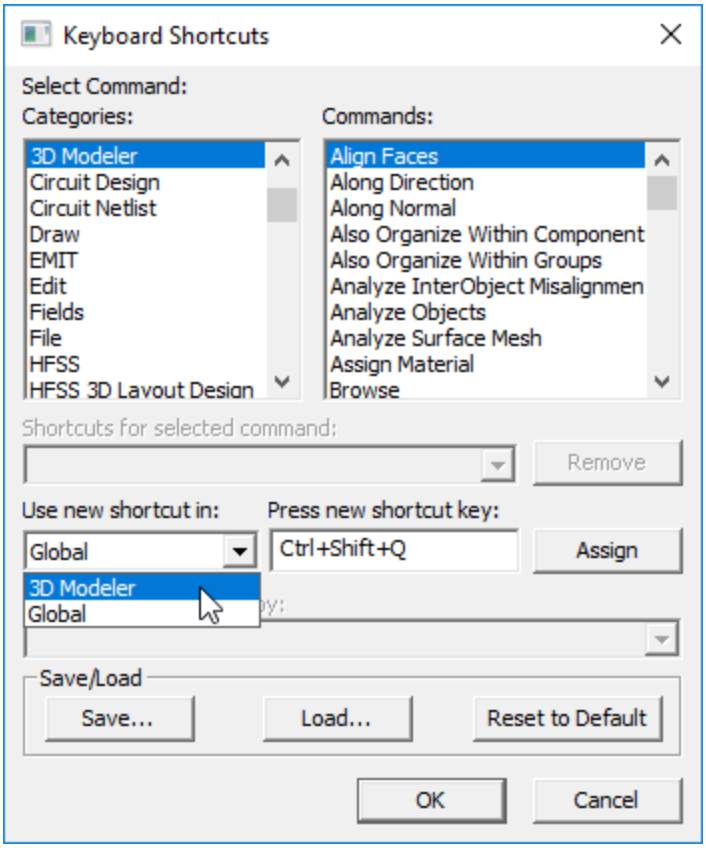
1. Select the **Category** and **Command**.
2. If you want to disable a current assignment for the selected command, click **Remove**.
3. To assign a keyboard shortcut, place the cursor in the **Press new shortcut key** field.

   The field displays the keystrokes you make. When you have made keystrokes, the **Assign** button becomes available. If you combine keystrokes, these are displayed with a plus sign (+) between them. For example, Ctrl+P or Alt+O.

   If the shortcut you select is currently in use, that information displays in the **Shortcut currently used by** field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. The **Use new shortcut in** drop-down list displays **Global** by default, which means that the shortcut will apply to all applicable contexts. If a limited context exists, the menu offers a selection.



5. When you have made your desired assignments, you can save them to a named file.

   Click **Save...** to save the assignments to your desired location in Ansoft Keyboard Shortcut (*.aks) format.

   If you have an existing *.aks file, use the **Load...** button to locate and select the file.

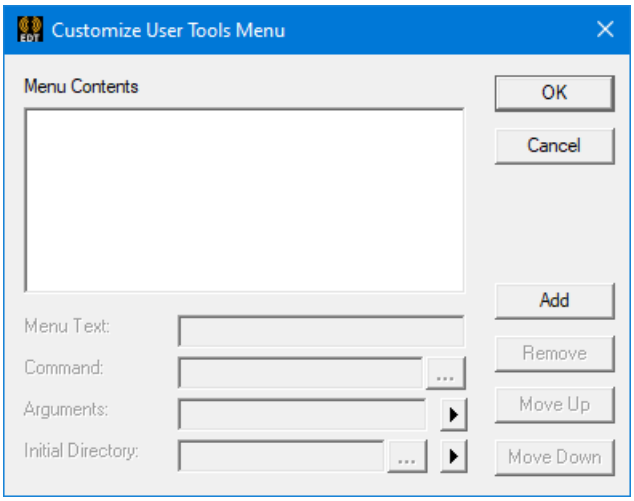
6. Click **OK** to save the current settings, or **Reset to Default**.

Adding External Tools

To add an **ExternalTools** menu to Ansys Electronics Desktop:

1. Click **Tools** > **External Tools**. This displays the **Customize User Tools Menu** dialog box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



If a **User Tools** menu has been previously defined, its contents are displayed in the **Menu Contents** window. Navigation buttons allow you to **Add**, **Remove**, **MoveUp** and **MoveDown** items which are displayed in the **Menu Contents** window.

2. Click **Add**. This enables the following fields:

   Menu Text — Displays the text you want to appear in the **UserTools** menu.

   Command – Displays the external executable. Click the browse button to navigate to the file location.

   Arguments – Specifies the argument to be associated with the command. Click the right-arrow button to choose from the following: File Path, File Directory, File Name, File Extension, Project Directory, or Temp Directory.

   Initial Directory – Specifies an initial directory for the command to operate in. Click the browse button to navigate to the file location. Click the right-arrow button to navigate through your desktop or across the network.

3. Click **OK** to add the **ExternalTools** menu to Ansys Electronics Desktop, or click **Cancel** to close the dialog box without changes.

Note:

To execute a custom script using the **ExternalTools** customization, enter the name of the program that will execute the script in the **Command** field and enter the location of the script in the **Arguments** field. For example:

For Windows, enter the name of the non-graphical Windows Script Host — 'cscript' — in the **Command** field and enter the location of the script in the **Arguments** field:

Arguments: C:\scripts\myscript.py

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Using the Password Manager to Control Access to Resources

Ansys Electronics Desktop lets you specify library resources that require password access, and encryption of those resources. For convenience, the same password can apply to multiple resources. To access the **Password Manager,** click **Tools** > **Password Manager**. This displays the **Password Manager** window.

To Specify a New Password Protected Resource

1. Click **Tools** > **Password Manager**.
2. Click **New**.

   This opens the **New Encrypted Resource** dialog box.

3. Specify the name of the resource that you want to protect and click **OK**.

   This displays the **Enter Passwords** window, which contains radio buttons to let you:

   - Enter Password and confirm for **Full Access** or for **Execute Only Access**.
   - **Use Ansys Password** (for execute only). This option does not require you to enter a password, but still encrypts the library.

4. Once you have selected a radio button and specified any necessary passwords correctly, click **OK**.

   The **Password Manager** updates to show the resource.

To Encrypt a Resource

1. Click **Tools** > **Password Manager**.
2. The **Password Manager** window appears.
3. In the Password Manager, select an existing resource to highlight it.
4. Click **Encrypt File**.

   A file browser window appears.

5. Use the drop-down menu to select the appropriate **Files of Type** filter.

   Any existing resources in the selected directory will appear.

6. When you have selected the appropriate resource, click **OK**.

   This encrypts the resource.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> The **Expire** resource on option lets you select the date when the password expires for the relevant resource.

Running Ansys Electronics Desktop from a Command Line

Ansys Electronics Desktop includes line arguments that can be included when launching from a command line or terminal prompt. All command-line arguments are case-insensitive. The commands associated batch options can also be used with a Job Management Interface for submitting jobs to Ansys or RSM and other supported schedulers.

Command-line Syntax

```
ansysedt <options> <run command(s)> <project file/script file>
```

It is good practice to put quotation marks around the path to the solver executable, and around the full path to the project. This ensures that spaces in the path or project will not be an issue. The same is true of the design name, if there are spaces.

Run Commands

The following command line run commands are available for Ansys Electronics Desktop. Of the commands (BatchSave, BatchSolve, BatchExtract, RunScript, RunScriptandExit), one or none must be specified as arguments after the solver executable. When none is specified, you may specify a project or archive to open when Electronics Desktop launches, and can only use the **-Iconic** and **-Help** options. The commands are further described below:

- **-BatchSave** [options] **<***file or folder specifier***>**

  Saves a named project or folder containing one or more project files or folders to the current version. You can run this command with the **-Iconic**, **-Logfile**, and **-ng** options.

  If no migration is necessary (*e.g.* a project containing a circuit design): The original file will be overwritten with the new version, and no backup will be made.

  Special behavior when opening backed up files from the user interface: Files located in the AnsysEM_Backup directory would be the original non-migrated files that were backed up during an earlier –batchsave or open. Opening a file located in the AnsysEM_Backup directory via the open file dialog box will invoke the Parasolid migration, and the migrated file will be saved in the parent folder of the AnsysEM_Backup folder with a unique name so as not to overwrite any existing files.

  If a ***file*** is given, **-batchsave** will run on the specified file.

  If a ***folder*** is given, **-batchsave** will run on all files underneath the specified folder.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

.aedt, .aedtz, and .a3dcomp files will be processed.

Allowed options:

norecurse: only process files in top level of input folder

forcearchive: project files are converted, then saved as archive files.

previewonly: don't perform actual conversion, instead write preview of filenames to batchlog.

outputfolder=<outputfolder>: save converted files to <outputfolder>, preserving subfolder structure.

- **-BatchSolve <***project file name***>**

  By default, this run command solves all adaptive setups, Optimetrics setups, and sweeps found in the project file. You can run this command with the **-Iconic**, **-Logfile**, **-ng**, and **-WaitForLicense** options. If parallel solve is possible, you can use the **-Distribute** option.

  If you wish to specify which setups **-BatchSolve** completes, you can use additional parameters:

  - **[*designName*]** – batch solve all setups for the specified design in the project file.
  - **[*designName*]:Nominal** – batch solve all nominal setups for the specified design in the project file.
  - **[*designName*]:Optimetrics** – batch solve all Optimetrics setups for the specified design in the project file.
  - **[*designName*]:[*Nominal/Optimetrics*]:[*SetupName*]** – batch solve the specified Nominal or Optimetrics setup in the specified design.

  If you wish to specify whether **-BatchSolve** setups are completed locally or remotely, you can use the following options:

  - **-Local** – performs the **-batchsolve** on the local machine.
  - **-Remote -machineList** – performs the **-batchsolve** on a remote machine. The <*machineList*> should provide a single hostname.
  - **-Distributed -machineList** – performs a distributed **-batchsolve** using a specified machine list.

    The **-machineList** parameter for a **-Distributed** setup can be formatted three ways:

    - **-MachineList list= "<***machine1***>, <***machine2***>, ..."** – machine names (either by IP address or hostname) are separated by commas. If the list contains any whitespace, it must be enclosed in quotation marks. The number of distributed COM engines run on each host is equal to the number of times the hostname appears in the list. That is, if host1 appears in the list

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

once, and host2 appears twice, then one COM engine will run on host1 and two COM engines will run on host2.

list= accepts the following additional modifiers:

<*MachineName***>:<***TasksOnMachine***>:<***CoresOnMachine***>:<***RAM Limit in %***>:<***GPUsOnMachine***>**

Duplicate machine names are not permitted. The integer for <*CoresOnMachine*> must be greater than the integer for <*TasksOnMachine*>. RAM% must be of the form "<num>%" where num is an integer between 1 and 99. Please be sure to leave sufficient RAM for the operating system and applications. If -auto is specified with a machine list, the number of tasks for each machine must be -1.

Example:

```
list="Orion:4:8:90%:1, Aries:3:12, Pluto:6:12"
```

> **Note:**
>
> Duplicate machines are not allowed when specifying these additional modifiers. The number of cores must be greater than the number of tasks.

- **-MachineList file= "<***machineListFilepath***>"** – machine names (either by IP address or hostname) are listed in a file (one per line), and you specify the filepath. The number of distributed COM engines run on each host is equal to the number of times the hostname appears in the file. That is, if host1 appears in the file once, and host2 appears twice, then one COM engine will run on host1 and two COM engines will run on host2.

  file= accepts the following additional modifiers, in the file itself:

  <*MachineName***>:<***TasksOnMachine***>:<***CoresOnMachine***>:<***RAM Limit in %***>:<***GPUsOnMachine***>**

  Duplicate machine names are not permitted. The integer for <*CoresOnMachine*> must be greater than the integer for <*TasksOnMachine*>. RAM% must be of the form "<num>%" where num is an integer between 1 and 99. Please be sure to leave sufficient RAM for the operating system and applications. If -auto is specified with a machine list, the number of tasks for each machine must be -1.

  Example:

  ```
  "Orion:4:8:90%:1",
  ```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
"Aries:3:12",
"Pluto:6:12",
```

> **Note:**
>
> Duplicate machines are not allowed when specifying these additional modifiers. The number of cores must be greater than the number of tasks.

- **-MachineList num= "<***numberofDistributedEngines***>"** – This format is used when a scheduler (such as LSF, PBS, SGE or HPC) is used to manage the jobs sent to a cluster of hosts. In a scheduler environment, you can specify the number tasks for distributed processing. In this case, you do not specify the machine names after the flag because the names are provided by the scheduler. For example, in the Windows HPC environment, you can write the number of tasks as follows:

  ```
  -MachineList num=4
  ```

Distributed setups can also take the following optional arguments. When these are not present, the behavior defaults to single-level distributed solutions with no change in order of precedence among possible distribution types.

The arguments are:

- **includeTypes= <***default***>|<***distribution type 1, distribution type 2***, ...>** – If included distribution types are specified, only the listed distribution types are enabled. If default is specified, the default set of enabled distribution types is used. To see valid distribution types for your design, click **Simulation** > **Analysis Config** to open the **Analysis Configuration** window and view the types on the **Job Distribution** tab.

  If the list contains any whitespace, it must be enclosed in quotation marks. For example:

  ```
  "includeTypes=Frequencies,Mesh Assembly"
  ```

- **excludeTypes= <***default***>|<***distribution type 1, distribution type 2***, ...>** – If excluded distributed types are specified, all distribution types except those listed will be enabled. If default is specified, the default set of enabled distribution types is used. To see a valid distribution types for your design, click **Simulation** > **Analysis Config** to open the **Analysis Configuration** window and view the types on the **Job Distribution** tab.

  If the list contains any whitespace, it must be enclosed in quotation marks. For example:

  ```
  "excludeTypes=Frequencies,Mesh Assembly"
  ```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **maxLevels= <**1 | 2**>** – the maximum number of levels of job distribution (the current maximum is 2). See: Selecting Optimal Configurations for Distributed Analysis.
- **numLevel1=** – when two-level distribution is selected (**maxLevels=2**), this specifies the number of level 1 tasks.

-Auto [**NumDistributedVariations=<***num***>**]

This flag enables automatic HPC settings and must be used with one of the following options:

- **-machinelist list=**<*machine list*>, with tasks for each machine set to -1
- **-machinelist numcores=**<*num*>, under a scheduler

All design types being solved must support **-auto** or the solve will be aborted.

The NumDistributedVariations option can be used to specify the number of optimetrics variations to solve simultaneously. The default is to solve optimetrics variations sequentially.

Arguments with **-auto** in a scheduler environment:

- **numcores=**<*total number of cores*>

  Total number of cores, and can be used only with -auto and in a scheduler environment.

- **file="**<*tmachine list file path*>**"**

  The specified file can contain line delimited machine specifiers as described above.

- **num=**<*tnum distributed tasks*>

  This is the total number of tasks and used only in a scheduler environment.

- **numgpus=**<*tnumber of GPUs to use*>

  This is the total number of GPUs and used only in a scheduler environment. numgpus must be combined with either **num=** or **numcores=**.

  You can also specify how a **-BatchSolve** distributes Optimetrics variations:

- **-auto** – Without additional parameters, the batch log file will specify that Optimetrics variations be solved sequentially. If -auto is specified with a machine list, the number of tasks for each machine must be -1.
- **-auto NumDistributedVariations=<***num***>** – You can specify an integer value greater than 1. This is the number of variations that will be solved in parallel.

- **-BatchExtract <***BatchExtract script file name***> <***project file name***>** – allows the following commands to be executed non-graphically via script and without checking out any GUI licenses:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- ExportProfile
- ExportConvergence
- ExportMeshStats
- ExportNetworkData
- ExportNMFData
- ExportEigenmodes
- ExportTransientData
- Update Reports
- ExportToFile

A project file *must* be specified when **-BatchExtract** is used. Commands in the script file will only be executed in the specified project.

> **Important:**
>
> - **-ng** must be used with **-BatchExtract**, or it will fail.
> - Only the scripts listed above are supported for **-BatchExtract**. Including unsupported script commands will terminate script execution.

- **-RunScript <***script file name***>** – runs the specified script. You can use the **-ScriptArgs** option to add one or more arguments to this command, and the **-Iconic** option.
- **-RunScriptAndExit <***script file name***>** – runs the specified script and exits Electronics Desktop. You can use the **-ScriptArgs** option to add one or more arguments to this command. You can also use **-Iconic**, **-Logfile**, and **-WaitForLicense**.

> **Note:**
>
> **-BatchSolve <***DesignName***>** is mutually exclusive with **-RunScriptAndExit <***ScriptName***>**.

- **-monitor** – during non-graphical analysis, you can monitor progress and messages. Progress, warning and info messages are logged to the standard output stream. Error and fatal messages are logged to the standard error stream. Schedulers intercept these streams and provide commands for display of this output. See individual scheduler documentation for specifics.
- **-grpcsrv** – For external cpython scripting support. If not specified with **ansysedt.exe**, the Start GRPV server listens on a port in the default range 50051:51051. If specified, Start GRPV server listening on the the specified port number. An error is issued if the port is already used. For example:

```
ansysedt.exe // Start GRPV server listening on a port in
the default range 50051:51051.
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
ansysedt.exe -grpcsrv portnumber // Start GRPV server
listening on the the port number. error if the port
already used.
ansysedt.exe -grpcsrv 50051:50150 // Start GRPV server
listening on a port range 50051:50150.
ansysedt.exe -grpcsrv 50051:100 // Start GRPV server
listening on a port range 50051:50151.
```

Job Management from the Command Line

- **-showmonitorjob** – Launch the monitor job dialog.
- **-showsubmitjob** – Launch the submit job dialog.
- **-showselectscheduler** – Launch the select scheduler dialog.

Run Command Examples

A distributed **-BatchSolve** of a specified design's Optimetrics setups, with a specified machine list:

```
C:\Program Files\ANSYS Inc\v252\AnsysEM\ansysedt -distributed -
machinelist list="255.255.1.1,255.255.1.2" -batchsolve
myDesign:Optimetrics "C:\myProject.aedt"
```

A **-BatchExtract** operation using paths to a script file and a project file:

> **Note:** The example is for an HFSS project. The path, project and design names will vary depending on what the user specifies.

```
ansysedt -ng -batchextract exportToFile.py "C:\Program Files\ANSYS
Inc\v252\AnsysEM\Examples\ElectronicsDesktop\HFSS\RF
Microwave\OptimTee.aedt"
```

Where exportToFile.py contains:

```
oDesktop.RestoreWindow()
oProject = oDesktop.SetActiveProject("OptimTee")
oDesign = oProject.SetActiveDesign("HFSSDesign1")
oModule = oDesign.GetModule("ReportSetup")
oModule.UpdateReports(["XY Plot 1"])
oModule.ExportToFile("XY Plot 1", "exportToFilePy.csv")
```

A **-BatchSolve** of a specified design's nominal setups, run in a minimized window, with a specified log file:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
ansysedt -Iconic -LogFile "H:\Logs\mylog.log" -BatchSolve
myDesign:Nominal "H:\Projects\MyProject.aedt"
```

Specifying Project Files

Specifying a project file opens that project when Electronics Desktop launches. If **-BatchSolve** is set, the project will also be solved.

You can specify an archive file instead of a project file. If **-Batchsolve** is set, the project will be automatically restored and solved. Otherwise, you are prompted for a restore location, and the project will be restored and opened.

When a **-Batchsolve** is being performed on an archive file, you may also specify **-archiveoptions**:

- **overwritefiles** – allows non-project/results-extracted files to overwrite existing files.
- **path= <***projectFilepath***>** – extracts the project file and associated files to the specified path. If not specified, the archive will be extracted into the same directory as the archive file.
- **repackageresults** – Add batchsolve results back to archive file.
- **winpath= <***windowsProjectFilepath***>** – specifies the Windows-specific path to the extracted project file. This is used when a batch job is to be run on a Linux system, but monitored on Windows.

Options

The following options can be associated with one or more of the run commands:

- **-autoextract** – exports profile (as text), convergence (as text), and report data (as CSV) for the requested project/design/setup in a batch job. Once the solve is complete, an export directory is created (for example, "Project1.aedtexport" for a project named "Project1.aedt") that contains a subrectory for each design name. You can also specify `-autoextract "reports, fieldplots"` to also generate *.aedtplt files for each field plot and possible *.avz file (for import and display in Ensight) for all valid field plots. Export files reside within each design-name directory, and include setup name, design variation, job ID, and problem type, as applicable.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

- The -autoextract option is only valid when used with -BatchSolve
- The -autoextract option is automatically added for all Ansys Cloud Burst jobs submitted from Electronics Desktop. There is also an additional "reports" and/or "fieldplots" option that immediately follow "-autoextract". This causes all reports to be exported as CSV files at the end of the batch solve, after the profile and convergence have been exported.
- For example, you can specify `-autoextract "reports, fieldplots"` to also generate *.aedtplt files for each field plot and possible *.avz file for all valid field plots.

- **-batchoptions** – for batch jobs, specifies any of the options in **Tools** > **Options**. See additional information.
- **-batchoptionhelp** – opens a window showing -batchoptions help. The paths shown in this window can be used with batchoptions and the Update Registry Get and Set commands. See: Setting or Removing Option Values in Configuration Files: UpdateRegistry Command.
- **-distribute** – distributes a batch solve to multiple machines. This option must be combined with the **-BatchSolve** run command. See: Distributed Analysis.
- **-help** – opens a window displaying command line options. This can only be used without a run command.
- **-iconic** – runs Electronics Desktop with the window iconified (minimized).
- **-logfile <***filePath***>** – specifies a log file. If none is specified, <project_name>.log will be written to the <project_name>.batchinfo directory.
- **-monitor** – enables batch job output to standard output and standard error streams.
- **-ng** – runs Electronics Desktop in non-graphical mode. This *must* be used with the **-BatchExtract** command. For the ansysedtng beta option, see: Running Ansys Electronics Desktop from a Command Line (Nongraphical) Beta.
- **-validateonly** – If true, validation will be performed, but none of the setup will be solved. Allowed values: true, "= 1", false, "= 0".
- **-waitforlicense** – directs Electronics Desktop to wait for unavailable licenses.
- **-scriptargs** – used in conjunction with **-RunScript** or **-RunScriptAndExit**, adds arguments to the specified script. You can pass multiple arguments to **-scriptargs** by surrounding the arguments in quotation marks. For example:

  ```
  ansysedt.exe -scriptargs "Design1 Setup1" -RunScriptAndExit
  C:\temp\test.py
  ```

  In Python, the command line parameter following **-scriptargs** is passed without modification as a single string in the ScriptArgument python variable.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In either case, **Design1** is taken into Electronics Desktop as the first argument, and **Setup1** as the second argument. If you failed to use quotation marks, **Design1** would be taken as the first argument and **Setup1** would not be understood by Electronics Desktop.

-Batchoptions

All options that are specified through **Tools** > **Options** go into the user-level registry.

> **Note:**
>
> - Options are arranged as keys and values (in a structure similar to the *Windows Registry*). However, these options are not a part of the *Windows Registry* but are separately stored and maintained by the Ansys Electronics Desktop software.
> - For access to options and functionality beyond what is directly accessible via the user interface or batch options, refer to the documentation of the **UpdateRegistry** tool. This tool is discussed in the following help topic and in the topics that follow it in the same branch of the product help:
>
>   Setting or Removing Option Values in Configuration Files: UpdateRegistry Command

You can override the option registry entries via the **-batchoptions** command line. These overrides apply only to the current Desktop session. The registry setting overrides may be specified on the command line, or may be in a file with the file pathname specified on the command line. Batch jobs can be submitted from the command line or through Electronics Desktop's job submission window.

Large Scale DSO offers two new batchoptions related to the redistribution ability.

- LargeScaleDSO/VarRedistribution, where 0 disables redistribution (default), and 1 enables it.
- LargeScaleDSO/RedistributionLimit, is a positive integer specifying the minimum estimated remaining time (in minutes) for variations to redistribute to another task. The default is 3.

> **Note:**
>
> **-batchoptions** is only valid for batch jobs. It is ignored if you have not specified **-BatchSolve**, **-BatchSave**, or **-BatchExtract**.

-Batchoptions Examples

The batchoption **CreateStartingMesh** is available for the following products:

HFSS, HFSS-3DLayout, Icepak, Q3D, Q2D, Maxwell3D, Maxwell2D, and Mechanical.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When this option is set, only the initial mesh and manual mesh operations are completed for the batch solution.

> **Note:**
>
> No adaptive meshing occurs for any Icepak or Mechanical solutions. Therefore, after solving, the final mesh will be identical to the starting mesh for these two design types.

This example enables CreateStartingMesh for HFSS, and runs a batch solution of the specified project:

```
ansysedt -batchoptions "'HFSS/CreateStartingMesh'=1" -batchsolve
"D:\projects\MyProject.aedt"
```

See: Additional Examples of -Batchoptions Use.

Export Options Files

The **Tools** > **Options** > **Export Options Files** command writes XML files containing the options settings at all levels to the specified directory. This feature is intended to make it easier for different users to use Ansys Electromagnetics Suite 2025 R2 installed on shared directories or network drives. See: Example Uses for Export Options Features.

Examples and Further Explanations of -batchoptions Use

This section provides further examples and explanations of -batchoptions.

- Example with registry settings specified on the command line
- Example with registry settings specified in a file
- When to Use the -batchoptions Desktop Command Line Option

The following examples use general Desktop and HFSS-specific settings. This feature is available for all desktop products.

- The registry path separator is the slash (/) character.
- Each complete registry key (that is, a registry path and option name) is enclosed in single quotes.
- Registry string values are enclosed in single quotes.
- After the -batchoptions switch, the set of registry keys and values that follows it must be enclosed in double quotes. However, if a batchoptions file is referenced (instead of listing the options directly on the command line), the double quotes are not used around the filename.
- Backslashes in registry key string values must be escaped with another backslash (\\ ), since a backslash by itself is an escape code within strings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Example with registry settings specified on the command line

```
ansysedt.exe -batchsolve -batchoptions
"'Desktop/Settings/ProjectOptions/NumberOfProcessors'=4
'HFSS/NumCoresPerDistributedTask'=2   (* This option is not
currently available from the Add Batchoption dialog box.)
'Desktop/ProjectDirectory'='C:\\projects\test'" projectname.aedt
```

This command line overrides registry values of the NumberOfProcessors (Desktop/Settings/ProjectOptions key) and ProjectDirectory (Desktop key) options.

Note:

- Multiple registry settings may appear in a single -batchoptions value, separated by whitespace.
- The -batchoptions value must be enclosed in double quotes if it contains any whitespace.

Example with registry settings specified in a file

```
ansysedt.exe -batchsolve -batchoptions <filename>
projectname.aedt
```

where the referenced file, <*filename*>, contains:

```
$begin 'Config'
  'Desktop/Settings/ProjectOptions/NumberOfProcessors'=4
  'HFSS/NumCoresPerDistributedTask'=2
  'Desktop/ProjectDirectory'='C:/projects/test'
$end 'Config'
```

This command overrides the registry values of the NumberOfProcessors (Desktop/Settings/ProjectOptions key), NumCoresPerDistributedTask (HFSS key), and ProjectDirectory (Desktop key) options. These overrides apply only to the current Electronics Desktop session.

Note:

- The -batchoptions **<*filename*>** value must be enclosed in double quotes if it contains whitespace
- The **$begin 'Config'** and **$end 'Config'** lines are required

For additional options you can override from the command line with **-batchoptions**, see:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For -batchoptions Use: Project Directory and Lib Paths
- For -batchoptions Use: TempDirectory
- For -batchoptions Use: Various Desktop Settings

When to Use the -batchoptions Desktop Command Line Option

You can set analysis parameters for batch mode jobs using the graphical user interface (GUI). For example, you can set all options for a batch job using the **Add Batch Option** dialog box, which is accessed through the **Submit Job To** dialog box. These parameter settings include the following solver options (several examples, not a complete list):

- HPCLicenseType
- tempdirectory
- Desktop/AutoExtractReports
- Desktop/Settings/ProjectOptions/MumberOfProcessors
- <*design_type*>/DefaultProcessPriority
- <*design_type*>/EnableGPU and/or EnableGPUForEye – Applicable to Circuit Design, EMIT, HFSS, HFSS 3DLayout, and Maxwell 3D (also EnableGPUForSBR for HFSS only)
- <*design_type*>/MPIVendor (either “Intel” or “Microsoft”) – Applicable to HFSS, HFSS 3DLayout, Icepak, Maxwell 2D, Maxwell 3D), and Q3D

For graphical analyses that do **not** use batch mode, you specify the analysis parameters using the GUI (**Tools** > **Options** > **General Options** or **HPC and Analysis Options**). These settings are written to the registry when you exit the Electronics Desktop program. The settings are read from the registry when the application is started. Therefore, when you start the Electronics Desktop application, all settings retain the values from the previous session of the same user on the same machine. If there was not a previous session of the same user on the same machine, then the values are obtained from other registry configuration files or from a default value.

When running a batch analysis, any setting that is not specified using the **-batchoptions** command line option is taken from the registry. This value is typically the setting from the last session of the same user on the same machine. However, the **-batchoptions** command line option allows you to override the parameter with values specified on the command line or in a batchoptions file. The values specified using the **-batchoptions** command line option only apply to the batch job, and do not affect the parameter values stored in the registry.

If important **-batchoptions** values are not specified when running a batch job, the paramaters could be affected by an interactive session running on the same host by the same user. Parameter changes can occur if the user sets an option in the GUI and then exits the program, or if another process that accesses the registry exits. To be sure of the desired batch job outcome, avoid changing options in concurrent interactive sessions or include the desired -batchoptions in the command line.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For -batchoptions Use: Project Directory and Lib Paths

The PersonalLib, syslib and userlib settings are a little different from other settings. If the final directory name is different from what is expected, then PersonalLib, syslib or userlib is appended as a final directory. In addition, these settings may come from a different registry value if the registry values shown above are not set.

Registry Key	Default Value	Units or Values	Description
Desktop/ProjectDirectory	subdirectory of user's HOME directory or “Documents” directory	Directory pathname	Directory where new projects are created
Desktop/PersonalLib	PersonalLib subdirectory of user's HOME directory or “Documents” directory	Directory pathname	Directory PersonalLib is appended if final directory is not PersonalLib
Desktop/syslib	syslib subdirectory of installation directory	Directory pathname	Directory syslib is appended if final directory is not syslib
Desktop/userlib	userlib subdirectory of installation directory	Directory pathname	Directory userlib is appended if final directory is not userlib

For -batchoptions Use: TempDirectory

Registry Key	Default Value	Units or Values	Description
TempDirectory	Set by installer	-	Directory for temporary files

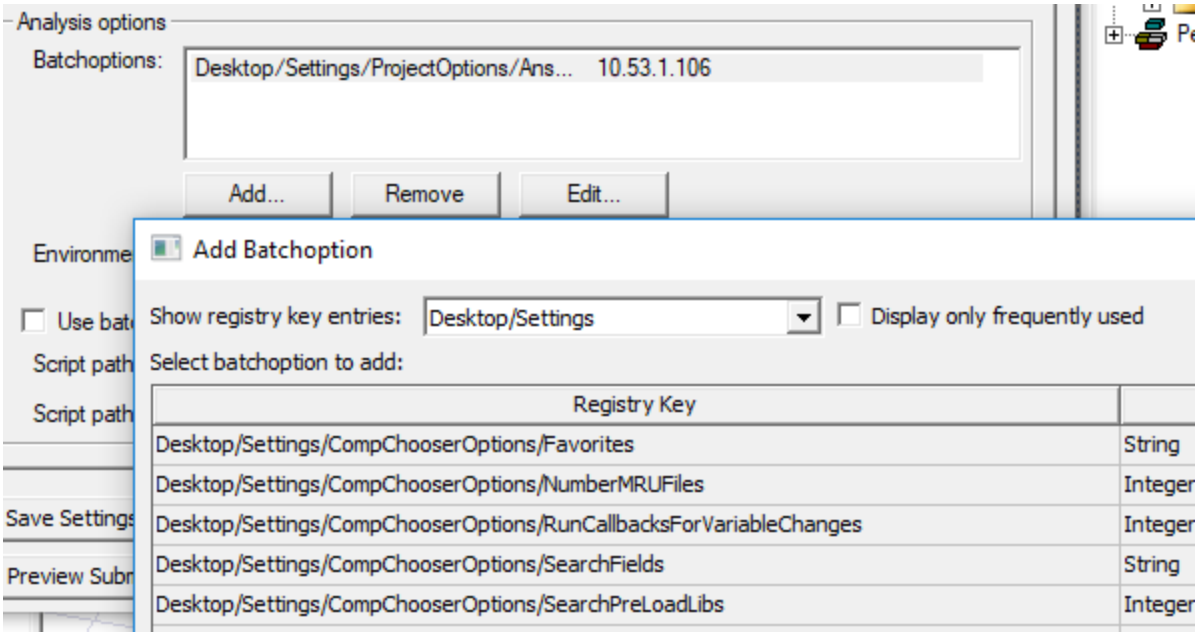
For -batchoptions Use: Various Desktop Settings

Note that most of these options only affect the GUI. To view these options from the *Submit Job To* window:

1. In the *Analysis options* area of the *Submit Job To* window, click **Add...**.
2. In the *Add Batchoption* window that appears, select **Desktop/Settings** from the **Show**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

registry key entries drop-down menu.



Registry Key	Default Value	Units or Values	Description
Desktop/Settings/ProjectOptions/AnimationMemory	200	Megabytes (MB)	Stop animations when available memory falls below this value
Desktop/Settings/ProjectOptions/AnsoftCOMPreferredIPAddress (see note below table)	“” (empty string)	IP address (as a string)	IP address used to connect from COM engines to ansysedt.exe

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Registry Key	Default Value	Units or Values	Description
Desktop/Settings/ProjectOptions/AnsysEMPreferredSubnetAddress (see note below table)	“” (empty string)	IP address (as a string)	Subnet used to connect COM engines to ansysedt.exe – allowed formats are: • IPv4 network prefix in CIDR notation Example: 123.123.123.0/24 • IPv4 network prefix with /subnet mask appended Example: 123.123.123.0/255.255.255.0
Desktop/Settings/ProjectOptions/AutoSaveInterval	10	edits	Number of edits to allow between autosaves
Desktop/Settings/ProjectOptions/AutoShowMessageWindow	1 (true)	0 (false) or 1 (true)	Show message window on new messages
Desktop/Settings/ProjectOptions/AutoShowProgressWindow	0 (false)	0 (false) or 1 (true)	Show progress window when starting a simulation
Desktop/Settings/ProjectOptions/DiskLimitForAbort	0	Megabytes (MB)	A warning is issued when available disk space falls below this value
Desktop/Settings/ProjectOptions/DoAutoSave	1 (true)	0 (false) or 1 (true)	Enables autosaves if true
Desktop/Settings/ProjectOptions/DrawStateIconsInProjectTree3	1 (true)	0 (false) or 1 (true)	Change icon when selection does not match active window

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Registry Key	Default Value	Units or Values	Description
Desktop/Settings/ProjectOptions/ExpandMessageTreeOnInsert	1 (true)	0 (false) or 1 (true)	Ensure that new messages are visible in the message window tree
Desktop/Settings/ProjectOptions/ExpandOnInsert	0 (false)	0 (false) or 1 (true)	Expand project tree on insert
Desktop/Settings/ProjectOptions/HighlightActiveContextInProjectTree2	1 (true)	0 (false) or 1 (true)	Emphasize active command context (menu and toolbars)
Desktop/Settings/ProjectOptions/SavePreviewImagesInProject File	1 (true)	0 (false) or 1 (true)	Save preview images in project file
Desktop/Settings/ProjectOptions/UpdateReportOnFileOpen	0 (false)	0 (false) or 1 (true)	Update reports on file open

Note:

The preferredIP address and preferred subnet address settings are mutually exclusive. If both are specified to be non-empty strings, then the preferred IP address takes precedence, and the preferred subnet address is ignored. This feature is typically used for cluster environments using batch solves. The setting can be made via batchoptions but can also be done via UpdateRegistry.

Batchoptions: Override Registry Entry

Any registry entry can be overridden via a command-line option.

Example: batchoptions specified on a command line

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
ansysedt -batchsolve -batchoptions
"'Desktop/Preferences/ProjectOptions/NumberOfProcessors'=4 'HFSS 3D
Layout Design/NumCoresPerDistributedTask'=2" projectname.aedt
```

Example: batchoptions specified in a file

```
ansysedt -batchsolve -batchoptions numprocfile projectname.aedt
```

where numprocfile contains

```
$begin 'Config'
  'Desktop/Preferences/ProjectOptions/NumberOfProcessors'=4
  'HFSS 3D Layout/NumCoresPerDistributedTask'=2
$end 'Config'
```

Running Ansys Electronics Desktop from a Command Line (Nongraphical) Beta

> **Note:**
>
> Running Electronics Desktop using the ansysedtng command is currently a beta feature. For information on enabling beta options, see General Options: Desktop Configuration.

Ansys Electronics Desktop includes line arguments that can be included when launching from a command line or terminal prompt. All command-line arguments are case-insensitive. The commands associated batch options can also be used with a Job Management Interface for submitting jobs to Ansys or RSM and other supported schedulers.

> **Note:**
>
> Linux users whose installations lack a MainWin home directory receive an error when running the ansysedt command. To run Elecronics Desktop from a command line successfully on such Linux machines, use the ansysedtng command and options described in this section.

Command-line Syntax

```
ansysedtng <options> <run command(s)> <project file/script file>
```

It is good practice to put quotation marks around the path to the solver executable, and around the full path to the project. This ensures that spaces in the path or project will not be an issue. The same is true of the design name, if there are spaces.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Run Commands

The following command line run commands are available for Ansys Electronics Desktop. BatchSolve must be specified as arguments after the solver executable. When none is specified, you may specify a project or archive to open when Electronics Desktop launches, and can only use the **-Help** option. The commands are further described below:

- **-BatchExtract <***BatchExtract script file name***> <***project file name***>** – allows the following commands to be executed non-graphically via script and without checking out any GUI licenses:
- ExportProfile
- ExportConvergence
- ExportMeshStats
- ExportNetworkData
- ExportNMFData
- ExportEigenmodes
- ExportTransientData
- Update Reports
- ExportToFile
- A project file *must* be specified when **-BatchExtract** is used. Commands in the script file will only be executed in the specified project.
-
  > **Important:**
  >
  > - Only the scripts listed above are supported for **-BatchExtract**. Including unsupported script commands will terminate script execution.
- **-BatchSolve <***project file name***>**

  By default, this run command solves all adaptive setups, Optimetrics setups, and sweeps found in the project file. You can run this command with the **-Logfile** and **-WaitForLicense** options. If parallel solve is possible, you can use the **-Distribute** option.

  If you wish to specify which setups **-BatchSolve** completes, you can use additional parameters:

  - **[*designName*]** – batch solve all setups for the specified design in the project file.
  - **[*designName*]:Nominal** – batch solve all nominal setups for the specified design in the project file.
  - **[*designName*]:Optimetrics** – batch solve all Optimetrics setups for the specified design in the project file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **[*designName*]:[*Nominal/Optimetrics*]:[*SetupName*]** – batch solve the specified Nominal or Optimetrics setup in the specified design.

If you wish to specify whether **-BatchSolve** setups are completed locally or remotely, you can use the following options:

- **-Local** – performs the **-batchsolve** on the local machine.
- **-Remote -machineList** – performs the **-batchsolve** on a remote machine. The <*machineList*> should provide a single hostname.
- **-Distributed -machineList** – performs a distributed **-batchsolve** using a specified machine list.

  The **-machineList** parameter for a **-Distributed** setup can be formatted three ways:

  - **-MachineList list= "<***machine1***>, <***machine2***>, ..."** – machine names (either by IP address or hostname) are separated by commas. If the list contains any whitespace, it must be enclosed in quotation marks. The number of distributed COM engines run on each host is equal to the number of times the hostname appears in the list. That is, if host1 appears in the list once, and host2 appears twice, then one COM engine will run on host1 and two COM engines will run on host2.

    list= accepts the following additional modifiers:

    <*MachineName***>:<***TasksOnMachine***>:<***CoresOnMachine***>:<***RAM Limit in %***>:<***GPUsOnMachine***>**

    Duplicate machine names are not permitted. The integer for <*CoresOnMachine*> must be greater than the integer for <*TasksOnMachine*>. RAM% must be of the form "<num>%" where num is an integer between 1 and 99. Please be sure to leave sufficient RAM for the operating system and applications. If -auto is specified with a machine list, the number of tasks for each machine must be -1.

    Example:

    ```
    list="Orion:4:8:90%:1, Aries:3:12, Pluto:6:12"
    ```

    > **Note:**
    >
    > Duplicate machines are not allowed when specifying these additional modifiers. The number of cores must be greater than the number of tasks.

  - **-MachineList file= "<***machineListFilepath***>"** – machine names (either by IP address or hostname) are listed in a file (one per line), and you specify the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

filepath. The number of distributed COM engines run on each host is equal to the number of times the hostname appears in the file. That is, if host1 appears in the file once, and host2 appears twice, then one COM engine will run on host1 and two COM engines will run on host2.

file= accepts the following additional modifiers, in the file itself:

<*MachineName*>:<*TasksOnMachine*>:<*CoresOnMachine*>:<*RAM Limit in %*>:<*GPUsOnMachine*>

Duplicate machine names are not permitted. The integer for <*CoresOnMachine*> must be greater than the integer for <*TasksOnMachine*>. RAM% must be of the form "<num>%" where num is an integer between 1 and 99. Please be sure to leave sufficient RAM for the operating system and applications. If -auto is specified with a machine list, the number of tasks for each machine must be -1.

Example:

```
"Orion:4:8:90%:1",
"Aries:3:12",
"Pluto:6:12",
```

> **Note:**
>
> Duplicate machines are not allowed when specifying these additional modifiers. The number of cores must be greater than the number of tasks.

- **-MachineList num= "<*numberofDistributedEngines*>"** – This format is used when a scheduler (such as LSF, PBS, SGE or HPC) is used to manage the jobs sent to a cluster of hosts. In a scheduler environment, you can specify the number tasks for distributed processing. In this case, you do not specify the machine names after the flag because the names are provided by the scheduler. For example, in the Windows HPC environment, you can write the number of tasks as follows:

  ```
  -MachineList num=4
  ```

Distributed setups can also take the following optional arguments. When these are not present, the behavior defaults to single-level distributed solutions with no change in order of precedence among possible distribution types.

The arguments are:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **includeTypes= <***default***>|<***distribution type 1, distribution type 2***, ...>** – If included distribution types are specified, only the listed distribution types are enabled. If default is specified, the default set of enabled distribution types is used. To see valid distribution types for your design, click **Simulation** > **Analysis Config** to open the **Analysis Configuration** window and view the types on the **Job Distribution** tab.

  If the list contains any whitespace, it must be enclosed in quotation marks. For example:
  ```
  "includeTypes=Frequencies,Mesh Assembly"
  ```
- **excludeTypes= <***default***>|<***distribution type 1, distribution type 2***, ...>** – If excluded distributed types are specified, all distribution types except those listed will be enabled. If default is specified, the default set of enabled distribution types is used. To see a valid distribution types for your design, click **Simulation** > **Analysis Config** to open the **Analysis Configuration** window and view the types on the **Job Distribution** tab.

  If the list contains any whitespace, it must be enclosed in quotation marks. For example:
  ```
  "excludeTypes=Frequencies,Mesh Assembly"
  ```
- **maxLevels= <**1 | 2**>** – the maximum number of levels of job distribution (the current maximum is 2). See: Selecting Optimal Configurations for Distributed Analysis.
- **numLevel1=** – when two-level distribution is selected (**maxLevels=2**), this specifies the number of level 1 tasks.

-Auto [**NumDistributedVariations=<***num***>**]

This flag enables automatic HPC settings and must be used with one of the following options:

- **-machinelist list=**<*machine list*>, with tasks for each machine set to -1
- **-machinelist numcores=**<*num*>, under a scheduler

All design types being solved must support **-auto** or the solve will be aborted.

The NumDistributedVariations option can be used to specify the number of optimetrics variations to solve simultaneously. The default is to solve optimetrics variations sequentially.

Arguments with **-auto** in a scheduler environment:

- **numcores=**<*total number of cores*>

  Total number of cores, and can be used only with -auto and in a scheduler environment.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **file="**<*tmachine list file path*>**"**

  The specified file can contain line delimited machine specifiers as described above.

- **num=**<*tnum distributed tasks*>

  This is the total number of tasks and used only in a scheduler environment.

- **numgpus=**<*tnumber of GPUs to use*>

  This is the total number of GPUs and used only in a scheduler environment. numgpus must be combined with either **num=** or **numcores=**.

  You can also specify how a **-BatchSolve** distributes Optimetrics variations:

- **-auto** – Without additional parameters, the batch log file will specify that Optimetrics variations be solved sequentially. If -auto is specified with a machine list, the number of tasks for each machine must be -1.
- **-auto NumDistributedVariations=<***num***>** – You can specify an integer value greater than 1. This is the number of variations that will be solved in parallel.

- **-monitor** – during non-graphical analysis, you can monitor progress and messages. Progress, warning and info messages are logged to the standard output stream. Error and fatal messages are logged to the standard error stream. Schedulers intercept these streams and provide commands for display of this output. See individual scheduler documentation for specifics.

Run Command Examples

A distributed **-BatchSolve** of a specified design's Optimetrics setups, with a specified machine list:

```
C:\Program Files\ANSYS Inc\v252\AnsysEM\ansysedtng -distributed -
machinelist list="255.255.1.1,255.255.1.2" -batchsolve
myDesign:Optimetrics "C:\myProject.aedt"
```

A **-BatchSolve** of a specified design's nominal setups, run in a minimized window, with a specified log file:

```
ansysedtng -LogFile "H:\Logs\mylog.log" -BatchSolve
myDesign:Nominal "H:\Projects\MyProject.aedt"
```

Specifying Project Files

Specifying a project file opens that project when Electronics Desktop launches. If **-BatchSolve** is set, the project will also be solved.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can specify an archive file instead of a project file. If **-Batchsolve** is set, the project will be automatically restored and solved. Otherwise, you are prompted for a restore location, and the project will be restored and opened.

When a **-Batchsolve** is being performed on an archive file, you may also specify **-archiveoptions**:

- **overwritefiles** – allows non-project/results-extracted files to overwrite existing files.
- **path= <***projectFilepath***>** – extracts the project file and associated files to the specified path. If not specified, the archive will be extracted into the same directory as the archive file.
- **repackageresults** – Add batchsolve results back to archive file.
- **winpath= <***windowsProjectFilepath***>** – specifies the Windows-specific path to the extracted project file. This is used when a batch job is to be run on a Linux system, but monitored on Windows.

Options

The following options can be associated with one or more of the run commands:

- **-autoextract** – exports profile (as text), convergence (as text), and report data (as CSV) for the requested project/design/setup in a batch job. Once the solve is complete, an export directory is created (for example, "Project1.aedtexport" for a project named "Project1.aedt") that contains a sub-directory for each design name. You can also specify `-autoextract "reports, fieldplots"` to also generate *.aedtplt files for each field plot and possible *.avz file (for import and display in Ensight) for all valid field plots. Export files reside within each design-name directory, and include setup name, design variation, job ID, and problem type, as applicable.

  > **Note:**
  >
  > - The -autoextract option is only valid when used with -BatchSolve
  > - The -autoextract option is automatically added for all Ansys Cloud Burst Computing jobs submitted from Electronics Desktop. There is also an additional "reports" and/or "fieldplots" option that immediately follow "-autoextract". This causes all reports to be exported as CSV files at the end of the batch solve, after the profile and convergence have been exported.
  > - For example, you can specify `-autoextract "reports, fieldplots"` to also generate *.aedtplt files for each field plot and possible *.avz file for all valid field plots.

- **-batchoptions** – for batch jobs, specifies any of the options in **Tools** > **Options**. See additional information.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **-distribute** – distributes a batch solve to multiple machines. This option must be combined with the **-BatchSolve** run command. See: Distributed Analysis.
- **-help** – opens a window displaying command line options. This can only be used without a run command.
- **-logfile <***filePath***>** – specifies a log file. If none is specified, <project_name>.log will be written to the <project_name>.batchinfo directory.
- **-monitor** – enables batch job output to standard output and standard error streams.
- **-ng** – runs Electronics Desktop in non-graphical mode.
- **-validateonly** – If true, validation will be performed, but none of the setup will be solved. Allowed values: true, "= 1", false, "= 0".
- **-waitforlicense** – directs Electronics Desktop to wait for unavailable licenses.

-Batchoptions

All options that are specified through **Tools** > **Options** go into the user-level registry.

> **Note:**
>
> - Options are arranged as keys and values (in a structure similar to the *Windows Registry*). However, these options are not a part of the *Windows Registry* but are separately stored and maintained by the Ansys Electronics Desktop software.
> - For access to options and functionality beyond what is directly accessible via the user interface or batch options, refer to the documentation of the **UpdateRegistry** tool. This tool is discussed in the following help topic and in the topics that follow it in the same branch of the product help:
>
>   Setting or Removing Option Values in Configuration Files: UpdateRegistry Command

You can override the option registry entries via the **-batchoptions** command line. These overrides apply only to the current Desktop session. The registry setting overrides may be specified on the command line, or may be in a file with the file pathname specified on the command line. Batch jobs can be submitted from the command line or through Electronics Desktop's job submission window.

> **Note:**
>
> **-batchoptions** is only valid for batch jobs. It is ignored if you have not specified **-BatchSolve**.

-Batchoptions Examples

The batchoption **CreateStartingMesh** is available for the following products:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HFSS, Icepak, Q3D, Q2D, Maxwell3D, Maxwell2D, and Mechanical.

When this option is set, only the initial mesh and manual mesh operations are completed for the batch solution.

> **Note:**
>
> No adaptive meshing occurs for any Icepak or Mechanical solutions. Therefore, after solving, the final mesh will be identical to the starting mesh for these two design types.

This example enables CreateStartingMesh for HFSS, and runs a batch solution of the specified project:

```
ansysedtng -batchoptions "'HFSS/CreateStartingMesh'=1" -batchsolve
"D:\projects\MyProject.aedt"
```

See: Additional Examples of -Batchoptions Use.

Export Options Files

The **Tools** > **Options** > **Export Options Files** command writes XML files containing the options settings at all levels to the specified directory. This feature is intended to make it easier for different users to use Ansys Electromagnetics Suite 2025 R2 installed on shared directories or network drives. See: Example Uses for Export Options Features.

Running Ansys Electronics Desktop with a JSON File

Ansys Electronics Desktop includes line arguments that can be included in a JSON file and executed by entering the -json command line option. The -json option takes a JSON file as argument, and runs AEDT with the options specified within the file. All options in the -help text is supported. Options in the JSON file can be used together with options specified in the command line. If the same option is specified both in the command line and the JSON file, the option in the command line overrides the option in the JSON file.

> **Note:**
>
> The -json option functions with both the ansysedt and ansysedtng commands.

Enter the command as follows to execute the JSON file

```
ansysedt -json <filepath to the JSON file>
```

JSON File Format

Take the following into consideration when creating a JSON file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The JSON file must contain an object. Each option is a key value pair where the key is the option name (no dash) and the value is the argument.
- For options that do not take any arguments, such as -monitor, the value must be a bool - true or false to turn on or off the option, respectively.
- For options that take optional arguments, such as -logfile, the value can either be a bool or some other type (in this case, a string specifying the log file) depending on the option.
- Project/archive file and folder should be specified directly on the command line when using -json.
- See the example below for a JSON file containing all options in the -help text.

> **Note:**
>
> The example does not contain a valid combination of options but is solely used to show what type of argument each option takes.

```
{
    "archiveoptions":
    {
        "overwritefiles": true,
        "path": "\\\\dataserver\\home\\user\\OptimTee.aedt",

}
```

Running Ansys Electronics Desktop from a Windows Remote Terminal

When running HFSS 3D Layout from a remote terminal, there are some performance and behavior issues to consider. These issues are due to the interaction of bandwidth/opengl drivers/remote-terminal-protocol

- Showing axes when interactively drawing objects will slow the performance.
- Remote OpenGL performance will be slower in general. Graphics card and driver quality helps.
- All 3D windows will be closed when you switch from remote PC to a console or from a console to remote. This is to avoid display/opengl instability during the switch.
- Grid will not be turned off while viewing a plot from a remote desktop. The mouse over highlights on 2D plots may appear as not totally overlapping the line color or as thin dotted lines.

Using Windows HPC Commands

HPC Integration allows you to submit jobs directly using Ansys Electromagnetics command line arguments for batch solves. Ansys Electromagnetics products must be accessible from the same directory on all machines. The Ansys Electromagnetics command line syntax is documented here. You must pass in a -distributed flag as part of the Ansys Electromagnetics command line arguments if you want to run a distributed simulation.

For information concerning the supported HPC software, go the the Platform Support webpage and click the links to the following topics:

- *Ansys 2025 R2 - Job Schedulers and Queuing Systems Support*
- *Ansys 2025 R2 - Message Passing Interface Support for Parallel Computing*

Before running a job you must click **Tools** > **Job Management** > **Select Scheduler** and use the dialog box to designate the head node of a cluster. You can then click **Tools** > **Job Management** > **Submit Job** to submit the batch commands for the job.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Customizing Ansys Electronics Desktop with Ansys ACT

With Ansys ACT, you can create custom applications or extensions to customize supported Ansys products, including Electronics Desktop.

> **Note:**
>
> The **ACT Extensions** window and the design wizards it contains (*5G Wizard, HFSS Antenna Design Toolkit, HFSS-EMA3D Link,* and *Maxwell Eccentricities*) are only available for the Windows version of the Ansys Electronics Desktop software. These items are not available when the software is installed on a Linux platform.

An ACT guided process extension enables you to leverage both the functionality of Electronics Desktop and the scripting capabilities of the Workbench/AIM framework API. You can manipulate existing features and simulation components, organizing them as needed to produce a custom automated process. A guided process extension is exposed in Electronics Desktop as a wizard that provides step-by-step simulation guidance within the application workflow.

To access ACT functionality in Electronics Desktop, open the ACT Home page by clicking **View** > **ACT Extensions**.

For more information, see ACT Simulation Wizards and Electronics Desktop Wizard in the *Ansys ACT Developer's Guide*.

Installing PyAEDT (Beta)

PyAEDT is a Python library that interacts with the AEDT API to make scripting simpler for the end user. It supports all AEDT 3D products (HFSS, Icepak, Maxwell 3D, and Q3D Extractor), 2D tools, Ansys Mechanical, EMIT, Circuit tools like Nexxim, system simulation tools like Twin Builder, and layout tools like HFSS 3D Layout and EDB. Additionally, it enables the end user to have a CPython interface with AEDT. Its class and method structures simplify operation for the end user, enabling more Pythonic code while reusing information as much as possible across the various APIs.

Documentation for PyAEDT can be found online at: https://aedt.docs.pyansys.com/version/stable/

Installing PyAEDT adds three items to the **Tools** > **Toolkit** > **PersonalLib** menu and to the **Automation** tab:

- **Console** – launches the PyAEDT console.
- **Jupyter Notebook** – launches Jupyter Notebook (a computational notebook) in an internet browser.
- **Run PyAEDT Script** – launches a file browser allowing you to select a Python script to run via PyAEDT.

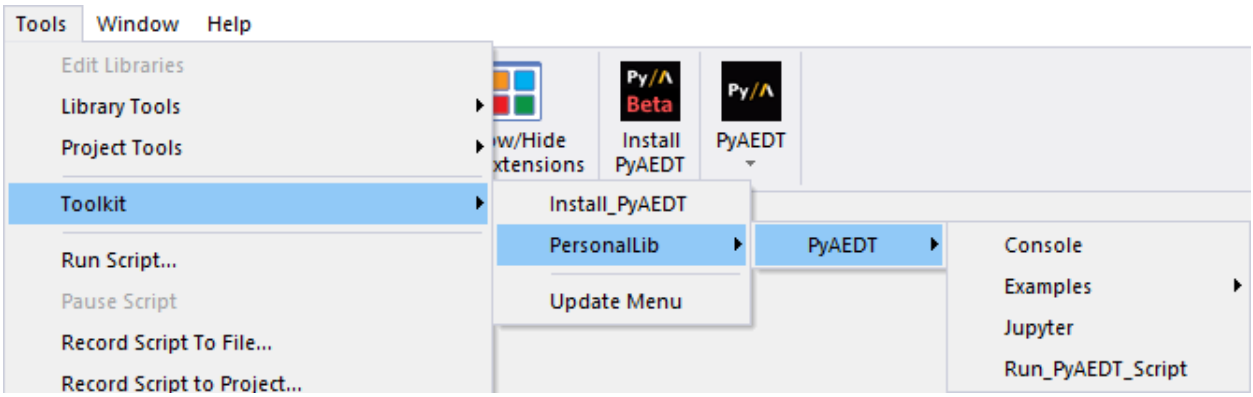
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

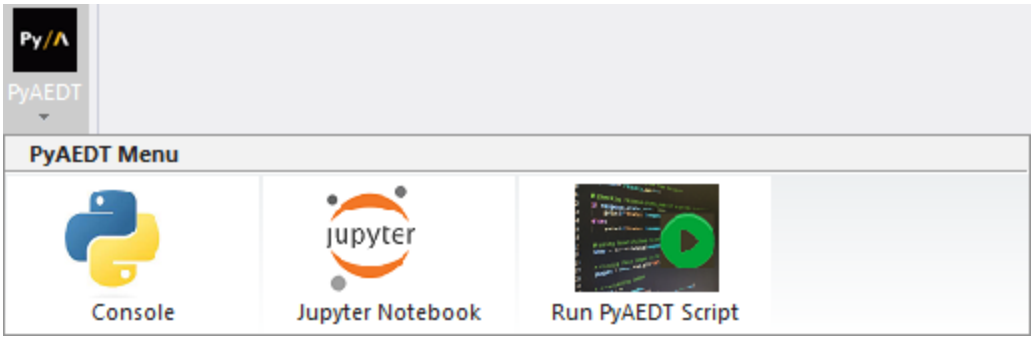
To install PyAEDT:

- From the **Automation** tab, click **Install PyAEDT**.

A web browser launches, and takes you to detailed installation instructions.

When installation is complete, the **Tools** > **Toolkit** > **PersonalLib** menu and the **Automation** tab update to display PyAEDT menu options:





Debug Logging

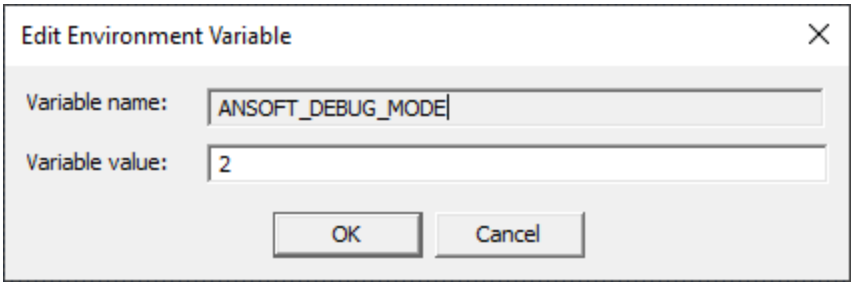
Electronics Desktop provides error logging capabilities.

To begin logging errors:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Click **Tools** > **Debug Logging**.

   The **Edit Environment Variable** window appears, showing the ANSOFT_DEBUG_ MODE variable.

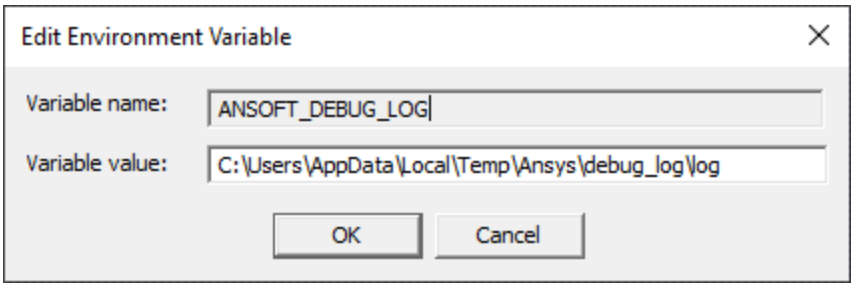


2. Enter a **Variable value**.

   The default value is 2, and should not be changed unless directed by technical support.

3. Click **OK**.

   The **Edit Environment Variable** window updates to display the ANSOFT_DEBUG_LOG variable.



4. Enter a folder path where log files (*.log) will be stored.
5. Click **OK**.

   Errors are logged to the specified folder until you disable logging.

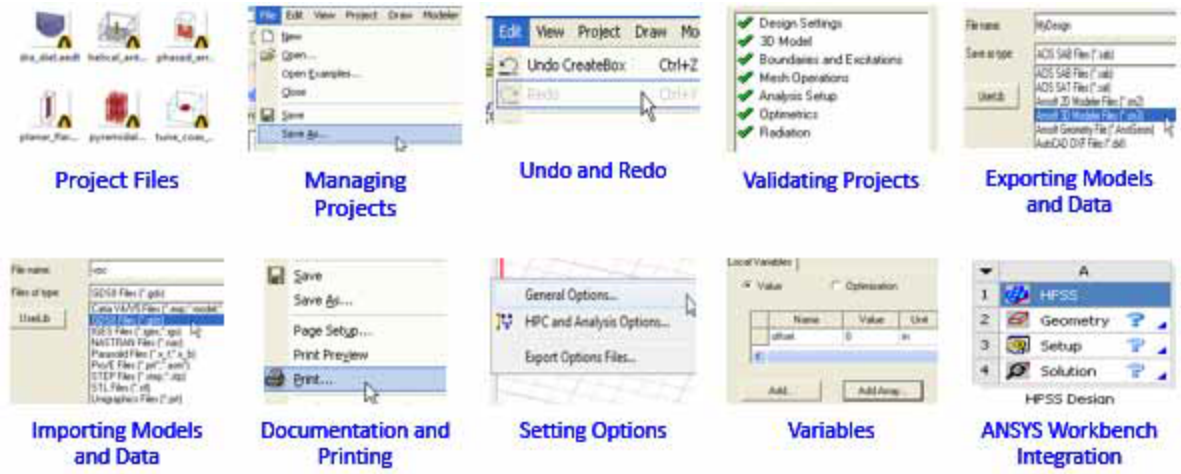
To stop logging errors:

- Click **Tools** > **Stop Debug Logging**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3 - Working with Ansys Electronics Desktop Projects

An Ansys Electronics Desktop project is a folder that includes one or more models, or *designs*. Each design ultimately includes a geometric model, its boundary conditions and material assignments, and field solution and post-processing information, or a schematic or netlist.



A new project called *Projectn* is automatically created when the software is launched. By option, a design named Design*n* is automatically created for a new project. You can also open a new project by clicking **File** > **New**. In general, use the **File** menu commands to manage projects. If you move or change the names of files without using these commands, the software may not be able to find information necessary to solve the model.

> **Note:**
>
> Not all options and capabilities documented in this section apply to all design types.

Ansys Electronics Desktop Files

When you create any project in Ansys Electronics Desktop, it is given an .aedt file extension and stored in the directory you specify. For Legacy projects, the transition is handled as follows:

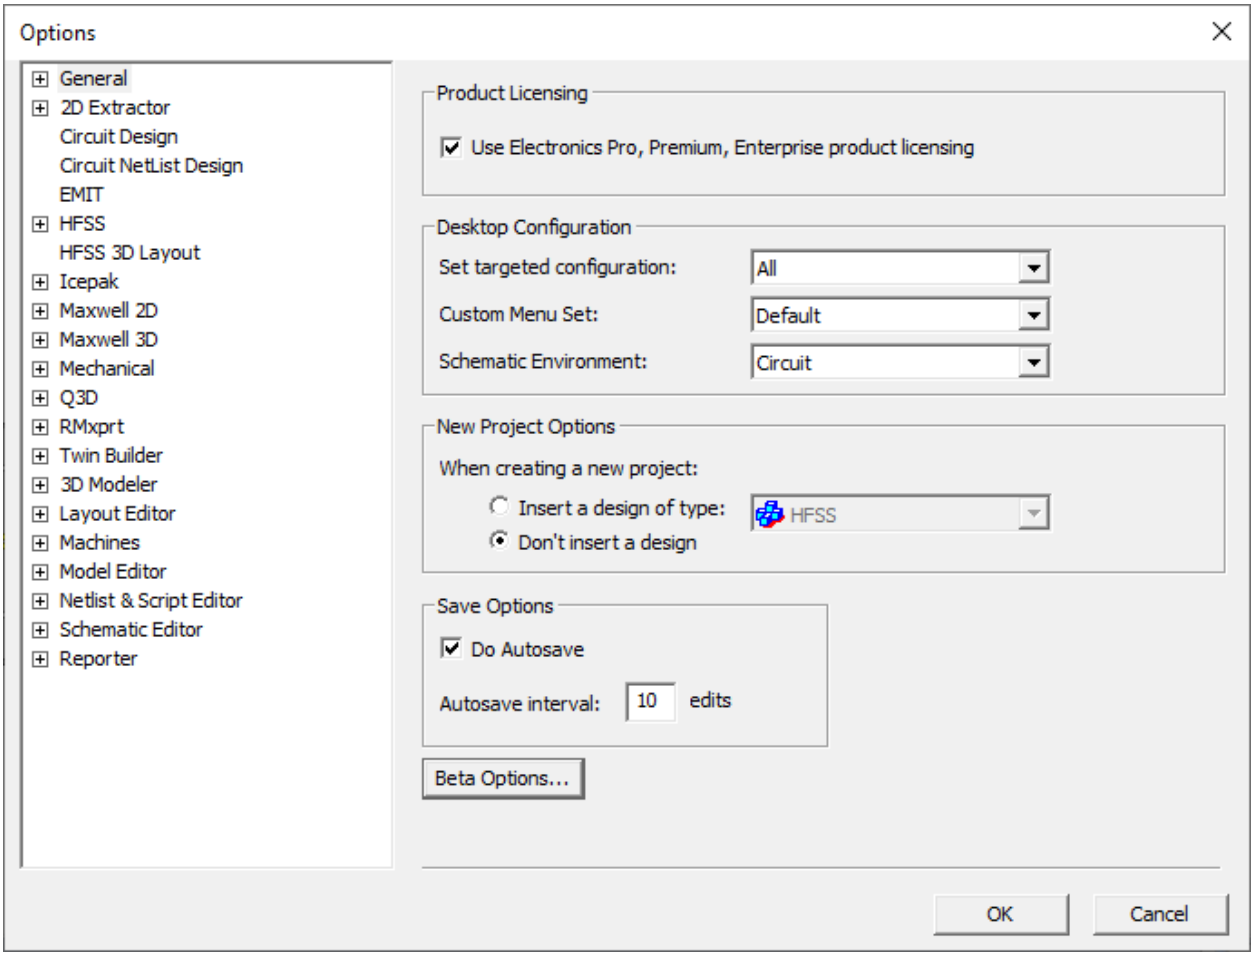
- When opening a legacy project in interactive mode, a dialog box appears, informing you that the legacy file extension is no longer supported and that if you continue, the project will be converted to the new .aedt extension. If you agree, the project and results directory are renamed/moved to the new file extensions immediately. The read continues with the standard code for reading previous version projects.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The Ansys Electronics Desktop 2025R1 version cannot open projects created with 2022R2 or earlier that were using ACIS modeler.
- Attempts to run batch solve or non-graphical with a legacy project return an error. There is no automatic/hidden conversion of file extensions. Note that the existing BatchSave command can be used to convert many projects to the new extension and version.
- Workbench integration has not been modified. It continues to open legacy projects without a warning and copies results from legacy to the new extension.

Setting Project Options

Tools > **Options** > **General Options** opens the **Options** window.



The left pane provides access to the following sets of options:

- General
- 2D Extractor
- Circuit Design

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Mechanical
- RMxprt
- Twin Builder
- 3D Modeler
- Machines
- Model Editor
- Reporter

Use **Tools > HPC and Analysis Options** to specify active configuration per design type, queuing, distributed memory vendor, HPC licensing, select a MPI vendor, and whether to enable GPU for transient solves.

The **Tools > Options > Export Options Files** command writes xml files containing the Options settings at all levels to the specified directory. The **Tools** > **Options** > **Export Options** feature is intended to make it easier for different users to use Ansys Electromagnetics tools installed on shared directories or network drives. The Example Uses for Export Options Features section outlines some use cases enabled by this feature.

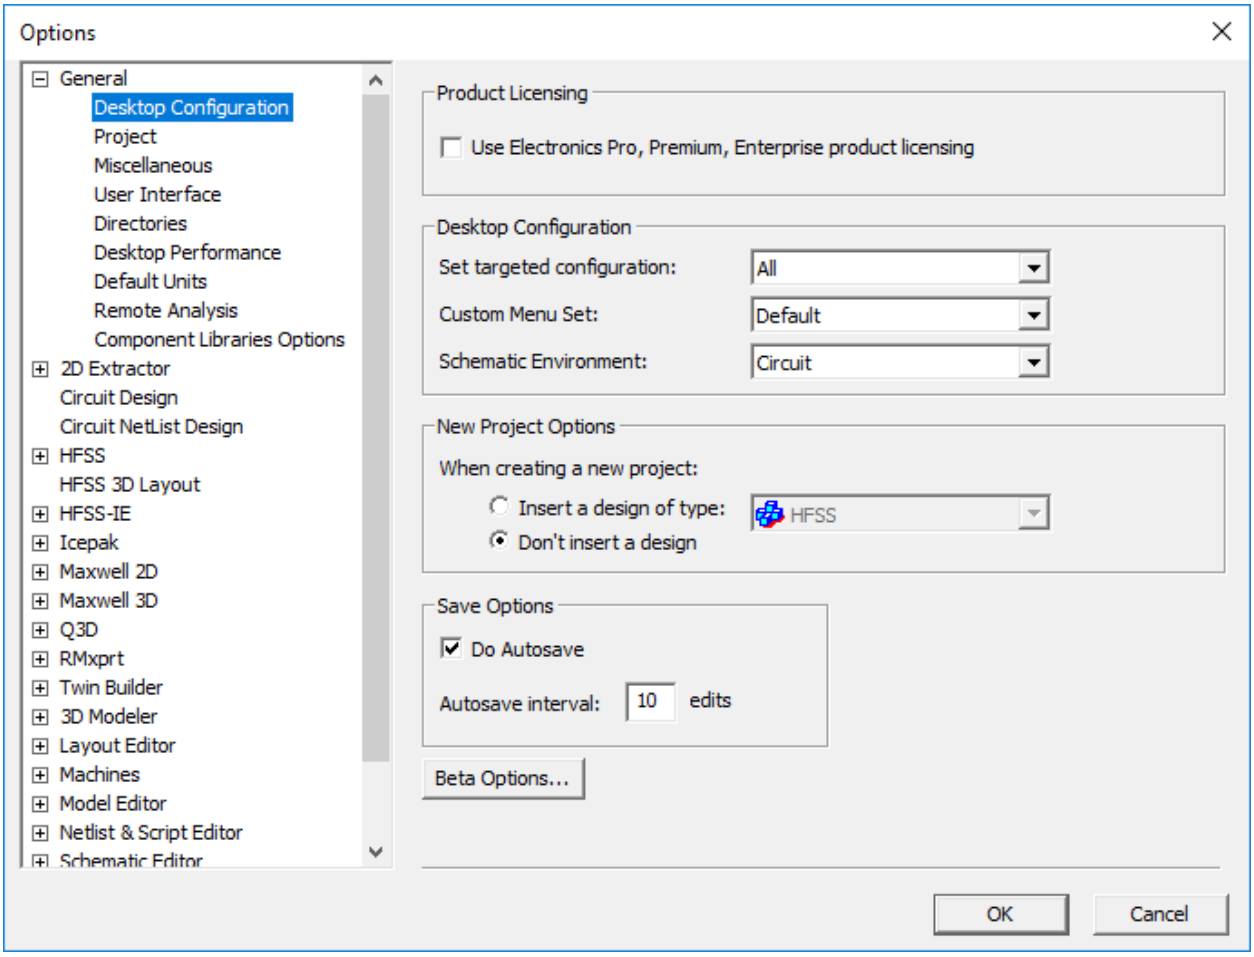
Setting General Options

To set general options in Ansys Electronics Desktop:

1. Click **Tools** > **Options** > **General Options**.

   The **Options** window opens with the Desktop Configuration options selected by default.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



In the left pane, select the entries below **General** to display the associated options:

- Desktop Configuration
- Project
- Miscellaneous
- User Interface
- Directories
- Desktop Performance
- Default Units
- Remote Analysis
- Component Libraries Options

2. Click each entry and make the desired selections.

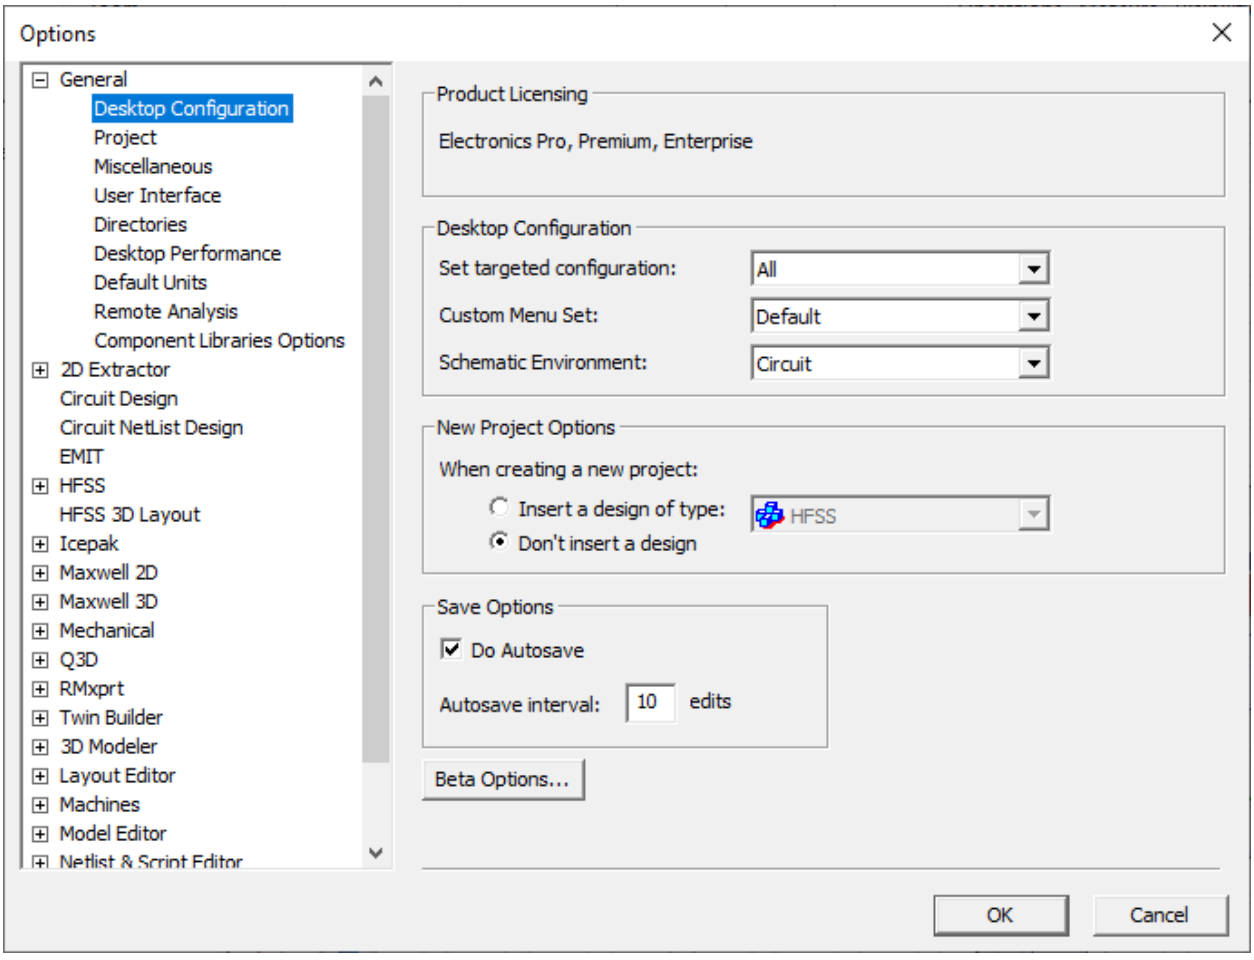
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Click **OK**.

> **Note:**
>
> Not all option settings are applied immediately in the current design. Some settings take effect in newly created designs.

General Options: Desktop Configuration

Under General Options, **Desktop Configuration** options allow you to customize Electronics Desktop in a way that suits your work priorities. These include options for menus, new projects, save intervals, and beta features.



Ansys Electronics Desktop now uses Electronics Pro, Premium, Enterprise (PPE) product licensing. Legacy product licensing and DSO are no longer supported.

With PPE, HPC licensing is used to enable all cores, GPUs, and distributed tasks.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For more details, see Setting HPC and Analysis Options.

In the **Desktop Configuration** area, options include:

- **Set Targeted Configuration** – Choosing a Targeted Configuration changes the Custom Menu Set and Schematic Environment for your area of focus.

  Choices are:

  - **All** – Default option. Sets the **Custom Menu Set** to **Default**, the **Schematic Environment** to **Circuit**, and the default design type to **HFSS**.
  - **EM** – Electromagnetic focus. Sets the **Custom Menu Set** to **EM**, the **Schematic Environment** to **Twin Builder**, and the default design type to **Maxwell 3D**.
  - **RF** – Radio Frequency focus. Sets the **Custom Menu Set to** RF, the **Schematic Environment** to **Circuit**, and the default design type to **HFSS**.
  - **SI** – Signal Integrity focus. Sets the **Custom Menu Set** to **SI**, the **Schematic Environment** to **Circuit**, and the default design type to **HFSS 3D Layout**.
  - **Twin Builder** – Sets everything to default to **Twin Builder**.
- **Custom Menu Set** – Changes which menu options are available in Electronics Desktop.

  Choices are:

  - **Default** – All solvers appear on the **Project** menu.
  - **EM** – Only electromagnetics solvers appear on the **Project** menu.
  - **RF** – Only radio frequency solvers appear on the **Project** menu.
  - **RF.0** – All solvers appear on the **Project** menu. The **HFSS RF Setup** menu appears.
  - **SI** – Only signal integrity solvers appear on the **Project** menu.
  - **SI1.0** – Only signal integrity solvers appear on the **Project** menu. The **Import**, **Solution Setup**, **Automation**, and **Definitions** menus appear.
  - **SI2.0** – All solvers appear on the **Project** menu. The **HFSS SI Setup** menu appears.
  - **Twin Builder** – Only Twin Builder appears on the **Project** menu.
- **Schematic Environment** – Select **Circuit**, **Twin Builder**, or **Maxwell**.

In the **New Project Options** area, options include:

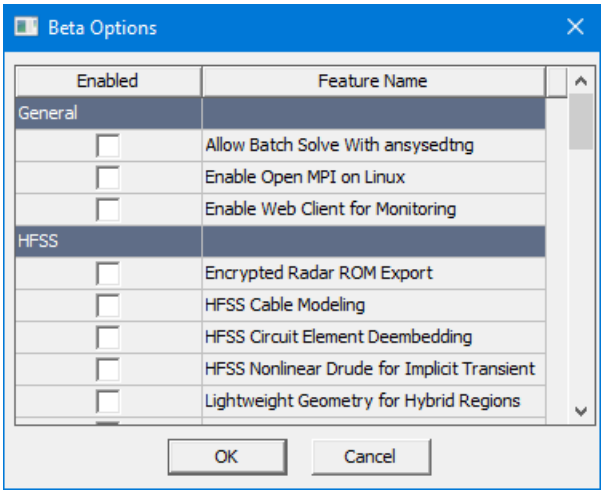
- **When Creating a New Project** – Select whether to insert a design when creating a new project. If you choose to insert a design by default, use the drop-down menu to select the default design type.

In the **Save Options** area, options include:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Do Autosave** – Electronics Desktop has autosave enabled by default. Deselect this option to disable it.
- **Autosave Interval** – When **Do Autosave** is enabled, select the number of edits at which Electronics Desktop autosaves.

Click the **Beta Options** button to open a window listing beta options. You may need to scroll or size the window to view all options.

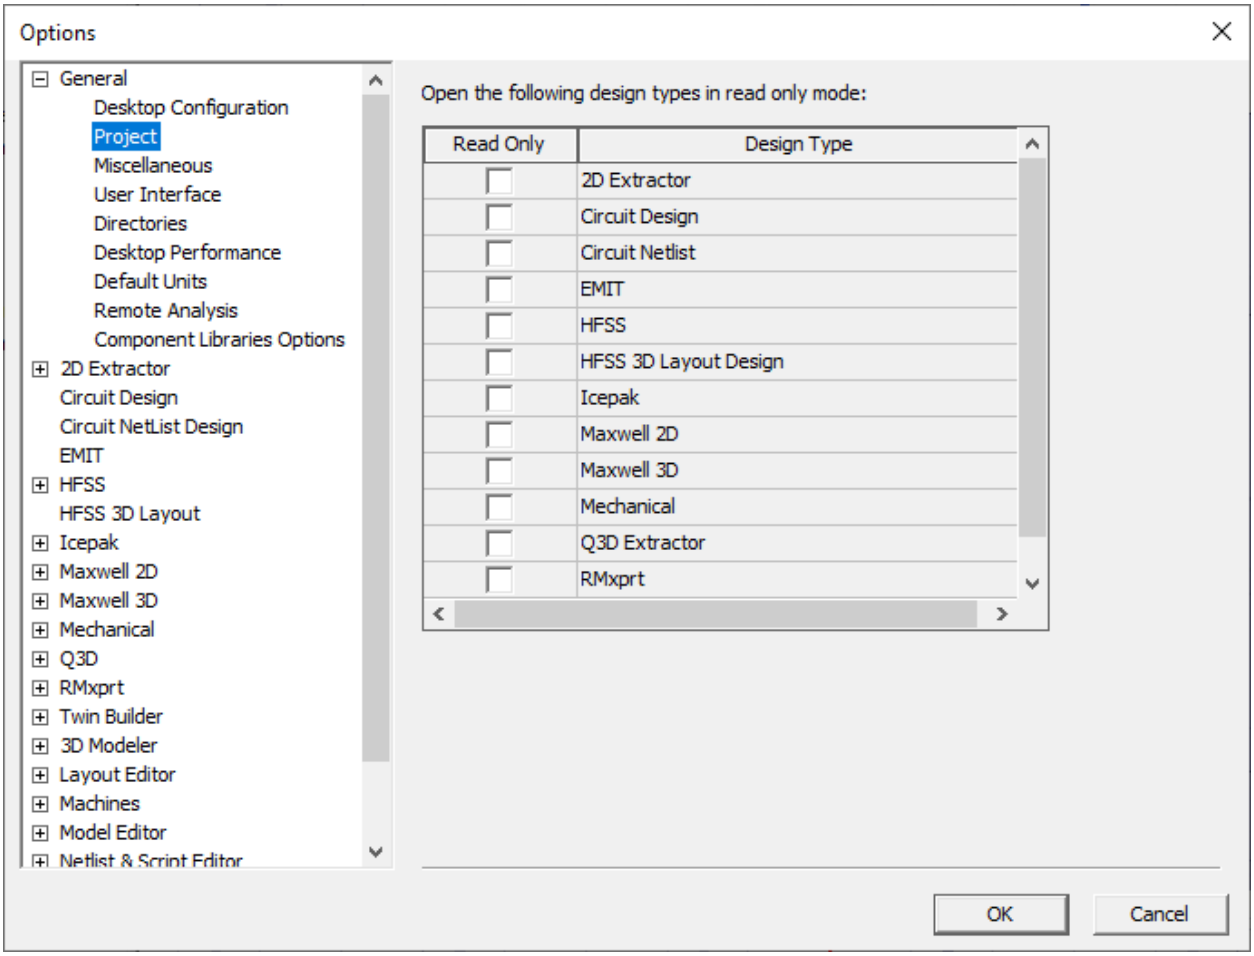


From there, enable or disable options, and click **OK**. You will need to restart to enable your selections.

General Options: Project Options

Under General Options, **Project** options allow you to select design types to open in read-only mode. This can help prevent accidental changes.

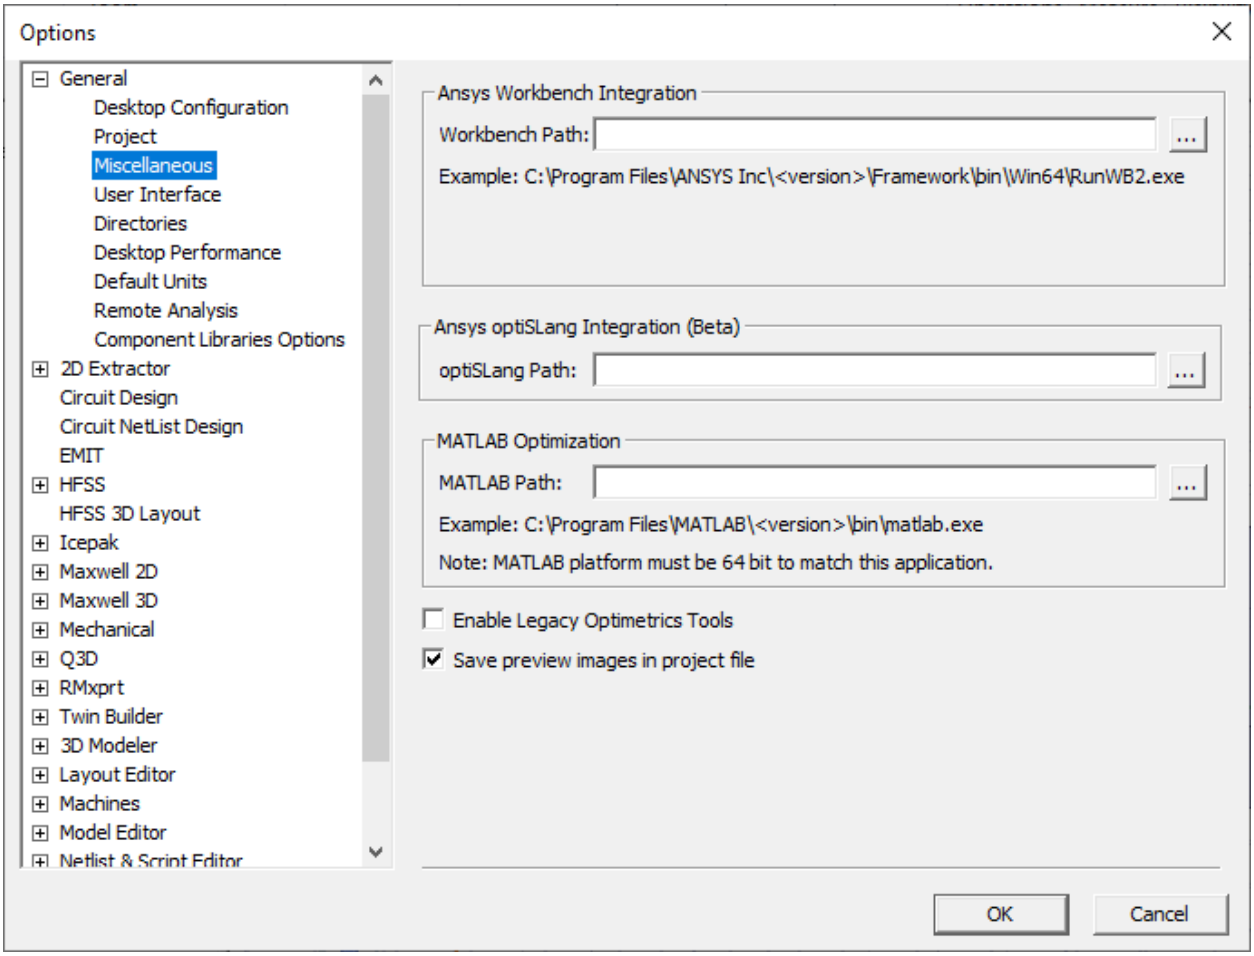
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



General Options: Miscellaneous Options

Under General Options, **Miscellaneous** options allow you to specify paths for Ansys Workbench Integration, optiSLang path, MATLAB Optimization and to enable Legacy Optimetrics Tools.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Workbench Integration allows you to specify the path to your Ansys Workbench installation. This path can be used in Optimetrics for connecting to the Design Xplorer.

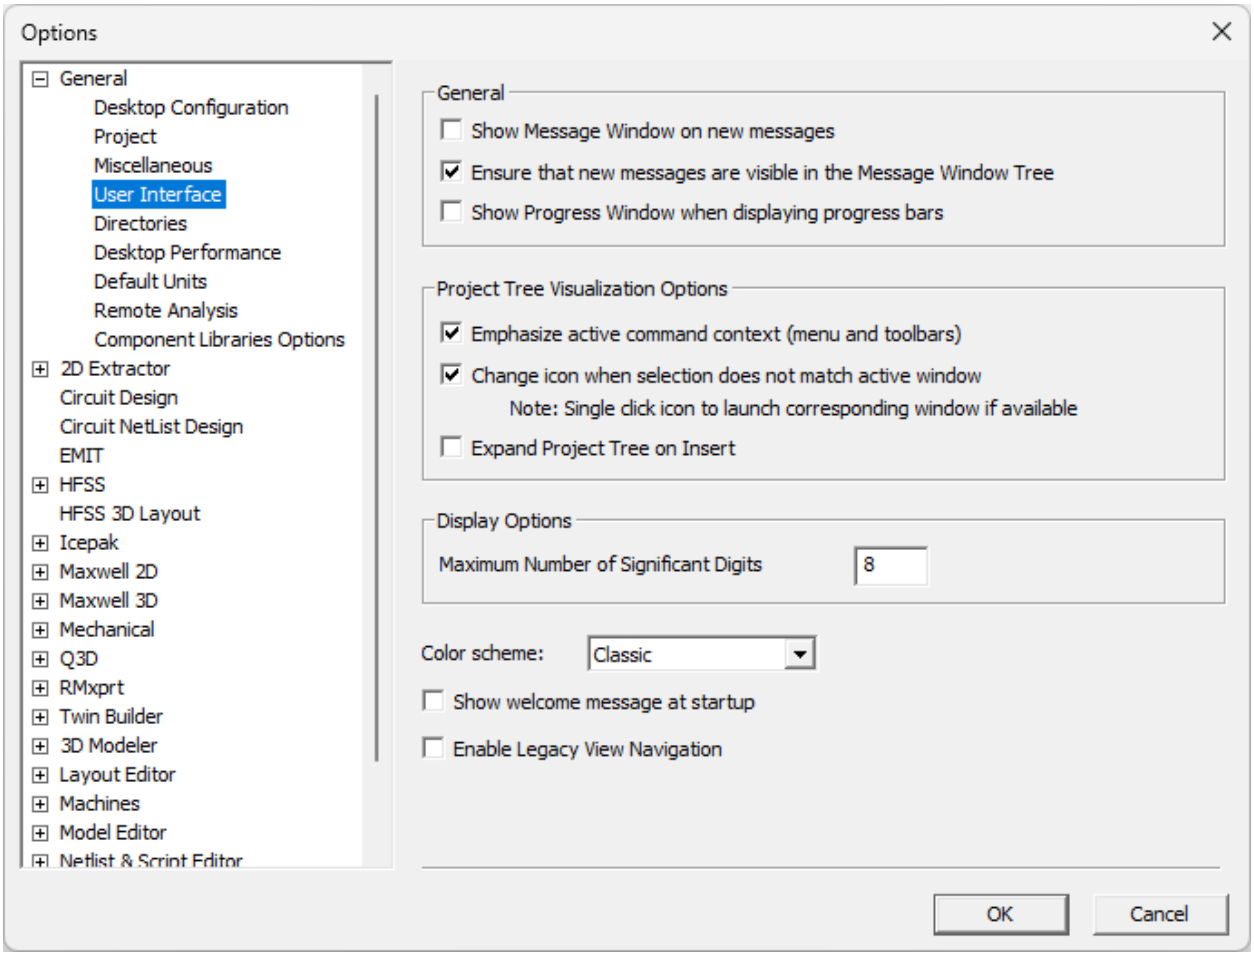
MATLAB Optimization allows you to specify the path to your installation of MATLAB. MATLAB can be used as an Optimizer.

> **Note:**
>
> The platform for MATLAB and Ansys Electronics Desktop must match (for example, a 64 bit version of MATLAB).

General Options: User Interface Options

Under General Options, **User Interface** options allow you to change how Electronics Desktop displays messages, command text, the project tree, welcome messages, and more.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



In the **General** area, options include:

- **Show Message Window on new messages** – when selected, the message window automatically opens if a message arrives.
- **Ensure that new messages are visible in the Message Window Tree** – when selected, the message window expands as needed to display messages.
- **Show Progress Window when displaying progress bars** – when selected, the progress window automatically opens while simulations are in progress.

In the **Project Tree Visualization Options** area, options include:

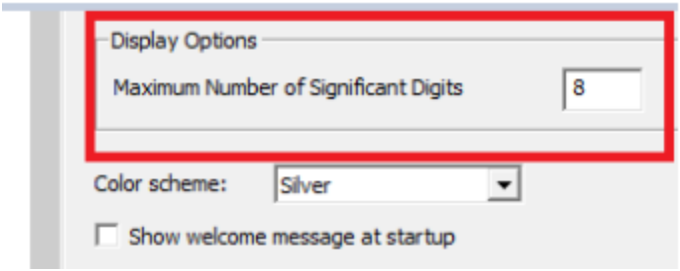
- **Emphasize active command context** – when selected, active elements in the Project Tree display in bold text.
- **Change icon when selection does not match active window** – when selected, a small, window-shaped overlay icon displays in the corner of the selected Project Tree element. This icon changes when the data in the active window is unrelated to the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

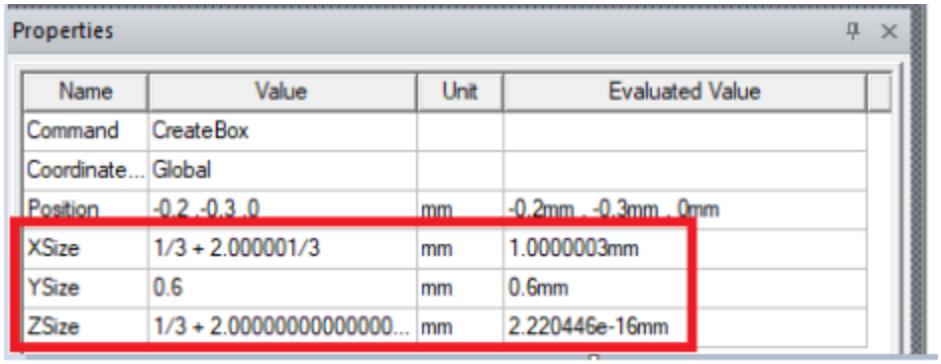
selected project item (data affecting the same model is considered to be related). Clicking the icon opens the window and brings it into focus.

- **Expand Project Tree on Insert** – when selected, the Project Tree automatically expands when you insert a new design.

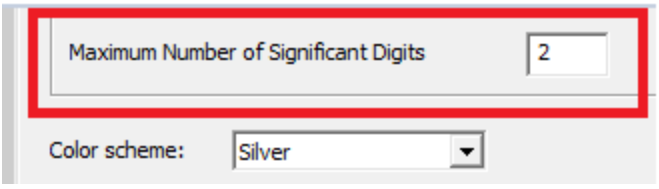
In the **Display Options** area, specify the **Maximum Number of Significant Digits** to display. The default is 8 and the maximum is 20. This affects the digits displayed in the **Solutions** dialog box, evaluated variable values, Animation dialog boxes, Optimetrics, Reports, and so forth. For example, here is the default.



So some evaluated variable values with significant digits appear as follows.

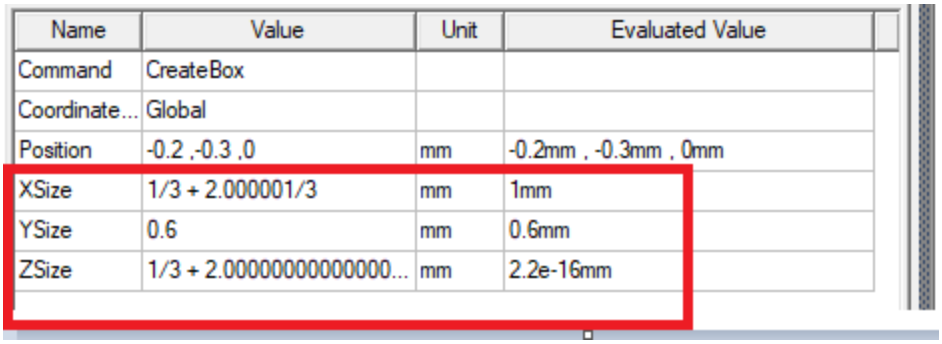


Change Precision = 2. This lets you display near-zero values in the Properties window as 0.



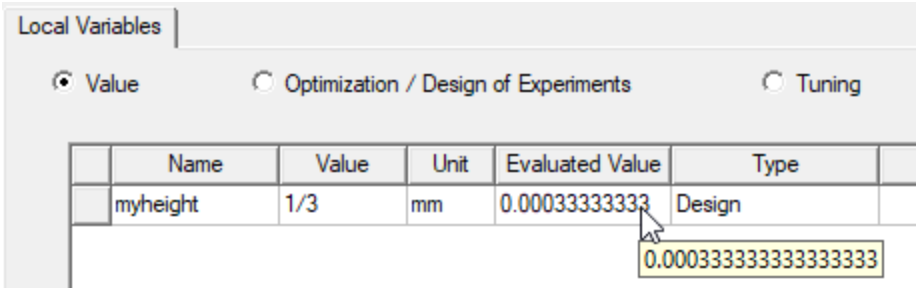
You can see that XSize is now rounded off to cleanly display 1mm. The decimal part of ZSize also shows cleaner value, but it is not rounded off to zero.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

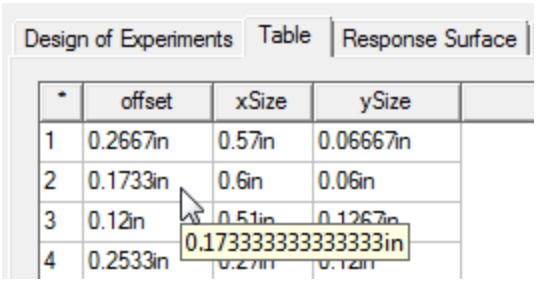


Name	Value	Unit	Evaluated Value
Command	CreateBox		
Coordinate...	Global		
Position	-0.2 ,-0.3 ,0	mm	-0.2mm , -0.3mm , 0mm
XSize	1/3 + 2.000001/3	mm	1mm
YSize	0.6	mm	0.6mm
ZSize	1/3 + 2.00000000000000...	mm	2.2e-16mm

You can still see the full precision values in tooltips by holding a cursor over the displayed value.



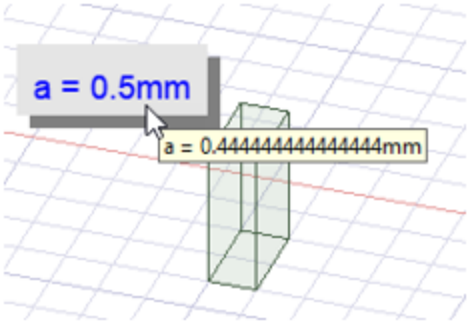
In the case of variable values, if you have assigned more significant digits, you will see these when editing the variable value. In the case of table displays of values, the tooltip display shows all available digits when the mouse pointer is over a result:

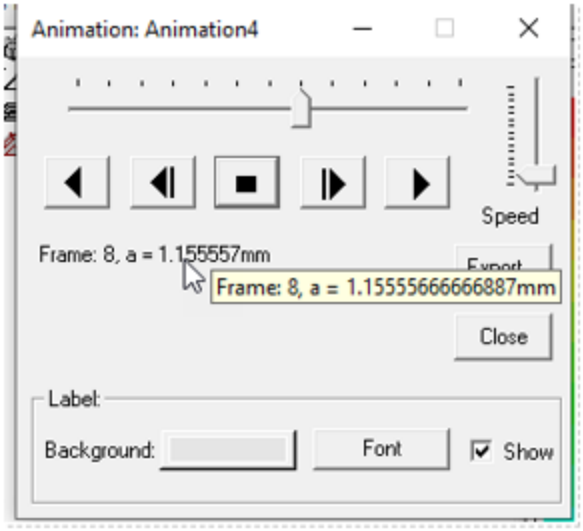


If you set the **Maximum Number of Significant Digits** to a lower value, Change Precision = 2. You can see that XSize is now rounded off to cleanly display 1mm. The decimal part of ZSize also shows cleaner value, but it is not rounded off to zero.

The tooltip functions to show internal digits in throughout the Ansys Electronics Desktop interface.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





Select a **Color Scheme**. The choices are **Light (Beta)**, **Dark (Beta)**, or **Classic**: See Choosing a Color Scheme for more information and samples of each scheme.

Select **Show welcome message at startup** if you want to see a welcome message when Electronics Desktop opens.

Enable legacy view navigation enables you to choose between two schemes for view navigation keyboard shortcuts and mouse button assignments, as follows:

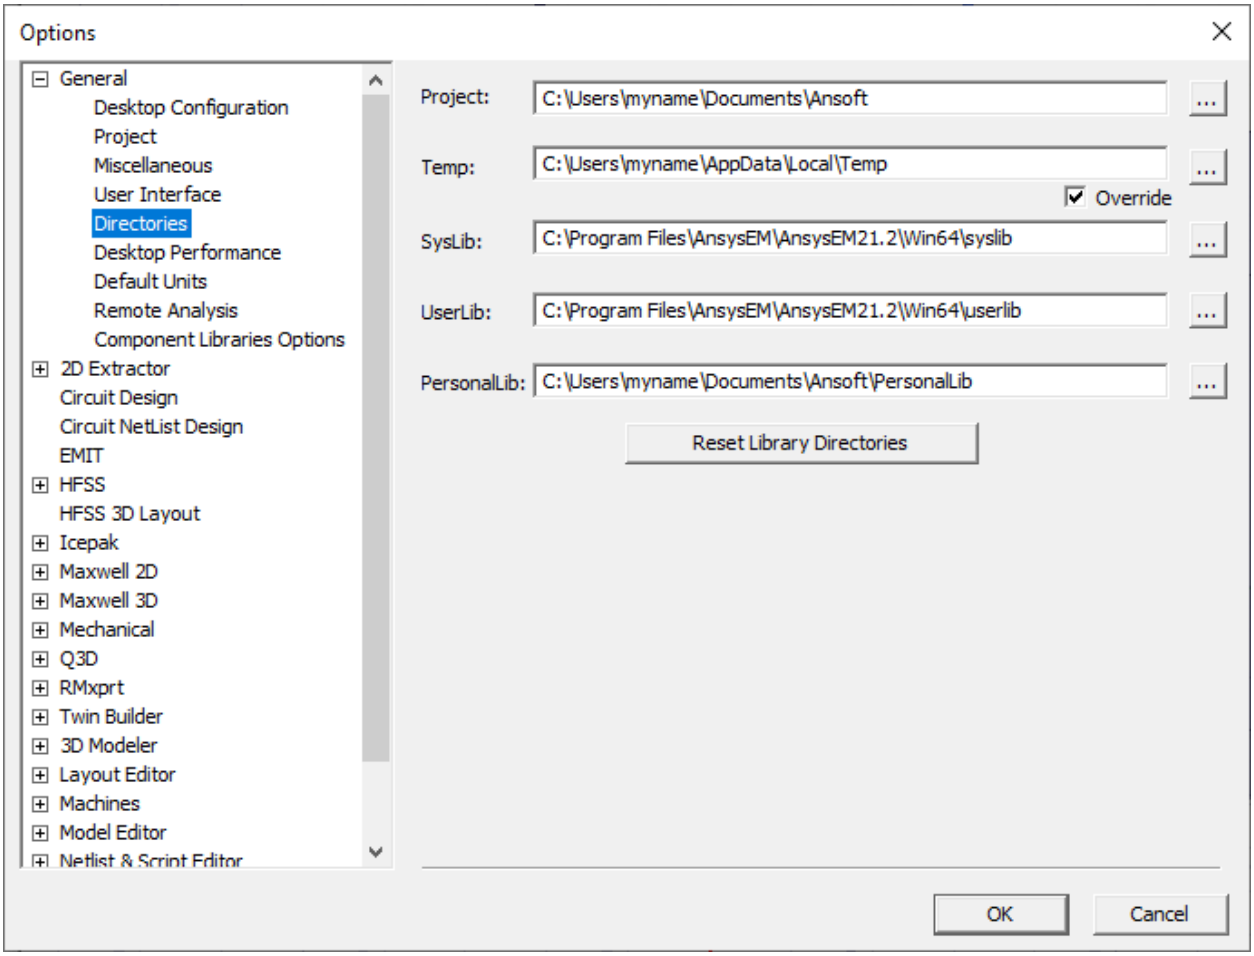
- **Cleared:** Use only the view navigation mouse-button and hotkey assignments introduced in Ansys Electronics Desktop version 2024 R1 and applicable to subsequent versions too. Legacy (2023 R2 and earlier) mouse-button and hotkey assignments will *not* be recognized when this option is cleared.
- **Selected:** Both the legacy (2023 R2 and earlier) and current (2024 R1 and newer) mouse-button and hotkey assignments are supported, and either can be used for view navigation.

See Choosing the View Navigation Options for more information, including a detailed comparison of the two schemes.

General Options: Directories Options

Under General Options, **Directories** options allow you to get the paths for Project, Temp, SysLib, UserLib, and PersonalLib directories.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Use the **[...]** buttons to browse to paths and click **OK**. You will need to select **Override** to change the Temp directory.

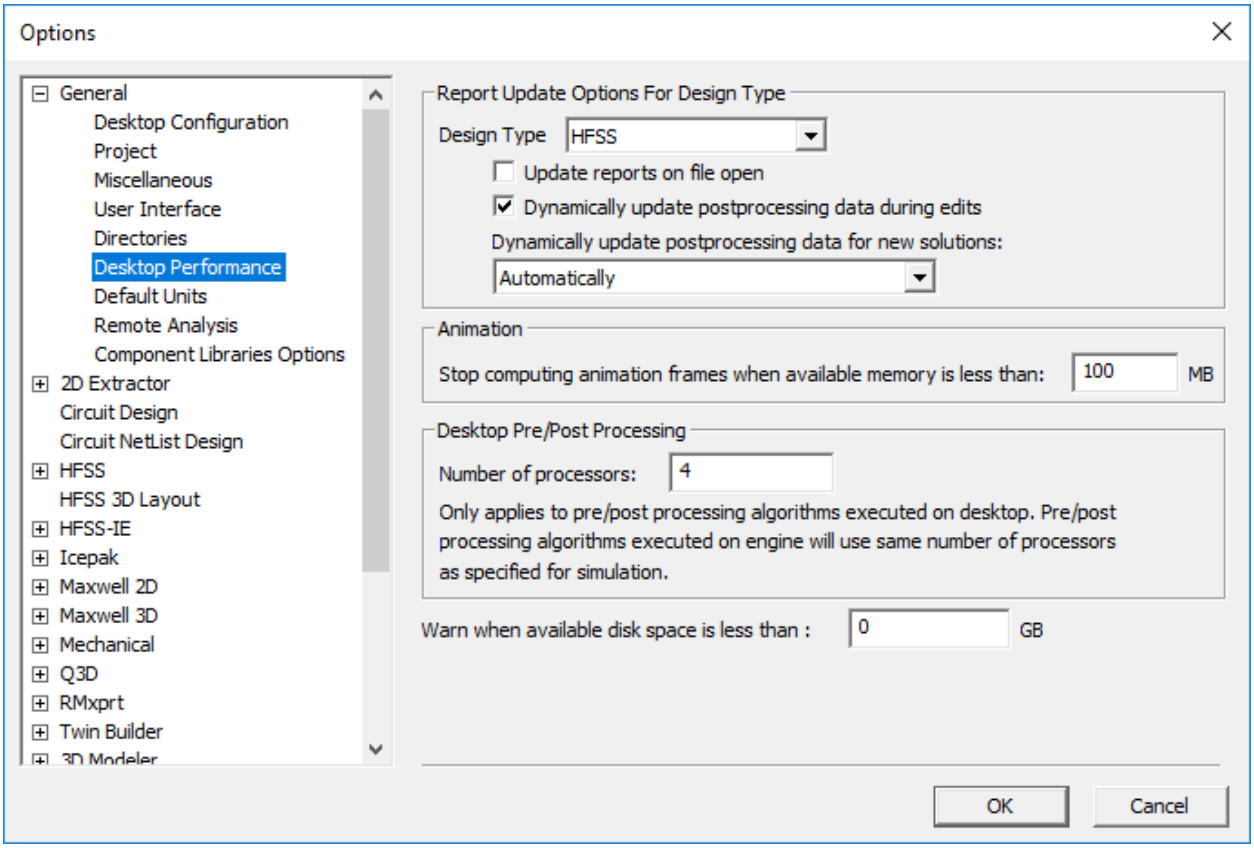
If you need to restore defaults, click **Reset Library Directories**.

> **Note:**
>
> Your changes will be reflected in the User Defined Primitives menu on next startup.

General Options: Desktop Performance

Under General Options, **Desktop Performance** options allow you to change settings for animation, pre/post-processing, disk space warnings, and updating reports.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



These options are set on the **Desktop Performance** panel under **General** in the **Options** window.

In the **Report Update Options for Design Type** area, select a **Design Type**. For each type, you can set the following options:

- **Update Reports on File Open** – when selected, reports are automatically updated whenever an existing file with solution data is opened for viewing/editing.
- **Dynamically Update Postprocessing Data During Edits** – when selected, report plots and overlays update as you edit their parameters.
- **Dynamically Update Postprocessing Data for New Solutions** – Because updating reports during analysis can impact solution time, you can specify how often your reports are updated:
    - **After Each Variation** – updates reports after analysis of each variation has been completed. Used for an Optimetric or parametric analysis.
    - **Automatically** – balances report and field plot updating with solution time.

      For Adaptive Passes, plots update at the end of each solution pass. For Last Adaptive or Transient, plots update at the end of the transient or adaptive solution.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For example, reports may be updated after each adaptive pass but field plots will not be updated until the solution is complete.

- **Immediately** – updates reports and plots as soon as data comes from the solver.

  This option will have the greatest impact on overall solution time, but affords the fastest updates to reports and field plots. Caution should be used in selecting this option. Some types of reports and field plots may take a long time to update, especially as mesh size increases.

- **Never** – updates reports only upon manual intervention. This prevents updates from impacting solution time.
- **On Completion** – updates reports once, when the solution completes.

> **Note:**
>
> Updates done on completion are done after the solve has been completed, and the time for that update is not included in the simulation profile.

In the **Animation** area, you can elect to **Stop computing animation frames when available memory is less than** a specified value, in MB (the default is 100MB). This setting is used to prevent problems related to low memory should an animation require large memory allocation.

In the **Desktop Pre/Post Processing** area, you can specify the **Number of Processors**. This option only affects pre- and post-processing (not solve or simulation). Pre-processing algorithms can take advantage of multiple processors for visualization and faceting of 3D models, model validation for 3D products, auto net identification for Q3D, and more. The default value is determined by the number of logical processors on the machine running Electronics Desktop:

- The default core usage per desktop session (UI + solve) is set to 2/3 of the logical processors on the machine.
- The cores for default local config is max{4, 1/3 of the logical processors on the machine}
- The default number of processors for pre/post is min{1, 2/3 of the logical processors - default_cores_for_local_config}
- When the core usage per desktop session cannot be evenly distributed between solve and pre/post, more cores will be assigned to solve.

Example 1:

- logical processors = 24
- cores usage per desktop session = 16
- local hpc set to 4 cores
- processors for pre/post set to 12

Example 2:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- logical processors = 20
- cores usage per desktop session = 13
- local hpc set to 4 cores
- processors for pre/post set to 9

Example 3:

- logical processors = 5
- cores usage per desktop session = 3
- local hpc set to 2
- processors for pre/post set to 1

You can also elect to **Warn when available disk space is less than** a specified value, in GB.

General Options: Default Units

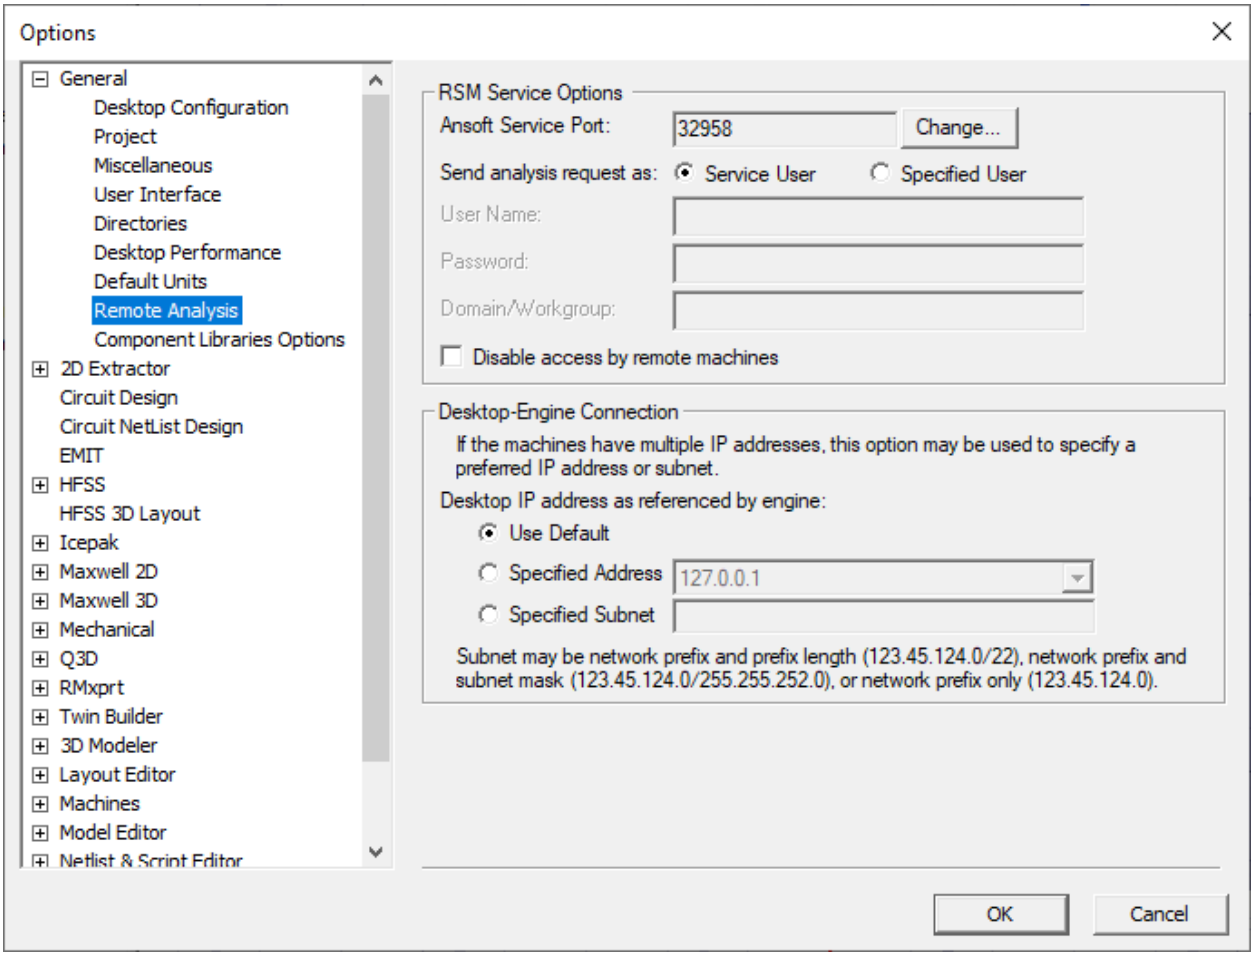
Under General Options, **Default Units** options allow you to set default units for the following:

- Length
- Angle
- Time
- Temperature
- Torque
- Magnetic Induction
- Pressure
- Frequency
- Power
- Voltage
- Current
- Speed
- Mass
- Conductance
- Resistance
- Inductance
- Capacitance
- Force
- Angular Speed
- Magnetic Field Strength

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

General Options: Remote Analysis Options

Under General Options, **Remote Analysis** options allow you to launch all analyses as a service or specified user rather than as the current user.



In the **RSM Service Options** area, options include:

- **Ansoft Service Port** – Click **Change** to update the port number. Ansys Electromagnetics RSM Service should be running on this port for all distributed machines.
- **Send Analysis Request As** – Select either **Service User** or **Specified User**. Selecting **Specified User** enables the **User Name**, **Password**, and **Domain/Workgroup** fields.

> **Note:**
>
> If any of the remote machines is Linux-based, you must specify the current user.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Disable Access By Remote Machines** – If desired, select to disable access for remote machines.

When multiple IP addresses are available, the **Desktop-Engine Connection** area allows you to specify the preferred IP address for communication:

- **Use Default** – your system's default IP address.
- **Specified Address** – an IP address you specify.
- **Specified Subnet** – a subnet you specify. Subnet may be network prefix and prefix length (123.12.123.0/22), network prefix and subnet mask (123.12.123.0/255.255.252.0), or network prefix only (123.23.123.0).

Changing the Listening Port used by Ansys RSM Service

To change the listening port used by the RSM Service, you must change the ansoftrsmservice.cfg file, as follows:

Specify the ListenPort within a 'CommDetails' block, which must be within a 'Default:CommDetails' block, which must be within the top level block of the file (the 'AnsoftCOMDaemon' block). The following example changes the listen port from 32958 to 32957, with these blocks at the beginning of the file:

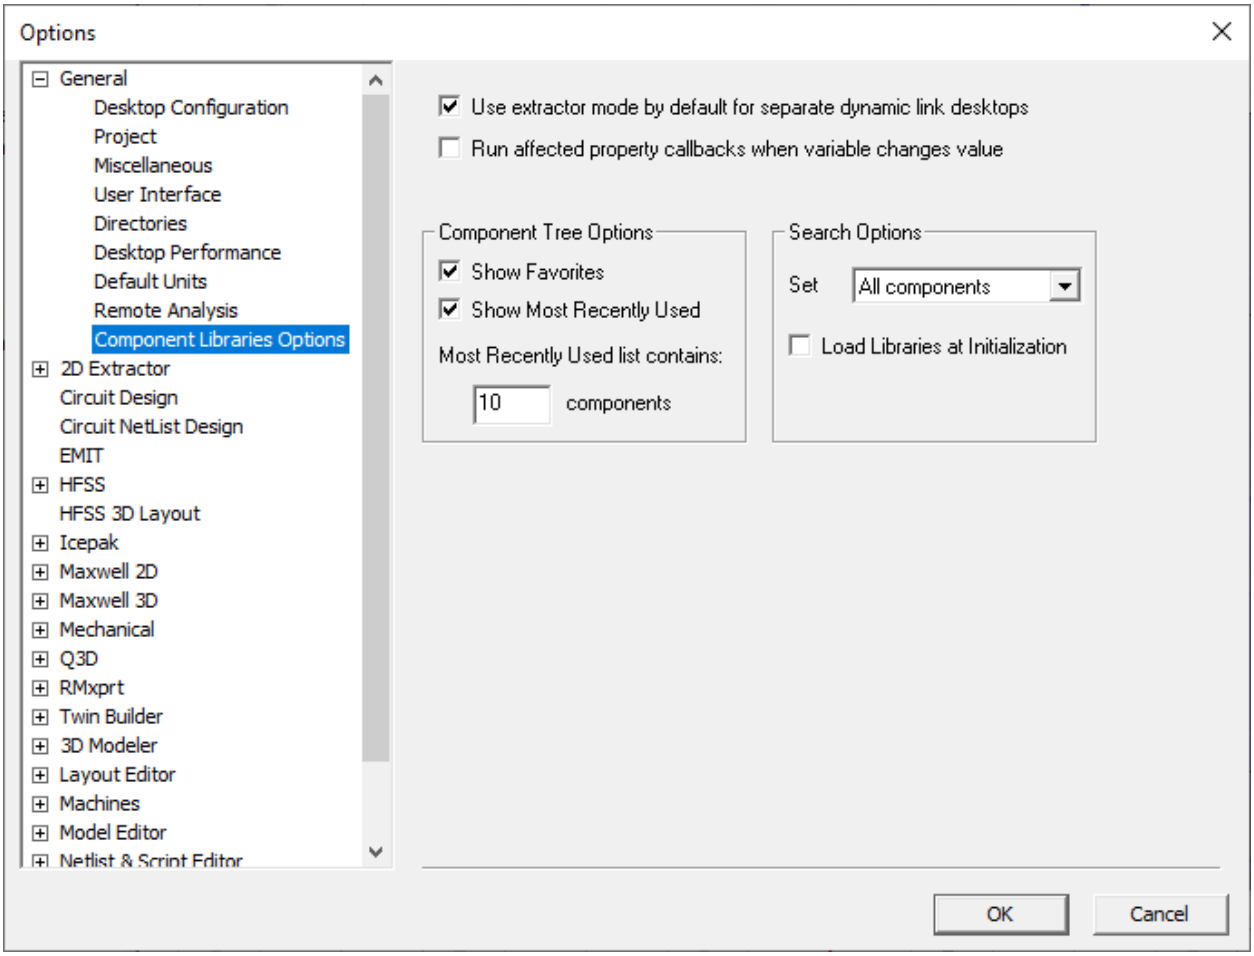
```
$begin 'AnsoftCOMDaemon'
  $begin 'Default:CommDetails'
    $begin 'CommDetails'
      ListenPort='32957'
    $end 'CommDetails'
  $end 'Default:CommDetails'
  . . . .
$end 'AnsoftCOMDaemon'
```

For the second level block, ensure that there is a single colon character and no spaces or tabs separating the two parts of the block name 'Default:CommDetails'. The third level block, with name 'CommDetails' is also required. Use caution when editing this file by hand, because any typos in the block or value names may cause the data to be ignored.

General Options: Component Libraries Options

Under General Options, **Component Libraries** options allow you to change how Electronics Desktop handles components.

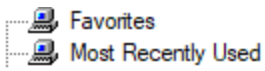
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can elect to **Use extractor mode by default for separate dynamic link desktops**, or to **Run affected property callbacks when variable changes value**.

In the **Component Tree Options** area, options include:

- **Show Favorites** – enables the **Favorites** folder in the **Component Libraries** tree.
- **Show Most Recently Used** – enables the **Most Recently Used** folder in the **Component Libraries** tree. Use the field to specify the number of components shown in the **Most Recently Used** folder. The default is 10.



In the **Search Options** area, options include:

- **Set** – specifies the search set when searching the Component Libraries. Choose to search **All components**, **Current list only**, or **Append to current list**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Load Libraries at Initialization** – this option can slow initialization.

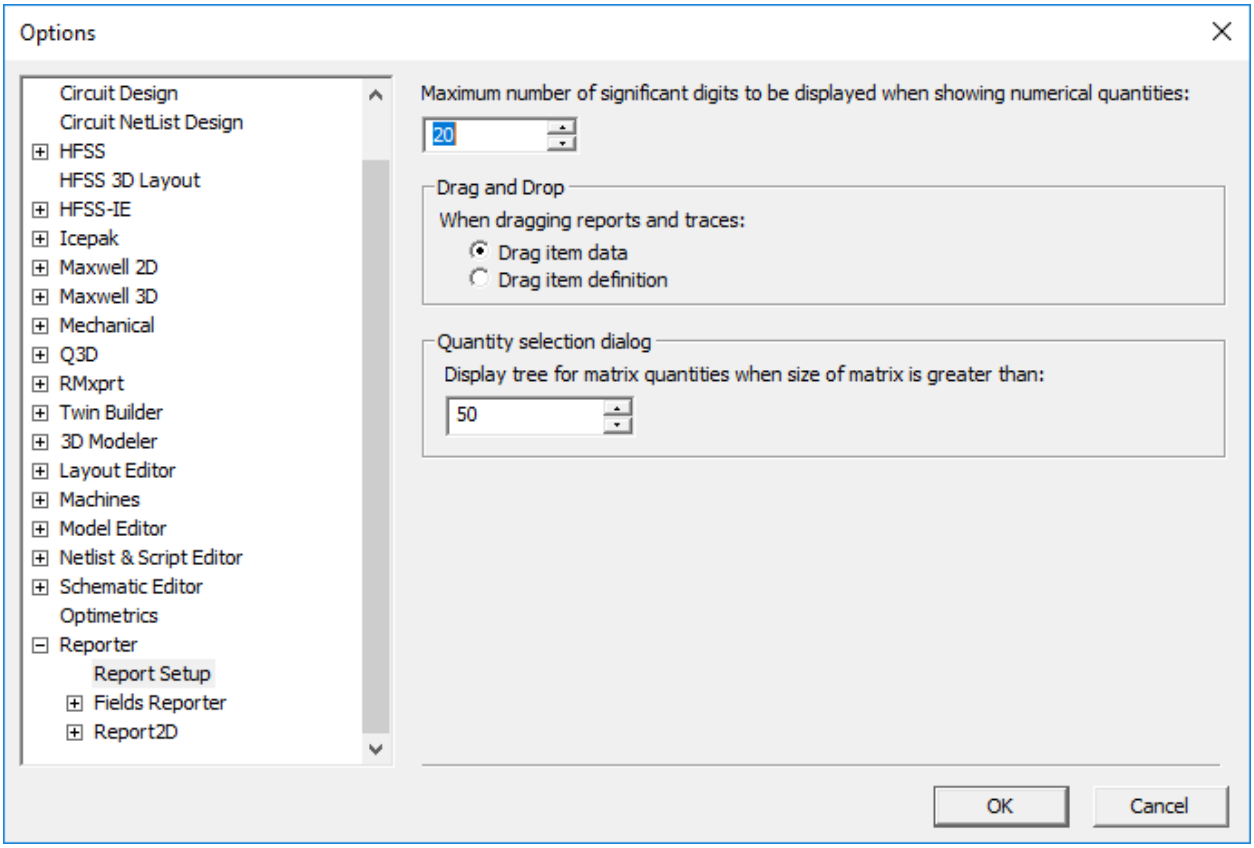
Setting Reporter Options

To set Reporter options in Ansys Electronics Desktop:

1. Click **Tools** > **Options** > **General Options**.
2. In the left pane, select **Reporter**.
3. Select the entries below **Reporter** to display the associated options:
   - Report Setup
   - Fields Reporter
   - Report2D
4. Click each entry and make the desired selections.
5. Click **OK** to apply your preferences.

Reporter Options: Report Setup Options

Under Reporter Options, **Report Setup** options allow you to customize significant digits, drag-and-drop, and quantity selection options for reports.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Set the **Maximum number of significant digits to be displayed when showing numerical quantities**. The value must be between 0 and 20.

In the **Drag and Drop** area, select how Electronics Desktop behaves when you drag reports and traces. You can either **Drag item data** or **Drag item definition**.

In the **Quantity Selection Dialog** area, select a **Display tree for matrix quantities when size of matrix is greater than** value. When the number of matrix elements is larger than the selected number, the Quantities field uses a tree structure to divide matrix quantities into groups by their first element name. The initial display shows groups, without initially listing group members. This is useful when dealing with large matrices.

Reporter Options: Fields Reporter Options

Under Reporter Options, **Fields Reporter** options fall into three categories:

- Animation Options
- Mesh Plot Options
- Streamline Plot Options

In the left pane, select a category to view those options.

From the **Animation** options, you can set the following:

- **Group Field Overlays by Type** – If selected, field overlays are grouped in the Project Tree. If deselected, they are not.
- **Default Phase Animation Settings** – Select the default start and stop angles as well as the number of steps for Scalar and Vector plots.

From the **Mesh Plot** options, you can set the **Clipping of volume mesh plot**. When dragging a clip plane, the plot can update automatically. Select **Never** to disable this feature, **Always** to enable it at all times, or set a maximum number of mesh elements for automatic update. This option allows you to update plots for smaller meshes but avoid automatically updating larger plots that may consume too much memory.

From the **Streamline Plot** options, set **Streamline drawing stopping criteria** and **Streamline marker spacing**.

Reporter Options: Report2D Options

Under Reporter Options, **Report2D** options fall into several categories:

- Curve
- Axis
- Grid
- Header

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Note
- Legend
- Marker
- Marker Table
- X/Y Markers
- Stacked
- Digital
- General
- Table

In the left pane, select a category to view those options.

Report2D Options: Curve

Curve settings change how curves are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Curve**:

- **Line Style** – use the drop-down menu to select from: Solid, Dot, ShortDash, DotShortDash, Dash, DotDash, DotDot, DotDotDash, and Long Dash.
- **Color** – double-click a color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Width** – set the line width by editing the real value in the text field.
- **Arrows** – select the check box to use arrows on curve ends.
- **Show Symbol** – select the check box to have symbols mark the locations of data points on the curve.
- **Sym Freq** – set the symbol frequency by editing the integer value in the text field.
- **Sym Style** – use the drop-down menu to select a symbol from: Box, Circle, Vertical Ellipse, Horizontal Ellipse, Vertical Up Triangle, Vertical Down Triangle, Horizontal Left Triangle, and Horizontal Right Triangle.
- **Fill Sym** – select the check box to set the symbol display as solid. Otherwise it will display as hollow.
- **Sym Color** – double-click a color box to display the **Color** dialog box. Select a default or custom color and click **OK**.

Report2D Options: Axis

Axis settings change how axes are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Axis**:

- **Axis Name** – this describes the axis to which a row's settings apply. You cannot change this field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Color** – double-click a color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Font Color** – double-click a color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Edit Font** – click **Edit Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Min Gutter %** – sets the amount of empty space (gutter) around the axis.
- **Font Description** – describes the settings applied from the **Font** window. You cannot change this field. To change the font, use **Edit Font**.
- **Axis Scaling** – Linear or Log. The default is linear.

Report2D Options: Grid

Grid settings change how grids are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Grid**:

- **Grid Name** – this describes the grid to which a row's settings apply. You cannot change this field.
- **Line Style** – use the drop-down menu to select from: Solid, Dot, ShortDash, DotShortDash, Dash, DotDash, DotDot, DotDotDash, and Long Dash.
- **Line Color** – double-click a color box to display the **Color** dialog box. Select a default or custom color and click **OK**.

Report2D Options: Header

Header settings change how headers are displayed in reports. You can separately style the Title and Subtitle.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Header**:

- **Color** – click a color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Font** – click **Edit Title Font** or **Edit Subtitle Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Company Name** – Enter a company name to appear on all reports.
- **Show Ansys Logo** – Remove the check from the box to hide the Ansys logo that appears on all reports (checked by default).

Report2D Options: Note

Note settings change how notes are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Note**:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Note Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Note Font** – click **Edit Note Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Background Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Background Visibility** – select the check box to make the background color visible. Deselect to make it transparent.
- **Border Line Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Border Visibility** – select the check box make the note border visible. Deselect to make it transparent.
- **Border Line Width** – set the line width by editing the real value in the text field.

Report2D Options: Legend

Legend settings change how legends are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Legend**:

- **Legend Name** – Default is no name. When non-empty, a header row for the Legend in plot shows up with that string.
- **Show Trace Name** – select the check box to show the trace name; deselect it to hide the trace name.
- **Show Solution Name** – select the check box to show the solution name; deselect it to hide the solution name.
- **Show Variation Key** – select the check box to show the variation key; deselect it to hide the variation key.
- **Highlight Curve on Hover** – select the check box to highlight a curve when you hover the cursor over it; deselect it to leave the curve as-is when you hover the cursor.
- **Text Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Text Font** – click **Edit Text Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Background Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Border Line Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Border Line Width** – set the line width by editing the real value in the text field.
- **Grid Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can set different **Text Color** and **Text Font** settings for the Header Row.

Report2D Options: Marker

Marker settings change how markers are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Marker**:

- **Marker Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Marker Font** – click **Edit Marker Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Arrow Direction** – use the drop-down menu to set the arrow direction to Up, Down, Left, or Right.

Report2D Options: Marker Table

Marker Table settings change how marker tables are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Marker Table**:

- **Text Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Text Font** – click **Edit Text Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Background Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Border Line Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Border Line Width** – set the line width by editing the real value in the text field.
- **Grid Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Grid Line Width** – set the line width by editing the real value in the text field.

You can set a different **Text Color** and **Text Font** for the header row.

Report2D Options: X-Y Markers

X-Y Marker settings change how X-Y markers are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **X-Y Markers**:

Background Colors

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Marker [#] Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.

Properties

- **On-screen intersection** – select the check box to enable on-screen intersection; deselect to disable.
- **Marker Font** – click **Edit Marker Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Text Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Line Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Line Style** – use the drop-down menu to select from: Solid, Dot, ShortDash, DotShortDash, Dash, DotDash, DotDot, DotDotDash, and Long Dash.
- **Line Width** – edit the text field to specify a line width.
- **Show Name** – select the check box to show X-Y marker names; deselect to hide.
- **Snap to Vertex** – select the check box to snap markers to the vertex; deselect to disable snapping.

Inter Marker Deltas

- **Show Delta** – select the check box to show inter-marker deltas; deselect to hide.
- **Delta Font** – click **Edit Delta Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Delta Text Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Line Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Line Style** – use the drop-down menu to select from: Solid, Dot, ShortDash, DotShortDash, Dash, DotDash, DotDot, DotDotDash, and Long Dash.
- **Line Width** – edit the text field to specify a line width.

X Value Manual Format

The default number format is Auto. When number format is auto, X-value number format corresponds to X-axis number format with extra 2 precision.

- X Value Number format. Can be Auto, Decimal, Scientific, Integer.
- X Value Field Width. Default 3.
- X Value Field Precision, Default 2.

Y Value Manual Format

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The default number format is Auto. When number format is auto, Y-value number format corresponds to Y-axis number format with extra 2 precision.

- Y Value Number format. Can be Auto, Decimal, Scientific, Integer.
- Y Value Field Width. Default 3.
- Y Value Field Precision, Default 2.

Report2D Options: Stacked

Stacked settings change how stacked plots are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Stacked**:

- **Auto Fit Mode** – select the check box to enable auto fit; deselect to turn off autofit.
- **Stack Height in Pixels** – set the default stack height.
- **Curve Grouping Strategy** – can be **Single**, **By Trace**, or **By Units**. **Single** means that a new stacked plot shows a single curve per stack. **By Trace** means that all curves are grouped by their trace. **By Units** means that all curves are grouped by their unit type.

If you change the **Curve Grouping Strategy** set by default, existing stacked plots remain unaffected. The new default will apply only to new stacked plots.

Report2D Options: Digital

Digital settings change how digital stack heights are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Digital**:

- **Digital Literal Foreground** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Expand Arrays/Records** – select the check box to automatically expand arrays and records; deselect it to disable.
- **Digital Stack Height in Pixels** – enter the stack height for Analog, Digital, Enum, Event, and Literal stacks.

Report2D Options: General

These settings contain general report options.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **General**:

- **Background Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Plot Area Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Highlight Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Accumulate Depth** – enter a value; the default is 4.
- **Enable Y Axis Stripes** – select the check box to add stripes to the Y axis; deselect to remove stripes.
- **Auto Scale Fonts** -on by default and when enabled scales text in plots and colorkey (contour plot, field plots in 3D modeler) for high resolution screens.

Curve Tooltip

- **Show Trace Name** – select the check box to display trace names in the tooltip when hovering the cursor over a curve.
- **Show Variation Key** – select the check box to display the variation key in the tooltip when hovering the cursor over a curve.
- **Show Solution Name** – select the check box to display the solution name in the tooltip when hovering the cursor over a curve.

Clipboard Option

- **Capture Aspect Size Ratio** – select either **As Shown** or **Full Screen**.
- **Capture Background Color** – select either **As Shown** or **White**.

Format

- **Field Width** – enter a field width value.
- **Precision** – enter a precision value.
- **Use Scientific Notation** – select the check box to use scientific notation; deselect to disable scientific notation.

Report2D Options: Table

Table settings change how tables are displayed in reports.

From the **Options** dialog box, the following options are set in **Reporter** > **Report 2D** > **Table**:

- **Rows Per Page** – enter the number of rows you would like to display per page; the default is 2500.
- **Text Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Text Font** – click **Edit Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Border Width** – enter a value for the border width.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Border Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Grid Width** – enter a value for the grid width.
- **Grid Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Background Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Page Link Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Arrow Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.

Header Row

- **Text Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.
- **Text Font** – click **Edit Font** to open the **Font** dialog box, where you can select a font, font style (for example, italic), and font size. Then click **OK**.
- **Background Color** – click the color box to display the **Color** dialog box. Select a default or custom color and click **OK**.

Format

- **Field Width** – enter a value for the field width.
- **Precision** – enter a value for the precision.
- **Use Scientific Notation** – select the check box to enable scientific notation; deselect it to disable scientific notation.

Copy to Clipboard

- **With Header** – select to include header when copying the table to a clipboard; deselect to remove it.
- **With Tab Separator** – select to include tab separator when copying the table to a clipboard; deselect to remove it.

Setting HPC and Analysis Options

All analysis parameters are accessed via a single window. The machine list and options settings have been integrated into analysis configurations. The default configuration is for solving on a single, local machine. You can create many analysis configurations for remote and distributed solutions, and switch between them depending on the job being solved. Multiprocessing has been integrated into the machine lists.

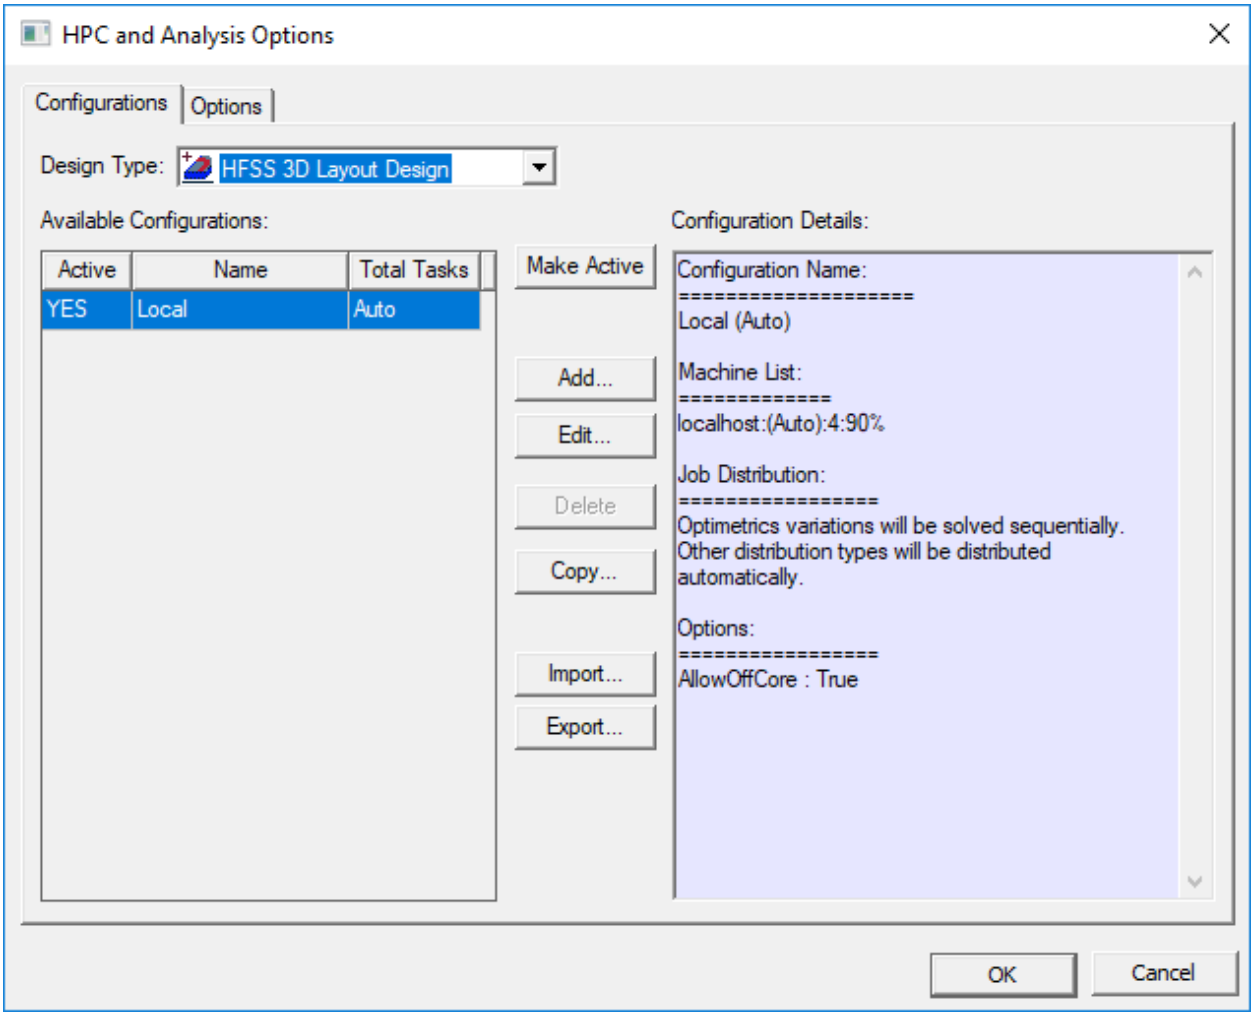
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To set HPC and Analysis Options:

1. Click **Tools** > **Options** > **HPC and Analysis Options**.

   You can also access HPC and Analysis Options using the **HPC Options** icon on the **Simulation** ribbon.

   The **HPC and Analysis Options** window appears, displaying the **Configurations** tab.



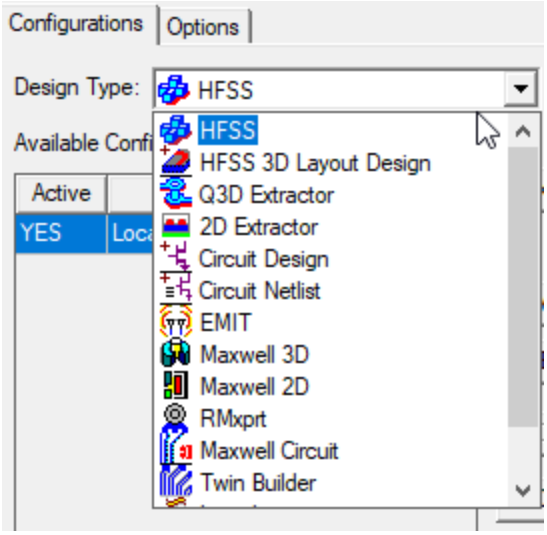
Configurations Tab

Available Configurations are described by **Name**, whether or not they are **Active**, and the **Total Tasks** the configuration can execute.Selecting a configuration from the list displays the details of that configuration in the **Configuration Details** panel.

From the **Configurations** tab, select the **Design Type** to display a list of available configurations for that type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Configurations must be defined for all design types separately. To use similar analysis parameters for different design types, create separate analysis configurations for each design type. The active configuration is used when solving an analysis for that design type.



Selecting an Available Configuration

To activate a configuration, select it from the **Available Configurations** list and click **Make Active**. The active configuration will be indicated by a **YES** in the **Active** column.

Additional options include:

- **Add** – launches a dialog box to create a new analysis configuration.
- **Edit** – launches a dialog box to edit the currently selected analysis configuration.
- **Delete** – deletes the currently selected analysis configuration(s).

> **Note:**
>
> You cannot delete the Local configuration.

- **Copy** – creates a new analysis configuration, and launches a dialog box to edit it. If the dialog box is canceled, the new analysis configuration is not created.
- **Import** – allows you to import an *.acf file to create an analysis configuration.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

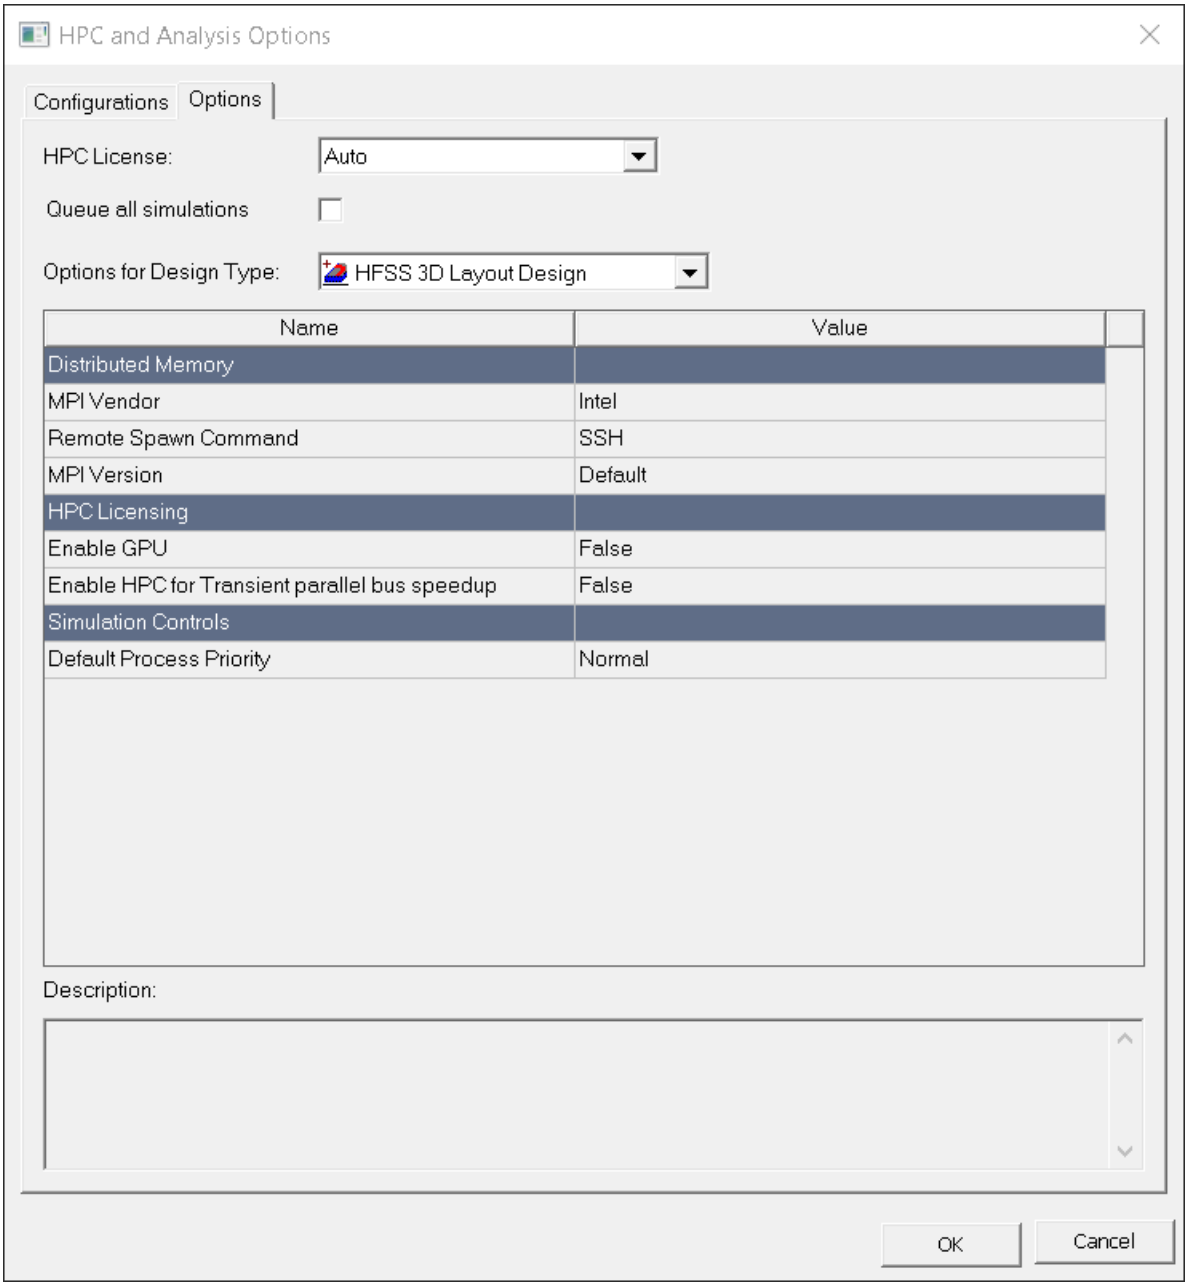
> **Note:**
>
> Importing analysis configurations always adds the imported analysis configurations to the current design type. If there is a name conflict between an imported analysis configuration and an existing analysis configuration, the imported configuration is renamed and a notification appears.

- **Export** – allows you to export the selected analysis configurations to an *.acf file. You can then import the configurations into a different design type, or import them on a different machine.

Options Tab

The **Options** tab in the **HPC and Analysis Options** dialog box contains general and product-specific settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Important:

Available options vary by design type. Certain items discussed on this page may not be visible, depending on the currently selected design type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

These options are not specified for, or saved as part of, the current analysis configuration. Instead, they are global and are always in effect for the given design type when both of the following conditions are true:

- A design of the matching design type is being solved.
- You have not specified corresponding overriding batch options on the command line.

From the **Options** tab, you can:

- Choose the HPC license type
- Enable queuing
- Specify Distributed Memory settings (for example, MPI for certain solvers)
- Set licensing options
- Enable GPU (for Transient, Matrix and SBR+ solves)
- Set the Default Process Priority

> **Note:**
>
> Solving with Intel MPI on a single Windows machine does not require MPI installation, but registration of the user's password with Intel MPI on the host is required if using password authentication. Solving with Microsoft MPI on a single Windows machine requires Microsoft MPI to be installed and the MS-MPI Launch Service to be started. These steps are not required for Microsoft MPI analysis on a Windows HPC cluster. Solving with Microsoft MPI on multiple Windows hosts is only supported on a Windows HPC cluster.
>
> Users running on Linux do not need to install MPI manually.

For **HPC License**, select **Auto**, **Workgroup** or **Pack**.

HPC licensing enables the use of cores and GPUs to accelerate simulations. In general, each core requires one unit of HPC, while each GPU requires eight units. The selected HPC license type determines which license is used, and how units of HPC are converted to license counts.

- **Workgroup** (formerly "pool") – One HPC workgroup license enables one unit of HPC.
- **Pack** – One HPC pack license enables eight units of HPC. Additional packs multiply by four, enabling 32, 128, 512,... , in the context of a single simulation.
- **Auto** – delegate the choice of Workgroup or Pack licensing to the Ansys Licensing Settings tool which is a separate application installed along with Electronics Desktop. When set to Auto, the default is to use HPC Pack first, then Workgroup.

Electronics Desktop products include four units of HPC for each licensed simulation. This means that up to four units can be used without requiring HPC licenses; license counting begins with the fifth unit. For example, a simulation that uses 36 cores requires 32 HPC units after

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

subtracting the four included cores. This simulation will check out 32 HPC workgroup licenses, or two HPC pack licenses.

HPC licenses enable all parallel and distributed simulations, including distributed variations. Distributed variations require a single set of solver licenses, plus HPC to enable the variations.

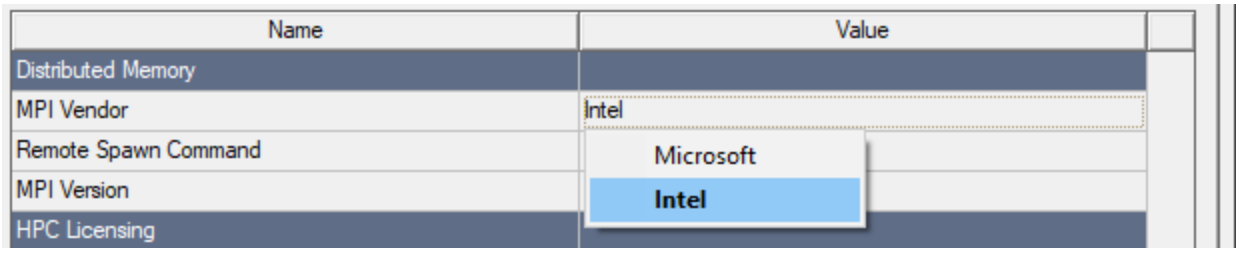
For HPC Workgroup, distributing *N* variations requires 8*(*N*–1) workgroup licenses and, together with the solver licenses, enables up to four HPC units per variation. Each additional set of *N* workgroup licenses will enable one additional HPC unit per variation. For HPC Pack, distributing *N* variations requires *N*–1 pack licenses and, together with the solver licenses, enables up to four HPC units per variation. Each additional set of *N* pack licenses will enable 8, 32, 128,... additional HPC units per variation.

Ansys licensing supports distributed simulations when Electronics Desktop is called from other Ansys tools, such as optiSLang and Workbench. In such cases, distributed design points (variations) generally use HPC counts as described above.

> **Note:**
>
> Licensing for some calling products may include some distributed design points, in which case the total required HPC will be reduced.

If the **Queue all simulations** check box is selected, the Desktop queues any active simulations for design types that have **Save before solving** turned off in the **General Options** and then processes them in order. You can view and change the queue by using Show Queued Simulations.

To configure options:



The solvers use the industry standard Message Passing Interface (MPI) and can perform solutions that distribute memory use across machines in a cluster or network. Memory used by the MPI-enabled solver is therefore limited by the set of machines that is available rather than the shared memory available on any single machine. This allows you to simulate larger structures and to optimally reconfigure the cluster of machines for the problem at hand. For solving on a single machine, MPI is not required, nor does it provide an advantage.

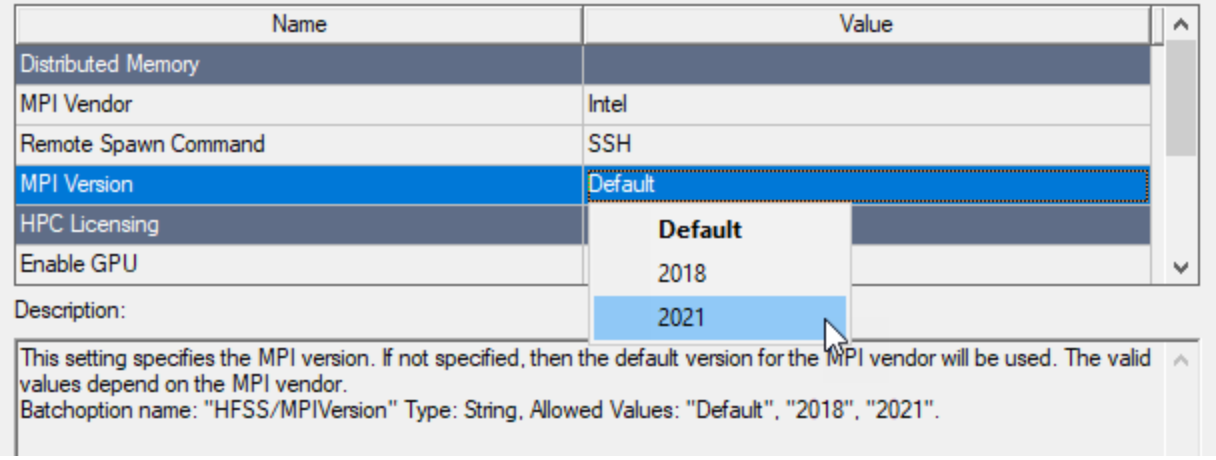
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To use the distributed memory solution you will need to install MPI software from a supported third party vendor on all the machines you intend to use.

Depending on the MPI vendor, you may need to set passwords for authentication on the machines. Settings within each design type turn on distributed memory solutions and define the list of machines you intend to use.

You can specify the MPI version. If not specified, the default version for the MPI vendor will be used. This setting is ignored if there is only one supported version for the selected MPI Vendor. Multiple versions are only supported for Intel MPI, as follows:

- The value "Default" indicates that the default Intel MPI version should be used. This is Intel MPI 2021 in most cases.
- The value "2018" indicates that Intel MPI 2018 should be used.
- The value "2021" indicates that Intel MPI 2021 should be used.



Also see Setting Intel MPI Interconnect for more details.

InfiniBand Support for Windows

By default, MPI vendors use the fastest interconnect by default (typically InfiniBand is faster than Ethernet). If you want to override the default behavior and force the use of Ethernet, you can set the ANSOFT_MPI_INTERCONNECT environment variable to "eth" for the job. Also see Setting Intel MPI Interconnect for more details.

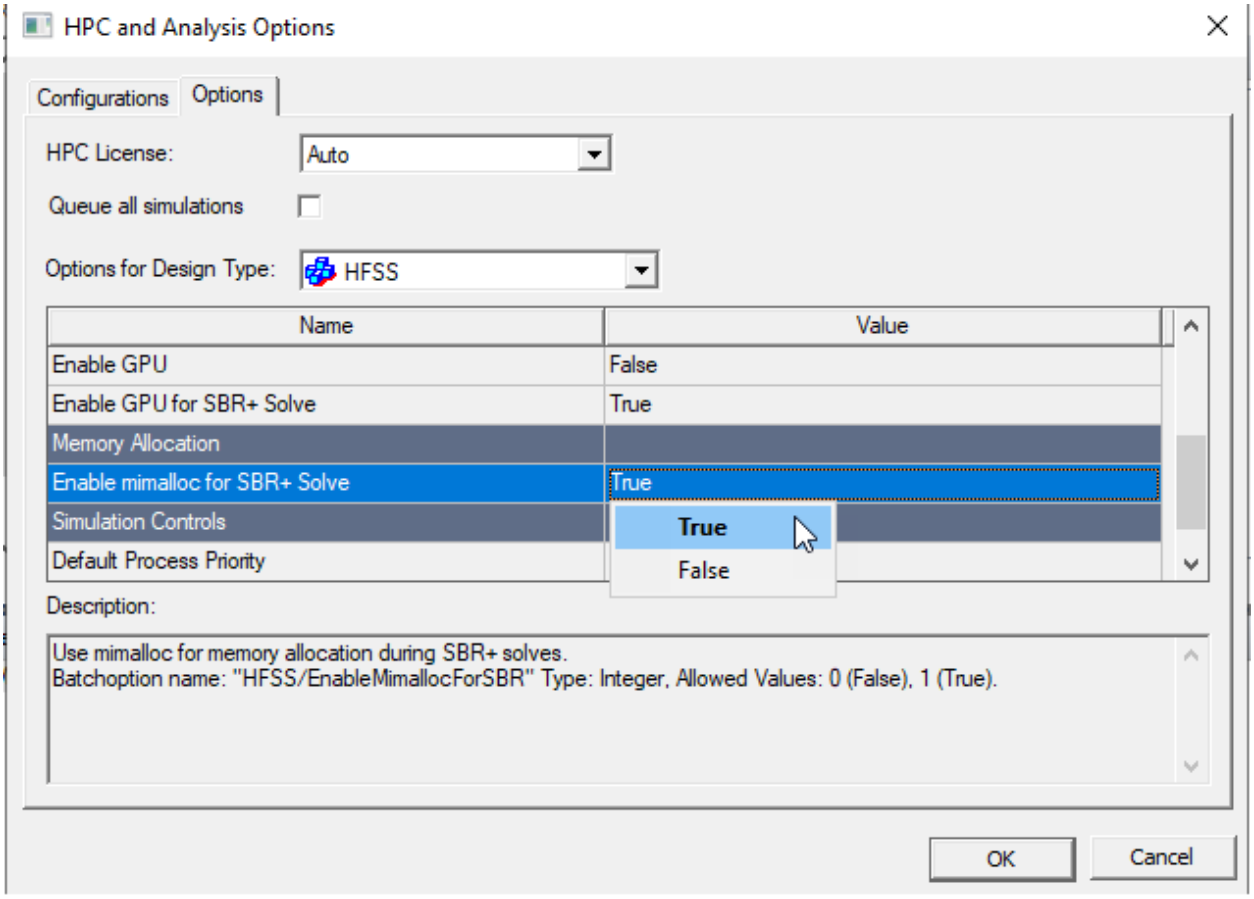
1. For Linux authentication, specify the Remote Spawn command as RSH or SSH (the default).

   For details on the requirements for GPU use, see Transient GPU Acceleration

2. **Memory Allocation**. The HFSS SBR+ solver leverages mimalloc by default on Windows to deliver better performance, especially in multi-threaded environments. On certain systems, this might cause the HFSS SBR+ not to execute. In this case, users can use the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

default Windows memory allocation by setting the "Enable mimalloc for SBR+ solve" option to "False"."



3. **Simulation Controls**: Optionally, you can select one of the following from the **Default Process Priority** drop-down menu:
    - **Critical** (highest) (Not recommended)
    - **Above Normal** (Not recommended)
    - **Normal** (Default)
    - **Below Normal**
    - **Idle** (lowest)

You can also set these values using Python scripts.

For information on editing configurations, see Editing Distributed Machine Configurations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specifying the Remote Spawn Command (Linux)

An important step in using a high performance cluster is setting up authentication across machines so that the machines can be accessed without a password. By default, HFSS 3D Layout uses SSH authentication on Linux to spawn commands on the remote machines but also supports RSH. The selection of which to use is made on the **Options** tab of the **Tools > Options > HPC and Analysis**.

SSH

You will need to set up passwordless access to use HFSS 3D Layout on a Linux cluster with SSH or RSH. In general, for SSH, this is accomplished by:

1. Verifying that you have working SSH servers and clients on your machines.
2. Verifying that the server will accept passwordless logins. You may need to edit the /etc/ssh/ssh_d file to allow RSAAuthentication and PubkeyAuthentication.
3. Generating keys on the client system using the ssh-keygen program. Do not use a passphrase so that you can access the machine without a password.
4. Copying the public key generated in step 1 from the ~/.ssh directory to the server. The easiest way to transfer the keys is to use the ssh-copy-id program. Alternately, you can use any file transfer utility. If the server already has a list of existing keys for other clients add the new public key to the list.
5. Testing the connection. Log in to the client machine using the username that you used to create the identity keys. Open a new shell terminal and attempt to open an SSH login session. For example, type `ssh 192.168.0.4` (where the IP address is the address of the machine you are attempting to connect to). The server should allow you to log in without requesting a password.

Consult the documentation for your machines and network for detailed instructions.

RSH

If you choose to use RSH, you will need to make sure RSH is installed on all the machines and set up the machines so that you are not prompted for a password. There are different ways to set up passwordless RSH, so be sure to consult the documentation for your machines and network for detailed instructions.

Machine access using RSH without a password is often set up by editing the /etc/hosts.equiv file and adding entries for the hosts you would like to use without a password. This file lists hosts and users that are granted "trusted" access to the system.

If you look at the /etc/hosts.equiv file you should have something similar to the following:

Contents of the /etc/hosts.equiv file:

```
job1.n1.com
job2.n1.com
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
job3.n1.com
```

The machines job1, job2 and job3 can connect without a password. You may also need to verify that the files /etc/hosts.allow and /etc/hosts.deny are empty. Consult your local documentation for detailed instructions and troubleshooting suggestions.

Scheduler

The Remote Spawn Command setting is only meaningful when running on the Linux Operating System. The value 'Scheduler' is valid if the job is a scheduler job running under an LSF, SGE or SLURM scheduler, and only if the MPI Vendor is "Intel".

When submitting a job using the AnsysEM job submission GUI, the Remote Spawn Command for an analysis may be specified using the batchoption with pathname 'DesignType/RemoteSpawnCommand', where DesignType is the Design Type to analyze. The Remote Spawn Command setting is only meaningful when running on the Linux Operating System. The value 'Scheduler' is valid if the job is a scheduler job running under an LSF, SGE or SLURM scheduler, and only if the MPI Vendor is "Intel". To specify the value 'Scheduler' for this option for a scheduler job, the Remote Spawn Command must be specified using the 'DesignType/RemoteSpawnCommand' batchoption in the product command line when the product is launched. In addition, the 'DesignType/MPIVendor' batchoption must be specified with value "Intel" in the product command line when the product is launched. For interactive scheduler jobs, the Remote Spawn Command and the MPI Vendor may be specified with batchoptions or as design type options in the **HPC and Analysis Options** dialog box.

Setting MPI Version

When submitting a job using the Ansys Electromagnetics job submission GUI, the MPI Version may be specified using the batchoption with pathname DesignType/MPIVersion, where DesignType is the type of design to analyze (e.g. HFSS). It allows selection of which Intel MPI version to use, for both Windows and Linux. Valid values are "Default", "2018", and "2021".

For interactive solves, the MPI version may be specified with the batchoption in the command line used to launch the product, or as a design type option in the HPC and Analysis Options dialog box.

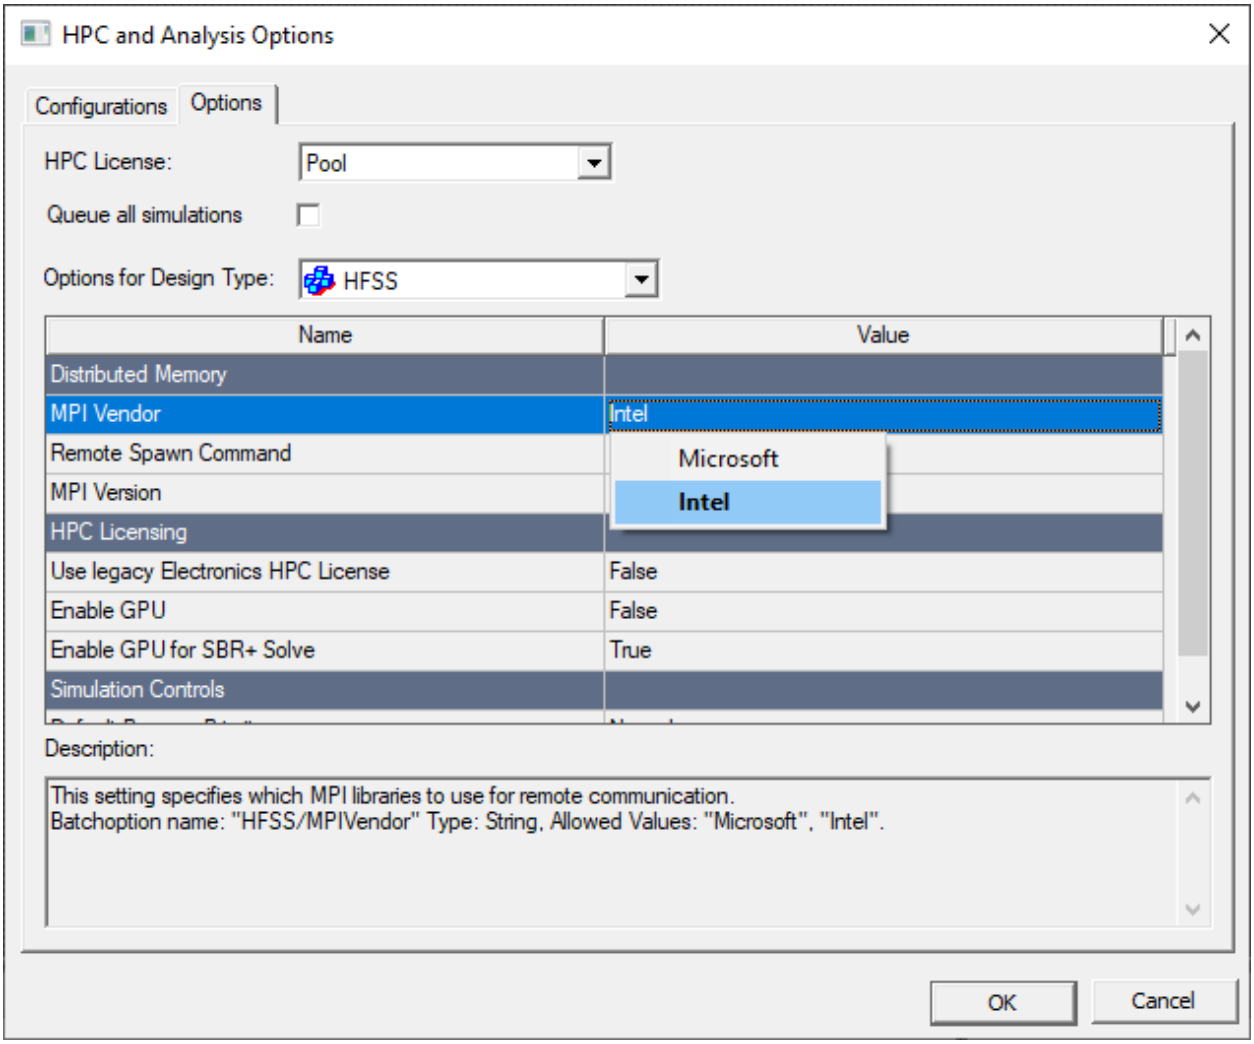
MPI Vendor and MPI Version

For HFSS, HFSS 3D Layout, Q3D Extractor, Maxwell, and Icepak design types:

These settings may be used to specify the MPI Vendor and Version for distribution via MPI.

Go to the **Options** tab of the **HPC and Analysis Options** dialog box, and select the design type. Then you can select the MPI Vendor and MPI version.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



MPI Vendor

The default MPI Vendor is "Intel". On Linux, "Intel" is the only supported MPI vendor. On Windows, both "Intel" and "Microsoft" are supported MPI vendor options. For jobs distributed to multiple hosts, the "Microsoft" MPI Vendor is only supported when running as a Windows HPC job.

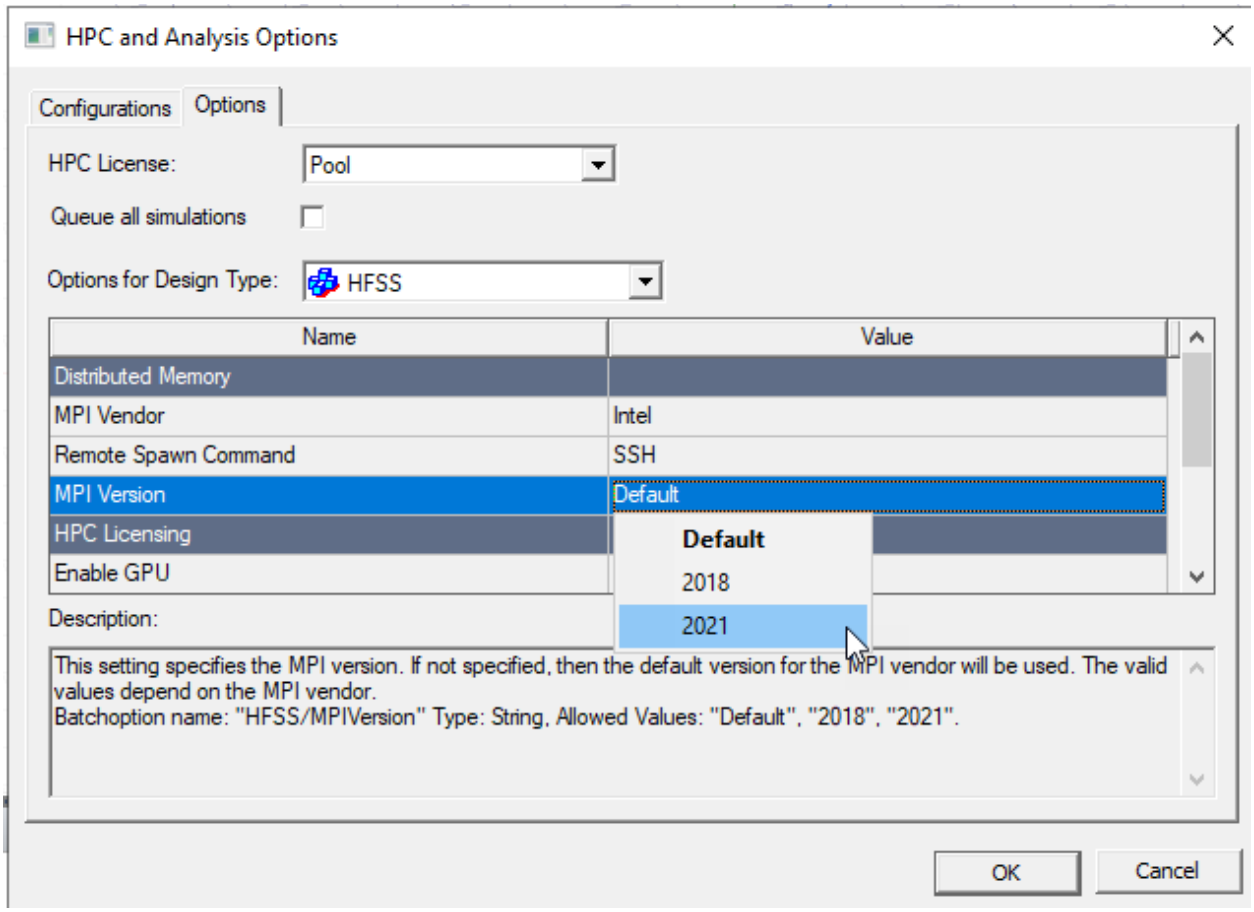
MPI Version

If only a single MPI Version is supported for the selected MPI Vendor, then the MPI Version option is ignored. Multiple versions are only supported for Intel MPI, as follows:

- The value "Default" indicates that the default Intel MPI version should be used. This is Intel MPI 2021 in most cases.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The value "2018" indicates that Intel MPI 2018 should be used.
- The value "2021" indicates that Intel MPI 2021 should be used.



Also see Setting Intel MPI Interconnect for more details.

Setting Options via Configuration Files

In addition to setting options from the Electronics Desktop user interface (UI), you can also set options in several configuration files. Option settings in configuration files may apply to all users or only to a specific user, and they may apply to all hosts or only to specific hosts. There are four levels of settings, listed below from most specific (highest precedence) to most general (lowest precedence):

- Host-dependent user options – apply to the specified user on the specified host only
- Host-independent user options – apply to the specified user on all hosts
- Host-dependent default options – apply to all users on the specified host
- Installation default – default for all users on all hosts

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In the list above, settings at any level override settings at lower levels . If there is no setting in any file, the application default value is used. See UpdateRegistry for instructions on selecting these levels.

> **Important:**
>
> Options set from the Desktop UI override and update user settings in configuration files. Otherwise, the existing configuration file settings are used.

Behavior Examples

Consider running an application as user **jsmith** on host **host123**. If there is no host-dependent user setting for the *Expand Project Tree on Insert* option in the host-dependent user options config file for user **jsmith** on host **host123**, but there is a setting for the "Expand Project Tree on Insert" option in the host-independent user options config file for user **jsmith**, then the latter setting will be used if it is not overridden using the Desktop UI. Any settings in the host-dependent default options config file or the installation default config file are ignored.

As another example, consider running an application as user **jdoe** on host **host123**. If there is no setting for the *Expand Project Tree on Insert* option in the host-dependent user options config file for **jdoe** on **host123** or in the host-independent user options config file for user **jdoe** or in the host-dependent default options config file for host **host123**, then the value from the installation default config file are used, if present.

Rules for Modifying Option Settings

Option settings displayed in the Desktop UI follow the above rules. That is, if there is a setting in any of the option config files, then the setting from the highest priority config file is displayed in the Desktop UI. If there is no setting in any of the option config files, then the global default value is used. You can modify settings using the Options dialog boxes in the Desktop UI. If the dialog box is closed with the **Cancel** button, changes made on any of the tabs are discarded. If the dialog box is closed with the **OK** button, any settings that have been changed by the user are written to the host-dependent user options config file. The changed values written to this file are then used the next time that the application is run by the same user on the same host. The Desktop UI option settings are not written to any of the other option config files.

Configuration File Locations

The configuration files for host-dependent and installation **default** options reside at: "<*installation-directory*>\ANSYS Inc\v252\AnsysEM\config". The configuration files for host-dependent and host-independent **user** options reside in a subfolder of the user's Documents folder (for Windows) or the user's HOME folder (for Linux). See the tables below for specific Windows and Linux file names and paths.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Products with Multiple Desktop Versions

For products that have multiple Desktop versions, each will have a separate user-specific config directory, with a different value for the <*ApplicationName&Version*> directory name.

Table of Directories and Files

The following table shows the directories and files, where the *Level Name* is the name used to describe an options config file when using the UpdateRegistry tool.

Config File	**Level Name**	**File Name**	**Windows Directory Path**	**Linux Directory Path**
host-dependent user options	user_machine	<*hostname*>_user.XML	%UserProfile%\Documents\Ansoft\<*ApplicationName&Version*>\config	$HOME/Ansoft/<*ApplicationName&Version*>/config
host-independent user options	user	user.XML		
host-dependent default options	install_machine	<*hostname*>.XML	*"<Installation_Directory>*\ANSYS Inc*"<Version>*\AnsysEM\config"	*"<Installation_Directory>*/ansys_inc/*"<Version>*/AnsysEM/config"
installation default	install	default.XML		

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

- ***<hostname>*** is the name of the computer on which the Electronics Desktop software is installed
- **$HOME** is the user's home directory on Linux
- ***<ApplicationName&Version>*** is the product name (without spaces) followed by the four-digit year of the version, a decimal point, and the minor release number (such as ElectronicsDesktop2025.2)
- **%UserProfile%** is a Windows variable that represents the currently active user's profile (for example, C:\Users\JohnDoe)
- ***<Installation_Directory>*** is the root folder where the Ansys software is installed (typically, C:\Program Files, on Windows, or /opt, on Linux)
- ***<Version>*** is the lower-case letter "v" followed by last two digits of the product version's year and the minor release number, without a decimal point (such as v252)

The following table shows an example of specific file names and directory names for a typical Ansys Electronics Desktop installation on Microsoft Windows and on Linux. These are the files that apply to the current software version, user "**jsmith**," and hostname "**host123**":

Config File	Level Name	File Name	Windows Directory Path	Linux Directory Path
host dependent user options	user_machine	host123_user.XML	C:\Users\jsmith\Documents\Ansoft\ ElectronicsDesktop2025.2\config	/home/jsmith/Ansoft/ ElectronicsDesktop2025.2/config
host independent user options	user	user.XML		
host dependent default options	install_machine	host123.XML	"C:\Program Files\ANSYS Inc\v252\ AnsysEM\config"	/opt/ansys_inc/v252/AnsysEM/config
installation default	install	default.XML		

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

As with the temporary file location configuration files, the settings in these options files have precedence in the following sequence:

user_machine (highest precedence), user, install_machine, install (lowest precedence).

The first time you start and exit the application, the file at the "user_machine" level is created (<*hostname*>_user.XML). The other files are only created if you do one of the following:

- Use the Choose Registry Type command to switch to a machine-independent registry (user.XML), or
- Use the UpdateRegistry tool to specify an option at the "user," "install_machine," or "install" level.

If the temporary directory is set to an empty string in a configuration file, then that setting is ignored.

Setting or Removing Option Values in Configuration Files: UpdateRegistry Command

UpdateRegistry is a command line tool used to modify option settings in the options config files. You can use this command to add, change or remove settings from any of the option config files. This tool is included in the installation directory of each product. This feature makes it easier for different users to use Ansys Electromagnetics tools installed on shared directories or network drives.

The UpdateRegistry command has multiple command line formats, as shown below.

The following command line options are *mutually exclusive*:

- `-Set`
- `-Get`
- `-GetKeys`
- `-Delete`
- `-FromFile`

UpdateRegistry -Set Command

This command is used to add or modify an option setting in an option config file. If the option config file does not exist, it will be created. If the setting does not exist in the specified config file,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

it will be added. If the setting already exists in the specified config file, then the value will be changed to the specified value.

Example:

```
UpdateRegistry -Set -ProductName <name> -
RegistryKey <keyPath> -RegistryValue <value> [
-RegistryLevel <level> ]
```

Required:

`<name>`	The application or product name and version. For example, ElectronicsDesktop2025.2. If the name contains spaces, it must be quoted. The name can be found in the ProductList.txt file in the install directory: "...\ANSYS Inc\v252\AnsysEM\config\"
`<keyPath>`	The pathname of the option setting. This includes the same analysis-related registry keys and values that are displayed by the -batchoptions help. For example, Desktop/Settings/ProjectOptions/AnimationMemory
`<value>`	The new value of the option, typically a string or a number. If the value contains spaces, it must be quoted.

Optional:

`<level>`	When specifying `-RegistryLevel`, this is a string denoting which config file to modify. One of: install, install_machine, user, and user_machine. If the level is not specified, the user_machine (host-dependent user options) file is modified.

UpdateRegistry -Get Command

This command is used to view an option value in an option config file. If the setting exists in the specified config file or files, then the value, the value type and the config file where the value was found will be reported. If no value is found, then that will also be reported.

Example:

```
UpdateRegistry -Get -ProductName <name> -
RegistryKey <keyPath> [ -RegistryLevel <level>
]
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Required:

`<name>`	The application or product name and version. For example, ElectronicsDesktop2025.2. If the name contains spaces, it must be quoted. The name can be found in the ProductList.txt file in the install directory: "...\ANSYS Inc\v252\AnsysEM\config\"
`<keyPath>`	The pathname of the option setting. This includes the same analysis-related registry keys and values that are displayed by the -batchoptions help. For example, Desktop/Settings/ProjectOptions/AnimationMemory

Optional:

`<level>`	When specifying `-RegistryLevel`, this is a string denoting which config file to modify. One of: install, install_machine, user, and user_machine. If the level is not specified, then all config files are searched in order of precedence.

UpdateRegistry -GetKeys Command

This command is used to view the allowed key names for all of the option settings, or to view a subset of the key names that match a string. For each key displayed, the current value, if any, is also reported. If a key has a value in multiple config files, then only the highest precedence value is reported.

Example:

```
UpdateRegistry -GetKeys [ <pattern> ] -
ProductName <name> [ -Case ]
```

Required:

`<name>`	The application or product name and version. For example, ElectronicsDesktop2025.2. If the name contains spaces, it must be quoted. The name can be found in the ProductList.txt file in the install directory: "...\ANSYS Inc\v252\AnsysEM\config\"

Optional:

`<pattern>`	If no pattern is specified, then all allowed key names are reported. If a pattern is specified, then only keys that match the pattern are shown. For example, Settings/Project. If the name contains spaces, it must be quoted. By default, the pattern match is case insensitive.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

-Case	If this command line option is specified, then the pattern match is case sensitive.

UpdateRegistry -Delete Command

This command is used to remove an option setting from an option config file. If the setting does not exist in the specified config file, the file will not be changed. If the setting exists in the specified config file, then it will be removed. A setting may need to be removed from an option config file, to allow the setting from a lower priority file to be used by the application.

Example:

```
UpdateRegistry -Delete -ProductName <name> -
RegistryKey <keyPath> [ -RegistryLevel <level>
]
```

Required:

<name>	The application or product name and version. For example, ElectronicsDesktop2025.2. If the name contains spaces, it must be quoted. The name can be found in the ProductList.txt file in the install directory: "...\ANSYS Inc\v252\AnsysEM\config\"
<keyPath>	The pathname of the option setting. This includes the same analysis-related registry keys and values that are displayed by the -batchoptions help. For example, Desktop/Settings/ProjectOptions/AnimationMemory

Optional:

<level>	When specifying -RegistryLevel, this is a string denoting which config file to modify. One of: install, install_machine, user, and user_machine. If the level is not specified, the user_machine (host-dependent user options) file is modified.

UpdateRegistry -FromFile Command

You can use this form of the UpdateRegistry command to set multiple key-value pairs from a file with a single UpdateRegistry command. You specify the -FromFile command line option. This option must be followed by a filename. The file may contain multiple entries, where each entry contains a registry key and a registry value. The key-value pairs are added to the registry level specified by the -RegistryLevel command line option; if no -RegistryLevel is specified, then the default registry level (user_machine) is used.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UpdateRegistry File Format

> **Note:**
>
> Functionality featured in the example(s) in this section applies to multiple design types.

The file format is similar to the -batchoptions file format. An example UpdateRegistry file is shown below:

```
$begin 'AddEntries'
  'TempDirectory'='C:/temp/AnsysEM'
  'Desktop/Settings/ProjectOptions/HPCLicenseType'='Pool'
$end 'AddEntries'
```

Additional notes on the file format:

- The file may contain an arbitrary number of entries, one per line.
- Leading whitespace on each line is ignored. Spaces or tabs may be used to make the file more readable.

Registry key pathname:

- The registry key pathname appears before the equal sign "=" on each line.
- Each registry key pathname must be enclosed in single quotes.
- This includes the same analysis-related registry keys and values that are displayed by the -batchoptions help.

Registry value:

- The registry value appears after the equal sign on each line.
- Integral registry values must not be enclosed in quotes.
- All other registry values are treated as strings, and must be enclosed in single quotes.
- The forward slash "/" may be used as a directory separator on Windows and Linux. The back slash "\" may be used as a directory separator on Windows only.
- The back slash "\" is used as an escape character in the value string. That it, this character removes the special meaning of the following character.
- The single quote character normally ends the value string. The back slash may be used to remove this special meaning, and include a single quote in the string.
- To use a back slash as a directory separator on Windows, it must be escaped. That is, a double back slash "\\" is used to denote a single directory separator.

Alternative UpdateRegistry File Format:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Analysis Configuration File format, which is exported from the HPC and Analysis Options dialog box.

> **Note:**
>
> If a current registry does not exist,Ansys Electronics Desktop can detect earlier minor versions of same application on the same machine. If such a registry exists (and does not involve -help, -batchoptionhelp, IsBatchMode(), -regserver, -unregserver, running a script, or non graphical mode), a prompt displays allowing you to port the registry from an earlier version.

Example Uses for Export Options Features

The **Tools** > **Options** > **Export Options** feature is intended to make it easier for different users to use Ansys Electromagnetics tools installed on shared directories or network drives. This section outlines some use cases enabled by this feature.

> **Note:**
>
> Functionality featured in the examples in this topic apply to multiple design types.

Options that Apply to All Users

In many cases, an Ansys Electromagnetics tool installation is administered and maintained by a single user or group and used by a number of other users or groups. The permissions of the Ansys Electromagnetics tool installation may be set so that the administrator may add, delete or modify files, but other users may only read or execute these files. The administrator may set the recommended option settings in the installation default config file and/or the host dependent default options config file. These config files reside within the installation directory hierarchy, and should generally have the same permissions as other Ansys Electromagnetics tool installation files. This allows that administrator to control these settings, but does not allow other users to add, remove, or change these settings.

Each user can override any of these settings, if needed. This may be done using the Desktop UI, which affects the host-dependent user options config file. It may also be done using the host-independent user options config file. If user has overridden an option setting in either of the user files, the user may revert back to the option settings provided by the administrator by removing the setting of the same option in the host-dependent user option config file and/or the host-independent user option config file.

For global defaults, the administrator may set a value in the installation default config file. These settings will to apply to all users on all hosts.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In some cases, there are significant differences between the capabilities of different hosts. The host-dependent default config file may be used to specify different default values on some hosts. Any setting in a host dependent default config file would affect all users running on the specified host. The installation default value is used if there is no value specified for the setting in the host-dependent default config file for the current host. Note that the host-dependent default config file is named <*hostname*>.xml, where *hostname* is the name of the host computer.

Example: Searching for a Registry Key Pathname

Both administrators and ordinary users may occasionally use the UpdateRegistry command line tool to add, change or delete settings. To use this tool, the registry key pathname must be known by the user. The -GetKeys option may be used to quickly search for a key pathname if some information is known about it. For example, if the administrator knows that there is a setting related to issuing warning messages when available disk space is low, but does not know the exact key name, the following command may list some of the keys related to disk space:

```
UpdateRegistry -GetKeys disk -ProductName ElectronicsDesktop2025.2
```

This will display a list of all keys that match the string "disk" case insensitively.

Typical output may look like the following:

```
Registry keys matching pattern <disk> case insensitively:
Desktop/Settings/ProjectOptions/DiskLimitForAbort: value is <0> at
level <user_machine>
```

Example: Setting an Installation Default Value

The normal default for the Options/General/Desktop Performance/Warn when available disk space is less than setting is 0 MB. If the administrator is concerned that running out of disk space might be a common problem, the administrator could set the installation default for the warn setting setting to 1000 MB, for example. This limit would then apply to all users running on all hosts. The administrator could use the following command to change this setting for Ansys Electronics Desktop:

```
UpdateRegistry -Set -ProductName ANSYSElectronicsDesktop2025.2
 -RegistryKey Desktop/Settings/ProjectOptions/DiskLimitForAbort
 -RegistryValue 1000
 -RegistryLevel install
```

Example: Setting a Host-Dependent Default Value

For this example, assume that all hosts have two cores, except for three hosts: bighost1, bighost2, and bighost3, which have eight cores each. The administrator has set the Desktop/Settings/ProjectOptions/NumberOfProcessors option value to 2 in the installation

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

default config file. The administrator may set the Desktop/Settings/ProjectOptions/NumberOfProcessors option value to 8 in the host-dependent default config files for the three hosts having 8 cores: bighost1, bighost2 and bighost3. The administrator may log in to host bighost1 and run the following command to change this setting for the host-dependent default options config file for host bighost1:

```
UpdateRegistry -set -ProductName ElectronicsDesktop2025.2
 -RegistryKey Desktop/Settings/ProjectOptions/NumberOfProcessors
 -RegistryValue 8
 -RegistryLevel install_machine
```

To make this change for the other two hosts, the administrator would log in to bighost2 and bighost3, and run the same command on each of those hosts.

Example: Reverting from a User-Defined Option Value to the Administrator Default

Consider the case in which Electronics Desktop was installed and the administrator initially did not set a value for the Desktop/Settings/ProjectOptions/DiskLimitForAbort setting in the default installation config file. User jsmith (who always uses host jshost) wanted to be warned before disk space dropped to zero, so he set the Desktop/Settings/ProjectOptions/DiskLimitForAbort to 100 MB using the UI. This setting is recorded in the host dependent user options config file for host jshost and user jsmith. Now the administrator learns that many users are running into disk space issues, so that administrator sets the installation default value for the setting Desktop/Settings/ProjectOptions/DiskLimitForAbort to 1000 MB, as in the above example.

When user jsmith runs Electronics Desktop on host jshost, the disk limit is 100 MB, not 1000 MB, because the host-dependent user options config file overrides all of the other config files. User jsmith may revert to the administrator provided default by removing this setting from the host dependent user options config file for host jshost and user jsmith. The following command may be run by user jsmith on host jshost to remove this setting:

```
UpdateRegistry -Delete -ProductName ElectronicsDesktop2025.2
 -RegistryKey Desktop/Settings/ProjectOptions/DiskLimitForAbort
 -RegistryLevel user_machine
```

If user jsmith had added a value for this setting to the host-independent user options config file, then user jsmith would also run the following command to remove this setting from the host-independent user options config file:

```
UpdateRegistry -Delete -ProductName ElectronicsDesktop2025.2
 -RegistryKey Desktop/Settings/ProjectOptions/DiskLimitForAbort
 -RegistryLevel user
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

User Options and the UpdateRegistry Tool

> **Note:**
>
> Functionality featured in the example(s) in this section applies to multiple design types.

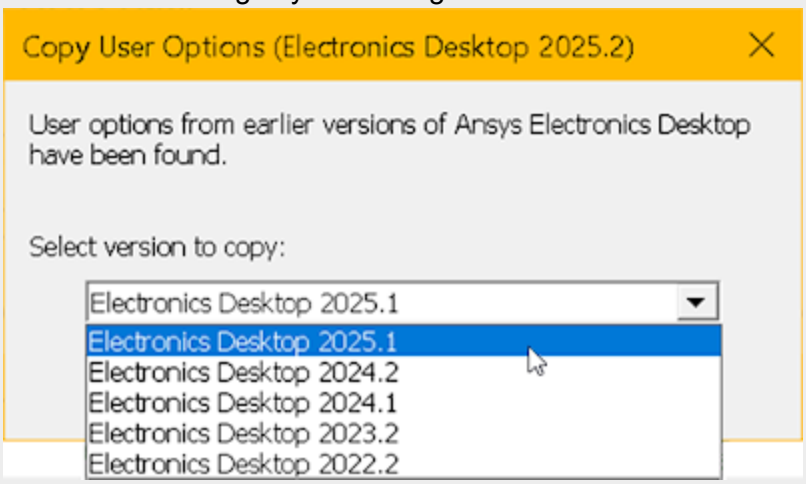
When you change an option's value using the Ansys Electronics Desktop UI, the new value is stored in the currently active user options registry. You can use the UpdateRegistry tool to add, modify, or remove settings. However, you cannot use the Desktop UI to *remove* settings from the registry. *You must use the UpdateRegistry tool to do that.*

If you have not already created a user options configuration file (either host-specific or host-independent), before launching the Ansys Electronics Desktop application for the first time, all settings will come from the *host-specific default* options configuration file or the *installation default options* configuration file. In a host-specific user options configuration file, any settings applicable to a different host from the current one will not be carried over to the new host. This behavior may be inconvenient if the user has preferred option settings that differ from the default settings, which apply to all users, especially if the user runs the application on a number of different hosts. In this case, the user may choose to use a host-independent registry and set the option values in this type of options file. See Understanding Registry Tools for more information. Host-independent option values can be used on all new hosts, overriding any values set by the administrator to apply to all users. Changes made in the UI can affect the user's host-specific or host-independent registry, depending on the currently specified registry type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

If a current registry does not exist, the program detects earlier major and minor versions of same application on the same host. If such a registry exists (and does not involve -help, -batchoptionhelp, IsBatchMode(), -regserver, -unregserver, running a script, or non graphical mode), a prompt displays the earlier versions you can select, from which the registry will be migrated.



Copy over registry entries (both Windows and Ansys .xml files).

Example: Removing a Host-Dependent User Option Setting

For this example, user jsmith always uses host jshost to run Ansys Electronics Desktop. At some point, jsmith set the Autosave interval in **General Options** > **Project Options** tab to 1000 edits, and this value was written to the jsmith's host-dependent user options config file for host jshost. Now, jsmith wants to remove this setting and return to the default value of 10. User jsmith may run the following command on host jshost to remove the Desktop/Settings/ProjectOptions/AutoSaveInterval option value from this config file:

```
UpdateRegistry -Delete -ProductName ElectronicsDesktop2025.2
-RegistryKey Desktop/Settings/ProjectOptions/AutoSaveInterval
-RegistryLevel user_machine
```

Example: Getting a Value from a Specific Configuration File

In the previous example, the user jsmith may decide to check the Desktop/Settings/ProjectOptions/DiskLimitForAbort setting in the host-independent user configuration file before making any changes to this setting. The following command may be used to quickly view this setting before making the change:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
UpdateRegistry -Get -ProductName ElectronicsDesktop2025.2 -
RegistryKey Desktop/Settings/ProjectOptions/DiskLimitForAbort -
RegistryLevel user
```

Example: Getting a Value Using Precedence Rules

In may cases, the user is more interested in the value of a setting that will be applicable when running the product than in the setting in a single configuration file. If the -Get option is used with no -RegistryLevel specified, then the value reported is the value found in the highest precedence configuration file. If the user jsmith is interested in the highest precedence value for the Desktop/Settings/ProjectOptions/DiskLimitForAbort setting, then the following command may be used to report this information:

```
UpdateRegistry -Get -ProductName ElectronicsDesktop2025.2 -
RegistryKey Desktop/Settings/ProjectOptions/DiskLimitForAbort
```

Example: Adding a Host-Independent User Option Setting

Consider the case in which there is no value set for the Desktop/Settings/ProjectOptions/DiskLimitForAbort setting for all users for Ansys Electronics Desktop. The default is then 0 MB. User jsmith uses a variety of hosts and wants to be warned whenever disk space drops to 250 MB on any host. User jsmith may use the following command to set the Desktop/Settings/ProjectOptions/DiskLimitForAbort option value to 250 MB for all hosts:

```
UpdateRegistry -set -ProductName ElectronicsDesktop2025.2
-RegistryKey Desktop/Settings/ProjectOptions/DiskLimitForAbort
-RegistryValue 250 -RegistryLevel user
```

Example: Setting a RegistryKey not defined in ElectronicsDesktopRegistrySyntax.xml

```
"C:\Program Files\ANSYS Inc\v252\AnsysEM">UpdateRegistry -Set -
ProductName ElectronicsDesktop2025.2 -RegistryKey "3D
Editors/Preferences/Geometry3D/q" -RegistryValue "m"

registry key is not defined in this product

Register value <3D Editors/Preferences/Geometry3D/q> is created with
value <m>
```

Example: Change a Newly Set Registry Key

```
"C:\Program Files\ANSYS Inc\v252\AnsysEM\">UpdateRegistry -Set -
ProductName ElectronicsDesktop2025.2 -RegistryKey "3D
Editors/Preferences/Geometry3D/q" -RegistryValue "n"
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
Register value <3D Editors/Preferences/Geometry3D/q> is set to <n>
```

If you attempt to set a registry key to the wrong data type, a message like the following appears.

```
Cannot set the registry value to different data type
The work around is delete it, then create it again
error on to set registry value at <3D
Editors/Preferences/Geometry3D/q>
```

Setting the Temporary Directory

The temporary directory may be viewed or set using the Electronics Desktop user interface (UI), or from the command line.

To set the directory via the UI:

1. Navigate to **Tools** > **Options** > **General Options**.
2. In the tree at the left side of the dialog box, expand the **General** branch and select **Directories**.
3. Use the **Temp** field and **Override** check box to enter a desired directory path. Values set in this manner are written to the user_machine level configuration file for the temporary directory. If the **Override** check box is cleared, clicking **OK** changes the user_machine level setting for the temporary directory to an empty string. This enables settings from the next highest precedence configuration file. The file that provides the currently active temporary directory setting is shown under the **Temp** edit box.

To set the temporary directory from the command line, using the -batchoptions command line option. See: Running Ansys Electronics Desktop from a Command Line and -Batchoptions Command Line Examples.

The temporary directory may be configured with an installation default value, as well as a host-dependent default value, a host-independent user-specified value and a host-dependent user-specified value. Temporary directory settings are stored in different files from the other option settings. These files are located in the same directories as the configuration files for the other option settings. The following table shows the directories and files used to store temporary directory settings.

Config File	**Level Name**	**File Name**	**Windows Directory Path**	**Linux Directory Path**
Host-dependent, user-specific temporary directory	user_machine	<*hostname*>.cfg	%UserProfile%\Documents\Ansoft\<*ApplicationName&Version*>\config	$HOME/Ansoft/<*ApplicationName&Version*>/config

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Config File	Level Name	File Name	Windows Directory Path	Linux Directory Path
Host-independent, user-specific temporary directory	user	default.cfg	"<*InstallationDirectory*>\ANSYS Inc\v252\AnsysEM\config"	<*InstallationDirectory*>/ansys_inc/v252/AnsysEM/config
Host-dependent, default temporary directory	install_machine	<*hostname*>.cfg		
Installation default temporary directory	install	default.cfg		

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

- **<*hostname*>** is the name of the computer on which the Electronics Desktop software is installed
- **$HOME** is the user's home directory on Linux
- **<*ApplicationName&Version*>** is the product name (without spaces) followed by the four-digit year of the version, a decimal point, and the minor release number (such as ElectronicsDesktop2025.2)
- **%UserProfile%** is a Windows variable that represents the currently active user's profile (for example, C:\Users\JohnDoe)
- **<*InstallationDirectory*>** is the root folder where the Ansys software is installed (typically, C:\Program Files, on Windows, or /opt, on Linux)
- **<*Version*>** is the lower-case letter "v" followed by last two digits of the product version's year and the minor release number, without a decimal point (such as v252)

As with other options, the settings in these files have precedence in the following sequence: user_machine (highest precedence), user, install_machine, install (lowest precedence). The installer creates the file at the "install" level (default.cfg). The first time you start and then exit the application, the file at the "user_machine" level is created (<*hostname*>.cfg). The other files are only created if you use the UpdateRegistry tool to specify an option at the "user" or "install_machine" level. If the temporary directory is set to an empty string in a configuration file, then that setting is ignored.

Temporary Directory Configuration File Format

This section describes the format of temporary directory configuration files. The format is the same for files at all four levels: user_machine, user, install_machine, and install. These files are text files, so any text editor may be used to modify or create them.

An example temporary directory configuration file is shown below:

```
$begin 'Config'
tempdirectory='C:/TEMP/AnsysEM'
$end 'Config'
```

The temporary directory specified by this configuration file is C:/TEMP/AnsysEM.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important:

- The string containing the pathname of the temporary directory must be enclosed in single quotes.
- The forward slash (/) may be used as a directory separator on Windows and Linux. The backslash (\) may be used as a directory separator on Windows only.
- The backslash (\) is used as an escape character in the tempdirectory string. That it, this character removes the special meaning of the following character.
- The single quote character normally ends the tempdirectory string. The backslash may be used to remove this special meaning, and include a single quote in the string.
- To use a backslash as a directory separator on Windows, it must be escaped. That is, a double backslash "\\" is used to denote a single directory separator.
- On Windows, a UNC path normally begins with two backslash characters. In a tempdirectory string, each of these backslash characters must be doubled, so four consecutive backslashes "\\\\" are used in the config file.

Example: Config File with UNC

```
$begin 'Config'
tempdirectory='\\\\hostxyz\\TEMP\\abc'
$end 'Config'
```

Here, hostxyz is a host with a sharename TEMP having subdirectory abc used as the temporarydirectory. This shows that four backslashes are required for UNC names and that backslashes used as directory separators must be doubled.

Example: Config File with Single Quote

```
$begin 'Config'
tempdirectory='C:/TEMP/ab\'cd'
$end 'Config'
```

Temporary directory is C:/TEMP/ab'cd. This shows how to include a single quote in a tempdirectory pathname. It also shows that forward slashes may be used as directory separators on Windows.

UpdateRegistry: Setting or Removing Temporary Directory Values in Configuration Files

The UpdateRegistry command line tool, described above, may be used to view, add, change or remove the temporary directory setting from any of the temporary directory config files. The registry key for viewing or modifying the temporary directory is TempDirectory.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The -Get, -Set, and -Delete options are valid for viewing, adding, changing, or deleting a temporary directory setting.

The -GetKeys option does not list the temporary directory key.

Batchoptions Command Line Examples

The `-batchoptions` entries command line argument may be used to specify one or more batchoptions settings from the command line. To specify multiple entries using a single `-batchoptions` argument, the entries should be enclosed in double quotes. Alternatively, the batchoptions may be specified in a file using the `-batchoptions <filename>` command line argument format. In this case, the filename is an absolute or relative pathname of the file containing the batchoptions, as described above.

> **Important:**
>
> The two approaches may not be combined: either all batchoptions must be in a file or all batchoptions must be specified explicitly on the command line.

Batchoptions File Format

> **Note:**
>
> Functionality featured in the example in this section applies to multiple design types.

An example batchoptions file is shown below:

```
$begin 'Config'
  'Desktop/ProjectDirectory'='C:/test/projects'
  'Desktop/Settings/ProjectOptions/NumberofProcessors'=2
$end 'Config'
```

Additional notes on the file format:

- The file may contain an arbitrary number of batchoption entries, one per line.
- Leading whitespace on each line is ignored. Spaces or tabs may be used to make the file more readable.
- The **Registry Key** appears before the equals sign (=) on each line and must be enclosed in single quotes ('). The registry key includes the key path and the name of the registry value.
- The registry value (or option value) appears after the equals sign on each line.
- Registry keys are case-insensitive.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- There are two supported types of registry values—string and integer:
  - Each **string** value must be enclosed in single quotes (').
  - Do **not** enclose **interger** values in quotes.
- For file paths within string values, the forward slash (/) may be used as a directory separator on both Windows and Linux systems.
- Alternatively, on Windows only, the customary backslash (\ ) may be used as a directory separator. However, in string values, the backslash is used as an escape code for indicating special characters that cannot be typed directly (such as \n for a new line). Therfore, if you use the backslash as a directory path separator, each instance must be doubled (\\ ). An example is: '\\\\host3\\temp\\Ansoft'. In this case, each double backslash is interpreted as a single backslash (\\host3\temp\Ansoft).
- The single quote character (') normally ends a string value. If you need to include a single quote (or apostrophe) within a string, use the backslash-apostrophe (**\'**) escape sequence. For example, the string '%UserProfile%/Documents/Ansoft/John\'s_Files', is interpreted as: %UserProfile%/Documents/Ansoft/John's_Files.

Example -BatchOptions with -Remote (Windows)

> **Note:**
>
> Functionality featured in the examples in this section applies to multiple design types.

In this example, we run a batch HFSS analysis of project file project1.aedt. We want all temporary files and directories to be created in C:\temp\HFSS instead of using the default temporary directory. We decide that the analysis will be done on a remote host, at IP address 12.34.56.78. Because of limited memory on the remote host, we decide to run the analysis using only a single COM engine. Because the remote host has four cores, we decide to use four four processors for of the analysis. We can use the **-Remote** option to specify that there will be a single remote COM engine.

Here is a sample command line for this analysis, where the project file \\somehost\projects\project1.aedt is located in a shared directory specified using a UNC path:

```
ansysedt -BatchSolve -Remote -Machinelist list=12.34.56.78
 -batchoptions "'TempDirectory'='C:/temp/HFSS'
'Desktop/Settings/ProjectOptions/NumberofProcessors'=4"
\\somehost\projects\project1.aedt
```

An alternative is to use the **-Distributed** command line option. Because the -Machinelist list contains only one host, there is a single remote COM engine in this case also.

```
ansysedt -BatchSolve -Distributed -Machinelist list=12.34.56.78
 -batchoptions "'TempDirectory'='C:\\temp\\HFSS'
 'Desktop/Settings/ProjectOptions/NumberofProcessors'=4"
 \\somehost\projects\project1.aedt
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The second line of the first example shows that you can use the forward slash "/" as a Windows directory separator within option value 'strings'. In this case, it is used in the TempDirectory path. You can also use the customary backslash "\" as a Windows directory separator, but it must be doubled to "\\" because the backslash is also an escape character within parameter strings. This usage is demonstrated in the second line of the second example, again in the TempDirectory path.

Example -Batchsolve with -Machinelist (Windows)

> **Note:**
>
> Functionality featured in the example(s) in this section applies to multiple design types.

Suppose that we want to run a batch HFSS analysis of project file project1.aedt. Because all of our hosts have multiples of 2 cores, we specify that we will use two threads for multiprocessing for both the distributed (HFSS/NumCoresPerDistributedTask) and non-distributed (Desktop/Settings/ProjectOptions/NumberOfProcessors) parts of the job. The analysis contains a sweep that will be distributed across three hosts: ahmed, bill, and catherine. The hosts ahmed and bill have four cores each, so we run two distributed COM engines on each of these hosts, each using two threads. Host catherine has only two cores, so we specify only one distributed COM engine on this host. This COM engine will also use two threads. We specify a desired RAMLimitPercent of 75 for this analysis.

Here is a sample command line for this analysis, where the project file \\dennis\projects\project1.aedt is located in a shared directory specified using a UNC path:

```
ansysedt -BatchSolve -Distributed
-Machinelist list=ahmed,ahmed,bill,bill,catherine
-batchoptions "'Hfss/RAMLimitPercent'=75
'Desktop/Settings/ProjectOptions/NumberOfProcessors'
'Hfss/NumCoresPerDistributedTask'=2"
\\dennis\projects\project1.aedt
```

Example -Batchsolve with -Machinelist (Linux)

> **Note:**
>
> Functionality featured in the example(s) in this section applies to multiple design types.

In this example, we run a batch HFSS analysis of project file project2.aedt. We have four identical host computers—host1, host2, host3, and host4 for analysis, and each host has 4 cores. We do not use multiprocessing for the distributed analysis, so NumCoresPerDistributedTask=1. As each host has four cores, we specify multiprocessing using

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4 threads for the non-distributed part of the analysis, so NumberOfProcessors=4. Because we do not use multiprocessing for the distributed analysis, we will run four distributed COM engines on each host, with a singe core available for each engine. We will specify a RAM limit of 75% for this analysis.

Here is a sample command line for this analysis, where the project file /home/jsmith/projects/project2.aedt is located in a shared directory:

```
hfss -BatchSolve -Distributed
-Machinelist file=/home/jsmith/hosts/list2
-batchoptions "HFSS/'RAMLimitPercent'=75
'Desktop/Setings/ProjectOptions/NumberOfProcessors'=4
'HFSS/NumCoresPerDistributedTask'=1"
/home/jsmith/projects/project2.aedt
```

For this example, the hostnames are in the text file /home/jsmith/hosts/list2. The file contents are as follows:

```
host1
host1
host1
host1
host2
host2
host2
host2
host3
host3
host3
host3
host4
host4
host4
host4
```

Example -Batchsolve for Local (Windows)

> **Note:**
>
> Functionality featured in the example(s) in this section applies to multiple design types.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In this example, we run a batch analysis of project file testproject.adsn on the local host. We want all temporary files and directories created in directory C:\temp\ansysedt instead of using the installation default temporary directory. Because the local host has four cores, we decide to use four threads for multiprocessing, for both distributed and non-distributed parts of the analysis.

Here is a sample command line for this analysis, where the project file \\host123\projects\testproject.adsn is located in a shared directory specified using a UNC path:

```
ansysedt -BatchSolve -Local -batchoptions
"TempDirectory='C:/temp/ansysedt'
'HFSS/SolverOptions/NumProcessors'=4
'HFSS/SolverOptions/NumProcessorsDistrib'=4"
\\host123\projects\testproject.adsn
```

Note that the batchoptions pathnames 'HFSS/SolverOptions/NumProcessors' and 'HFSS/SolverOptions/NumProcessorsDistrib' must be in single quotes because they both contain embedded spaces.

Batch Options and Analysis Configurations in the Registry

Analysis configurations are used to specify machines and options for local, remote, and distributed analysis, including capabilities that are enabled by HPC licenses.

How Analysis Configurations are Stored in the Registry

A configuration contains information beyond the machine or machines to use for a solution. Examples are the number of processors to allocate to the analysis for each machine in the list, memory limits, directory locations for personal libraries and temporary files, and many other preferences.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

- Options are arranged as keys and values (in a structure similar to the *Windows Registry*). However, these options are not a part of the *Windows Registry* but are separately stored and maintained by the Ansys Electronics Desktop software. For more information concerning the configuration files comprisisng the options registry, see the following topics:

  Setting Options Via Configuration Files
  Setting the Temporary Directory

- For access to options and functionality beyond what is directly accessible via the user interface or batch options, refer to the documentation of the **UpdateRegistry** tool. This tool is discussed in the following help topic and in the topics that follow it in the same branch of the product help:

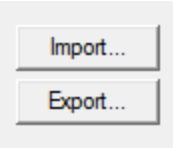
  Setting or Removing Option Values in Configuration Files: UpdateRegistry Command

General settings are associated with the Desktop application or 3D Editor. "HPCLicenseType" and "tempdirectory" values are at the root level of the registry. Other options are specific to a particular product or design type. For example, certain mesh, boundary, and memory limit settings as well as many other preferences are product-specific and are therefore associated only with the applicable design types. Such options appear with a consistent value name but in a different registry path for each applicable design type.

Copying a Configuration from one Design Type or Product to Another

To copy a configuration from one design type (or product) to another:

1. Click **Tools** > **Options** > **HPC and Analysis Options**. The *HPC and Analysis Options* dialog box appears.
2. On the **Configurations** tab of the **HPC and Analysis Options** dialog box, use the **Export…** button to export the configuration to a file.



3. Switch to the destination design type (or product) and use the **Import…** button to import the configuration data.

   Any data that is not applicable to the destination design type is ignored; any settings present in the destination design type that were not present in the source configuration will be assigned default values. The user may then edit the copy, as desired.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Using HPC and Analysis for Configurations

Due to the complexity of the registry values for the configurations we do not recommend directly editing these values using the *UpdateRegistry* tool. Instead, use the **HPC and Analysis Options** dialog box to edit or create a configuration. (See: Setting HPC and Analysis Options.) Configurations created or edited using the GUI are stored in the **user_machine** level of the registry. You can create a configuration for one of the other registry levels using the following steps:

1. Create the configuration using the GUI, then export the configuration to a file.
2. Delete the configuration using the GUI so that it will not be present in the **user_machine** level. Then, exit the GUI.
3. Use the **UpdateRegistry** tool to import the data into the desired registry level using the **-FromFile** option to specify the file exported via the GUI, and using the **-RegistryLevel** option to specify the registry level where the configuration is to be stored. For example, an administrator may use this approach to create a configuration at the **install** level that may be used by any user on any machine.

Batch Options

There is a large number of both general and product-specific options supported by the software. These options have evolved over time. Therefore, older batchoptions files may no longer be valid, and the options listed in the user interface of the current software may differ from earlier versions you have used. Additionally, there are options beyond those listed within the user interface (that is, the UI provides a subset of the available options). You can generate a more complete list of options by running the UpdateRegistry tool with the -GetKeys switch and piping the output to a text file, as detailed in the following Windows procedure:

1. In a command window, navigate to the following folder:

   "<*installation_directory***>\ANSYS Inc\v252\AnsysEM"**

2. Type and enter the following command:

   UpdateRegistry -GetKeys -ProductName ElectronicsDesktop20*xx.y* **>** <*text_file_path*>**\Batchoptions.txt**

   Substitute the last two digits of the installed product version year and the minor release number for *xx.y* (such as **25.1**). Also, substitute the desired *text_file_path* (such as **%UserProfile%\Desktop**).

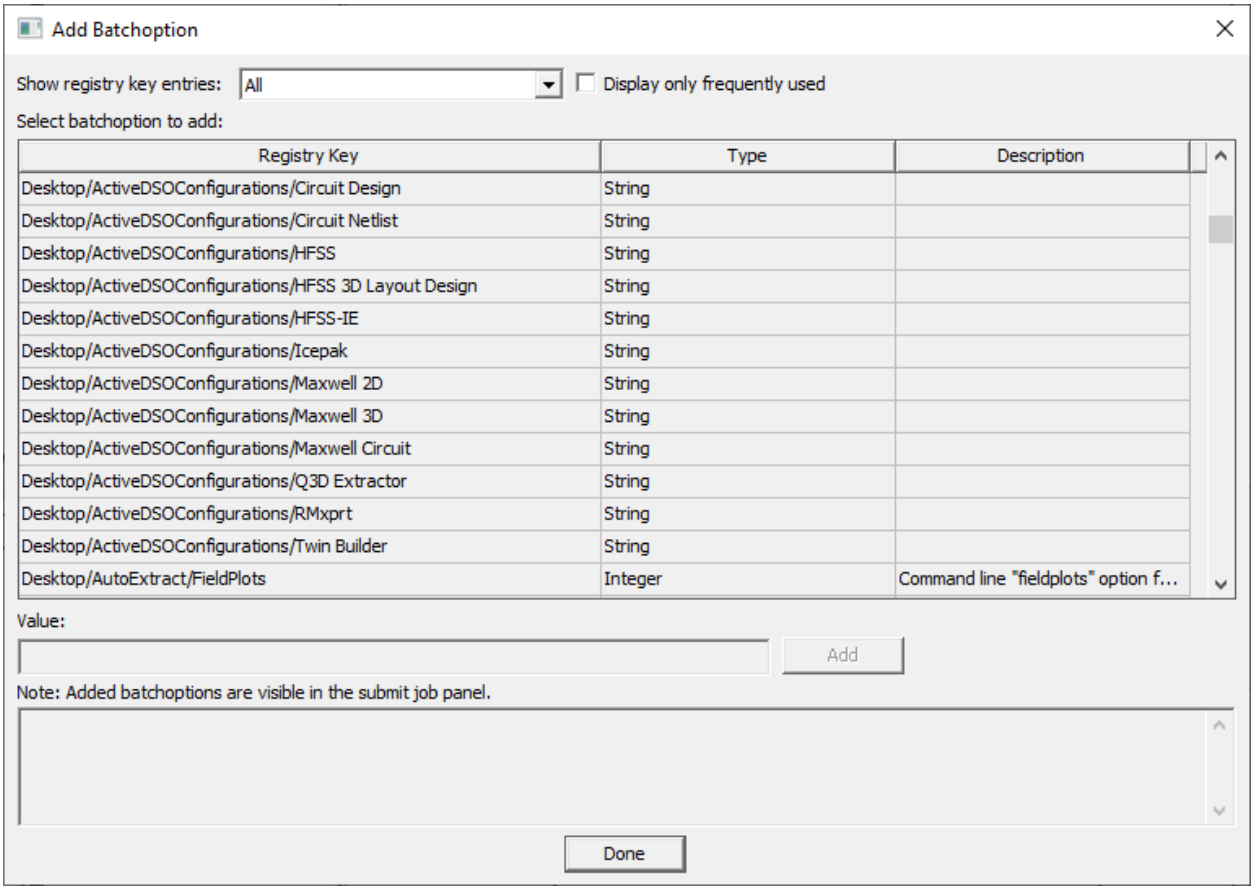
   The resulting **Batchoptions.txt** file will contain a nearly complete list of available options.

This procedure also works from the Linux <*installation_directory*>, which has the same downstream path (for example, under "opt/") as a Windows installation (typically under "C:\Program Files\").

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

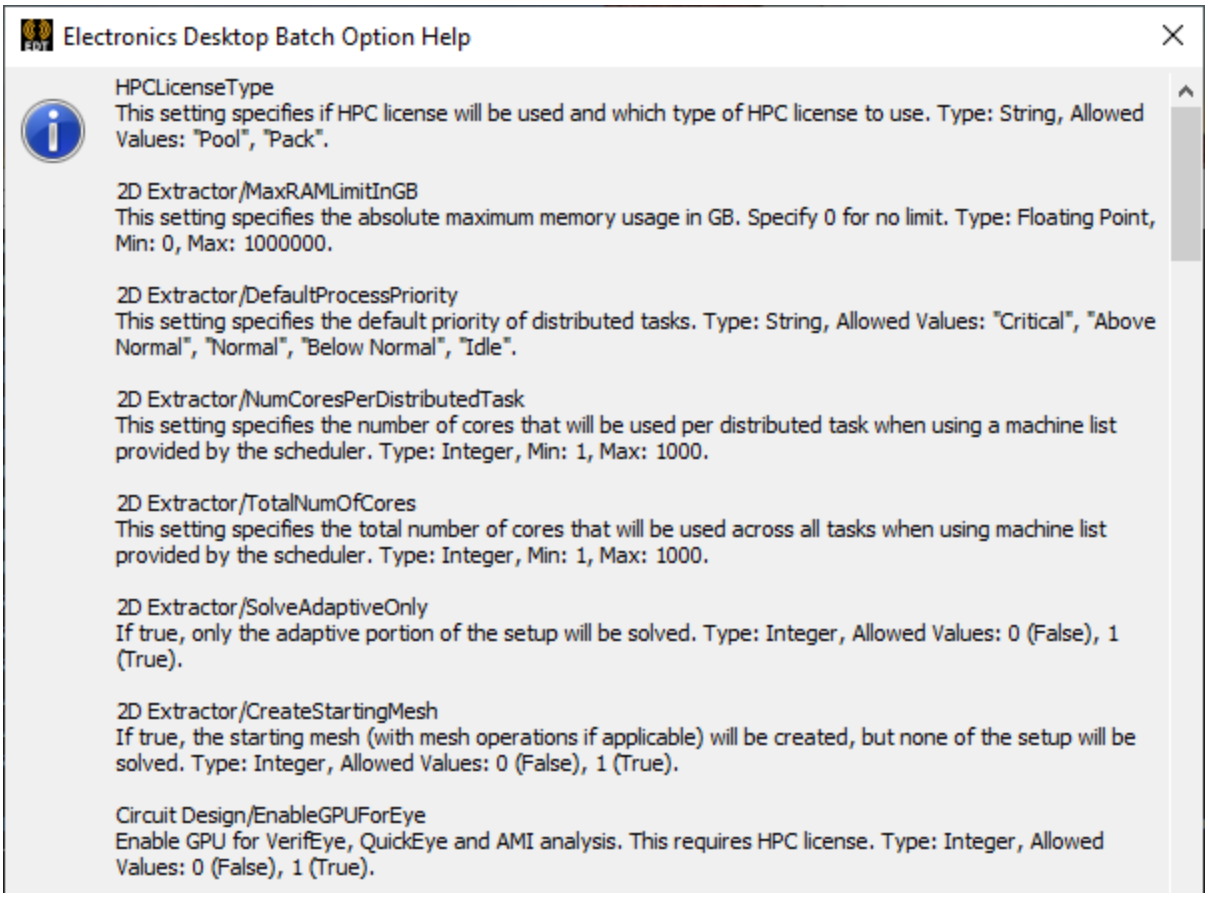
> **Note:**
>
> For special product-specific options that are neither available from the GUI nor listed by the UpdateRegistry tool, see Special Batch Options. Even though the -GetKeys switch does not list these special options, you can still use the UpdateRegistry tool to set them.

When you submit jobs to a remote computer or cluster, you can specify batch options using the job submission GUI. When using the GUI, you select the batch options from a list and therefore avoid typographical errors. For the most commonly used batch options, there is detailed information about the allowed values. Click **Submit** on the **Simulation** ribbon tab to access the *Submit Job To* dialog box. Then, click **Add** to access the **Add Batchoption** dialog box pictured below:



To assist users who need to specify batch options and are unable to use the job submission GUI, a new help option has been added. If the Electronics Desktop application is launched with the **-batchoptionhelp** command line argument, a message box is displayed which lists and describes the most common design type-specific batch options:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Managing Projects and Designs

An Ansys Electronics Desktop *project* is essentially a folder that includes one or more models, or *designs*.

Some basic tasks that can be performed on projects and designs include:

- Opening Projects
- Creating Projects
- Saving Projects
- Importing and Exporting Projects and Data
- Setting Project Options
- Validating Projects
- Copying and Pasting Projects and Designs
- Renaming Projects
- Deleting Projects or Designs
- Setting Read Only Designs

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

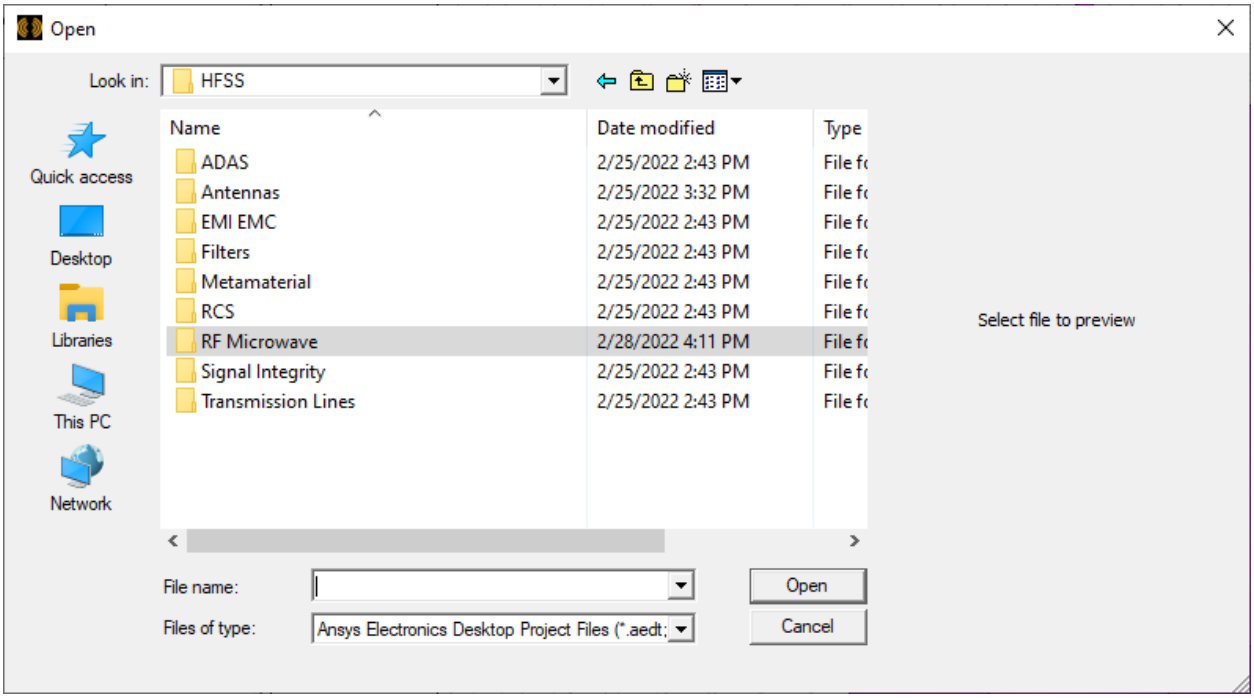
- Updating Design Components
- Undoing and Redoing Commands
- Inserting a Documentation File
- Saving Project Notes
- Printing

Opening Projects

Open a previously saved project using the **File** > **Open** command.

1. Click **File** > **Open** or click the **Open** icon on the **Desktop** tab of the ribbon.

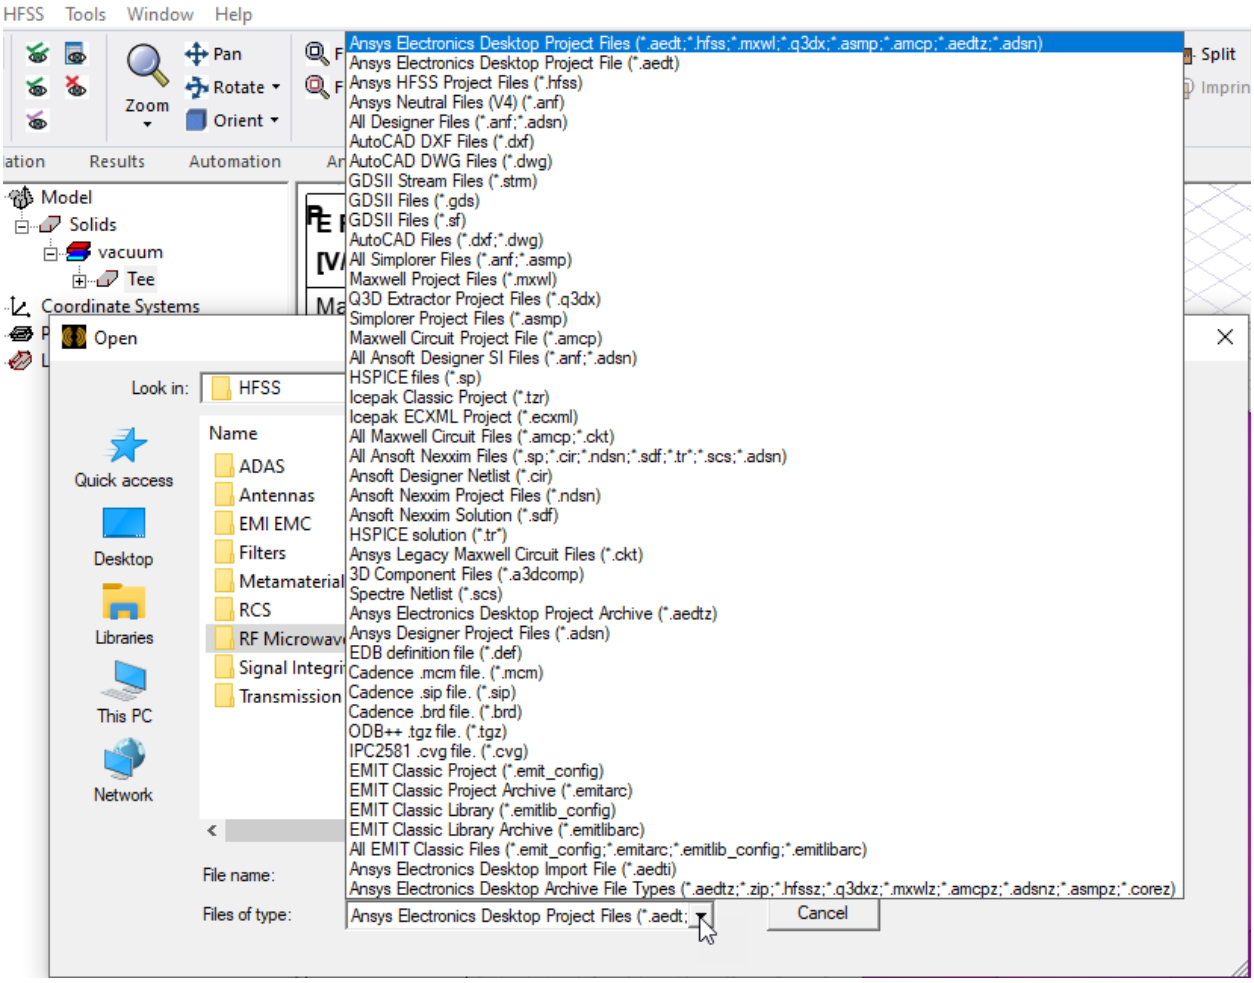
2. Use the file browser to find the project file.



By default, only files that can be opened or translated display. *.aedt is the main default, although, you can also view several types of legacy files. The dropdown for Files of type

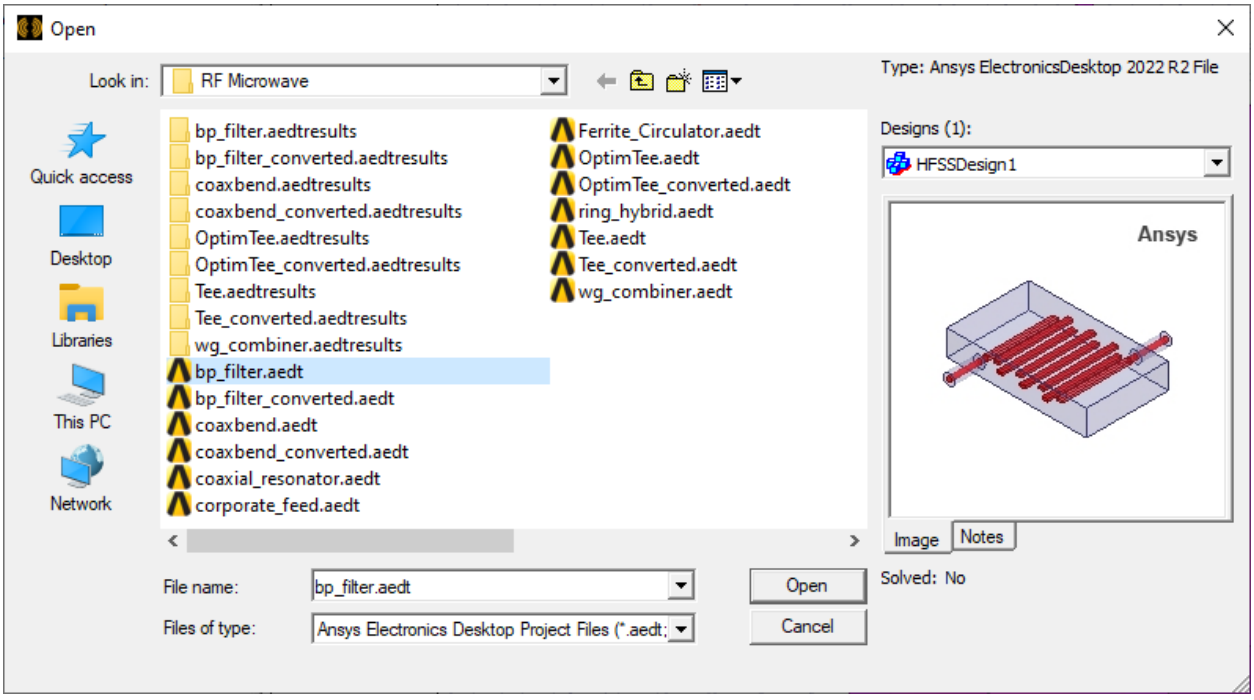
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

lists the kinds file and archive formats for which you can select filters.



3. Most of these will be familiar to those seeking them. The Ansys Electronics Desktop Import file (*.aedti) format is for importing exported projects from ANSYS Discovery, an ANSYS Workbench tool. This format allows import of side by side *.aedti and the corresponding geometry definition *.sat into the Ansys Electronics Desktop, and creates a ready-to-solve HFSS project.
4. Select the file you want to open.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. Click **OK**.

   The project information appears in the Project tree.

If you open another project without editing the automatically created project, the automatically created project is removed.

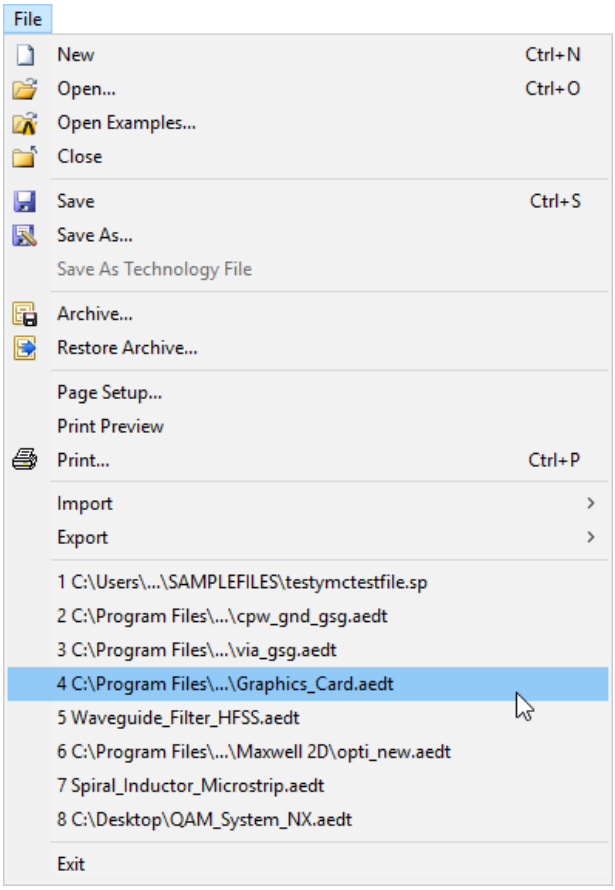
You can also open a saved project by:

- Dragging a project file icon to the Open icon
- Dragging a project file icon to the desktop
- Double-clicking a project file icon

Opening Recent Projects

Recently opened projects appear at the bottom of the **File** menu. To open one of these files, click its file name.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



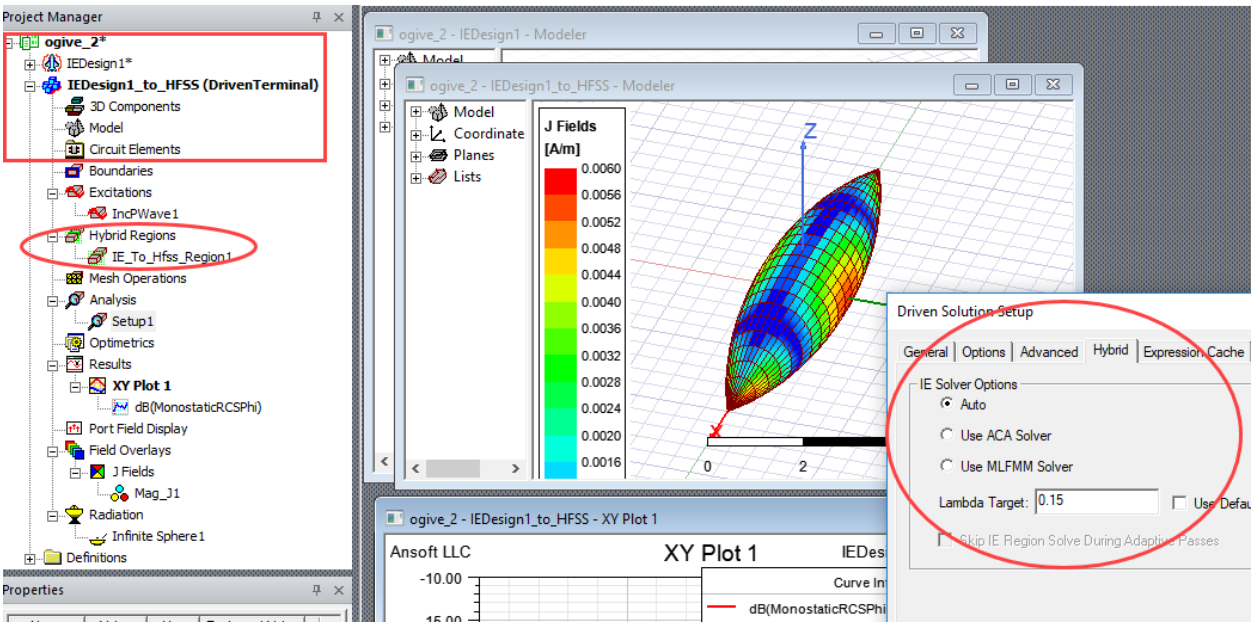
Opening Example Projects

You can directly access and open example projects included with product installation using **File** > **Open Examples**, or by clicking **Open Examples** on the **Desktop** tab of the ribbon. See Example Projects for additional description of these files.

Opening Legacy HFSS-IE Projects

If you open an existing HFSS-IE project in Ansys Electronics Desktop, it is automatically converted to an equivalent HFSS project with IE Regions assigned.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The primary changes in the converted project are that an IE Region is assigned to the objects, and that the **Hybrid** tab of the Setup has the IE Solver Options. All Excitations, Plots, Field Overlays, and Radiation are all equivalent to those in the original project. If you select the original project, the HFSS-IE menus will still appear for that project. However, going forward, HFSS-IE will not be supported. IE Regions should be used.

HFSS-IE included a Physical Optics (PO) solver for use with metallic designs excited by an incident plane wave, a far field wave, or a near field wave. The PO functionality can be achieved using PO Regions. This solver provides first-order scattering information, such as an approximate RCS. If that result is not accurate enough (for example, for a back lobe calculation), you can use the regular IE solver. The types of reports are the same; it is the accuracy that changes. When selected, it solves for only one pass, performing no adaptive refinement.

Opening Legacy Projects

To open a legacy project:

1. Click **File** > **Open**.
2. From the **Look in** drop-down menu, select the location of the project. In the folder list, double-click folders to find the one that contains the project.
3. Double-click the project you want to open.

Legacy Project Translation

When you open a legacy project, virtually all of the project's pre-processing data is translated. Solution results and Optimetrics setup data are unavailable; however, the nominal model

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

created for Optimetrics is translated.

The following table contains additional notes about the translation of legacy project information.

Model Geometry	• The translated geometry's construction history is unavailable; therefore, the original object properties you defined cannot be modified in the **Properties** window. • For units unavailable in the older version, such as yards, the nearest available units are used; the model will be scaled slightly to fit the new units. • View visualization settings apply to the saved design. If these have been changed from the default (15 deg), this affects the memory and CPU required to open the project.
Excitations and Boundaries	• If the legacy project contained both port impedance and calibration lines, the impedance lines are translated to integration lines, and calibration lines are ignored. If the project contained both impedance and terminal lines, both are translated to integration lines. The impedance lines are ignored for Driven Terminal solutions and terminal lines are ignored if the project is changed to a Driven Modal solution. • Boundaries assigned to named interface selections or rectangle selections are not translated.
Hybrid Regions	• Radiation Boundaries with FEBI become Hybrid Regions assigned as FEBI.
Materials	• Functions defined in legacy projects become project variables; therefore, functional material properties are translated. • Perfect conductors become regular materials with conductivity values of 1E30. • Object coordinate systems are created for objects assigned anisotropic materials in legacy projects. The coordinate system is defined at the same origin as the global coordinate system with the same orientation defined when the anisotropic material was assigned to the object in the legacy project. • Nonlinear materials from legacy projects that have magnetic saturation values greater than zero are treated as ferrite materials. Their properties are not modified.
Mesh Operations	• Mesh refinement operations performed on arbitrary boxes in legacy projects are ignored. • Area and volume-based mesh operations are translated as length-based mesh operations by taking their square roots and cube roots, respectively.
Optimetrics	• Setup information, including design variables, is not supported; however, the nominal model can be translated.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	• Parameterizing a translated model is limited because geometry construction history is unavailable.
Solution Types	• Driven solver projects that contained terminal lines are translated to Driven Terminal solution types.
Solution Setup	• Impedance-only and emissions-only solutions are not supported; therefore, these selections in legacy projects are ignored. • The design's initial mesh is used for the solution. Current meshes are not translated. • Saving dominant-only or higher-order-only mode S-matrix entries are not supported; therefore, these mode selections in legacy projects are ignored. • For frequency sweeps, the **Number of Steps** value specified in the legacy project is converted to the corresponding **Step Size** value. • The total number of requested adaptive passes in the legacy project becomes the **Maximum Number of Passes** value. For example, if you request 3 adaptive passes, solve them, and then request 2 adaptive passes, 5 will be the value specified for the **Maximum Number of Passes**.
Solutions	• Solution data is not translated; therefore, you must solve legacy projects again.

Note:

Legacy Circuit (Serenade) projects (**.ssp** extension) do not open correctly from the **File Open** dialog box. Contact Ansys Technical Support for assistance in converting legacy projects. Opening an Ansys Neutral File project (**.anf** suffix) begins with a conversion dialog box. See Importing ANF Design Data.

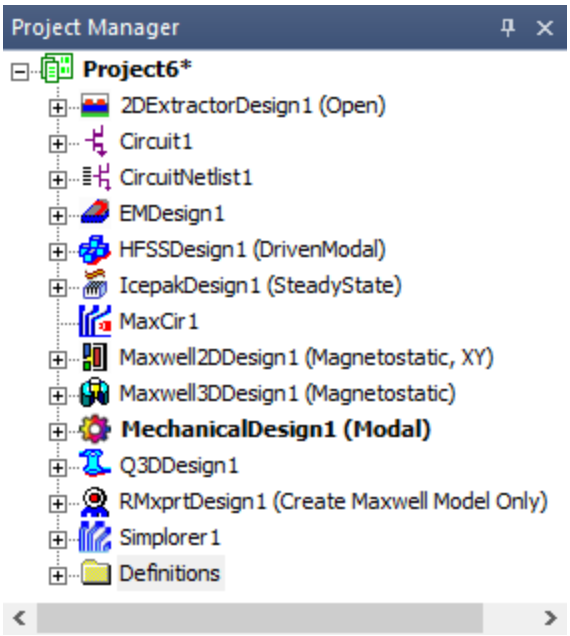
Creating Projects

To create a project, click **File** > **New**, or click the **New** icon on the **Desktop** tab of the ribbon.

A new project is listed in the project tree. It is named Project*n* by default, where *n* is the order in which the project was added to the current project folder.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

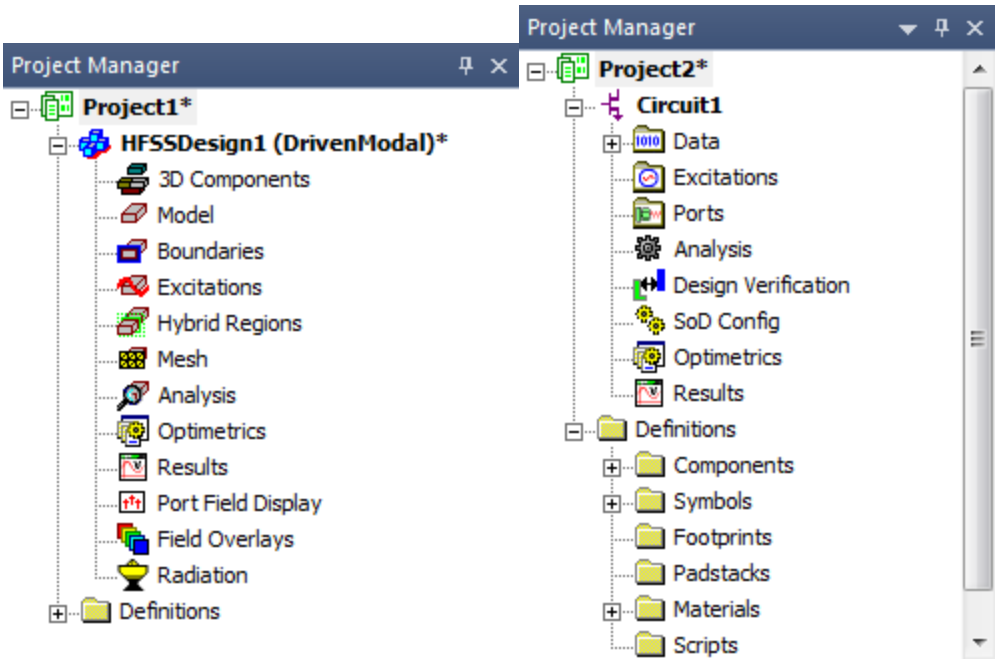
You can insert designs of any type into the project, where they are stored in the project tree.



The default name for each inserted project is <designType>*n*. You can also specify the name of the project when you save it using the **File** > **Save** or **File** > **Save As** commands.

You can view the contents of a project by clicking the plus sign (+) for each level of the hierarchy in the project or design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Saving Projects

Use the **File** > **Save As** command or select the **Desktop** tab of the Ribbon and click the **Save As** icon to:

- Save a new project.
- Save the active project with a different name or in a different location.
- Save the active project in another file format for use in another program.

Use the **File** > **Save** command or select the **Desktop** tab of the Ribbon and click the **Save** icon to save the active project.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Warning:**
>
> Be sure to save models periodically. Saving frequently helps prevent the loss of work if a problem occurs.
>
> Although Ansys Electronics Desktop has an auto-save feature, it may not save frequently enough for your needs.

Each solver has a Save Before Solving setting located in the **Tools** > **Options** window. This setting is enabled by default.

A prompt appears when you attempt to save a previously versioned file. If you agree to the prompt, the file is upgraded to the Ansys Electronics Desktop version in which you are running the software. In this case the file may no longer be compatible with previous versions. If you do not agree to the prompt, the file is not saved, so the file retains its previous compatibility.

If you have a simulation running, you see a warning that if you continue, Ansys Electronics Desktop will abort the simulation. If you OK the warning, Ansys Electronics Desktop aborts the simulation and saves the project.

Path Name Length Issues for Windows

For most Windows programs, the current directory pathname length is limited to 259 characters on startup. Thus, the pathname length of the directory containing installed programs should be limited to no more than 259 characters because double-clicking on an application in Windows Explorer will set the working directory to the directory containing the application when the application is started.

Win32 Long Paths Not Enabled

If win32 long paths are not enabled on the analysis host, then essentially all files are limited to a maximum absolute pathname length of 259 characters. Directories may be limited to a maximum absolute pathname length of about 246 characters.

Win32 Long Paths Are Enabled

If win32 long paths are enabled on the analysis host, then many files are not subject to the maximum absolute pathname length limit of 259 characters. Below is a partial list of files that are still subject to this limit even if win32 Long Paths are enabled:

- Project files
- Project Archive files
- Ansys EDB (Electronics Database) files, typically stored in the `ProjectName.aedb` folder

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The temporary directory and most temporary files

  Because some temporary files and directories have automatically generated names that are long, it is best to use a short pathname for the temporary directory.

  > **Important:**
  >
  > Although most temporary files are created within the temporary directory, there may be some temporary files within the project directory. As a result, the project file directory pathname should be well below the 259 character limit.

To enable Long Path support on Windows, both of the following requirements must be met:

- Long paths must be enabled on the machine

  Use either of two ways to do this:

  - **Via Registry Setting:** `HKLM\SYSTEM\CurrentControlSet\Control\FileSystem : LongPathsEnabled=1`
  - **Via Group Policy Tool:** The “Enable Win32 long paths” setting is in the folder: `Computer Configuration\Administrative Templates\System\Filesystem`

Changing Auto-Save Settings

Recent actions performed on the active project are stored in an auto-save file in case of a sudden workstation crash or other unexpected problem. The auto-save file is stored in the same directory as the project file and is named Project*n*.aedt.auto by default. Ansys Electronics Desktop automatically saves all data for the project to the auto-save file, except solution data.

By default, Ansys Electronics Desktop automatically saves project data after every 10 edits. An edit is any action performed that changes data in the project or the design, including actions associated with project management, model creation, and solution analysis.

After a problem occurs, you may be able to choose to re-open the original project file in an effort to recover the solution data, or to open the auto-save file. If the original file is not available, attempting to open the file provides a message that the auto-save is being used. If neither file is available, an error message displays.

To modify auto-save settings:

1. Click **Tools** > **Options** > **General Options**.

   The **Options** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Under **Desktop Configuration**, verify that **Do Autosave** is selected.

   This option is selected by default.

3. In the **Autosave interval** box, enter the number of *edits* that you want to occur between automatic saves. By default, this option is set to 10.

   > **Note:**
   >
   > Auto-save *always* increments forward; therefore, even when you undo a command, Ansys Electronics Desktop counts it as an edit.

4. Click **OK** to apply the specified auto-save settings.

   Once the specified number of edits is carried out, a "model-only" save will occur. This means that Ansys Electronics Desktop does not save solutions data or clear any undo/redo history. When Ansys Electronics Desktop auto-saves, an ".auto" extension is appended to the original project file name. For example, Project1.aedt will automatically be saved as Project1.aedt.auto.

> **Warning:**
>
> When you close or rename a project, Ansys Electronics Desktop deletes the auto-save file.

Save Before Solving Option

The **Save before solving** option forces a full save before running the solve and is enabled by default. For efficiency reasons, the project is saved only if it has been modified since its last save.

To change this setting, click **Tools** > **Options** to open the Options window. Select the **General** tab and use the **Save before solving** check box to toggle the option.

You can start a new solve while running another without having to abort the running solve. If you start a solve while another solve is running and the Save before solving option is set, Ansys Electronics Desktop asks if you want solve without saving first. This lets you perform multiple solves, and if you have not edited the project in between solves, crash recovery will work.

Recovering Project Data from an Auto-Save File

Following a sudden workstation crash or other unexpected problem, you can recover project data from its auto-save file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Warning:** When you recover a project's auto-save file you *cannot* recover any solutions data; recovering an auto-save file means you will lose any solutions data that existed in the original project file.

To recover project data in an auto-save file, if Ansys Electronics Desktop containing a design has unexpectedly crashed:

1. Launch Ansys Electronics Desktop from your desktop.
2. Click **File** > **Open**.
3. Select the original Project*n*.aedt project file for which you want to recover its Project*n*.aedt.auto auto-save file.

   The **Crash Recovery** window appears, giving you the option to open the original project file or the auto-save file.

4. Select **Open project using autosave file** to recover project data in the auto-save file**, and then click OK.** Ansys Electronics Desktop replaces the original project file with the data in the auto-save file.

   Ansys Electronics Desktop immediately overwrites the original project file data with the auto-save file data, removing the results directory (solutions data) from the original project file as it overwrites to the auto-save file.

> **Warning:** If you choose to recover the auto-save file, you cannot recover the original project file that has been overwritten; recovering data in an auto-save file is *not* reversible.

Importing and Exporting Projects and Data

Ansys Electronics Desktop can import and export a variety of file types.

Copying and Pasting a Project or Design

To **copy** a project or design:

1. In the Project Tree, select a project or design to enable the menu command **Edit** > **Copy**.
2. Click **Edit** > **Copy**.

   The project or design is copied for pasting.

To **paste** a project or design:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. In the Project Tree, select a project or design to enable the menu command **Edit** > **Paste**.
2. Click **Edit** > **Paste**.

   The project or design is pasted under the selected project, and an icon is added to the project tree.

> **Note:**
>
> You can also use keyboard shortcuts.

Renaming Projects

In general, use the **File** menu commands to manage projects. If you move or change the names of files without using these commands, the software may not be able to find information necessary to solve the model.

To rename an existing, active project:

1. Select the project in the Project Tree.
2. Right-click and select **Rename**.

   This activates the text field for the project name.

3. Type the new project name and press **Enter**.

   The new project name appears in the directory and the project remains in the original location.

Archiving Projects

Use the **File** > **Archive** command to place a project and any other files related to the project that you want to include in a *.<product>z file or *.zip format archive. You can make notes about the contents of the archive and specify whether to include results and solutions files. The **Archive** command attempts to automatically detect the necessary files for linked projects and automatically include them in the archive. You can also add additional files to the archive, including results files, external files and projects. For example, if a project linked to the main project also has linked or associated files, you can add them.

Archive File Types

Internally, project archive files are .zip files, and are compatible with any program that can read .zip files. Project archive files have an extension that is unique for each product, and is generated by adding a 'z' to the project file extension (for example, *.aedtz, *.adsnz). This extension displays as the default when saving and restoring archive files.

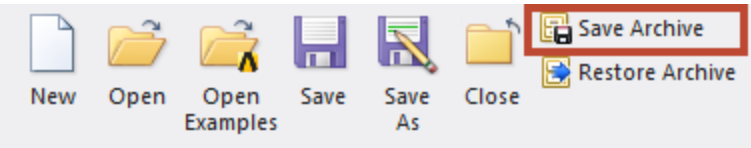
Archive Preview

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

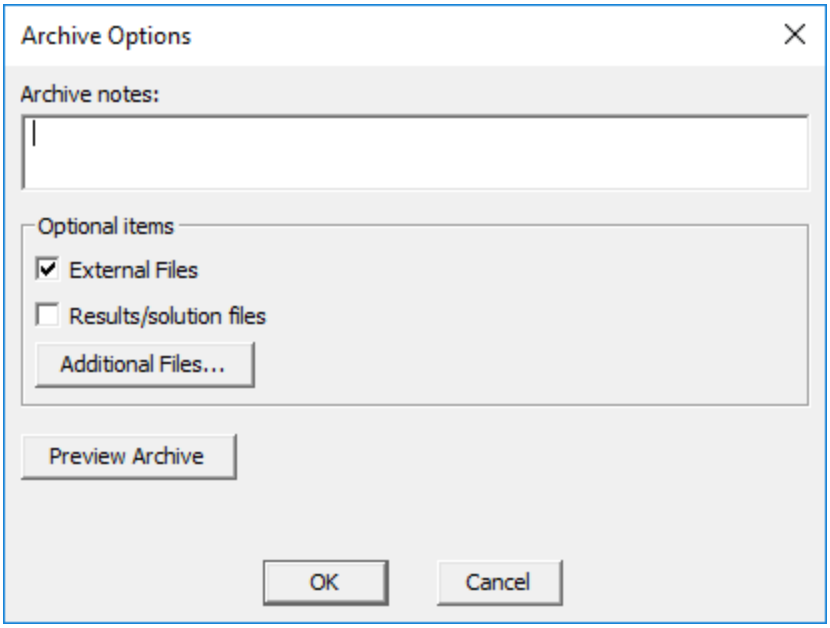
The **Archive** command includes a preview feature that lets you review the contents of a planned archive.

To archive the current project:

1. Click **File** > **Archive** or select the **Desktop** tab of the ribbon and click **Save Archive**.



The **Archive Options** dialog box opens.



- **Archive Notes** – in this field, you can specify notes that will be visible when previewing the archive. These notes can be viewed from the preview dialog box without restoring the archive.
- **External Files** – selecting this check box causes all external files to be included in the archive. These include any existing files associated with the project, such as linked files, or files added through the **Project** > **Insert Documentation File** command or **Project** > **Data Set** command.
- **Results/Solution Files** – selecting this check box causes the entire results directory to be included in the archive. This may greatly increase the size of the archive file.

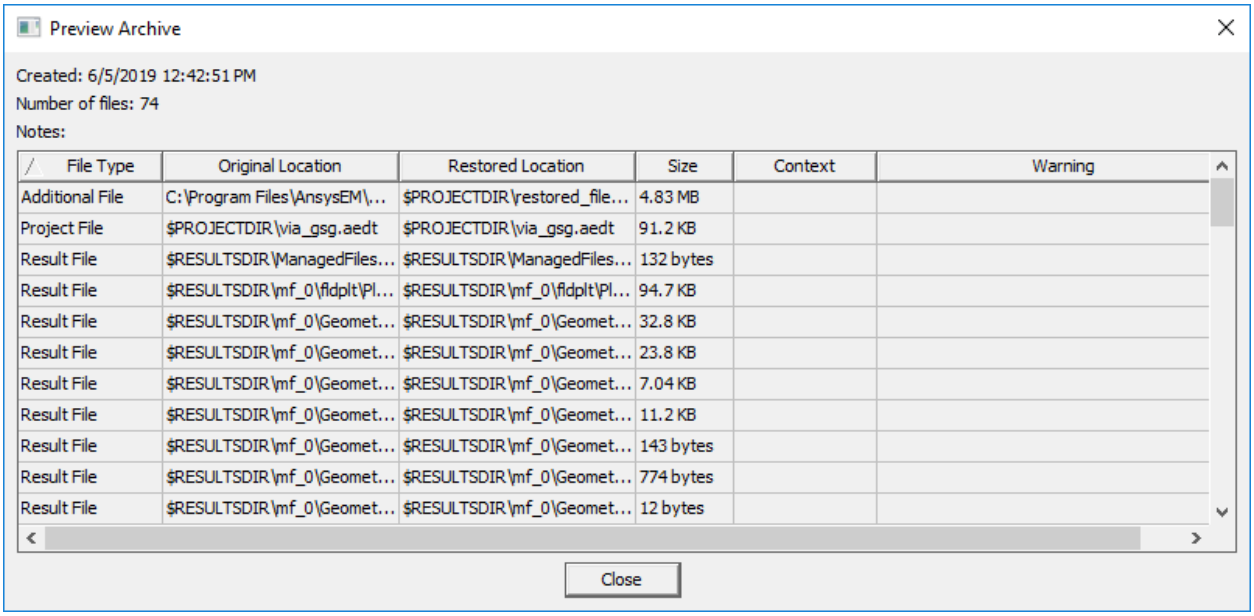
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Additional Files** – clicking this opens the **Add Additional Files to Archive** dialog box.

  - Click **Add** to browse and locate additional files you want to include in the archive.
  - Select and the **Remove** any files listed.
  - Click **OK** to accept changes or **Cancel** any proposed changes.

2. Select any optional items, and make any desired notes in the text field.
3. When you have made your selections, click the **Preview Archive** button in the Archive Options dialog box to view archive contents, file types, the locations of the archive files, and the locations where restoring from archive would place them. Additionally, there may be context or warning information.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



To read longer locations, you can drag the column header to expand them.

Previewing an archive before creating the archive can be helpful in order to see exactly what files will be included in an archive, as well as how those files are being relocated. Another purpose of previewing an archive is to view warnings and consider if any additional files need to be added to the archive.

4. When you are ready to create the archive, **Close** the preview and click **OK**.

   A browsing window appears.

5. Specify a name for your file and select the format you want to use from the **Save as type** drop-down menu.
6. Click **OK** to create the archive.

File Relocation

In a project to be archived, external files can be located anywhere on the user's system. One of the goals is for the restored project to be relatively self contained, and to NOT allow the restoring of an archived project to haphazardly write files anywhere on the restoring user's system.

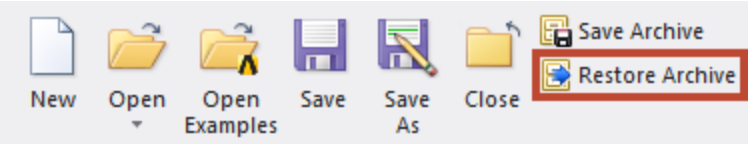
To achieve this, it is sometimes necessary to change the location of files in the archived project so that the external files are located in the project directory. At archive time, any external files not located in the project directory are relocated to the restored_files subdirectory of the project directory in the archived project. Any external files located in the user library or system library will be relocated to the personal library directory. Note that the project file that is written into the archive will be updated to refer to the files at the new locations, and the original project file will remain unaltered.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

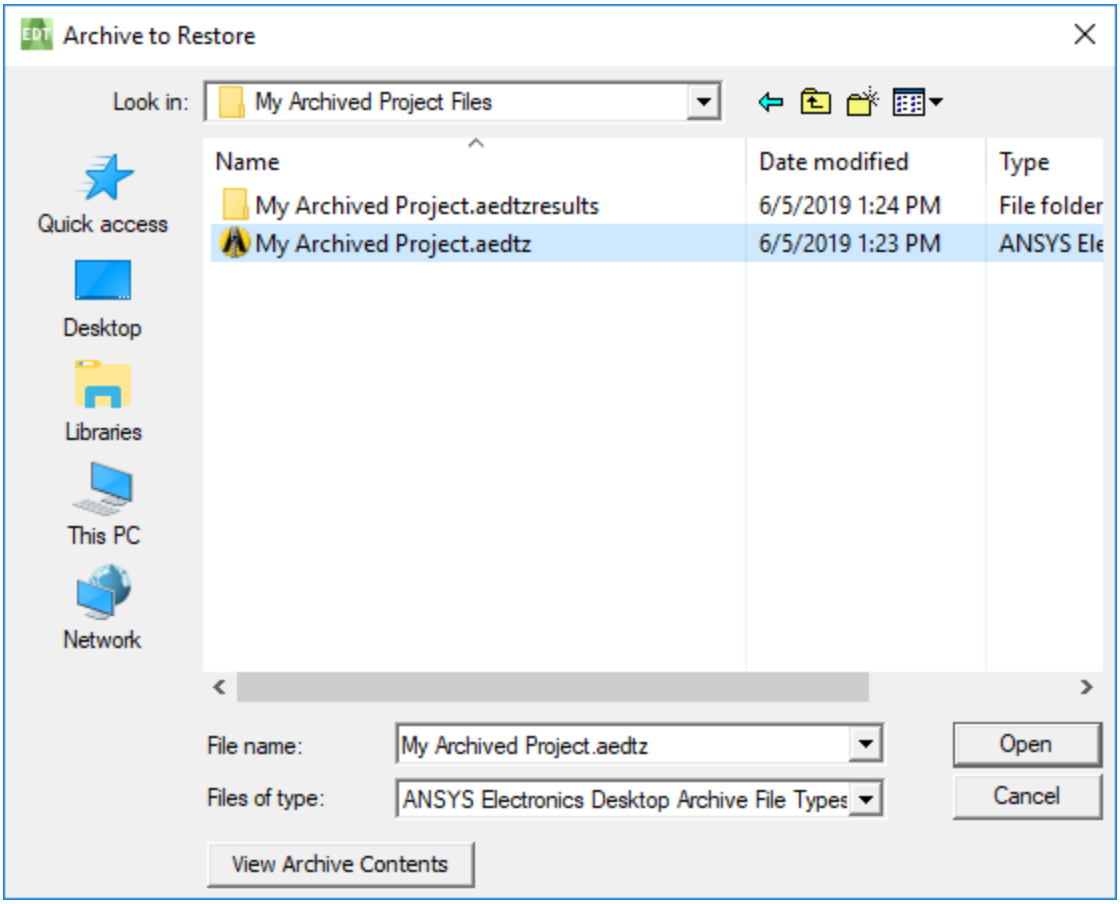
Restoring an Archived Project

To restore an existing archive created with **File** > **Archive...**, use the **File** > **Restore Archive** command.

1. Click **File** > **Restore Archive** or select the **Desktop** tab of the ribbon and click **Restore Archive**.



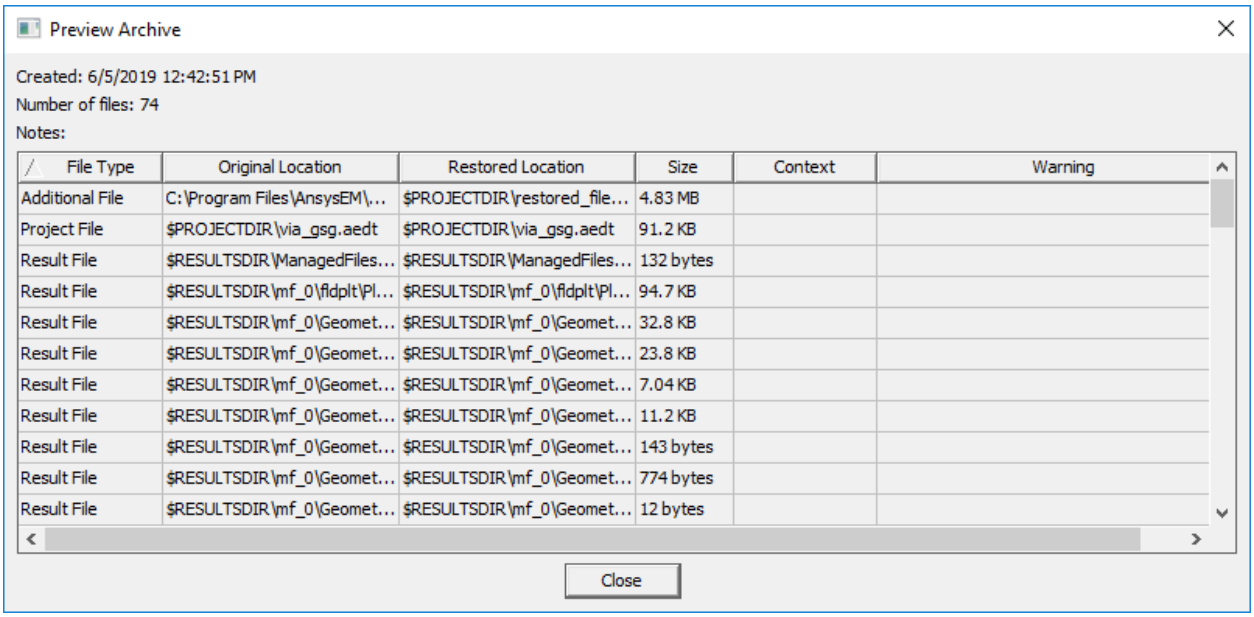
This displays an **Archive to Restore** browser window that lets you navigate your file system for *.aedtz, legacy *.*<solversuffix>z* or *.zip archive files.



2. If you select a valid archive file, you can click **View Archive Contents** to preview the contents.

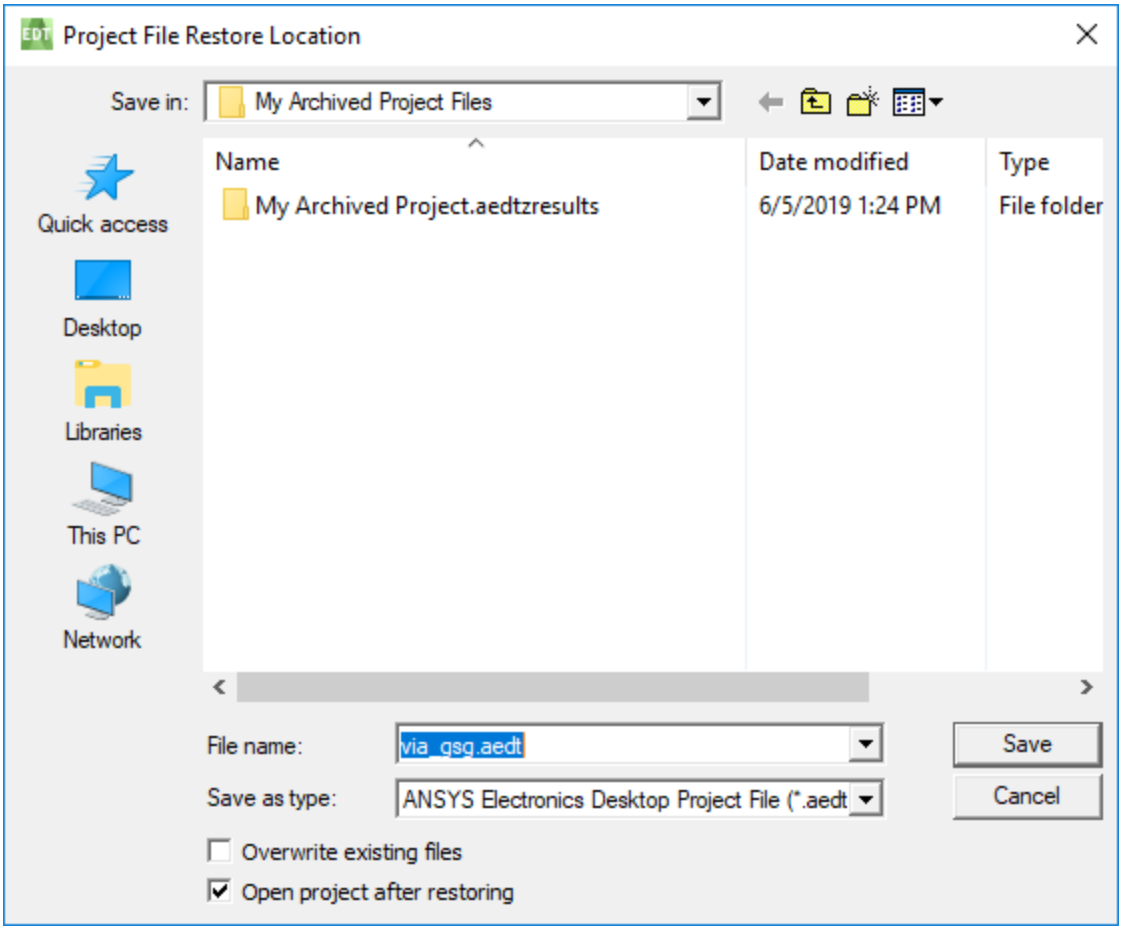
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **Preview Archive** dialog box lists all files in the archive, notes, the original and restored locations, and any warnings that were generated at archive time. These warnings may be useful to identify additional steps that are needed to update any files to refer to files which had to be manually added to the archive.



3. Click **Close** to exit the preview.
4. In the browsing window, click **Open** to change to a **Project File Restore Location** browser.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



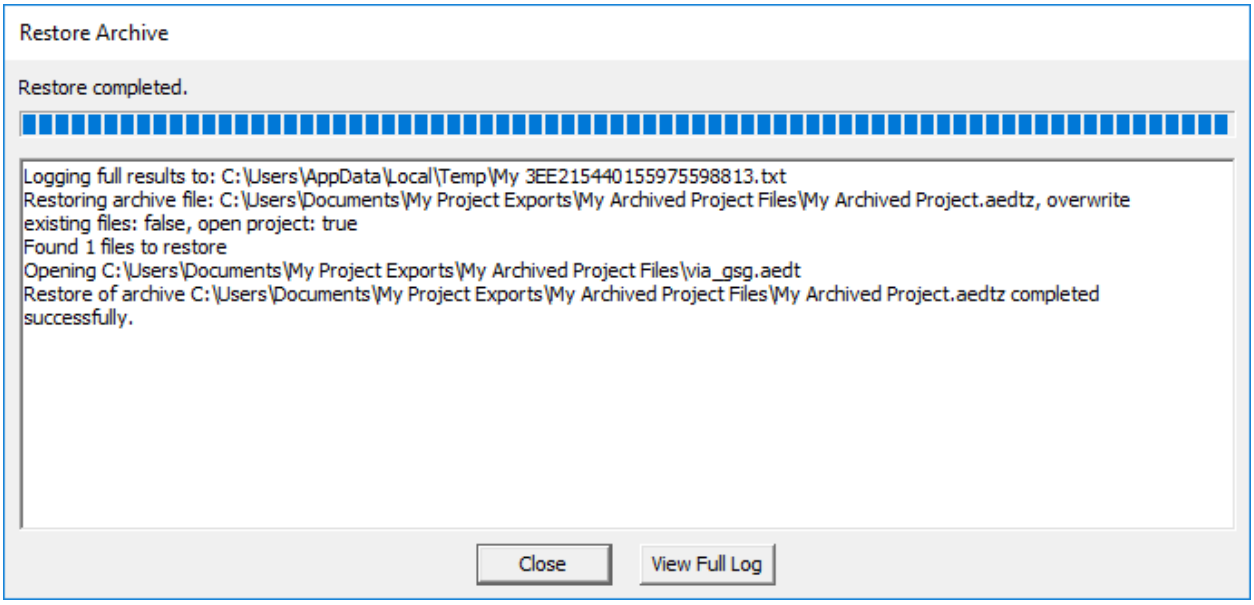
You can edit the file name, and select options:

- **Overwrite existing files** – If this check box is selected, restored files will automatically overwrite existing files during the restore process. If this button is deselected, existing files will not be modified.
- **Open project after restoring** – If this check box is selected, the project will be opened in this instance of the application after all files have been restored.

5. Click **Save** to restore the archived file.

   While restoring an archive, a dialog box displays showing restore results. A progress bar shows the relative progress, and the text window displays important information and warnings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Electronics Desktop also generates a full log file that contains detailed information about the restore process. The first line in the text window displays the location of the full log file. After the restore has been completed, you can click **View Full Log** to open this log file, or use a text editor and open the file at the specified location.

Deleting a Project or Design

To delete a project or design:

1. In the Project Tree, select a project or design.
2. Click **Edit** > **Delete**, or press the **Delete** key.
3. Confirm the warning box to complete the delete operation.

   The project or design is removed from the Project tree.

Setting Read Only Designs

Designs can be set as either Read Only or Full Access. Full Access is the default status of a design and allows you to modify the design. In Read Only mode, you may only run the design or link it to another design. Setting a design as Read Only protects it from accidental modification.

Read Only designs are marked with a red lock in the Project Manager:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To change a single design's designation:

1. In the **Project Manager**, right-click the design.
2. Select either **Convert to Read Only** or **Convert to Full Access**.

To change the designation of *every design* in a project:

1. In the **Project Manager**, right-click the project.
2. Select either **Convert All Designs to Read Only** or **Convert All Designs to Full Access**.

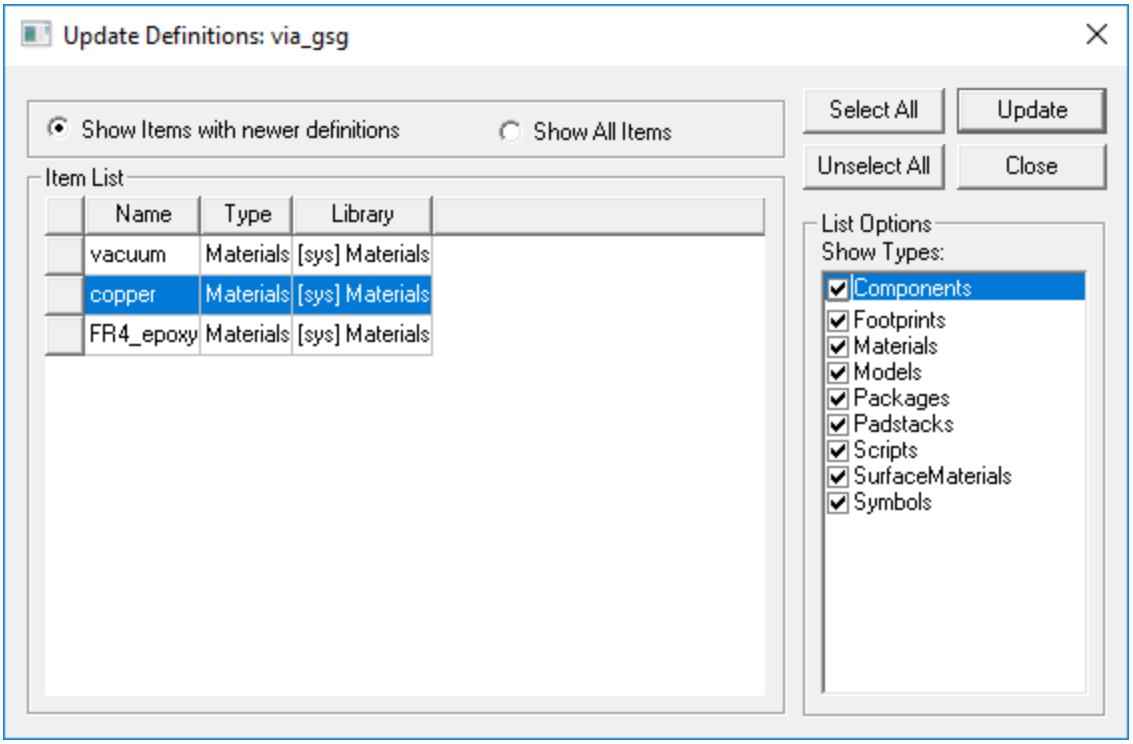
> **Note:**
>
> Read Only settings are not saved when you save the project file.

Updating Design Components

To update components defined in the current design:

1. Click **Tools** > **Project Tools** > **Update Definitions**.

   The **Update Definitions** dialog box appears.



2. Select either **Show Items with newer definitions** or **Show All Items**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. From the **Show Types** list in the **List Options** section, select the types of definitions you want to show in the **Item List**.
4. Select the item(s) you want to update from the **Item List**, or use **Select All.**
5. Click **Update**.

   A message appears telling you the update was successful.

6. Click **OK** to close the message.

When you are finished updating definitions, click **Close**.

Undoing and Redoing Commands

The **Edit** menu contains **Undo and** Redo commands.

Use the **Undo** command to cancel the last action you performed on the active project or design.

Use the **Redo** command to reperform an action you previously undid.

Both commands are useful for dealing with unintended actions related to project management, model creation, and post-processing.

To use **Undo** or **Redo**:

1. In the **Project Manager** window, do one of the following:
   - To undo or redo your last project-level action, such as inserting a design or adding project variables, click the project icon.
   - To undo or redo your last design-level action, such as drawing an object or deleting a field overlay plot, click the design icon.

   > **Note:**
   >
   > You cannot undo an analysis that you've performed on a model—that is, the **HFSS 3D Layout** > **Analyze** command.

2. Click **Edit** > [**Undo/Redo**], or click the **Undo** or **Redo** button () on the **Desktop** tab.

   Your action is undone or redone.

> **Important:**
>
> When you save a project, Electronics Desktop clears the entire undo/redo history for the project and its designs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Validating Projects

Before running an analysis on a model, it is important to first perform a validation check on the project. During a validation check, the solver examines the setup details of the active project to verify that all the necessary steps have been completed and that their parameters are reasonable.

To perform a validation check on the active project:

1. Click **HFSS 3D Layout** > **Validation Check**. You can also click the **Validate** icon on the **Simulation** ribbon tab.

   Electronics Desktop checks the project setup, and the **Validation Check** window appears.

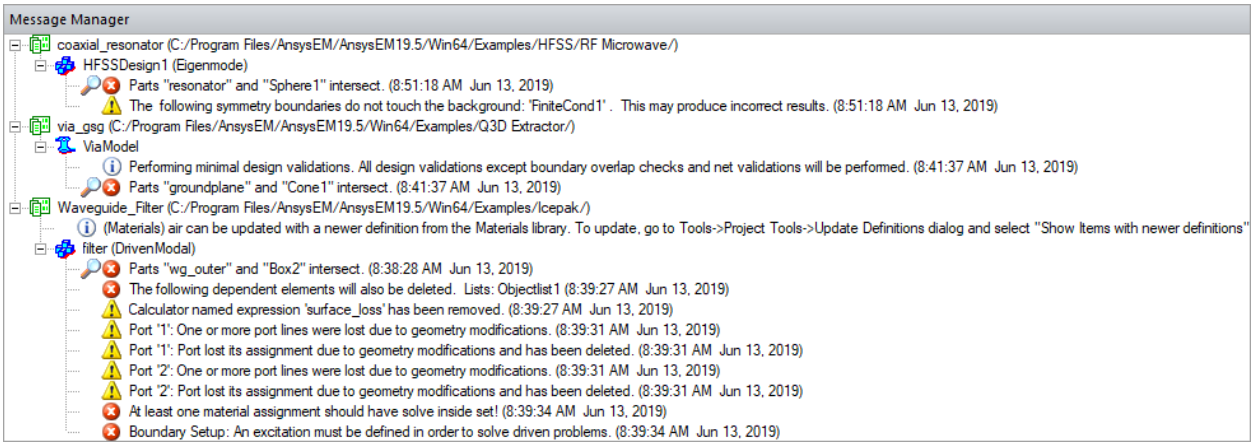
2. View the results of the validation check in the **Validation Check** window.

   The following icons can appear next to an item:

	Indicates the step is complete.
	Indicates the step is incomplete.
	Indicates the step may require your attention.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. View any messages in the **Message Manager** window.



4. If the validation check indicates that a step in your project is incomplete or incorrect, carefully review the setup details for that particular step and revise them as necessary.
5. After you have revised any setup details, click **HFSS 3D Layout** > **Validation Check** to run another validation check. Repeat until the Validation Check completes with no issues.
6. Click **Close**.

Modeler Validation Settings

You can adjust the degree to which the software checks a model for faults that could jeopardize mesh accuracy.

There are three levels of model validation for a given design: **Warning Only**, **Basic**, and **Strict**.

> **Note:**
>
> This setting only affects the "3D Model" stage of a design validation.

- **Warning Only** – allows all models to pass 3D Model validation regardless of any faults that are found (acis_entity check errors). These faults are posted in the message window as warnings.
- **Basic** – allows most models to pass 3D Model validation. This excuses non-manifold errors and most acis_entity_check errors. Some faults are flagged as model errors (basic entity check errors), thereby prohibiting a design from proceeding to the meshing stage of an analysis. You must either correct such errors before attempting to analyze the design under the **Basic** setting, or change the **Model Validation** level to **Warning Only**.
- **Strict** – enforces a tighter tolerance for model faults than the **Warning Only** and **Basic** settings. All model faults found during 3D Model validation are posted to the message window. These errors must be corrected before attempting to analyze the design under

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the **Strict** setting, otherwise you must change the **Model Validation** level to **Basic** or **Warning Only**.

To set the Model Validation level:

1. Select **HFSS 3D Layout** > **Design Settings**.

   The **Design Settings** dialog box appears. The **Validations** tab lets you set the validation as **Basic**, **Strict**, or **Warning Only** and includes solver-specific selections.

2. Choose the desired level of validation from the **Entity Check Level** drop-down menu.

   You can also click the **Save as Default** button to make the current selection the default, or select **Restore Default**.

3. Click **OK** to accept the selection and close the dialog box.

> **Note:** For more information on Maxwell-specific settings, see Maxwell Validation Tab.

Inserting a Documentation File

You may want to add a documentation file to the project tree.

1. Click **Project** > **Insert Documentation File**.

   This opens a file browser that lets you navigate your file system.

2. Select the documentation file and click **OK**.

   The documentation file is placed in the Project Tree.

Working with Design Notes

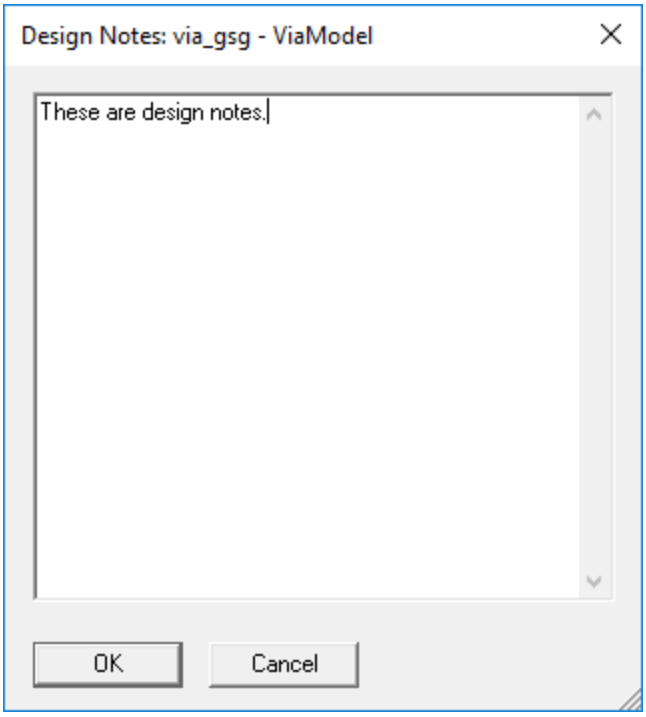
You can save design notes, such as information about the creation date or a description of the device being modeled. This is useful for keeping a running log.

To add notes:

1. Click **HFSS 3D Layout** > **Edit Notes**.

   The **Design Notes** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Click in the window and type your notes.
3. Click **OK** to save the notes with the current project.

To edit notes, use the same window or double-click the **Notes** icon (Notes) in the Project Tree.

To delete the existing notes for a design:

1. Select the **Notes** icon in the Project Tree.
2. Click **Edit** > **Delete**, or right-click and select **Delete**.

   The Notes icon is removed from the Project Tree.

> **Note:**
>
> Notes are used to document aspects of designs only.
>
> For project-level documentation, you can insert a documentation file into a project with the **Project** > **Insert Documentation File** command.

Printing

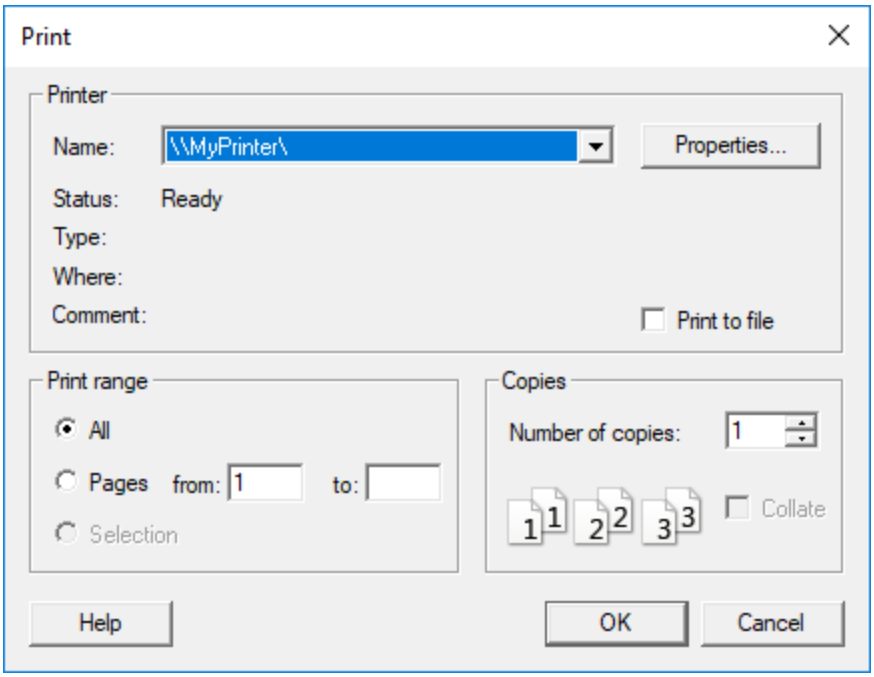
Electronics Desktop printing commands enable you to send an image of the active window to the printer.

To print the project:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Click **File** > **Print**.

   A dialog box similar to the following one appears:



2. Print options will vary based on your printer. Specify your desired options.
3. Click **OK** to print.

To change additional print settings, click **File** > **Page Setup**.

To preview what your printout will look like, click **File** > **Print Preview**.

> **Important:**
>
> To print from Ansys software on Linux, you must first configure a printer from the MainWin control panel.
>
> For more information, consult documentation for your specific instance of Linux.

Closing Projects

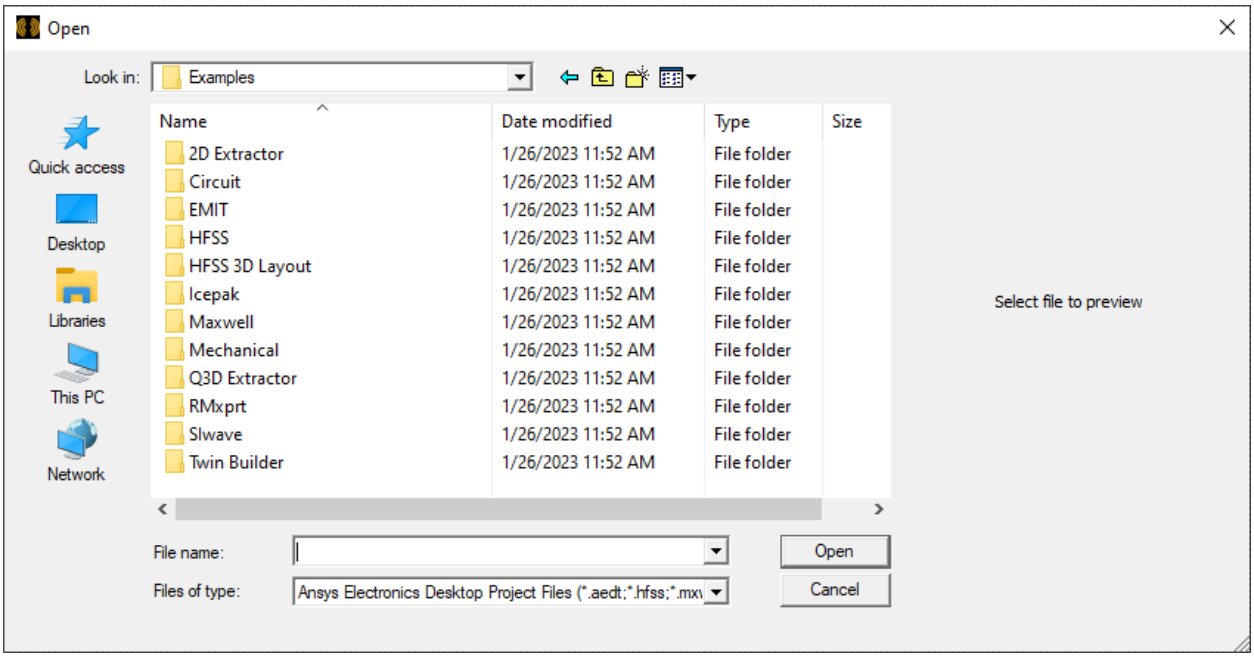
To close the current project, select **File > Close** or select the Desktop tab of the ribbon and click the Close icon.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If a simulation is running, a message appears stating that if you continue, the simulation will abort before closing. If you click **OK**, the Desktop aborts the simulation and closes the project.

Example Projects

Your Ansys Electronics Desktop installation includes an example directory containing projects folders for several kinds of designs.



Example projects are organized by the design type. The examples under Circuit, HFSS, and HFSS 3D Layout include subfolders, organizing the projects according to different applications:

- Circuit has subfolders for Automation, High Speed Digital, Low Noise Amplifier, RF Microwave, and Signal Integrity examples. The High Speed Digital folder has further subfolders for PCIe and USB projects. And the RF Microwave folder has further subfolders for Amplifiers, DC-IV, Filters, Misc, Mixers, Oscillators, and System projects.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- HFSS has subfolders for ADAS, Antennas, EMI EMC, Filters, Metamaterial, RCS, RF Microwave, Signal Integrity, and Transmission Lines.
- HFSS 3D Layout has subfolders for Antennas, Component, Filters, FSS, and Signal Integrity.

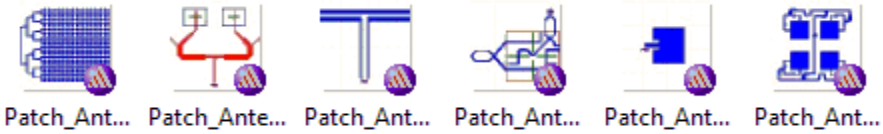
Several of these projects are associated with detailed getting started guides.

- HFSS 3D Layout Example Projects

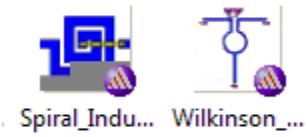
HFSS 3D Layout Example Projects

The examples directory for HFSS 3D Layout has subdirectories for Antennas, Component, Filters, FSS and Signal Integrity.

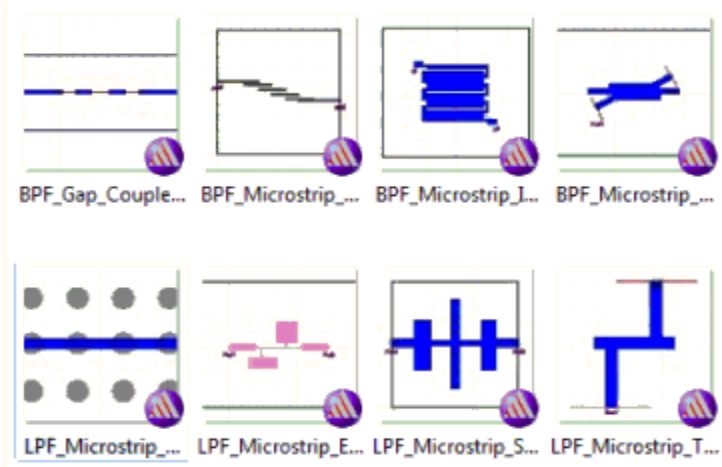
- Antennas



- Components



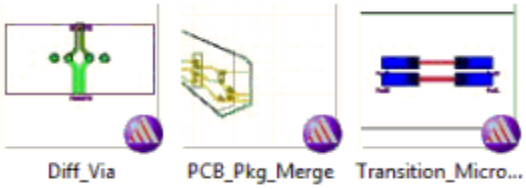
- Filters



- FSS

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Signal Integrity



Exporting Options Files

Ansys Electronics Desktop can export user and host options files in XML format.

Exporting Options Files Using the Desktop UI

Export options files by selecting **Tools** > **Options** > **Export Options Files**. This brings up a browser dialog box to select the destination directory.

Click **Open** to copy all config files for the current user and current host to the specified directory. Config files for the install, install_machine, user, and user_machine levels will be copied, if they exist. One additional file, admin.XML, will also be copied to the destination directory; this file does not contain user configurable options.

Exporting Options Files Using a Script

A script command has been added that exports options config files:

ExportOptionsFiles

Syntax	`ExportOptionsFiles <DestinationDirectory>`
Return Value	None.
Parameters	BSTR <DestinationDirectory>
Python Example	`oDesktop.ExportOptionsFiles ('D:/test/export')`

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Working with Variables

A variable is a numerical value, mathematical expression, or mathematical function that can be assigned to a design parameter in **HFSS 3D Layout**. You can assign a variable to any dimension, material property, or output value. Variables are useful in the following situations:

- You expect to change a parameter often.
- You expect to use the same parameter value often.
- You intend to animate a plot against a variable.

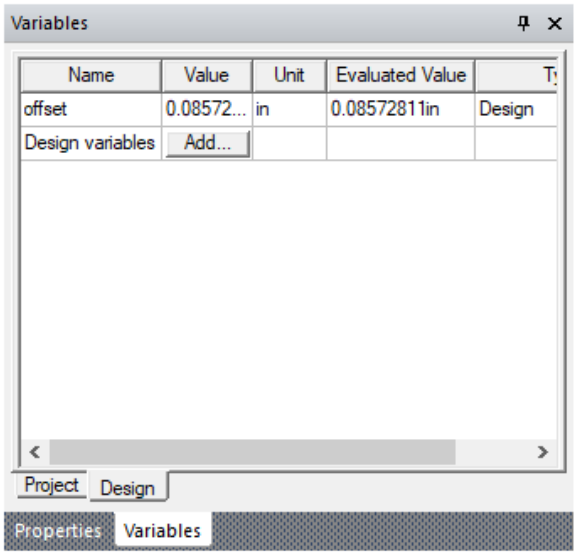
Variables can be regular variables, array index variables, or arrays. A project variable's value can reference other project variables or intrinsics. Values can be a number, variable, or mathematical expression.

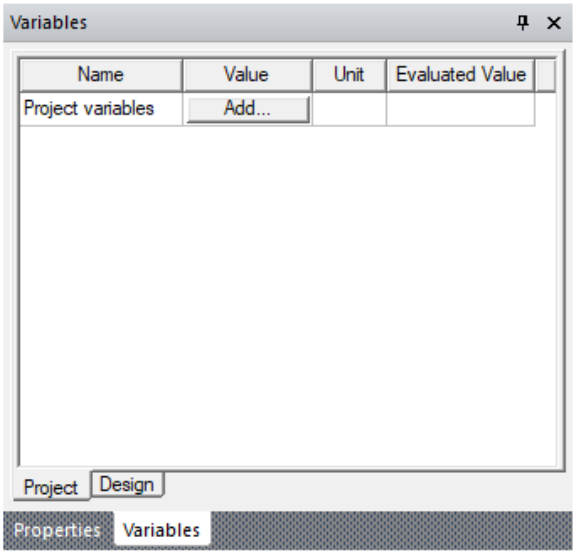
There are two types of variables in HFSS 3D Layout:

Project Variables	A project variable can be assigned to any parameter value in the HFSS 3D Layout project in which it was created. HFSS 3D Layout differentiates project variables from other types of variables by prefixing the variable name with dollar sign symbol ($). You can manually include the $ in the project variable's name, or HFSS 3D Layout will automatically append the project variable's name after you define the variable. Project variables can be designated as Design, ArrayIndex or Separator variables .
Design (Local) Variables	A design variable can be assigned to any parameter value in the HFSS 3D Layout design in which it was created. From the Design Variables **Properties** dialog box, you can Add, Add Array, Edit, or Remove design variables. Design Variables can be designated as Design, ArrayIndex or Separator variables

Clicking **View** > **Variables** brings up a dockable variable window that is associated with the active project and/or design. When there is an active project, there will be a corresponding project variable tab. When there is an active design, there will be a corresponding design variable tab. Each tab contains an **Add...** button allowing creation of new variable of this type. If variables exist for the Project or Design, they are shown in the corresponding tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

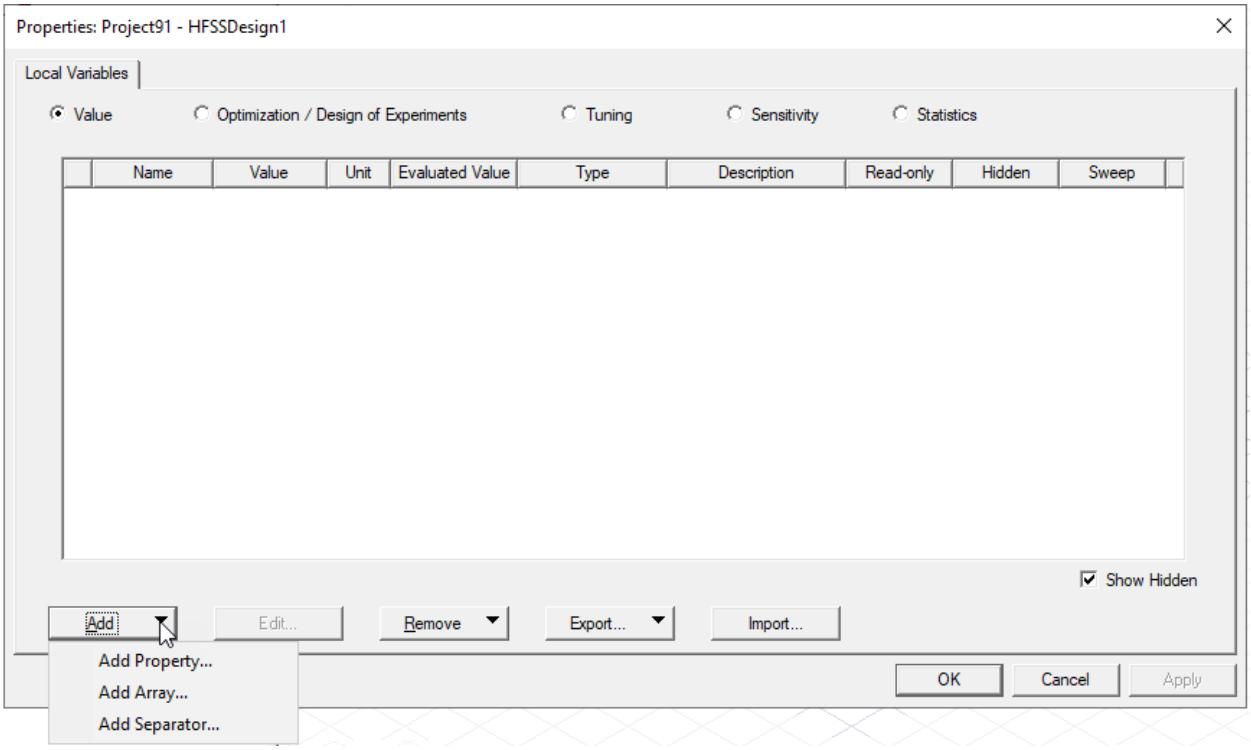




Importing and Exporting Variables

Once you have defined Design and/or Project Variables, you can export them to a csv file, and import them to another project or design. If there are naming conflicts on import, these are flagged as errors. The **Properties** dialogs for Design Variables and Project variables include **Import...** and **Export...** buttons.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Working with Project Variables

Project variables are available across all hierarchical levels of a project. A project variable can be assigned to a parameter value in the HFSS 3D Layout project in which it was created. HFSS 3D Layout differentiates project variables from other types of variables by prefixing the variable name with the dollar sign symbol ($). You can manually include the $ in the project variable's name when you create it, or HFSS 3D Layout will automatically append it after you define the variable.

The **Project Variables** menu item allows you to access three tabs:

- **Project Variables** – variables, which you define, that apply to the entire project.
- **Intrinsic Variables** – pre-defined variables that cannot be changed. See: List of Intrinsic Variables.
- **Constants** – pre-defined constants that cannot be changed. See: List of Constants.

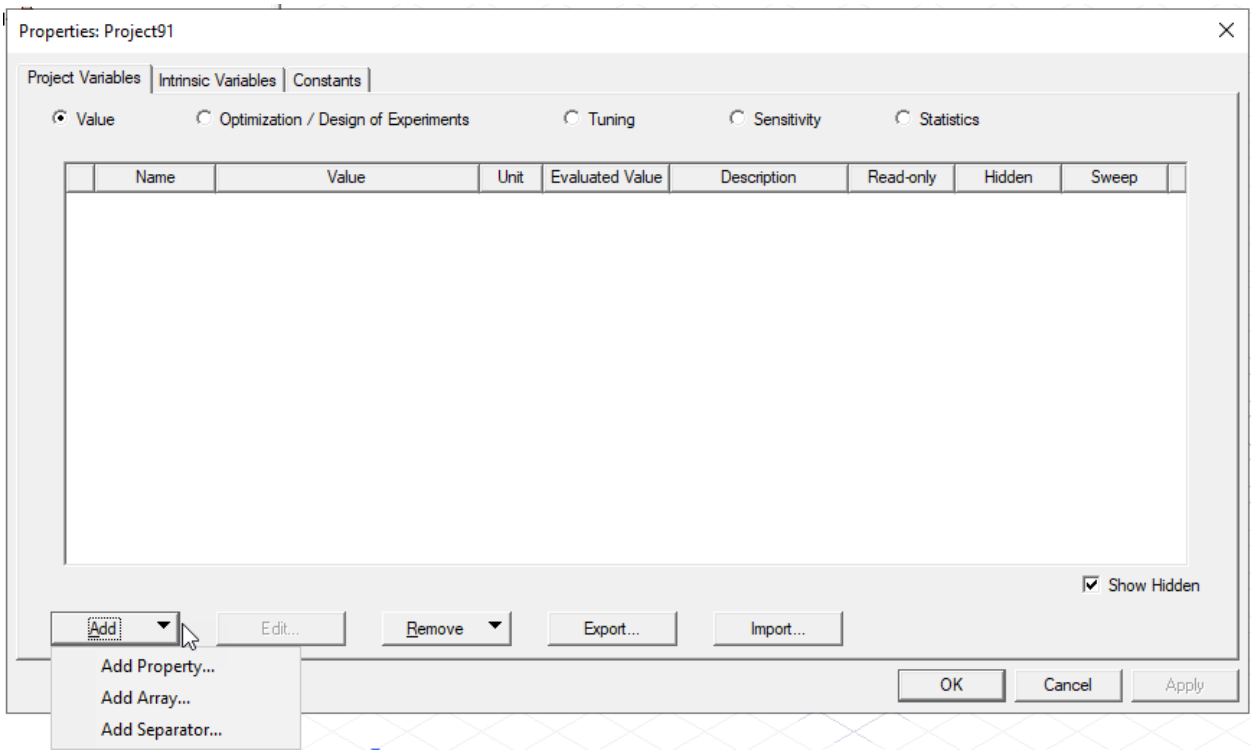
Adding a Project Variable

To define a Project Variable:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Access **Project Variables** one of three ways:
   - Click **Project** > **Project Variables**.
   - Right-click the project name in the Project Tree and select **Project Variables**.
   - From a menu in the lower left corner of the following Optimization dialogs: **Parametric**, **Optimization**, **Sensitivity**, **Statistical**, **Design of Experiments**, and **Design Xplorer Setup**. Click **Edit Variables** and from the menu select **Edit Project Variables**.

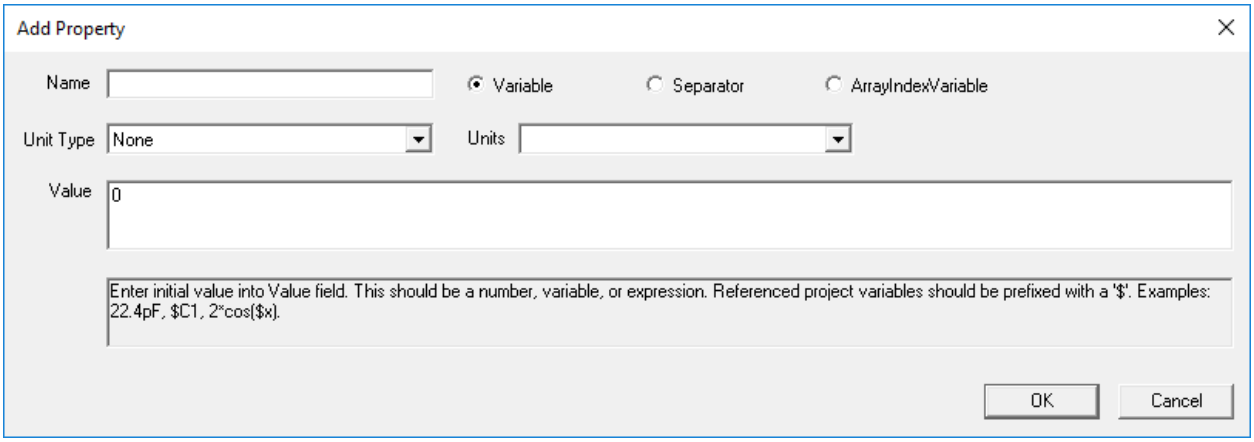
   The **Properties** window appears, on the **Project Variables** tab.



2. From the **Project Variables** tab, click **Add**.

   The **Add Property** dialog box appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Enter information for the variable, as applicable:
   - **Name** – project variable names must start with the dollar sign symbol ($), followed by a letter. The name can contain alphanumeric characters and underscores (_). You cannot use the names of Intrinsic Variables or pre-defined Constants.
   - **Variable Type** – use the **Variable**, **Separator**, and **ArrayIndexVariable** radio buttons to select the variable type.

     Your selection impacts which properties you can edit:

Variable Type	Editable Properties
Variable	Unit Type, Units, Value.
Separator	Name. A separator variable provides a bolded name for a blank line to facilitate grouping variables in variable lists.
Array Index Variable	Associate Array Variable, Value

   - **Unit Type** – for Variables, use the drop-down menu to select a type from the list (for example, Charge, Density, Energy, ...). “None” is the default.

     When you select a Unit Type, the choices in drop-down menu for the Units text box adapt to that unit type. For example, selecting Length as the Unit Type causes the Unit menu to show a range of metric and english units for length. Similarly, if you select the Unit Type as Resistance, the Units drop down lists a range of standard Ohm units.

   - **Units** – for Variables, use the drop-down menu to select a unit of measure.
   - **Value** – for Variables and ArrayIndexVariables, enter a number, variable, or mathematical expression. The quantity entered will be the current (or default) value for the variable. If the mathematical expression includes a reference to an existing variable, this variable is treated as a dependent variable. The units for a dependent

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

variable will automatically change to those of the independent variable on which the value depends. Additionally, dependent variables, though useful in many situations, cannot be the direct subject of optimization, sensitivity analysis, tuning, or statistical analysis.

For ArrayIndexVariables, the index reference can be a constant (for example, 1), an index (for example, ii) or an expression (for example, ii + 1). This allows you to sweep the index and simulate for different values that are stored in the array variable itself. In particular, it also enables you to sweep different text strings. This allows you to set a property to different string values as the index is swept.

> **Warning:**
>
> If you include the variable's units in its definition (in the **Value** text box), do not include the variable's units when you enter the variable name for a parameter value.

- **Associate Array Variable** – for ArrayIndexVariables, select an associated array from the drop-down list. You must have previously created an array.

4. Click **OK**.

   The new variable appears in the list. You can sort project variables by clicking the Name column header. Clicking once sorts them in ascending order, noted by a triangle pointing up. Clicking against sorts in descending order, noted by a triangle pointing down. Clicking a third time sorts in original order, with no triangle.

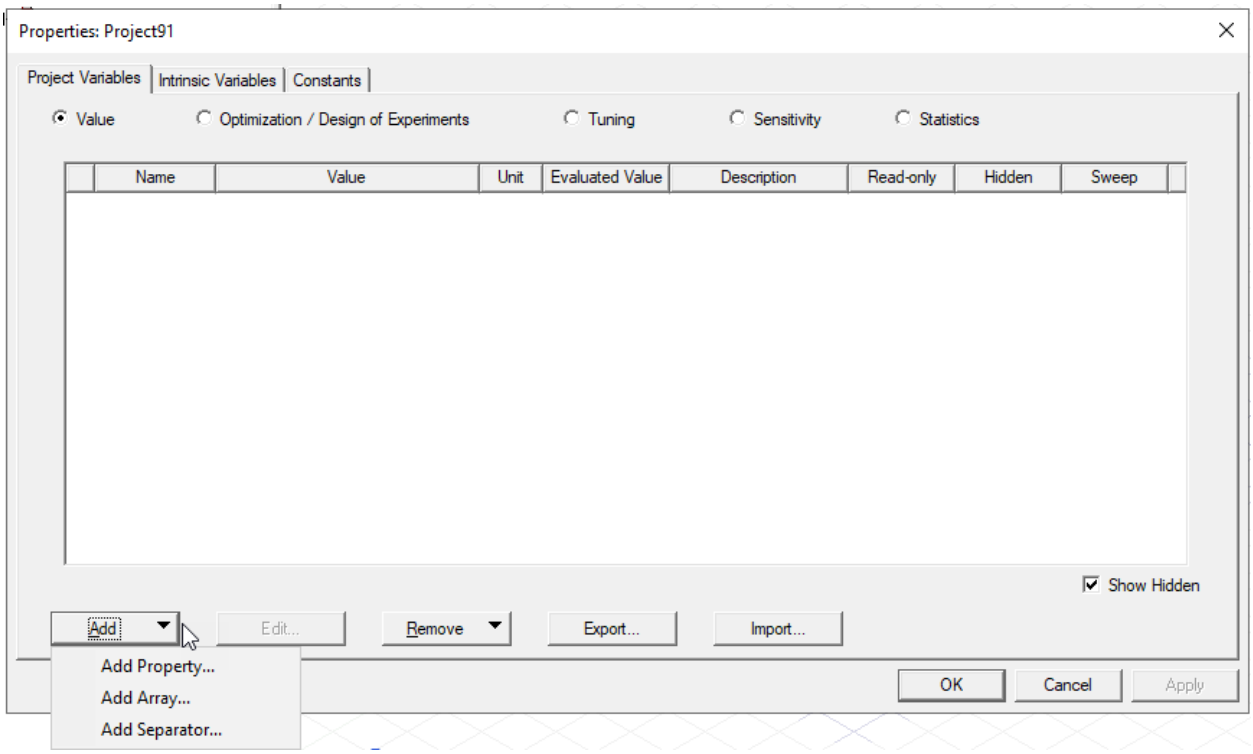
5. If desired, use the check boxes to designate a variable as **Read-only**, **Hidden**, or **Sweep**.
   - **Read-only** – when selected, the variable's name, value, unit, and description cannot be modified.
   - **Hidden** – hidden variables do not appear in the **Properties** window unless **Show Hidden** is selected.
   - **Sweep** – allows you to designate variables to include in solution indexing as a way to permit faster post-processing. Variables with the Sweep check box cleared are not used in solution indexing. If a solution exists, selecting or clearing a variable's Sweep setting produces a warning that the change will invalidate existing solutions. To continue, click **OK** to dismiss the warning.
6. Click **Apply** to apply changes.
7. Click **OK** to exit the window.

The new variable can be assigned to a parameter value in the project in which it was created. You can enable defined variables for Optimization/Design of Experiments, Tuning, Sensitivity, or Statistics. See: Optimetrics.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Importing and Exporting Project Variables

Once you have defined Project Variables, you can export them to a csv file, and import them to another project or design. If there are naming conflicts on import, these are flagged as errors. The **Properties** dialogs for and Project variables include **Import...** and **Export...** buttons.



When you click **Export....** a dialog lets you name the file and select a location. When you **Save**, if the file exists, an overwrite prompt should pop up.

Deleting a Project Variable

To remove a Project Variable:

1. Access **Project Variables** as described above.

   The **Properties** window appears, on the **Project Variables** tab.

2. Remove one or more variables:
   - To remove a specific variable, select it and click **Remove** > **Remove Selected**.
   - To remove all unused variables, click **Remove** > **Remove All Unused**.
   - To force the removal of all unused variables, including those in the project's undo/redo history, click **Remove** > **Force Remove All Unused**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Editing a Project Variable

To edit a Project Variable:

1. Access **Project Variables** as described above.

   The **Properties** window appears, on the **Project Variables** tab.

2. Select the variable you want to edit and click **Edit**.
3. Change the properties as desired and click **OK**.

Adding a Project Variable Array

You can define array variables that contain numbers or strings. Number array variables can be used in component property expressions, while string array variables can be used in certain component property values.

> **Note:**
>
> Text array variables can be used in certain component property values, but not all, and cannot be combined with operators to form more complex expressions.
>
> The index for a text array variable reference can either be a constant (1) or can be an index (ii) or even an expression (ii + 1). This allows you to sweep the index and simulate for different values that are stored in the array variable itself. In particular, it also enables you to sweep different text strings. This allows you to set a property to different string values as the index is swept. The following are properties that currently allow text array variables:
>
> - V_PRBS
> - V_PRBS_JITTER
> - V_PRBSD
> - V_PRBSG_JITTER
> - V_PSK
> - V_QAM
> - V_CPM

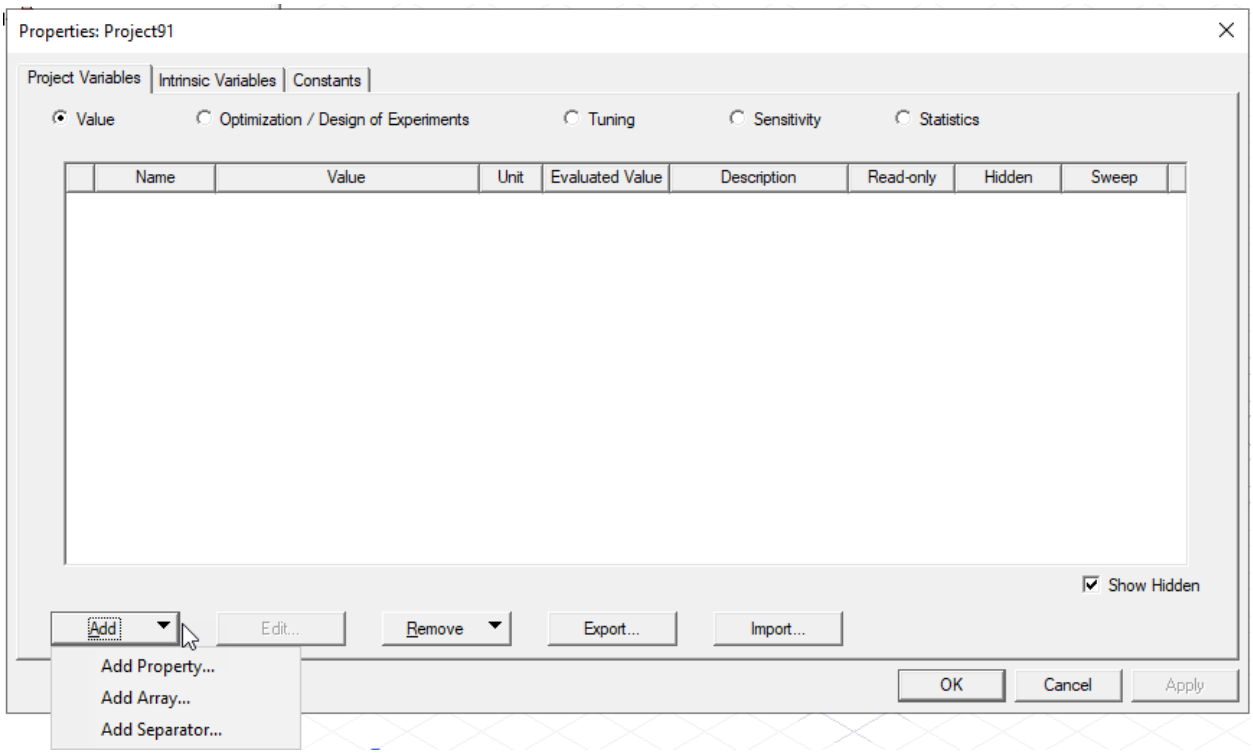
To define an array variable, you must first define a Project Variable Array:

1. Access **Project Variables** one of three ways:
   - Click **Project** > **Project Variables**.
   - Right-click the project name in the Project Tree and select **Project Variables**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From a menu in the lower left corner of the following Optimization dialogs: **Parametric**, **Optimization**, **Sensitivity**, **Statistical**, **Design of Experiments**, and **Design Xplorer Setup**. Click **Edit Variables** and from the menu select **Edit Project Variables**

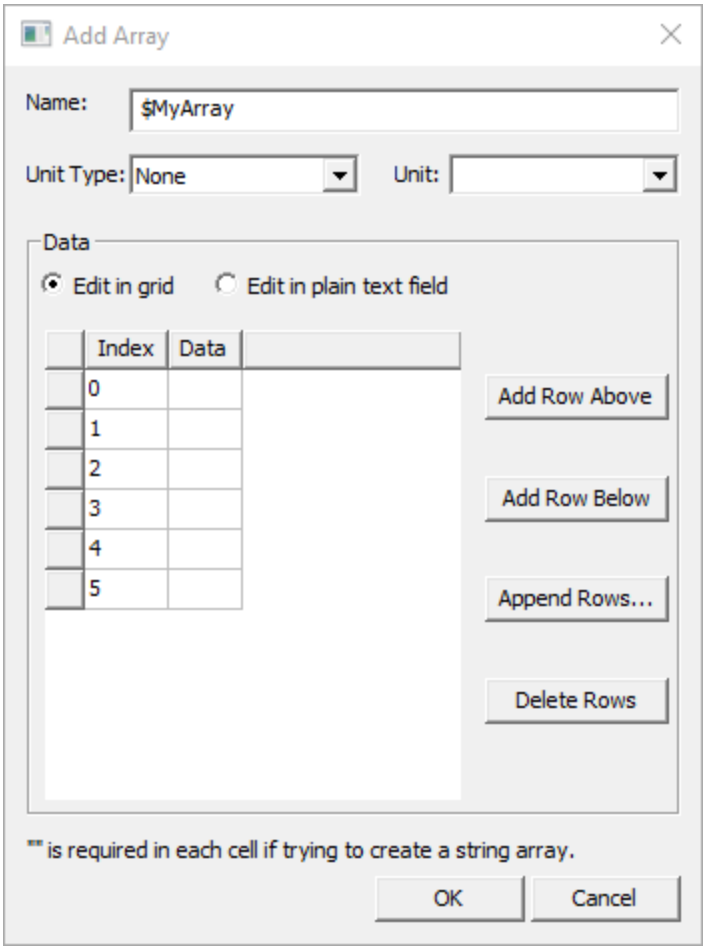
The **Properties** window appears, on the **Project Variables** tab.



2. Click **Add Array** > **Add Array...**.

   The **Add Array** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The value grid displays each array item's **Index** number, and the **Data** associated with that index number.

3. Give the variable array a **Name**, and select a **Unit Type** and **Unit** from the drop-down menus.
4. Use the control buttons to add, delete, and reposition rows in the value grid at left. The default is **Edit in grid**, but you may select **Edit in plain text field**.

> **Note:**
>
> Quotation marks (“ ”) are *required* as delimiters when array values are entered in either the grid or text field.

5. When you have finished entering values, click **OK**.

   The array appears in the **Project Variables** list.

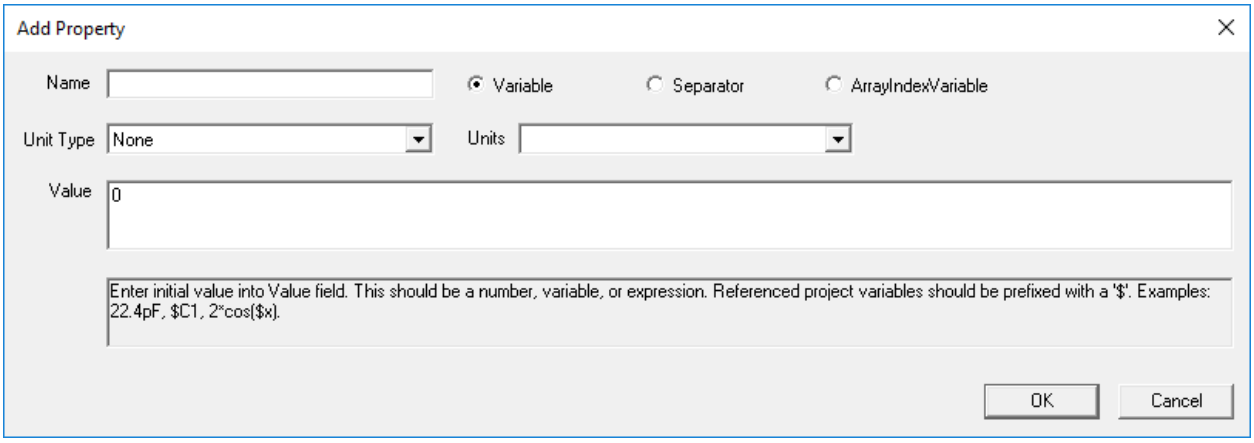
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can add a variable to the array by adding an ArrayIndexVariable on the **Project Variables** tab.

1. Access **Project Variables** one of three ways:
   - Click **Project** > **Project Variables**.
   - Right-click the project name in the Project Tree and select **Project Variables**.
   - From the **Setup Optimization** dialog box, click **Edit Variables** > **Edit Project Variables**.

   The **Properties** window appears, on the **Project Variables** tab.
2. From the **Project Variables** tab, click **Add**.

   The **Add Property** dialog box appears.



3. Enter information for the variable, as applicable:
   - **Name** – project variable names must start with the dollar sign symbol ($), followed by a letter. The name can contain alphanumeric characters and underscores (_). You cannot use the names of Intrinsic Variables or pre-defined Constants.
   - **Variable Type** – select ArrayIndexVariable.
   - **Value** – enter a number, variable, or mathematical expression. The quantity entered will be the current (or default) value for the variable. If the mathematical expression includes a reference to an existing variable, this variable is treated as a dependent variable. The units for a dependent variable will automatically change to those of the independent variable on which the value depends. Additionally, dependent variables, though useful in many situations, cannot be the direct subject of optimization, sensitivity analysis, tuning, or statistical analysis.

     For ArrayIndexVariables, the index reference can be a constant (for example, 1), an index (for example, ii) or an expression (for example, ii + 1). This allows you to

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

sweep the index and simulate for different values that are stored in the array variable itself. In particular, it also enables you to sweep different text strings. This allows you to set a property to different string values as the index is swept.

> **Warning:**
>
> If you include the variable's units in its definition (in the **Value** text box), do not include the variable's units when you enter the variable name for a parameter value.

- **Associate Array Variable** – for ArrayIndexVariables, select an associated array from the drop-down list. You must have previously created an array.

4. Click **OK**.

List of Intrinsic Variables

The Ansys Electronics Desktop software recognizes a set of intrinsic variables that can be used to define expressions. Intrinsic variable names are reserved and may not be used as user-defined variable names.

To view the list of Intrinsic Variables, click **Project** > **Project Variables** and select the **Intrinsic Variables** tab.

Name	Unit	Description
_Empty		Empty value, taken to be model default by simulator (Twin Builder)
_I1	mA	Armature current; **this variable is only used in RMxprt**.
_I2	mA	Exciting current; **this variable is only used in RMxprt**.
_I3	mA	Current; **this variable is only used in RMxprt**.
_I4 through _I9		Not used
_t,**_u**,**_v**		Variables to define parametric equation-based curve.
_V1 to **_V9**	mV	Port Voltage in user-defined model (V).
Ang	Ang	Angle. Postprocessing variable
Budget Index		Postprocessing variables; cannot be set by the user
Distance	mm	
Electrical Degree	deg	Electric degree of the rotating machine; cannot be set by the user.
F	GHz	Frequency of the circuit/system analysis
F1, **F2**, **F3**	GHz	Frequency tones 1, 2, 3 in harmonic balance analysis. (Hz).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name	Unit	Description
FNoi	GHz	Offset noise frequency in harmonic balance noise analysis.
Freq	Hz	Frequency for analysis and postprocessing; cannot be set by the user
Hmax	ns	
Hmin	ns	
Ia, **Ib**	mA	Postprocessing variables; cannot be set by the user
Index		Identifier for a data point; cannot be set by the user
IWave Phi, **IWave Theta**	deg	Incident wave spherical coordinate variables. Phi is the angle from the origin in the z direction and Theta the angle from the x-axis.
Normalized Deformation, **Normalized Distance**		Postprocessing variables; cannot be set by the user
OP	mW	Postprocessing variables; cannot be set by the user
Pass		Post processing variables, not settable by the user.
Phase	deg	Angle of a complex number.
Phi	deg	The angle measured from the x-axis and can be from 0 to 360 degrees.
R	mm	R is the cylindrical coordinate system variable.
Rho		Rho is the spherical coordinate system variable.
Rspeed	rpm	Speed of the machine.
Spectrum	GHz	Postprocessing variable.
Temp	cel/deg	Analysis temperature (deg)
Tend	ns	
Theta	deg	The angle measured from the z-axis, which is the axis perpendicular to the plane of the work space, and must be from 0 to 180 degrees.
Time	ns	Time point in transient analysis
Time0	ns	Time 0 point in a transient analysis
Vac, **Vbe**, **Vce**, **Vds**, **Vgs**	mV	Post processing variables; cannot be set by the user
X,**Y**,**Z**	mm	Point coordinate variables in the modeler.
ZAng, **XRho**	deg	A spherical coordinate system; cannot be set by the user

List of Constants

To view the list of constants, click **Project** > **Project Variables** and select the **Constants** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name	Value	Description
abs0	-273.15	Absolute zero (C)
boltz	1.3806503e-23	Boltzmann constant (J/K)
c0	299792458	Speed of light in a vacuum (m/s)
e0	8.854187817e-12	Permittivity of vacuum (F/m)
elecq	1.602176462e-19	Electron charge (C)
eta	376.730313461	Impedance of vacuum (Ohm)
false	0	Boolean False
g0	9.80665	Acceleration due to gravity of Earth (m/s^2)
mathE	2.718281828	Euler's number (Napier's constant)
pi	3.1415926535898	Ratio of circumference to diameter
planck	6.6260755e-34	Planck's constant (m^2*kg/s)
true	1	Boolean True
u0	1.2566370614359e-06	Permeability of vacuum (H/m)

Working with Design Variables

Design Variables (Local Variables) are only available within the HFSS 3D Layout design for which they are defined. A design variable can be assigned to a parameter value in the design. You can also add a variable defined with an array of values. Choosing **Add Property** pops up an **Add Property** dialog with default radio button on Variable; choosing **Add Array** pops up an **Add Array** dialog; choosing **Add Separator** pops up an **Add Property** dialog with default radio button on Separator.

The **Design Properties** menu item allows you to access up to three tabs, depending on your design:

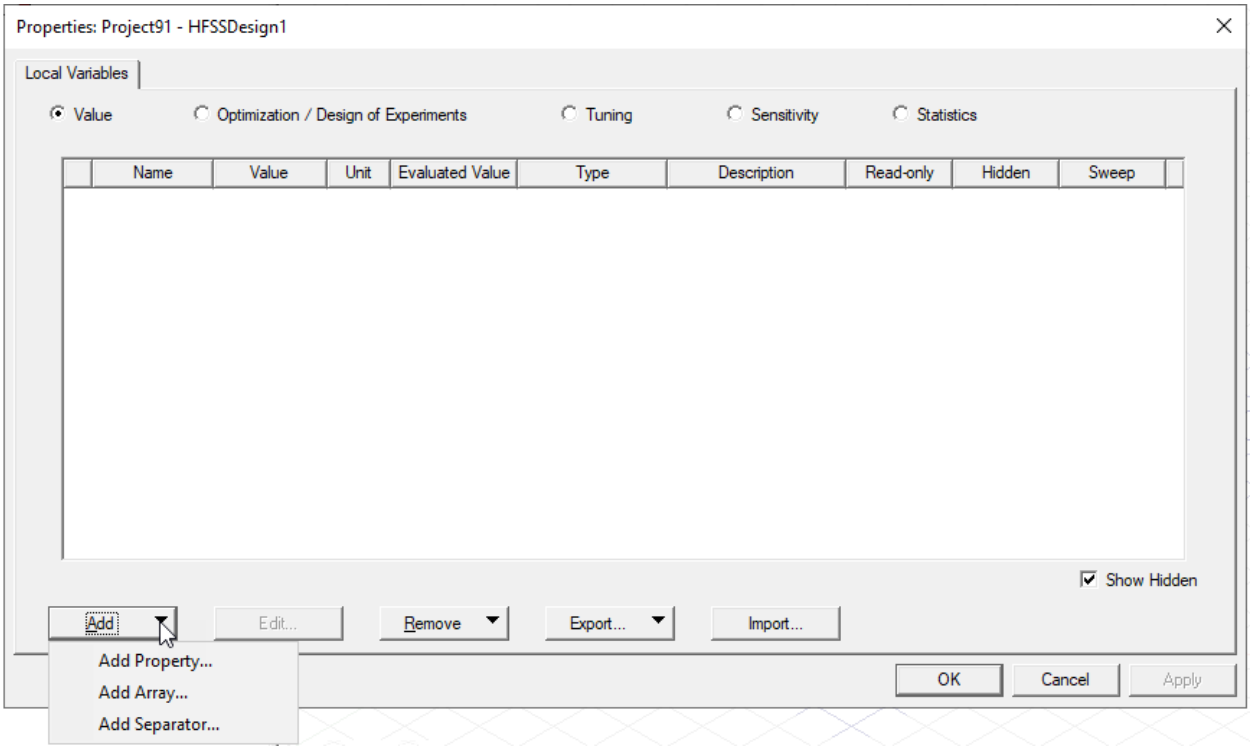
- **Parameter Defaults** – local variables with default values that can be overridden in instances of a design. For example, if three subcircuit instances contain a parameter default C1 that is defined as equal to 11.3pF, C1 may be overridden as 11.8pF in the first instance, overridden as 10.9pF in the second, and left at its default value of 11.3pF in the third. A property value that has been set by means of a parameter default is called a *passed parameter*. Parameter defaults can be defined at the design level.
- **Local Variables** – variables, which you define, that apply to the current design only. Local variables can be defined at the design level.
- **General** – pre-defined design variables that cannot be changed. You cannot use the names of these variables when creating a new variable.

> **Note:**
>
> Not all tabs appear for all designs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Importing and Exporting Variables

Once you have defined Design Variables, you can export them to a csv file, and import them to another project or design. If there are naming conflicts on import, these are flagged as errors. The Properties dialogs for Design Variables include **Import...** and **Export...** buttons.



Defining Local Variables at the Design Level

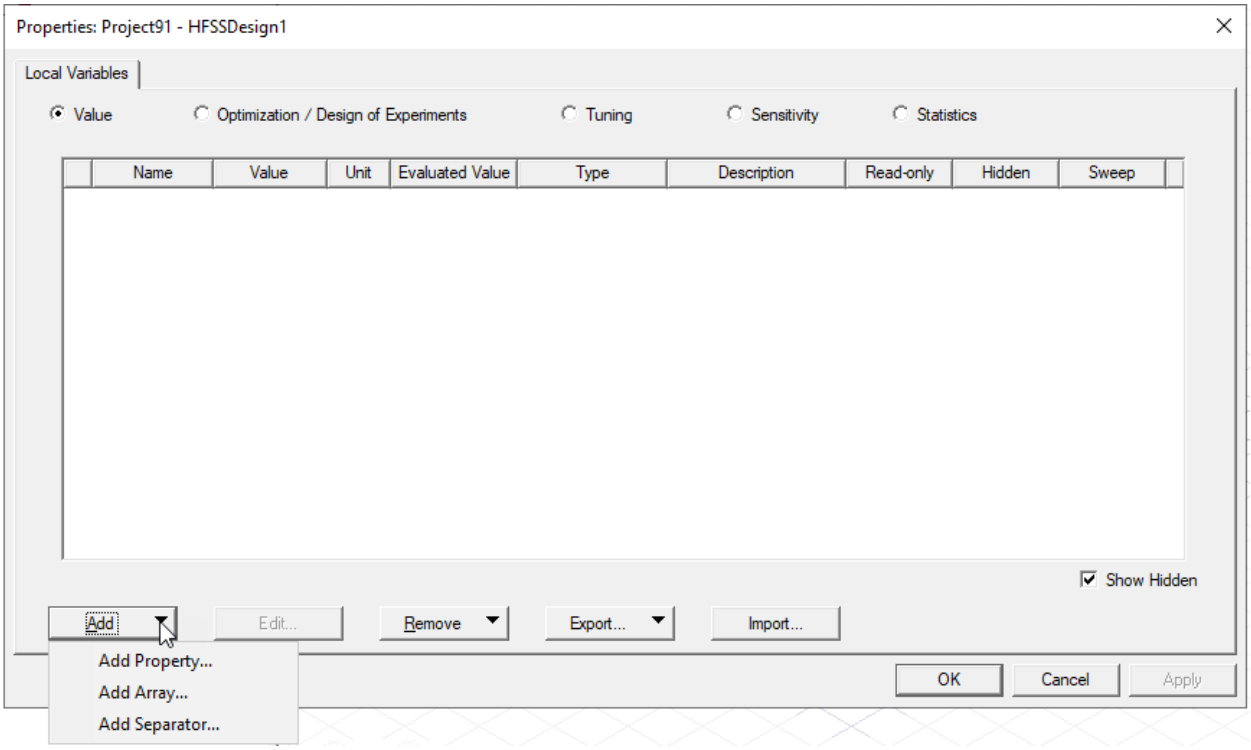
Adding a Local Variable

To define a Local Variable:

1. Access **Design Properties** one of three ways:
   - Click **HFSS 3D Layout** > **Design Properties**.
   - Right-click the design name in the Project Tree and select **Design Properties**.
   - From a menu in the lower left corner of the following Optimization dialogs: **Parametric**, **Optimization**, **Sensitivity**, **Statistical**, **Design of Experiments**, and **Design Xplorer Setup**. Click **Edit Variables** and from the menu select **Edit Design Variables**

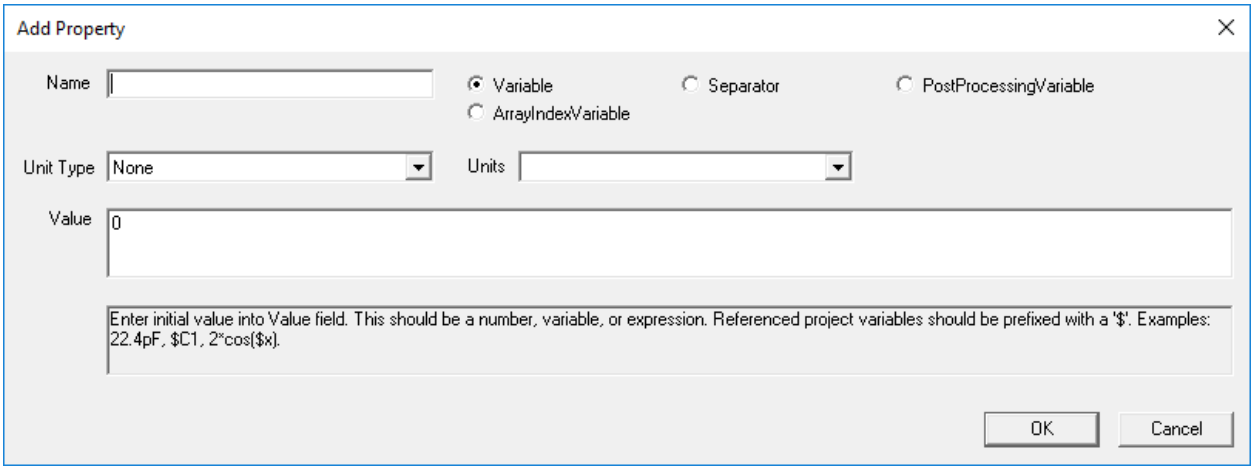
   The **Properties** window appears with the **Local Variables** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Click **Add**.

   The **Add Property** window appears.



3. Enter information for the variable, as applicable:
   - **Name** – the name must start with a letter and can contain alphanumeric characters and underscores (_). You cannot use any names already defined on the **General** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Variable Type** – use the **Variable**, **Separator**, **ArrayIndexVariable**, and **PostProcessingVariable** radio buttons to select the variable type.

  > **Note:**
  >
  > Not all variable types are available for all designs.

  Your selection impacts which properties you can edit:

Variable Type	Editable Properties
Variable	Unit Type, Units, Value.
Separator	Name. A separator variable provides a bolded name for a blank line to facilitate grouping variables in variable lists.
Array Index Variable	Associate Array Variable, Value
PostProcessingVariable	Unit Type, Units, Value.

- **Unit Type** – for Variables and PostProcessingVariables, use the drop-down menu to select a type from the list (for example, Charge, Density, Energy, ...).
- **Units** – for Variables and PostProcessingVariables, use the drop-down menu to select a unit of measure.
- **Value** – for Variables, ArrayIndexVariables, and PostProcessingVariables, enter a number, variable, or mathematical expression. The quantity entered will be the current (or default) value for the variable. If the mathematical expression includes a reference to an existing variable, this variable is treated as a dependent variable. The units for a dependent variable will automatically change to those of the independent variable on which the value depends. Additionally, dependent variables, though useful in many situations, cannot be the direct subject of optimization, sensitivity analysis, tuning, or statistical analysis.

  For ArrayIndexVariables, the index reference can be a constant (for example, 1), an index (for example, ii) or an expression (for example, ii + 1). This allows you to sweep the index and simulate for different values that are stored in the array variable itself. In particular, it also enables you to sweep different text strings. This allows you to set a property to different string values as the index is swept.

  > **Warning:**
  >
  > If you include the variable's units in its definition (in the **Value** text box), do not include the variable's units when you enter the variable name for a parameter value.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Associate Array Variable** – for ArrayIndexVariables, select an associated array from the drop-down list. You must have previously created an array.

4. Click **OK**.

   The new variable appears in the list. You can sort local variables by clicking the Name column header. Clicking once sorts them in ascending order, noted by a triangle pointing up. Clicking against sorts in descending order, noted by a triangle pointing down. Clicking a third time sorts in original order, with no triangle.

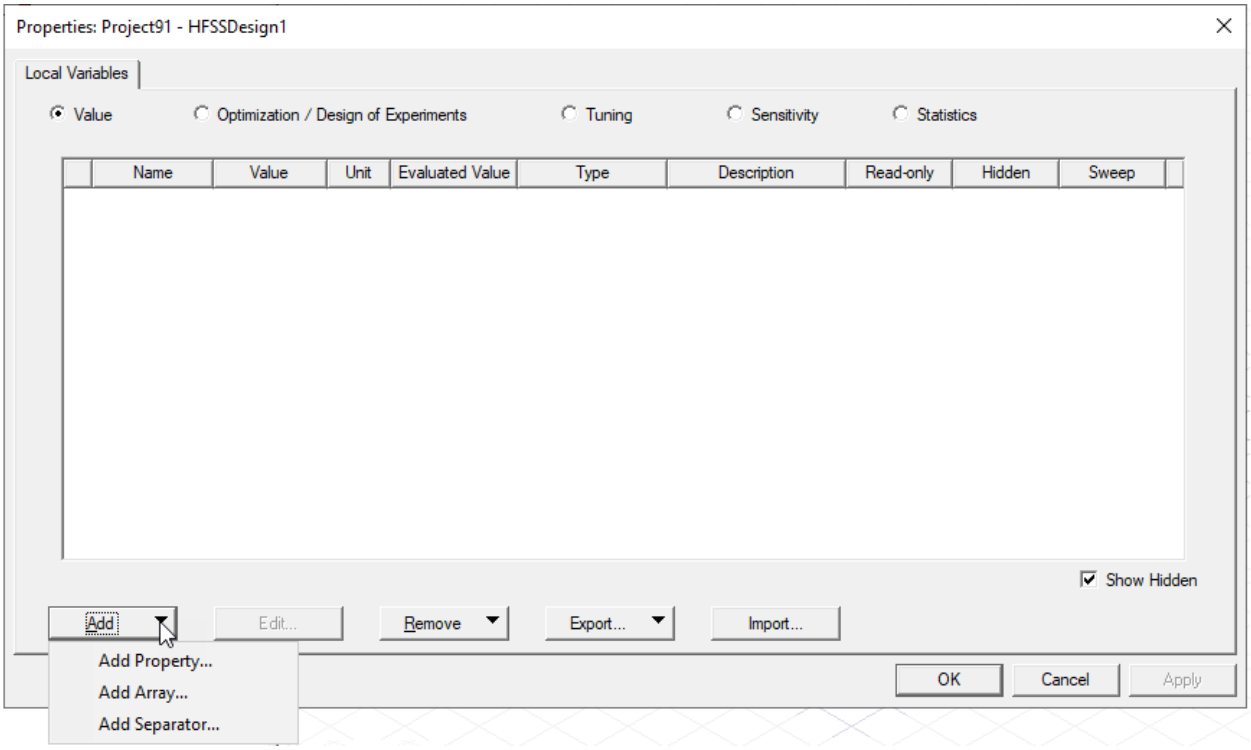
5. If desired, use the check boxes to designate a variable as **Read-only**, **Hidden**, or **Sweep**.
   - **Read-only** – when selected, the variable's name, value, unit, and description cannot be modified.
   - **Hidden** – hidden variables do not appear in the **Properties** window unless **Show Hidden** is selected.
   - **Sweep** – allows you to designate variables to include in solution indexing as a way to permit faster post-processing. Variables with the Sweep check box cleared are not used in solution indexing. If a solution exists, selecting or clearing a variable's Sweep setting produces a warning that the change will invalidate existing solutions. To continue, click OK to dismiss the warning.
6. Click **Apply** to apply changes.
7. Click **OK** to exit the window.

The new variable can be assigned to a parameter value in the project in which it was created. You can enable defined variables for Optimization/Design of Experiments, Tuning, Sensitivity, or Statistics. See: Optimetrics.

Importing and Exporting Variables

Once you have defined Design Variables, you can export them to a csv file, and import them to another project or design. If there are naming conflicts on import, these are flagged as errors. The Properties dialogs for Design Variables include **Import...** and **Export...** buttons.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Deleting a Local Variable

To remove a Local Variable:

1. Access **Local Variables** as described above.
2. Remove one or more variables:
   - To remove a specific variable, select it and click **Remove** > **Remove Selected**.
   - To remove all unused variables, click **Remove** > **Remove All Unused**.
   - To force the removal of all unused variables, including those in the project's undo/redo history, click **Remove** > **Force Remove All Unused**.

Editing a Local Variable

To edit a Local Variable:

1. Access **Local Variables** as described above.
2. Select the variable you want to edit and click **Edit**.
3. Change the properties as desired and click **OK**.

Overriding a Local Variable

You can override a variable value from an analysis setup's **General** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Select the **Override** check box next to the value you wish to override, and enter a new value in the **Value** field.

Design Variable	Override	Value	Units
padrad	☐	0.6	mm
viarad	☐	0.2	mm

Defining Parameter Defaults at the Design Level

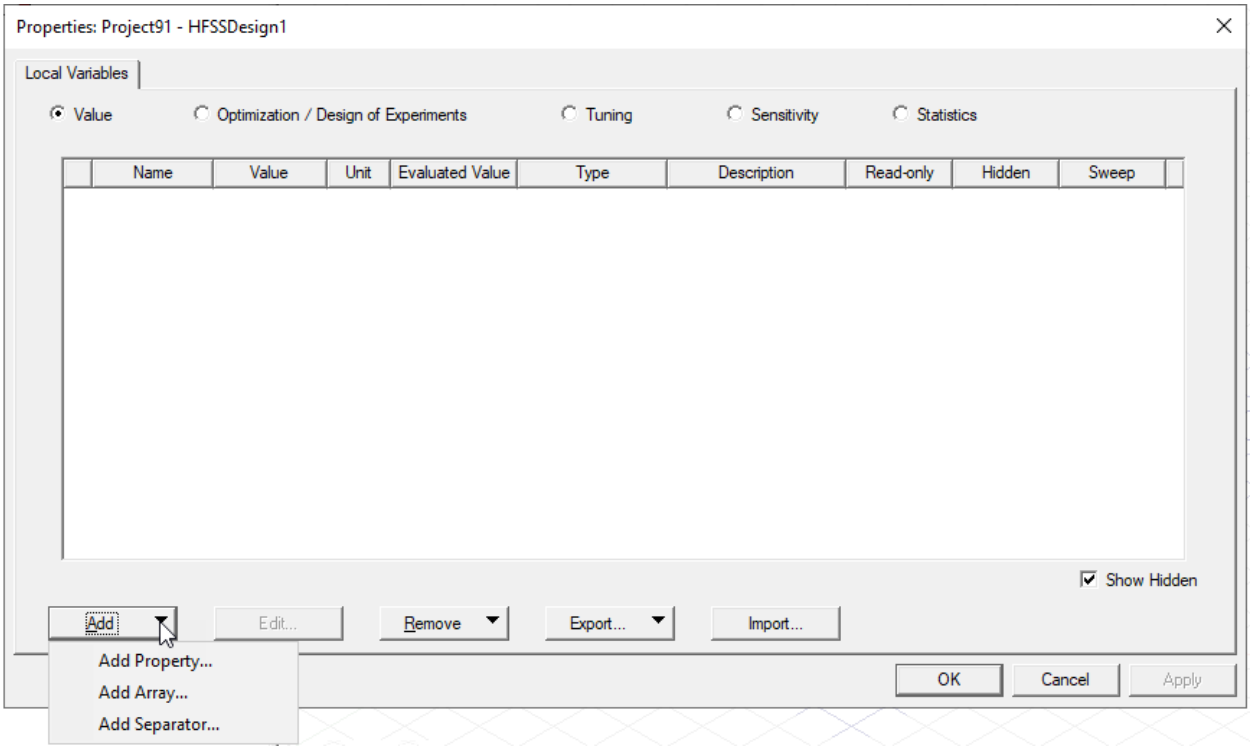
Adding a Parameter Default

To define a new parameter default at the design level:

1. Access **Design Properties** one of three ways:
    - Click **HFSS 3D Layout** > **Design Properties**.
    - Right-click the design name in the Project Tree and select **Design Properties**.
    - From a menu in the lower left corner of the following Optimization dialogs: **Parametric**, **Optimization**, **Sensitivity**, **Statistical**, **Design of Experiments**, and **Design Xplorer Setup**. Click **Edit Variables** and from the menu select **Edit Design Variables.**

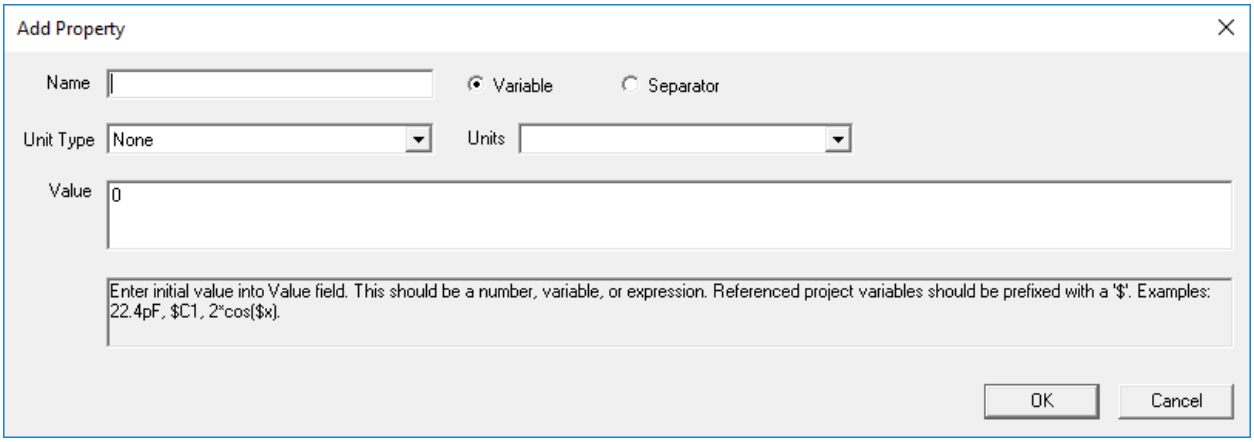
    The **Properties** window for design variables appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Click **Add...**.

   The **Add Property** window appears.



3. Enter information for the parameter default, as applicable:
   - **Name** – the name can contain alphanumeric characters and underscores (_). You cannot use any names already defined on the **General** tab.
   - **Variable Type** – select **Variable** to enter a value, or select **Separator** to provide a bolded name for a blank line.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Your selection impacts which properties you can edit:

Variable Type	Editable Properties
Variable	Unit Type, Units, Value.
Separator	Name. A separator variable provides a bolded name for a blank line to facilitate grouping variables in variable lists.

- **Unit Type** – for Variables, use the drop-down menu to select a type from the list (for example, Charge, Density, Energy, ...).
- **Units** – for Variables, use the drop-down menu to select a unit of measure.
- **Value** – for Variables, enter a valid numeric quantity. Alternately, you can assign a variable to a parameter by typing a variable name or mathematical expression in place of a parameter value.

4. Click **OK**.

   The new variable appears in the list. You can sort local variables by clicking the Name column header. Clicking once sorts them in ascending order, noted by a triangle pointing up. Clicking against sorts in descending order, noted by a triangle pointing down. Clicking a third time sorts in original order, with no triangle.

5. If desired, use the check boxes to designate a variable as **Read-only**, **Hidden**, or **Sweep**.
   - **Read-only** – when selected, the variable's name, value, unit, and description cannot be modified.
   - **Hidden** – hidden variables do not appear in the **Properties** window unless **Show Hidden** is selected.
6. Click **Apply** to apply changes.
7. Click **OK** to exit the window.

Deleting a Parameter Default

To remove a Parameter Default:

1. Access **Parameter Defaults** as described above.
2. Select a parameter from the list and click **Remove**.

Editing a Parameter Default

To edit a Parameter Default:

1. Access **Parameter Defaults** as described above.
2. Select the parameter you want to edit and click **Edit**.
3. Change the properties as desired and click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Overriding a Parameter Default

You can override a parameter default from an analysis setup's **General** tab.

Select the **Override** check box next to the value you wish to override, and enter a new value in the **Value** field.

Design Variable	Override	Value	Units
padrad	☐	0.6	mm
viarad	☐	0.2	mm

Adding a Design Variable Array

You can define array variables that contain numbers or strings. Number array variables can be used in component property expressions, while string array variables can be used in certain component property values. Design variable arrays are only available within the HFSS 3D Layout design for which they are defined.

> **Note:**
>
> Text array variables can be used in certain component property values, but not all, and cannot be combined with operators to form more complex expressions.
>
> The index for a text array variable reference can either be a constant (1) or can be an index (ii) or even an expression (ii + 1). This allows you to sweep the index and simulate for different values that are stored in the array variable itself. In particular, it also enables you to sweep different text strings. This allows you to set a property to different string values as the index is swept. The following are properties that currently allow text array variables:
>
> - V_PRBS
> - V_PRBS_JITTER
> - V_PRBSD
> - V_PRBSG_JITTER
> - V_PSK
> - V_QAM
> - V_CPM

To define an array variable, you must first define a Local Variable Array:

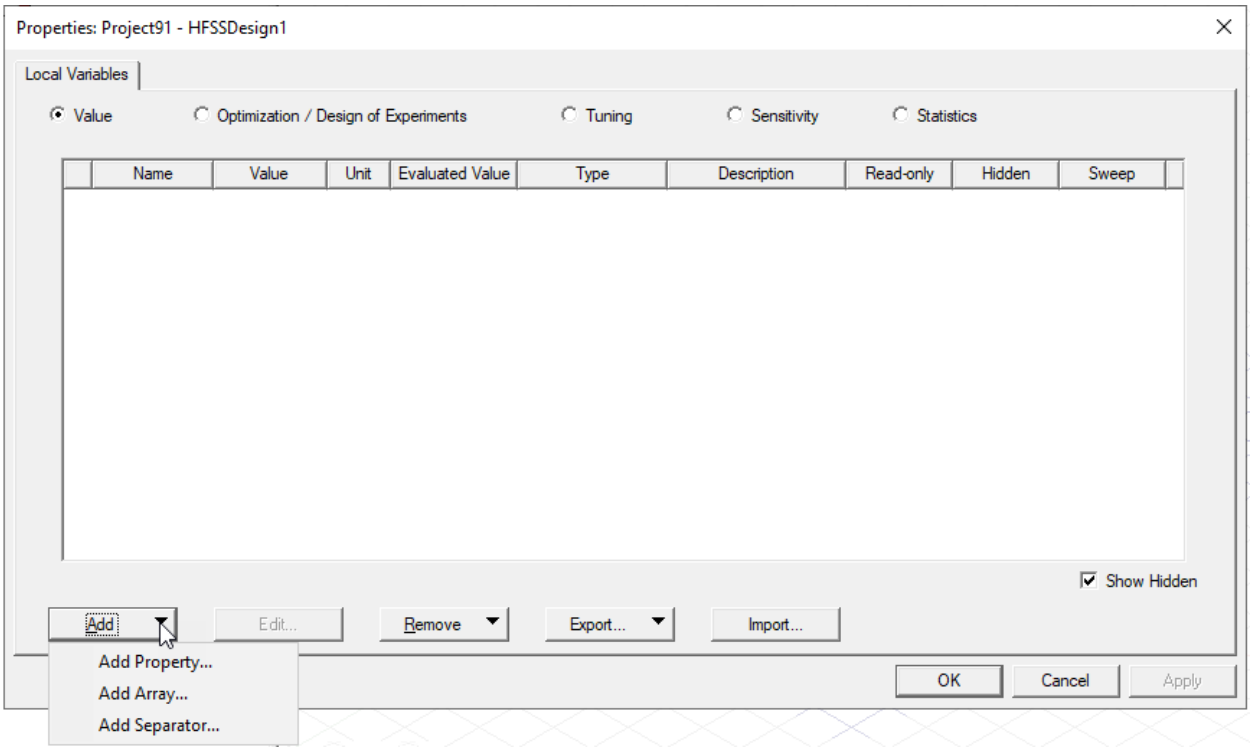
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Access **Local Variables** one of three ways:
   - Click **HFSS 3D Layout** > **Design Properties**.
   - Right-click the design name in the Project Tree and select **Design Properties**.
   - From a menu in the lower left corner of the following Optimization dialogs: **Parametric**, **Optimization**, **Sensitivity**, **Statistical**, **Design of Experiments**, and **Design Xplorer Setup**. Click **Edit Variables** and from the menu select **Edit Design Variables**

   The **Properties** window appears.

2. Select the **Local Variables** tab.

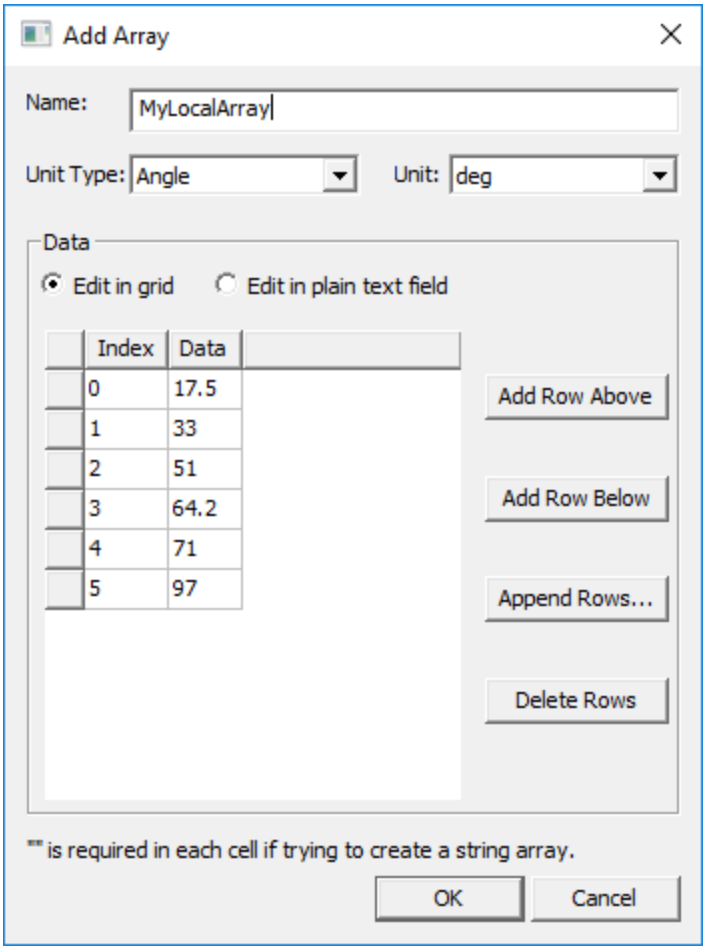
   The **Local Variables** tab displays.



3. Click **Add Array**.

   The **Add Array** window appears.

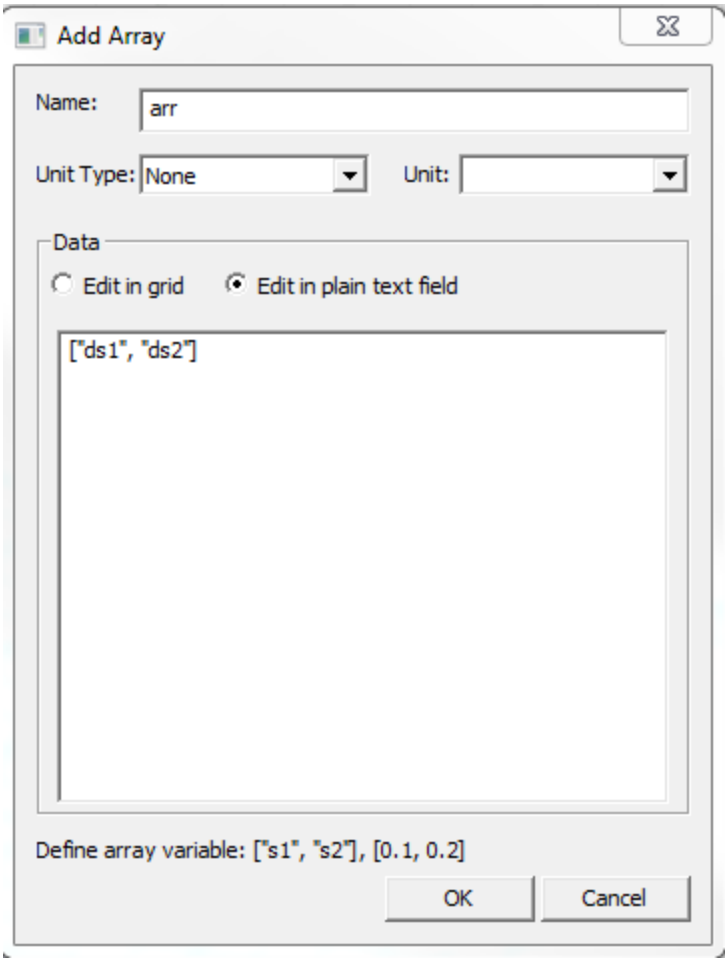
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The value grid displays each array item's **Index** number, and the **Data** associated with that index number.

If you elected to **Edit in plain text field** in the Add Array dialog box, the bracketed and comma delimited format is used.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Give the variable array a **Name**, and select a **Unit Type** and **Unit** from the drop-down menus.
5. Use the control buttons to add, delete, and reposition rows in the value grid at left. The default is **Edit in grid**, but you may select **Edit in plain text field**.

   > **Note:**
   >
   > Quotation marks ("") are *required* as delimiters when array values are entered in either the grid or text field.

6. When you have finished entering values, click **OK**.

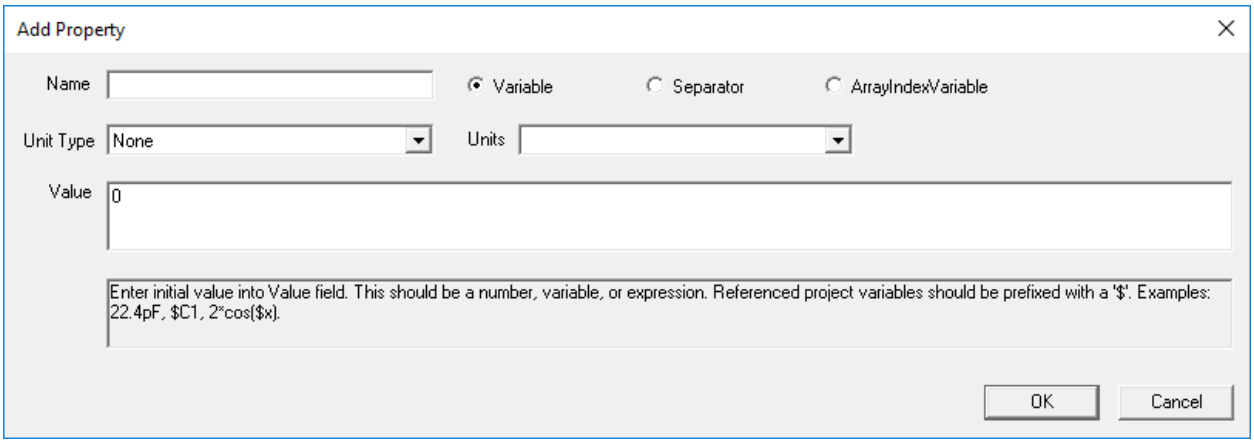
   The array appears in the **Local Variables** list.

You can add a variable to the array by adding an ArrayIndexVariable on the **Local Variables** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Access **Local Variables** one of three ways:
   - Click **HFSS 3D Layout** > **Design Properties**.
   - Right-click the design name in the Project Tree and select **Design Properties**.
   - From the **Setup Optimization** dialog box, click **Edit Variables** > **Edit Design Variables**.
2. From the **Local Variables** tab, click **Add**.

   The **Add Property** dialog box appears.



3. Enter information for the variable, as applicable:
   - **Name** – the name can contain alphanumeric characters and underscores (_). You cannot use the names of Intrinsic Variables or pre-defined Constants.
   - **Variable Type** – select ArrayIndexVariable.
   - **Value** – enter a number, variable, or mathematical expression. The quantity entered will be the current (or default) value for the variable. If the mathematical expression includes a reference to an existing variable, this variable is treated as a dependent variable. The units for a dependent variable will automatically change to those of the independent variable on which the value depends. Additionally, dependent variables, though useful in many situations, cannot be the direct subject of optimization, sensitivity analysis, tuning, or statistical analysis.

     For ArrayIndexVariables, the index reference can be a constant (for example, 1), an index (for example, ii) or an expression (for example, ii + 1). This allows you to sweep the index and simulate for different values that are stored in the array variable itself. In particular, it also enables you to sweep different text strings. This allows you to set a property to different string values as the index is swept.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Warning:**
>
> If you include the variable's units in its definition (in the **Value** text box), do not include the variable's units when you enter the variable name for a parameter value.

- **Associate Array Variable** – for ArrayIndexVariables, select an associated array from the drop-down list. You must have previously created an array.

4. Click **OK**.

Converting Variables and Parameter Defaults

Design (Local) variables can be converted to parameter defaults, and vice versa.

To convert a parameter default or local variable:

1. Access **Design Properties** one of three ways:
   - Click **HFSS 3D Layout** > **Design Properties**.
   - Right-click the design name in the Project Tree and select **Design Properties**.
   - From the **Setup Optimization** dialog box, click **Edit Variables** > **Edit Design Variables**.

   The **Properties** window appears.
2. Select either the **Parameter Defaults** tab or the **Local Variables** tab, depending on which item you want to convert.
3. Select the variable/parameter and click **Convert to Parameter** or **Convert to Variable**.

   The item will move to the list on the appropriate tab.

Some special cases to consider:

- If a local variable references another local variable, it cannot be converted to a parameter default. You will see a pop-up message if you attempt to convert. This is because local variables can reference parameter defaults, but parameter defaults cannot reference local variables.
- Parameter defaults can be overridden and can have different values in each subcircuit, while a Local Variable cannot. If a parameter default has been overridden and you convert it to a variable, it will lose all overrides. Attempting to do so will display a pop-up message asking if you really want to do the conversion and lose the override values.

Adding Variables and Parameter Defaults from Components

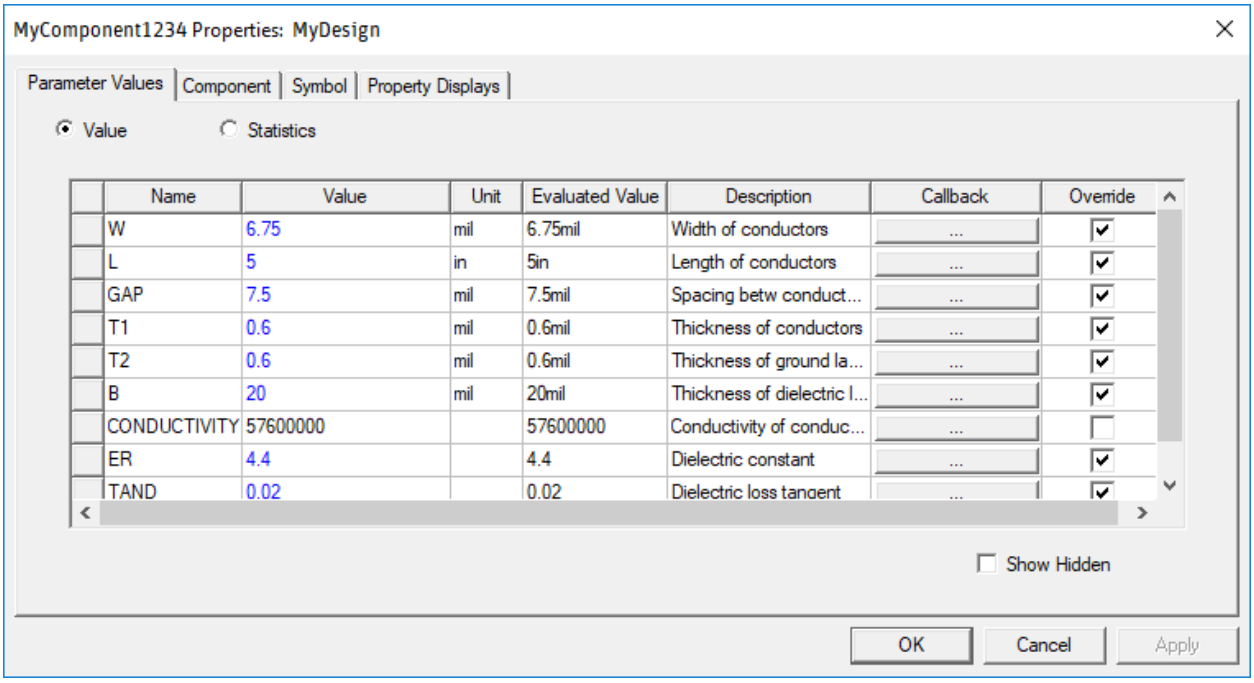
To define a new variable or parameter default from a component:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Display a component's **Properties** window one of three ways:
   - Double-click the component.
   - Select the component and click **Edit** > **Properties**.
   - Select the component, right-click and select **Properties**.

   The **Properties** window appears.
2. Select the **Parameter Values** tab.

   The **Parameter Values** tab displays.



3. Select the **Value** radio button.
4. Select the **Value** field for the parameter you want to set equal to a local variable.
5. Type the variable name. The name may not be the same as an intrinsic variable or constant.

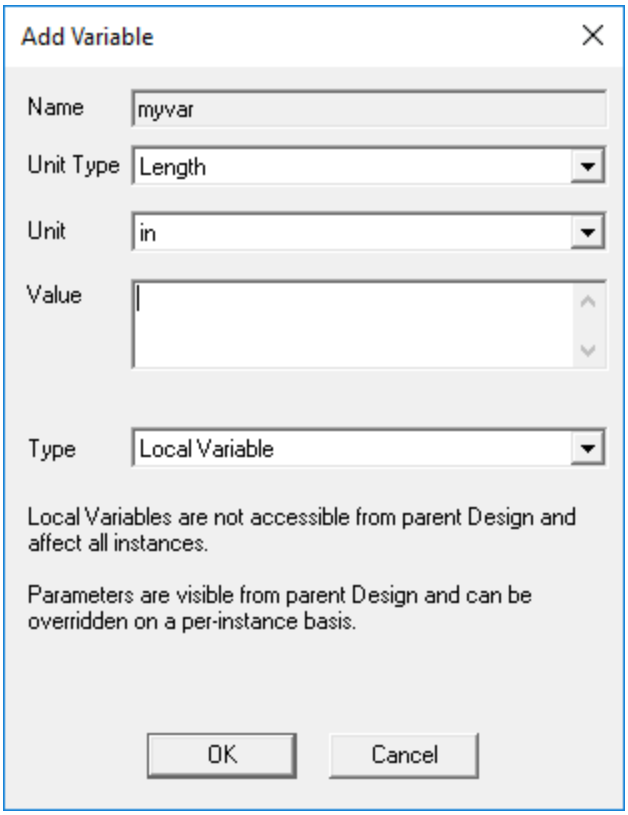
   Variable names may include alphanumeric characters and underscores (_).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Important:**
>
> If you wish to define a Project Variable, you must begin the name with a dollar sign ($).
>
> When you enter a name beginning with $, you will only be allowed to define it as a Project Variable.

6. Press **Enter**.

   The **Add Variable** window appears.



7. Select a **Unit Type** and **Unit** using the drop-down menus.
8. Enter a **Value**.

   The Value can be a number, variable, or mathematical expression. The quantity entered will be the current (or default) value for the variable. If the mathematical expression includes a reference to an existing variable, this variable is treated as a dependent variable. The units for a dependent variable will automatically change to those of the independent variable on which the value depends. Additionally, dependent variables,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

though useful in many situations, cannot be the direct subject of optimization, sensitivity analysis, tuning, or statistical analysis.

> **Warning:**
>
> If you include the variable's units in its definition in the **Value** text box, do not include the variable's units when you enter the variable name for a parameter value.

9. From the **Type** drop-down menu, select **Local Variable** or **Parameter Default**.

> **Note:**
>
> If you wish to define a Project Variable, your variable name must begin with a dollar sign ($).

10. Click **OK** to exit the **Add Variable** window.
11. Click **Apply** to save your changes.
12. Click **OK** to exit the **Properties** window.

Fixed vs. Non-Fixed Variables

By default, both Project variables and Design variables are included in the list of variables that index solution data. As a result, they are visible when selecting data to be displayed in plots.

However, if you define a variable as *fixed*, it is not swept and will not index solution data. Consequently, defining variables as fixed can speed up simulation—particularly if there are many variables to simulate.

To define a variable as fixed:

1. Open the **Properties** window for either Project or Design variables.
2. Clear the **Sweep** check box next to the variable you want to be fixed.

	Name	Value	Unit	Evaluated Value	Type	Description	Read-only	Hidden	Sweep
	wg_width	7.1	mm	7.1mm	Design		☐	☐	☑
	fillet_radius	0	mm	0mm	Design		☐	☐	☐

- If a **Sweep** check box is selected (default) the corresponding variable is NOT fixed.
- If a **Sweep** check box is cleared, the variable is fixed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

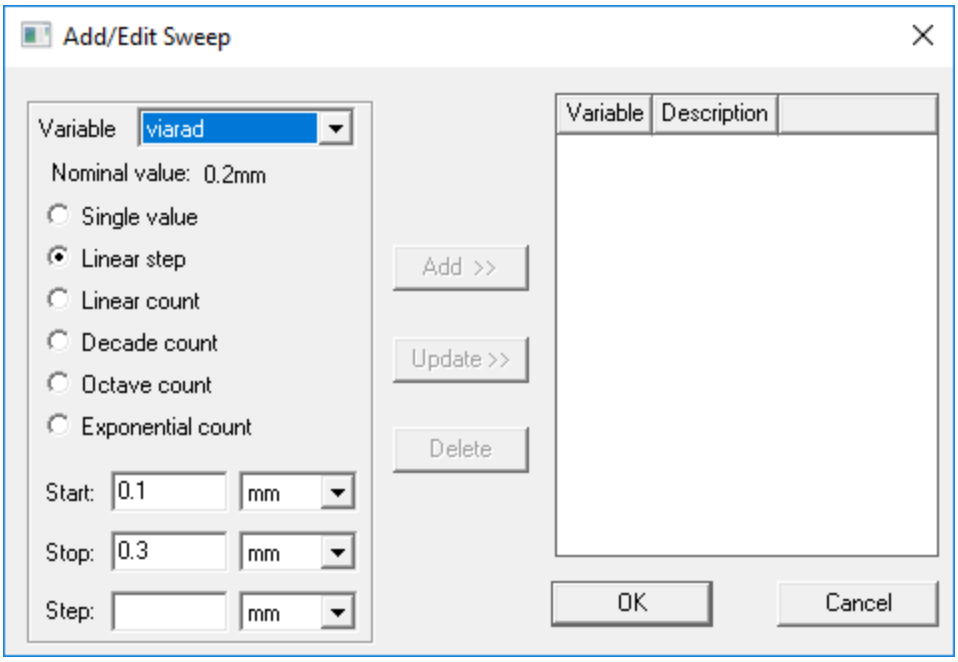
Non-Fixed Variable Sweeps

When setting up a sweep, the **Setup** window contains a list of variables being swept.

To add a non-fixed variable sweep:

1. Click **Add**.

   The **Add/Edit Sweep** window appears.



2. Use the **Variable** drop-down menu to select a non-fixed variable.
3. Select the desired settings and click **Add**.
4. Click **OK** to close the **Add/Edit Sweep** window.
5. Click **OK** to exit the **Setup**.

Orphaned Sweeps

If you create a simulation setup that contains a sweep of a variable, and then subsequently clear the variable's **Sweep** check box, the variable becomes fixed and, as a result, its sweep is "orphaned." The sweep is removed from the setup and the simulation runs as if the sweep did not exist.

- When you close the **Properties** window, a warning message is added to the **Message Window** for each orphaned sweep.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- If you edit an orphaned variable in the **Properties** window and reselect its **Sweep** box, the orphaned sweep will be restored to the setup list.
- If you double-click a setup that contains orphaned sweeps, a pop-up dialog box asks if you want to delete the orphaned sweeps. If you respond **Yes**, all orphaned sweeps are deleted when the **Properties** window is closed. Even if you reselect a **Sweep** check box, its orphaned sweep will NOT be restored. This action is undoable.
- Orphaned sweeps are not written to disk when the project is saved, so once you save a project and close it, any orphaned sweeps are permanently lost.

Choosing a Variable to Optimize

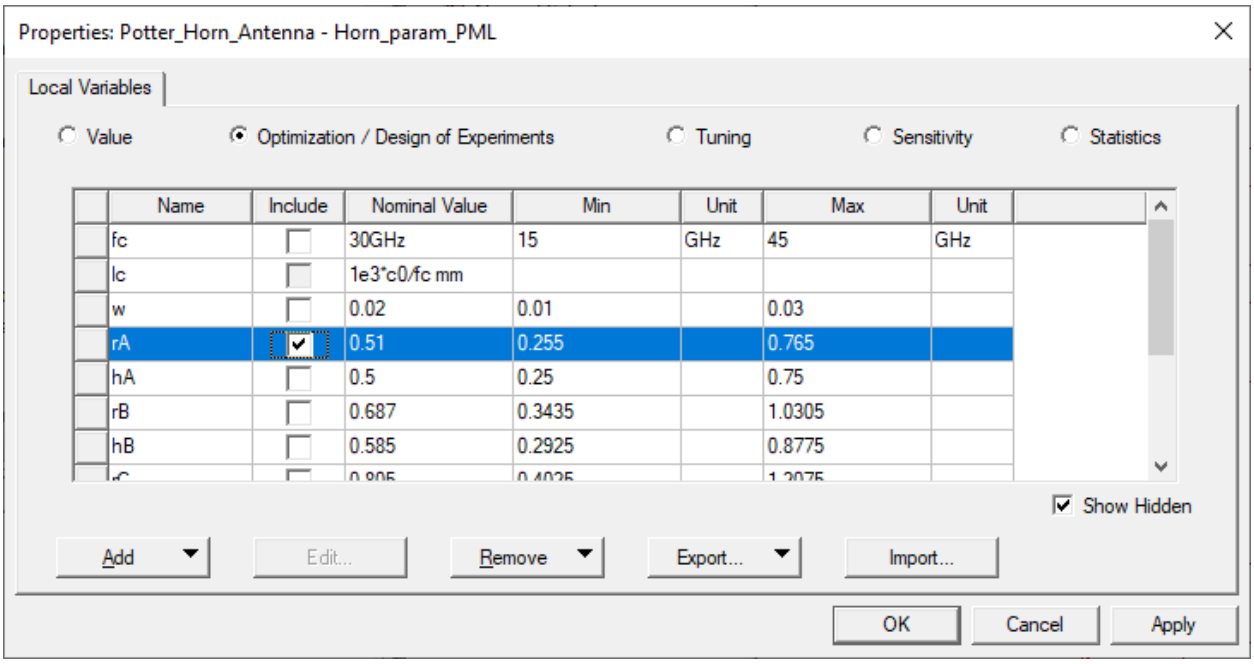
Before a variable can be optimized, you must specify that you intend for it to be used during an optimization analysis in the **Properties** window.

To specify that a variable is to be used during optimization:

1. Navigate either to the Project Variables **Properties** window (**Project** > **Project Variables**), or to the Design Variables **Properties** window (**HFSS 3D Layout** > **Design Properties**).

   The **Properties** window appears.

2. Use the tabs to navigate to the variable you want to optimize.
3. Select the **Optimization / Design of Experiments** radio button.
4. Use the **Include** check boxes to select variables for optimization.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Important:**
>
> Dependent variables cannot be optimized.
>
> Variables containing complex numbers cannot be used in an Optimetrics sweep or for optimization, statistical, sensitivity, and tuning setups.

The selected variable(s) will be available for optimization in an Optimetrics setup defined in the current design or project.

5. If desired, use the **Min** and **Max** fields to override the default minimum and maximum values that Optimetrics will use for the variable in every optimization analysis. During optimization, the optimizer will not consider variable values that lie outside of this range.

Choosing a Variable to Tune

Before a variable can be tuned, you must specify that you intend for it to be tuned in the **Properties** window.

To specify that a variable is to be tuned:

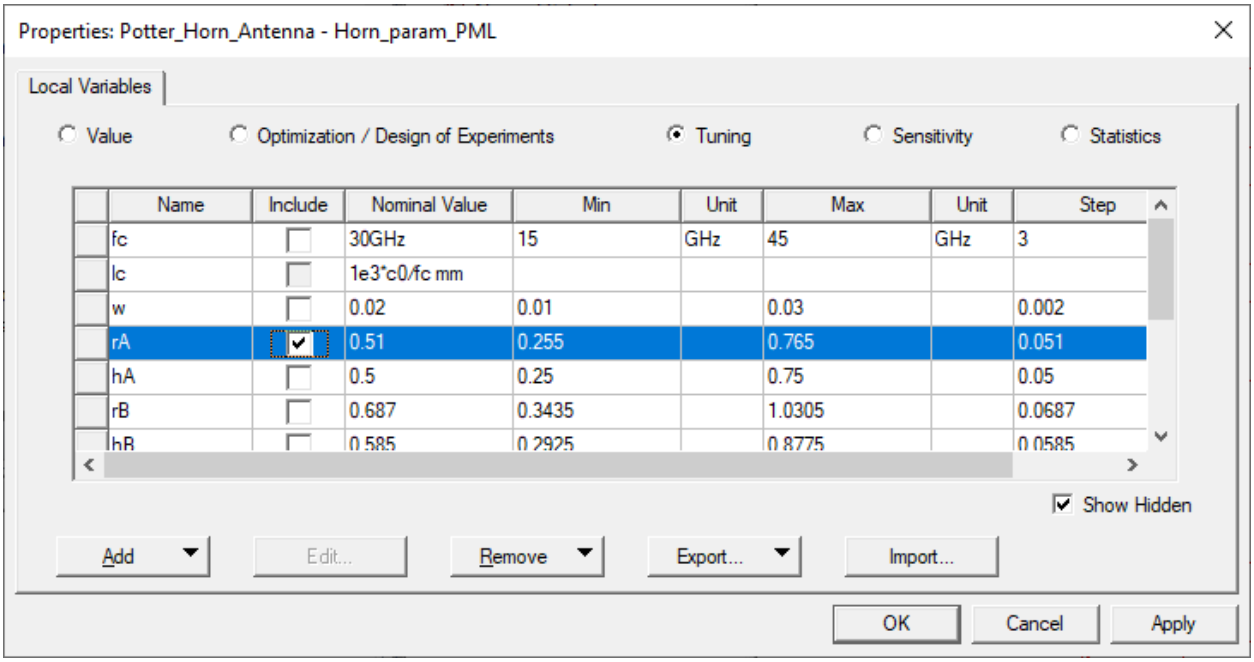
1. Navigate either to the Project Variables **Properties** window (**Project** > **Project Variables**), or to the Design Variables **Properties** window (**HFSS 3D Layout** > **Design Properties**).

   The **Properties** window appears.

2. Use the tabs to navigate to the variable you want to optimize.
3. Select the **Tuning** radio button.
4. Use the **Include** check boxes to select variables for tuning.

> **Important:**
>
> Dependent variables cannot be tuned.
>
> Variables containing complex numbers cannot be used in an Optimetrics sweep or for optimization, statistical, sensitivity, and tuning setups.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The selected variable(s) will be available for tuning.

Including a Variable in a Sensitivity Analysis

Before a variable can be included in a sensitivity analysis, you must specify that you intend for it to be used during a sensitivity analysis in the **Properties** window.

To specify that a variable is to be used during sensitivity analysis:

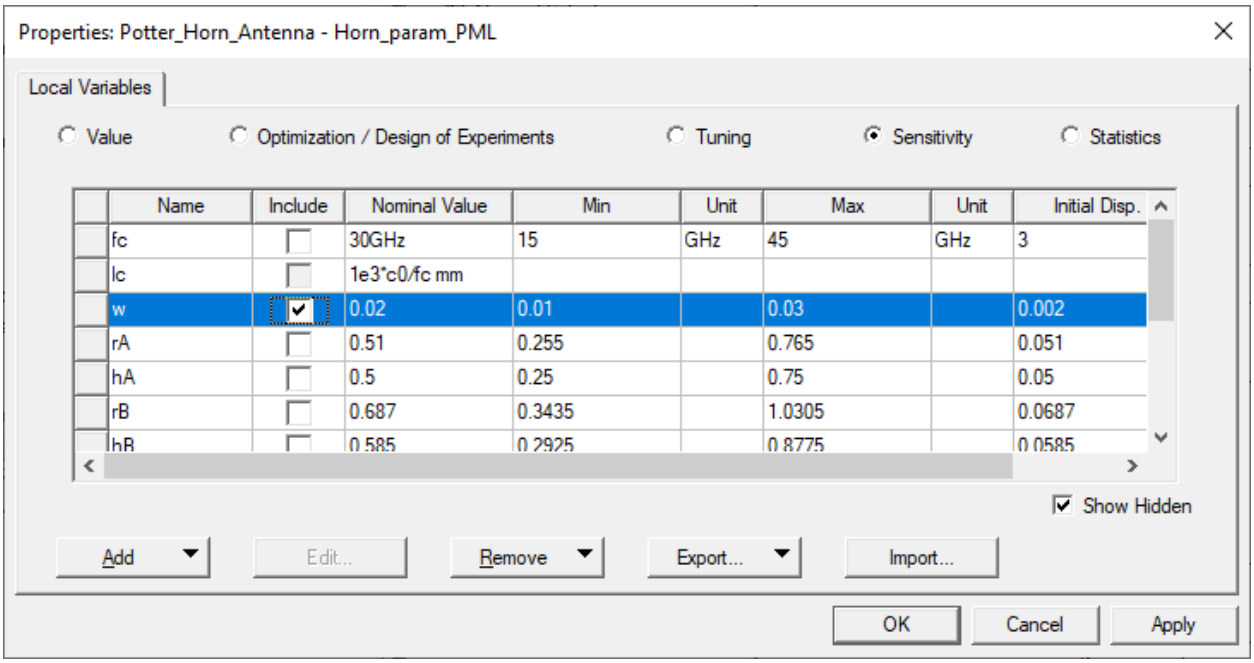
1. Navigate either to the Project Variables **Properties** window (**Project** > **Project Variables**), or to the Design Variables **Properties** window (**HFSS 3D Layout** > **Design Properties**).

   The **Properties** window appears.

2. Use the tabs to navigate to the variable you want to use.
3. Select the **Sensitivity** radio button.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Use the **Include** check boxes to select variables for sensitivity analysis.



> **Important:**
>
> Dependent variables cannot be included in a sensitivity analysis.
>
> Variables containing complex numbers cannot be used in an Optimetrics sweep or for optimization, statistical, sensitivity, and tuning setups.

The selected variable(s) will be available for sensitivity analysis in the current design or project.

5. If desired, use the **Min** and **Max** fields to override the default minimum and maximum values that Optimetrics will use for the variable in every sensitivity analysis. During analysis, the optimizer will not consider variable values that lie outside of this range.
6. If desired, use the **Initial Disp.** field to override the default initial displacement value that Optimetrics will use for the variable in every sensitivity analysis. During analysis, Optimetrics will not consider a variable value for the first design variation that is greater than this step size away from the starting variable value.

Including a Variable in a Statistical Analysis

Before a variable can be included in a statistical analysis, you must specify that you intend for it to be used during a statistical analysis in the **Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To specify that a variable is to be used during statistical analysis:

1. Navigate either to the Project Variables **Properties** window (**Project** > **Project Variables**), or to the Design Variables **Properties** window (**HFSS 3D Layout** > **Design Properties**).

   The **Properties** window appears.

2. Use the tabs to navigate to the variable you want to use.
3. Select the **Statistics** radio button.
4. Use the **Include** check boxes to select variables for statistical analysis.

> **Important:**
>
> Dependent variables cannot be included in a statistical analysis.
>
> Variables containing complex numbers cannot be used in an Optimetrics sweep or for optimization, statistical, sensitivity, and tuning setups.

   The selected variable(s) will be available for statistical analysis in the current design or project.

5. If desired, click the **Distribution Criteria** button to override the distribution criteria that Optimetrics will use for the variable in every statistical analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Copying and Pasting a Variables List

From either the Project or Design variables window, you can copy a list of variables and their values to the clipboard. You can then paste them in a plain text, tab-separated format. This is useful for creating documentation.

To copy and paste the variables list:

1. Navigate to the Project Variables or Design Variables **Properties** window.
2. Right-click and select **Copy to Clipboard**.
3. Open a text editor and **paste**.

The pasted variables appear in a tab separated column format. Fields that do not contain values are left blank.

Name	Value	Unit	"Evaluated Value	"Description	Read-only	Hidden
$width	14.8570192	mm	14.8570192mm		false	false
$length	7.824547736	mm	7.824547736mm		false	false
$height	0.45*$width		6.68565864mm		false	false

Working with Datasets

Datasets are collections of plotted data points that can be extrapolated into an equation based on the piecewise linear makeup of the plot. Each plot consists of straight line segments whose vertices represent their end points. A curve is fitted to the segments of the plot and an expression is derived from the curve that best fits the segmented plot. The created expression is then used in piecewise linear Intrinsic Functions. You can add datasets at either the project level or the design level. They can be for various purposes, including to define frequency-dependent port impedances or frequency-dependent global variables.

Project-level datasets are typically used for defining material properties at the project level (applicable to all designs in the project).

Design-level datasets can be used in geometry entities like part commands, coordinate systems, points, and planes. Design-level datasets do not work with equation-based surfaces or curves. Design-level datasets can be used directly with piecewise linear functions in expressions or indirectly through variables that can refer to the dataset.

Design-level datasets can also be used in the following operations:

- **Creating or editing geometry** – when a geometry uses a dataset directly, edit dataset invalidates the solution. When a geometry uses a variable that is defined by dataset, editing the dataset does not invalidate the solution.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Creating an Animation** – based on a variable which can index in datasets.
- **Copying and Pasting Geometry** – if a part refers to a design dataset, it will be pasted to destination design.

The **Datasets** dialog box provides a browsable listing of all datasets currently defined for the project or design. A preview window displays a plot of the currently selected dataset. Controls allow you to **Add**, **Edit**, **Remove**, and **Clone** datasets; to **Import** and **Export** characteristic data; and to launch the **SheetScan** tool to extract data from graphics such as data sheets.

To access the **Datasets** window:

- For project-level datasets, including 3D datasets, click **Project** > **Datasets**.
- For design-level datasets, click **HFSS 3D Layout** > **Design Datasets**.

Adding Datasets

The following procedure describes how to add a dataset manually.

You can also add datasets:

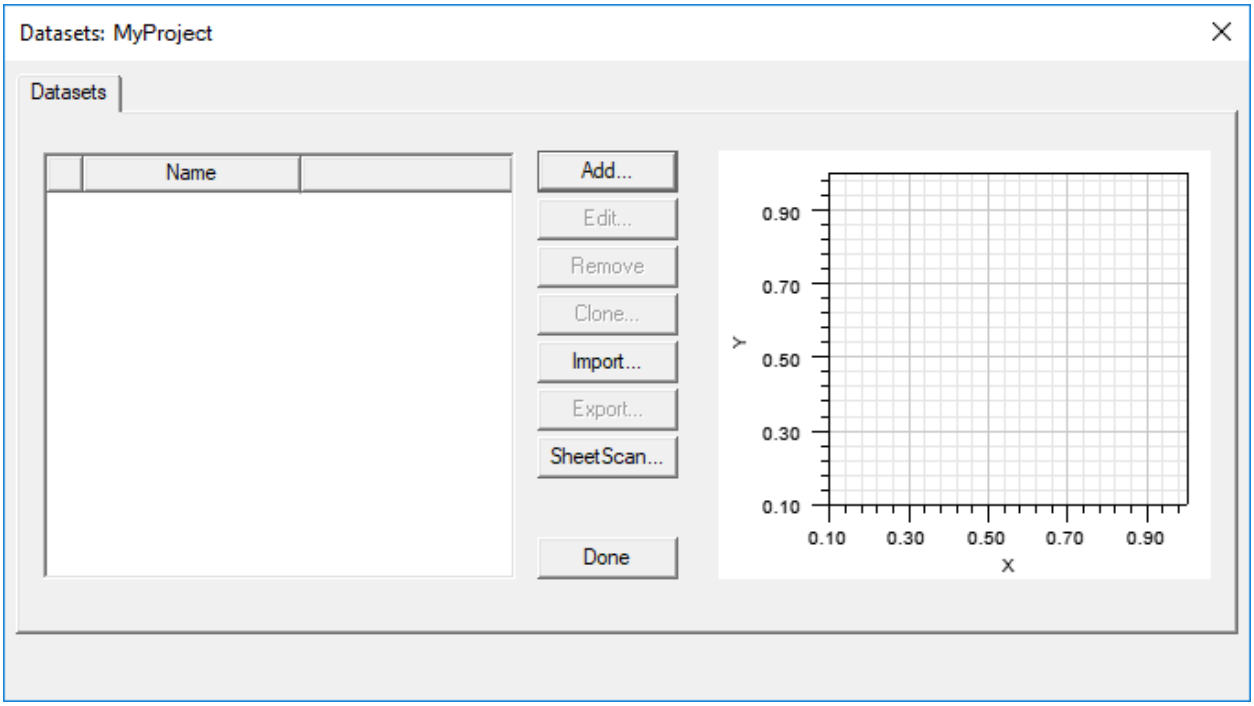
- By importing data from an external tab delimited file using the **Import...** button.
- Using the Sheetscan tool.

To add a dataset manually:

1. Access the **Datasets** window:
   - For project-level datasets, click **Project** > **Datasets** from the menu bar, or click **Datasets** on the **Desktop** ribbon tab.
   - For design-level datasets, click **HFSS 3D Layout** > **Design Datasets** from the menu bar.

   The **Datasets** window appears, listing any project or design-level datasets.

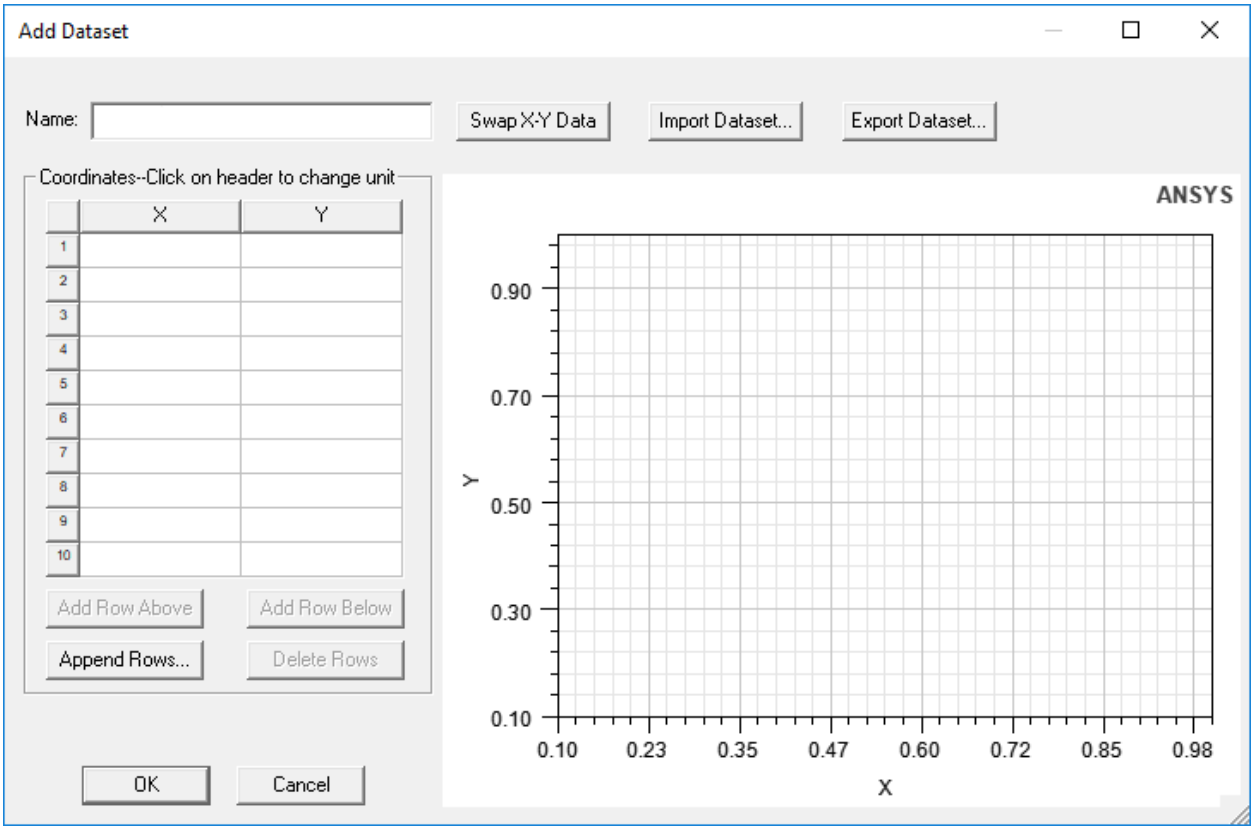
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Click **Add**.

   The **Add Dataset** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The left side of the **Add Dataset** window contains fields for the dataset name and a table for X- and Y- coordinates. The right side contains a graphic display that draws a line for the coordinates you add. It also includes buttons for the following functions:

- **Swap X-Y Data** – this swaps the X- and Y- coordinates and adjusts the graphical display.
- **Import Dataset** – this provides a way to import data sets from an external source. The format is a tab-separated points file. Clicking the button opens a file browser window.
- **Export Dataset** – this provides a way to export the current dataset to a tab separated points file. Clicking the button opens a file browser window.
- **Add Row Above** – adds a new row to the table above the selected row.
- **Add Row Below** – adds a new row to the table below the selected row.
- **Append Row** – opens a dialog box that lets you specify a number of rows to add to the table.
- **Delete Row** – deletes the selected row or rows.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

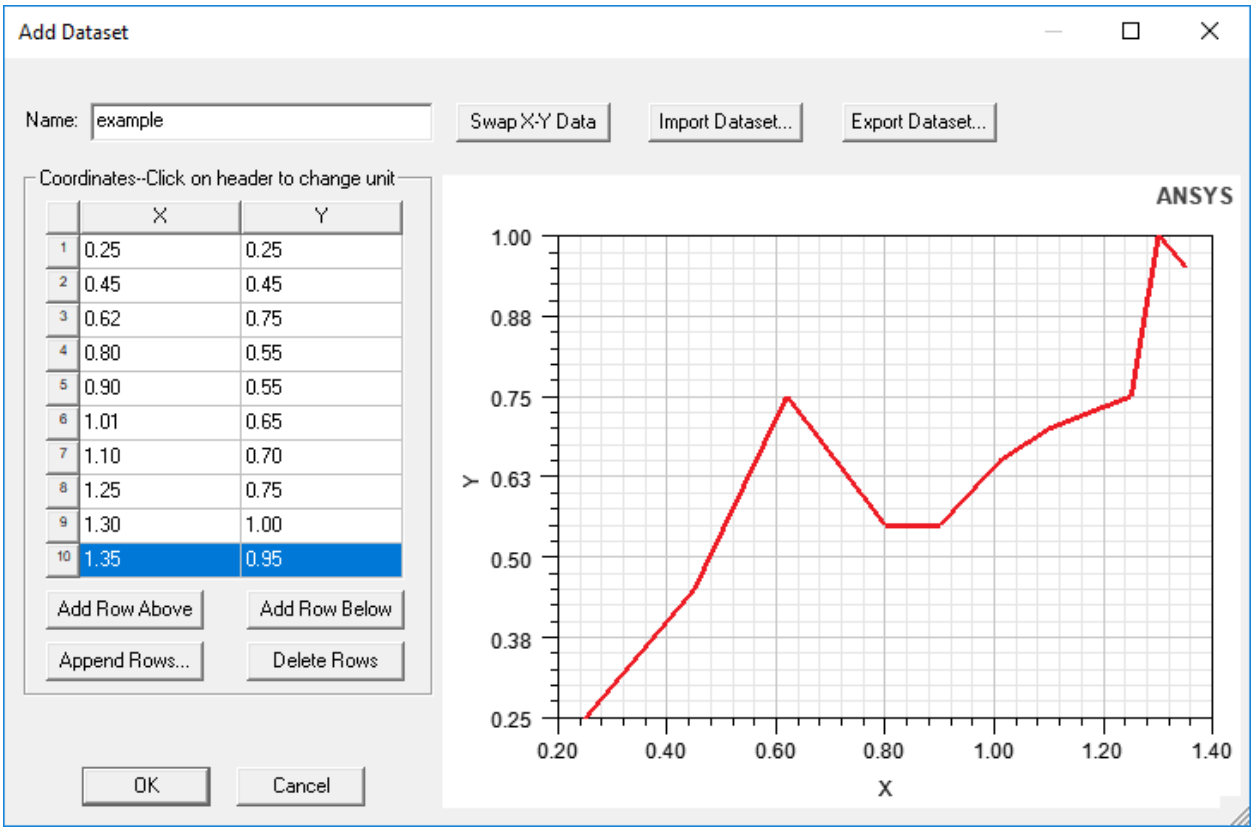
3. Enter a **Name** for the dataset.

> **Note:**
>
> Project-level datasets must begin with a dollar sign character ($). If you do not type one, it will be added for you.

4. Enter X/Y coordinates, either by manually typing or by clicking **Import Dataset**.

   If desired, click the **X** and **Y** column headers to change the unit.

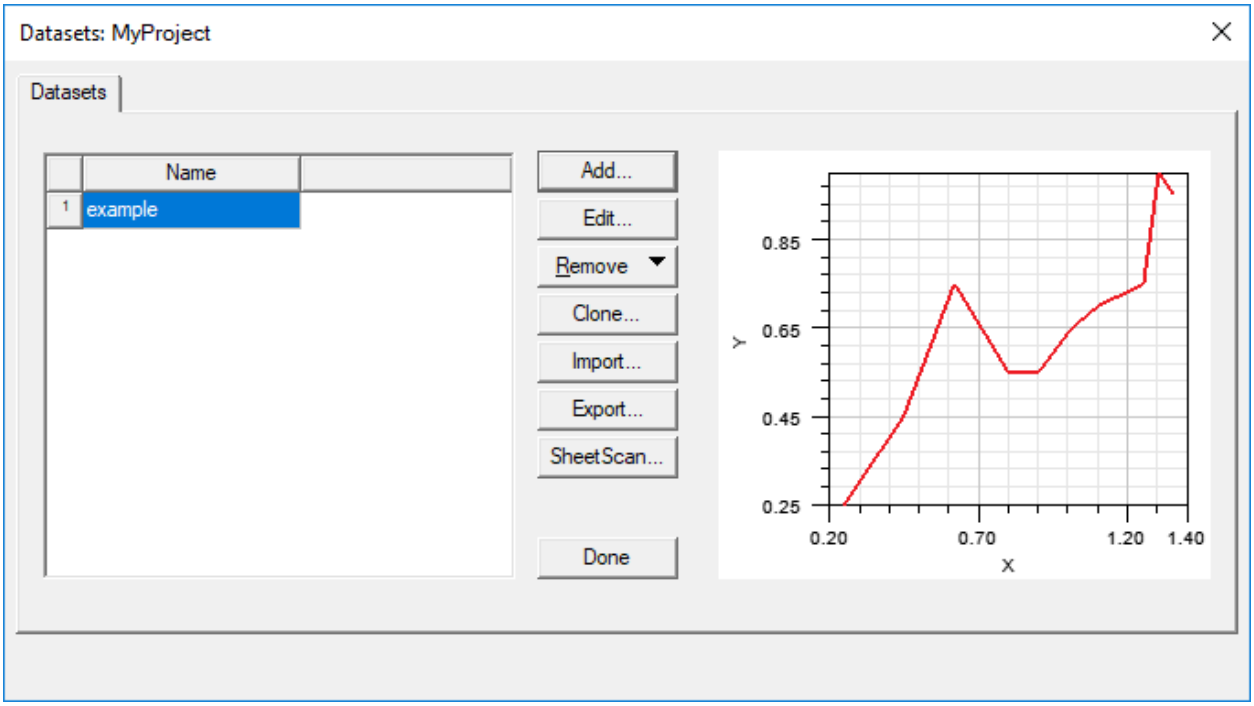
   The display updates to show your coordinates.



5. When you are finished, click **OK** to exit the **Add Datasets** window.

   The new dataset appears in the **Datasets** list.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The dataset plot is extrapolated into an expression that can be used in parametric analyses, boundary definitions, or assigned to a material property value.

You can now edit, remove, clone, or export the dataset. You can also change the plot display properties.

6. Click **Done** to exit the **Datasets** window.

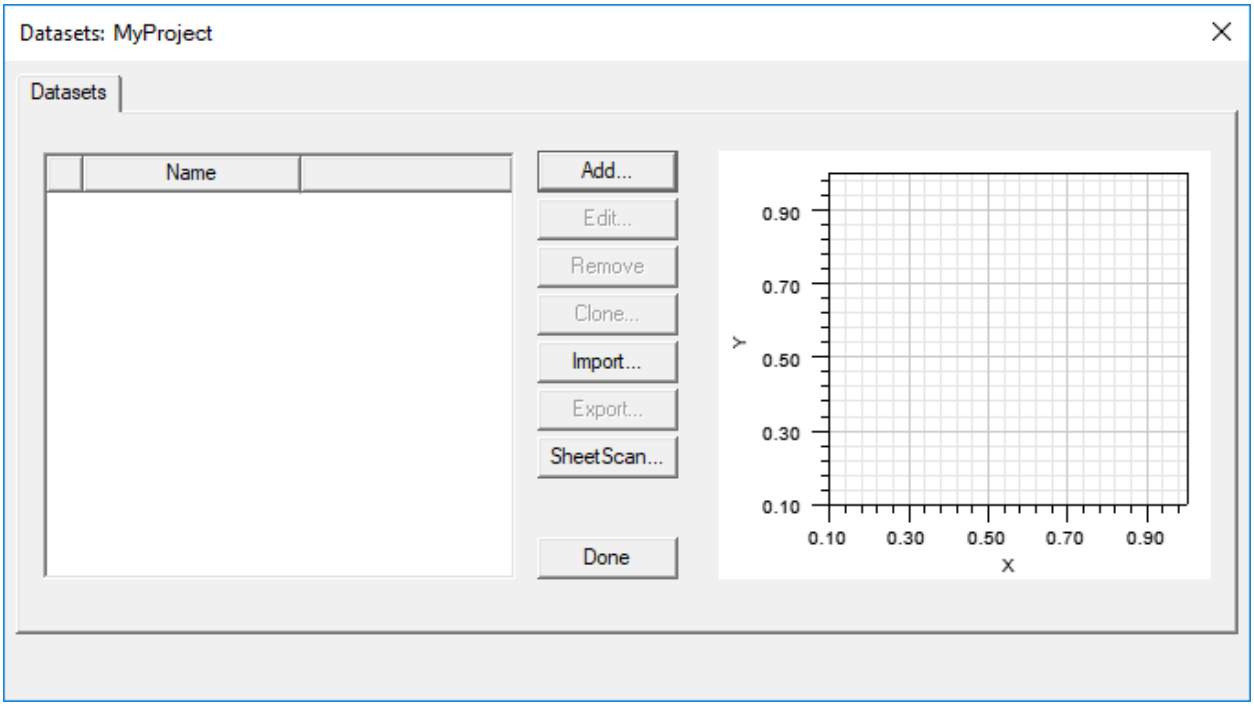
Importing Datasets

To import a dataset from a file:

1. Access the **Datasets** window:
   - For project-level datasets, click **Project** > **Datasets**.
   - For design-level datasets, click **HFSS 3D Layout** > **Design Datasets**.

   The **Datasets** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Click **Import**.
3. In the file browser that appears, use the drop-down menu to select the file format of the file you wish to import.

> **Note:**
>
> The table below lists the file types supported for *Project level datasets*. For *Design level datasets*, only **.tab** files are supported.

.mdx, .mda	Twin Builder Characteristic format
.xls, .xlsx	Microsoft Excel
.txt	text file
.csv	Comma-separated value
.out	Maxwell SPICE (read-only - reads data inside the KW_ DATA section)
.cfg	Comtrade (IEEE Std C37-111-1999)
.dat	TEK Oscilloscope
.tab	tab delimited data files

   a. If you select an **.mdx**, **.mda**, **.out**, **.cfg**, or **.tab** file, the data is imported immediately into **Datasets** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. If you select an **.xls** or **.xlsx** file containing multiple sheets, a **Table Properties** dialog box appears, where you can choose the desired sheet from a drop-down menu. Otherwise, selecting an .xls or .xlsx file imports the data immediately.

> **Note:**
>
> Microsoft Excel is required to import .xls or .xlsx files.
>
> Only the first two columns of data are imported, the left-most column containing the X-coordinate values. The x-coordinate values for successive data points must increase within ten significant digits. Non-numeric entries are assigned a value of zero.
>
> The first row of data is assumed to contain column headings and is ignored.

c. Selecting a .**txt** or .**csv** file opens an **Import** dialog box where you can specify settings for reading the data in the file for import. You can choose the separator(s) and decimal symbol, as well as the line at which to begin the import. The dialog box shows both the original text and the text as it would appear when imported based on the current import settings.

4. When satisfied with the import settings, click **OK** to import the data.

   Imported datasets take the name of the imported file. If a dataset of the same name already exists, a number will be appended to the end of the new dataset (for example, a duplicate 'dataset' becomes 'dataset1').

   Once the data has been imported, you can edit, remove, clone, or export the dataset. You can also change plot display properties.

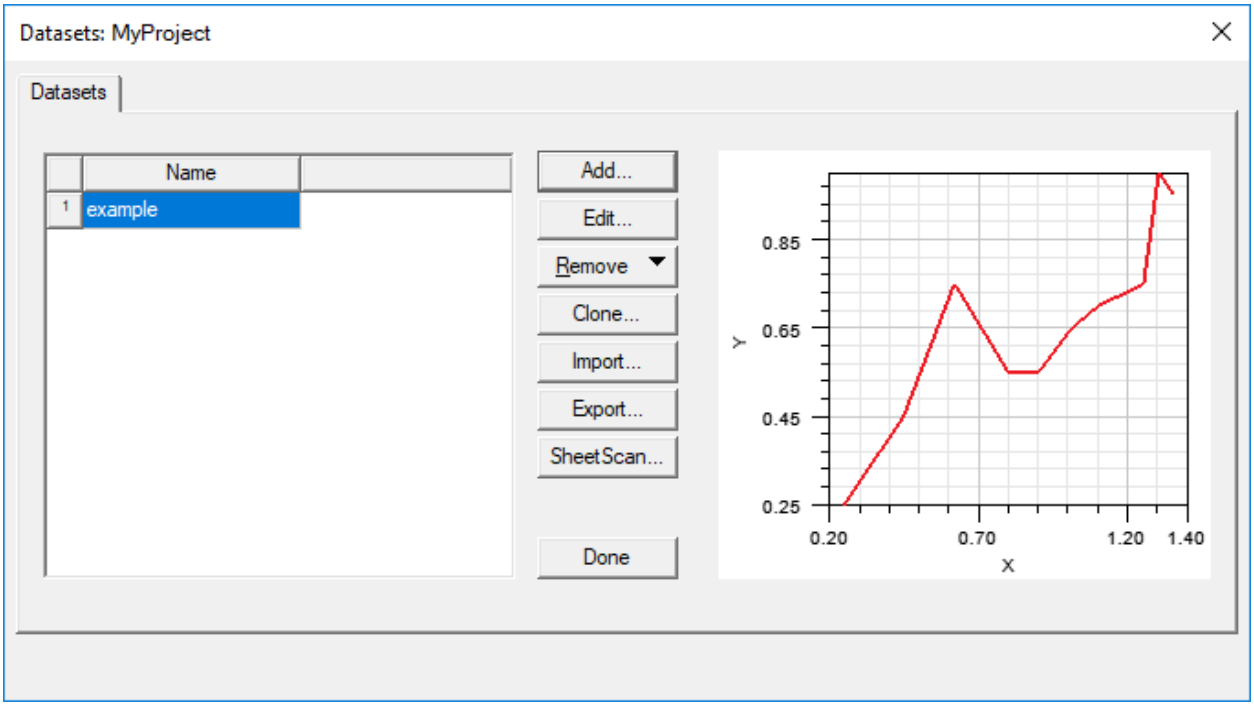
Editing Datasets

To modify an existing dataset:

1. Access the **Datasets** window:
   - For project-level datasets, click **Project** > **Datasets**.
   - For design-level datasets, click **HFSS 3D Layout** > **Design Datasets**.

   The **Datasets** window appears, listing any project or design-level datasets.

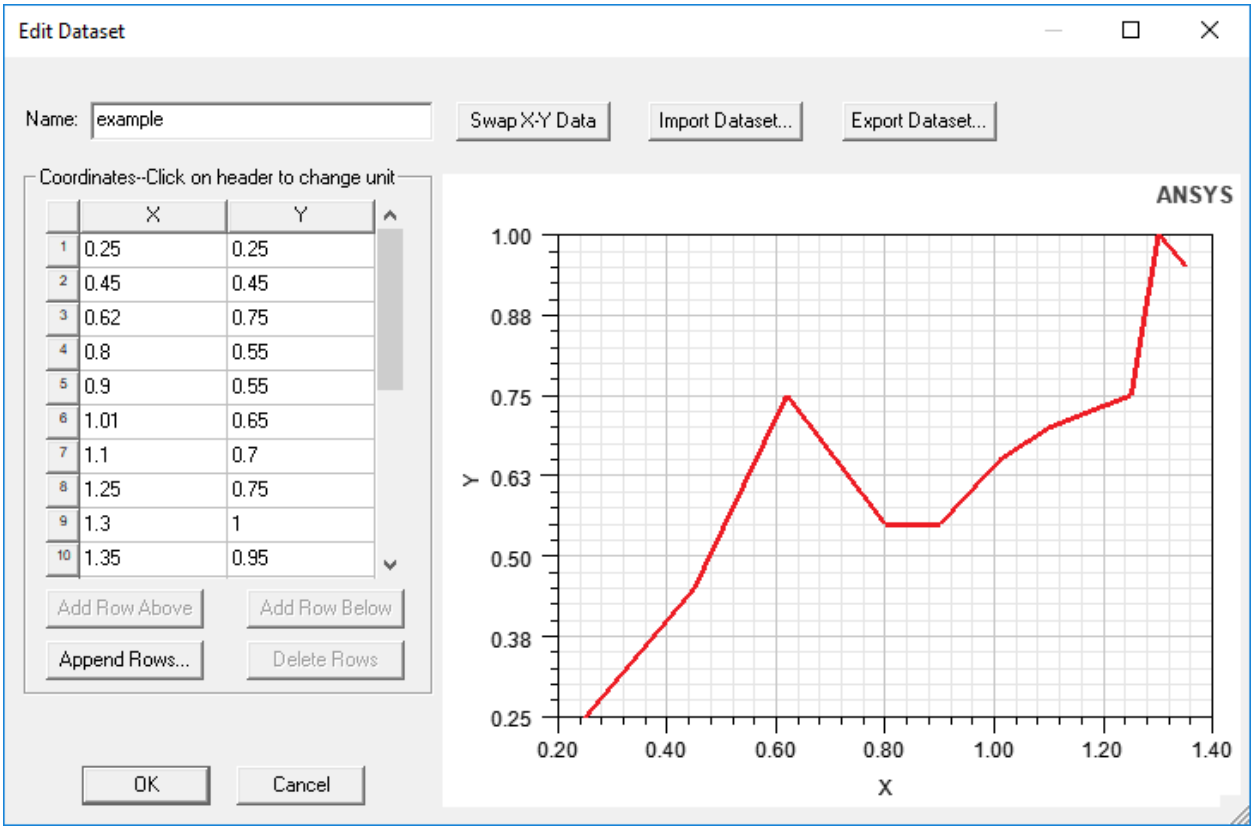
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Click **Edit**.

   The **Edit Dataset** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Change the **Name** and **X/Y** coordinates as desired.
4. When you are finished, click **OK** to exit the **Edit Dataset** window.
5. Click **Done** to exit the **Datasets** window.

Cloning Datasets

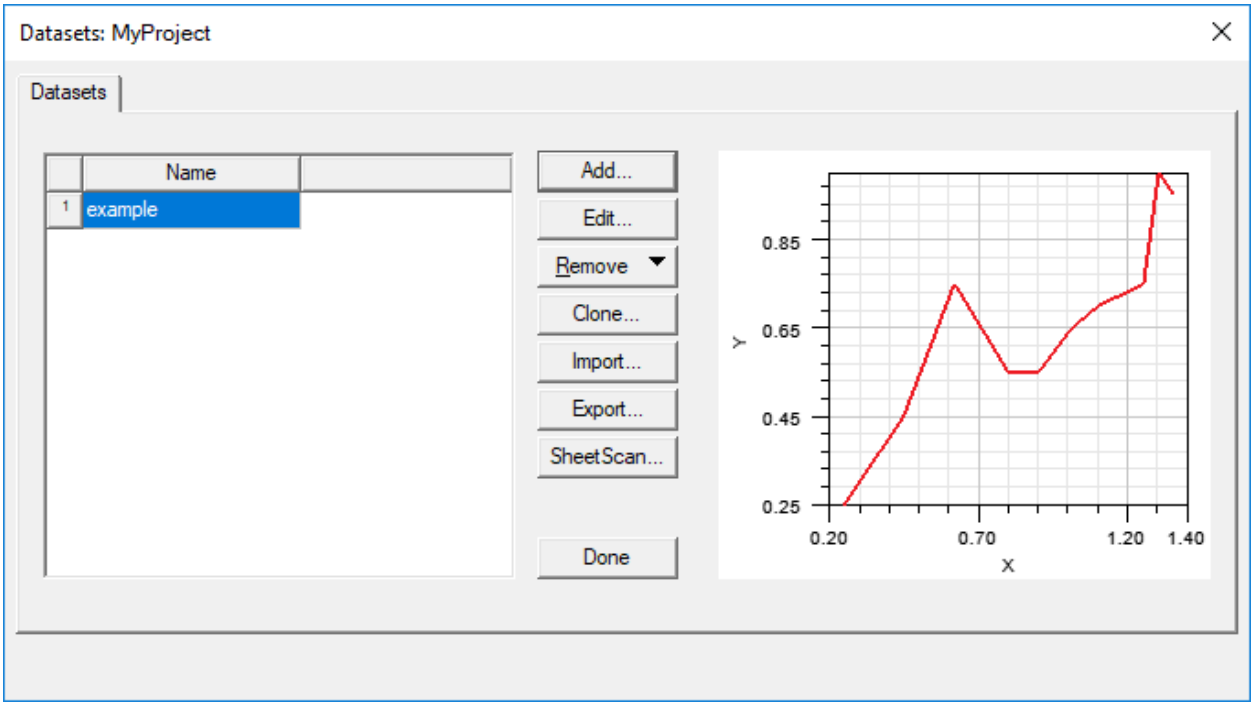
Cloning a dataset creates an identical copy of an existing dataset. The clone can then be modified as necessary.

To clone a dataset:

1. Access the **Datasets** window:
   - For project-level datasets, click **Project** > **Datasets**.
   - For design-level datasets, click **HFSS 3D Layout** > **Design Datasets**.

   The **Datasets** window appears, listing any project or design-level datasets.

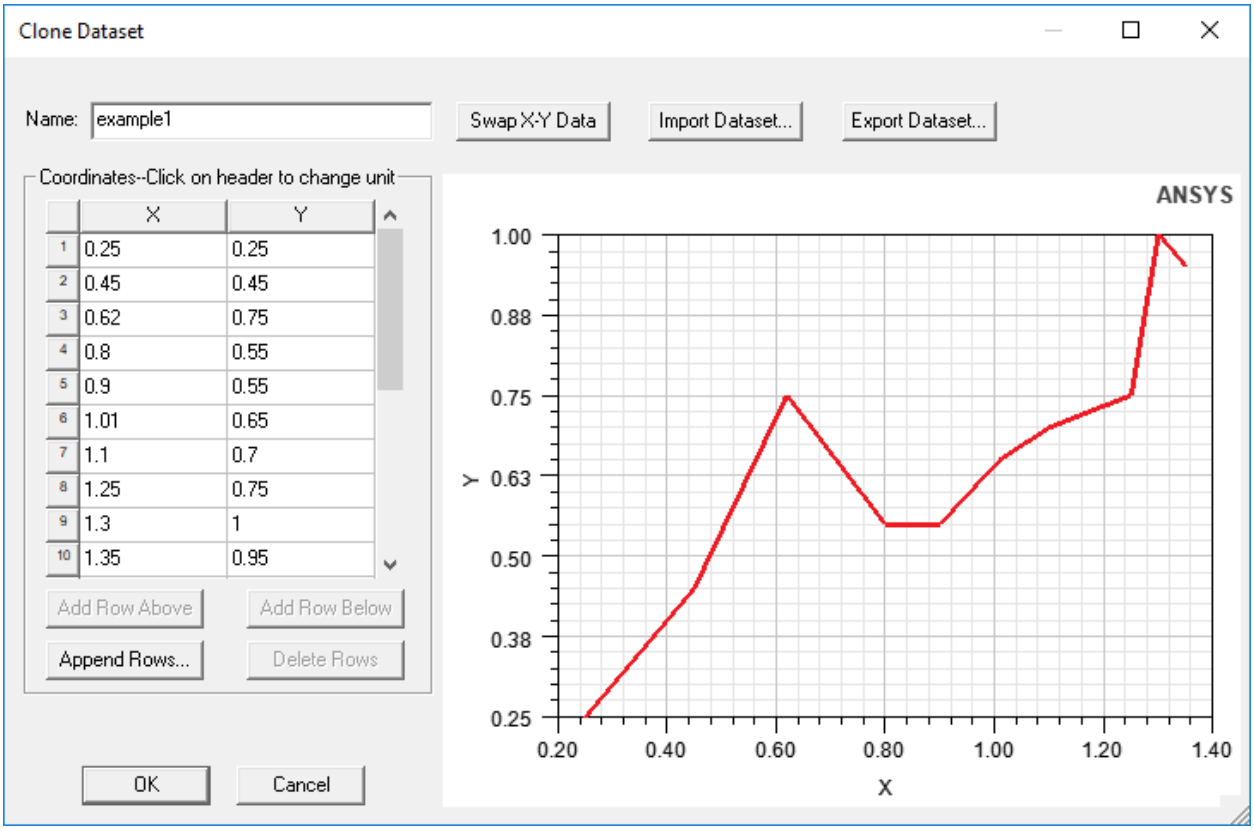
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Click **Clone**.

   The **Clone Dataset** window appears. The default name is the original dataset name with a number appended to the end.

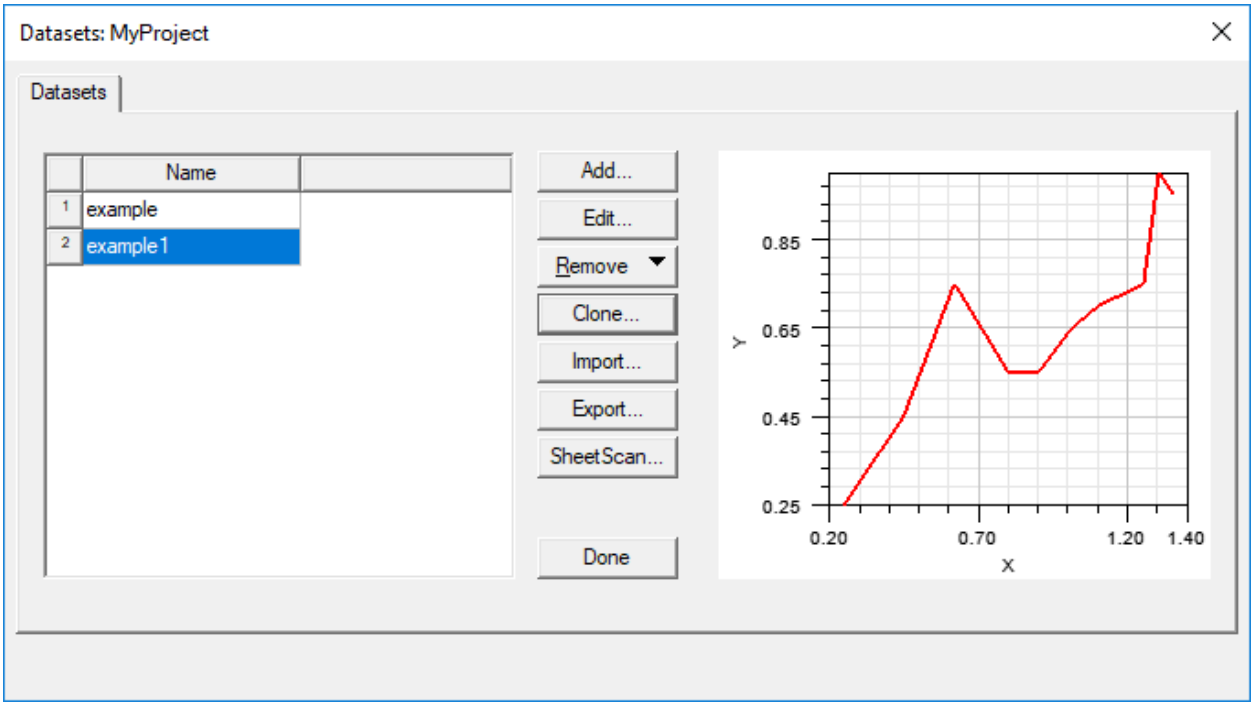
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Change the **Name** and **X/Y** coordinates as desired.
4. When you are finished, click **OK** to exit the **Clone Dataset** window.

   The cloned dataset appears in the list.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. Click **Done** to exit the **Datasets** window.

Exporting Datasets

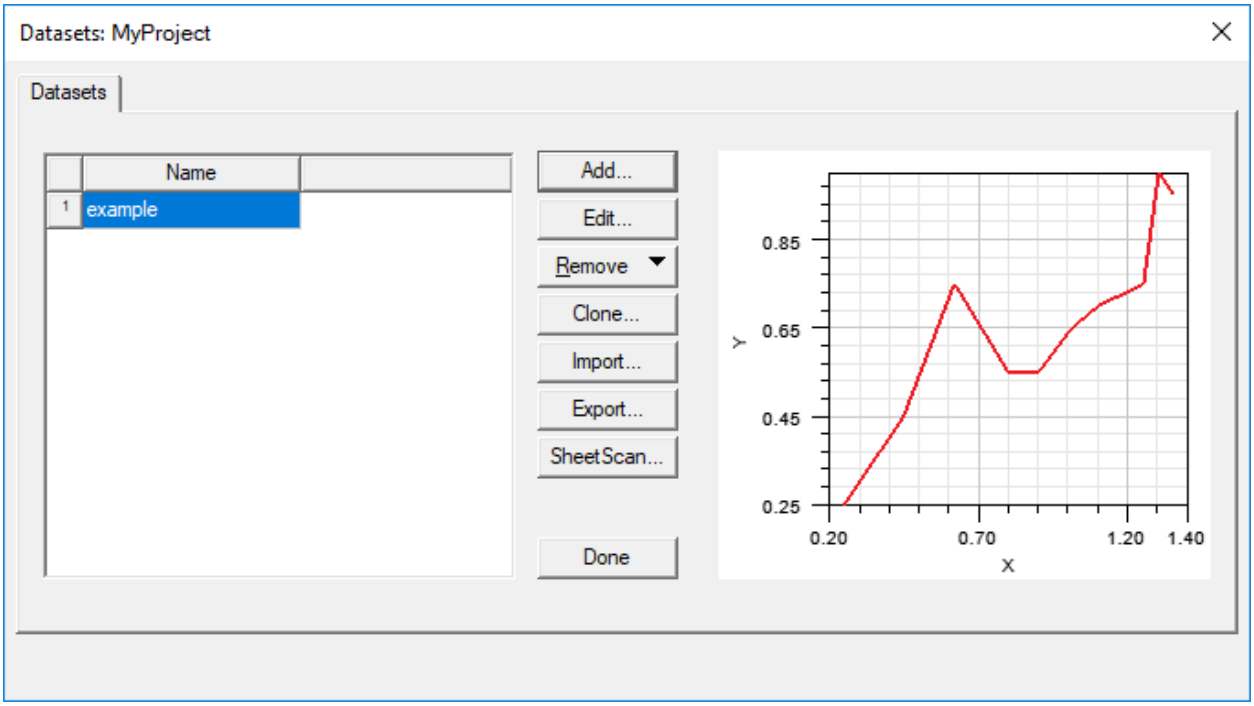
You can export datasets in **.tab** format.

To export a dataset:

1. Access the **Datasets** window:
   - For project-level datasets, click **Project** > **Datasets**.
   - For design-level datasets, click **HFSS 3D Layout** > **Design Datasets**.

   The **Datasets** window appears, listing any existing datasets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Select a dataset and click **Export**.
3. Browse to the location where you would like to save the *.tab file.
4. Enter a name for the file.
5. Click **Save**.

   The dataset file is saved to the specified location for later import.

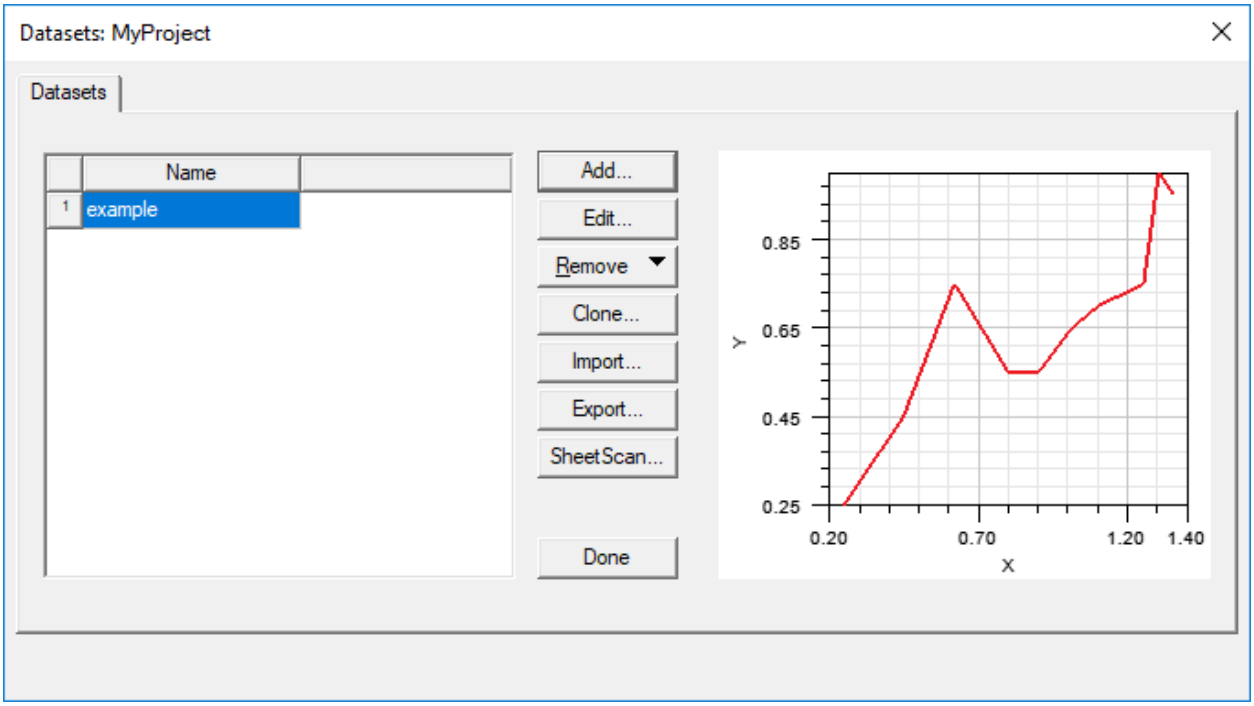
Removing Datasets

To remove a previously added dataset:

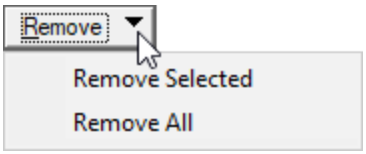
1. Access the **Datasets** window:
   - For project-level datasets, click **Project** > **Datasets**.
   - For design-level datasets, click **HFSS 3D Layout** > **Design Datasets**.

   The **Datasets** window appears, listing any existing datasets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Select a dataset and click **Remove**.
3. Select either **Remove Selected** to remove the selected dataset or **Remove All** to remove all project or design-level datasets.



The selected dataset(s) are deleted from the list.

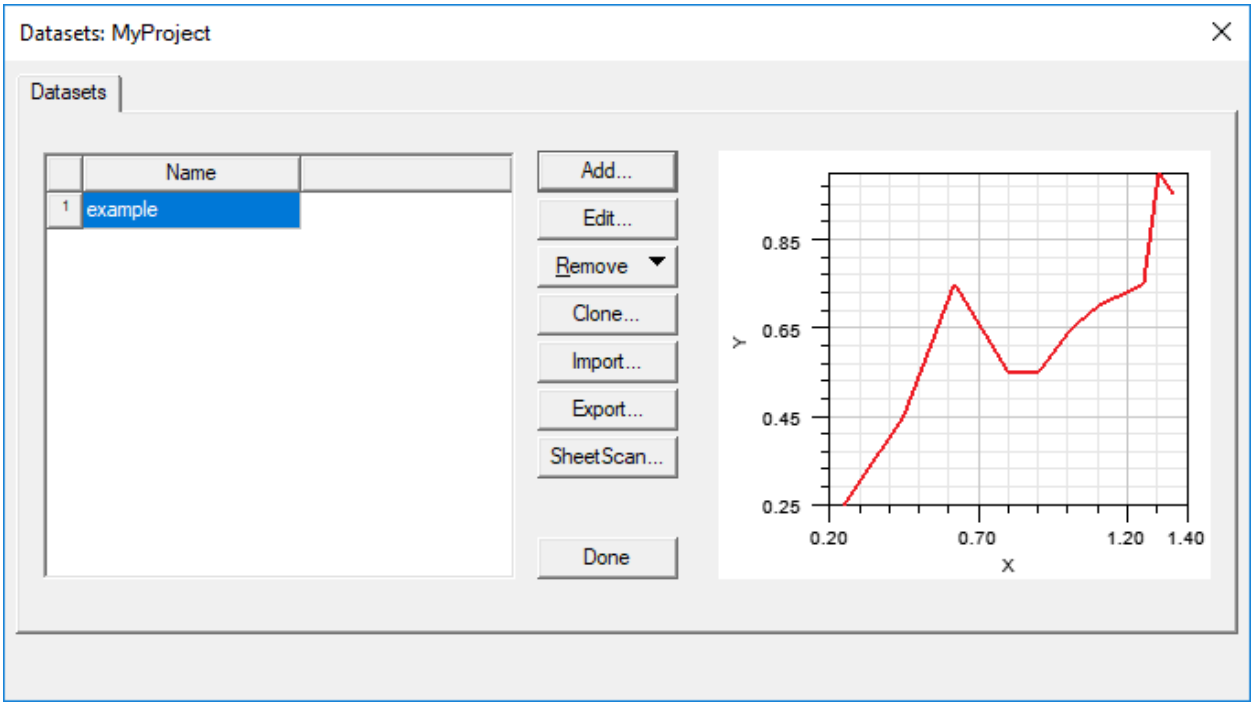
> **Note:**
>
> The **Remove All** option does not work across dataset types. That is, selecting **Remove All** from the **Project Datasets** window does not remove design-level datasets, and vice versa.

4. Click **Done** to exit the **Datasets** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Changing Dataset Plot Properties

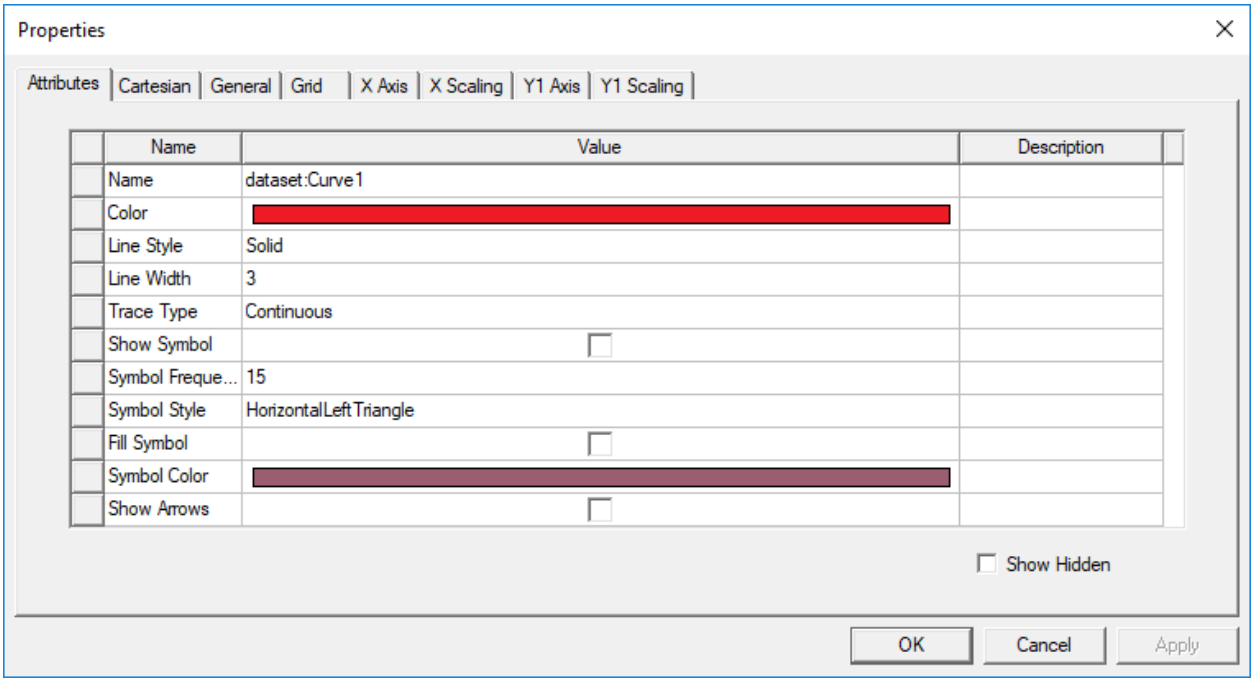
From the **Datasets** window, you can change the appearance of a dataset's plot.



To change a plot's appearance:

1. Double-click a plot element (for example, a line, axis, or title) to open that element's **Properties** window.

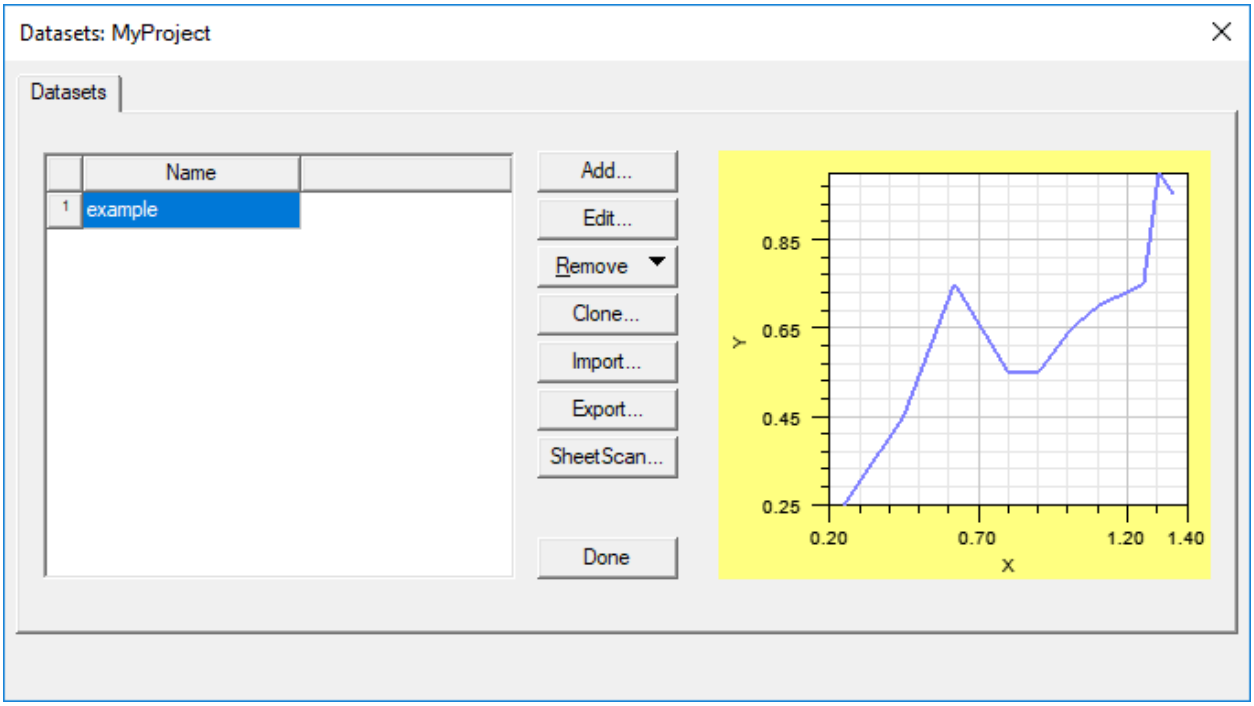
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Set the colors, fonts, and styles as applicable and as desired.
3. Click **Apply**.
4. Click **OK** to exit the **Properties** window.

   The plot now displays as specified.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Using SheetScan

SheetScan allows you to extract characteristics data from graphics such as data sheets which have been scanned and saved in any of the following formats: .bmp, .dib, .jpg, .gif, .tif, .tga, .pcx, .htm, or .html.

Access SheetScan from the **Datasets** window:

- For project-level datasets, click **Project** > **Datasets**.
- For design-level datasets, click **HFSS 3D Layout** > **Design Datasets**.

In addition to importing graphic files directly, SheetScan also can be used to browse the Internet for datasheet information and transfer a snapshot of the web page to the SheetScan editor where you can map axes on the image as an overlay. You can then manually add datapoints to approximate the characteristic curve(s) on the datasheet.The sampled data can then be converted to Ansys Electronics Desktop format, and the extracted data exported to an Ansys Electronics Desktop dataset or saved to a tab-delimited file.

The process for creating a dataset using SheetScan involves four basic operations:

- Loading a datasheet into SheetScan.
- Defining a coordinate system for the imported datasheet picture.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Defining a characteristic curve using the datasheet picture as reference.
- Exporting the characteristic curve data to a file or to a dataset.

SheetScan Menus and Settings

In the SheetScan window, various menus and toolbars allow you to access SheetScan functionality.

The top menu bar contains the following submenus:

- **File** – allows you to open, close, save, and print files.
- **Edit** – provides access to cut, copy, and paste functions.
- **View** – allows you to select which toolbars appear in the SheetScan window (see below).
- **Options** – provides access to document settings.
- **Picture** – provides options for loading a picture or HTML file into SheetScan, and for deleting a picture.

> **Note:**
>
> The **Delete** action cannot be undone. If you delete a picture from the SheetScan editor, you must reload it from the source file or Internet web page.

- **Coordinate System** – provides options for creating and editing a coordinate system.
- **Curve** – provides options that allow you to define a curve.
- **Window** – provides options for rearranging the currently open SheetScan windows (for example, overlapping and tiling).
- **Help** – accesses the Electronics Desktop online help.

SheetScan View Options

You can toggle the following toolbars via **View** > **Toolbar**:

- **Standard** – provides access to basic functions such as file Open and Save, Cut, Copy, Paste, Print, and Help.

- **Curve** – contains a drop-down menu allowing you to select a curve and tools for working with curve values.

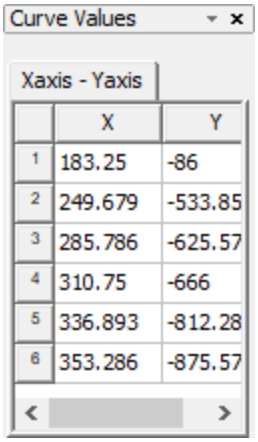
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Zoom** – provides tools for scaling the current view.

From the **View** menu, you can also toggle the following:

- **Status Bar** – displays, at the bottom of the screen, the current cursor coordinates.

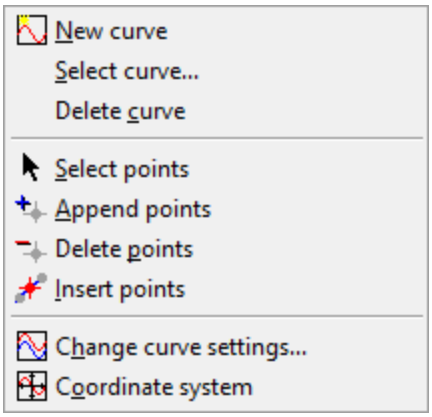
- **Curve Values** – dockable window that displays the data points used while creating a characteristic curve. Data for each curve on a sheet is displayed on its own tab. You can manually change the X and Y values in the table to fine-tune the characteristic curve.



- **Grid** – displays the coordinate grid you created over the sheet.

SheetScan Right-click Menu

Once you have loaded a sheet, you can right-click in the SheetScan window to access curve and coordinate system options:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SheetScan Settings

Default settings can be changed from **Options** > **Settings**.

The **Settings** dialog box contains three tabs:

- **Document** – allows you to set the width and height of the sheet created when a picture is imported. You can either enter the dimensions manually, or allow SheetScan to adapt the dimensions to the picture being loaded.
- **Axis** – allows you to set the name, units, scaling, and offset for the X and Y axis. You can also select **Monotonicity in X** to prevent adding consecutive data points whose X-values are not increasing.
- **Representation** – allows you to choose whether to connect points on the characteristic curve and to choose the connecting line color. You can also decide whether to display markers and choose marker colors.

> **Note:**
>
> You can also override the default settings on the **Axis** and **Representation** tabs for individual curves (See: Defining a Characteristic Curve in SheetScan).

Loading a Datasheet Picture into SheetScan

By default, SheetScan opens a new, blank datasheet editing window.

There are two ways to load a datasheet picture into the editor: directly, or by using the HTML Viewer.

Loading a Datasheet Picture Directly

1. Browse directly to the datasheet picture file by choosing **Picture** > **Load Picture** to open a file browser window.
2. When you have located the desired file, click **OK** to load the image into the SheetScan editor. Supported file types include: .bmp, .dib, .jpg, .gif, .tif, .tga, .pcx, .htm, and .html.

Loading a Datasheet Picture Using the HTML Viewer

1. Choose **Picture** > **Internet** to open the HTML Viewer.
2. Browse the Internet for the desired datasheet.
3. Resize the HTML Viewer window and adjust its scrollbars until the desired portion of the datasheet is in view.
4. Click the **To SheetScan** button ( ) to copy the visible contents into the SheetScan editor window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> To hide the datasheet picture, select **View** > **Picture**.

After loading a datasheet picture into the SheetScan editor, the next step is defining a coordinate system for the imported picture.

Defining a SheetScan Coordinate System

You can define a coordinate system for a graph on a datasheet picture that you have previously loaded into the SheetScan editor.

To define the coordinate system:

1. Select **Coordinate System** > **New** to open the **Coordinate System** dialog box.

   You can enter points manually or select them using a crosshair.

2. To activate the crosshair cursor, click **Point1**.

   The cursor transforms into a crosshair.

3. Position the cursor over a corner of the datasheet graph and click the left mouse button.

   The **Coordinate System** dialog box reappears, displaying the X- and Y-Coordinate values for the chosen point.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Enter the X-Value and Y-Value for this point. Typically, these values will correspond to the values taken from the axis scale values on the datasheet.
5. Select the desired scaling (linear, logarithmic, or decibel) for both the X and Y axes.
6. Repeat the above steps for **Point2** and **Point3**.
7. Click **OK**.

   The grid is placed over the graphic.

   > **Note:**
   >
   > - You can edit the grid after placement by selecting **Coordinate System** > **Properties**, by clicking the coordinate system icon on the Curve toolbar ( ), or by right-clicking in the SheetScan editing window and selecting **Coordinate System**.
   > - You can hide the grid by selecting **View** > **Grid**.

8. You can now define a Characteristic Curve.

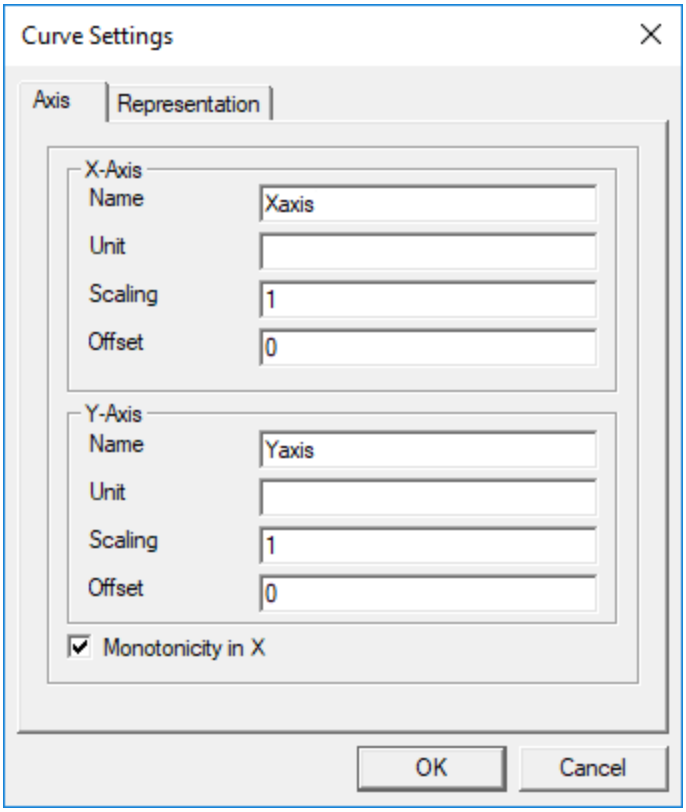
Defining a Characteristic Curve in SheetScan

Once you have loaded a datasheet picture in the editor and have defined a coordinate system, you can define one or more characteristic curves as follows:

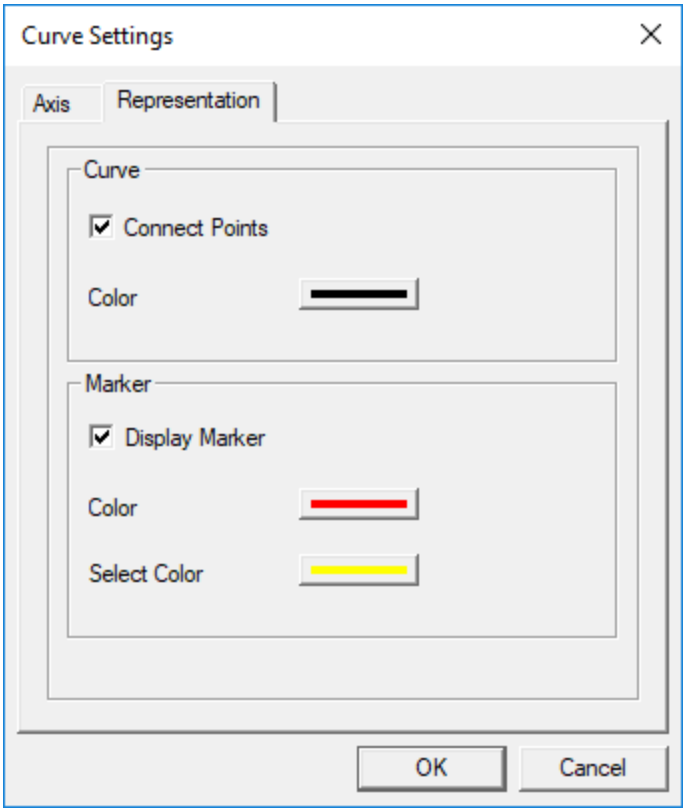
1. Choose **Curve** > **New**.

   The **Curve Settings** dialog box opens, containing the **Axis** and **Representation** tabs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Use the fields on the **Axis** tab to define the curve's properties. Use the buttons on the **Representation** tab to change the curve's appearance.
3. Click **OK**.

   The cursor changes to a crosshair.

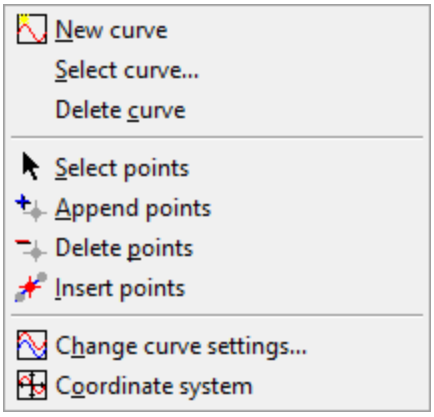
4. Click the points of the characteristic which you want to capture for the dataset. The points are connected automatically.
5. Repeat steps 1 through 4 for each additional characteristic curve you wish to define.

After characteristic curves have been defined, you can perform various operations on them. See: *Performing Operations on SheetScan Curves.*

Performing Operations on SheetScan Curves

Use the **Curve** menu (from the toolbar or by right-clicking in the sheet) to perform actions on SheetScan curves.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can perform the following actions:

- **New Curve** – allows you to define a new characteristic curve.
- **Select Curve** – opens the **Select Curve** dialog box, listing all active curves. Select the desired curve and click **OK**.
- **Delete Curve** – deletes the selected curve.

> **Warning:**
>
> You cannot undo this action. If you delete a curve and its data points from the SheetScan editor, you must reconstruct it manually.

- **Select Points** – select this option, then click a point to select it. **Ctrl+click** allows you to select multiple points.
- **Append Points** – select this option, then click to add data points to the end of a curve.
- **Delete Points** – select this option, then click a data point to remove it from the curve.
- **Insert Points** – select this option, then click to insert new data points between existing data points.
- **Change Curve Settings** – opens the **Curve Settings** dialog box, where you can edit the initial curve settings.
- **Coordinate System** – opens the Coordinate System dialog box, where you can edit the coordinate system settings.

Checking for Monotonicity in X

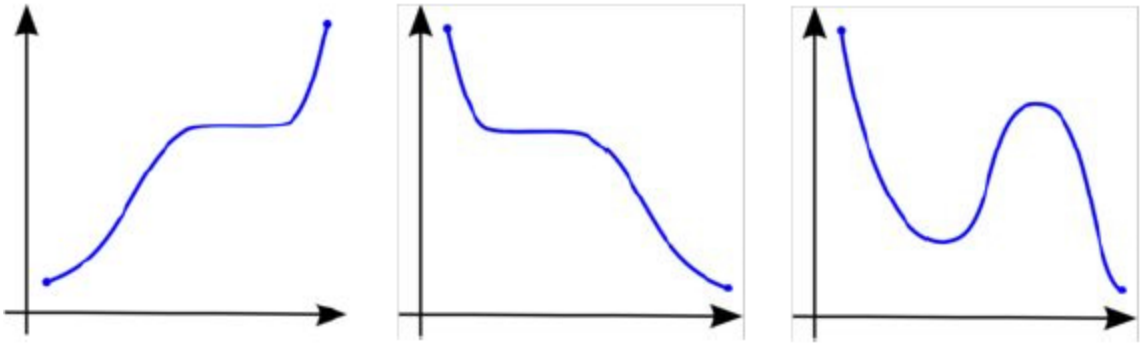
HFSS 3D Layout requires that characteristics be monotonically increasing along the X-axis. In other words, successive data points must have increasing X-values, while Y-values may both increase and decrease.

To check for monotonicity in X from SheetScan:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select **Curve** > **Check Monotonicity**.

   If the characteristic curve is monotonically increasing in X-value, the check completes without notice. Typical examples of curves that meet monotonicity criteria are shown below.



2. If the characteristic curve is not monotonically increasing in X-value, a dialog box displays informing you that errors were found. Click **Yes** to have SheetScan automatically correct the errors.

Importing Characteristic Data into SheetScan

SheetScan supports data import from the following file types:

- Twin Builder Characteristic (*.mdx, *.mda)
- Microsoft Excel (*.xls, *.xlsx)
- Text (*.txt)
- Comma Separated Value (*.csv)
- Spice (*.out)
- Comtrade (*.cfg)
- TEK Oscilloscope (*.dat)

> **Note:**
>
> Before importing characteristic data, you must define a coordinate system.

To import characteristic curve data into SheetScan:

1. Click **File** > **Import**.
2. In the file **Open** dialog box, select the desired data file and click **Open**.
   a. Selecting an **.xls** or **.xlsx** file containing multiple sheets opens a **Table Properties** dialog box where you can choose the desired sheet from a drop-down menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

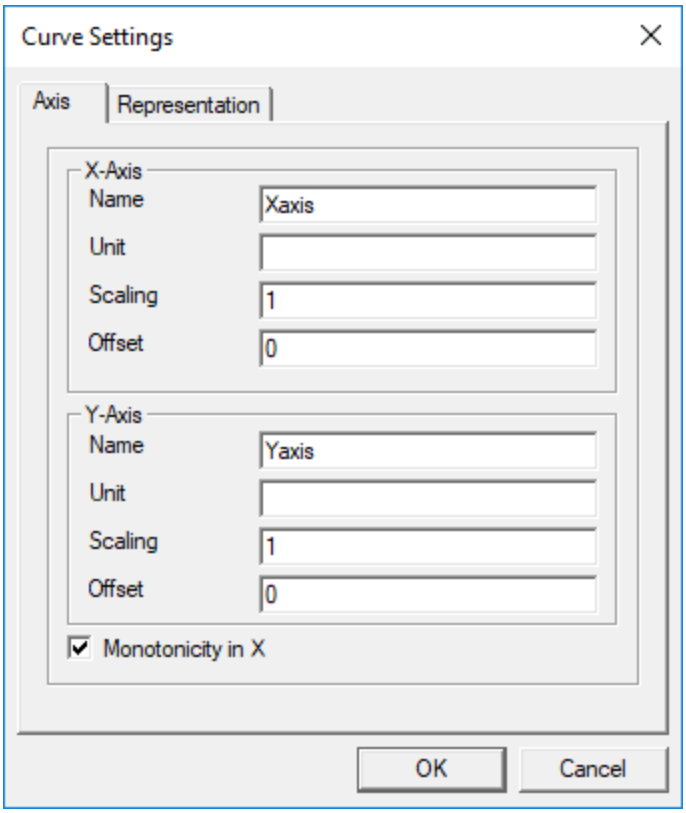
Otherwise, selecting an **.xls** or **.xlsx** file imports the data immediately into the **Add Dataset** dialog box.

> **Note:**
>
> - Only the first two columns of data are imported, the left-most column containing the X-coordinate values. The x-coordinate values for successive data points must increase within ten significant digits. Non-numeric entries are assigned a value of zero.
> - The first row of data is assumed to contain column headings and is ignored.

b. Selecting a **.txt** or **.csv** file opens an **Import** dialog box in which you can specify how to settings for reading the data in the file for import. You can choose the separator(s) and decimal symbol, as well as the line at which to begin the import. The dialog box shows both the original text and the text as it would appear when imported based on the current import settings.

When satisfied with the import settings, click **OK** to import the data.

The **Curve Settings** dialog box opens.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Change **Curve Settings** as needed and click **OK** to complete the data import.

   The new characteristic curve is added to the current SheetScan sheet.

Exporting SheetScan Data

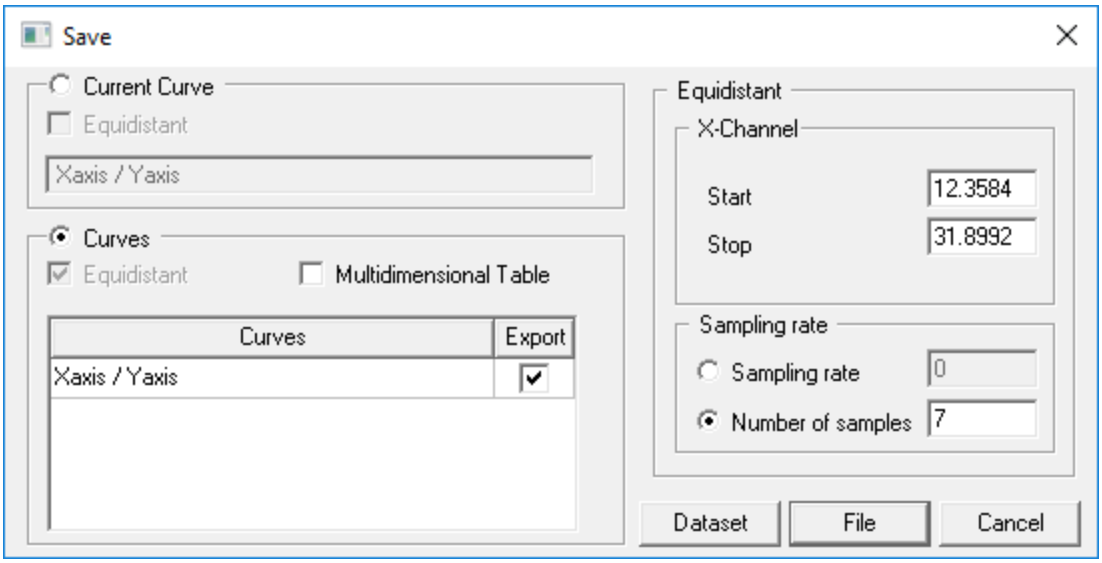
After defining a coordinate system and adding a curve, you can export SheetScan curve data directly to:

- Electronics Desktop Dataset
- Twin Builder Characteristic (*.mdx) file
- Comma Separated Value (*.csv) file
- Comtrade (*.cfg) file

To export curve data:

1. Click **File** > **Export**.

   The **Save** dialog box appears.



2. In the **Save** dialog box, choose **Current Curve** (default) to export current curve data, or **Curves** to choose the curve(s) whose data you wish to export. Choosing **Curves** reveals a list box showing all of the curves available for export.

> **Note:**
>
> The **Multidimensional Table** option is not currently supported.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Choose **Equidistant** if you want to set the **Start** and **Stop X-Channel** values and a **Sample Rate** or **Number of samples** for the exported dataset(s).
4. Click **Dataset** to export curve data directly to the project's dataset file, or click **File** to export as one of the supported file types.

Defining an Expression

Expressions are mathematical descriptions that typically contain Intrinsic Functions, such as sin (x), and arithmetic operators, such as +, -, *, and /, as well as defined variables. For example, you could define: x_size = 1mm, y_size = x_size + sin(x_size). Defining one variable in terms of another makes it a dependent variable. Dependent variables, though useful in many situations, cannot be the subject of optimization, sensitivity analysis, tuning, or statistical analysis.

The Constants tab of the **Project Variables** window lists all available pre-defined constants. These may not be reassigned a new value.

Numerical values may be entered in Ansys shorthand for scientific notation. For example, $5x10^7$ could be entered as **5e7**.

Defining Mathematical Functions

A mathematical function is an expression that references another defined variable. A function's definition can include both expressions and variables.

The following mathematical functions may be used to define expressions:

Basic Functions	**/**, **+**, **-**, *****, mod (modulus), ****** (exponentiation), **-** (Unary minus), **==** (equals), **!** (not), **!=** (not equals), **>** (greater than), **<** (less than), **>=** (greater than equals), **<=** (less than equals), **&&** (logical and), **||** (logical or)
Intrinsic Functions	**if**, **abs**, **exp**, **pow**, **ln** (natural log), **log10** (log to the base 10), **sqrt**
Trigonometric Expressions	**sin**, **cos**, **tan**, **asin**, **acos**, **atan**, **sinh**, **cosh**, **tanh**

The predefined variables X, Y, Z, Phi, Theta, R, and Rho must be entered as such. X, Y, and Z are the rectangular (Cartesian) coordinates. Phi, Theta, and Rho are the spherical coordinates. R is the cylindrical radius, and Rho is the spherical radius.

If you do not specify units, all trigonometric expressions expect their arguments to be in radians, and the inverse trigonometric functions' return values are in radians. If you want to use degrees, you must supply the unit name **deg**. When the argument to a trigonometric expression is a variable, the units are assumed to be radians. These function names are reserved and may not be used as variable names.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

As far as expression evaluation is concerned: units are conversion factors (that is, from the given unit to SI). Note also that the evaluated value of an expression) is always interpreted as in SI units.

Valid Operators for Expressions

The operators that can be used to define an expression or function are performed in a sequence.

The following table lists valid operators and the sequence in which they are accepted (listed in decreasing precedence):

()	Parenthesis	1
!	Not	2
^ (or **)	Exponentiation (If you use "**" for exponentiation, as in previous software versions, it is automatically changed to "^".)	3
-	Unary minus	4
*****	Multiplication	5
/	Division	5
+	Addition	6
-	Subtraction	6
==	Equals	7
!=	Not equals	7
>	Greater than	7
<	Less than	7
>=	Greater than or equal to	7
<=	Less than or equal to	7
&&	Logical and	8
||	Logical or	8

Using Intrinsic Functions in Expressions

HFSS 3D Layout recognizes a set of intrinsic trigonometric and mathematical functions that can be used to define expressions. Intrinsic function names are reserved and may not be used as variable names.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

If units are not specified, all trigonometric functions interpret their arguments as radians. Likewise, return values of inverse trigonometric functions are output in radians. When the argument to a trigonometric expression is a variable, the units of the variable are assumed to be radians. To have values interpreted in degrees, supply the argument with the unit name **deg**.

The following intrinsic functions may be used to define expressions:

Function	Description	Syntax
abs	Absolute value (|x|)	abs(x)
sin	Sine	sin(x)
cos	Cosine	cos(x)
tan	Tangent	tan(x)
asin	Arcsine	asin(x)
acos	Arccosine	acos(x)
atan	Arctangent (in range of -90 to 90 degrees)	atan(x)
atan2	Arctangent (in range of -180 to 180 degrees)	atan2(y,x)
asinh	Hyperbolic Arcsine	asinh(x)
atanh	Hyperbolic Arctangent	atanh(x)
sinh	Hyperbolic Sine	sinh(x)
cosh	Hyperbolic Cosine	cosh(x)
tanh	Hyperbolic Tangent	tanh(x)
even	Returns 1 if integer part of the number is even; returns 0 otherwise.	even(x)
odd	Returns 1 if integer part of the number is odd; returns 0 otherwise.	odd(x)
sgn	Sign extraction	sgn(x)
exp	Exponential ($\mathbf{e}^x$)	exp(x)
pow	Raise to power (x^y)	pow(x,y)
if	If	if(cond_exp,true_exp,false_exp)
pwl	Piecewise Linear. (**pwl** can be used with datasets for Design Variables but not for Project variables).	pwl(dataset_exp,variable)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

pwl_periodic	Piecewise Linear for periodic extrapolation on x.	pwl_periodic (dataset_ exp,variable)
sqrt	Square Root	sqrt(x)
ln	Natural Logarithm (The "log" function has been discontinued. If you use "log(x)" in an expression, the software automatically changes it to "ln (x)".)	ln(x)
log10	Logarithm base 10	log10(x)
int	Truncated integer function	int(x)
nint	Nearest integer	nint(x)
max	Maximum value of two parameters	max(x,y)
min	Minimum value of two parameters	min(x,y)
mod	Modulus	mod(x,y)
rem	Returns the fractional part of a decimal number such that rem (x) = x-int(x)	rem(x)
clp	Implements smooth interpolation employing weighted impact of all points of the dataset (not just the closest one). See formula below. **Note:** If used with a large 3D dataset, clp function will degrade.	clp (*datasetName* , X,Y,Z)

clp Formula

$$clp\left(Dataset,X,Y,Z\right)=\begin{cases} DatasetValue_i \text{ if } r_i\left(X,Y,Z\right) < r_{rounding} \\ \Sigma_i \frac{DatasetValue_i}{r_i^4} \Big/ \Sigma_i \frac{1}{r_i^4} \quad otherwise \end{cases}$$

$$r_i\left(X,Y,Z\right)=\sqrt{\left(X-DatasetX_i\right)^2+\left(Y-DatasetY_i\right)^2+\left(Z-DatasetZ_i\right)^2}$$

Using Piecewise Linear Functions in Expressions

The following piecewise linear intrinsic functions are accepted in expressions:

- **`pwl (dataset_expression, variable)`** – piecewise linear along the X-axis and returns a corresponding Y value.
- **`pwlx (dataset_expression, variable)`** – piecewise linear with linear extrapolation on x returns a corresponding Y value.
- **`pwl_periodic (dataset_expression, variable)`** – also interpolates along the X-axis, but periodically.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

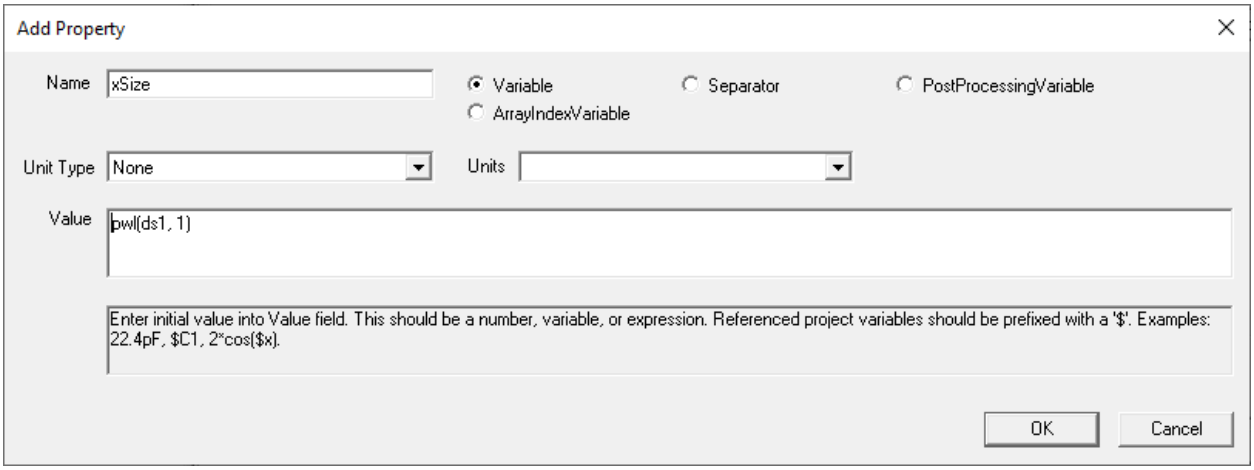
You can use **pwl** in an expression that uses datasets for such things as a frequency dependent material property (See: Adding Datasets).

For example, you can specify BulkConductivity as:

```
pwlx($ds1, Freq)
```

You can create a design variable representing a dimension `xSize` as `pwl(ds1, 1)` where `ds1` is a dataset.

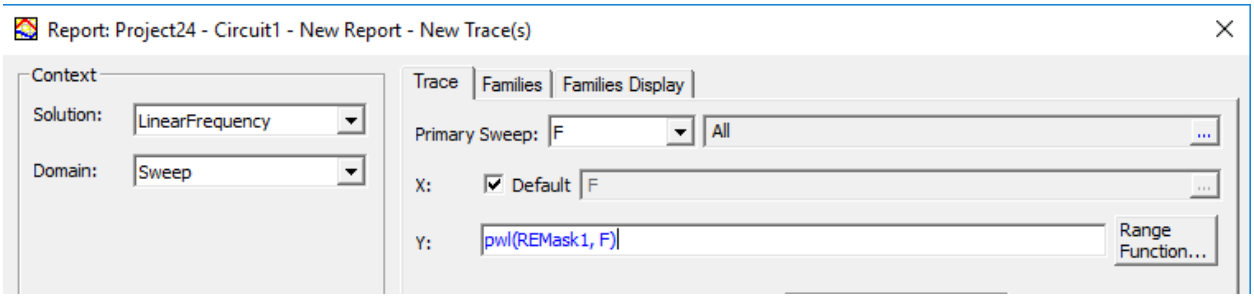
Doing so looks like this:



After the dataset is configured, the **Properties** window shows the new variable.

To use datasets in reports, create a report using **pwl(dataset_expression,**`variable`**)** where `variable` is the primary sweep in the report.

For example:



Note:

pwl can be used with datasets for Design Variables but not for Project variables.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Using Dataset Expressions

A dataset is a collection of data. It can take the following form:

$ds1((x0,y0), ..., (xn,yn))

Once created, a dataset (such as $ds1) may be used as the first parameter to piecewise linear (**pwl**, **pwlx**, and **pwl_periodic**) functions, and may also be assigned to variables, in which case the variable may be used as the second parameter to **pwl**, **pwlx**, and **pwl_periodic** functions.

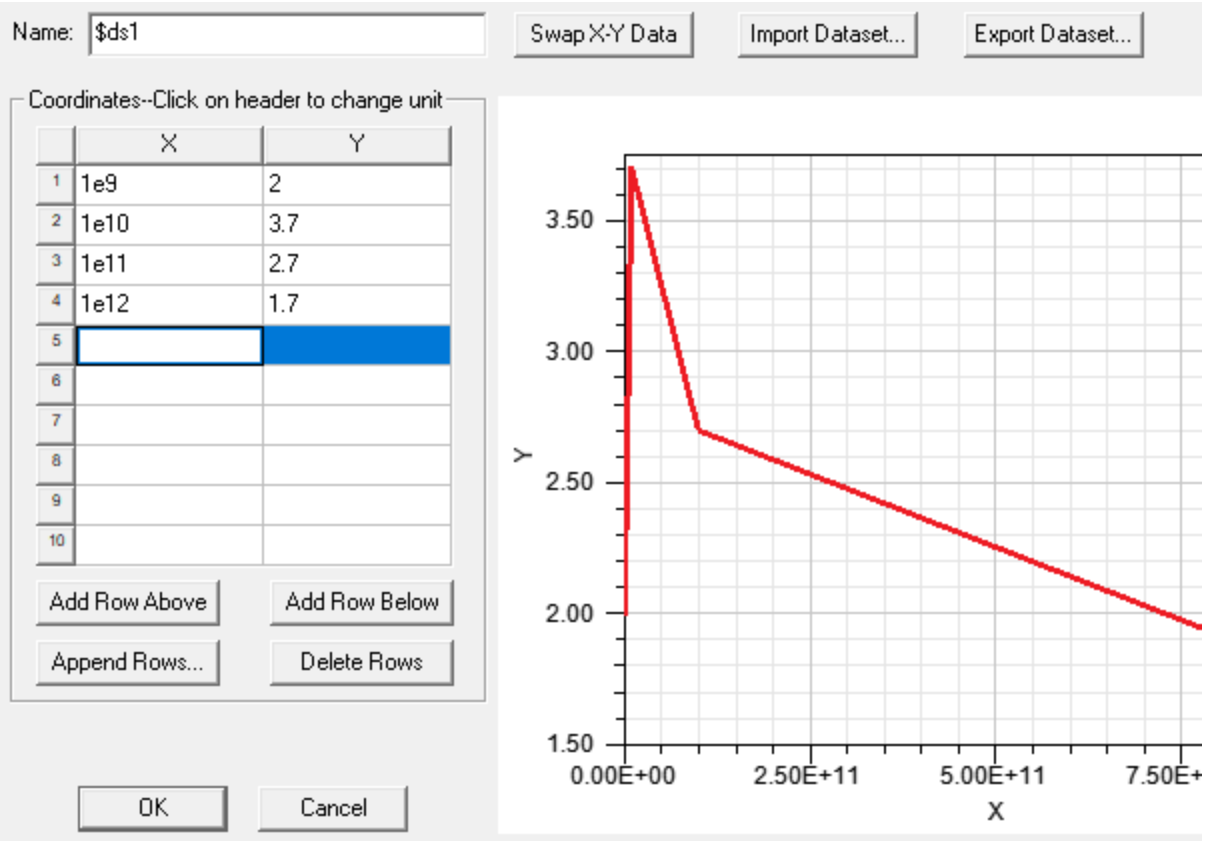
You can generate a dataset using a series of points in a plot on the **Datasets** dialog box (See: Adding Datasets). Each plot consists of straight line segments whose vertices represent their end points. A curve is fitted to the segments of the plot. This curve, which best fits the segmented plot, consists of the co-ordinates used in the creation of the dataset. The dataset may then be used in the piecewise linear intrinsic functions.

> **Note:**
>
> The following is an example showing how to make a material property frequency dependent using a dataset as the first parameter to a **pwl** function. The values used are arbitrary.

1. For a project-level dataset, click **Project** > **Datasets**. For a design-level dataset, click **HFSS 3D Layout** > **Design Datasets**.
2. Click **Add**.
3. Set the **Name** field and **Coordinates** as desired and click **OK**.

   The dataset is created.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

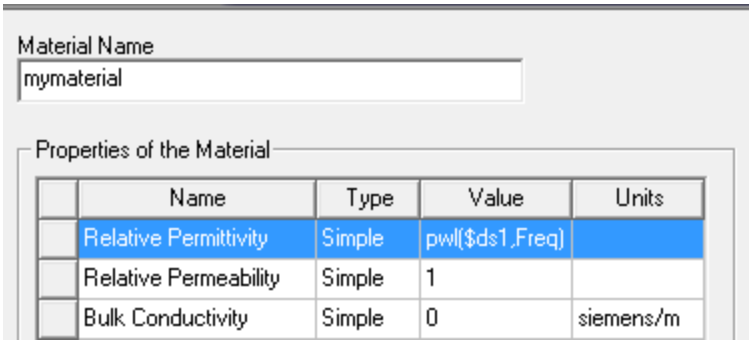


Note:

By default, the dollar sign ($) is assigned to a project dataset even if you do not use one while naming it.

4. Go to **Tools** > **Edit Libraries** > **Materials** to open the **Edit Libraries** dialog box.
5. Click **Add Material**.
6. Type in the piecewise linear function and use the dataset $ds1, as shown in the following figure.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



7. Click **OK**.

Co-simulation of Circuit and Field Solver Designs

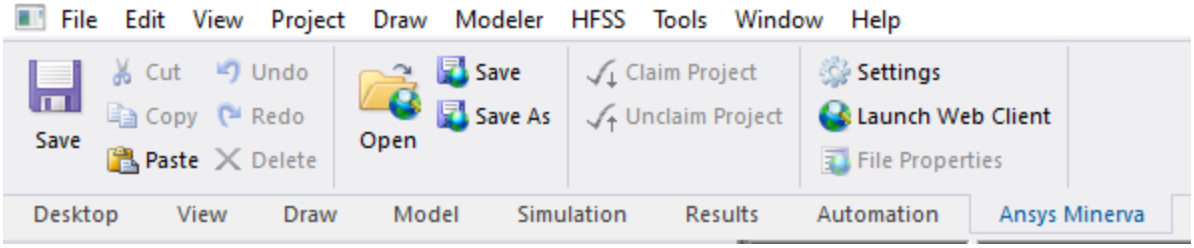
The Electronics Desktop features Dynamic Links and Solver on Demand™ technology to allow flexible and accurate modeling of unrestricted structures used in high-frequency system designs of components and circuits. Dynamic Links allows the Circuit project to incorporate projects from HFSS, Q3D, 2D Extractor, and SIwave as active components. Use Solver on Demand technology to simulate structures via circuit, system, and field solver models at the touch of a button. Solver on Demand incorporates electromagnetic solver results directly into larger network topologies and allows you to maximize both speed and accuracy. Solution data is cached and used in place of re-simulating unless you change structure parameters.

For more information see Dynamic Links and Solver On Demand.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

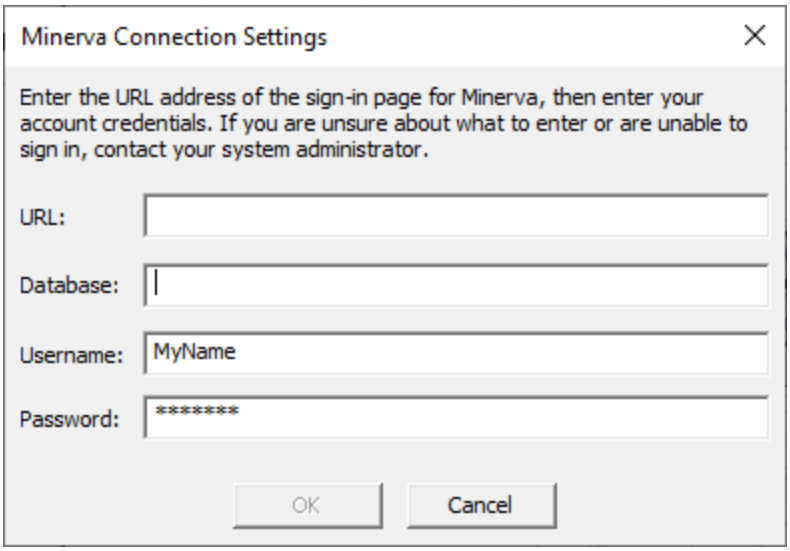
4 - Minerva Remote Storage Environment

Ansys Minerva is a remote storage environment where you can store Ansys project archive files. You can collaborate with other users by downloading a project, making changes, and then uploading the project. One of the features of Ansys Minerva is the ability to store and retrieve Ansys projects from the Minerva server. This ability has been integrated into Electronics Desktop so it is now possible to download and open a project stored on Minerva directly from the Electronics Desktop interface. In the same way, it is also possible to save a project to Minerva. The image below shows the Minerva ribbon containing Minerva commands accessible through the desktop.



Minerva has its own HTML web interface with additional features as a knowledge management application that secures critical simulation data, and provides simulation process and decision support to simulation teams across geographies and functional silos.

Minerva Settings

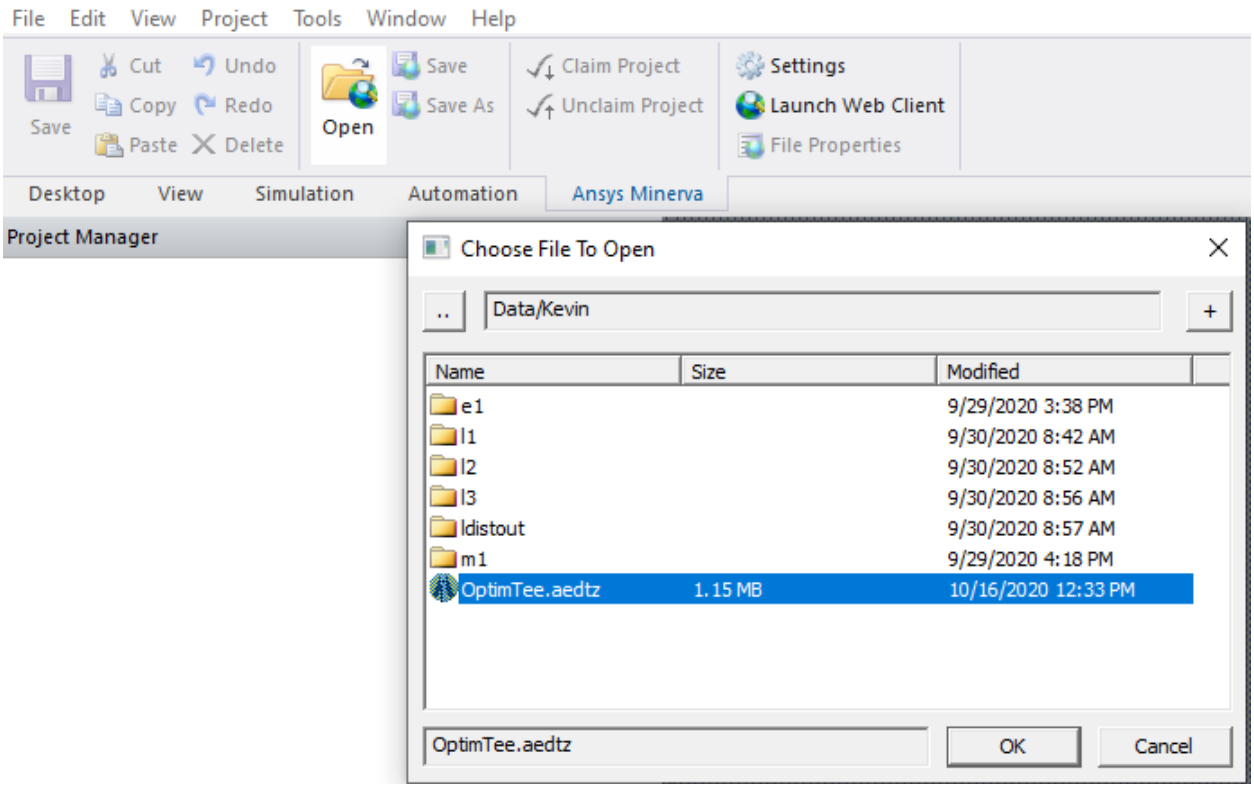


When you first login via the desktop, or to the Web Client, you must provide a Minerva URL, a database name, a user name, and a password. You will need to obtain these from your system

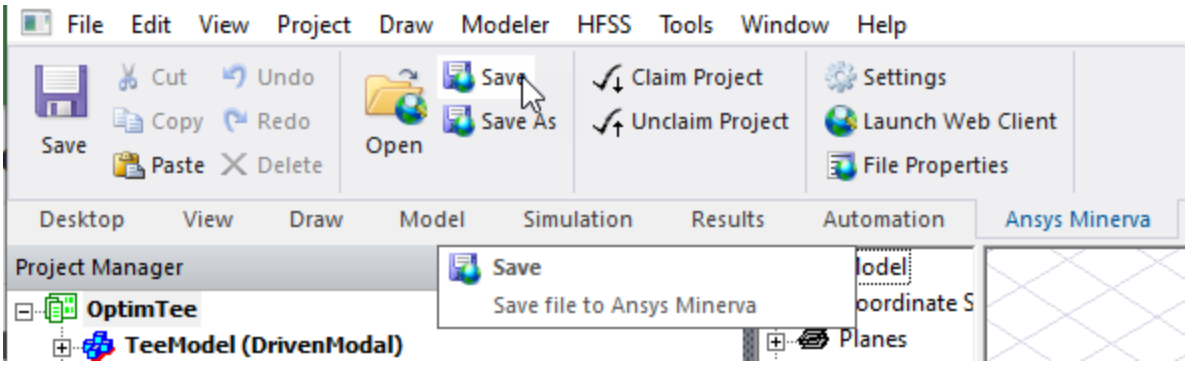
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

administrator. Once you provide the connection settings, the other Minvera commands are enabled.

Open – opens the Choose File to Open browser that lets you select and download an archive file, extract it, and open it. The [..] button moves up one level in the file hierarchy. The [+] button creates a new folder at the current level.

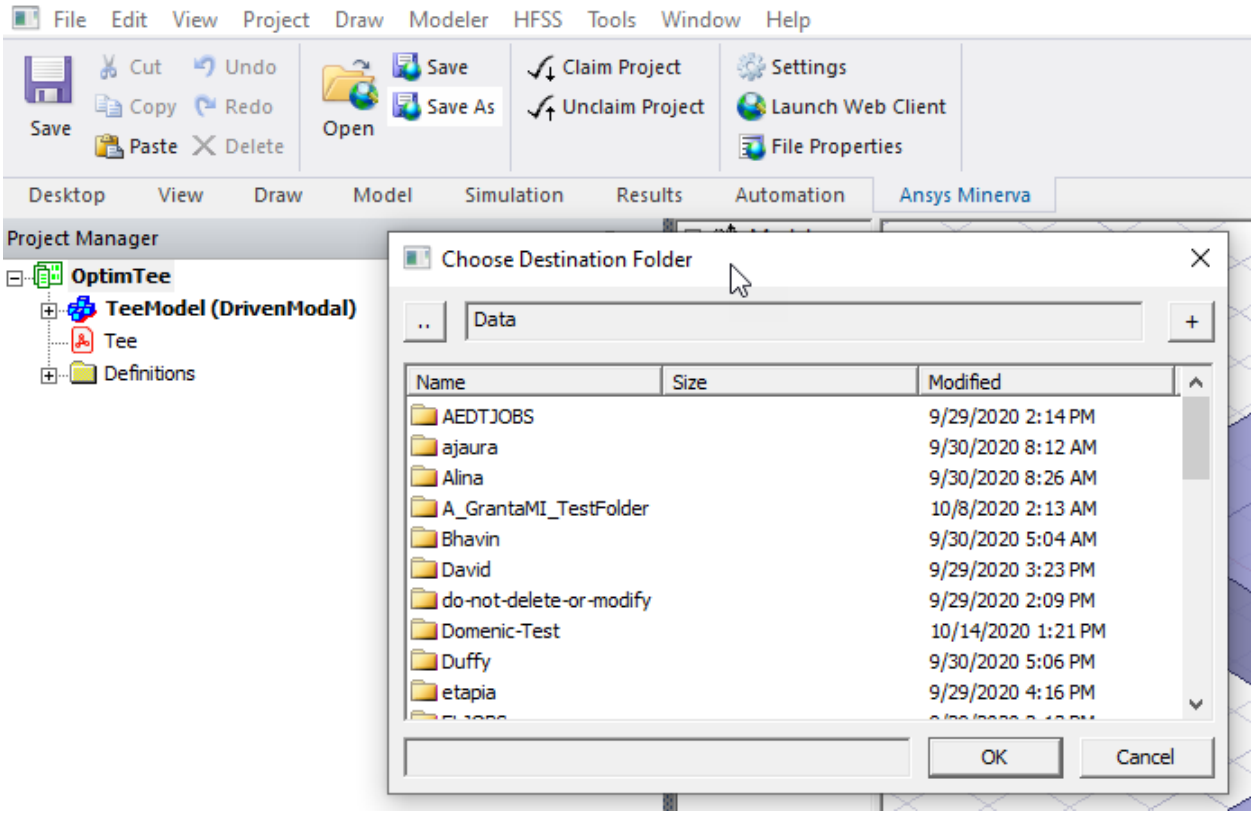


Save – archives the current project, and saves it to a remote Minerva system.



Save As – prompt for remote file, archive project, save to remote Minerva system.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



In order to prevent users from overwriting each other's work, Minerva has added the concept of claiming and unclaiming files. A file claimed by one user cannot be overwritten on the Minerva server by another user. Unclaimed files can be overwritten by anyone at any time. Once a file has been claimed by one user, it cannot be claimed by a different user until it has been unclaimed by the original claimer. Note: even if a project is claimed by one user, other users are free to download, open and edit the file locally.

The recommended flow when working on a project is

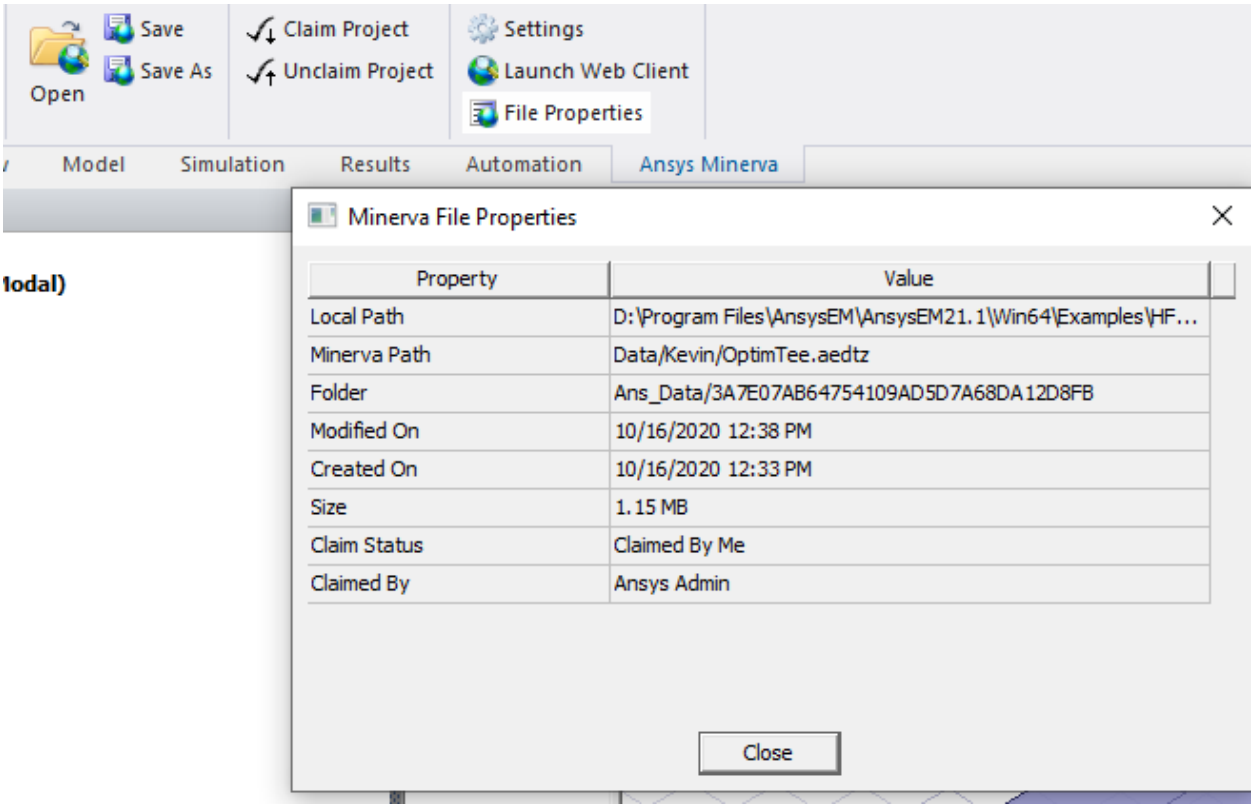
1. Claim the file, make sure you are working with the most recent version
2. Make edits
3. Save the file to Minerva
4. Unclaim the file

Claim Project – claims file so it cannot be modified by other users.

Unclaim Project – releases claimed file.

File properties – opens a dialog letting you view remote file properties. Notice the Claim Status and Claimed By properties.

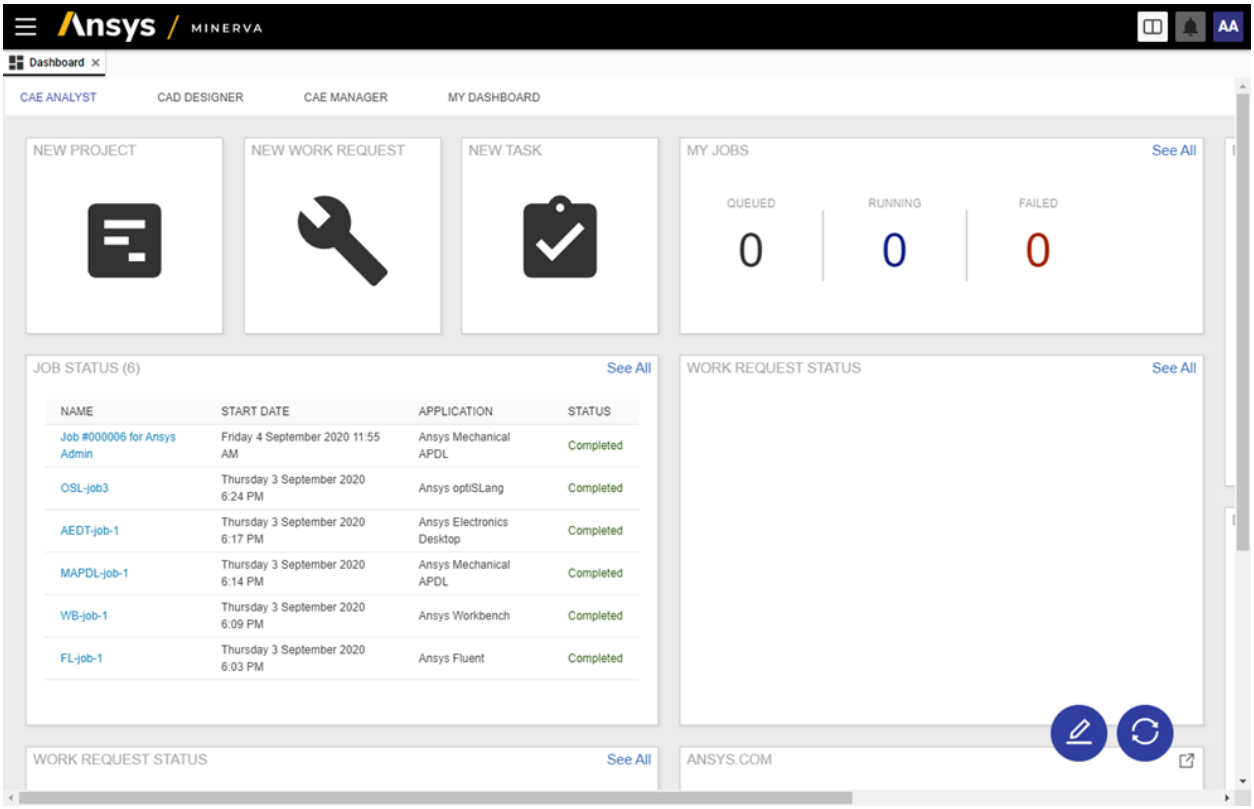
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Launch Web Client:

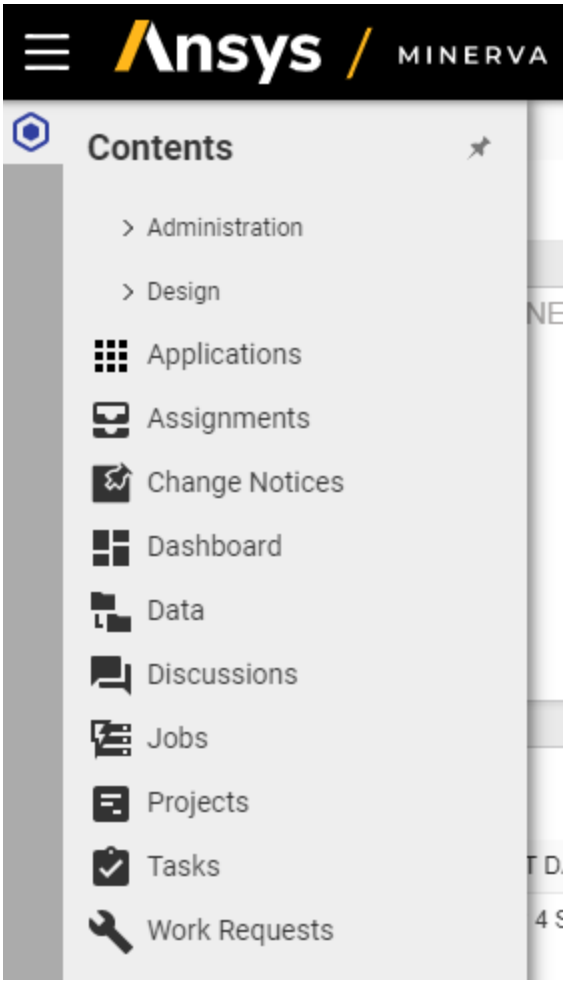
Ansys Minerva, powered by Aras, is a knowledge management application that secures critical simulation data, and provides simulation process and decision support to simulation teams across geographies and functional silos. Launching the Minerva Web Client gives access to these features. This opens a dialog calling for you to specify provide login information. It attempts to open a web browser window, so your default browser must be compliant.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



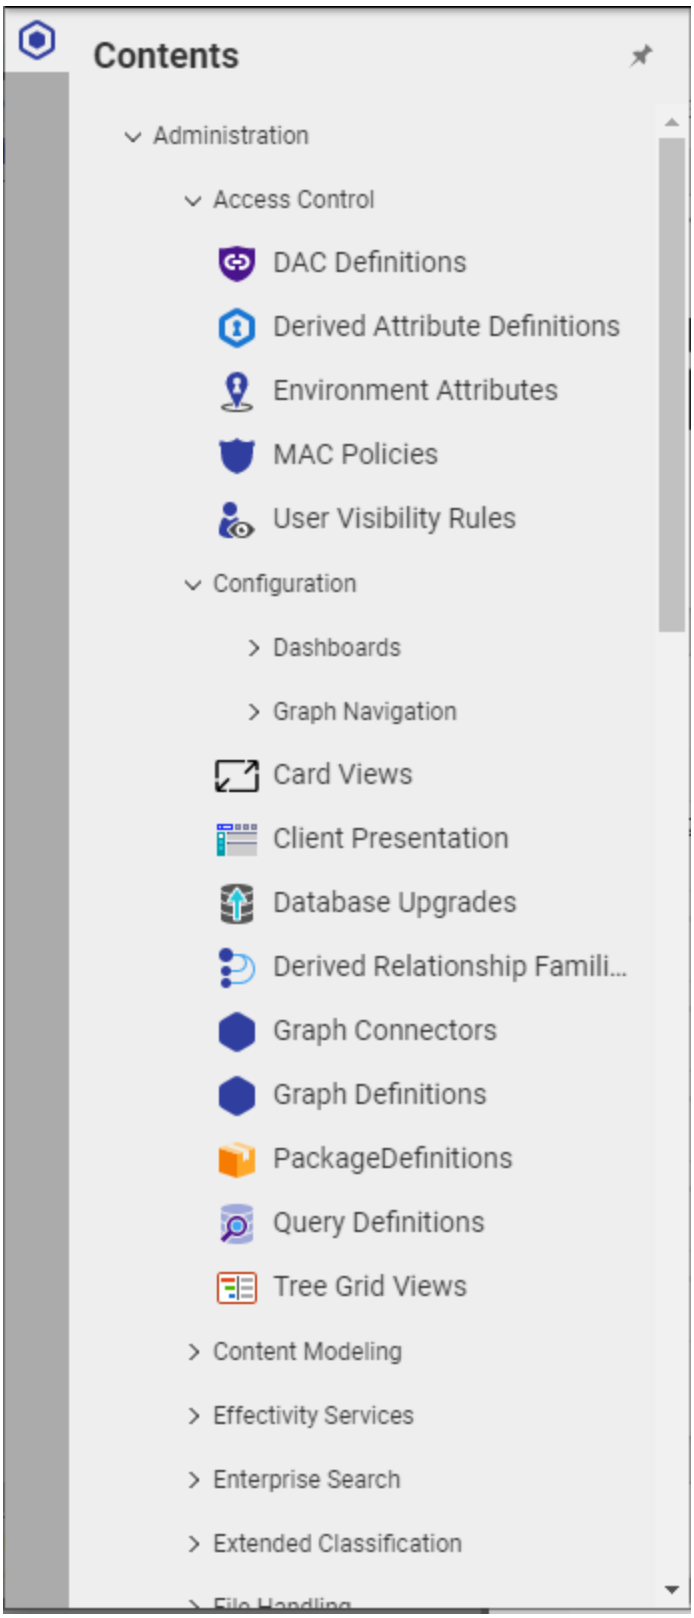
Clicking on the triple bar icon left of the Ansys logo opens up access to the more robust Minerva Web Client functionality.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The arrow icons for Administration open up further functionality.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5 - Layout and Circuit Import Export Operations

- Exporting Layout Design Data — Layout design data, in several industry-standard formats, can be imported to and exported from the Ansys Electronics Desktop (AEDT)™ electronics systems design platform projects for post-processing, simulation, and analysis. Layout design data, in several industry-standard formats, can be imported to and exported from AEDT projects for post-processing, simulation, and analysis.
- Importing Circuit Models — Ansys provides support for imported models and libraries as components in the **Schematic Editor**, including SPICE/PSPICE components and libraries, IBIS buffer elements, Verilog components, W-elements, and X-parameter elements. Frequency-dependent network design data can be imported and used to generate schematic components.
- Exporting Network Design Data — The Linear Network Analysis Circuit solver and the field solver tools produce network design data that can be exported for use by other tools.
- Importing Solution Data — Solution data can be imported into and exported from Ansys projects

Importing Layout Design Data

Design data, in several industry-standard formats, can be imported into the Ansys Electronics Desktop (AEDT)™ electronics systems design platform.

Importing ANF Design Data

Ansys Neutral File (ANF) formatted files are typically generated by third party tools or by the “ALinks” program that translates third-party designs. ANF is a public, neutral file format that allows third party tools to exchange design data with Ansys products. ANFv2 and ANFv4 are two different public, neutral file formats. An ANFv4 file may contain schematic data, 2D geometry (layout), 3D geometry, and component data, but none of the data is required. A given ANFv4 file may contain just schematic data with no layout data, or may contain just layout data with no schematic data.

> **Note:**
>
> If material properties are not provided in the ANF file, the required material properties are taken from the Ansys Electronics Desktop (AEDT)™ electronics systems design platform material library database. These properties may be different from those in the tool used to generate the ANF file.

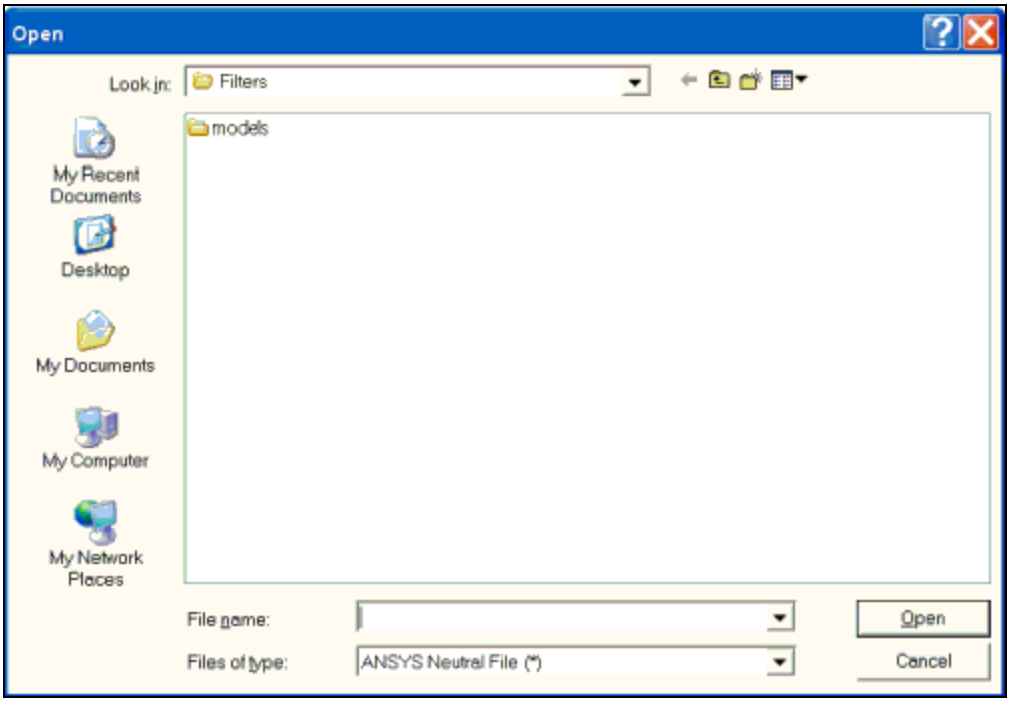
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When geometry is imported from ANF, ports are automatically added, and a subdirectory for the ANF-based project is configured in the Project directory. When ANF-based projects are saved, the **Save As** window always opens, regardless of where the ANF file originated. AEDT can import both ANFv2 and ANFv4 formatted files.

Importing ANFV2 Design Data

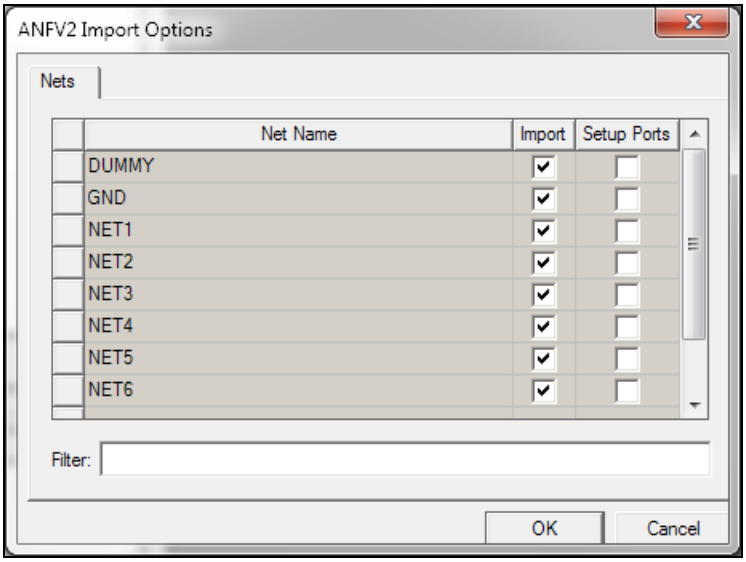
Follow these steps to open and import an ANFVS2-based project.

1. From **File**, select **Import** > **ANF** to open an explorer window.



2. click the **Look in** field to locate the directory containing the file with the project you want to open. Click the **Files of type** field to display the files with the ANF format.
3. Click ANF format file in the window to select it, or type its name into the **File name** field. If you select to open an ANFV2 file, a window appears that allows you to select the nets to import , then generate ports on. You can also select an associated .cmp file to import with it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



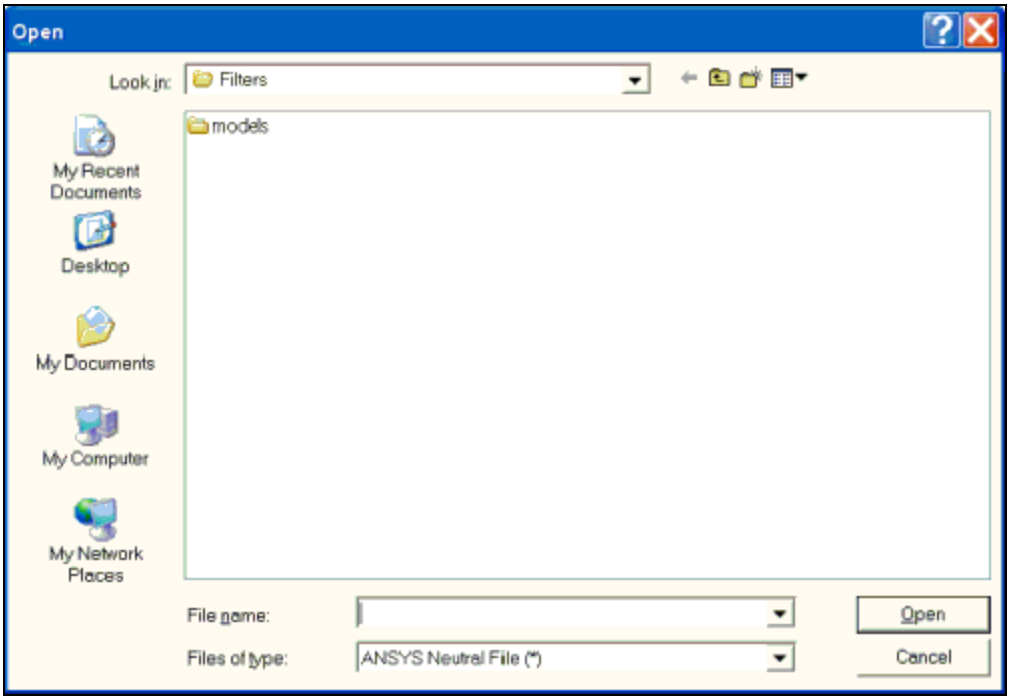
4. When you click **OK** in the **ANFV2 Import Options** window, the file is imported.

Only nets with a check in the **Import** column are imported. Pins that belong to nets with a check in the **SetupPorts** column become ports when imported. The **Filter** control can be used to select which nets are shown in the window.

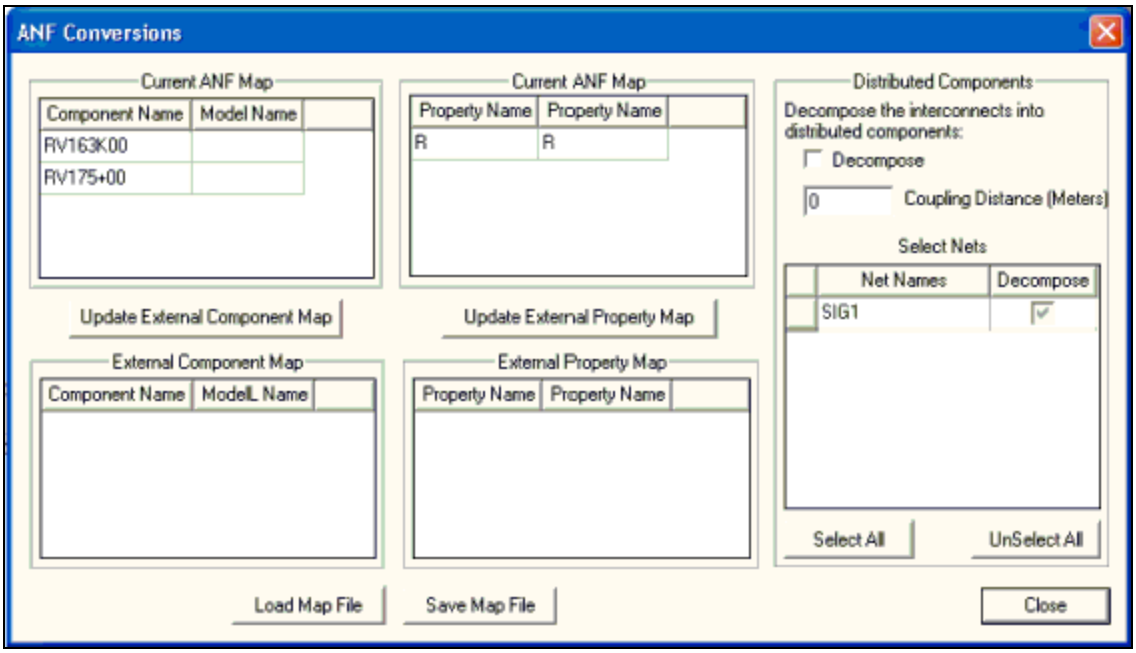
Importing ANFV4 Design Data

1. To open an ANFV4-based project, on the **File** menu, select **Import** > **ANF** to open an explorer window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. click the **Look in** field to locate the directory containing the file with the project you want to open. Click the **Files of type** field to display the files with the ANF format.
3. Click ANF format file in the window to select it, or type its name into the **File name** field.
4. Click **OK**. The **ANF Conversions** window opens:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. The **Current ANF (Components) Map** group boxes list the components on the ANF file and any associated models. You can enter the names of a model manually in the **Property Name** field. The ModelName property for the component are set to the entry in the **Model Name** field in the mapping, and the Netlist property begins with that name instead of the component name.
6. **Update External Component Map** saves any mappings you enter manually to a text file. Click **Save Map File** to open a File explorer window. Use the window to browse to the directory where the map file is to reside, then enter the name of the file. The map file is saved with a **.mapping** extension. The same mapping file should be used for both component and property mappings. After the mapping file has been created, **Update External Component Map** saves any mappings you enter manually.
7. The **Current ANF (Property) Map** group boxes list the mapping of properties in the ANF file to the properties that are used when the file is imported. You can enter the mapped name of a property manually in the **Model Name** field. The name for the property are set to the entry in the netlist.
8. **Update External Property Map** saves any mappings you enter manually to a text file. Click **Save Map File** to open a File explorer window. Use the window to browse to the directory where the map file is to reside, then enter the name of the file. The map file is saved with a **.mapping** extension. After the mapping file has been created, **Update External Component Map** saves any mappings you enter manually.
9. **Load Map File** opens an explorer window. Browse to the directory where the map file resides, then select or enter the name of the file. The map file can contain component and/or property mappings, and must have a **.mapping** extension. The same mapping file should be used for both component and property mappings.
10. The **External Component Map** area lists the components that have been read from an external mapping file. The display changes each time the external file is updated on the window.
11. The **External Property Map** area lists the properties that have been read in from an external mapping file. The display changes each time the external file is updated from the window.
12. The **Distributed Components** area allows you to specify that imported interconnects are converted to distributed components if they fall within a minimum coupling distance (specify distance), and select the nets that are thus converted.
13. Click **Close**. The **Layout Editor** shows the design, and the projects window shows the imported project.

Importing Files into the Layout Editor

Using the **File** > **Import** command, you can read the following files directly into the layout editor.

- EDB, Cadence APC/Allegro/SiP, ANF, AutoCAD, GDSII, IPC2581a, XFL, Gerber, IDF, and ODB++ imports opens directly into a new project.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- ANX import opens directly into a selected project. Users select whether to add the import to a new design or to an existing design.

Split plane layers have not been poured (generated). Unused interior pads are not output. Nets have not been defined or have been "anonymized" away. Components lack reference designators or part numbers.

> **Note:**
>
> ODB++ allows the export of a .copper_weight for signal layers but not an actual thickness. Use a conversion factor of 1.4mil per ounce of copper. ODB++ v.8 allows for the export of .dielectric_constant, .loss_tangent and .bulk_resistivity but no material names. Generate the name of the layers by prepending ODB_COND_ and ODB_DIEL_ before the first layer the material properties show up in.

> **Note:**
>
> For the following, designs are imported with only the top and bottom layer visible:ODB++, Cadence APD/Allegro/SiP, and ANFV2.

To import a 2D model file:

1. Start a new project to open the Layout Editor.
2. Click **File** > **Import**, then choose and select the type of file to import from an explorer window.
3. click the **Look in** field to locate the directory containing the file you want to import. Click the **Files of type** field to display the files with the format you want to import.
4. Select the 2D model file you want import on the display.
5. Click **Open** to open a window specific to the requested format.

Modification after Import Stackup Options

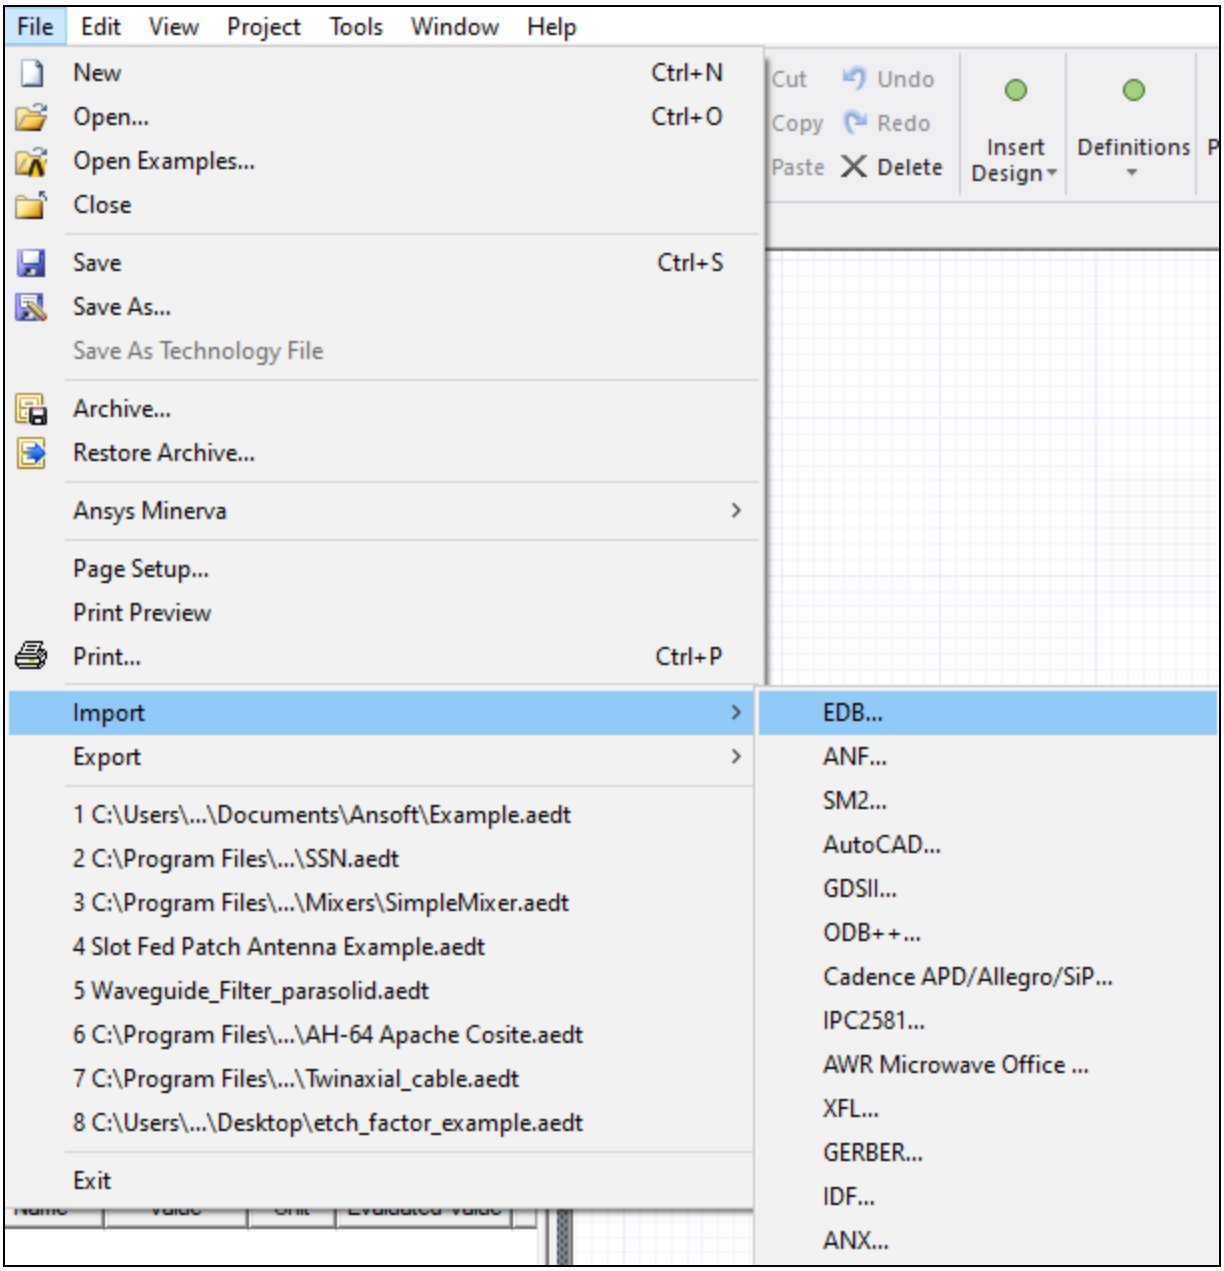
For a detailed description of how to combine exported .xml files, see Layer Stackup window.

Importing EDB Format Files

Follow these steps to import an EDB file, select **File** > **Import** > **EDB** which brings up a file open window.

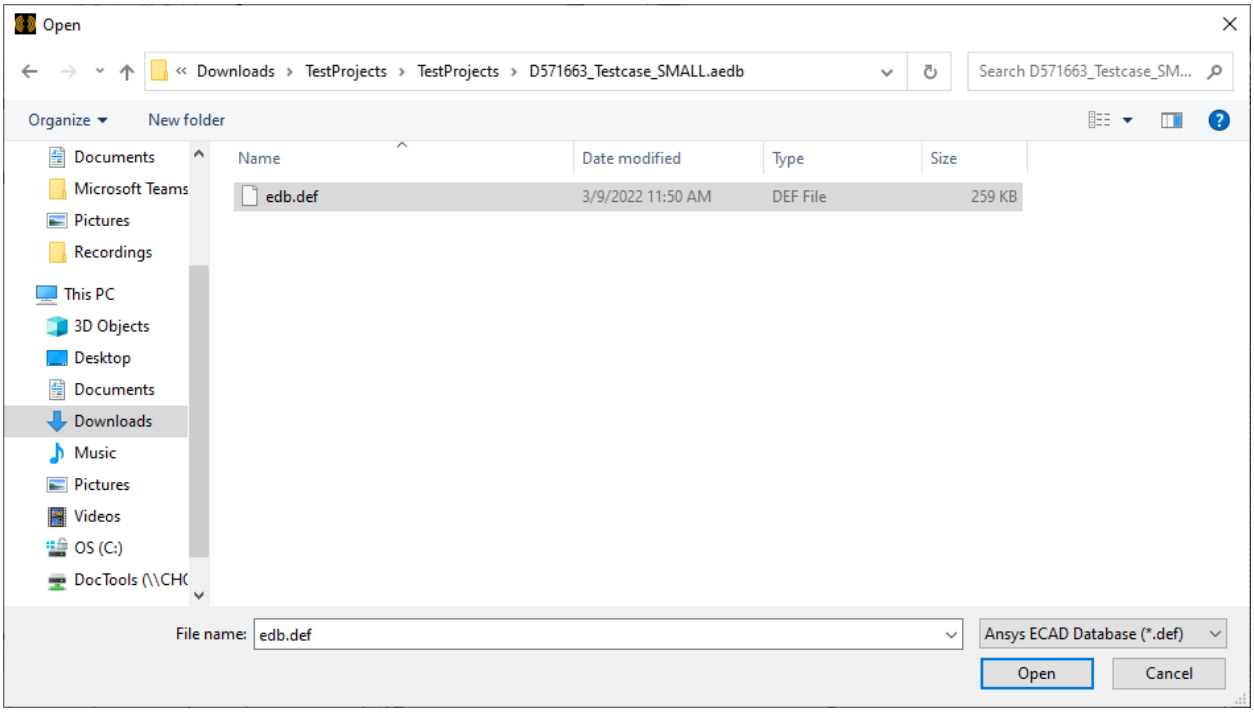
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select **File** > **Import** > **EDB** to open an explorer window.



2. Browse to and select the selected <database>edb.def (i.e., Ansys ECAD Database) file. Then click **Open** to close the explorer window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



A new project and design are created around the layout data found in the AEDB database.

> **Note:**
>
> If the database is already referenced by another the Ansys Electronics Desktop (AEDT)™ electronics systems design platform project, the two projects share the same database. No synchronization is provided for edits made through the independent projects (e.g., if the ports are deleted through one project, they are invalid in the other project and the behavior are indeterminate).

Importing Gerber Format Files into the Layout Editor

Only version RS-274X Gerber designs are supported. Assume the files are contained in either a directory or a directory that has been tar'ed and gzip'ed. On linux use "tar -cvzf gerber.tgz /home/user/gerber", where "gerber" is the name of the directory that contains the design. Support is also included for NC-Drill files (circular holes and drawn slots only).

The window is initialized with the name of the files identified as RS-274X or NC-Drill files. Only the files in the topmost directory are looked at. NC-Drill files are processed separately and their type cannot be changed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Import stackup and options** allows you to import information from an xml control file or a layer mapping file into the window.
- **Export control file** creates an xml control file using the information imported to the window to the location specified.

Layers Pane

- **File Layer Name** is name of the file in the directory; it does not include the path.
- **Import check box** specifies which layers to import.
- **Import layer name** is the name of the new layer. Note the information contained in the control file is exported on the **Layer Stackup** window and is not directly usable by the translator — if layer names are changed. One can, however, combine the records for renaming layers with the control file exported on the stackup window; for more information see Control File Usage with Renaming. The Ansys Electronics Desktop (AEDT)™ electronics systems design platform also supports reading .tech and .layermap files.
- **Type** can be changed and identifies the layer type that are used to place each layer in the file. Via and wirebond types are special and allows users to select the start and stop layers by expanding the window's width.

Options Pane (NC Drill)

If your drill holes appear to be out of whack, you need to expressly describe the format of the NC Drill file. Many cad systems include a comment in the NC Drill file that are automatically processed, but if this does not work the parameters can be set explicitly. Typically, both fields need to be set.

- **Format(digit.digit)** – Unit type is always defined but typically decimal points are not used in the file and you need to know how many digits are before the decimal and how many are after (e.g., "2.4"). The period is required and the format is "digit period digit".
- **Omit Zeroes** – Zeroes can be omitted on the leading or trailing side of numbers.

Via and Wirebond Types

- **Via** – By "_Default_", Start Layer is the top-most signal layer and Stop Layer is the bottom-most layer. To set up blind and buried vias it is best to start by setting the layer types for all layers , then reorder by dragging the rows by selecting the filled-in cell on the left.
- **Wirebond** – By "_Default_", Start Layer" and "Stop Layer" are set to the signal layer directly underneath the Wirebond. If no signal layer lies underneath the Wirebond the "Start Layer" and "Stop Layer" are set to the bottom-most layer. Wirebond layer rows can be moved up and down by dragging and dropping.

Importing IDF Files

Icepak and HFSS 3D Layout can import Intermediate Data Format (IDF) files that have been exported from an ECAD package. The IDF is a neutral file format that is supported by many

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ECAD packages (for example, Allegro from Cadence, Board Station from Mentor Graphics, and Visula from Zuken) and some mechanical CAD packages (for example, PTC Creo, SDRC/I-deas, and Unigraphics). You can import IDF 2.0 and IDF 3.0 files into Icepak or HFSS 3D Layout. Note that IDF 4.0 files cannot be read by either Icepak or HFSS 3D Layout. This is because, currently, ECAD and CAD packages do not export to the IDF 4.0 format, due to the changes from IDF 3.0 to IDF 4.0.

Overview of Importing IDF Files

IDF 2.0 consists of two files, a board file and a library file. IDF 3.0 may consist of two or three files: a board file, a library file, and (in some cases) a control file. The board file contains information about the outline of the board, its thickness, and the positions (but not the sizes) of the components on the board. The library file contains information about the components of the board: their sizes, and their thermal and electrical properties. Icepak and HFSS 3D Layout needs both of these files to obtain complete thermal information about the board and the components. The control file contains information about the placement of boards in a rack.

Note that IDF 2.0 is a simpler format than IDF 3.0. For example, information such as junction-to-case thermal resistances and operating power information can be found only in an IDF 3.0 file.

When importing an IDF file, you can choose to filter out devices by height, power, or type, while optionally choosing to retain the filtered devices as non-model objects. Board conductivity properties, such as board thickness and materials assignment, can be specified and are used to calculate the orthotropic conductivity for the board. The IDF import workflow also allows you to specify a cut-off height for devices when the default height in the IDF file is large. And, if desired, you can select to import the board and devices as simple rectangular objects.

Import an IDF File

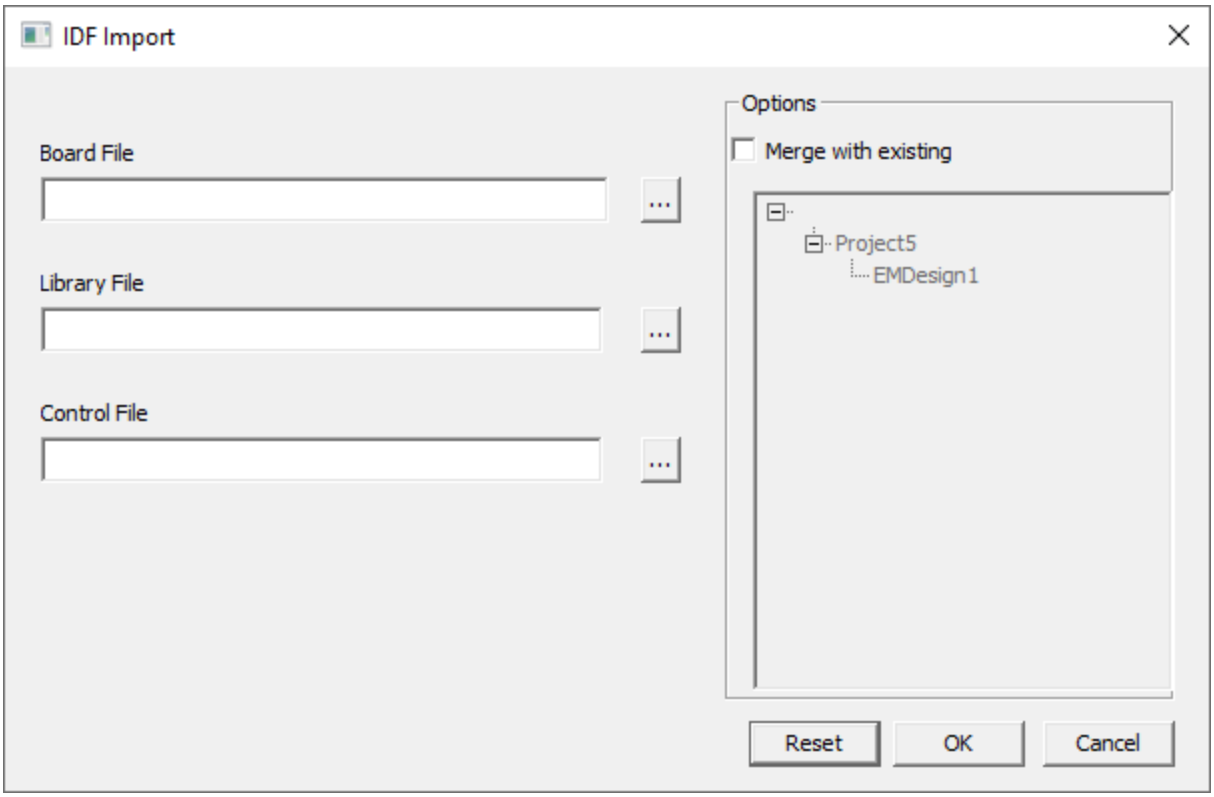
Follow this procedure to import an Intermediate Data Format (IDF) files that have been exported from an ECAD package.

1. Choose **File** > **Import** > **IDF**.

   > **Note:**
   >
   > The **File** > **Import** > **IDF** option creates a new HFSS 3D Layout project and is not relevant in Icepak designs.

2. On the **IDF Import** dialog box, click the button next to the **Board File** field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. In the **Open** dialog box, browse to the location of the IDF files, select the board file, and click **Open**. If available, the **Library File** and **Control File** fields are automatically populated.
4. If needed, click the button next to **Library File** and **Control File** to select these files.
5. If updating components with IDF information:
    a. In the **Options** area, click **Merge with existing**.
    b. Select the existing file.
    This merges any new properties into the existing file. To update a component with IDF data, the component must exist in both the design and IDF files.
6. Click **OK** to import the model.

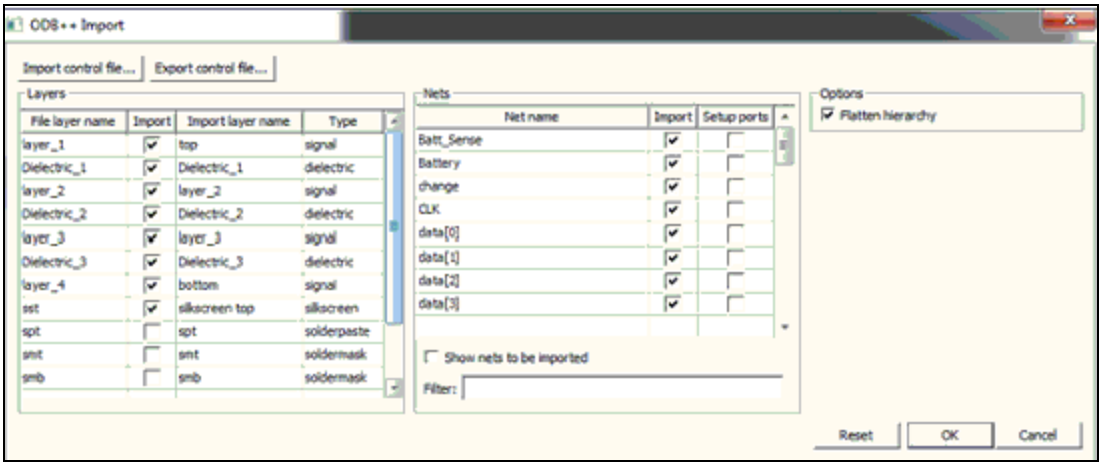
Importing ODB++ into the Layout Editor

The Ansys Electronics Desktop (AEDT)™ electronics systems design platform supports importing ODB++ from many platforms. The translator relies on optional information in the EDA data file and component layer files to integrate the manufacturing data into PCB level objects such as Padstacks. If this data is missing the design may not be imported correctly. When first importing a design into AEDT, please make note of any error or warning messages; common issues include:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Split plane layers have not been poured (generated)
- Unused interior pads are not output
- Nets have not been defined or have been "anonymized" away
- Components lack reference designators or part numbers

To access the window shown in the following diagram, refer to Importing Files into the Layout Editor. Select a *.tgz* file or a Windows directory to import, to open the **ODB++ Import** window.



The window is initialized with the nets and layers on the imported design. Note that while signal layers can be excluded, they are imported if a hole begins or ends on that layer. Excluding layers can speed up both the translation and import into AEDT. Excluding nets can also speed up the import of a design into AEDT and make the design easier to work with.

- **Import stackup and options** allows you to import information from an xml control file or a layer mapping file into the window. Note the information contained in the control file is exported on the Layer Stackup window and is not directly usable by the translator if layer names are changed. One can however combine the records for renaming layers with the control file exported on the stackup window; for more information see Control File Usage with Renaming. Ansys Electronics Desktop also supports reading .tech and .layermap files.
- **Export control file** creates an xml control file using the information imported to the window to the location specified. This file can either be imported and used through the window or used directly with Anstranslator.exe.

Layers Pane

- **Import** check box specifies which layers to import. Note that while signal layers can be excluded they always be imported if the signal layer is at the top or bottom of a hole (padstack).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Import Layer Name** renames a layer. Note that all layers including drawing layers can be renamed. Once imported into AEDT this mapping are lost and you need to refer to these layers by their new name.
- **Type** is set based on properties in the ODB++ file and can be changed if needed.

Nets Pane

- **Import** check box specifies which nets to import. Ensure **Dummy** is checked if you want to import the metal not assigned to a specific net.
- Check **Setup Ports** to automatically creates ports on imported nets.

Options Pane

- **Flatten Hierarchy** should usually be selected. This makes sure that all the component data is moved down and is ready for simulation.

Control File Usage

Importing a control file into the window preserves not only the layer settings but also the Component property section of the .xml file. This means that if you import the following control file C28 has a value of 4.7nF.

```
<?xml version="1.0" encoding="UTF-8" standalone="no" ?>
<c:Control xmlns:c="http://www.ansys.com/control"
schemaVersion="1.0">
  <Components schemaVersion="1.0">
    <TypeMap>
      <!-- Match C28 exactly -->
      <RefDes RegEx="C28" Type="Capacitor" SC_Value="4.7n"/>
    </TypeMap>
  </Components>
</c:Control>
```

For details on the TypeMap see ODB++ Control File Part Mapping.

Importing IPC2581 rev.a, rev.b, and rev.c Files into the Layout Editor

Note that the Ansys Electronics Desktop (AEDT)™ electronics systems design platform only supports IPC2581 rev.a and rev.b, and interprets the default behavior based on the schema. All references to IPC2581 signify only rev.a or rev.b.

IPC2581 rev.a

Design should be exported as "Full".

IPC2581 rev.b

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Design should be exported as "User" design with all data selected.

IPC2581 rev.c

Design should be exported as "User" design with all data selected.

Importing Files

For information on how to initially access the IPC2581 import window (**File** > **Import**), see the introductory topic Importing Files into the Layout Editor. Select a *.cvg* or *.xml* file or a Windows directory to open the **IPC2581 Import** window. The window initializes with the nets and layers on the imported design.

- **Import stackup and options** allows you to import information from an xml control file or a layer mapping file into the window. Note the information contained in the control file is exported on the Layer Stackup window and is not directly usable by the translator if layer names are changed. The **Edit Layers** window is not used by the translator and is ignored.
- **Export control file** creates an xml control file using the information imported to the window to the location specified. This file can either be imported and used through the window or used directly with Anstranslator.exe. Note that this can be used to read in an IPC Layer Stackup file and export an .xml file that can be used with an IPC2581 file.

Layers Pane

- **Import** check box specifies which layers to import. Padstacks are shortened or removed entirely as selected. Type is set based on properties in the IPC2581 file and can be changed if needed. The only exception is the "SOLDERMASK" layer which are imported as a dielectric layer.
- **Import Layer Name** renames a layer. Note that all layers including drawing layers can be renamed. Once imported into AEDT, this mapping are lost and you need to refer to these layers by their new name.

Nets Pane

- **Import** check box specifies which nets to import. Ensure **Dummy** is checked if you want to import the metal not assigned to a specific net.
- Check **Setup Ports** to automatically creates ports on imported nets.

Importing DXF and DWG Format Files into the Layout Editor

The Ansys Electronics Desktop (AEDT)™ electronics systems design platform imports AutoCAD version 2.5 (AC1002) through 2012 (AC1024) on Linux and version 2.5 (AC1002) through 2017 (AC1027) on Windows. See the introductory topic Importing Files into the Layout Editor for the initial steps in the process of importing 2D data into the Layout Editor. Once a 2D model file is selected, an explorer window opens.

The window is initialized with the layers on the imported AutoCAD file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Import stackup and options** allows you to import information from an xml control file or a layer mapping file into the window.
- **Export control file** creates an xml control file using the information imported to the window to the location specified.

Layers Pane

- **File Layer Name** is name of layer as stored in the dxf or dwg file.
- **Import** check box specifies which layers to import.
- **Import layer name** is the name of the new layer. Note the information contained in the control file is exported on the **Layer Stackup** window and is not directly usable by the translator — if layer names are changed. One can, however, combine the records for renaming layers with the control file exported on the stackup window; for more information see Control File Usage with Renaming. AEDT also supports reading .tech and .layermap files.
- **Type** can be changed and identifies the layer type that are used to place each layer in the file. Via and wirebond types are special and allows users to select the start and stop layers by expanding the window's width.

Options Pane

- Use **Override AutoCAD file units and the Units** drop-down menu to select units to interpret the DXF/DWG file contents.
- **Import Only Named Nets** – Only applicable when a valid 3D Layer stackup is imported. When checked this option sets *ImportDummyNet="false"*.

Objects Pane

- Use the check boxes to fine-tune the import:

  — Auto detect closure checks polylines to see whether they are closed. If a polyline is closed, AEDT creates a polygon in the design.

  — Self stitch causes multiple straight line segments to be joined to form polylines. Tolerance is used to decide if two coordinates are the "same" and should be considered for joining. If the resulting polyline is closed, a polygon is created in AEDT. You have the choice of two different tolerances for self stitching: **DefaultTolerance** and explicit **Tolerance**. Default tolerance is a geometric tolerance based on the extents of the project being imported. Explicit tolerance allows you to expand the tolerance based on your knowledge of the dxf project being imported.

  — Defeature removes certain small features in the imported geometry to reduce complexity. The features that are removed include multiple points placed in the specified distance, thin or narrow regions ("thins" and "spikes"), and extraneous points along straight line segments. Specify the distance in the **Tolerance** area.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

— Round coordinates rounds all imported data to the specified number of decimal places.

— Convert closed wide lines to polygons imports wide polylines as polygons. You have more flexibility to change the shape of such an object when it is imported as a polygon.

The following DXF entities can be imported as 2 dimensional objects from AutoCAD:

- Arc
- Solid
- Circle
- Block
- Ellipse
- Array of blocks (MInsert)
- 2D Polyline, Polyline, and Line

When you have completed selections on both tabs, click **OK** on either tab and the file is imported into the active **Layout** window.

Via and Wirebond Types

- **Via** – By "_Default_", Start Layer is the top-most signal layer and Stop Layer is the bottom-most layer. To set up blind and buried vias it is best to start by setting the layer types for all layers , then reorder by dragging the rows by selecting the filled-in cell on the left.
- **Wirebond** – By "_Default_", Start Layer" and "Stop Layer" are set to the signal layer directly underneath the Wirebond. If no signal layer lies underneath the Wirebond the "Start Layer" and "Stop Layer" are set to the bottom-most layer. Wirebond layer rows can be moved up and down by dragging and dropping.

Importing Cadence APD/ALLEGRO/SIP Files into the Layout Editor

The Ansys Electronics Desktop (AEDT)™ electronics systems design platform supports Extracta Import from Cadence. Note that Extracta.Exe is a Cadence supplied executable and must be installed on your machine and on your executable path for this to work. To access the window shown in the following diagram, refer to Importing Files into the Layout Editor. Once a *.brd*, *.sip*, or *.mcm* file is selected, an explorer window opens.

The window is initialized with the nets on the imported design.

- **Import stackup and options** allows you to import information from an xml control file or a layer mapping file into the window. Note the information contained in the control file is exported on the Layer Stackup window and is not directly usable by the translator if layer names are changed. One can however combine the records for renaming layers with the control file exported on the stackup window; for more information see Control File Usage

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

with Renaming. Ansys Electronics Desktop also supports reading .tech and .layermap files.

- **Export control file** creates an xml control file using the information imported to the window to the location specified. This file can either be Imported and used through the window or used directly with Anstranslator.exe.

Nets Pane

- **Import** check box specifies which nets to import.
- Check **Setup Ports** to automatically creates ports on imported nets.

Options Pane

- **Import Dummy Net** – Imports all metals on the specified net. This is independent of the list of nets.
- **Default Component** – When default component is checked, if components come in without resistor, capacitor or inductor types, a default RLC value is set commensurate with the type and a best guess at pin pairing is generated.
- **Import Hatching** – Extracta has an option to export plane data, with or without hatching. If this option is checked hatching are generated.
- **Import Bondwire Definitions** – Select an XML file from which to import bondwire definitions

Control File Usage

Importing a control file into the window preserves not only the layer settings but also the Component property section of the .xml file. This means that if you import the following control file, C28 has a value of 4.7nF.

```
<?xml version="1.0" encoding="UTF-8" standalone="no" ?>
<c:Control xmlns:c="http://www.ansys.com/control"
schemaVersion="1.0">
  <Components schemaVersion="1.0">
    <TypeMap>
      <!-- Match C28 exactly -->
      <RefDes RegEx="C28" Type="Capacitor" SC_Value="4.7n"/>
    </TypeMap>
  </Components>
</c:Control>
```

For details on the TypeMap see ODB++ Control File Part Mapping.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Importing XFL Files into the Layout Editor

For information on how to initially access the XFL import window (**File** > **Import**), see the introductory topic Importing Files into the Layout Editor. After selecting an *.xfl* file, the XFL import window opens initialized with nets on the design.

- **Import stackup and options** allows you to import information from an xml control file or a layer mapping file into the window.
- **Export control file** creates an xml control file using the information imported to the window to the location specified. This file can either be imported and used through the window or used directly with Anstranslator.exe. Note that this can be used to read in an IPC Layer Stackup file and export a *.xml* file that can be used with an IPC2581a file.

Nets Pane

- **Import** check box specifies which nets to import.
- Check **Setup Ports** to automatically creates ports on imported nets.

Importing GDSII Format Files in IC Mode

GDSII files are imported into IC mode through the GDSII import window. This window lists layers in the design, allowing users to designate a control file (e.g., a technology file), select from several options, and/or import information from an XML control file, layer mapping file, or a layer filter. Once GDSII files (*.*gds*, *.*sf*, or *.*strm*) are imported into the Ansys Electronics Desktop (AEDT)™ electronics systems design platform, they can be edited in the **Layout Editor** (IC mode). IC mode reconfigures the **Layout** tab with new commands which allow users to import, simplify, and convert large GDSII files into EDB (i.e., Electronic Database) files.

1. Import the GDSII file with a control file.
2. Simplify the design using the tools available in IC mode:
    a. Crop and delete inappropriate objects
    b. Group vias
    c. Snap vias
    d. Wrap geometry
    e. Snap primitives
    f. Trace nets

Importing a GDSII file

The **GDSII Import** window provides a basic layer mapping which is numerically ordered based on the first layers provided in the GDSII file. To improve the mapping, add a control or technology file, and a layer map file. These files map layers in the GDSII file to layers in the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

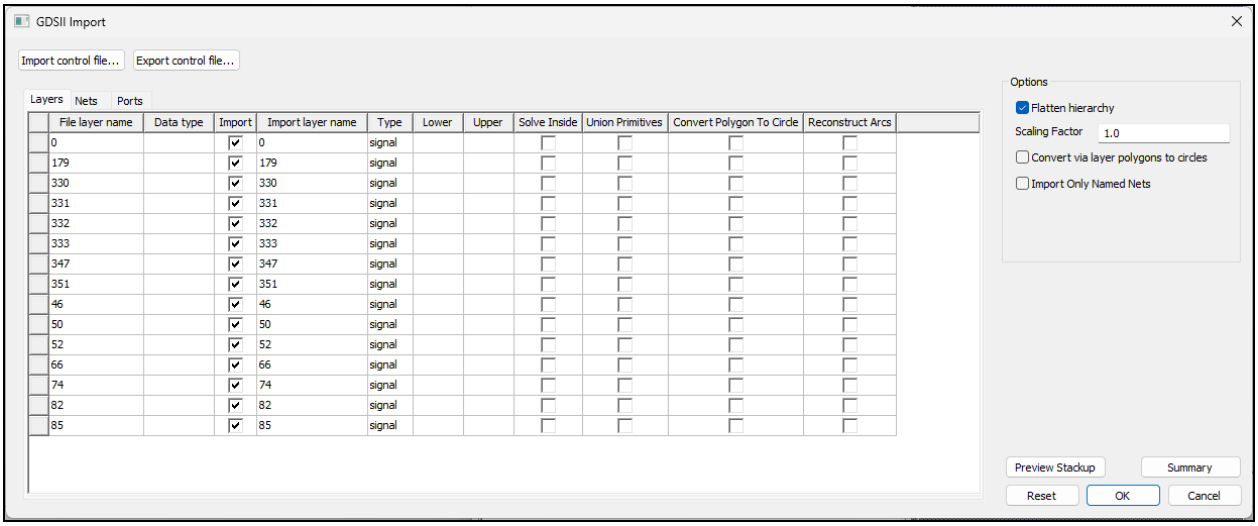
imported stackup. Each set of geometries in the GDSII file only appear on a single layer, so multiple file layers can map to an import layer but file layers cannot map to multiple import layers.

Layers can be renamed during the import process, but the information contained in the control file is exported on the Layer Stackup window and is not directly usable by the translator. When a design is imported, layer mapping is not maintained internally. To re-translate a design with renamed layers, use the same layer names specified in the GDSII file. It is also possible to combine the records for renaming layers with the control file exported on the stackup window. See Control File Usage with Renaming.

> **Note:**
>
> A new OASIS translator (i.e., Open Artwork System Interchange Standard) has been introduced as a beta feature in Anstranslator. To use this functionality, enter `-i=oasis` at the command prompt while running a command. All arguments that are valid for GDSII files should work with OASIS (*.oasis) files. The **GDSII Import** window in AEDT now supports importing OASIS files.

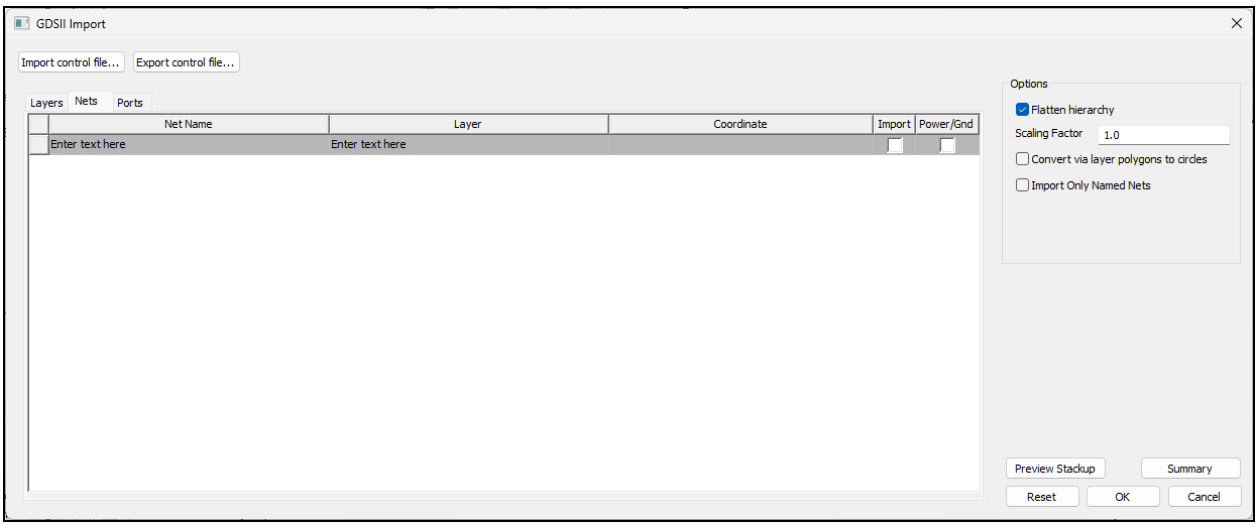
If all conductive layers have thickness, the three-dimensional connectivity of the design is used to generate nets. Follow these steps to import a GDSII file with AEDT.

1. From the **File** menu, select **File** > **Import** > **GDSII** to open an explorer window.
2. Navigate to the selected GDSII (*.gds) file in the explorer window. Then double-click the file or select the file and click **Open** to open the **GDSII Import** window, on the **Layers** tab. This window contains three tabs: **Layers**, **Nets**, and **Ports**.
    - **Layers** – displays layer import options, layer parameters, and editable geometry options (i.e., **Solve Inside**, **Union Primitives**, **Convert Polygon To Circle**, and **Reconstruct Arcs**).

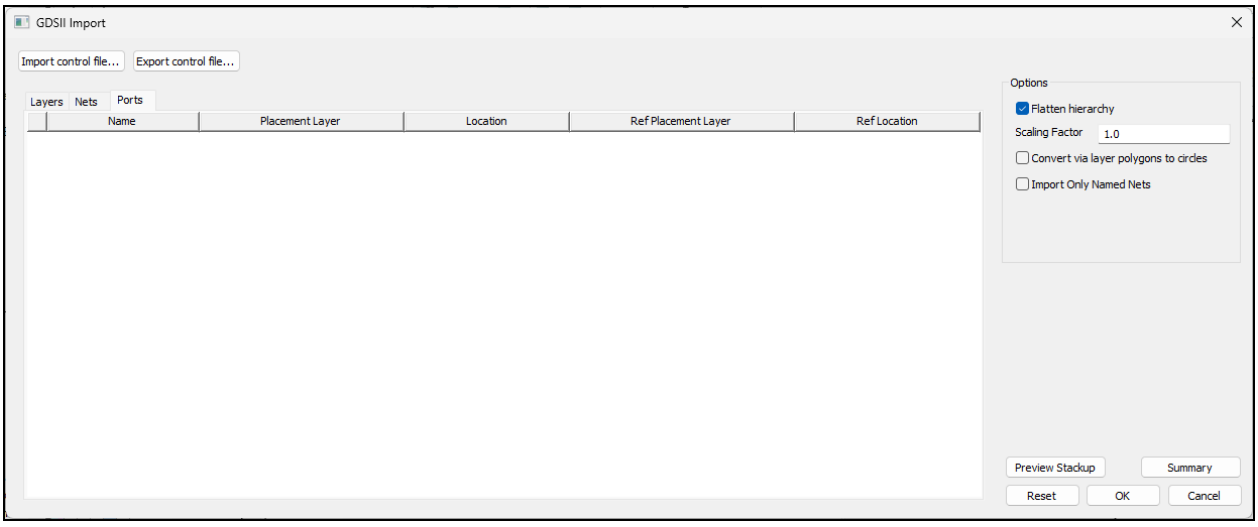


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Nets** – allows users to select nets by **Net Name**, **Layer**, or **Coordinate** for **Import** and designate **Power/Gnd** nets.

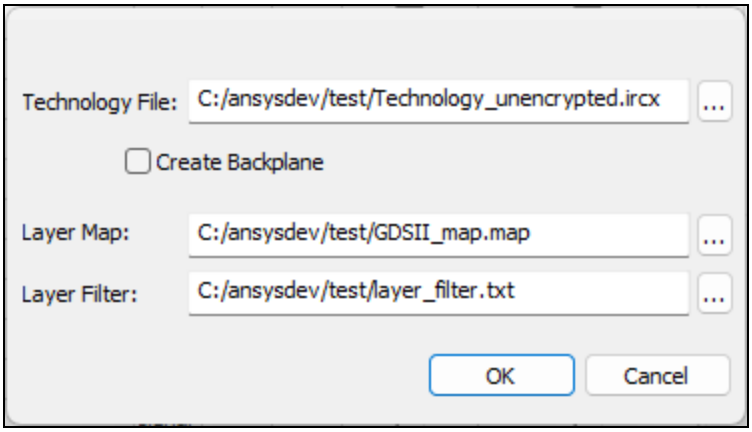


- **Ports** – provides a list of ports and a method of adding ports via *.csv* file. Refer to Add Ports From a *.CSV* File.



3. Use an XML control file to change import settings. To import a control file or technology file, perform the following substeps:
    a. From the **GDSII Import** window, click **Import control file** to open a window with three fields (i.e., **Technology File**, **Layer Map**, and **Layer Filter**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



> **Note:**
>
> A **Technology File** and **Layer Map** are required. All selected files **must** reference compatible (i.e., in sync) data or errors will result.

b. Click the [**...**] button next to the **Technology File** field to open an explorer window.

> **Note:**
>
> To change the root directory that opens when clicking the **Technology File** [**...**] button, create the environment variable `ANSYS_GDS_TECHFILE_ROOT` with the value of the appropriate directory path (e.g., `C:\TechFiles\TestFolder`).

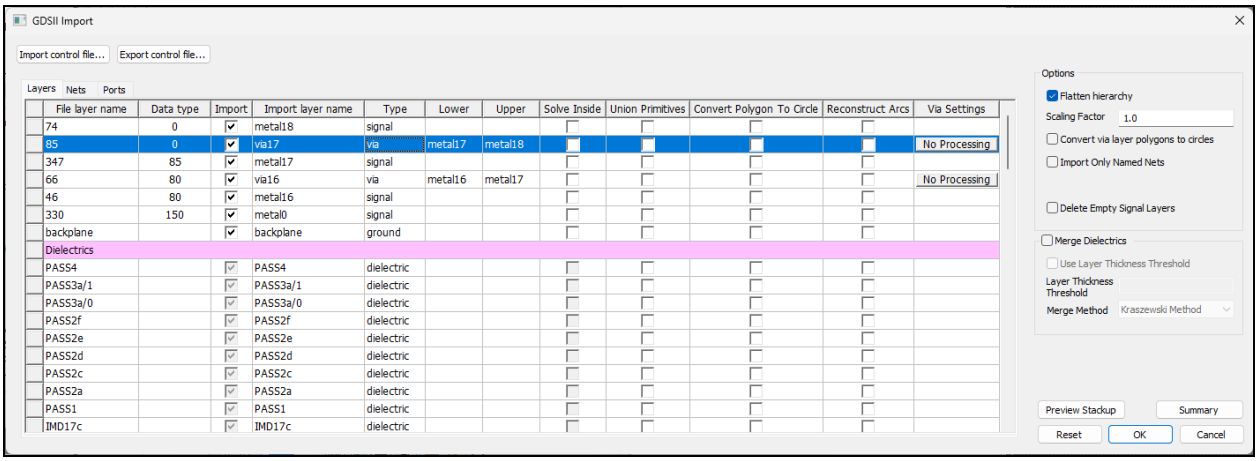
c. Navigate to the selected technology file or control file. Then double-click the file or select the file and click **Open** to close the explorer window and return to the previous window.

> **Note:**
>
> A technology file can have an *.xml*, *.layermap*, *.ircx*, *.vlc.tech*, or *.itf* extension.

4. If a technology file is imported, at user discretion, check the **Create Backplane** box.
5. If a technology file is imported, click the [**...**] button next to the **Layer Map** field to open an explorer window.
6. Navigate to the selected *.map* file. Then double-click the file or select the file and click **Open** to close the explorer window and return to the previous window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

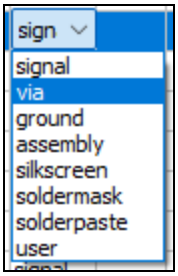
7. If applicable, click the **[...]** button next to the **Layer Filter** field to open an explorer window. A technology file must either contain references to the same number of signal/via layers in a design's stackup or a layer filter can be used to specify which layers from the technology file to redefine within the stackup. Refer to Adding a Technology File to a Design.
8. Navigate to the selected *.txt* file. Then double-click the file or select the file and click **Open** to close the explorer window and return to the previous window.
9. Click **OK** to close the window and import the technology file and/or the map file. When an imported control file contains dielectric layers, the layers are separated in the **Layers** tab, and an additional **Merge Dielectrics** area appears beneath the **Options** area.



10. If applicable, check the **Merge Dielectrics** area box, and the **Use Layer Thickness Threshold**check box. If the **Use Layer Thickness Threshold** box is checked, enter a value in the **Layer Thickness Threshold** field and select a **Merge Method** from the drop-down menu. Refer to Dielectric Simplification (Merging).
11. If applicable, select **Delete Empty Signal Layers**.
12. From the **Layers** table:
    a. Check the boxes in the **Import** column to choose which layers to import (all layers checked by default).
    b. Rename any layer on the text fields in the **Import layer name** column.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

c. Set the type of each layer from the drop-down menus in the **Type** column.



> **Note:**
>
> If a layer's type is set to **via**, the **Via Settings** column appears in the **Layers** tab and the **GDSII Import** window automatically resizes to fit. The geometry on the via layer is converted to a padstack instance between the signal layer above (**Upper**) and the signal layer below (**Lower**). Values for **Upper** and **Lower** are filled automatically.
>
> For on-chip structures, click **No Processing** in the **Via Settings** column to open the **Via Settings** window. Then, at user discretion, check the **Via Grouping** or **Via Snapping** boxes, select **Grouping/Snapping Methods** from the drop-down menus, enter **Tolerance** thresholds, and make additional changes, as appropriate (i.e., check the **Check Containment** or **Remove Dangling Vias** boxes). Finally, click **Apply**.

d. If applicable, use the check boxes for each layer to enable any/all of the following geometry options:
   - **Solve Inside** – completes simulation calculations within the specified layer.
   - **Union Primitives** – unites overlapping primitives on the same layer.
   - **Convert Polygons to Circles** – converts polygons within a minimum threshold into circles.
   - **Reconstruct Arcs** – smooths and reconnects segmented arcs within a minimum threshold.

13. If applicable, enable other options in the area:
    - **Flatten hierarchy** – flattens hierarchies in a design *after* the design is modified.
    - **Scaling Factor** – scales the XY coordinates of all geometries. It does not apply to layer thickness (default is 1.0, which represents no change). The scaling factor *t* can be any real number greater than 0.
    - **Convert via layer polygons to circles** – changes any polygons on via layers to

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

circles.

- **Import Only Named Nets** – only imports geometry that is assigned to a named net.

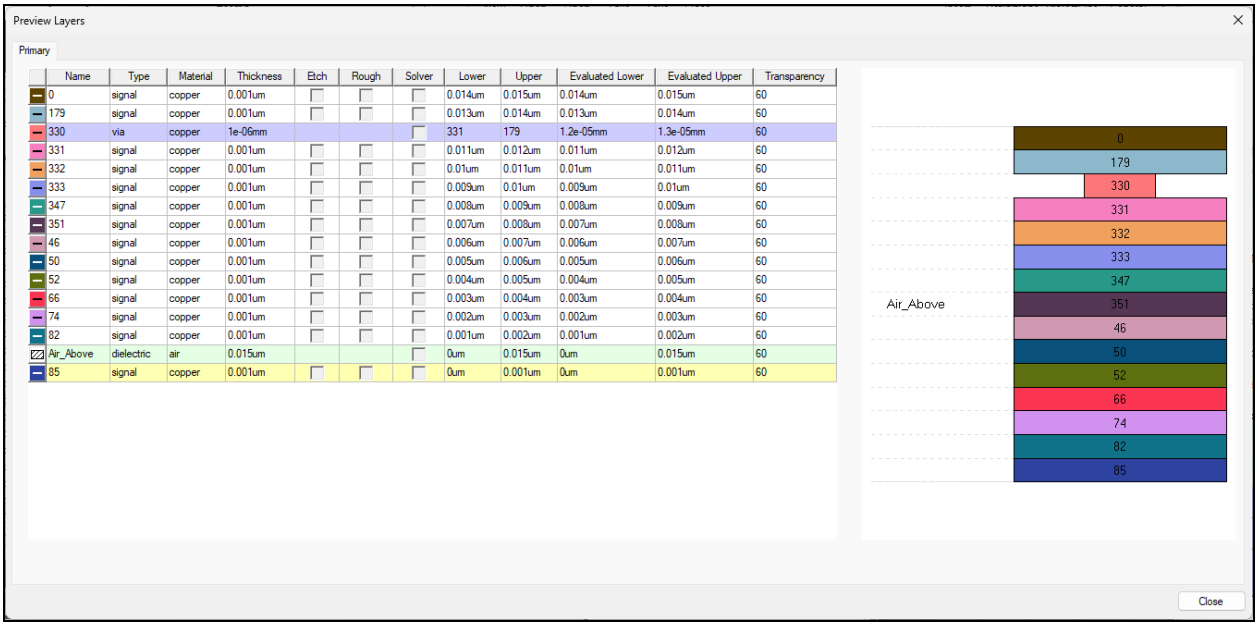
14. To create a new control file that includes any changes made in this window, click **Export control file.**.
15. Click **OK** to open the file in the **Layout Editor**.

> **Note:**
>
> Any geometrically identical primitives that meet the requirements will be automatically compressed to improve system and simulation performance.

The procedure is complete.

The Preview Stackup Window

Click **Preview Stackup** to open the **Preview Layers** window, which displays the stackup data table and visual representation of the stackup.

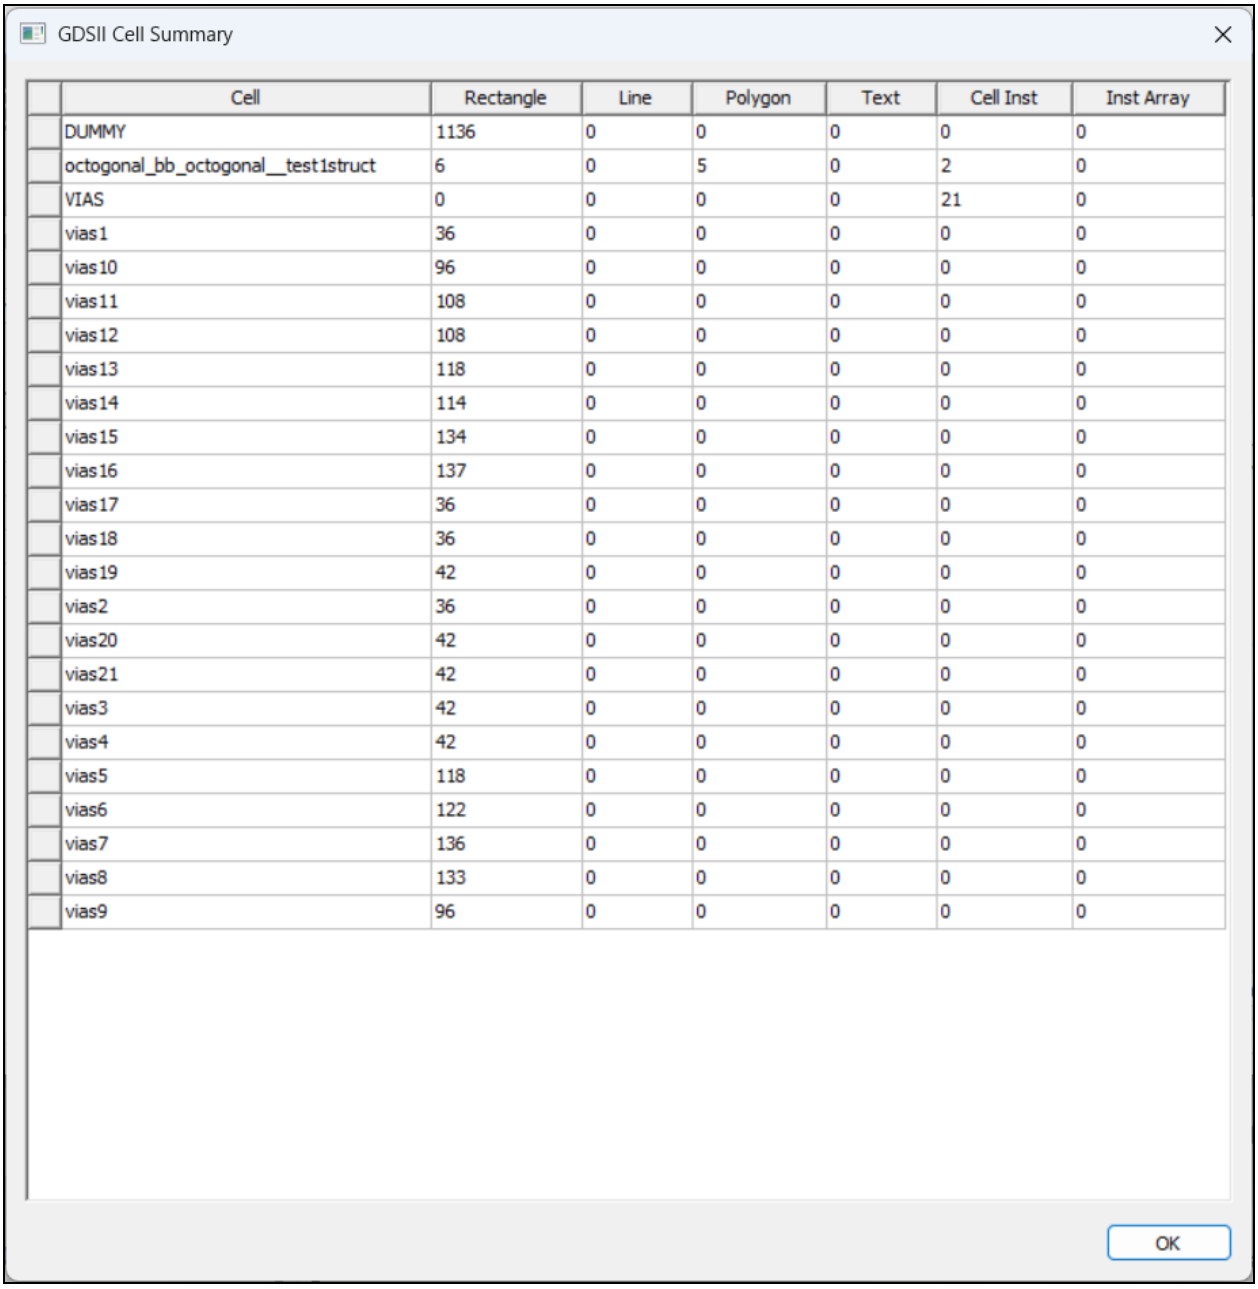


> **Note:**
>
> The default **Thickness** of imported layers is **1e-6m** (i.e., **0.001um**). **Elevation** is calculated dynamically according to the entered thickness of all layers.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The Cell Summary Window

Click **Summary** to open the **GDSII Cell Summary** window, which lists the number of rectangles, lines, polygons, texts, cell instances, and instance arrays for each cell.



Cell	Rectangle	Line	Polygon	Text	Cell Inst	Inst Array
DUMMY	1136	0	0	0	0	0
octogonal_bb_octogonal__test1struct	6	0	5	0	2	0
VIAS	0	0	0	0	21	0
vias1	36	0	0	0	0	0
vias10	96	0	0	0	0	0
vias11	108	0	0	0	0	0
vias12	108	0	0	0	0	0
vias13	118	0	0	0	0	0
vias14	114	0	0	0	0	0
vias15	134	0	0	0	0	0
vias16	137	0	0	0	0	0
vias17	36	0	0	0	0	0
vias18	36	0	0	0	0	0
vias19	42	0	0	0	0	0
vias2	36	0	0	0	0	0
vias20	42	0	0	0	0	0
vias21	42	0	0	0	0	0
vias3	42	0	0	0	0	0
vias4	42	0	0	0	0	0
vias5	118	0	0	0	0	0
vias6	122	0	0	0	0	0
vias7	136	0	0	0	0	0
vias8	133	0	0	0	0	0
vias9	96	0	0	0	0	0

Reset

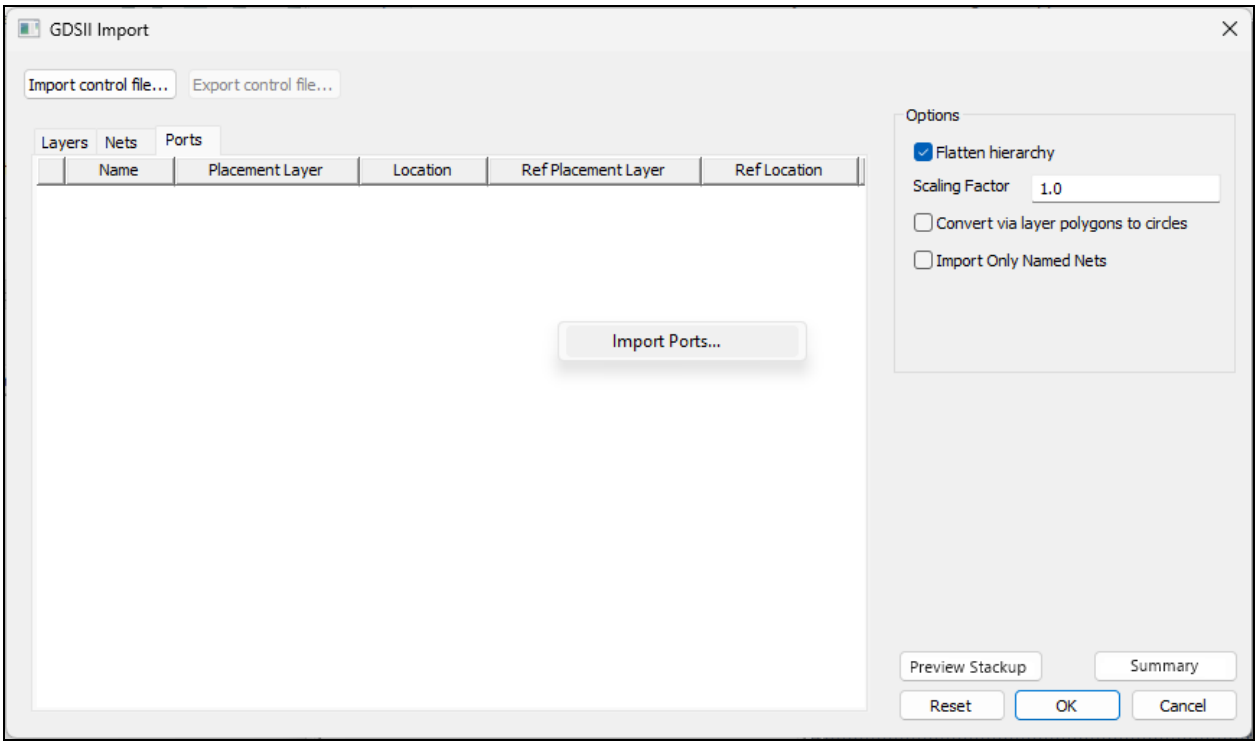
Click **Reset** to undo all changes made since importing the GDSII file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Adding Ports From a *.CSV* File

Import ports from a *.csv* file by following these steps.

1. From the **Ports** tab, right-click in the port grid and select **Import Ports** to open an explorer window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Here is an example of port data displayed in a file:

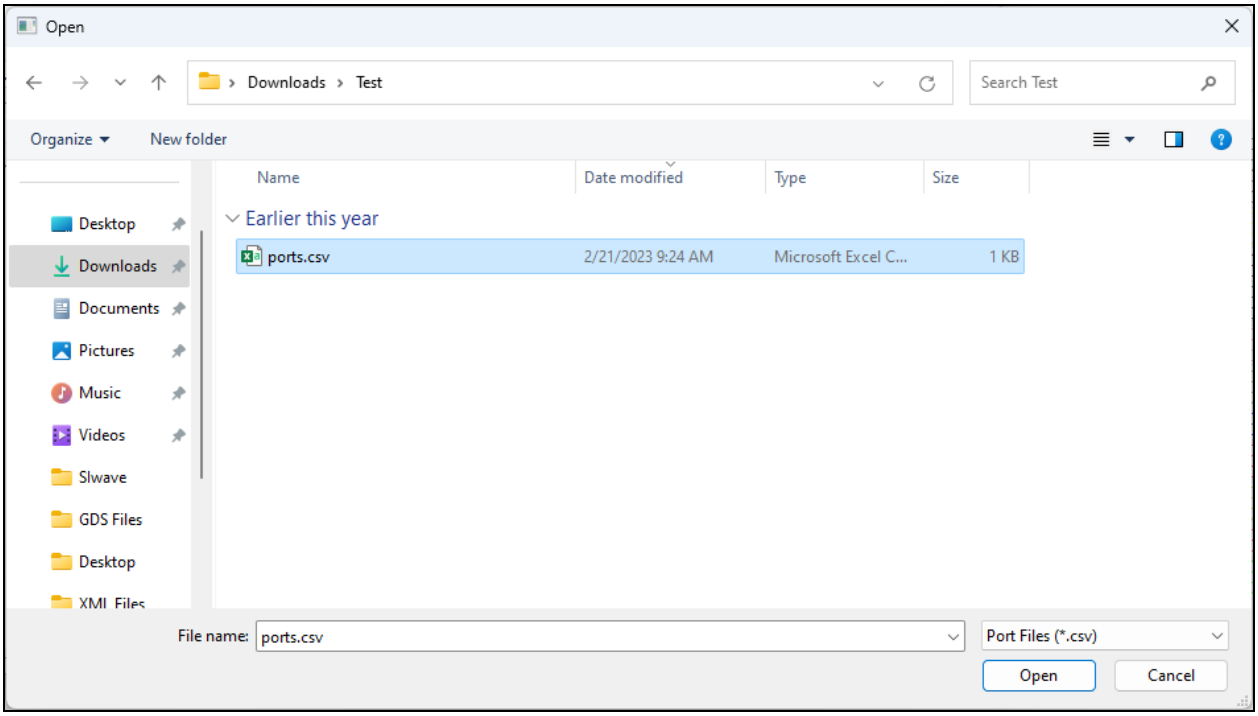
```
! example of two ports
#unit mm
port1  -9 0   Metal9   -9 0   Metal6   40
port2  9 0    Metal9   9 0    Metal6   60
```

Keep in mind the following:

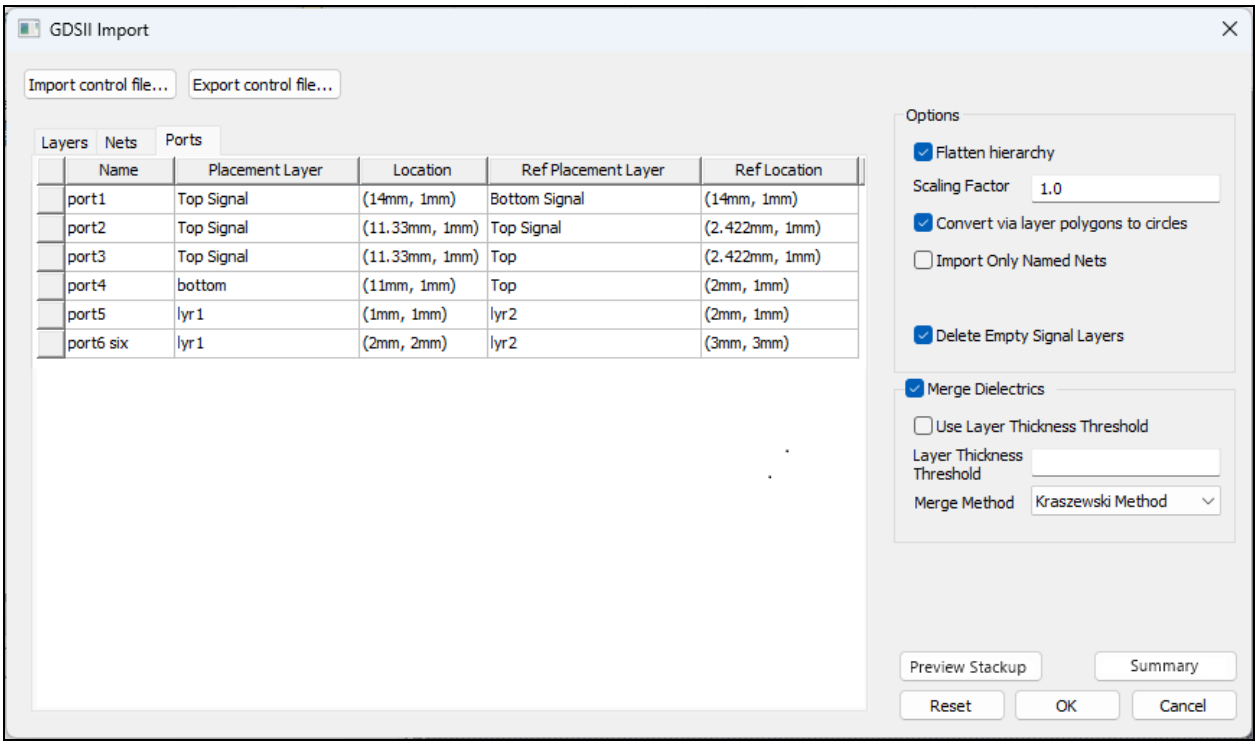
- Port data in a **.csv* file must be entered precisely: <`port name`> <`x coordinate`> <`y coordinate`> <`placement layer name`> <`x coordinate`> <`y coordinate`> <`reference placement layer name`> <Z_0 (i.e., port impedance)>
- `!` and/or `*` are comment lines, ignored during import
- `#unit` <`abbreviation of unit of measurement`> specifies the unit of measurement used
- data can be separated by commas or spaces

2. Navigate to the selected *.csv* file. Then double-click the file or select the file and click **Open** to close the explorer window and return to the **GDSII Import** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. The ports grid is now populated with the data on the *.csv* file.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click **OK** to save changes and import the GSII file.

The procedure is complete.

Net Tracing in IC Mode

The GDSII file format does not directly support the concept of nets. When the Ansys Electronics Desktop (AEDT)™ electronics systems design platform imports a GDSII file, it creates nets based on the placement of geometries, cells, cell references, and input from the GDSII file's control file text (e.g., text in GDS_CELL_RULES > BLACK_BOX_CELLS and GDS_NET_DEFINITIONS). The **Net Tracing** feature uses the control file text to populate the **Net Tracing** window.

Net Tracing identifies the primitive that encapsulates the text's location (i.e., the seed text), then searches for any primitives that are physically connected to the seed text and adds them to the net. Then Net Tracing searches for primitives that are physically connected to those newly added primitives. This process continues until all physically connected primitives are identified and added to the net.

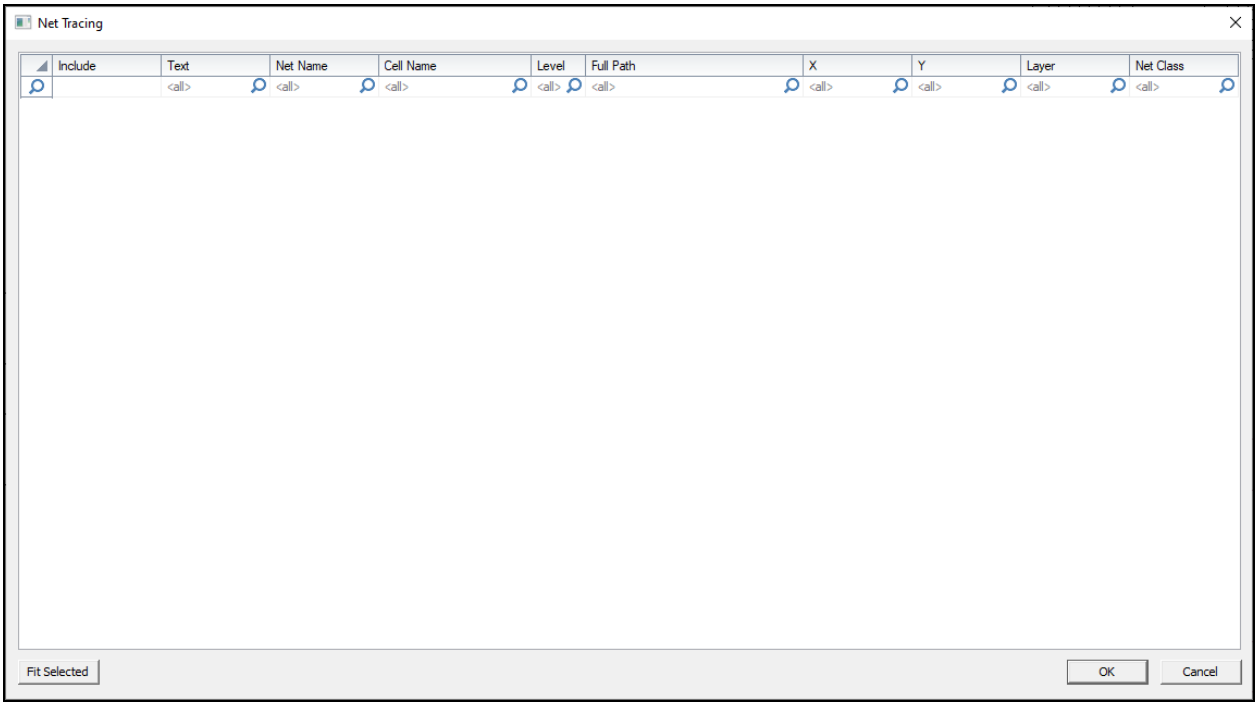
> **Note:**
>
> Only the control file can provide seed text for net tracing. New seed text cannot be added in IC mode.

Follow these steps to access the **Net Tracing** window.

1. From the **Layout** tab, click **Net Tracing**.

   The **Net Tracing** window opens and displays a list of all potential nets and columns of relevant data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **Include** - whether net tracing is performed on this text object (i.e., check or uncheck)
- **Text** - origin text for the net
- **Net Name** - name applied to the net if/when it is created
- **Cell Name** - name of the cell the text is in
- **Level** - level of the net in the design hierarchy
- **Full Path** - specific location of the net in the design hierarchy
- **X** - x coordinate of the starting text
- **Y** - y coordinate of the starting text
- **Layer** - layer the starting text is on
- **Net Class** - name of a group of associated nets

2. Decide which nets to create and check the adjacent box in the **Include** column for each.
3. Click **OK** to close the window. All Included nets are created and their starting text is deleted from the cell. Any remaining text can be used again.

Viewing Physically Connected Elements in IC Mode

From the **Layout Editor**, users can view elements that are physically connected in a design.

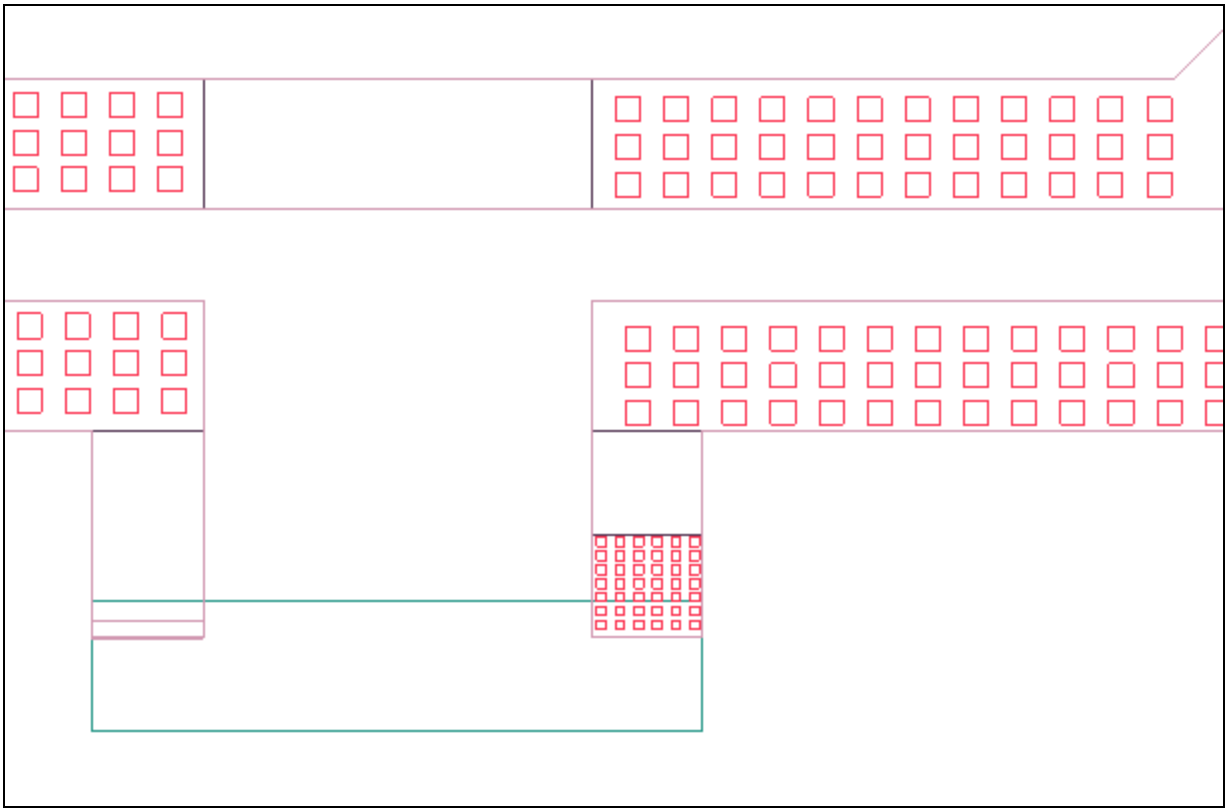
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: Not all elements work with the **Show Physically Connected** feature. Connections through solderballs, planar bondwires, and very simple instances of 3D-extrusion are supported. Bondwires with 3D geometry and most 3D-extrusions cannot be tracked.

Complete the steps in the following subsections to view physically connected elements in the **Layout Editor**, and then an organized list of physically connected elements in the **Design List** window.

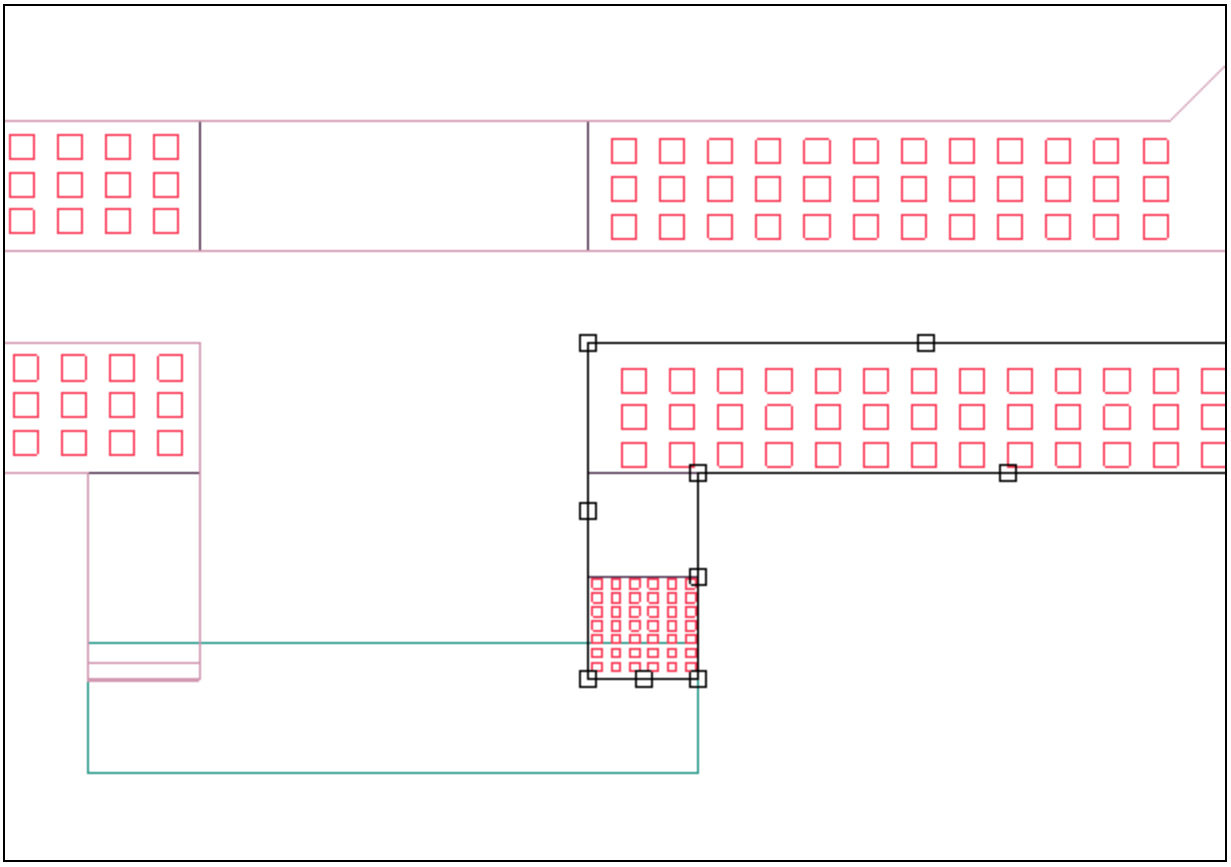
Viewing Physically Connected Elements in the Layout Editor

1. If applicable, navigate to the **Layout Editor** tab and the selected components.

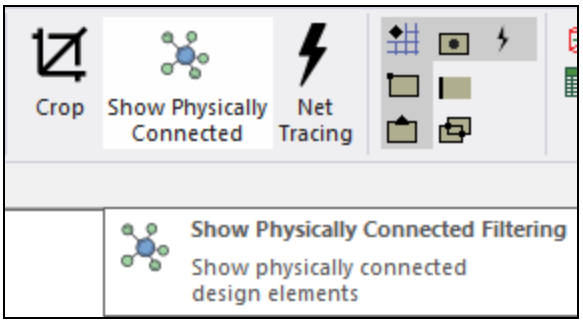


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **Layout Editor**, select a selected element.

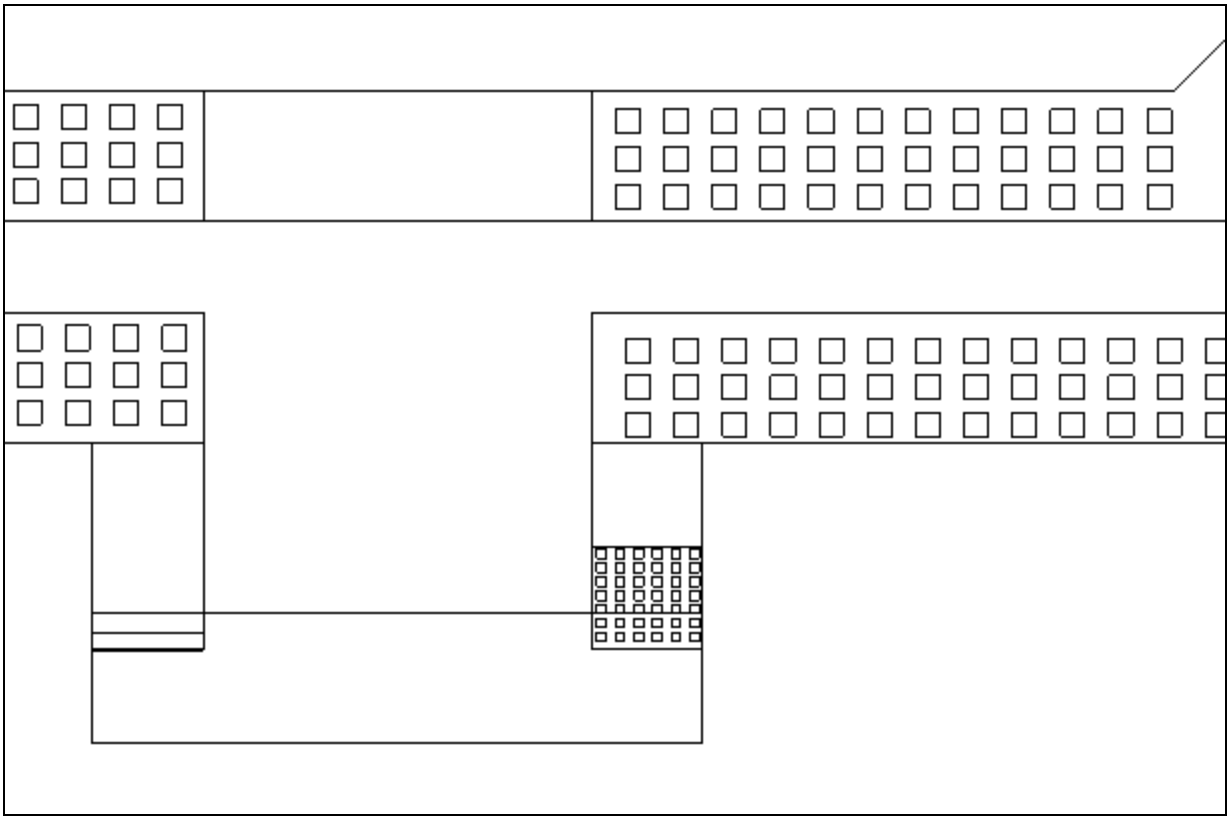


3. From the **Layout** tab, click **Show Physically Connected**.



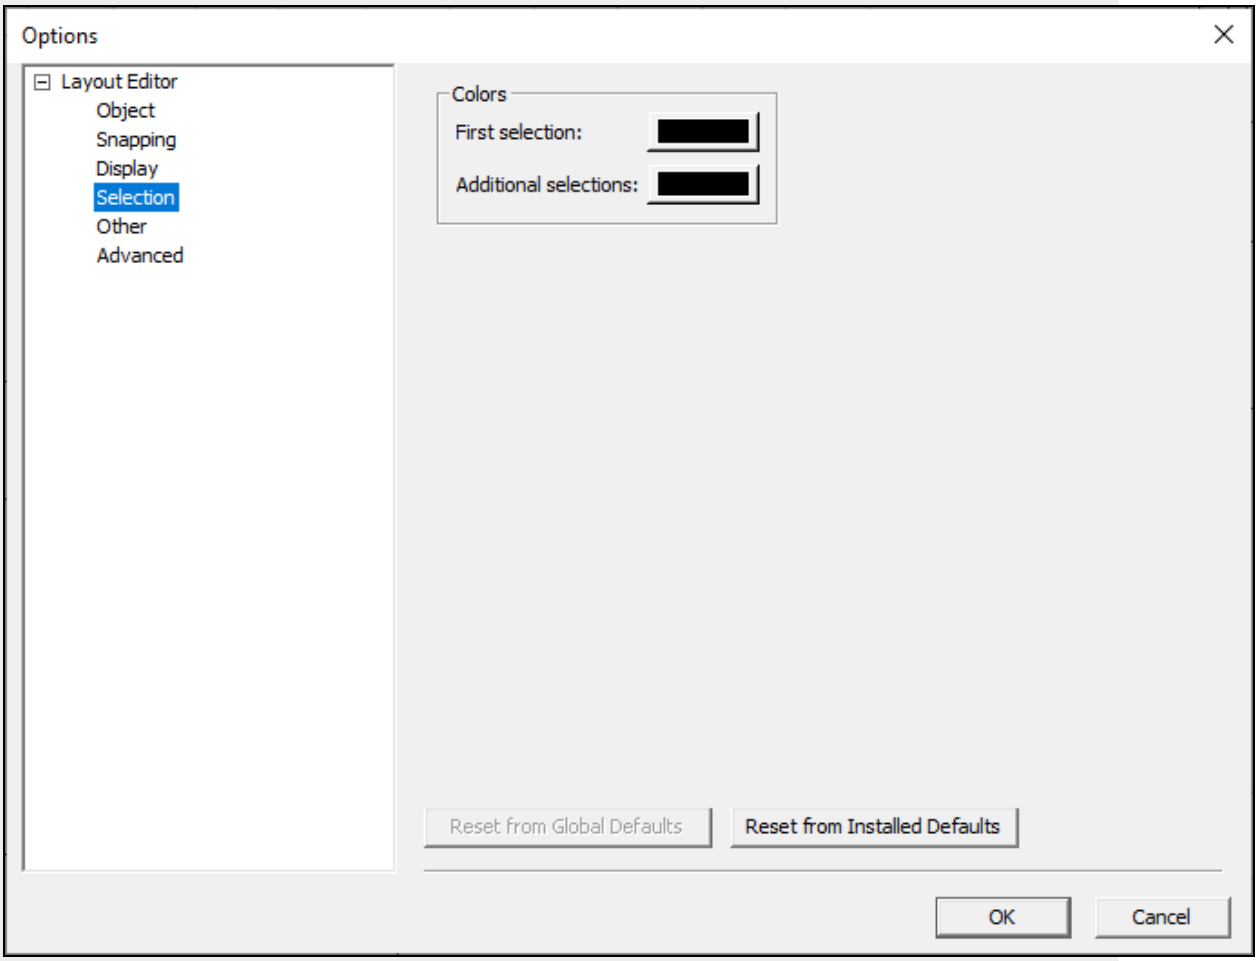
Every element physically connected to the selected element is highlighted.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

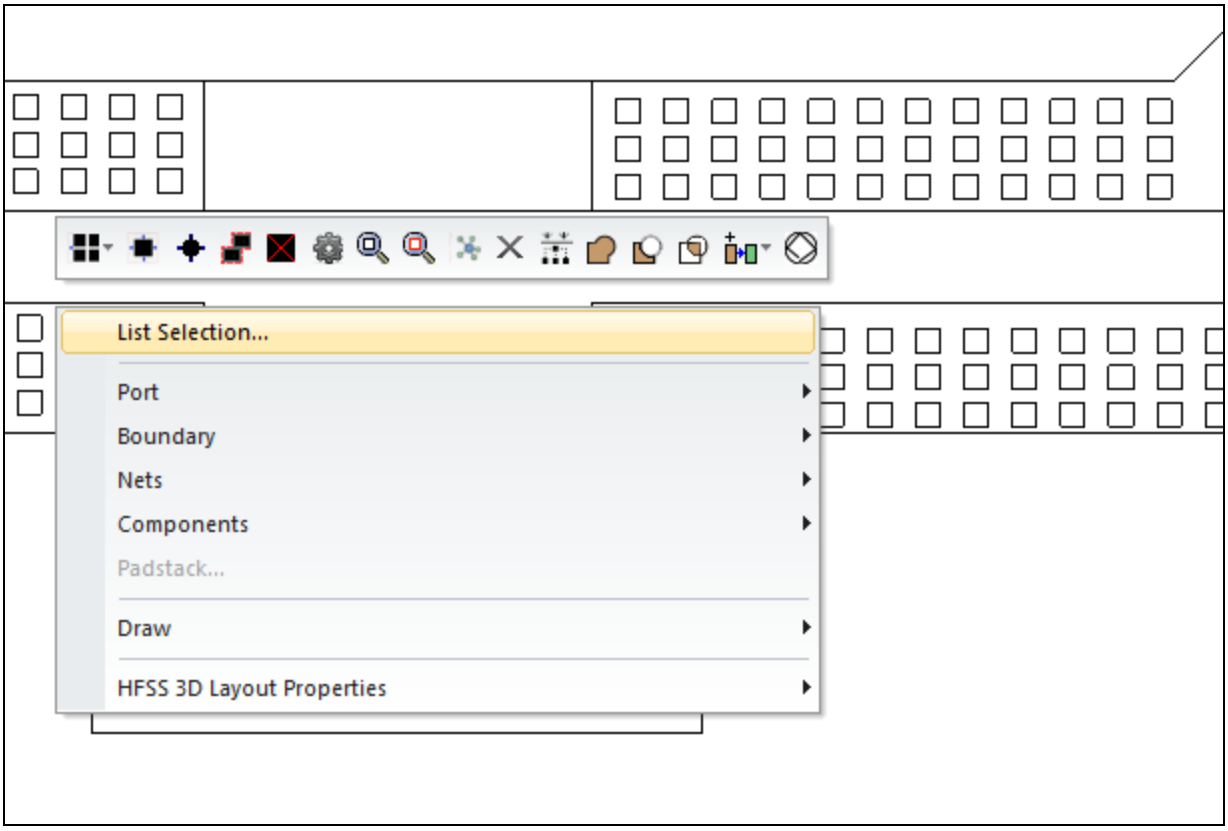
Note: To change the selection and highlight colors, refer to Layout Editor Options: Selection Panel.



Viewing Physically Connected Elements in the Design List Window

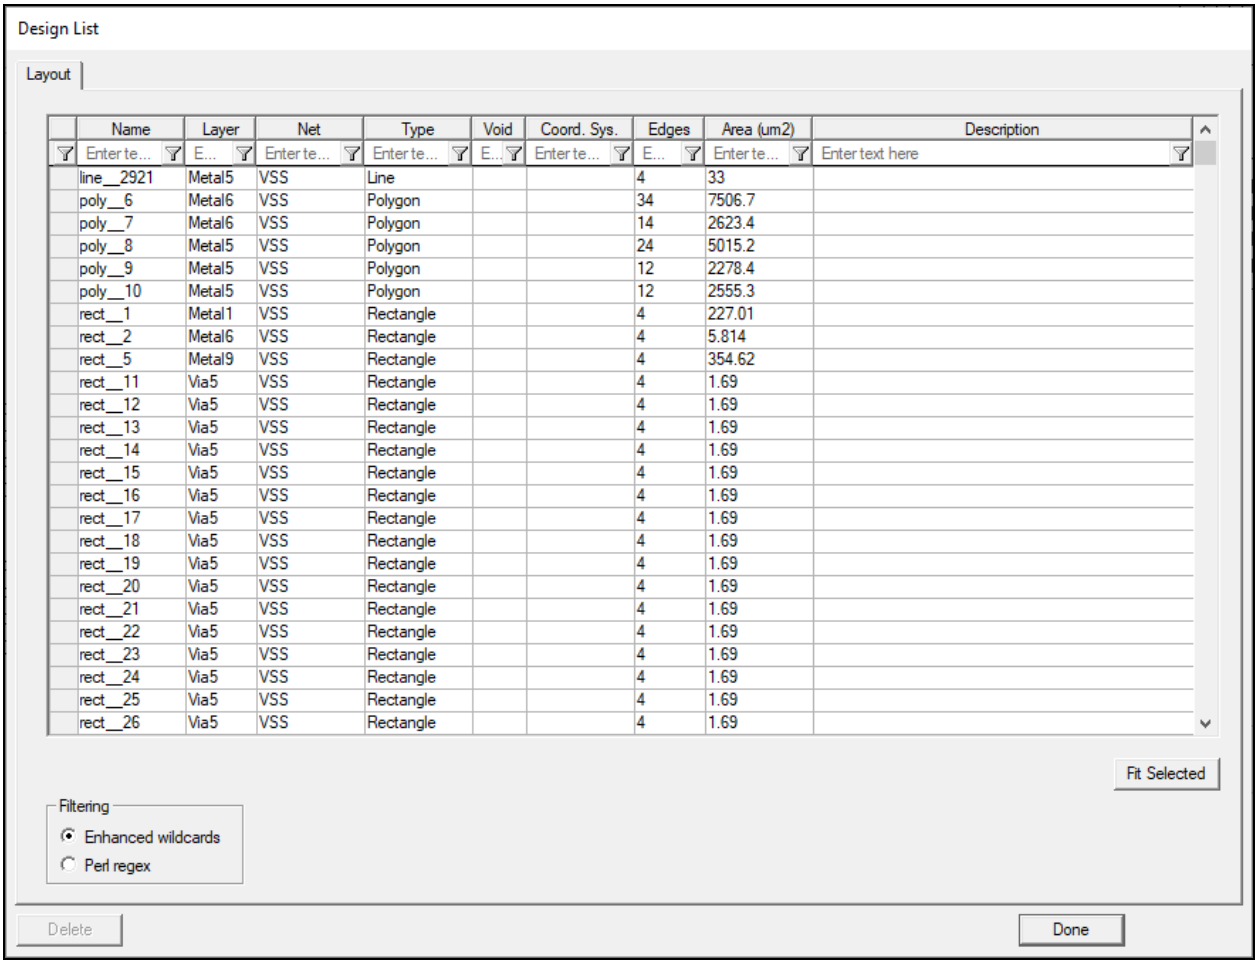
To view a list of the physically connected objects selected in Viewing Physically Connected Elements in IC Mode, right-click within the **Layout Editor** while the selection is still active.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Then select **List Selection** to open the **Design List** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Importing Tabular Arrays

Array data in tabular format can be imported from a file using the **Array Import** wizard. From the **Tools** menu, select **Import Array from Table** to open an explorer window. Then choose *.csv* file to import data from.

The tabular array .csv file should contain the following formatting:

```
arrIndex1    arrIndex2    arrIndex3
c1    "a0"   b1
c2    "a2"   b2
c3    "a3"   b3
```

- First row consisting of list of Array Index Variable names separated by tabs or commas
- Remaining rows consisting of a list of string values separated by tabs or commas

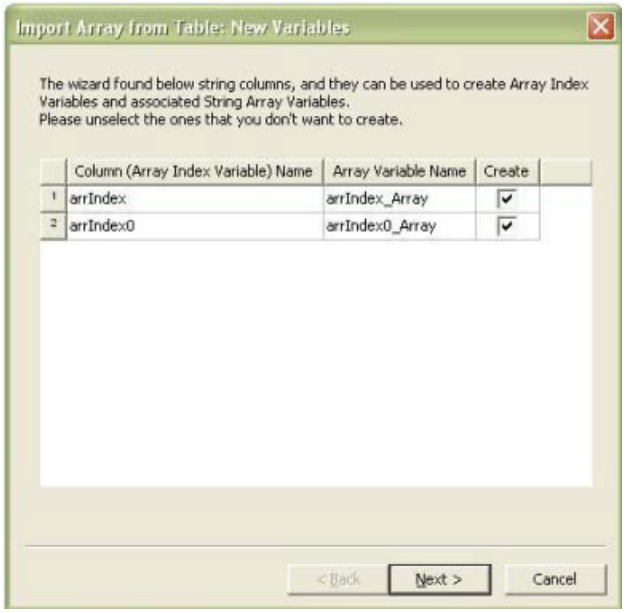
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Double quotation marks (“ “) for string values are optional

After you select a *.csv* file to open.

- If no existing array variables are present in the design, the **Import Array From Table: New Variables** window opens.
- If one or more existing array variables are present in the design, the **Import Array From Table: Existing Variables** window opens.

Each window is shown in the following diagram.



The following controls are available:

- **Column (Array Index Variable) Name** cannot be modified and is used to create the array index variable.
- The associated **Array Variable Name** has the default name “<*ColumnName*>_Array". You can modify the **Array Variable Name**, but variable uniqueness and validity is checked upon closing the wizard.
- Click the **Create** check box to specify that the array index variable should be created.
- Click the control buttons at bottom to go **Back** to the previous wizard window, proceed to the **Next** wizard window, or click **Cancel** to close the window without making changes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If one or more existing array variables are present in the design, clicking **Next** in wizard window opens the **Import Array From Table: Existing Variables** window.

The following controls are available:

- **Array Index Variable** name can *not* be modified.
- **Associated Array Variable** can be modified, but variable uniqueness and validity is checked upon closing the wizard.
- The following choices appear in the **Action** drop-down menu:

  — **Merge with existing value**

  — **Replace existing value**

  — **No Action**

  If you select **Replace existing value**, you are then prompted for verification.

- If you import a file to a design where a string column already exists as an **ArrayIndexVariable**, the value of the variable is checked when imported. If the existing array value is a superset of new array values, the array variable are appear in the **ExistingVariables** window.

Also use the same .csv tabular array file to setup a parametric analysis. See Optimetrics.

When the parametric analysis is set up, the **ArrayIndexVariable** is searched and its index is used to create the table. Whether the **ArrayIndexVariable** refers to a double array or a string array, you must use the array element on the imported file — rather than the index value itself — to set up the **Parametric from File** analysis.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direct Import Cadence APD Links

Direct Import From a Static Data Source

- *.mcm, *.sip, and *.brd requires a binary installation of the Cadence SPB platform. Specifically, extracta.exe must be available and executable in the local environment.
- *.anx is a static data source that can be exported from within Cadence SPB and transported to the local machine. This mechanism allows you to use APDLinks without a local installation of the Cadence tools.

Importing Metal on Nets Without Names

By default, when importing .mcm, .sip, and .brd files, the Ansys Electronics Desktop (AEDT)™ electronics systems design platform filters out all metal on the nets without name. If this behavior is undesirable you need to create a control file with the exact same name as the file you are looking at with the type changed to .xml and located in the same directory. The file should look like the following diagram. If ImportDummyNet is "true" any metal on the dummy net are imported. AEDT also allows control of the assignment of default values to components with the EnableDefaultComponentValues. Legal values for both of these are "true" or "false".

```
<?xml version="1.0" encoding="UTF-8" standalone="no" ?>
<c:Control xmlns:c="http://www.ansys.com/control"
schemaVersion="1.0">
<ImportOptions ImportDummyNet="true"
EnableDefaultComponentValues="true"/>
</c:Control>
```

Layout Links

Utilizing Layout Links take advantage of a closer integration between the 3D Layout and external data sources. Layout Links permits HFSS to host source-specific translation features and allows for plug-ins that behave as “quasi-native” primitives that also use external data semantics. Ensure APDLinks is activated by completing these steps.

1. Select **Tools** > **Layout Links**
2. Click the **Config** tab
3. If applicable, click **AddLink** , then select <installdir>/apdlinks.dll to activate APDLinks.

- Activation of a Link is only required once. On subsequent Ansys Desktop sessions, the link remains available and activate. Once a link is loaded, it is listed in the **AvailableLinks** column of the **Layout Links** tab.
- The Cadence APD/Allegro Link provides **Action** for **Server** configuration, **Options** setup, and **Bondwire** management.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cadence APD Links

Utilizing Cadence APD, take advantage of a closer integration between 3D Layout and external data sources. The following subsections describe Cadence APD link actions regarding servers, options, and bondwires.

Configure Ports for Dynamic Interaction with the Cadence Data Source

- HFSS can interact dynamically with an active Cadence session using IPC. Multiple clients can be configured and ports specified on the **Cadence APD Links** window.

Configure Import Options

- Purge conflicting net geometry: upon import, if the target layout already contains geometry on a given net, delete it.
- Import diestacks: create and adjust layers and geometry using the SiP diestack information.
- Configure discrete components by configuring ports and creating local references for surface mount devices (SMDs).
- Post-import callback by configuring a script to execute after design import.
- Implement naming conventions by specifying how to name imported pins.

Configure and View Active Bondwire Definitions

- Cadence bondwire profile definitions can be loaded and used within HFSS Layout. Profiles found in *.*abwlb* (Ansys Bondwire Definition) files in syslib folder are automatically loaded.
- Profiles are defined and parsed using the Cadence XML Wirebond Document Type Definition.
- Profile definitions can be viewed, imported, and edited in the **Bondwires** tab of the **Edit Libraries** window (i.e., from **Tools** select **Edit libraries** > **Bondwires** to open the **Edit Libraries** window.

SPB License For Direct Import

Utilizing Layout Links and Cadence APD, take advantage of a closer integration between HFSS 3D Layout and external data sources. There are several modes of operations regarding Direct Import, some require an SPB License while some do not.

Prerequisites

The following section details the minimal installations required to implement the various modes of operation for direct import. These operations allow you to take advantage of a closer

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

integration between the 3D Layout and external data sources.

Direct Import of brd/mcm/sip Files

Extracta is an unlicensed utility provided by Cadence. Typically, however, a minimal Cadence installation is required to execute this application. For this method, extracta.exe must be locally executable.

Export/Import

This is similar to the ANF data-transfer model. You can export an *.anx file from a different machine as a standalone file and import it to leverage all the Layout Links features.

Client/Server Interaction

For this, you need to be working in the APD environment, so a Cadence installation and license are required. This also requires Layout Links integration be installed and configured for the SPB environment. Currently, this must be downloaded and manually configured.

Running AnsTranslator on the Command Line

The format for running **AnsTranslator** on the DOS command line is:

```
AnsTranslator <input> <output> <switches>
```

Where:

- `AnsTranslator` is the complete path to AnsTranslator.exe
- `<input>` is the required path to the design to be translated
- `<output>` is the optional path to the edb directory. By default, the export type is edb. If no `<output>` is specified, the edb design is created in the same folder as the `<input>` file/folder.
- `<switches>` are any of the following options:
  - `-i=inputFormat`

    Specifies the file format for translator input. If not specified, the file type is deduced from the file extension. Gerber designs must be explicitly specified though this option.

    Options: AutoCAD, GDSII, Extracta, IPC2581, ODB++, Gerber, or anfv2

  - `-o=outputFormat`

    Specifies the output format. The default output is edb.

    Options: edb and ControlFile

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> An IPC2581 rev.c exporter has been introduced as a beta feature in Anstranslator. To use this functionality, enter `[design file].aedb [IPC-2581 file].xml -i=edb -o=ipc2581` at the command line. Flex and multi-zone designs, non-laminate designs, and backdrills are not currently supported, and padstack instances that include backdrills will be exported without them. Designs are flattened during export. Circular, square, and rectangular pads are exported as intended, while all other pad shapes are converted to polygons, except thermal pads, which are ignored and not exported. Circular and square holes in the design's padstack definition are exported as intended, whereas all other hole shapes are converted to polygons and exported as a rev. 4 *.xml.

- `-c=controlFileName`

  Specifies the path to a control file (*.xml). If not specified, the control file is still used (*.xml) as long as it has the same name and path as the `<input>` file/folder.

  > **Note:**
  >
  > To generate nets during import, enter:
  >
  > `<GDS_CELL_RULES>`
  >
  > `<WHITE_BOX_CELLS>*</WHITE_BOX_CELLS>`
  >
  > `</GDS_CELL_RULES>`
  >
  > This will automatically generate all nets.

- `-l=logFilename`

  Specifies the path to log file (*.log). By default, the log file is created in the same folder as the `<output>` edb file.

- `-w=workingDirectoryName`

  Specifies the directory to use for any file manipulation needed by the translation. If not specified, the directory for the input is used as the working directory.

- `-t=technologyFile`

  Specifies the path to a technology that defines a stack up. The file can be *.layermap, *.ircx, *.vlc.tech, or *.itf. *.itf must have a mapping file specified with

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

them. Use this switch when a technology file is provided. Users should specify either a control file (-c) **or** a GDS layer mapping file (-g).

- `-f=filterfile.text`

  Use to specify all signal layers to import into the design as a list of layer names separated by end of lines. Via layers will only be imported if both the start and end layers are included in the list. The file can be *.ircx, *.itf, or *.vlc.tech. Requires a technology file (-t) switch.

- `-g=gdsMappingFile`

  Specifies the path to a GDS layer mapping file (*.map).

- `-v`

  Specifies verbose logging (without this option, only warnings and errors are logged).

- `-a(nfcmp)`

  Optionally used for ANFV2 import to specify a *.cmp file

> **Note:**
>
> A new OASIS translator (i.e., Open Artwork System Interchange Standard) has been introduced as a beta feature in Anstranslator. To use this functionality, enter `-i=oasis` at the command line. All arguments that are valid for GDSII files should work with OASIS (*.oasis) files. The **GDSII Import** window in the Ansys Electronics Desktop (AEDT)™ electronics systems design platform now supports importing OASIS files.

Net Importation in AnsTranslator

When bringing in ODB++ and Extracta designs through AnsTranslator, Nets is automatically assigned into two distinct Net/Classes: "Power/Ground Nets" or "Non Power/Ground Nets". These can be overridden through the .xml control file. A sample xml file is included in the following diagram, with an explanation that follows.

```
<?xml version="1.0" encoding="UTF-8" standalone="no" ?>
<c:Control xmlns:c="http://www.ansys.com/control"
schemaVersion="1.0">
<Nets>
  <Net Name="GND" IsSignalNet="false" />
  <Net Name="VCC"/>
  <Net Name="Battery"/>
  <Net Name="Batt_Sense"/>
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
  <Net Name="change"/>
  <Net Name="CLK"/>
  <Net Name="data[0]">
    <NetClass Name="data" />
    <NetClass Name="sig" />
  </Net>
  <Net Name="data[1]">
    <NetClass Name="data" />
    <NetClass Name="sig" />
  </Net>
  <Net Name="data[2]">
    <NetClass Name="data" />
    <NetClass Name="sig" />
  </Net>
  <Net Name="data[3]">
    <NetClass Name="data" />
    <NetClass Name="sig" />
  </Net>
  <Net Name="data[4]">
    <NetClass Name="data" />
    <NetClass Name="sig" />
  </Net>
</Nets>
</c:Control>
```

1. If a net is not included in the list of nets it are not imported into the design. This an excellent way to look at a small subset of the design.
2. If "IsSignalNet" = "false", it is automatically assigned to the "Power/Ground Nets". If it is "true", it are assigned to "Non Power/Ground Nets".
3. If a NetClass has been assigned, it is not placed into the default categories, unless the "IsSignalNet" attribute is set or the NetClass is explicitly specified.

Layout and Control File

Many Anstranslator directories do not contain information that is required by the Ansys Electronics Desktop (AEDT)™ electronics systems design platform and SIwave, such as material and layer characteristics (e.g., height). This information is sometimes exported by the original source program (e.g., Cadence, Mentor Graphics) to the Anstranslator directories (e.g., ODB++ directories) and can then be used by the translator. But if this information is not present

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

in the directory, or if the information is present but needs to be changed, a separate input control file can be provided by the translator.

AEDT input control file is in XML and can be created using standard third party text editors such as Notepad in Microsoft Windows or VI in Linux. The associated XML schema file, "stackup.xsd," is located in the parent AEDT installation directory. The schema file can be used with third-party editors or scripting tools that check XML syntax. Specific keywords that are valid to use in the control file can be found in the "stackup.xsd" schema. The associated XML schema for the import options information is "ImportOptions.xsd".

You are not required to use a control file when importing translator files. However, if you do not use a control file, stackup and material definitions may not be defined. If you do use a control file, you can adjust the stackup either manually or by importing the control file into the design using the stackup window. If you import the control file, the stackup are modified according to rules described in Importing a Stackup.

Control files may be used for:

- Translator import
- Import using the stackup window
- AutoCAD import — AutoCAD import uses any specified stackup, material, or import option information specified in the control file to fill the import window and set up for import.
- GDSII import — GDSII import uses any specified stackup or material information specified in the control file to fill the import window and set up for import.

An example of a control file follows. The first three lines are heading lines that are required in all control files used with the translator. From the following example, after the heading lines, two other sections are present: one for materials and one for layers.

```

Control File Usage with Renaming

Three examples of a GDS control file follow. The first was output by the GDS import window. The second was output on the Layer Stackup window and the third, which is suitable for import, was constructed by making sure the layer mapping is identical in the second file as it was in the first. Note that not all Control File settings are applicable to all design types.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The following example was created for GDS import but the principle applies to importing Autocad and ODB++. Layer remapping is not supported for the importing of Cadence APD/Allegro/Sip.

Name="30" refers to the layer in the original design.

TargetLayer="Top" refers to the new name of the layer.

1. From **Import** window

```
<?xml version="1.0" encoding="UTF-8" standalone="no" ?>

<c:Control xmlns:c="http://www.ansys.com/control"
schemaVersion="1.0">

<Stackup schemaVersion="1.0">

<Materials>

[[[[[[[[[[[[[ Deleted for space reasons ]]]]]]]]]]]]]

</Materials>

<Layers LengthUnit="mm">

<Layer Color="#008000" FillMaterial="FR4_epoxy" GDSIIVia="false"
Material="copper" Name="30" TargetLayer="Top" Thickness="0"
Type="conductor"/>

<Layer Color="#004080" FillMaterial="FR4_epoxy" GDSIIVia="false"
Material="copper" Name="55" TargetLayer="Bottom" Thickness="0"
Type="conductor"/>

</Layers>

</Stackup>

<ImportOptions Flatten="true" GDSIIConvertPolygonToCircles="false"/>

</c:Control>
```

If the Ansys Electronics Desktop (AEDT)™ electronics systems design platform exports on the Layer Stackup window, note the layer that is called "30" in the gds design is referred to as "Top" in the example. To use the example file, make the substitution Name="Top" with Name ="30" TargetLayer="Top", etc. You are able to define your dielectric layers, etc., in AEDT and use the modified file for repeated translation.

2. From **Layer Stackup** window

Using Excel to Generate a Control File

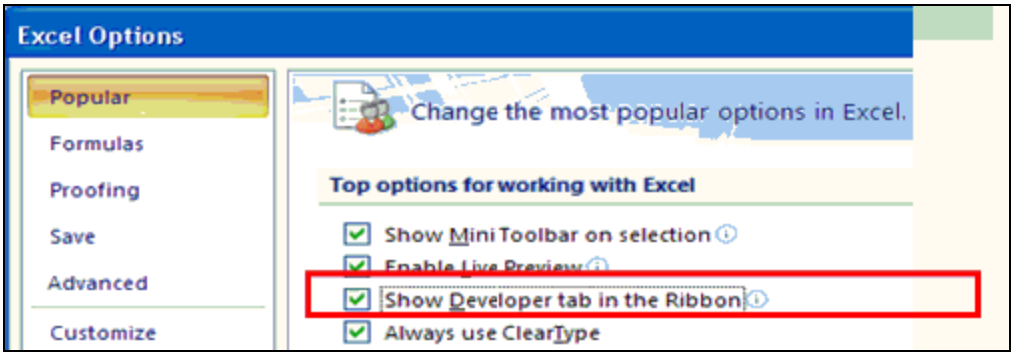
It is possible to use XML schema functionality in Microsoft Excel to create stackup-layer information that can then be exported to an ODB++ control file.

An XML schema is basically a set of rules (constraints) that define the structure and content (elements) of an XML file. Both XML and XML Schema documents (*.xml, *.xsd) are straightforward user-friendly text files, and Microsoft Excel offers an intuitive interface that “maps” elements in an XML schema to data cells in an ordinary worksheet. As such, and because the XML schema is quite simple, it is possible to use a plain-text XML editor in Microsoft Excel to create stackup-layer controls that are suitable for Ansys tools. These controls can then be exported to an Control File.

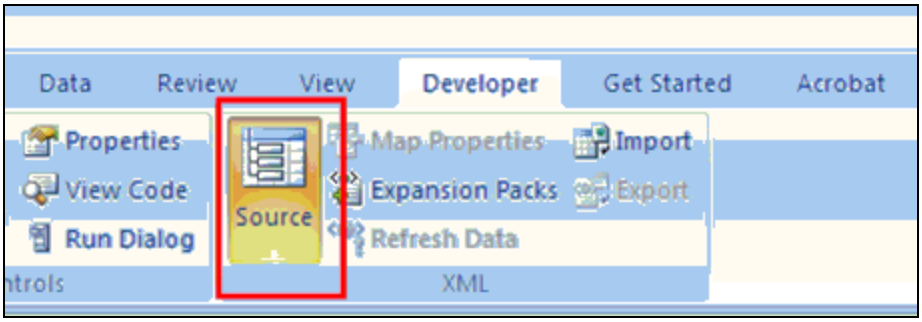
The schema used in the following example is shipped with the Ansys Electronics Desktop (AEDT)™ electronics systems design platform v6.0 (or higher) and can be found at <*desktop_inst_dir*>\Stackup.xsd, where <*desktop_inst_dir*> is the AEDT installation directory. In this example, Microsoft Excel 2007 is used, but Excel 2003 should also be compatible.

1. **Access XML Functionality in Excel:** To access the XML import/export functionality in Excel, you must first activate the Developer Tab. If the Developer Tab is not already visible, click the Office Button , then select **Excel Options**.

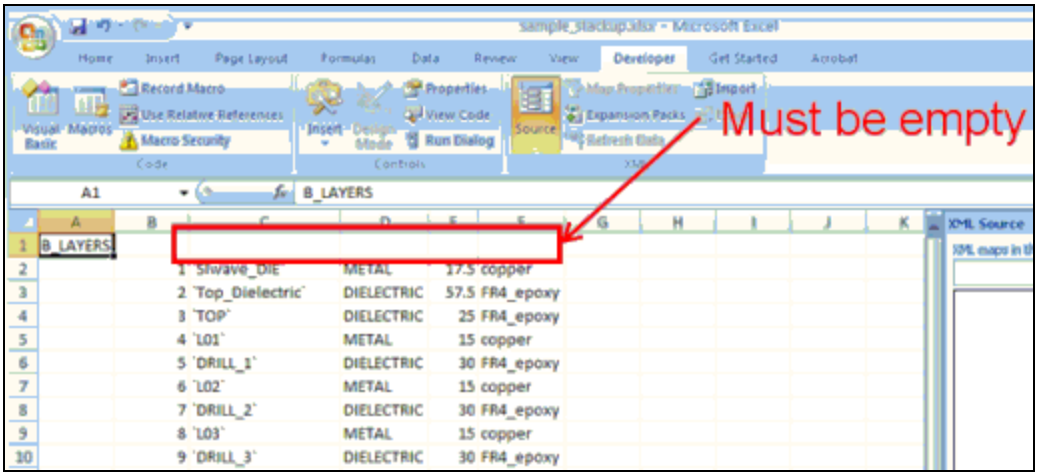
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. If applicable, select the **Popular** category, then click **Show Developer tab in the Ribbon**. Then, on the Developer tab in the XML group, click **Source** to display the XML Source task-pane.

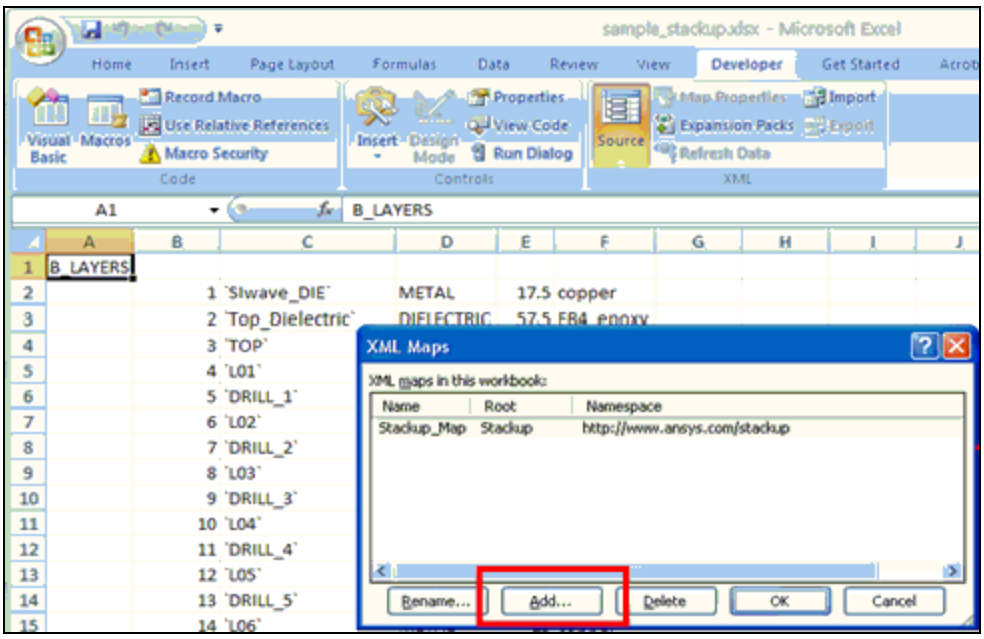


3. **Open the Excel Spreadsheet:** Open an appropriate spreadsheet file (*.xls or *.xlsx) to export to the control file.

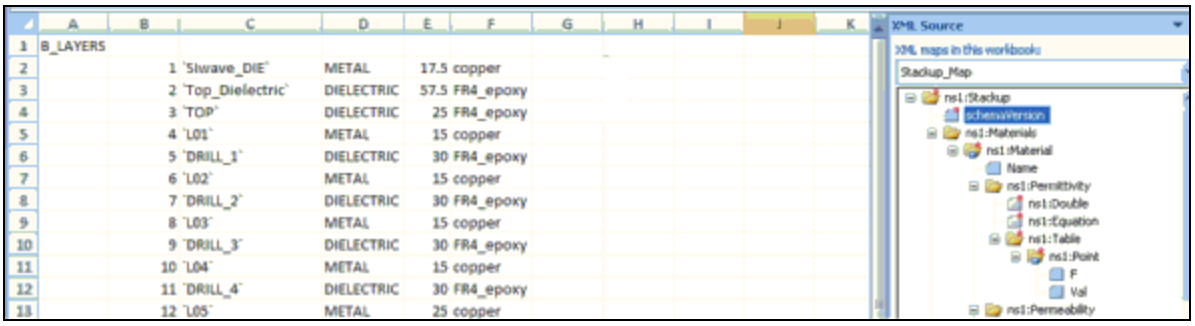


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. **Load the Ansys XML Schema:** In the XML Source task pane, click XML Maps to open the XML Maps window box.



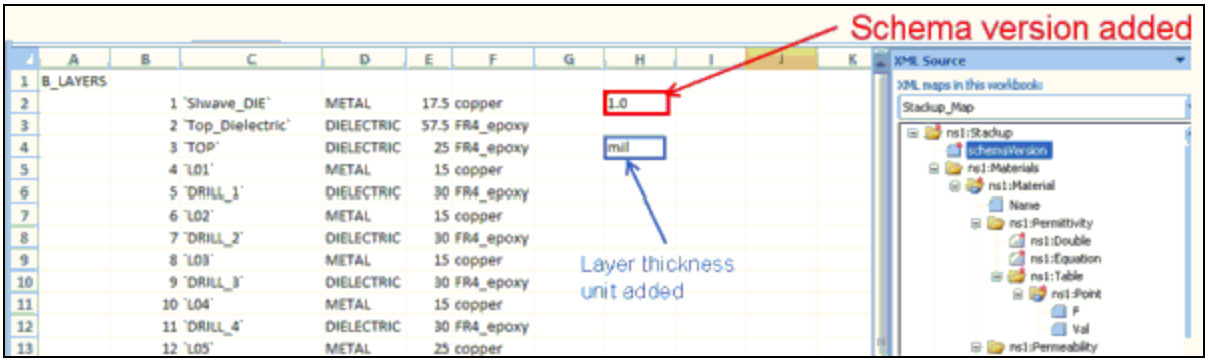
5. **Load the Ansys XML Schema** (contd)**:** Click **Add** to open the Select XML Source window, then browse to the .xsd file in the AEDT installation directory and click **Open.** Next, click **OK** to close the Source window. The XML schema are loaded into the XML Source Pane.



6. **Prepare the Excel Spreadsheet**: From the schema element list that appears in the task pane, those elements with a red star are mandatory fields that you must map to cells in the worksheet. But, you do not need to map a starred element if its parent is not also starred. For most Excel files, you need to add at least one cell in the worksheet that contains the schema version number — which is currently fixed at “1.0” — you can add it anywhere, but it must be formatted as “text”, instead of the default format “number”, so that the literal string are exported. You may add additional fields to the worksheet, such as a layer-

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

thickness unit, but this is not required.



7. **Prepare the Excel Spreadsheet** (contd): Many pre-existing layer-stackup files may contain names/symbols that are different from those used by the XML Schema. These names are flagged as errors, even if they represent the same entity. Because of this, these names must be replaced with valid entries before being exported to XML (e.g., “METAL” is not a valid layer type and is replaced with “conductor”, and since XML is case-sensitive, “DIELECTRIC” is replaced with “dielectric”).

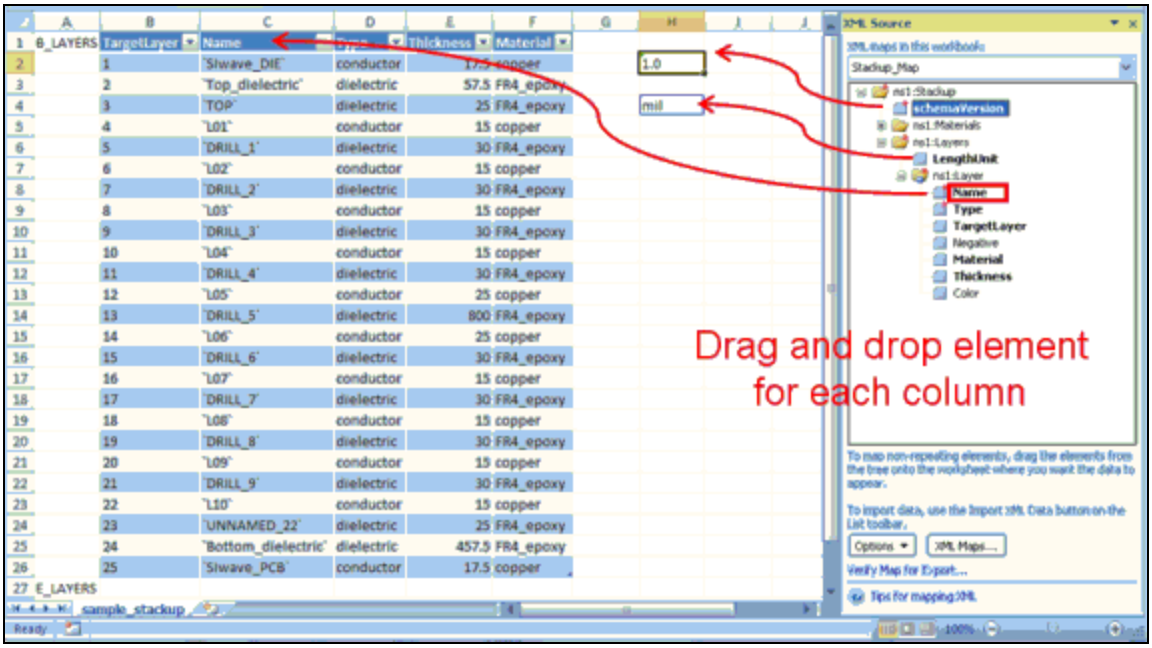
	A	B	C	D	E	F	G	H	I	J	K
1	B_LAYERS										
2		1	`SIwave_DIE`	conductor	17.5	copper		1.0			
3		2	`Top_dielectric`	dielectric	57.5	FR4_epoxy					
4		3	`TOP`	dielectric	25	FR4_epoxy		mil			
5		4	`L01`	conductor	15	copper					
6		5	`DRILL_1`	dielectric	30	FR4_epoxy					
7		6	`L02`	conductor	15	copper					
8		7	`DRILL_2`	dielectric	30	FR4_epoxy					
9		8	`L03`	conductor	15	copper					

For a complete list of valid entries for each element, open the XML Schema document (*.xsd) in a text editor and search for the element name.

8. **Map the XML schema to the workbook**: Drag each element on the task pane to the corresponding cell in the workbook. The mapped areas appear in the blue nonprintable borders. Repeat this mapping operation for each element by dragging it into the workbook.

- For columns of data, drop the element on the cell directly above the top row in order to make it the header.
- For a single cell, drop the element on the cell itself.

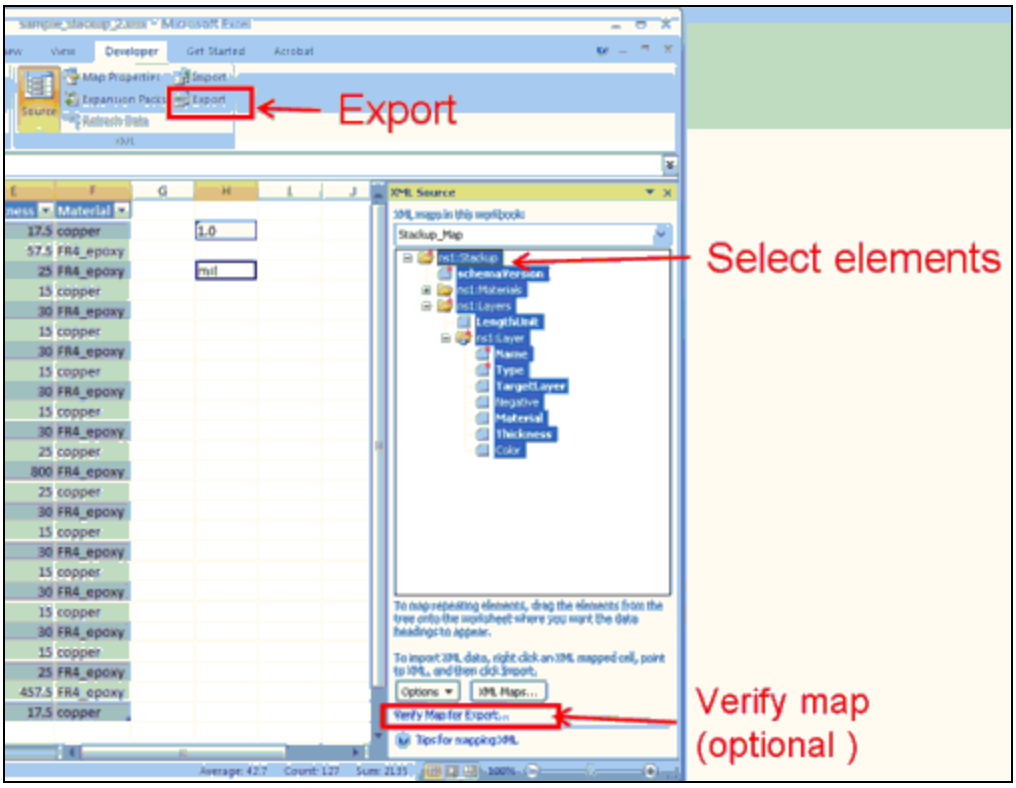
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



9. **Export to XML File:** Select elements in the task pane to export them. All corresponding mapped cells are highlighted in the worksheet (Hint: To select all, click on **ns1::Stackup**). From the **Developer** tab, click **Export**. From the Export XML window that opens, specify a

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

name for the file. Next, click **Save** and the file is exported to XML.



10. **Review the XML File:** You can open the exported XML file in a text editor or Internet Explorer for review.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```

Exporter Issues

The following known issues have been found regarding translated directories. The problems occur when the contents of a file do not completely conform to the Valor specifications. Anstranslator response varies depending on the nature of the problem, and an informative warning/error message is provided.

Extra text after the part-name of a CMP record in a components file

The one-word component part-name should be the final text before the terminating semi-colon in a CMP record (";"). Any extra text is ignored.

Example with the extra text in bold:

```
CMP 8 0.94074 0.3248 270.0 N J1 mPCIE EDGECONN ;0=1,1=0.000010
```

Duplicate pin numbers in TOP records in a components file

Each toeprint record (TOP) for a component should have a distinct pin number. When a duplicate is found, the duplicate pin number is changed to an unused number. Users are given a warning.

Example:

The bold pin numbers are duplicates.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
...
TOP 14 -0.1284500 0.1181400 90.0000000 N 108 0 15

```

A NET record in an eda data file contains extra text

The net name specified in the NET line of an eda data file should not contain spaces. If spaces are present, they are replaced with underscores. A warning is issued. This situation could happen when net names with spaces are exported without removing the spaces.

Example:

These NET lines from an edata/data file result in nets named JTG_ENA_TOP and JTG_ENA_PHY.

```
#NET 973
NET JTG_ENA TOP
...
#NET 974
NET JTG_ENA PHY
```

Duplicate pin names

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Duplicate pin names in the same component — as defined by a PKG record in an eda data file. When a pin name is duplicated, the translator forces it to be unique by appending a number. A warning is issued.

Example with pin names 11 through 18 used twice in the PKG record:

```
# PKG 2
PKG smnhda18.2_39_ni 0.03937 -0.4084999 -0.24 0.3825 0.24
RC -0.251 -0.24 0.502 0.48

Property line contains multiple words for property name

A property line (PRP) should contain a single-word property-name followed by a quoted string for the value. Some PRP lines have multiple words that precede the quoted value. In this case, it is assumed that the extra words are intended to be part of the property name and they are then concatenated together with underscores. A warning is issued.

Example:

```
PRP SIMULATION MODEL 'MAX2003'
```

Property line contains extra text after value

A property line (PRP) should contain a single-word property-name followed by a quoted string for the value. Some PRP lines have multiple-quoted values. The text after the first quoted value is ignored. A warning is issued.

Example:

```
PRP PART LABEL 'RELE' TN2C'
```

Property line is missing value

A property line (PRP) should contain a single-word property-name followed by a quoted string for the value. Some PRP lines are missing the quoted value. When this occurs, the property is ignored. A warning is issued.

Example:

```
PRP Manufacturer
```

Discrepancy between component file and eda file

A correlation exists between the toeprints specified in the component file and those specified in the eda file. If the files are created incorrectly and their indexes do not match, the Anstranslator aborts translating the components file. Overall translation is continued, but components, padstacks, and nets are not translated. A warning is issued.

Negative net index specified in components file

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Toeprints in a component file should have a positive net index. If the net index is negative, the Anstranslator aborts translating the components file. Overall translation is continued with padstacks and nets being translated, but components are not translated. A warning is issued.

Example with negative net index in bold:

```
TOP 1 6.31 7.9018001 0.0 N -1 0 2_3
```

The eda data file contains a trace subnet with a hole feature

Trace subnets (part of eda data file) should have only copper features as members. If holes are found as trace members, the hole feature is ignored. A warning is issued.

Example with hole feature in bold.

```
SNT TRC

FID H 6 4717
```

Features from multiple padstacks are listed in the same toeprint in the eda data file

The features listed for a toeprint in an eda data file can be on the same padstack. When features from multiple padstacks are found in one toeprint warnings are issued. The first padstack is translated normally. Pads and hole on the other padstacks are merged into the first when possible.

Arc definition is incorrect

Arcs are specified in directories with a start point, end point, and center point. The distance on the start point to the center should be the same as the distance on the end point to the center. If the two distances are different, an arc can not be created, and instead, the start and end points are used to create a segment (0 height arc). A warning message is issued.

Holes not specified in eda data file

Padstack via and pin holes are specified in the eda data file of the directories. Following is an excerpt of an eda via specification. FID entries specify each part of a via: holes, pads, and antipads. Entries containing "C" are pads (copper), and entries containing "L" are antipads (laminate). Lines containing "H" specify holes, but there are no holes specified in this example because a known problem exists wherein hole features are not specified in the eda data file.

```
SNT VIA

FID C 2 8479

FID C 3 10992

FID L 4 1310

FID L 5 2414

FID L 8 1310
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
FID L 11 1310

FID L 14 2053

FID L 15 1310

FID C 16 5566

FID C 17 3399
```

If "H" lines are present they indicate which feature from which layer is to be used for the hole. Hole features are found on ODB drill layers. There is a drill layer defined in this ODB folder and it does have features. But because of a known problem, holes are not specified in the eda data file, so “H” lines are not present in the file.

A line in the feature file contains a non-numeric attribute value

The feature file contains lines that list numeric values which specify the setting of various attributes and options. The following feature line mistakenly contains an attribute with a string value instead of a numeric value.

```
P 3.6765000 2.4700000 0 P 0 0;0=0,1=NO,2=1
```

The attribute are not used and a warning message is issued.

Non-numeric value for attribute on feature line in the features file

Feature lines may have attributes specified at the end of the line. The value for an attribute is omitted for boolean attributes. Otherwise it is an number representing either the numerical value for integer and float attributes, an option number for option attributes, or an integer referencing a string on the attribute text string section of the file. The following feature line has a value that is a string, rather than either being omitted or a number as is correct.

```
P 3.6765000 2.4700000 0 P 0 0;0=0,1=NO,2=1
```

The attribute are not used and a warning message is issued.

Missing package name

The PKG record in the eda data file is missing the required package name. There should be a package name in the underlined space underneath.

```
# PKG 0

PKG 0.1 -0.1275 -0.0275 0.9275 1.0275
```

Package contour hole before island in eda data file

A package contour specification for a footprint outline mistakenly specifies a **hole (H)** before it specifies the **island (I)** that could contain it. The hole is ignored and a warning is issued.

```
# PKG 20
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```

Features on negative layers specified to be copper rather than laminate

Subnet toeprint features in the eda data file that are on negative layers should be specified as laminate. Some tools incorrectly export them as copper. When this deviation is supported, the feature is used as if it is laminate; the feature becomes an antipad. Copper features in a subnet toeprint are pads. If the FID line under layer 5 is a negative layer, the "C" should be an "L".

```
SNT TOP B 32 0
FID C 5 598
```

ODB++ Translator

ODB++ is an ASCII open-format developed by Mentor Graphics to capture CAD/EDA, assembly, and PCB fabrication information. It has become the proprietary industry standard for formatting and transferring PC board data.

AnsTranslator, allows you to utilize ODB++ and ANF file formats to perform analyses of printed circuit boards in support of Ansys SIwave™. **AnsTranslator** takes as input an ODB++ v7.1 job structure and produces as output an ANFv4 file or an ANFv2 file and an Ansys SIwave™ component file (.cmp).

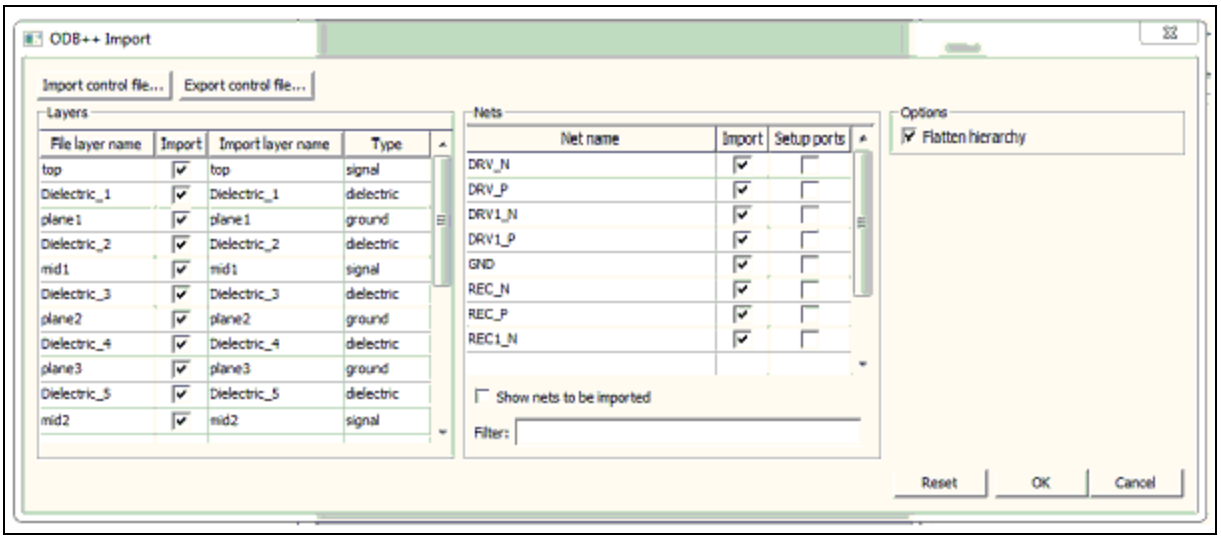
- The input to **AnsTranslator** is an ODB++ v7.1 job structure (either as a compressed .tgz file or an uncompressed top folder) and an optional control file (.xml).
- **AnsTranslator** can export to an edb directory or to a control file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The output from **AnsTranslator** is either an EDB directory or ANFV2 file and a component file (.cmp). ANFV4 is also supported. A log file (.log) is also produced.
- The information translated is a collection of geometric data that is sufficient to perform a useful analysis of the represented circuit for Ansys SIwave™ designs (which also supports Ansys HFSS™, Ansys Q3D Extractor®, and TPA). Note the **AnsTranslator** process is subject to whatever limitations exist for the ANF format to represent ODB++ content.
- If the board outline is included in the profile file, it are translated onto an assembly layer called "outline". This same polygon are used to translate negative-plane data to a positive-plane shape. If the board outline is composed entirely of disjoint segments, the Ansys Electronics Desktop (AEDT)™ electronics systems design platform attempts to stitch the data together so long as the end points are within a nanometer of each other.
- The data can be modified through the Control File.

Importing ODB++ in Ansys Electronics Desktop

The ODB++ translator is a link to an external DLL that can be accessed by clicking **File** > **Import** > **ODB++** which opens the import window.



Import and Export Control Buttons

- **Import control file** opens a window which allows a user to import a selected control file.
- **Export control file** writes an xml control file based on the information in the window to the location specified.

Layers Pane

- **Import** check box specifies which layers to import.
- **Import layer** name can be edited.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Type** can be changed and identifies the layer type that are used to place each layer in the file (not editable if the layer already exists; for layers that don't exist, click in the column to see a drop-down menu of choices).

Nets Pane

- **Import** check box specifies which nets to import.
- The **Nets** grid control allows users to select nets to import, and indicate if pins on that net should be imported as ports.
- Pins that belong to nets with a check in the **SetupPorts** column become ports when imported.
- **Show nets to be imported** moves nets to be imported to the top of the grid control.
- **Filter** involves enhanced wild card filtering is used to select which nets are shown in the window by using wild cards and characters; the two wild cards supported are * and ? (See **Regular Expressions for Nets** below).

Options Pane

- **Flatten hierarchy** allows users to select importing the ODB++ with components or flattening the components.

When you have completed selections, click **OK** and the file is imported into the active Layout window.

Regular Expressions for Nets

You can use regular expressions to search for nets. These match a text pattern and use special constructions to represent strings or single characters.

To use a regular expression, enter the name of the object you want to select in the field, using wild cards when selected. The following regular expressions are supported:

*****	Matches any sequence of characters. For example, **net*** selects objects **net_1a**, **net_1b**, **netLength**.
?	Matches any character. For example, **net_?** selects objects **net_1**, **net_2**, **net_a**, **net_b**.

These match a text pattern and use special constructions to represent strings or single characters (e.g., net* selects all pins in nets that start with "net", net*:1* selects pins with name that start with "1" in the nets that start with name "net", A*:3? selects pins 31, 32, 33, 34 etc in nets, A1, ACC, AGND, AGND2).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Control File Part Mapping

During translation, it is often appropriate to augment available data for the purposes of simulation. One area that is often vital is component classification and value assignment; this supplementary information can be added using an XML Control File with a Components/TypeMap and/or ODBPropertyMap.

- The *TypeMap* element provides a sequence of either *Part* or *RefDes* elements.
- Each element specifies a Perl Regular Expression.
- A component's type and value are matched sequentially using the *TypeMap*, with *Part* elements evaluating against a part name and *RefDes* elements against the reference designator.

For example, a Control File mapping the type of components with reference designators beginning in 'L' to an inductor, 'R' to a resistor, and 'C' to a capacitor, is implemented as:

```
<?xml version="1.0" encoding="UTF-8"?>
<c:Control schemaVersion="1.0 "
xmlns:c="http://www.ansys.com/control">
  <Components schemaVersion="1.0 ">
    <TypeMap>
      <RefDes Type="Inductor " RegEx="L.*"/>
      <RefDes Type="Resistor " RegEx="R.*"/>
      <RefDes Type="Capacitor " RegEx="C.*"/>
    </TypeMap>
  </Components>
</c:Control>
```

The regular expressions in this example are mutually exclusive and, thus, do not rely on order for evaluation. A more complicated *TypeMap*, using part names, reference designators, and relying on order is:

```
<TypeMap>
  <RefDes RegEx="L.*" Type="Inductor"/>
  <RefDes RegEx="R.*" Type="Resistor" SR_Value="25ohm" />
  <Part RegEx="100nF " Type="Capacitor" SC_Value="100nF" SR_
  Value="0.1ohm" />
  <Part RegEx=".*nF " Type="Capacitor" SC_Value="0.1uF" SR_
  Value="0.1ohm" SL_Value="0.1nH" />
  <RefDes RegEx="C.*" Type="Capacitor" SC_Value="1uF"/>
</TypeMap>
```

The following mappings should result:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Part Name	Refdes	Mapped To
AA-0.1nF	C21	Capacitor: (0.1uF,0.1ohm,0.1nH)
AB-1000nF-T	C22	Capacitor:(1uF)
100nF	C23	Capacitor:(100nF,0.1ohm)
100nF	L-C24	Inductor

Information regarding component type and values can be specified in the control file. If the component information is not in the control file, the translator looks for optional properties in the ODB++ component files if the component has 2 pins. If the component records in these files have property records TYPE and VALUE, the contents of these properties are used to determine component information. All comparisons are case independent.

The following table shows the type assigned to the component based on the TYPE property content:

TYPE property	Type assigned to the component
"resistor" or "embedded resistor"	resistor
"inductor"	inductor
"capacitor" or "embedded capacitor"	capacitor
any other TYPE content	**the content of VALUE is used to deduce the type**
1. content does not begin with a number	component is assumed to be discrete
2. content begins with a number	
• without any following text	resistor
• last letter is "h"	inductor
• last letter is "f"	capacitor
• following text includes "ohm"	resistor
• last letter is a unit abbreviation ("p", "n", "u", "m", "k", "meg", "g", or "t")	resistor

ODBPropertyMap

If an ODBPropertyMap is not defined in the .xml file types and values of component are assigned primarily through the TypeMap. Any unmatched components then has their type and value set on the component PRP with key *Type* in the component_top and component_bottom file and the values on the PRP key called *Value* or *Val*. If additional control is selected one can define the ODBProperty map.

If one wishes to use the TypeMap as default values one can now set the "PrioritizeOverTypeMap" attribute to true in the ODBPropertyMap. From the following case, if

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the a component R1 had a resistance value set in the VALUE key of "1K": with the flag set to true the resistance is set to 1000 ohm, if the flag is not set the resistors value are 25ohm.

Fields are listed in priority order and the names are compared without case sensitivity. That is the field named Type takes precedence over all the other fields and it matches "TYPE", "type", etc. Because the TypeOnly field is true it are only used to set the type and should not correspond to a value. If this is being used for R1, it is likely "resistor". If a field is not "TypeOnly" it are used to infer an RLC type. It is important to make your "TypeOnly" first in the list if you need to guarantee it are used. At present only 2 pin components with properties are supported.

The SeparationCharacter attribute takes a string of characters to cut at. For example, if the value supplied are in the form "220K/5%" and "3.9K,1%", set SeparationCharacter = ", /".

This string cuts at commas, spaces and the back slash.

```
<?xml version="1.0" encoding="UTF-8" standalone="no" ?>
<c:Control xmlns:c="http://www.ansys.com/control"
schemaVersion="1.0">
  <Components schemaVersion="1.0">
    <TypeMap>
      <RefDes RegEx="L.*" Type="Inductor"/>
      <RefDes RegEx="R.*" Type="Resistor" SR_Value="25ohm" />
      <Part RegEx="100nF" Type="Capacitor" SC_Value="100nF" SR_
      Value="0.1ohm" />
      <Part RegEx=".*nF" Type="Capacitor" SC_Value="0.1uF" SR_
      Value="0.1ohm" SL_Value="0.1nH" />
      <RefDes RegEx="C.*" Type="Capacitor" SC_Value="1uF"/>
    </TypeMap>
    <ODBPropertyMap PrioritizeOverTypeMap ="true">
      <ODBProperty Name="Type" TypeOnly="true"/>
      <ODBProperty Name="Value" SeparationCharacters = ", /"/>
      <ODBProperty Name="Val"/>
      <ODBProperty Name="InstPar" SeparationCharacters = ", /"/>
    </ODBPropertyMap>
  </Components>
</c:Control>
```

Exporting Layout Design Data

Design and analysis data from the Ansys Electronics Desktop (AEDT)™ electronics systems design platform can be exported to other systems in a variety of industry-standard data formats.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

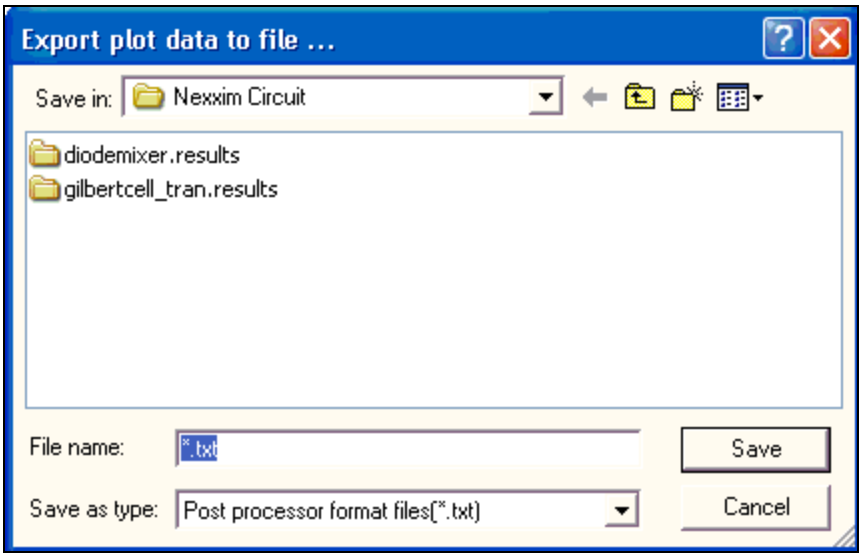
Note the default export file name is made up of the project name followed by a space followed by the circuit/subcircuit name.

Exporting Data Table Files

Follow these steps to export simulation results in ASCII tabular format.

1. Open the plot you want to export.

2. From the **Report2D** menu, select **Export to File**. (Alternatively, right-click the data table, then click **Export to File**.) to open the **Export plot data to file** window.

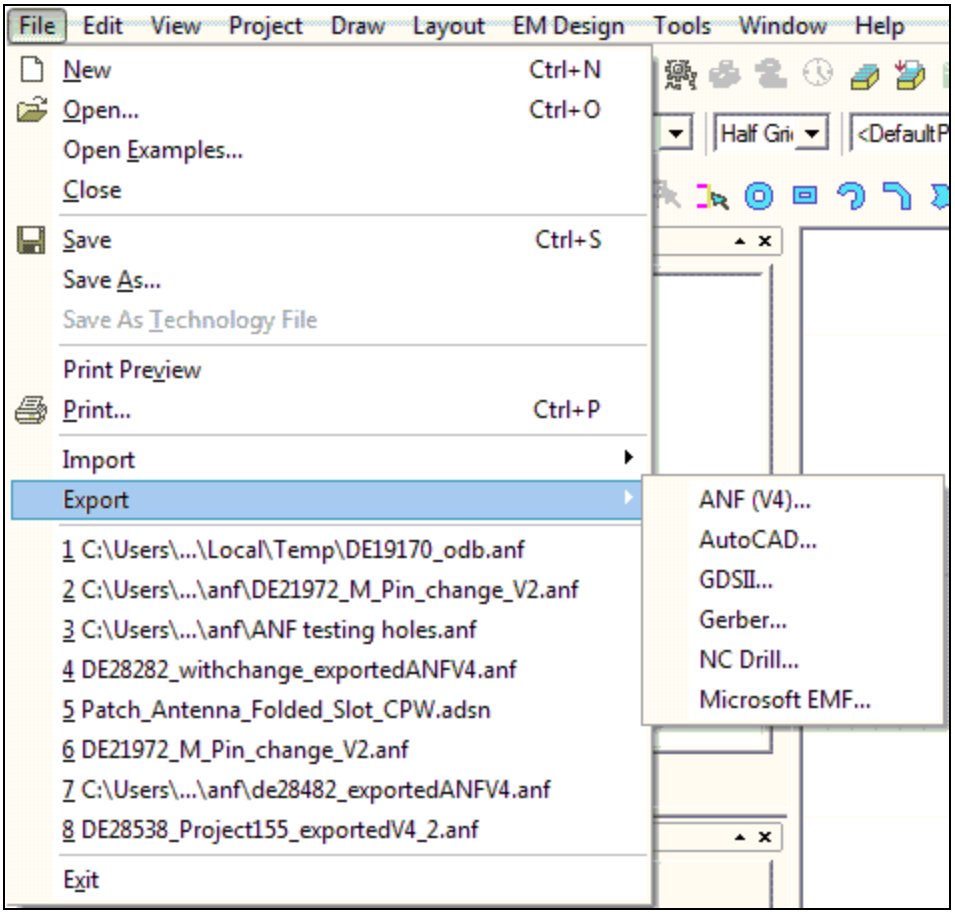


3. Browse to the directory, then give the file a name. Click **Save**.

Exporting Layout Data

Using the **File** > **Export** command, you can export layout data using the following file formats/types:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- On physical layers such as silkscreen and signal layers, property displays are drawn with Hershey fonts and possess a constant size. These property displays are exported from the Ansys Electronics Desktop (AEDT)™ electronics systems design platform to GDSII, Gerber, and DXF formats.
- On non-physical layers such as symbol layers, property displays do not possess a constant size — they are scaled during zooming. As a result, property displays on non-physical layers do not export from AEDT.

To export layout data:

1. From the **File** menu, click **Export**. Then select the type of file to export to open an explorer window.
2. Select a file format and click **Save**.

If you select Ansys Neutral or Microsoft Enhanced the file is saved. If you select a different format, one of the following window opens:

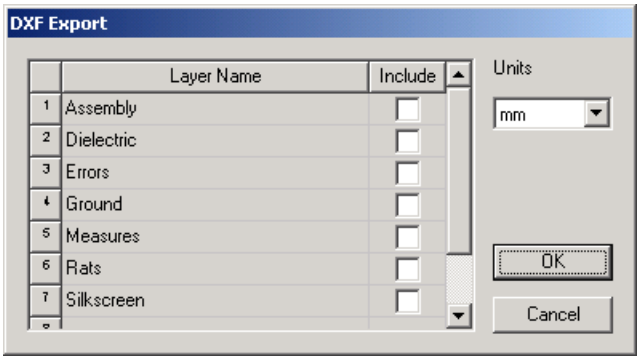
- DXF Export
- GDSII Export

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Gerber Export
- NC/Drill Export

DXF Export

To export layout data, on the **File** menu, select **Export** > **AutoCAD** to open an explorer window. Selecting **AutoCad DXF File** opens the **DXF Export** window**.**



- Choose a unit of measurement on the **Units** drop-down menu (cm, ft, in, km, meter, mil, nm, uin, um). Default type is *mm*.
- To save a **Layer Name**, check its corresponding **Include** area, and click **OK.**

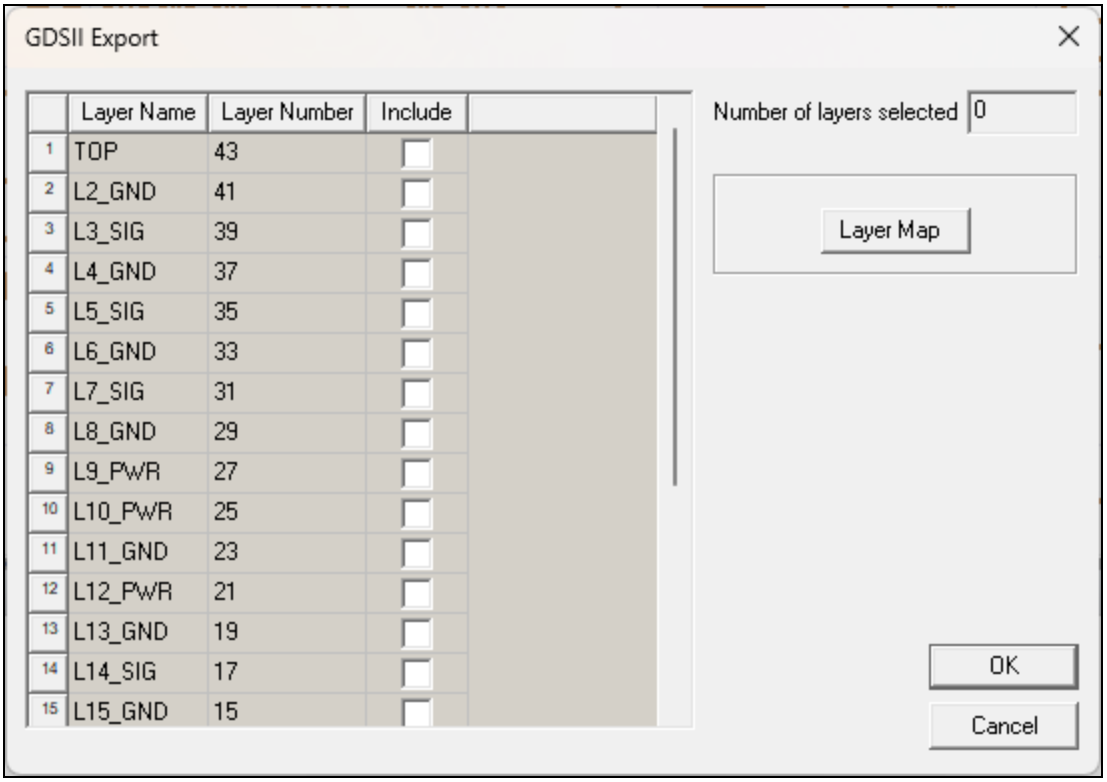
During export, a polygon with voids is converted into a single polygon with no holes where bridges connect the voids to the outer contour.

Text that is Hershey font are exported as polygons, that is, the text is thickened.

GDSII Export

To export layout data, on the **File** menu, select **Export** > **GDSII** to open an explorer window. Then select **GDSII** or **GDSII (Stream)** to open the **GDSII Export** window**.**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

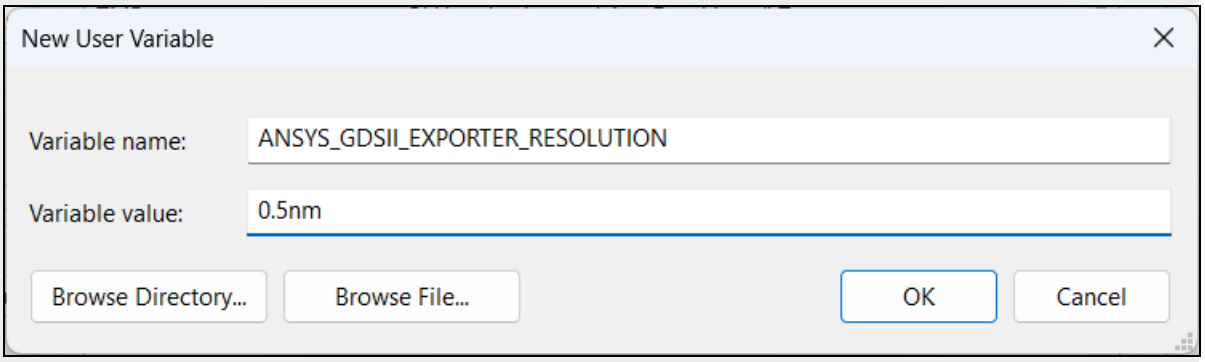


Text that is Hershey font are exported as polygons, that is, the text is thickened.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The Ansys Electronics Desktop (AEDT)™ electronics systems design platform assumes exported GDSII files require a resolution of 1nm. If users export GDSII files with a resolution less than 1nm, the user can change the value of the parameter by creating the environment variable `ANSYS_GDSII_EXPORTER_RESOLUTION` and entering an appropriate value (e.g., `ANSYS_GDSII_EXPORTER_RESOLUTION=0.5nm`).



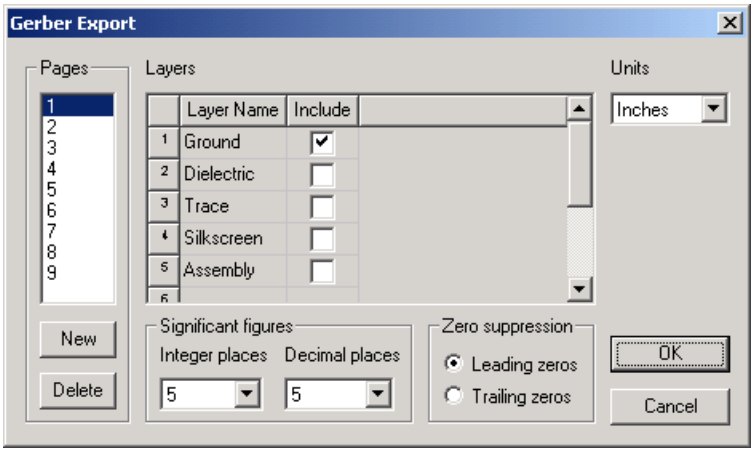
Gerber Export

When you export to Gerber from a layout in the Ansys Electronics Desktop (AEDT)™ electronics systems design platform, each layer is treated as a separate “page” and each page is exported to a separate file. Each file is named by appending the layer/page number to the export file name that is selected by the user.

- You can export more than one layer/page to a Gerber file by selecting additional layers in the Gerber Export window. Header information in each exported file lists the layers that are included in the file.
- You can suppress the exporting of a particular Gerber layer by deleting the page(s) in the Gerber Export window. Only those pages that are displayed in the Gerber Export window are exported.

To export layout data, on the **File** menu, select **Export** > **Gerber** to open an explorer window. Name and save the .Gerber file. Then, select **Gerber** to open the **Gerber Export** window**.**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

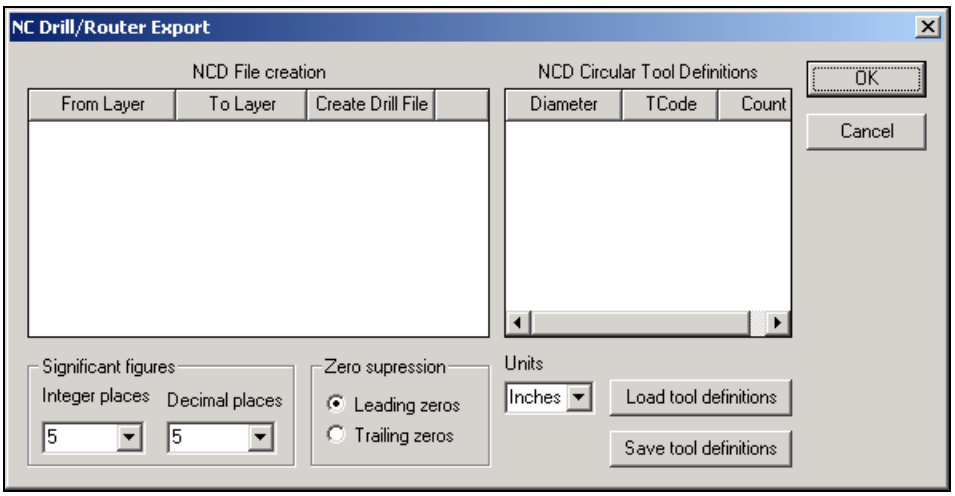


- Click **New** to add pages or Click **Delete** to remove pages.
- Check an **Include** area for each Layer you wish to save.
- Set **Units** to Inches or Millimeters.
- Select the selected **Zero suppression** setting.
- Select the selected number of **Significant figures** for **Integer** and **Decimal** places.
- Click **OK**.

Text that is Hershey font are exported as polygons. That is, the text is thickened. AEDT exports Gerber RS274-X format.

NC Drill/Router Export

To export layout data, on the **File** menu, select **Export** > **NC Drill** to open an explorer window. Selecting **NC Drill File** opens the **NC Drill/Router Export** window**.**



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **Load tool definitions** to load and view definitions.
- Click **Save tool definitions** to save definitions.
- Select the selected **Zero suppression** setting.
- Select the selected number of **Significant figures** for **Integer** and **Decimal** places, and click **OK**.

Exporting Graphics Files on the Layout 3D Editor

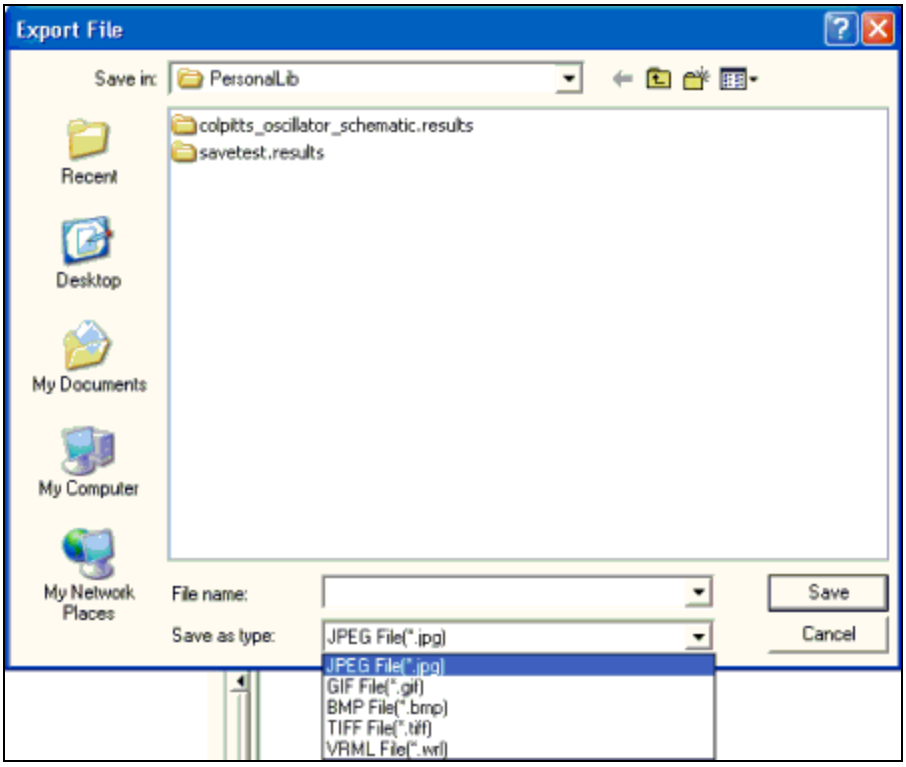
You can export the following graphics formats on the 3D layout editor:

Extension	Contents
.bmp	Bitmap files.
.gif	Graphics Interchange Format files.
.jpeg	Joint Photographics Experts Group files.
.tiff	Tagged Image File Format files.
.wrl	Virtual Reality Modeling Language (VRML) files.

To export a file to a graphics format:

1. From the **Edit 3D** menu, select **Export** to save the file in a graphics format. The Export File window opens:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Use the file browser to find the directory where you want to save the file.
3. Type the name of the file in the **File Name** area.
4. Select the selected graphics file format on the **Save as type** pull-down list.
5. Click **Save**. The file is exported to the specified location as a graphics file.

Exporting ANF Layout or Schematic Data

You can export design data in the Ansys neutral file format (.anf) from either the layout or the schematic editors in the the Ansys Electronics Desktop (AEDT)™ electronics systems design platform. From the **File** menu, select **Export** > **ANF (V4)** to open an explorer window. Name and save the .anf file.

For a reference to the Ansys Neutral File format specification, see Ansys Neutral File Format.

Importing Circuit Models

Ansys provides support for imported models and libraries as components in the **Schematic Editor**. You can import the following models:

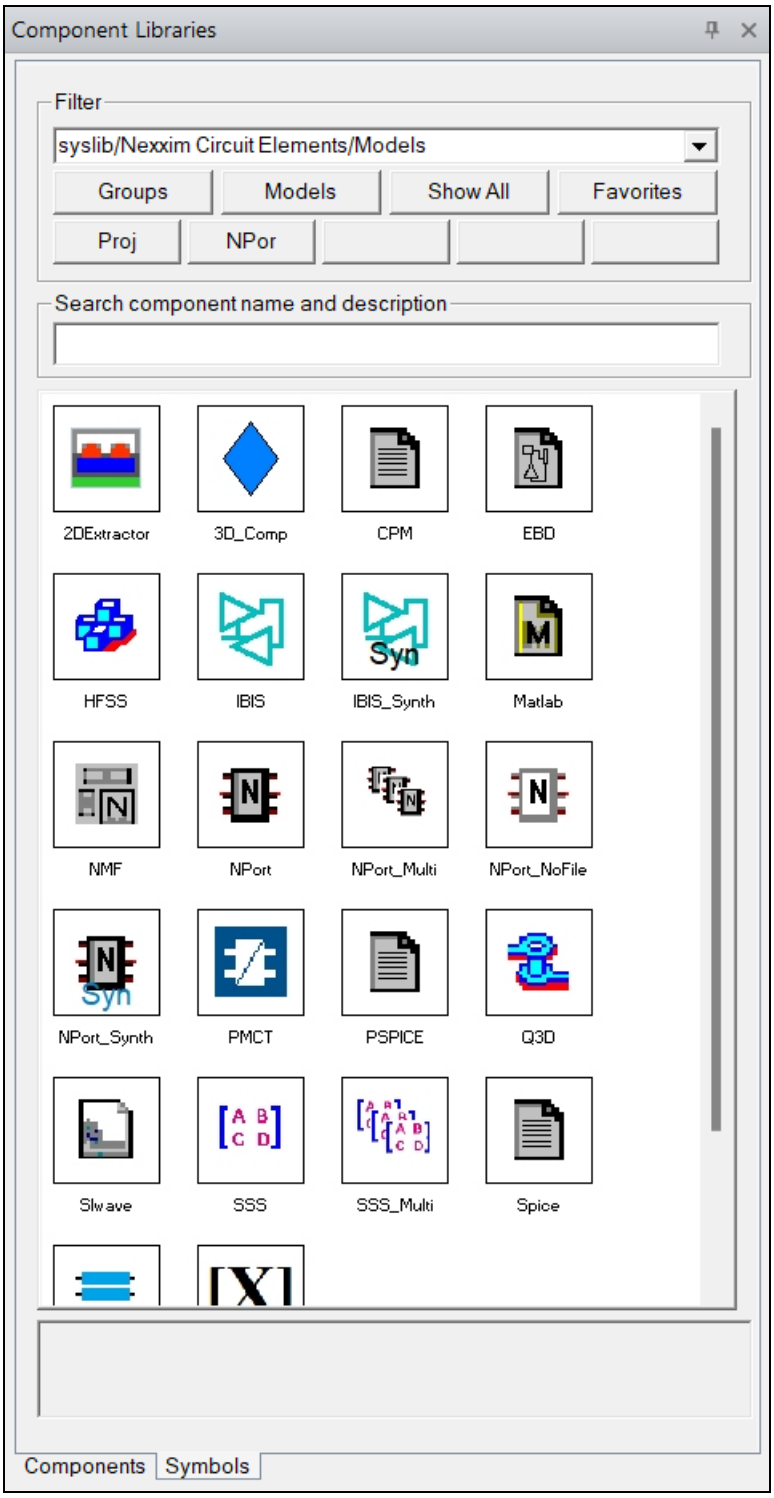
- SPICE components and libraries
- IBIS buffer elements

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- W-elements
- State-space models
- X-parameter elements
- Verilog models (not currently supported on Ubuntu Linux).
- Network solution data such as SYZ-parameters

All of these models can be imported via the **Component Libraries** window by clicking **Models**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



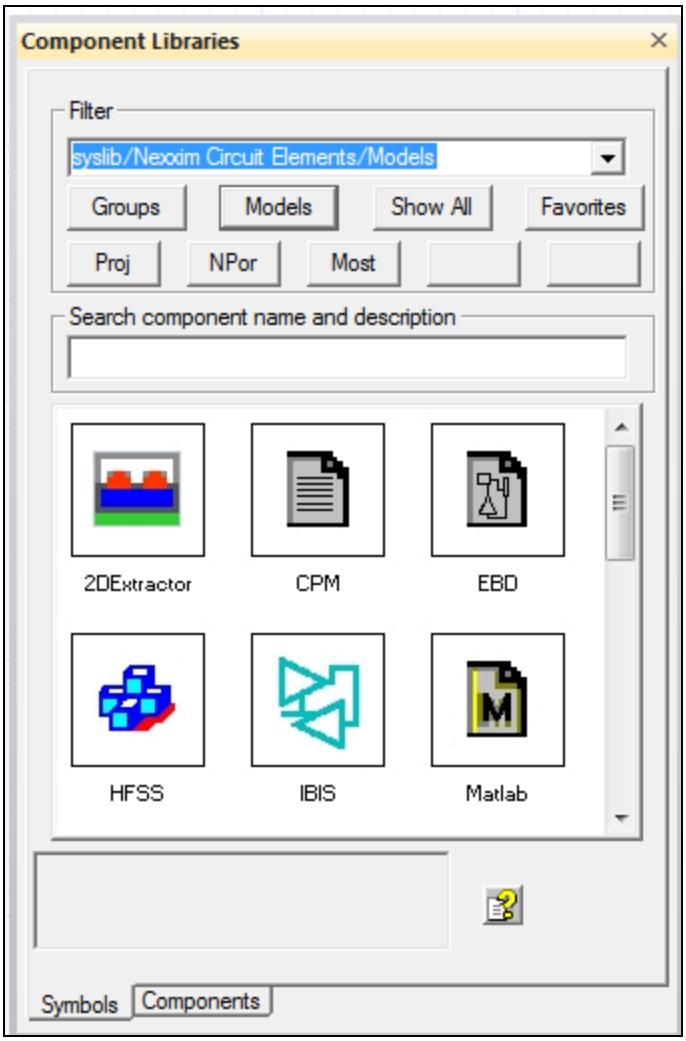
Double-click an icon matching the appropriate model type. Refer to the following topics.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Selecting a Model to Import

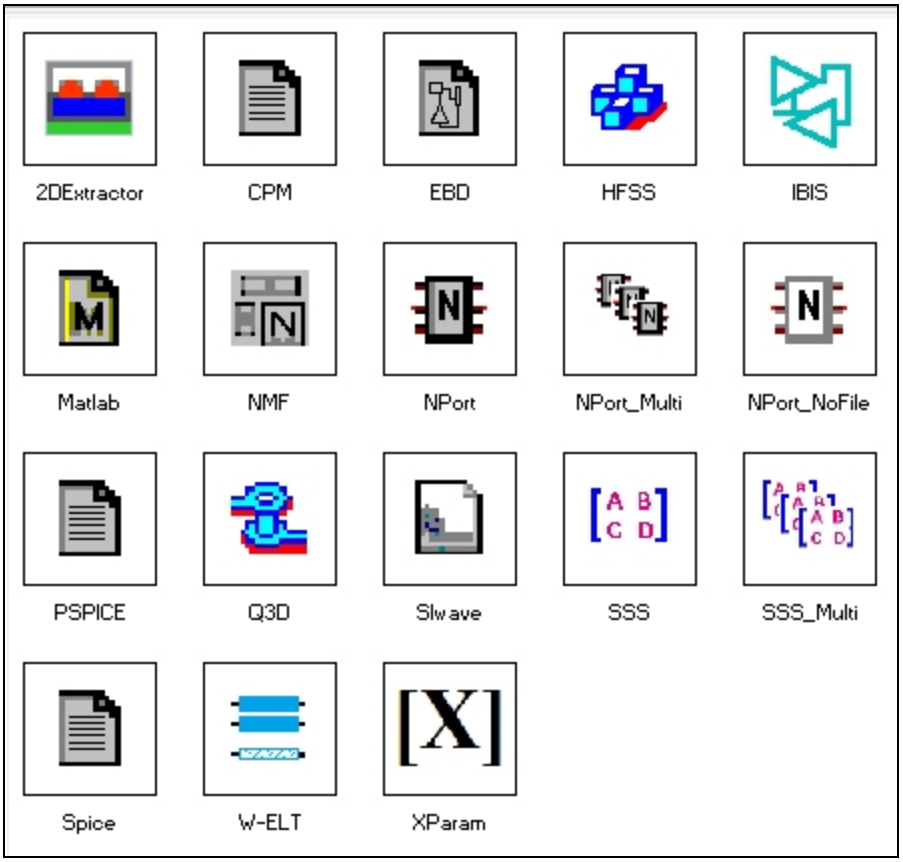
The Models Library is a library of Model Components that can be imported and placed in the schematic. Components such as NPorts, IBIS buffers, SPICE netlists, State-space models, W-elements, and X-Parameter elements are created from information in external files. Also use the Import Model facility to set up dynamic links to HFSS and other solver projects.

You can invoke the Models Library on the **Symbols** tab, by clicking **Models**.



The **Symbols** area displays the Model components.

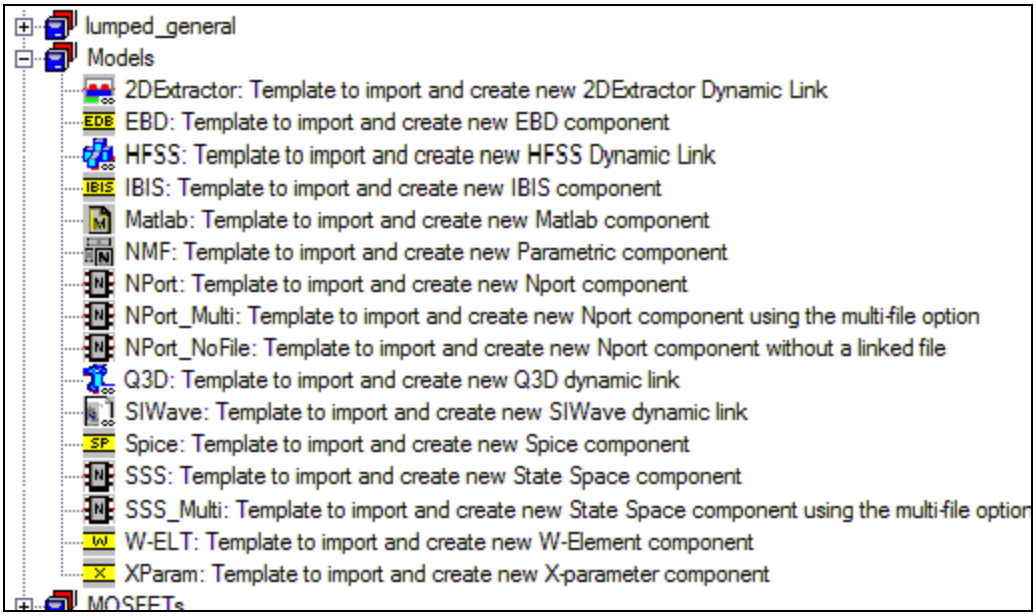
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Clicking on any of these opens a window to select the file. When the file is open, if applicable, a second window opens to retrieve additional information. Once you click OK, clicking in the schematic places the new component.

These import items can also be accessed on the Component Libraries docking window like any component library. From the Components tab, expand the Models library to display the component types.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Double-clicking any of the individual components opens a window to select a file or project of the selected type.
- Once a component of a given type has been created, you can filter for that type to see them all (e.g., after placing several NPort components, view the Symbols tab, and type "NP" into the **Filter** area and select "type: NPort". This filters to show only NPort components).

For more information, see Using the Component Libraries Window.

SPICE Library Support

The Ansys Electronics Desktop (AEDT)™ electronics systems design platform allows you to import SPICE® libraries and SPICE components with an import wizard. Imported SPICE components can then be exported to AEDT library. The SPICE import window includes a check box for PSPICE models. A separate icon allows you to import a PSPICE model directly

> **Note:**
>
> Imported SPICE models and netlists must be in HSPICE, PSPICE, or Spectre format for simulation and post-processing with the Nexxim simulator.
>
> The Spice Import Wizard supports the following models:
>
> - amp, c, csw, d, l, ltra, njf, nmf, nmos, npn, pjf, pmf, pmos, pnp, r, sp, sw, u, urc, w

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

SPICE Library Import Procedure

To import a SPICE library or one of its components in a Circuit schematic:

1. View the **Component Libraries**. Open the **Symbols** area. Click **Models**.
2. From the area, select the **Spice** icon to open the **Select Model File** window.
3. The **Files of type** menu lists the file types for the SPICE file. You can import a SPICE library (.lib), a SPICE subcircuit definition (.cir, .spc, .sp), or a Spectre-format (.scs). You can specify the location of the SPICE file by clicking **Use Path**, **PersonalLib**, **UserLib**, or **SysLib**.

   > **Note:**
   >
   > **Import Spectre**. Spectre-format files are case-sensitive.

   Within the **PersonalLib**, **userlib**, or **syslib** folder, select the file from those listed, or type the name of the file in the **File Name** area. Note that **syslib** is reserved for libraries supplied with the Ansys Electronics Desktop (AEDT)™ electronics systems design platform. See Paths for Model File Selection for details.
4. Click **Open** in the **Select Model File** window to open the **Component Import** window.

The **Component Import** window lists all the SPICE components that are contained in the library.

- Check a box in the **Create Component** column to select the corresponding component for import.
- Click the **Symbol** and **Footprint** column boxes to assign a symbol and footprint to a component. These steps are optional; if either one is left unspecified, a default symbol or footprint is created automatically.
- Select **OK** to import the selected components and thereby display their names in the **Project Manager** window.

Once the component has been placed in the schematic, its Property Window will show a checkbox property named **NetlistAsSubcircuit**. Enabling the checkbox affects only what is written to the netlist for simulation. When the checkbox is enabled, the Spice model component will be netlisted inside its own subcircuit along with its file reference. This means the model name (taken from the Spice file) cannot conflict with the same model name in a different Spice file netlisted for a different component. If two Spice files with identical model names are read into the global scope, only data from one of the spice files will be used for all components referencing that model name, causing a simulation error. Checking the ”NetlistAsSubcircuit” property will move the file out of the global scope and prevent this problem.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Warning:**
>
> If the SPICE file has more than 10k characters in its DATA member, the parameter definitions from that file are not imported. The simulators gets the correct information on the parameters on the .lib or .sp file, but the parameters cannot be overridden on a per-instance basis.

Grouped Components

From the **Component Import** window, select **Group similar components** in order to group components that have the same parameter names and values. **Require consistent parameter values** (enabled only when **Group similar components** is selected) enforces that every element in the group has the same parameter values, which is the default.

The criteria for grouped components are:

- Components must be selected for import.
- Components must have the same number of pins.
- Models must have the same base model type (cap, bjt, etc).

After selecting **Group similar components** in the **Component Import** window, similar components are grouped in the display:

- After grouping, the **Name** column displays the file name of the component group appended with a group number; you can change this name by typing in the **Name** column.
- Multiple groups can be found, but every element of a group must have the same grouping criteria.
- A group can only be created if it contains multiple components.

Select **OK** to import the component group and thereby display its name in the **Project Manager** window.

- After placing the component group in the schematic, the component possesses a special property, **VComp**, that is displayed in the **Properties** window. Click the **VComp** property to select which model in the group are used in the schematic.
- Click **Choose Model** in the **Properties** window to open a **Model List** window that displays all the models in the group.
- You can then select a new model, click **OK,** and the new model name are reflected in the **Properties** window.

5. If you do not select your own symbol for an imported component, a default symbol are automatically selected. To select your own symbol, click **Symbol** to open the **Select Definition — Symbols** window. For more information, see Using the Symbol Editor.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. If you do not select your own footprint for an imported component, a default footprint are automatically selected. To select your own footprint, click **Footprint**. If you have encrypted libraries, this opens the **Enter Password** window.

After entering a valid password, or if you do not have encrypted libraries, the next window to open is the **Select Definition — Footprints** window. For more information, see Using the Footprint Editor.

7. If you select **Check this box if this is a PSPICE component** on the Component Import window, the component is imported as a PSPICE component.

The global tab of the netlist for the component includes lines (shown in **bold**) to switch to the PSPICE parser for this library, then back to Nexxim for the rest of the netlist:

```
simulator lang=pspice
.inc "C:\Documents\Ansoft\PersonalLib\Component Data
Files\Component Data Files\Spice\BC8\\
57_PNP_Model.lib"
simulator lang=nexxim
```

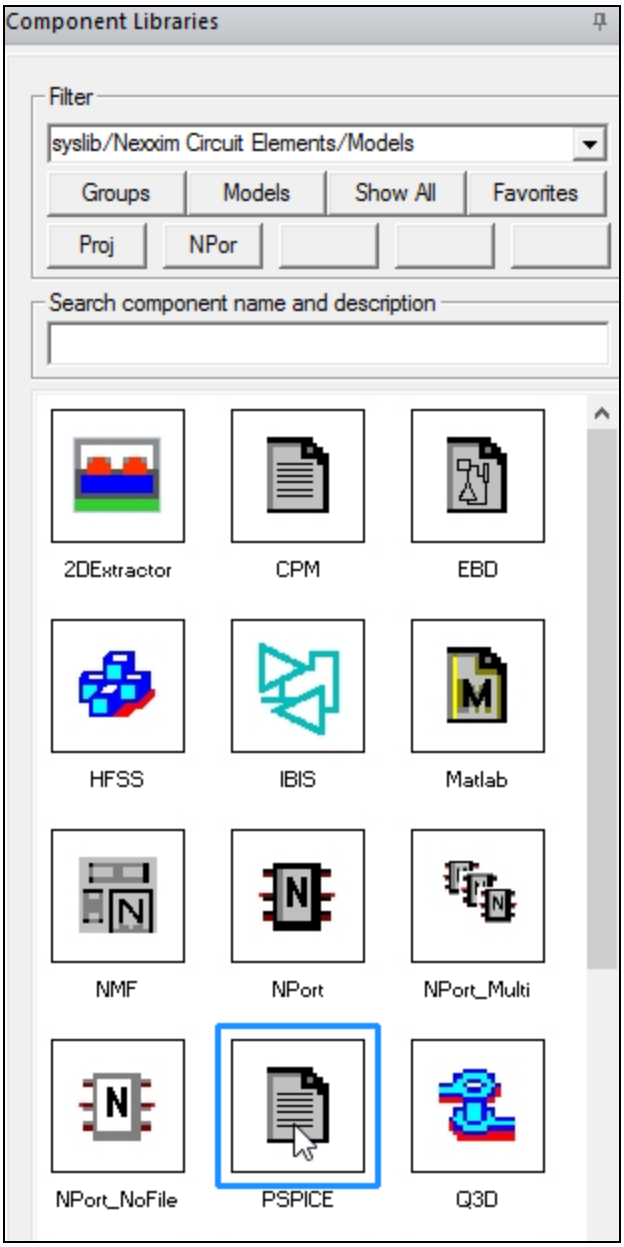
For more information about AEDT libraries see Using the Component Editor.

PSPICE Library Import Procedure

To import a PSPICE library or one of its components in a Circuit schematic:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. View the **Component Libraries**. Open the **Symbols** area. Click **Models**.



2. From the area of icons, select the **PSPICE** icon to open the **Select Model File** window.
3. The **Files of type** menu lists the file types for the PSPICE file. You can import a PSPICE library (.lib) or a PSPICE subcircuit definition (.cir, .spc, .sp). You can specify the location of the PSPICE file by clicking **Use Path**, **PersonalLib**, **UserLib**, or **SysLib**.

Within the **PersonalLib**, **userlib**, or **syslib** folder, select the file from those listed, or type the name of the file in the **File Name** area. Note that **syslib** is reserved for libraries supplied with the Ansys Electronics Desktop (AEDT)™ electronics systems design platform. See Paths for Model File Selection for details.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click **Open** in the **Select Model File** window.

The window lists all the SPICE components that are contained in the library.

- Check a box in the **Create Component** column to import the corresponding component.
- Click the **Symbol** and **Footprint** column boxes to assign a symbol and footprint to a component. These steps are optional; if either one is left unspecified, a default symbol or footprint is created automatically.
- Click **OK**.
- click the **Select Component** window to select one or more library components.
- Select **OK** to import the selected components and display their names in the **Project Manager** window.

The global tab of the netlist for the component includes lines (shown in **bold**) to switch to the PSPICE parser for this library, then back to Nexxim for the rest of the netlist:

```
simulator lang=pspice
.inc "C:\Documents\Ansoft\PersonalLib\Component Data
Files\Component Data Files\PSpice\BC8\\
simulator lang=nexxim
```

Once the component has been placed in the schematic, its Property Window will show a checkbox property named **NetlistAsSubcircuit**. Enabling the checkbox affects only what is written to the netlist for simulation. When the checkbox is enabled, the Spice model component will be netlisted inside its own subcircuit along with its file reference. This means the model name (taken from the Spice file) cannot conflict with the same model name in a different Spice file netlisted for a different component. If two Spice files with identical model names are read into the global scope, only data from one of the spice files will be used for all components referencing that model name, causing a simulation error. Checking the ”NetlistAsSubcircuit” property will move the file out of the global scope and prevent this problem.

For more information about AEDT libraries see Using the Component Editor.

Modifications to SPICE Pin Names

When importing a SPICE component, the Ansys Electronics Desktop (AEDT)™ electronics systems design platform may modify pin names for compatibility with AEDT pin names and guarantee uniqueness of pin names.

- The following characters are invalid in AEDT pin names and are removed (squeezed out) from pin names: []<>{}&*<space>,\
- No other modification to pin names are made. Capitalization at the location of removed characters is not adjusted.
- A uniqueness test is performed. Any non-unique names have _## appended to the name, where ## is a number that increments until a unique name is generated. Pin names are

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

processed in the order they are specified on the .subckt line. No check is performed to see if the name already has a _## in it and attempt to increment that number. Thus if there are two P_1 pins, the result is a P_1 pin and a P_1_1 pin.

PSPICE Model Support

The following types of models are supported:

- Semiconductor
- PSPICE Function
- PSPICE Vendor Libraries

Semiconductor Model Support

The following table shows the supported PSPICE semiconductor models.

Type	PSPICE	Support	Comments
D<name> - d	PSPICE diode	Supported	
M<name> - nmos/pmos	Level=1 Shichman-Hodges	Supported	
M<name> - nmos/pmos	Level=2 geometry-based, analytic	Available[2]	
M<name> - nmos/pmos	Level=3 semi-empirical, short-channel	Supported	
M<name> - nmos/pmos	Level=4 BSIM	Available[2]	Level=13
M<name> - nmos/pmos	Level=5 EKV version 2.6	Available[2]	Level=55
M<name> - nmos/pmos	Level=6 BSIM3 version 2.0	Not supported	
M<name> - nmos/pmos	Level=7 BSIM3 version 3.2	Supported	
J<name> - njf/pjf	PSPICE Junction FET	Supported	
B<name>, gasfet	Level=1 Curtice	Available[2]	NJF Level=3 SAT=0
B<name>, gasfet	Level=2 Raytheon or Statz	Available[2]	NJF Level=3 SAT=2 or Level=25
B<name>, gasfet	Level=3 TOM by Triquint	Available[2]	NJF Level=3 SAT=3
B<name>, gasfet	Level=4 Parker-Skellern	Available[2]	Level=18
B<name>, gasfet	Level=5 TOM-2 by Triquint	Not supported	
B<name>, gasfet	Level=5 Tom-3 by Triquint	Available[2]	Level=7
Q<name> -	Level=1 Gummel-Poon	Supported	

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Type	PSPICE	Support	Comments
npn/pnp			
Q<name> - npn/pnp	Level=2 Mextram	Available[2]	
Z<name> - nigbt		Not supported	Not implemented in simulator

Note:

1. For MESFETs, PSPICE uses B<name> for instance and GASFET to call the model. Nexxim uses J<name> and NJF/PJF.
2. "Available" in the table means the model is available but has not been tested for PSPICE compatibility

PSPICE Function Support

The following table lists the built-in functions available for use in parameter statements, user-defined functions, and expression-based behavioral circuit elements.

Function	Support in Nexxim
Built in Functions	
ABS(x)	Supported
ACOS(x)	Supported
ACOSH(x)	Supported

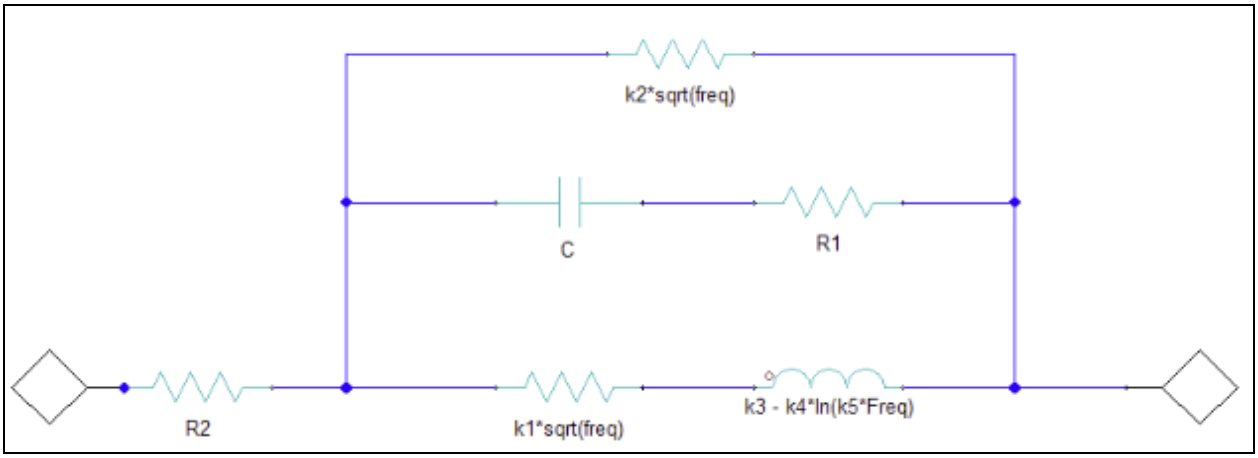
PSPICE Vendor Library Support

Coilcraft Power Inductors are supported.

Coilcraft Power Inductors

The following lumped-element spice model on the manufacturer is implemented for Power Inductor parts. Model parameters for the elements are those specified in the datasheet tables for the associated parts.

Time-domain simulation is enabled by evaluating all frequency-dependent equations at 100KHz. This frequency can be adjusted by modifying the parameter ‘tran_eval_freq’ in the model library.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IBIS Library Support

The Ansys Electronics Desktop (AEDT)™ electronics systems design platform provides an easy way to import IBIS® buffer components, pins and models from IBIS libraries and place them as components in the schematic. Property settings allow you to set up IBIS transmitters, receivers, and other elements, including IBIS-AMI components.

To import and use an IBIS buffer component, use the following steps:

1. Import IBIS Library File
2. Import IBIS Single Component or Pin or Buffer Element
3. Place IBIS Buffer Component in Schematic
4. Edit IBIS Component Properties
5. IBIS File Import Technical Notes

A separate procedure allows the import of IBIS EBD Files:

- Importing IBIS EBD Files

An IBIS I/O Wizard is available for connecting schematic signal, power, and ground nodes to IBIS buffer instances:

- IBIS I/O Wizard

A component defined by the IBIS Algorithmic Model Interface (AMI) specification requires special import and setup steps, described in the AMI Analysis topic.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note: (for HSPICE users)

AEDT IBIS Components created with the "Import IBIS Components" procedure contain certain convenience features that are only tested for compatibility with the Nexxim simulator.

1. **Pin Imports,** which provide automatic instantiation of the lumped RLC package parasitics on the **[Package]** or **[Pin]** keywords.
2. The **buffer_mode** parameter **Internal** settings, which allow users to specify the mode of the device (Input, Output, High Impedance) from a pull down list instead of creating a voltage source to drive the enable node.
3. The **logic_in** parameter **Internal** setting, which allows users to configure a built-in eye source instead of creating an external voltage source to provide the bit pattern.

Follow these steps when importing IBIS components to create a Circuit Design that is compatible with other simulators.

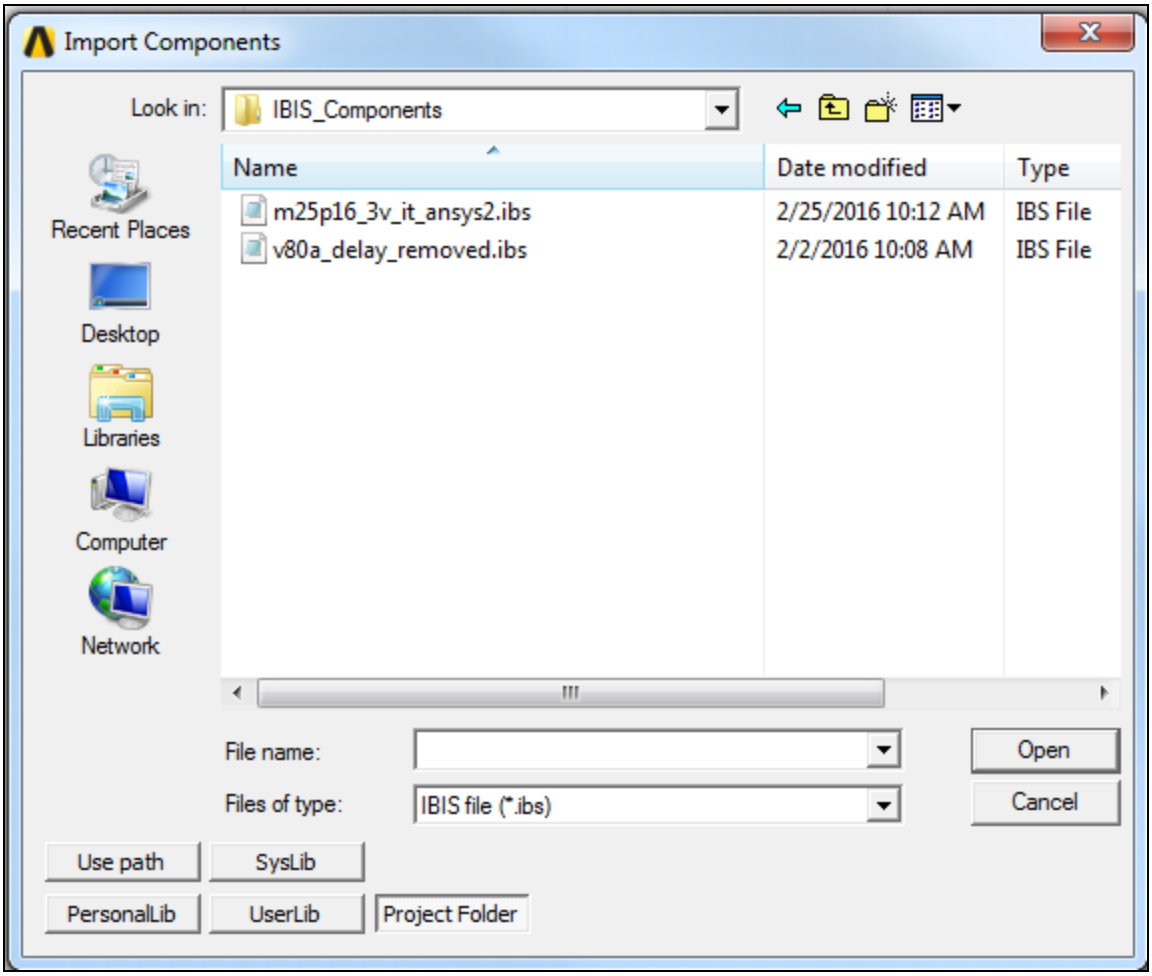
1. Click the **Buffer Import** tab in the **Import IBIS Components** window. Do not click the **Pin Import** tab.
2. When placing the components on the schematic and configuring the circuit, provide external sources and click the **Select Net** option to connect the **buffer_mode** (enable) and **logic_in** (bit source) parameters to the external sources.

Import IBIS Library File

To import an IBIS buffer or buffer model from an IBIS library file (.ibs) in a Circuit schematic:

1. View the **Component Libraries**. Open the **Symbols** area. Click **Import Models**. From the area, select the **IBIS** icon to open the **Import Components** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Specify the location of the IBIS file by clicking **Use Path**, **PersonalLib**, **UserLib**, or **SysLib**.

See Paths for Model File Selection for details.

3. Within the **PersonalLib**, **userlib**, or **syslib** folder, select the file from those listed, or type the name of the file in the **File Name** area. Note that **syslib** is reserved for libraries supplied with the Ansys Electronics Desktop (AEDT)™ electronics systems design platform.

If you select **Use path**, type the name of the file in the **File Name** area, or click the **Look in** field to navigate to the file and record its name. Note that components or libraries imported with Use Path may not be portable when the project is moved to another machine.

When **Project Folder** is selected, references to the file in the design are relative to the directory where the project resides. In this case, the path is saved in the project **.adsn** file as a variable such as:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
.lib '$PROJECTDIR/x_113854.ibs'
```

The variable $PROJECTDIR are expanded to the current location of the project when the design is converted to a netlist and run by an analysis tool. Otherwise, an absolute path is saved. If you move a project and its library files together to a new directory, you can preserve the file references by selecting the **Project Folder** option.

4. Click **Open** to select the IBIS file and open the **Import IBIS** window. The next step is to select the pins and buffer models to make into schematic components.

Import IBIS Single Component or Pin or Buffer Element

Import IBIS Single Component or Pin or Buffer Element

IBIS devices are created in the Ansys Electronics Desktop (AEDT)™ electronics systems design platform using Single Component Import, Pin Import or Buffer Model Import. A component import can include [Package Model] and [Pin Mapping] information to control power and parasitic package behavior. A Pin Import captures the behavior of a given pin on a component defined in the IBIS file. A device created via Pin Import contains the behavior of the model associated with the pin, and it also contains information about the parasitic package model specified for that pin. A buffer model import captures the behavior of a given model in an IBIS file without any package parasitic modeling.

The **Import IBIS** window enables the following actions:

- Import a complete component with a [Package Model] and importing all signal, power, ground, and NC pins. See Import Single Component with [Package Model], All Pins.
- Import a complete component with a [Package Model], but importing only selected signal, power, ground, and NC pins. See Import Single Component with [Package Model], Selected Pins.
- Import a complete component without a [Package Model], importing all signal pins. See Import Single Component with No [Package Model], All Pins.
- Import a complete component without a [Package Model], importing only selected signal pins. See Import Single Component with No [Package Model], Selected Pins.
- Import selected pins from a selected component. See Pin Import Tab.
- Import a buffer model without referencing a specific component or pin. See Buffer Import Tab.

Import Single Component with [Package Model], All Pins

An IBIS buffer imported as a single component has a rectangular schematic symbol with terminals for the imported pins in the IBIS model. When no individual pins are selected, Nexxim imports all eligible pins. When the IBIS component definition includes a [Package Model], and **Use Package Model** is selected, Nexxim uses the information in the [Package Model] to instantiate RLC parasitics between the die-side and the board-side nodes. The power and

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ground pins become available for import, and the **Component External Power** property is present. Then you can connect the pins to signals, power sources, and grounds in the schematic. The **Component External Power** property is set to ON, so the component expects power through the component terminals.

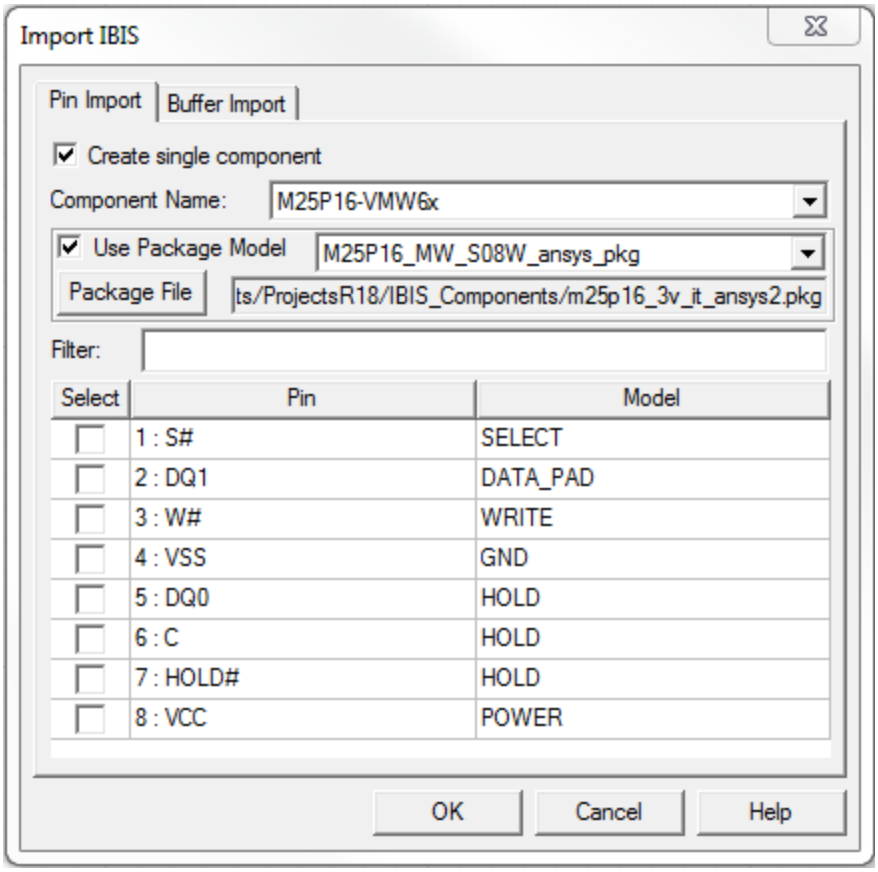
When the component definition includes a [Pin Mapping], Nexxim constructs the specified power and ground buses internal to the component. A [Pin Mapping] is required in all cases where the component has multiple POWER and GND buses. However, Nexxim can make the power bus connections without a [Pin Mapping] when there is exactly one POWER bus and one GND bus, identified by their IBIS signal_name entries. Each bus (signal_name) can have multiple pins, which are tied together. Nexxim halts with an error message if there is no [Pin Mapping] and the component does not have exactly one POWER bus and one GND bus.

When you have identified the IBIS library file in the **Import Components** window, the **Import IBIS** window appears.

To import a single IBIS component that includes a [Package Model] and importing all component signal, power, ground, and no-connect (NC) pins:

1. Click the **Create single component** check box at the top of the **Pin Import** tab.
2. From the **Component Name** field, use the drop-down menu to select the component with a [Package Model] on the IBIS file.
3. If the component definition includes a [Package Model], click the **Use Package Model** check box and choose the package model from the drop-down menu.
4. If the [Package Model] is defined in a separate .pkg file rather than in the IBIS file, click **Package File** and select the package model file.
5. Do not select any individual pins. With no individual pins selected, Nexxim imports ALL the signal, POWER, GND, and NC pins on the component definition.
6. Click **OK** to create the component and add it to the **Definitions** > **Components** listing in the **Project Tree**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



(See *Power Nodes* in the "IBIS File Import Technical Notes" on page 5-121 for details on the methods for supplying power to imported IBIS components. See *Package RLC Parasitics* in the technical notes for details on support for RLC parasitics in IBIS components.

The next step is to place the IBIS components in the schematic.

Place IBIS Buffer Component in Schematic

Import Single Component with [Package Model], Selected Pins

An IBIS buffer imported as a single component has a rectangular schematic symbol with terminals for the imported pins in the IBIS model. When individual pins have been selected, only those pins are imported. When the IBIS component definition includes a [Package Model], and **Use Package Model** is selected, Nexxim uses the information in the [Package Model] to instantiate RLC parasitics between the die-side and the board-side nodes. The power and ground pins become available for import, and the **Component External Power** property is present. Then you can connect the pins to the individual signals, power sources, and grounds in the schematic. The **Component External Power** property is set to ON, so the component expects power through the component terminals. When the component definition includes a [Pin Mapping], Nexxim constructs the power and ground buses internal to the component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

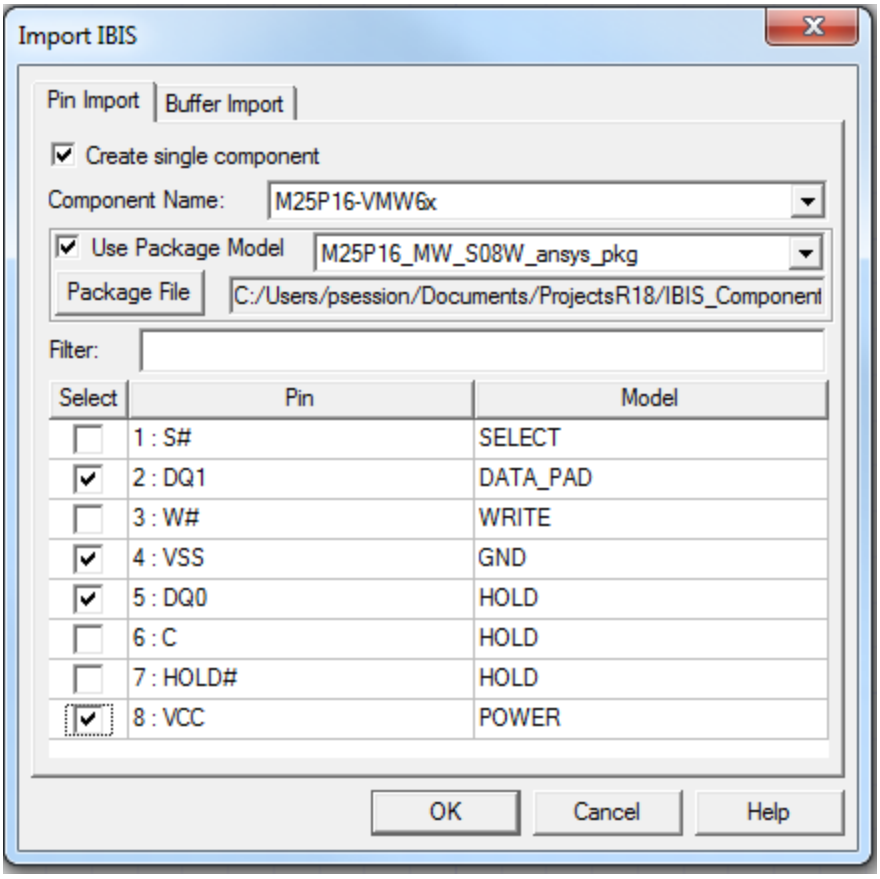
The pins selected for import must include a subset of POWER and GND pins sufficient to power any power rail (bus) used by any of the imported signal pins (e.g., if one of the imported signal pins specifies a bus "VCC" in the pu_ref column of its [Pin Mapping] entry, and no power pin attached to the "VCC" bus is imported, Nexxim issues an error).

When you have identified the IBIS library file in the **Import Components** window, the **Import IBIS** window appears.

To import a single IBIS component that includes a [Package Model] with selected component signal, power, ground, and no-connect (NC) pins:

1. Click the **Create single component** check box at the top of the **Pin Import** tab.
2. From the **Component Name** field, use the drop-down menu to select the component with a [Package Model] on the IBIS file.
3. If the component definition includes a [Package Model], click the **Use Package Model** check box and choose the package model from the drop-down menu.
4. If the [Package Model] is defined in a separate .pkg file rather than in the IBIS file, click **Package File** and select the package model file.
5. Select the selected individual pins. Nexxim imports only the selected signal, POWER, GND, and NC pins.
6. Click **OK** to create the component and add it to the **Definitions** > **Components** listing in the **Project Tree**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



(See *Power Nodes* in the "IBIS File Import Technical Notes" on page 5-121 for details on the methods for supplying power to imported IBIS components. See *Package RLC Parasitics* in the technical notes for details on support for RLC parasitics in IBIS components. The next step is to place the IBIS components in the schematic.

Place IBIS Buffer Component in Schematic

Import Single Component with No [Package Model], All Pins

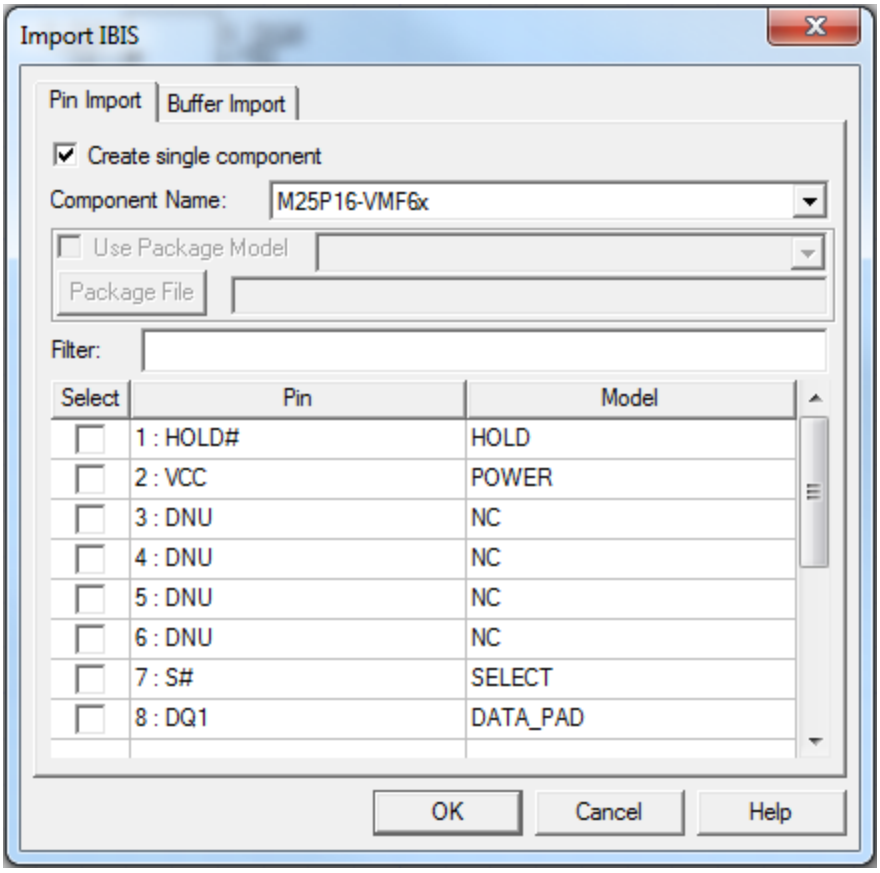
An IBIS buffer imported as a single component has a rectangular schematic symbol with terminals for the imported pins in the IBIS model. When no individual pins are selected, Nexxim imports all eligible pins. When the IBIS component definition does not include a [Package Model], the [Package Model] option is deactivated, and the power and ground pins are not available for import. Then you can connect the pins to signals in the schematic. The component expects power as specified by the **power** parameter on each pin. Any [Pin Mapping] in the component definition is ignored. Nexxim uses the [Pin] or [Package] data (selected by **pkg_ selector** property) to instantiate RLC parasitics between the die-side and the board-side nodes.

When you have identified the IBIS library file in the **Import Components** window, the **Import IBIS** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To import a single IBIS component without a [Package Model] and importing all component signal pins:

1. Click the **Create single component** check box at the top of the **Pin Import** tab.
2. From the **Component Name** field, use the drop-down menu to select the component on the IBIS file.
3. Do not select any individual pins. With no individual pins selected, Nexxim imports ALL the signal pins on the component definition.
4. Click **OK** to create the component and add it to the **Definitions** > **Components** listing in the **Project Tree**.



(See *Power Nodes* in the "IBIS File Import Technical Notes" on page 5-121 for details on the methods for supplying power to imported IBIS components. See *Package RLC Parasitics* in the technical notes for details on support for RLC parasitics in IBIS components. The next step is to place the IBIS components in the schematic.

Place IBIS Buffer Component in Schematic

Import Single Component with No [Package Model], Selected Pins

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

An IBIS buffer imported as a single component has a rectangular schematic symbol with terminals for the imported pins in the IBIS model. When individual pins have been selected, only those pins are imported. When the IBIS component definition does not include a [Package Model], the [Package Model] option is deactivated, and the power and ground pins are not available for import. Then you can connect the pins to the individual signals in the schematic. The component expects power as specified by the **power** parameter on each pin. Any [Pin Mapping] in the component definition is ignored. Nexxim uses the [Pin] or [Package] data (selected by **pkg_selector** property) to instantiate RLC parasitics between the die-side and the board-side nodes.

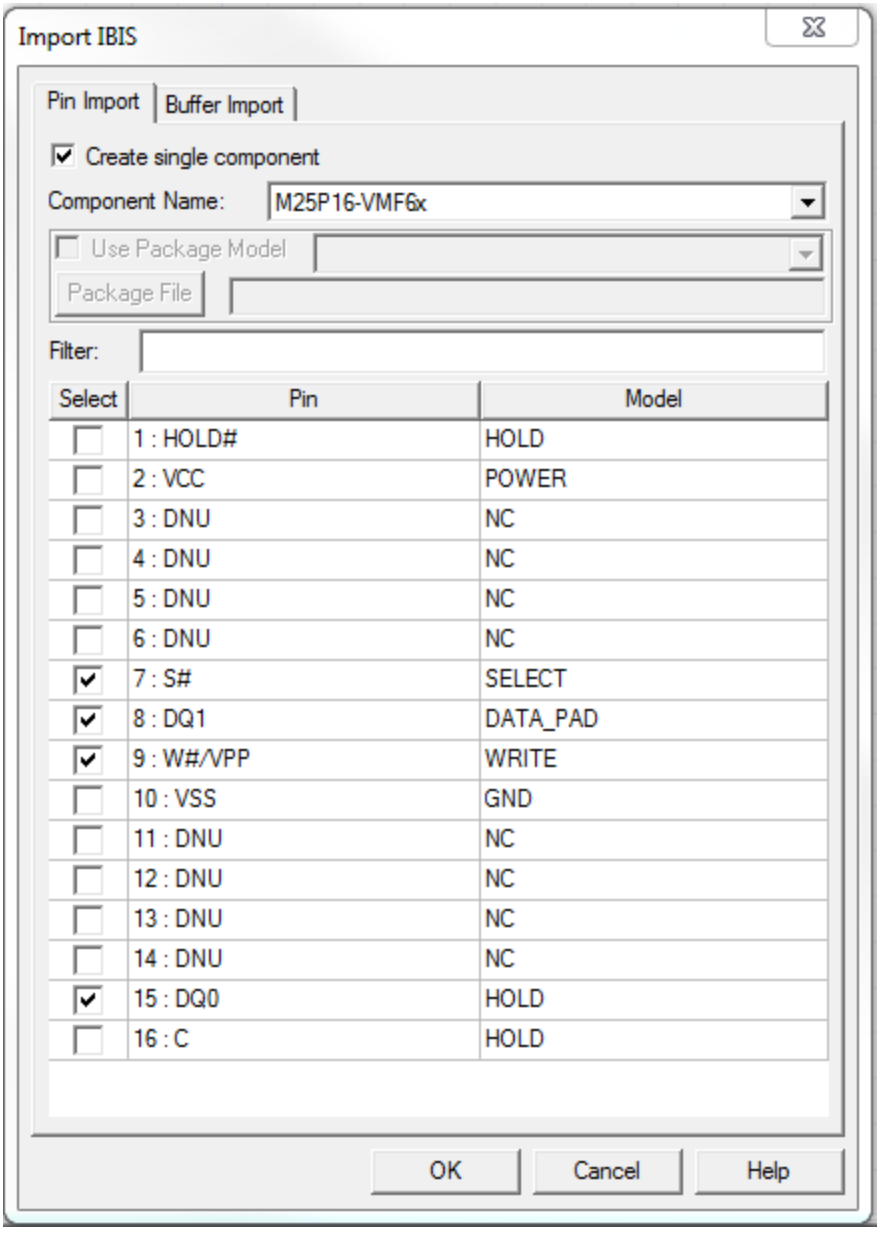
When you have identified the IBIS library file in the **Import Components** window, the **Import IBIS** window appears.

To import a single IBIS component without a [Package Model] with selected component signal pins:

1. Click the **Create single component** check box at the top of the **Pin Import** tab.
2. Select the selected individual pins. Nexxim imports only the selected signal pins.
3. Click **OK** to create the component and add it to the **Definitions** > **Components** listing in

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the **Project Manager** window.



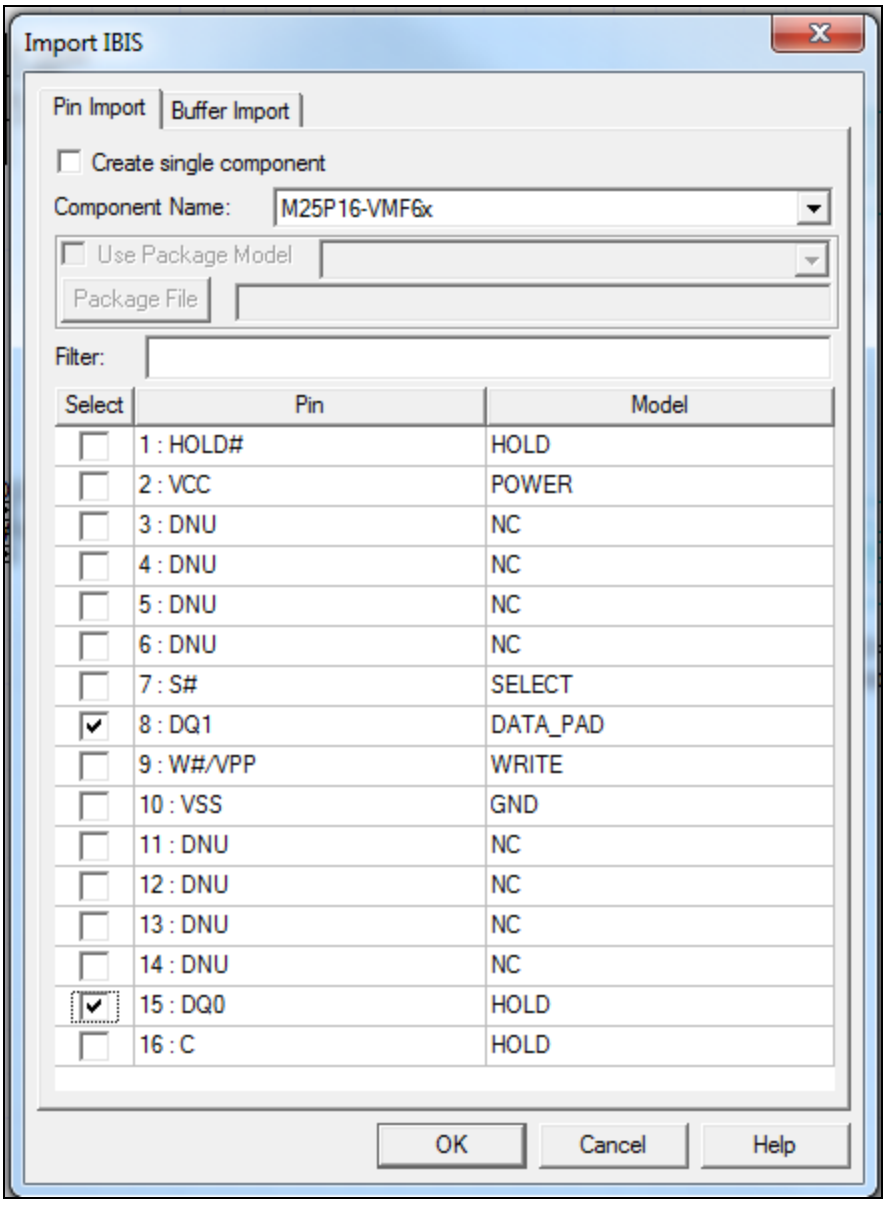
(See *Power Nodes* in the "IBIS File Import Technical Notes" on page 5-121for details on the methods for supplying power to imported IBIS components. See *Package RLC Parasitics* in the technical notes for details on support for RLC parasitics in IBIS components. The next step is to place the IBIS components in the schematic.

Place IBIS Buffer Component in Schematic

Pin Import Tab

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

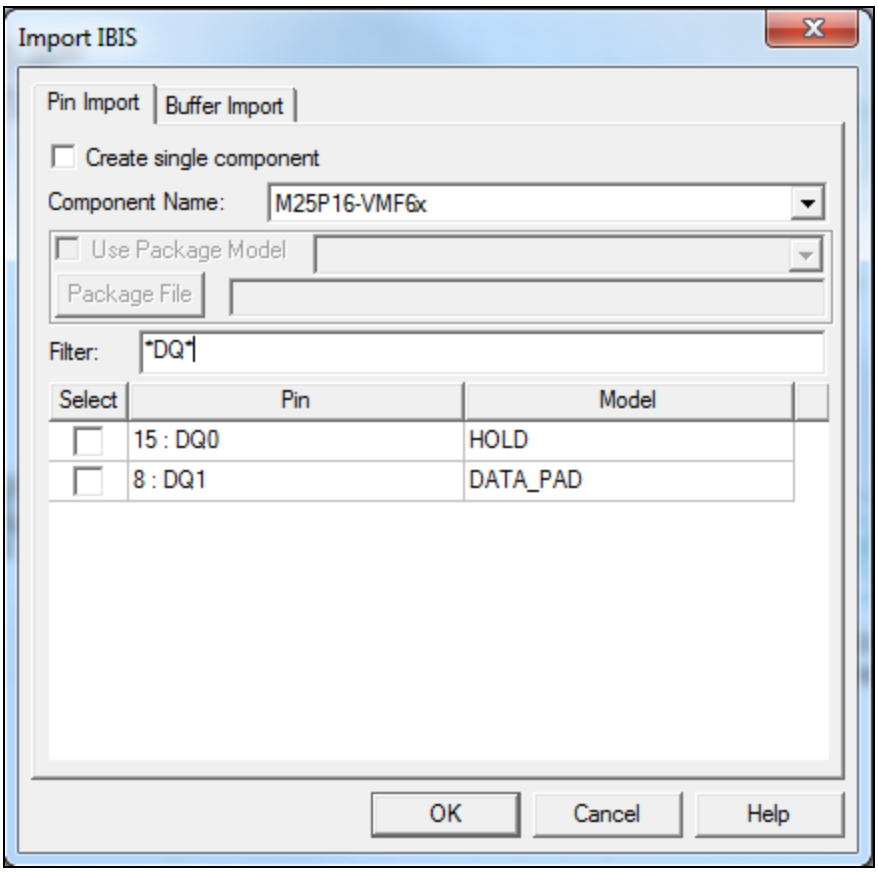
Click the **Pin Import** tab to import one or more buffer pins from a specified IBIS component. Each pin imported with **Pin Import** has a buffer model (or model selector). Each pin gets its power as specified in its **power** parameter, and uses the package model selected by a **Package Model** import or by the pin's individual **pkg_selector** parameter (which is not displayed when a **Package Model** was imported).



1. The **Component Name** field lists all the IBIS components contained in the selected IBIS library. Scroll the list and select the name of the component to import.

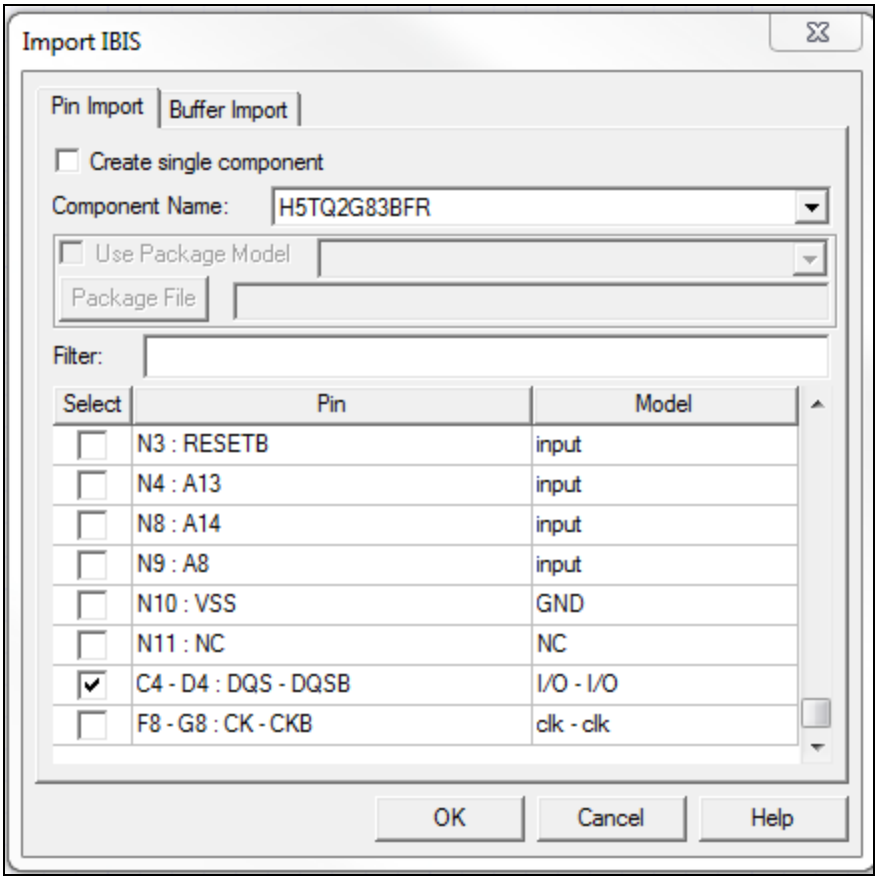
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. To import the pins as a single component where each pin retains its own model and buffer type, check **Create single component**. See Import IBIS Single Component or Pin or Buffer Element for details.
3. The **Pin Import** tab displays the pins defined for the component in the IBIS file, and the model or model selector associated with each pin. Single pins are listed first, then differential pin pairs if any are defined in the IBIS file.
4. To create a muiti-pin component:
    - Use the check boxes to select one or more pins to import.
    - Alternatively, click the **Filter**: field to enter a pin name, which can use asterisks as wild-card characters. Click **Select** at the top of the column to automatically select any pin names that match the Filter:



If the IBIS file contains differential pins, they appear in the pin list:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Here the two differential pins (C4-D4: DQS - DQSB) have been selected.

5. Click **OK** to generate the components on the IBIS Pin Import.

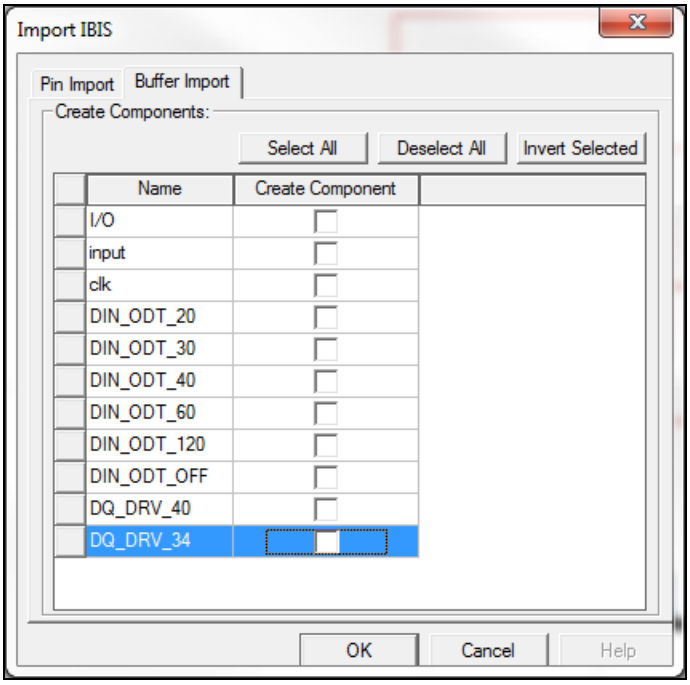
(See *Power Nodes* in the "IBIS File Import Technical Notes" on page 5-121 for details on the methods for supplying power to imported IBIS components. See *Package RLC Parasitics* in the technical notes for details on support for RLC parasitics in IBIS components. The next step is to place the IBIS components in the schematic.

Place IBIS Buffer Component in Schematic

Buffer Import Tab

The **Buffer Import** tab allows users to create an Ansys Electronics Desktop (AEDT)™ component representing a single buffer model or model selector from an IBIS file. Each pin gets its power as specified in its **power** parameter, and has no package model support.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



(Refer to *Power Nodes* in the "IBIS File Import Technical Notes" on page 5-121 for details on the methods for supplying power to imported IBIS components. Refer to *Package RLC Parasitics* in the technical notes for details on support for RLC parasitics in IBIS components. The next step is to place the IBIS components in the schematic.

If users check the **Create Component** box for any of the imported buffer models, the next step is to place the IBIS components in the schematic.

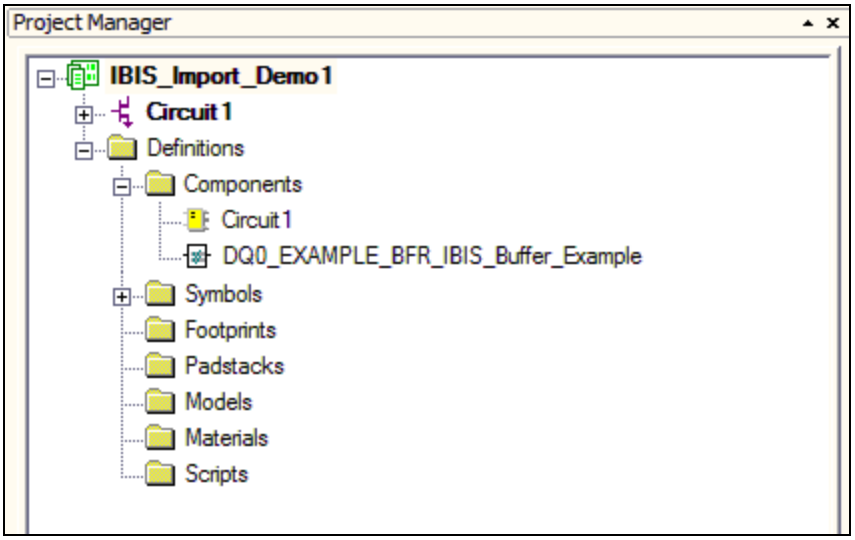
Place IBIS Buffer Component in Schematic

Place IBIS Buffer Component in Schematic

In most cases, after clicking OK on the **IBIS Import** window, a copy of the symbol for the component are attached to the cursor so you can place it in the schematic. Also generate an instance of an IBIS buffer component from the Definitions folder:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

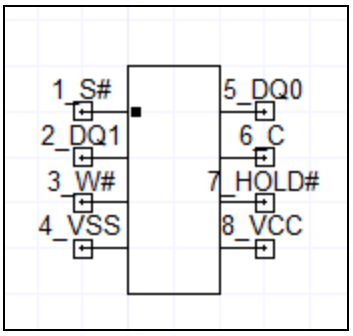
1. Expand the Definitions folder in the Project window, then expand the Components folder.



2. Click selected component and drag the symbol into the schematic.

Component Import, Package Model, All Pins Imported

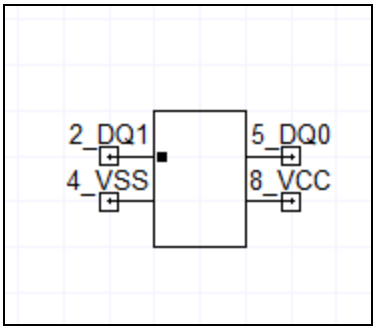
IBIS single components are named for the IBIS library file and the [Component] entry. The symbol shows all the pins with pin names and signal_names read from the file. This is the symbol for component with a [Package Model] and all pins imported. The symbol includes all signal, POWER, and GND pins for connection in the schematic.



Component Import, Package Model, Selected Pins Imported

IBIS single components are named for the IBIS library file and the [Component] entry. The symbol shows all the pins with pin names and signal_names read from the file. This is the symbol for component with a [Package Model] with some selected pins imported. The symbol includes only the selected signal, POWER, and GND pins for connection in the schematic.

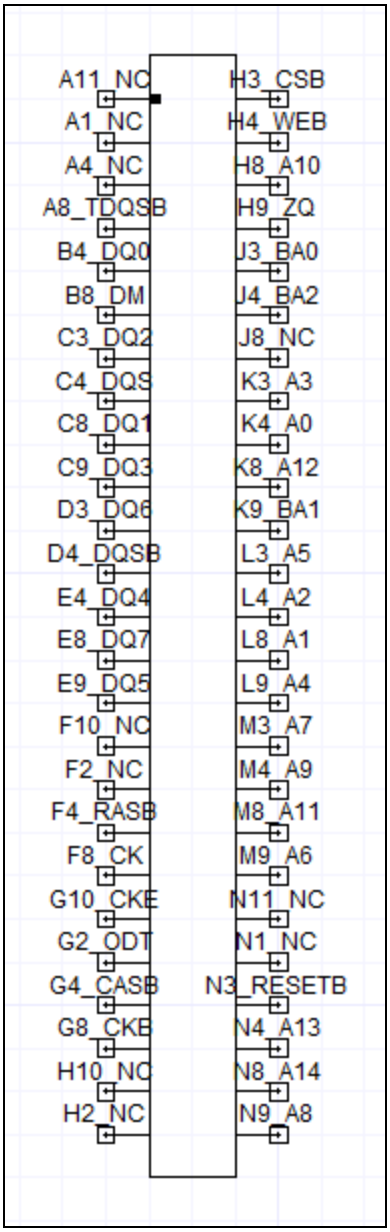
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Component Import, No Package Model, All Pins Imported

IBIS single components are named for the IBIS library file and the [Component] entry. The symbol shows all the pins with pin names and signal_names read from the file. This is the symbol for a component with no [Package Model] and all signal pins imported (no individual pins selected). The symbol includes all signal pins for connection in the schematic.

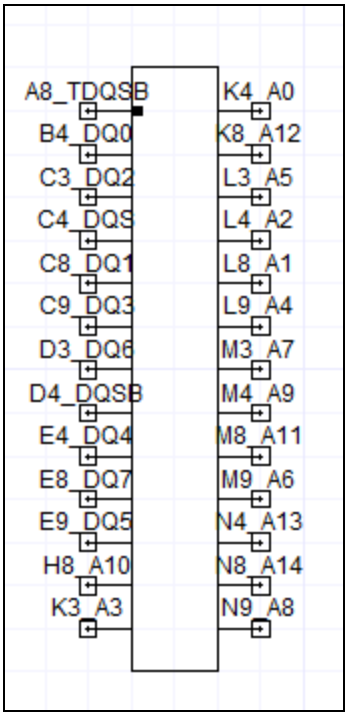
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Component Import, No Package Model, Selected Pins Imported

IBIS single components are named for the IBIS library file and the [Component] entry. The symbol shows all the pins with pin names and signal_names read from the file. This is the symbol for the component in the preceding screenshot with no [Package Model] and selected signal pins imported. The symbol includes just the selected signal pins for connection in the schematic.

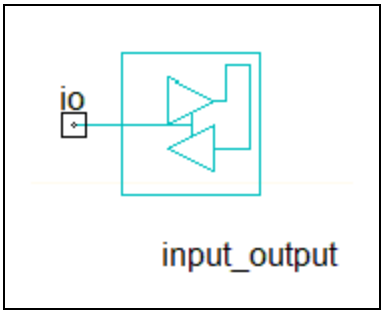
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Pin Import or Buffer Model Import

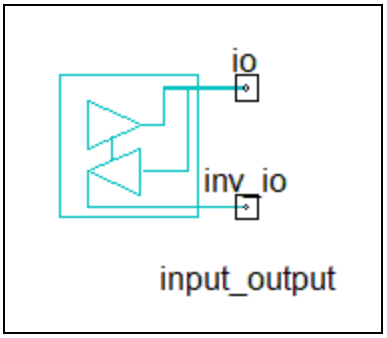
IBIS Pin Import components typically have names that begin with the pin name. IBIS Buffer Model Import component names begin with the model name or model selector name.

Single-pin IBIS components all use the following default schematic symbol. The text changes to show the buffer type selected for each component instance. The example shows the **input_ output** buffer type.



Differential IBIS components all use the following default schematic symbol.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



When you are finished placing instances of the component, right-click and select **Finish** or press **Esc** on the keyboard to stop placing instances.

The last step in the import process is to verify the settings of the component properties.

Edit IBIS Component Properties

Edit IBIS Component Properties

Right-click the IBIS buffer symbol and select **Properties** to open the **Property** window. The available properties depend on the buffer type and model. For imported Pins and Buffers, the property window shows the available properties directly. Once changes are made, click **OK** to close the **Property** window.

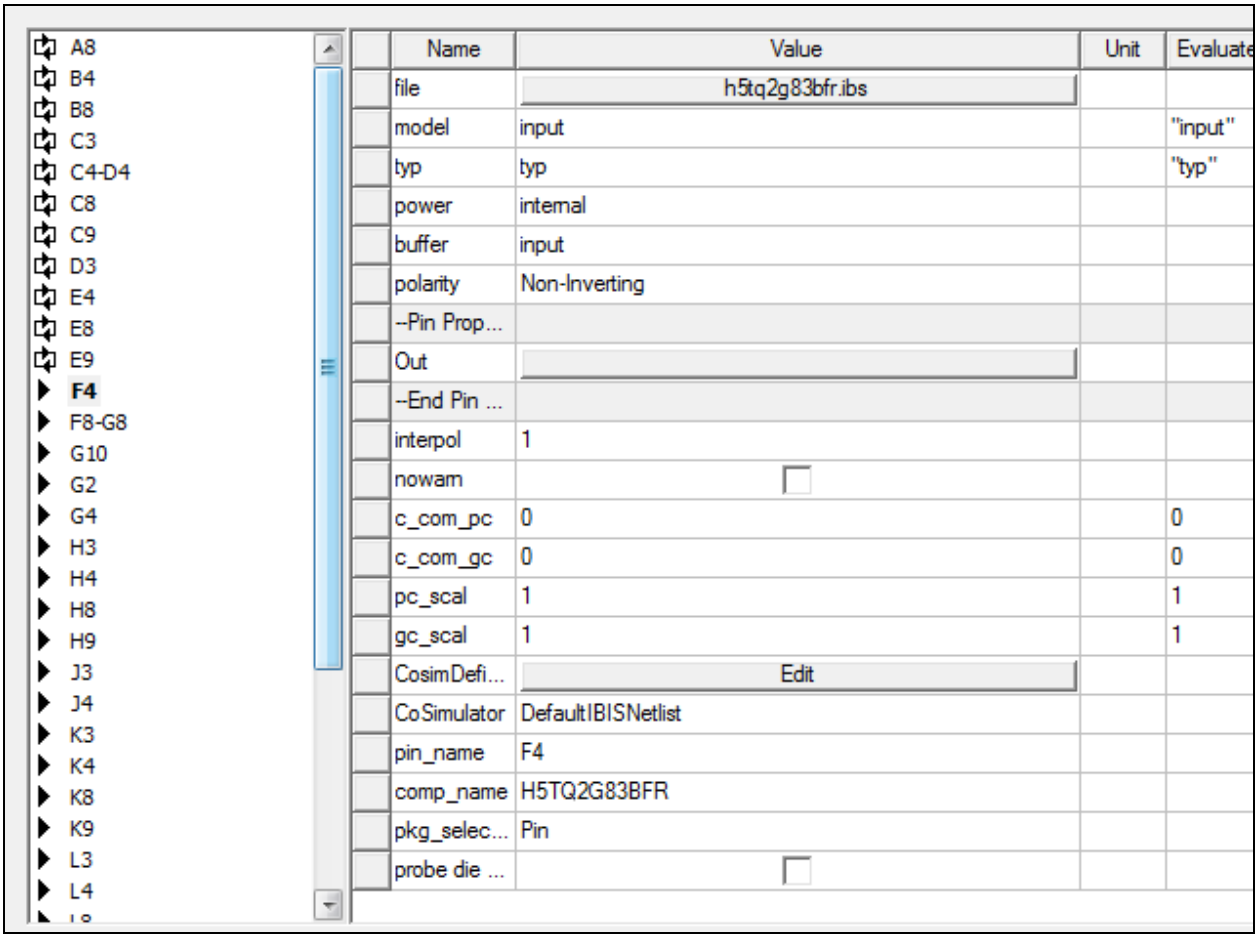
IBIS Property Locations

When the import is of an entire IBIS component, clicking **Properties** opens a Property window like the following:

	Name	Value	Unit	Eva...	Description
	file	m25p16_3v_it_ansys2.ibs			Name of IBIS file (required)
	CosimDefinition	Edit			
	Pin Info	Pin Info			
	CoSimulator	DefaultNetlist			
	Component External Power	☑			
	Package Model	M25P16_MW_S08W_ansys...			
	Status	Active			

From the **Properties** window for a single component, click **Pin Info** to bring up a window listing all the pins and the pin properties:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The area on the left lists all the pins in the component, with icons representing the buffer type. When you select one or more pins, the properties that apply to the selected pins are listed in the area on the right. The **Properties** window lists differential pin pairs (e.g., C4-D4), but the symbol shows separate terminals for both pins of a differential pair.

For a single pin or buffer model, all properties are on one page:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	Name	Value	Unit	Eva...	Description	Ca

Basic Buffer Properties

The basic IBIS component properties are displayed for all imported IBIS buffers.

- **File**: The name of the IBIS file.
- **Typ**: Assumed range of corner values for IBIS response parameters (See TYP Parameter Effects in the IBIS File Import Technical Notes)
- **Buffer**: Displays the buffer type corresponding to the model:
- Input
- Output
- Tristate
- Input/Output
- Open Drain, Open Sink, Open Source
- I/O Open Drain, I/O Open Sink, I/O Open Source
- Input ECL

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Output ECL
- Tristate ECL
- Input/Output ECL
- Terminator
- Series, Series Switch
- **Model**: Name of an IBIS model to associate with this component (pin or model). When the IBIS file specifies a Model Selector, the Model property lists the models in the selector so the user may select one. The list of available properties depends on the type of the model selected.

  > **Note:**
  >
  > A text array variable may be used for the **model** property. The array must contain model names with the same buffer type.
  >
  > See: Adding a Project Variable Array.

- **Polarity**: Non-inverting, Inverting, No Polarity, or Not Set, as specified in the IBIS file for each model.
- **Waveform Properties** The HSPICE-compatible Waveform properties control the details of the waveform processing and other buffer parameters. All buffer imports display the subset of these properties applicable to the buffer type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

interpol	1			Interpolation (1=linear, 2=spline)
nowarn				Disable parser warnings
c_com_pc	0		0	Fraction of capacitance on powe
c_com_gc	0		0	Fraction of capacitance on groun
c_com_pu	0		0	Fraction of capacitance on pullup
c_com_pd	0		0	Fraction of capacitance on pulldo
pc_scal	1		1	Scale factor for power clamp cur
gc_scal	1		1	Scale factor for ground clamp cur
pu_scal	1		1	Scale factor for pullup current driv
pd_scal	1		1	Scale factor for pulldown current
xv_pu				Node name for pu_scal
xv_pd				Node name for pd_scal
ramp_fwf	2			Falling waveform (0=ramp, 1=sing
ramp_rwf	2			Rising waveform (0=ramp, 1=singl
fwf_tune	0.1		0.1	Falling waveform adjustment
rwf_tune	0.1		0.1	Rising waveform adjustment
rwf_scal	1		1	Falling waveform scale factor
fwf_scal	1		1	Rising waveform scale factor
spu_scal	1		1	Additional scale factor for pullup c
spd_scal	1		1	Additional scale factor for pulldow
rm_dly_rwf	0	s	0s	Trim leading edge of rising wavefo
rm_dly_fwf	0	s	0s	Trim leading edge of falling wavef
rm_tail_rwf	0	s	0s	Trim trailing edge of rising wavefo
rm_tail_fwf	0	s	0s	Trim trailing edge of fallling wavef

- See Notes on IBIS Waveform Properties in the IBIS File Import Technical Notes for details on these properties.

Component and Pin Import Properties

These properties appear for single component and pin imports, not for buffer model imports.

- **pin_name** — The pin name on the IBIS file.
- **comp_name** — The name of the component on the IBIS file.
- **DieSideNodePrefix** — Allows users to add a keyword to the **probe die side node** name to help group nodes. The node representing the die side of the package is automatically generated. For a single IBIS pin component, the node is named **DS_***diesidenodeprefix*_*pinname_signalname_ID*, where:
  - *diesidenodeprefix* is the value entered in the **DieSideNodePrefix** property.
  - *pinname* is the **[Pin]** name on the imported pin's entry in the IBIS [Pin] table.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- *signalname* is the **signal_name** on the imported pin's entry in the IBIS [Pin] table.
- *ID* is the unique instance number of the IBIS device on the schematic (e.g., 130).

For example: `DS_U24_C2_DQ0_130`For differential pin pairs, the names of the two nodes are formatted like a single IBIS pin component with the addition of **_pos** and **_neg** suffixes. For example: `DS_U24_C3_DQS_t_131_pos` `DS_U24_C3_DQS_t_131_neg`In this case, *pinname* and *signalname* come on the first (non-inverting) pin in the IBIS [Diff Pin] table entry for the imported differential pin pair.

- **probe die side node** — The die side node waveforms are available in simulation output. If voltage probes are present elsewhere in the schematic, check the **probe die side node** check box to have the die side nodal voltage(s) appear as plottable quantities in the reporter, similar to if a probe had been placed on the die side node(s) for this IBIS device.
- **use_series_model** — For components with differential pins, the property list includes a **use_series_model** check box. Check this box to have Nexxim automatically instantiate any Series model defined between the differential pins in a Series Pin Mapping table in the IBIS file. Click the **model** property to manually select the Series model.

Pin Properties for Input Buffers

For Input buffers, the **Out** Pin property sets the connection for the (pseudo-digital) output pin that responds to inputs. Click the **Out Value** field button to open a window. Select from the list of nets to connect to the **Out** pin.

Pin Properties for Output Buffers

The **logic_in** Pin property sets the connection for the incoming data source. Click the **logic_in Value** field button to open a window. Select **Internal Source** to set up an internal data source (See *Eye Source Parameters*.) Click **Select Net** to display a list of nets to connect to the **logic_in** pin.

Eye Source Parameters When the IBIS buffer **logic_in** Pin property is set to **Internal Source**, the Property list includes selected Eye Source parameters to set up the internal data source.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

--Eye Source Parameters			
trise	5e-010	s	5e-010s
tfall	5e-010	s	5e-010s
phase_delay	0	s	0s
UIorBPS	UnitInterval		
UIorBPSValue	1e-009	s	1e-009s
DCDFractionorTime	Fraction		
dcd	0		0
bxrj			
bxpj			
bxuj			
bxcj			
Disable_Tx_Jitter	☐		
repeat_count	0		0
step_resp_num_ui	100		100
do_encoding	0		0
hold_last_bit	☐		
BitPattern			
--End Eye Source Parameters			

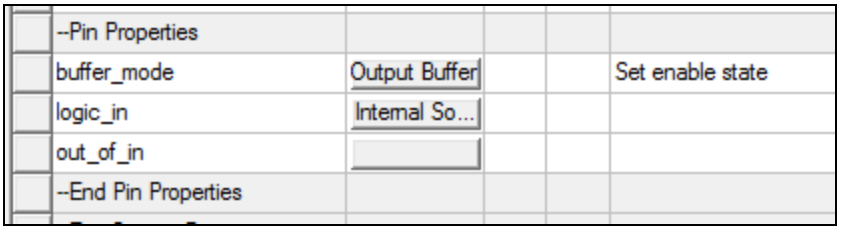
With the following exceptions, these parameters are documented in the topic Add a QuickEye Source to a Schematic.

Note:

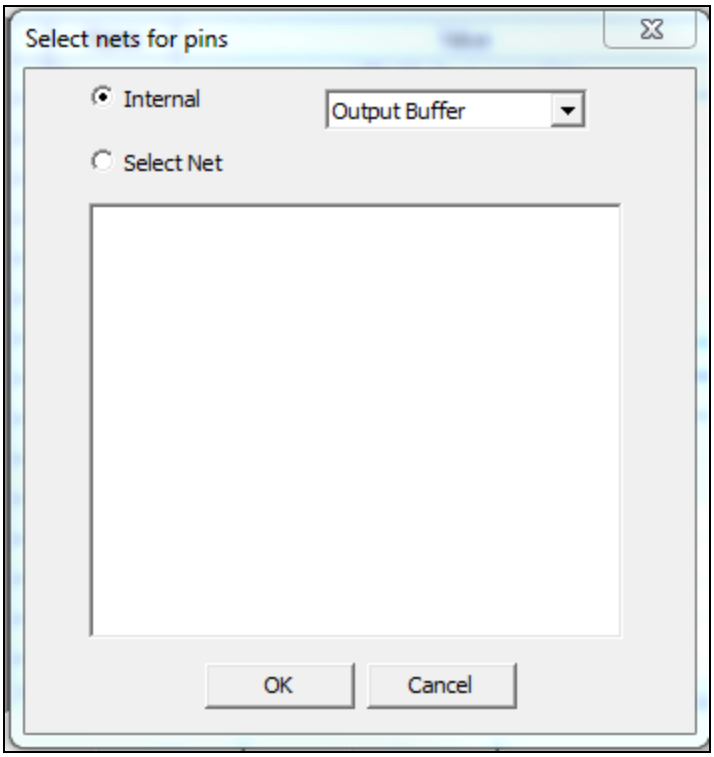
1. The **resistance** parameter on the Eye Source is not available with IBIS sources.
2. The **vlow** parameter on the Eye Source is not available with IBIS sources. IBIS sources must use 0V as the logic low voltage.
3. The **vhigh** parameter on the Eye Source is not available with IBIS sources. IBIS sources must use 1V as the logic high voltage.
4. The **FFE** parameter (Feed-Forward Equalization) on the Eye Source is not available with IBIS sources.
5. For IBIS, the **phase_delay** is a pure delay added before the bit pattern starts running.
6. The **Disable Tx Jitter** check box is available only on IBIS buffers. When this check box is **On** (checked), transmit jitter calculations are disabled. Transmit jitter settings in the properties list are not changed.

Pin Properties for Input-Output Buffers

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **buffer_mode** property sets the connection and condition for the Enable pin on the component (valid only for Input/Output and Tristate buffers). Click the **buffer_mode** property **Value** field button to open a window.



Select **Internal** to specify internal connections for the Enable pin. When **Internal** is checked, select buffer mode. The internal options depend on the **buffer_type** basic property:

- For **Input_Outputbuffer_types**, select Output Buffer or Input Buffer (default Output Buffer).
- For **Tristatebuffer_types**, select Output Buffer or High Impedance Buffer (default Output Buffer).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Alternatively, click **Select Net**. The window displays a list of nets in the circuit to connect to the Enable pin. The text at the upper-right of the window shows the setting of the Enable specification (Active-High, Active-Low) as read on the IBIS model in the file.

Click **OK** to close the window.

The **logic_in** Pin property sets the connection for the incoming data source. Click the **logic_in Value** field button to open a window. Select **Internal Source** to set up an internal data source (Refer to *Eye Source Parameters*.) Click **Select Net** to display a list of nets to connect to the **logic_in** pin.

For Input_Output buffers, the **out_of_in** Pin property sets the connection for the (pseudo-digital) output pin that responds to inputs. Click the **out_of_in Value** field button to open a window. Select from the list of nets to connect to the **out_of_in** pin.

Package Support Properties

Package Model This property is available only with a single component import that references a Package Model. The name of the [Package Model] definition to use for instantiating the RLC parasitics. With a [Package Model], Nexxim is able to instantiate the coupled RLC parasitics between the die side and the board side of each pin. When a [Package Model] is used, the **pkg_ selector** property is not displayed for the individual pins.

pkg_selector The **pkg_selector** parameter is used to select the selected packaging model for pins not handled by a [Package Model] definition. When **pkg_selector** is set to **Pin** (the default), the pin-specific package model is used if it exists; otherwise, the default package model for that component is used. When **pkg_selector** is set to **Package**, the default [Package] model for that component is used, whether a [Pin] package model exists. When **pkg_selector** is set to **None**, no package model is used, and the device behavior is identical to one created with a Buffer Import of the same model.

Power Selection Properties

Component External Power This property is available only with a single component import that references a Package Model. When **Component External Power** is **On** (checked), Nexxim expects power via the terminal pins on the component schematic symbol, and the **power** property is ignored for the individual pins. Nexxim connects power buses as described in the component [Pin Mapping] entry.

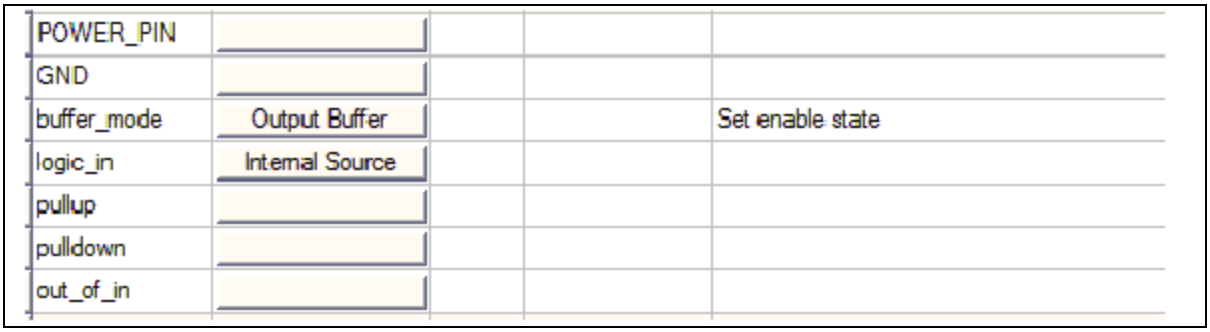
> **Note:**
>
> If you subsequently deactivate (uncheck) **Component External Power**, the power to each pin must be specified with its **power** property (on the **Pin Info** window), and any POWER or GND pins that are imported become No-Connects.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If you subsequently deactivate (uncheck) **Component External Power**, the power to each pin must be specified with its **power** property (on the **Pin Info** window), and any POWER or GND pins that are imported become No-Connects..

Power Connections for power nodes, internal or external. This parameter is enabled when a single component with a package model has the Component External Power deactivated, and for all imported single pins and buffer models.

When the **power** property is set to **external**, the Pin Properties show the power pins:



Click the power, ground, pull-up, and pulldown **Value** field buttons to open the window, then select on the available nets.

> **Note:**
>
> Use page ports to name the outputs of sources in the circuit as nets.

For more information, see *Power Nodes* in the "IBIS File Import Technical Notes" below

AMI Specific Properties

When the IBIS Pin Import selection references an Algorithmic Model (AMI), the properties list contains AMI-specific properties including AMI file references and AMI parameters that are made user-visible in the AMI file. Refer to AMI Analysis for details on importing AMI components.

IBIS File Import Technical Notes

This topic describes the conventions that should be followed to produce a correct simulation with the imported IBIS buffer elements.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Support for IBIS Specification

The Ansys Electronics Desktop (AEDT)™ electronics systems design platform can parse IBIS® input files, but not all features of the IBIS specification are supported. Some IBIS buffers are available as built-in Nexxim components.

AEDT supports the following features of the IBIS specification:

- Import IBIS library files (.ibs).
- Import IBIS Electrical Board Description files (.ebd); see Importing IBIS EBD Files.
- Convert models for single-ended (not differential) driver and receiver pins to SPICE circuits.
- Extract IV curves on the following and translate into equivalent piece-wise linear devices for SPICE: Pull-up, Pull-down, power and ground clamp devices.
- Extract rise/fall-time information on the IBIS file in order to sequence the pull-up/down devices.
- Read in pin parasitics (RLC elements) and incorporate into models.
- Package models ([Package Model] coupled RLC matrices, .pkg files.)
- Transmitter and receiver analog models from Touchstone files (Note: BIRD158 is provisional. It is not yet approved into the IBIS standard and is subject to change. The Ts4 related parameters that are supported represent everything up to and including revision BIRD 158.7).

The following features of the IBIS specification are **not** supported:

- Series switch groups
- Submodels of type Bus_hold and Fall_back. Dynamic_clamp IS supported.
- Power/ground pulse tables

Power Nodes

All active IBIS components contains some combination of pullup, pulldown, power clamp, and ground clamp nodes. Power to these nodes can be applied at the component level using the [Pin Mapping], or at the relevant nodes of each pin, using the default power parameters.

Component-Level Power and Ground with Package Models

When you are importing a Single Component with a Package Model, the power and gnd pins that you select are exposed in the schematic to wire to the selected power or ground rails. Nexxim uses the [Pin Mapping] information (power and ground bus definitions) in the IBIS component definition along with the RLC parasitic data (from die side to board side) in the Package Model definition to connect the power and ground buses to power and ground nodes on the signal pin buffers. The **Component External Power** property is set to ON in the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

component. When **Component External Power** is ON, the power parameters on individual pins is ignored.

The IBIS file may contain a [Pin Mapping] keyword defining buses that connect POWER and GND pins to the voltage supply nodes of any buffers connected to signal pins. When a [Package Model] is used, and the **Component External Power** is on, Nexxim uses the [Pin Mapping] data to connect the prescribed power buses between the die-side nodes of POWER and GND pins and the voltage supply nodes of buffers. Any imported pins that are NOT included in the Package Model definition use the uncoupled lumped RLC package defined in their [Pin] entry (or [Package] section if no [Pin] RLC data is specified).

Pin-Level Power and Ground

When you are importing either a Single Component without a Package Model, individual pins, or individual buffer models, power connections click the **power** parameter on the individual pins to control the connections. The **power** property also controls the power connections when a single component with a [Package Model] has been imported but the **Component External Power** switch is deactivated; changing the imported POWER and GND pins to No-Connects (NC).

By default, the **power** parameter is set to **internal**, so the component automatically drives the nodes using internal voltage sources set to the voltages specified in the IBIS model. When **power** is set to **internal**, users should NOT connect any of these nodes to voltage sources or to ground. Connecting external voltage sources or grounds when **power** is set to **internal** generates warning messages about parallel supplies, and may cause problems with simulation.

To use external sources and grounds, set the **power** parameter to **external**. With this setting, any pull-up, pulldown, power clamp, and ground clamp nodes appear as pin parameters with lists for selecting the external voltage nodes to connect (using page ports).

Package RLC Parasitics

Each pin on the component has two nodes, a die-side node and a board-side node (See the **probe_die_side** parameter discussion in Edit IBIS Component Properties). You can probe both nodes, but you can connect only to the board-side node. Between the die side and the board side, the package introduces RLC parasitics. Accurate modeling of these parasitics is required for signal and power integrity analyses.

By default, the RLC data is specified in the **[Package]** keyword in the IBIS file. The **[Package]** entry defines a range of values for the default RLC of the component pins. The IBIS file **[Pin]** keyword can contain values for the RLC parasitics on a pin-by-pin basis. If the **[Pin]** entry for the component includes individual RLC values for a given pin, they override the defaults in **[Package]**, for that pin. The **pkg_selector** property defaults to **Pin**. With this setting, Nexxim searches the IBIS component definition for a **[Pin]** keyword containing RLC data for the selected pin, and applies that data if the **[Pin]** entry is found. If no **[Pin]** entry is found, Nexxim uses the default **[Package]** data. Also select **Package** to have Nexxim skip the search for a **[Pin]** entry.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the IBIS file contains a [Package Model] keyword and you select **Use [Package Model]** at import time, the model RLC values override the **[Pin]** and **[Package]** values for the imported pins that are included in the Package Model Definition. The **pkg_selector** property is not displayed for the imported pins that have a **[Package Model]** definition. Any imported pins that are NOT included in the Package Model definition are handled as though their **pkg_selector** is set to **[Pin]**).

Support for Power Aware IBIS Output Buffer Models

Traditional IBIS models supply tables of currents delivered to the output by the pullup, pulldown, power clamp and ground clamp structures. The current delivered at the output is the sum of those four contributions. With traditional IBIS models, the current drawn on the power rails is whatever the four structures draw to deliver to the output. Power Aware IBIS output buffer models contain additional information about the actual current drawn on the supply rails. They also contain information that allows the simulator to more accurately account for the effects of variations in the supply rail voltages.

Composite Current

A **[Composite Current]** section in the IBIS file describes the shape of the rising or falling edge waveforms in the total current through the power reference terminal of the buffer. The composite current (Icc), the total current to be drawn through the power pin, is the sum of the current at the output (Iout) and the current internal to the device that goes to ground without reaching the output (Ibypass):

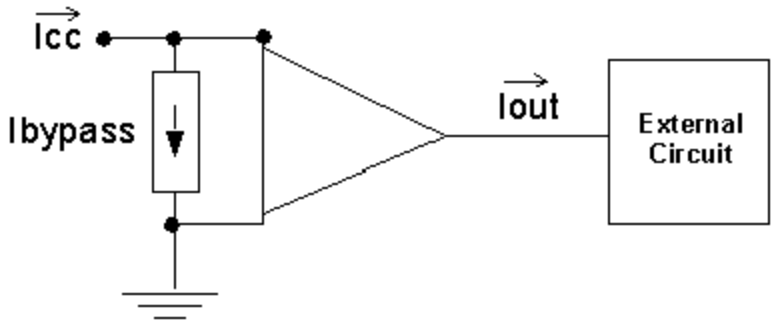
$$Icc = Iout + Ibypass$$

The IBIS file contains **[Rising Waveform]** and **[Falling Waveform]** tables of times and output voltages for the waveforms. The Ansys Electronics Desktop (AEDT)™ electronics systems design platform calculates the output current Iout based on the output voltage and the terminating load.

When the IBIS model file for an Output buffer contains a **[Composite Current]** section after a **[Rising Waveform]** or **[Falling Waveform]** table, Nexxim reads in the table of times and currents. The times in the composite current table are identical to the times in the corresponding waveform table. Nexxim calculates Ibypass at each time point by subtracting the output current on the composite current.

During simulation, Nexxim adds a current source to generate Ibypass between the power and ground pins of the power-aware Output buffer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

The current direction for Iout in the diagram has been reversed on the convention used in the IBIS specification, in order to simplify the formulas and discussion.

The current drawn on the power pin equals Icc, the current specified in the **[Composite Current]** table. The output current, Iout, is unchanged.

The composite current feature allows you to simulate with a non-ideal power supply and get accurate values for the power consumption. Power usage during events such as simultaneous switching operations (SSO) can be simulated accurately.

Gate Modulation Effect

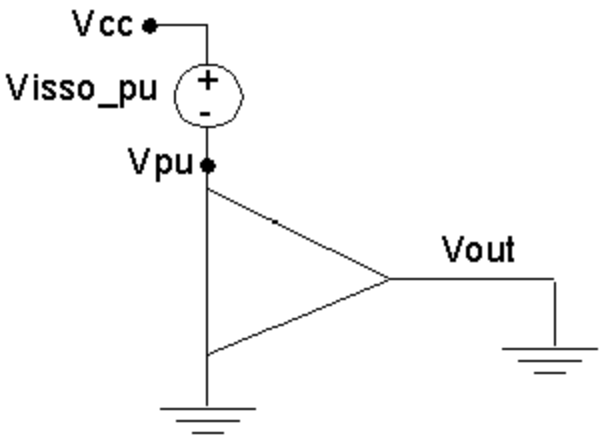
The gate modulation effect is the change in output current Iout due to fluctuations in the gate voltage.

The **[ISSO PU]** and **[ISSO PD]** tables allow the simulation to account for variations in the gate current due to bouncing on the supply voltage.

Gate Modulation at the Pullup Node

The **[Pullup]** section provides tables of output current Iout for values of the voltage drop (Vpu - Vout). Here is a reference diagram.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



From the absence of gate modulation:

$$Iout = Pullup(Vpu - Vout)$$

Vpu need not be equal to ideal voltage Vcc. Any voltage drop at the power pins affects the voltage difference between the power pin and the output pin, affects the lookup in the I-V table for the model.

The **[ISSO PU]** table gives the effective current of the pullup structure as a function of the voltage on the pullup reference node (the power node). When Nexxim finds an **[ISSO PU]** section after a **[Pullup]** entry, the calculation for Iout proceeds as follows.

1. Nexxim calculates the voltage drop between Vpu and Vout and uses this value as before to look up Iout before the adjustment for gate modulation.
2. Nexxim calculates the voltage difference between the ideal Vcc and the actual pullup voltage Vpu. This voltage difference is called Visso_pu in the diagram.
3. Nexxim uses the value of Visso_pu to access the table in the **[ISSO PU]** section. The table gives the output current for that amount of voltage modulation, Iisso_pu.
4. Nexxim accesses the **[ISSO PU]** table entry for Visso_pu=0V. The value of Iout at Visso_pu=0 is the nominal current, Inom_pu.
5. Nexxim calculates a scale factor Kpu as the ratio of the tabulated output current to the nominal current:

$$Kpu = \frac{Iissopu}{Inompu}$$

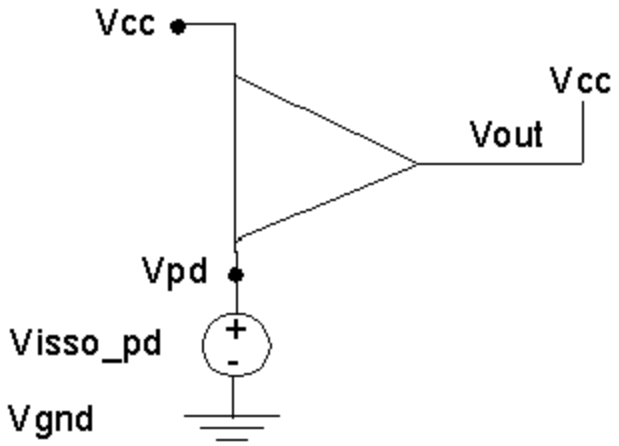
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. The final output current is the ideal output current on the **[Pullup]** table, scaled by the Kpu factor for the voltage modulation on the **[ISSO PU]** table:

$$Iout = Pullup(Vpu - Vout) \times Kpu(Vcc - Vpu)$$

Gate Modulation at the drop-down menu Node

The **[Pulldown]** section provides tables of output current Iout for values of the voltage drop on the output voltage to the drop-down menu reference voltage (Vout - Vpd). Here is a reference diagram.



From the absence of gate modulation:

$$Iout = Pulldown(Vout - Vpd)$$

The **[ISSO PD]** table gives the effective current of the drop-down menu structure as a function of the voltage from the drop-down menu reference node (the ground node).

When Nexxim finds a **[ISSO PD]** section after a **[Pulldown]** entry, the calculation for Iout proceeds as follows.

1. Nexxim calculates the voltage drop between Vout and Vpd and uses this value as before to look up Iout before the adjustment for gate modulation.
2. Nexxim calculates the voltage difference between the actual pulldown voltage Vpd and the ideal ground reference Vgnd. This voltage difference is called Visso_pd in the diagram.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Nexxim uses the value of Visso_pd to access the table in the **[ISSO PD]** section. The table gives the output current for that amount of voltage modulation, Iisso_pd.
4. Nexxim accesses the **[ISSO PD]** table entry for Visso_pd=0V. The value of Iout at Visso_pd=0 is the nominal current, Inom_pd.
5. Nexxim calculates a scale factor Kpd as the ratio of the tabulated output current to the nominal current:

$$Kpd = \frac{Iissopd}{Inompd}$$

6. The final output current is the ideal output current on the **[Pulldown]** table, scaled by the Kpd factor for the voltage modulation on the **[ISSO PD]** table:

$$Iout = Pulldown(Vout - Vpd) \times Kpd(Vpd - Vgnd)$$

Digital Voltage Levels

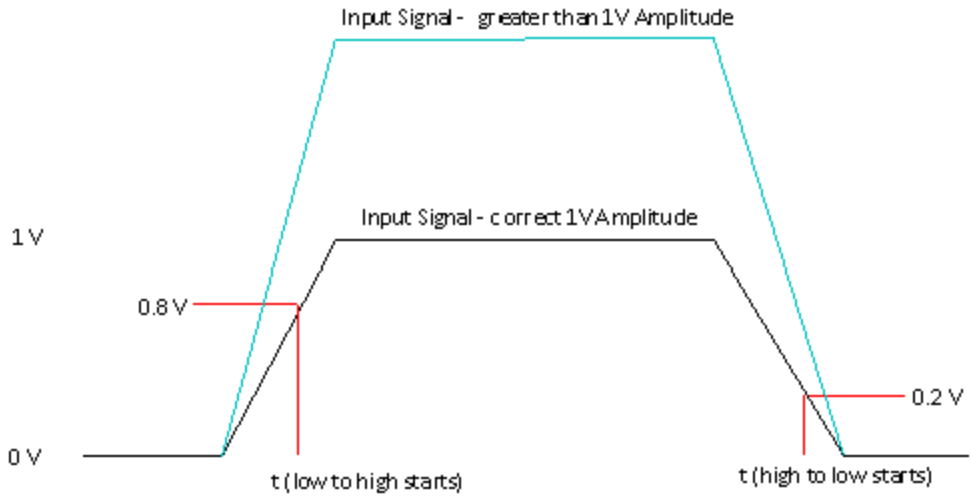
All digital nodes on IBIS components expect a voltage range of 0V to 1V.

When the internal buffer_mode settings and the internal eye source are used, the proper voltage levels are already assured. However, if you are connecting external nets to the "enable" or "logic_in" nodes instead, it is important to use the proper voltage range on the input signals.

Input Node Thresholds

Digital input nodes for drivers (output, I/O, etc.) use fixed thresholds of 0.2V and 0.8V to trigger changes in state from high to low and low to high, respectively. (See following figure).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



An external voltage supply may be connected to these nodes, but must supply the expected values: 0V for low or off and 1V for high or on. Because the transition trigger thresholds are fixed, duty cycle distortion (DCD) occurs if a high amplitude other than 1Vis used (blue trace in diagram). The amount of DCD is negligible if the transitions themselves are very fast relative to the overall pulse width. Using a high amplitude of less than 0.8V results in no output transitions occurring.

For initial transient values, and for DC analysis, a single fixed input threshold of 0.5V is used. If the input signal is above 0.5V, the output is placed in the high state. Otherwise, the output is placed in the low state.

These descriptions of the relationships between input voltage and output state for the Input buffer nodes assume the **Polarity** parameter in the IBIS model is set to **Non-Inverting**. The relationships are appropriately inverted if the IBIS buffer model has **Polarity** defined as **Inverting**.

Output Node Thresholds

The digital output nodes of receivers provide a waveform that switches between 0V and 1V. These transitions depend on the input signal, the values of **Vinl**, **Vinh**, and **Polarity** set in the IBIS model file, and the following criteria:

- If the output is in the low state (0V) and the input signal becomes greater than **Vinh**, the output transitions to high (1V).
- If the output state is high (1V) and the input signal becomes less than **Vinl**, the output transitions to low (0V).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For initial transient values, and for DC analysis, the buffers use a single fixed threshold equal to the average of **Vinl** and **Vinh**, [(**Vinh** + **Vinl**)/2]. If the input signal is above this threshold, the output is placed in the high state (1V). Otherwise, the output is placed in the low state (0V).

These descriptions of the relationships between input voltage and output state for the Output buffer nodes assume the **Polarity** parameter in the IBIS model is set to **Non-Inverting**. The relationships are appropriately inverted if the IBIS buffer model has **Polarity** defined as **Inverting**.

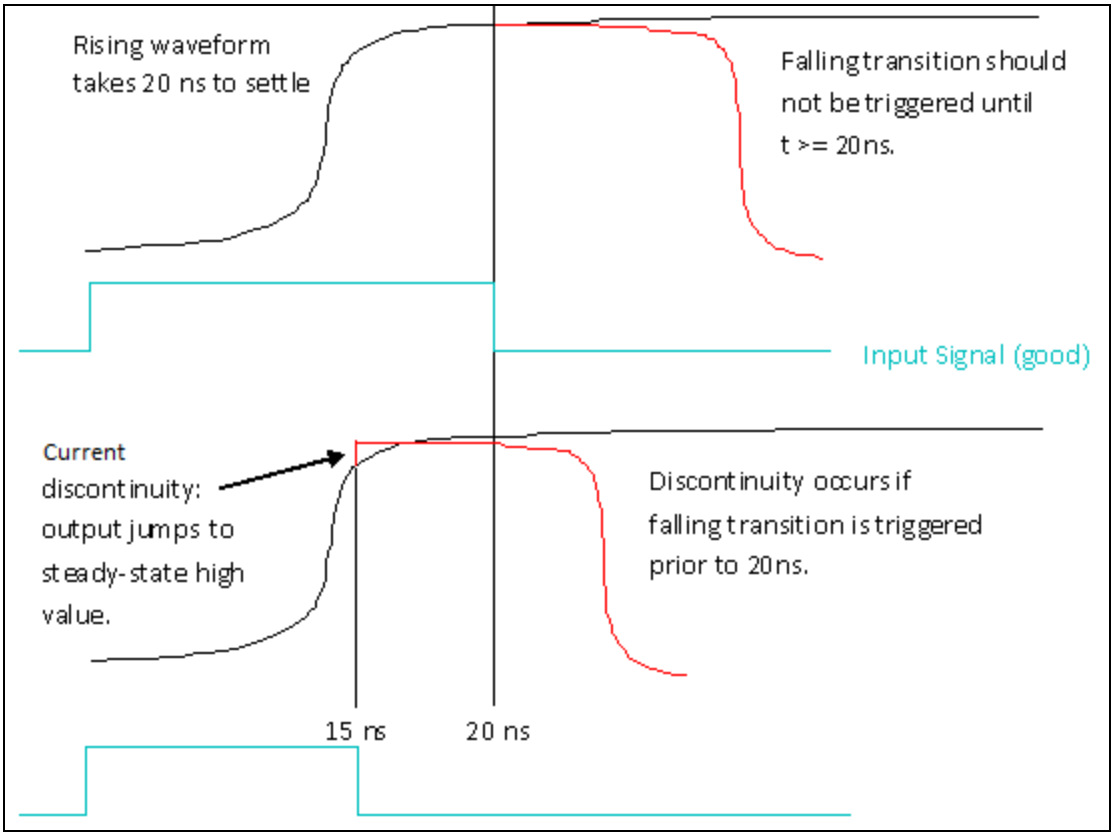
Enable Node Thresholds

A single fixed threshold of 0.5V is used for Enable nodes. If the Enable pin is higher than 0.5V, the enable state is considered high. Other wise, the enable state is considered low. The behavior of the component then depends on whether the IBIS buffer model has its **Enable** parameter set to **Active-High** or **Active-Low** in the IBIS file.

Transition Settling Times

Be careful to ensure the frequency of the input signal does not exceed the capabilities of the IBIS model. The frequency of the input signal must consider the time required for the output to settle. Whenever a transition from high to low or from low to high is triggered by the input signal, the output jumps to the steady-state current value from which the next transition starts. However, the actual waveform requires a settling time period to reach the steady-state high or low voltage. If the input then changes state too soon, the next transition occurs before the initial transition has settled to its steady-state value. This can lead to non-physical voltage slew rates and other unexpected simulation results.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For example, if the IBIS model takes 20ns to complete a rising transition, the input signal should stay in the high state (1V) for at least 20ns after a low-to-high-transition. If instead the input goes back to low after only 15ns, the behavior at the high-to-low transition creates a non-physical slope change in the output signal. Since the initial rising transition has not completed at 15ns, the output has not settled at the steady state from which the falling transition is to occur. The too-early falling transition causes the output current to jump discontinuously to the high value.

Notes on IBIS Waveform Properties

The IBIS buffer component Waveform properties allow for fine-tuning the power scaling and waveform rise and fall. The following table summarizes the property settings. Detailed notes on some of these properties follow the table.

IBIS Buffer Waveform Properties

Property	Description	Units	Default
INTERPOL	Interpolation: 1=linear, 2=spline	None	1
NOWARN	When present, turns off parser warnings	None	Warnings enabled
XV_PU	Name of node for pullup scaling factor output	None	None

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

XV_PD	Name of node for pulldown scaling factor output	None	None
RAMP_FWF	Falling waveform ramp specification: 0=ramp only, 1=single waveform in IBIS file, 2=double waveform in IBIS file	None	2
RAMP_RWF	Rising waveform ramp specification: 0=ramp only, 1=single waveform in IBIS file, 2=double waveform in IBIS file	None	2
FWF_TUNE	Falling waveform adjustment. Used only when RAMP_FWF=0 or 1. Waveform assumes device transitions from on to off in the fraction of the total transition time given by FWF_TUNE.	None	0.1
RWF_TUNE	Rising waveform adjustment. Used only when RAMP_RWF=0 or 1. Waveform assumes device transitions from off to on in the fraction of the total transition time given by RWF_TUNE.	None	0.1
C_COM_PC	Fraction of capacitance on power clamp vs. GC, PU, and PD, (value between 0 and 1). Capacitance fractions must sum to 1.0.	None	0
C_COM_GC	Fraction of capacitance on ground clamp vs. PC, PU, and PD (value between 0 and 1). Capacitance fractions must sum to 1.0.	None	1
C_COM_PU	Fraction of capacitance on pull-up vs. GC, PC, and PD (value between 0 and 1). Capacitance fractions must sum to 1.0.	None	0
C_COM_PD	Fraction of capacitance on pulldown vs. PC, GC, and PU (value between 0 and 1). Capacitance fractions must sum to 1.0.	None	1
PC_SCAL	Scale factor for power clamp current drive strength applied to IBIS table values	None	1.0
GC_SCAL	Scale factor for ground clamp current drive strength applied to IBIS table values	None	1.0
PU_SCAL	Scale factor for pull-up current drive strength applied to IBIS table values	None	1.0
PD_SCAL	Scale factor for pulldown current drive strength applied to IBIS table values	None	1.0
FWF_SCAL	Scale factor applied to falling ramp transition time	None	1.0
RWF_SCAL	Scale factor applied to rising ramp transition time	None	1.0
SPD_SCAL	Scale factor for pulldown current drive strength applied to	None	1.0

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	IBIS table values Used only when POWER=OFF and the voltage difference between the pull-up and pulldown nodes is not equal to the [Voltage Range] value in the IBIS file.		
SPU_SCAL	Scale factor for pull-up current drive strength applied to IBIS table values Used only when POWER=OFF and the voltage difference between the pull-up and pulldown nodes is not equal to the [Voltage Range] value in the IBIS file.	None	1.0
RM_DLY_RWF	Amount of time to trim off the front of the rising waveform, relative to time=0. Negative value invokes automatic removal of common delays on the fronts of rising and falling waveforms [see Automatic Delay Removal].	>=0: Sec <0: None	0.0
RM_DLY_FWF	Amount of time to trim off the front of the falling waveform, relative to time=0 Negative value invokes automatic removal of common delays on the fronts of rising and falling waveforms [see Automatic Delay Removal].	>=0: Sec <0: None	0.0
RM_TAIL_RWF	Amount of time to trim off the end of the rising waveform, relative to the time of the last point in the waveform	Sec	0.0
RM_TAIL_FWF	Amount of time to trim off the end of the falling waveform, relative to the time of the last point in the waveform	Sec	0.0

[1] If the values of RM_DLY_RWF and RM_DLY_FWF are not equal, Nexxim generates a warning, since the unequal values alter the duty cycle of the output waveform relative to what is specified by the IBIS file itself. The simulation runs.

[2] If the value of RM_DLY_RWF, RM_DLY_FWF, RM_TAIL_RWF, or RM_TAIL_FWF is such that more than 10 percent of the original voltage transition is trimmed off, Nexxim generates a warning, but the simulation runs.

[3] If the values of RM_DLY_RWF and RM_TAIL_RWF are such that fewer than three (3) data points are left in the resulting waveform, Nexxim ignores the settings and issues a warning. With fewer than three data points, ramp transitions may give better results.

[4] If the values of RM_DLY_FWF and RM_TAIL_FWF are such that fewer than three (3) data points are left in the resulting waveform, Nexxim ignores the settings and issues a warning. With fewer than three data points, ramp transitions may give better results.

[5] If the sum of RM_DLY_RWF and RM_TAIL_RWF is such the entire rising waveform is removed, Nexxim halts with an error.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

[6] If the sum of RM_DLY_FWF and RM_TAIL_FWF is such the entire falling waveform is removed, Nexxim halts with an error.

Automatic delay removal. Some IBIS models represent the throughput delay of the device by providing model waveforms with long initial plateaus, after which the device is switched at a much shorter period corresponding to the actual slew rate. However, the slew rate observed in Nexxim can be too high in such cases because the initial delay is not recognized as such, and the device appears to transition directly from steady-state low to steady-state high (and vice versa) when it is switched at the shorter period. Using RM_DLY_RWF and RM_DLY_FWF to manually trim the initial delay can be cumbersome when the model's waveforms have widely differing initial delays according to corner case (typ, min, max, fast, slow). The overall timing of the simulation is also shifted by trimming the waveforms.

Setting either RM_DLY_RWF or RM_DLY_FWF to a negative value (<0) invokes automatic delay removal for both rising and falling waveforms. The initial delay plateau is computed for each waveform in a given device's IBIS model. The common delay is the minimum of the values computed for all waveforms for the selected corner case (typ, min, max, fast, slow). The common delay time is removed on the beginning of each waveform. Then, an ideal delay element is added into the simulation flow to adjust for the time trimmed off the front of the waveforms.

TYP Parameter Effects

The **TYP** Parameter sets the allowable range of values affecting multiple IBIS buffer parameters:

typ = midrange of all values

min = minimum of all values

max = maximum of all values

fast = maxima and minima selected to produce the fastest transitions.

slow = maxima and minima selected to produce the slowest transitions.

The following table lists the effects on IBIS buffer parameters when the **TYP** parameter is set to **Fast** or **Slow**. In general, the **Fast** setting sets maxima and minima to provide the fastest transitions, while the **Slow** setting seeks to provide the slowest transitions.

Effects of TYP = Fast or TYP = Slow

IBIS Buffer Parameter	TYP Setting	
	Fast	**Slow**
C_comp	Min	Max
Cac	Min	Max
GND Clamp Reference	Min	Max
Pulldown Reference	Min	Max

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IBIS Buffer Parameter	TYP Setting	
	Fast	Slow

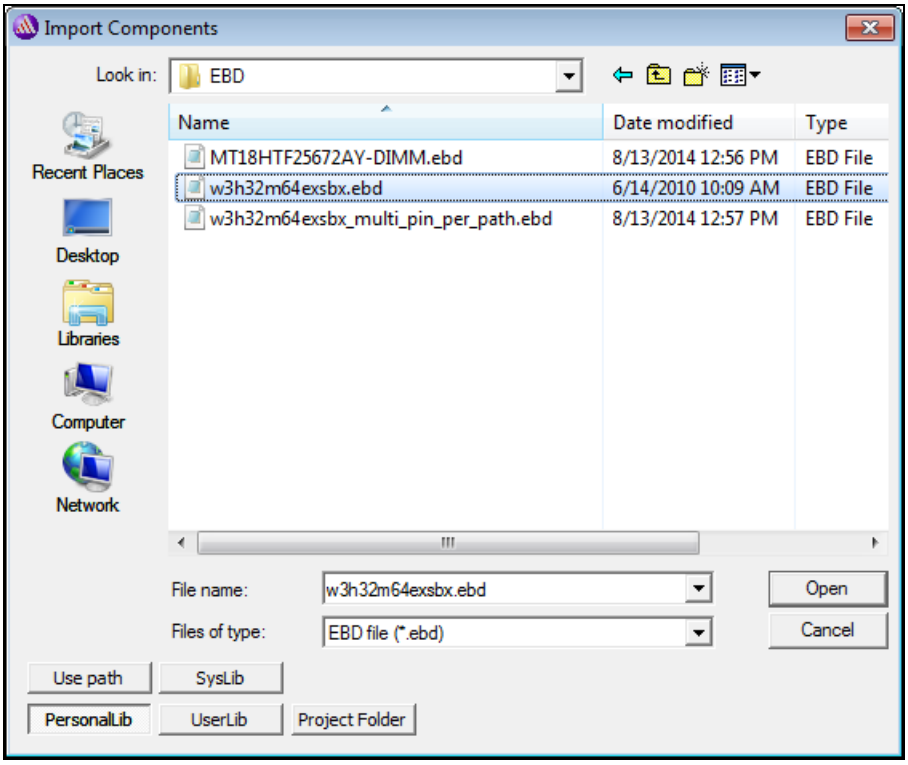
Importing IBIS EBD Files

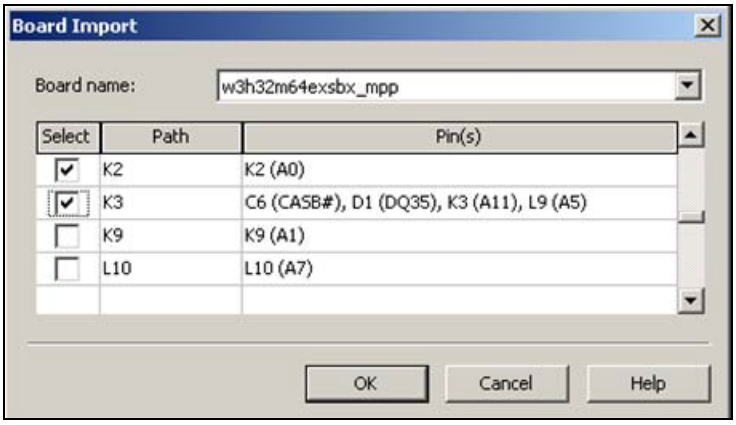
The Ansys Electronics Desktop (AEDT)™ electronics systems design platform IBIS support allows you to import.ebd files that contain board descriptions in the form of paths. When EDB file paths are imported, a corresponding Nexxim component is created. This option is only available for Nexxim designs. To import an IBIS EBD model:

1. View the **Component Libraries**. Open the **Symbols** area. Click **Import Models**.
2. From the area, select the **EBD** icon to open the **Import Components** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

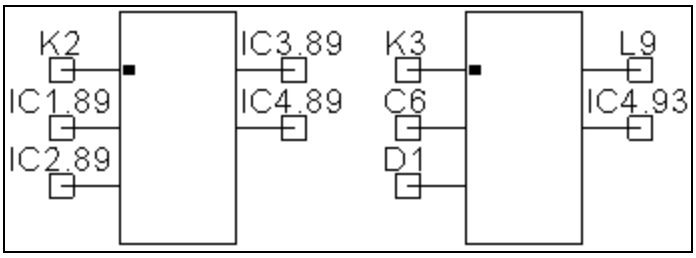


Select an .ebd file and click **Open** to open the following window. From the window, select boards and paths to import the file:



The **Board name** drop-down menu displays all the boards contained in the .ebd file; when a board is selected, the display grid updates to show the paths and pins contained on that board. The display grid also lists the various signal names for each pin in parenthesis. After selecting the selected paths and clicking **OK**, components are generated , then displayed on the Components tab and in the Definitions/Components area of the **Project Tree**. When placed on the schematic, the generated components resemble the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



IBIS I/O Wizard

The I/O Wizard provides an easy interface to set up drivers and receivers for a single schematic or for a group of schematic components. The drivers and receivers the I/O Wizard uses are IBIS components that have been previously imported. (If you have not already loaded the IBIS models, you are given the option to do so by the I/O Wizard.). See Import IBIS Library File.

The I/O Wizard inspects the current schematic, indicating all unconnected pins, and allows you to create components for the selected connectivity configuration. Connectivity options include:

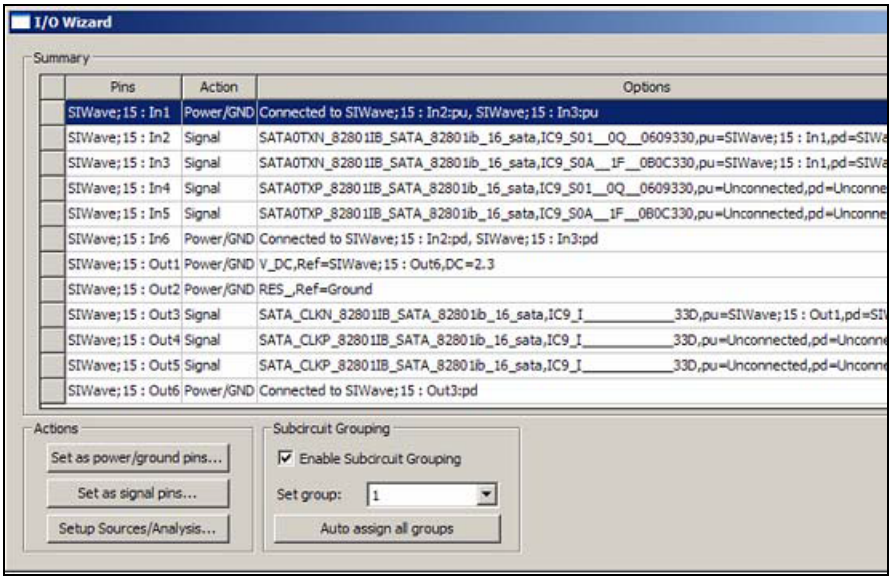
- Fully configured IBIS drivers and receivers
- Power and Ground pins
- Probes and designated points of circuit stimulation, such as Pseudo Random Bit Sources

After you set the initial configuration, the I/O Wizard can be rerun and any newly added or unconnected pins are indicated, allowing you to further modify the design.

IBIS I/O Wizard window

The I/O Wizard window provides a summary of the current Wizard configuration and allows you to perform various actions in order to set up individual pins. Click **Schematic** > **I/O Wizard** to open the Wizard window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Upon initialization, the I/O Wizard indicates all the unconnected pins that exist in the current schematic. For example, in the preceding screenshot, the Wizard window after each pin of a 12-pin Ansys SIwave™ component has been configured.

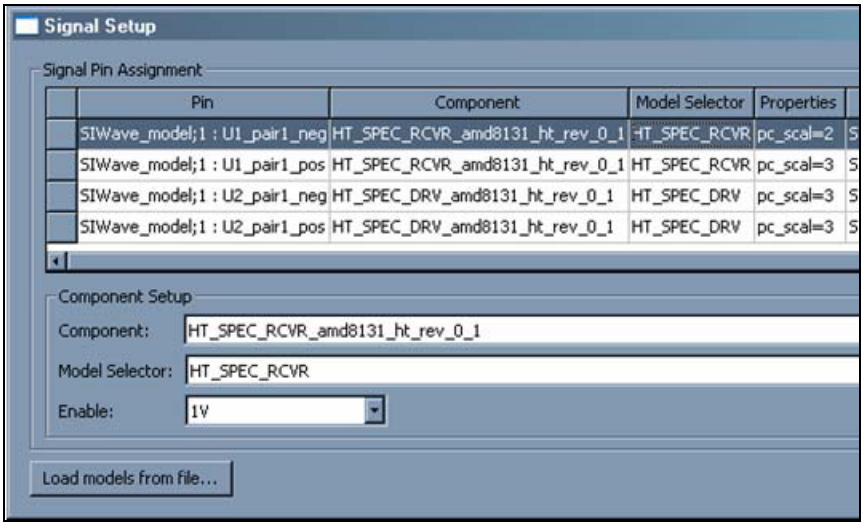
- The Wizard displays the current settings for each pin.
- Pins can either be left in the default unassigned state, assigned to a signal pin (driver or receiver), or assigned as a Power/Ground pin.
- Select one or more rows and click the various **Actions** buttons to associate selected pins with a given type. A configuration window appears that allows further customization.
- Power/Ground pins are initially assigned if the component's name contains "VSS", "GND", etc. Initial assignments can be overridden and customized.
- When **Enable Subcircuit Grouping** is selected, pins can be assigned to a group.
- **Auto assign all groups** attempts to group pins in a meaningful way — by grouping buffers with common pins into the same subcircuit group.

Click **OK** to close the window and implement any changes that have been configured.

IBIS I/O Wizard Signal Setup

To configure signal pin assignments using the I/O Wizard window, select the selected pins and click **Set as signal pins** ; this opens the **Signal Setup** window for the selected pins.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Fields in the **Signal Setup** window are editable. Also select multiple rows and click the **Component Setup** fields at bottom to make multiple changes to many pins simultaneously.

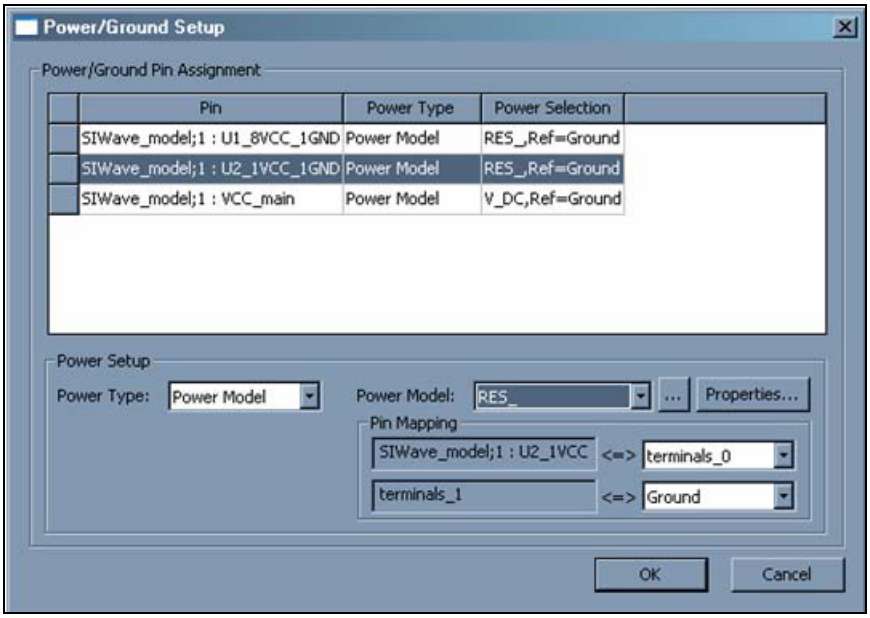
- The **Component** field lists components already imported, and represents either an IBIS pin or an IBIS model, depending on the component selected.
- The **ModelSelector** field lists the available models for this component (e.g., the **model_sel** property of the IBIS component).
- The **Pullup to pin** field lists non-signal pins (e.g., Power or Ground) to connect to the **Pull Up** pin for the attached buffer. The default is a Power/Ground pin. Alternately, select to select any one-port circuit in the project for the connection.
- The **Pulldownto pin** field follows the same rules as **Pullup to pin**, with regards to the **Pull Down** assignment for the attached buffer.
- For I/O Buffers, there is an **Enable** field that can either be 0V or 1V (depending on how the buffer is configured to operate). The **Enable** field is only visible for I/O buffers.
- Also load additional IBIS files by clicking **Load models from file** to open the Import IBIS File window.

Click **OK** to close the window and implement any changes that have been configured.

IBIS I/O Wizard Power/Ground Pin Setup

To configure Power and Ground settings, click **Set as power/ground pins** in the I/O Wizard window; this opens the **Power/Ground Setup** window for the selected pins.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Fields in the main grid-display window are not editable, but instead show the status of what you configure using the **PowerSetup** fields at the bottom of the window. You can select multiple rows and click the **Power Setup** fields to make multiple changes to many pins simultaneously.

- **PowerType** can either be **Buffer Connection**, **Reference Pin**, or **Power Model**.

  — **Buffer Connection** means the pin are directly connected to the Pull Up or Pull Down, according to what was specified in the Signal Setup window.

  — **Reference Pin** does not specifically assign a Power source or Ground, but this setting can be used for pin mapping.

  — **Power Model** allows a one or two port component to be connected directly to the pin. Click the **[...]** button to load a model. If the component selected for the Power Model has two pins, the **Pin Mapping** area is displayed. The top **Pin Mapping** area selects which of the Power Model's terminals is directly connected to the Power Pin selected in the pin grid. The bottom **Pin Mapping** area allows you to assign the remaining Power Model terminal to a net.

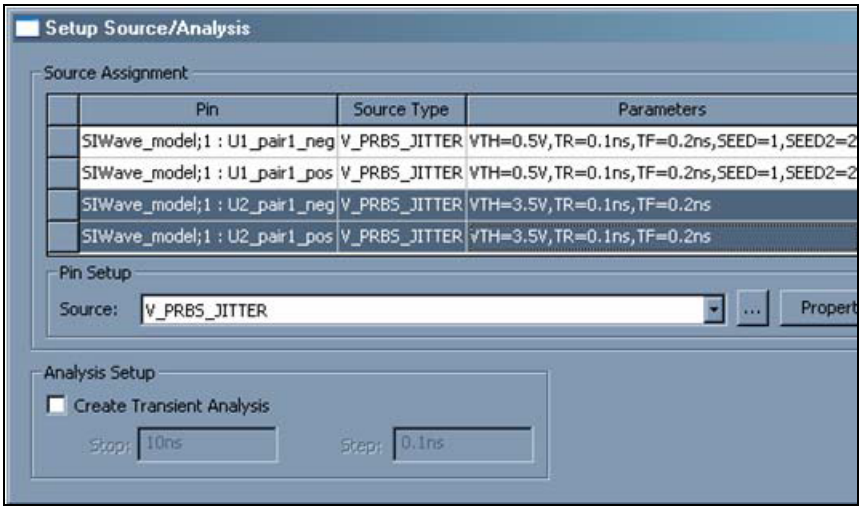
- Clicking **Properties** allows you to customize the parameters for the selected Power Model component.
- In order to connect a ground terminal, select Power Type: **Power Model**, then click the **[...]** button to load a **RES_ component** as the Power Model. This two port component, when not configured with a resistance parameter, acts as a short. The pin mapping for the **RES_ Power Component** allows you to then short the Power pin to Ground.

Click **OK** to close the window and implement any changes that have been configured.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

IBIS I/O Wizard Source/Analysis Setup

To configure source assignments, click **Setup Sources/Analysis** in the I/O Wizard window; this opens the **Setup Source/Analysis** window for the pins designated as “Signal”.



This window allows users to add sources to the project. Sources are connected to the selected drivers that have been configured for each of the signal pins. A transient analysis can also be set up, which streamlines the process. The fields in the window reflect customizations made to the Sources/Probe pin which allows for toggling the existence of a probe for the IBIS buffer.

- By default, a PRBS source with jitter is assigned to each signal pin. Sources are attached to the logic pin on the IBIS buffer (if applicable), not the actual signal pin. The **Source** selection box lists only the independent sources in the project. Grounds are automatically added to the other side of the source.

Click the **[...]** button to load another source , then click Properties to set the per-instance properties for the source. Checking the Probe box attaches a probe directly to the selected pin.

From the **Analysis Setup** area, set up a quick transient analysis by checking **Create Transient Analysis**, which enables the **Stop** and **Step** group boxes for controlling the analysis. After the window is closed, the setup can be further refined on the **Project Tree**.

Click **OK** to close the window and implement any changes that have been configured.

AMI Analysis

The IBIS Algorithmic Modeling Interface (AMI) allows time-domain simulation of a linear-channel Circuit design using customer-supplied models for the transmitter and receiver. Reports include plots of step responses from VerifEye, eye diagrams like those available for QuickEye, and bit-error-rate (BER) contours.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Set Up and Run AMI Analysis

AMI analysis is equivalent to the Time Domain simulation described in the IBIS AMI specification. To run AMI analysis, the design must include one or more IBIS AMI transmitters (or AMI Sources) and corresponding IBIS AMI receivers (or AMI Probes). Transmitter and receiver parameters are set up in the sources and probes (See Importing the AMI Transmitter and Receiver).

Other parameters and options can be specified in the AMI Analysis setup window, as described in the following topics.

AMI Analysis Outputs

To open the results of an AMI analysis, click the Results icon in the **Project Manager** window and select one of the following **Create Report** options.

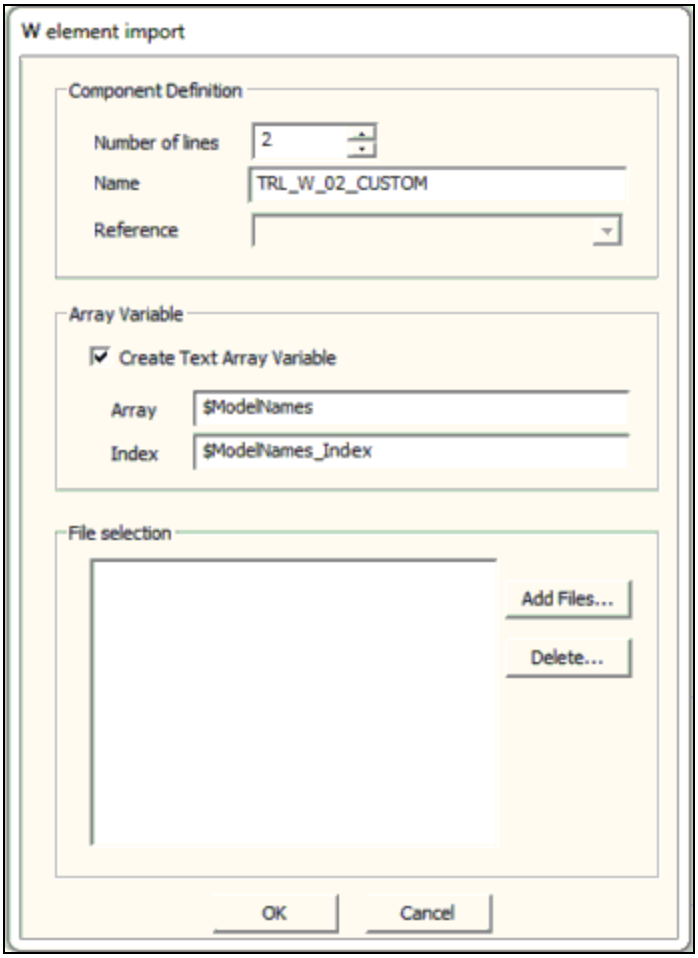
W-Element Model Support

Nexxim supports the import of W-element models via an import wizard.

To open the wizard:

1. View the **Component Libraries**. Open the **Symbols** area. Click **Import Models**.
2. From the area, select the **W-ELT** icon to open the **W element import** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Enter the **Number of lines** for the W-element.

4. Click **Add Files** to browse to a directory containing the data files for the W-element.

You can select multiple files. If **Create Text Array Variable** is checked, the Ansys Electronics Desktop (AEDT)™ electronics systems design platform creates a text array index to store the multiple files. The model is then created as a parametric model.

5. Click **OK**. An instance of the W-element is attached to the cursor, so drag it into the schematic to place the W-element. When instances of the component are placed, right-click and select **Finish** or press **Esc** on the keyboard to stop placing instances.

If the model was created as a parametric model, simulation setups can sweep the entries in the text array index (**$ModelNames_Index** in the example).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

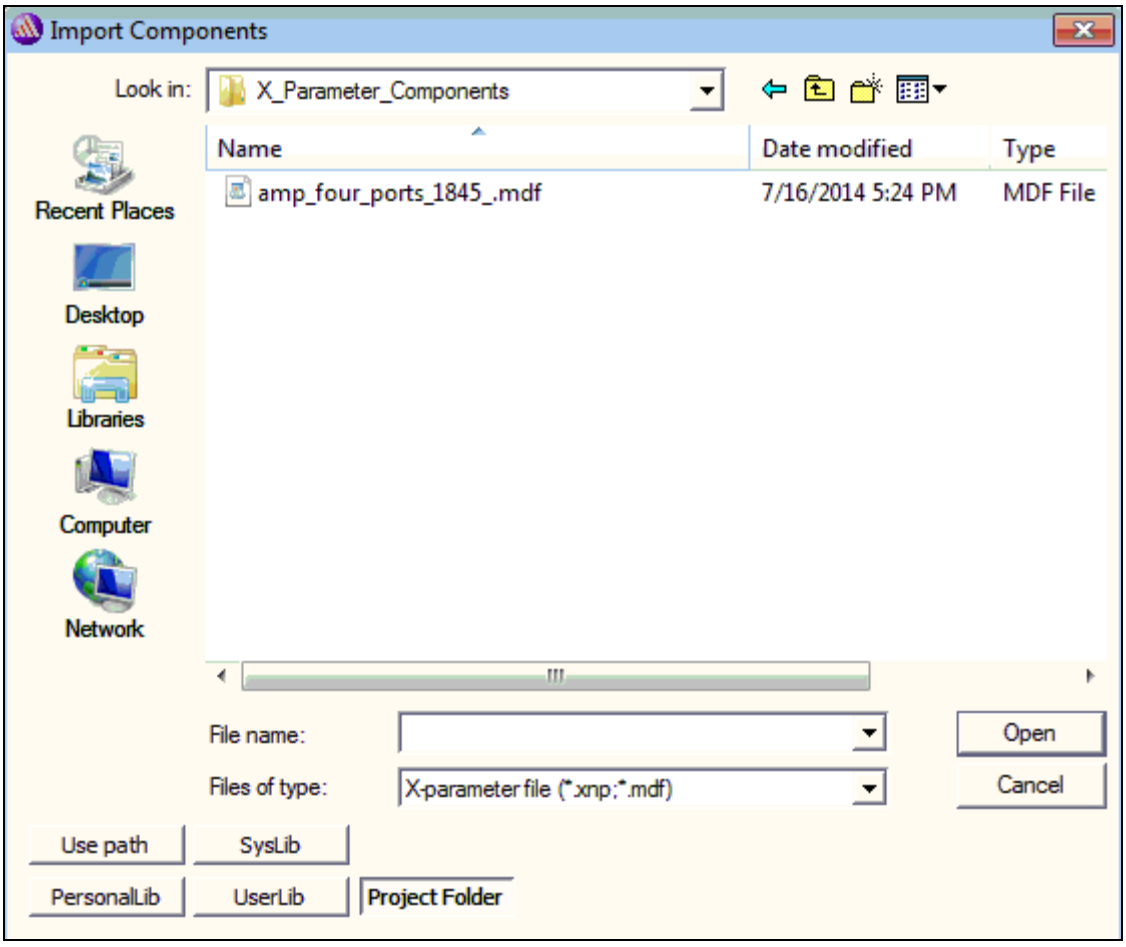
X-Parameter Model Support

X-parameters are the nonlinear counterparts of S-parameters. They can be used to model the frequency-domain behavior of driven nonlinear systems such as amplifiers and mixers.

Importing an X-Parameter Component

Nexxim supports the import of X-parameter models via an import wizard. To open the wizard,

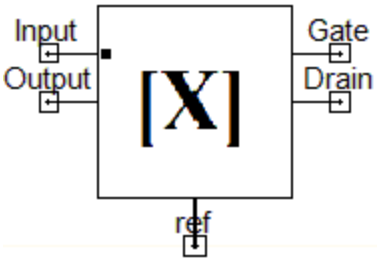
1. View the **Component Libraries**. Open the **Symbols** area. Click **Import Models**.
2. From the area of icons, select the **XParam** icon to open the **Import Components** window.
3. Select the file containing the X-parameter component information.



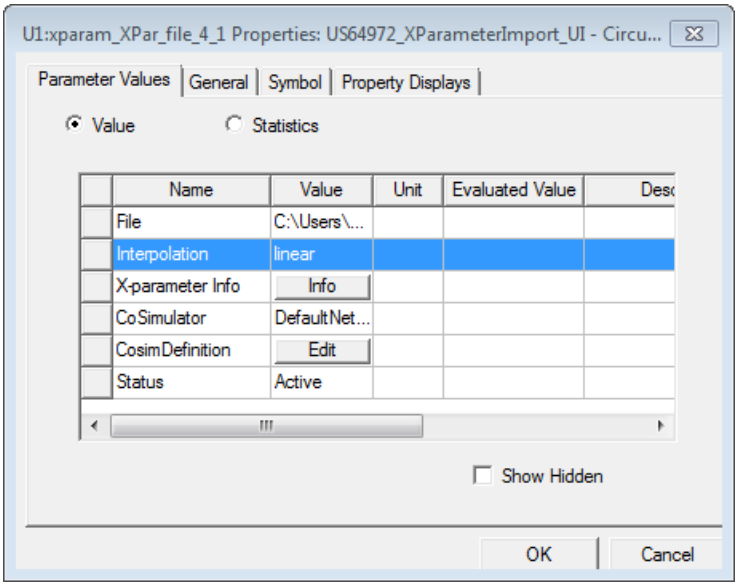
4. Select the file containing the X-parameter component information.
5. Click **Open** and an instance of the X-parameter element attaches to the cursor. Drag and

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

place it in the schematic. The port configuration is read from the file.



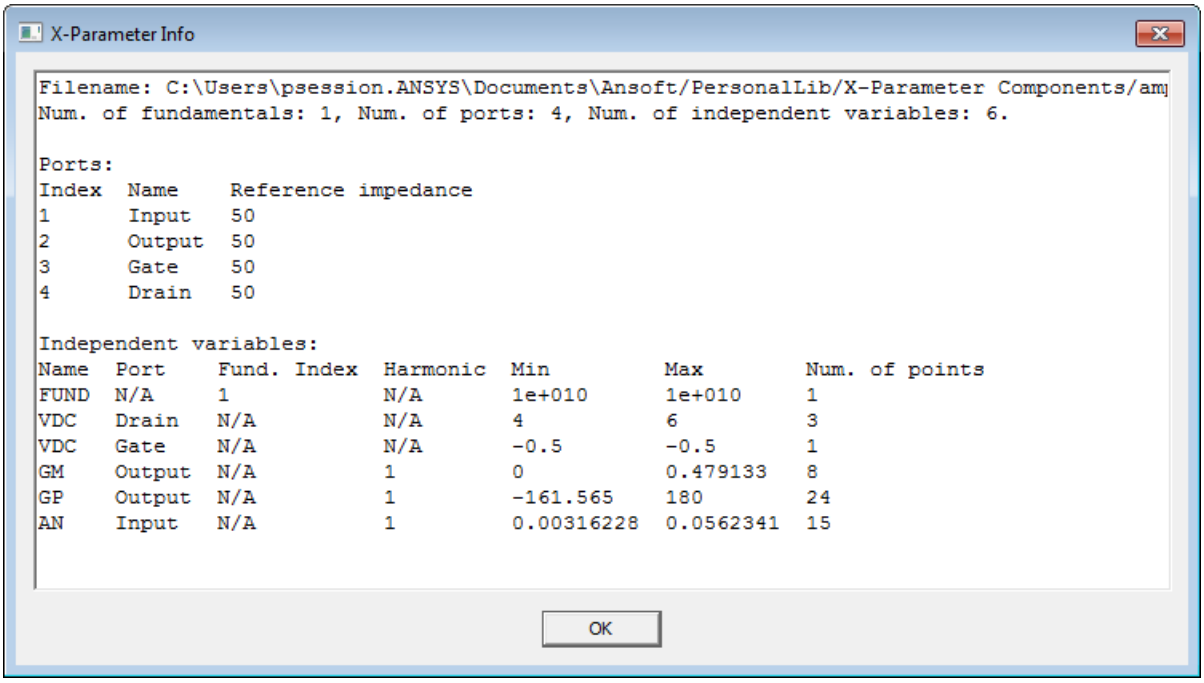
6. When you are finished placing instances of the component, right-click and select **Finish** or press **Esc** to stop placing instances.
7. Select the component to display its **Properties**.



The **Interpolation** property: Linear interpolation is the only choice currently available for calculating X-parameter values for solution points that are not in the file data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

8. Click **X-parameter Info** to display a (read-only) summary of the contents of the file.



The **Info** window displays:

From the top lines:

- The name of the file.
- The number of fundamental large-signal inputs.
- The number of ports.
- The number of independent variables in the file.

For each of the Ports:

- The port number.
- The port name.
- The reference impedance.

For each of the Independent Variables:

- The name of the variable.
- For the FUND variable, the index of that fundamental. A FUND with index 1 is required.
- For the VDC and IDC variables, the name of the port corresponding to the port number given in the file.
- For the variables after FUND, VDC and IDC, the name of the port and the harmonic number.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For all variables, the minimum and maximum values used in generating the X-parameters.
- For all variables, the number of sweep points employed in generating the data file. The number of sweep points affects the accuracy of the calculation when interpolation is required.

See Independent Variables for X-Parameters for details.

9. Click **OK** to close the X-Parameter Info window.
10. Click **OK** to close the Properties window.
11. Connect the X-parameter component to the circuit. The X-parameter model can be simulated only with Nexxim Harmonic Balance analysis. See the X-Parameter Technical Notes for information on the implementation.

X-Parameter Technical Notes

X-parameters are a superset of the frequency-dependent S-parameters. X-parameters are intended to model a device that generates a nonlinear response to an input whose energy is concentrated at one or a few fundamental frequencies. The response at each port consists of signals at the harmonics or the fundamental, or at the sums and differences of the harmonic frequencies of the fundamentals when more than one is present. The treatment of X-parameter models depends on the principle of *harmonic superposition*—the idea the harmonics are small in magnitude relative to the fundamental signal, and thus the harmonics can be superimposed linearly.

The X-parameter solver combines large-signal and small-signal models. In systems with nonlinear components, large-signal AC magnitudes can affect the operating point; small-signal contributors can be modeled accurately by linearizing the circuit around an operating point. The X-parameter solver calculates the Large-Scale Operating Point (LSOP) based on the large-signal contributors. The small-signal harmonic contributions are obtained by linearizing the system around the LSOP.

Let a be the vector of complex incident wave amplitudes to the device. Each element of the vector is indexed by port (1 to P) and harmonic (1 to N).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$a = \begin{bmatrix} a_{11} \\ \cdots \\ a_{1N} \\ a_{21} \\ \cdots \\ a_{2N} \\ \cdots \\ a_{P1} \\ \cdots \\ a_{PN} \end{bmatrix}$$

(1)

Vector *b* is a similarly indexed vector of scattered wave amplitudes. The vector *b* is a nonlinear complex function of *a*:

$$b = f(a)$$

(2)

From the situation represented by an X-parameter element, vector *a* is composed of one or a few large signals and several small-signal harmonics:

$$a = a_L + a_S$$

(3)

where the vector a_L contains the complex amplitudes of the large signals and zeros instead of the small-signal amplitudes. Similarly, the vector a_S contains the complex amplitudes of the small signals and zeros instead of the large-signal amplitudes.

If the *a* inputs are real, you could approximate *b* as:

$$b = f(a_L) + J(a_L)a_S$$

(4)

where $J(a_L)$ is a Jacobian matrix of the derivatives of *f* at $a = a_L$ with respect to the small-signals a_S.

But *a* and *b* are complex, so a different formulation is appropriate.

Start by splitting *a* into its real and imaginary parts:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$a = a^r + ja^i$$

(5)

$j = \sqrt{-1}$ where , and the superscripts *r* and *i* denote the real and imaginary parts of *a*, not exponents. Consider *f* as a function of two real vectors:

$$f(a) = f(a^r, a^i)$$

(6)

Then, linearizing *f* around the LSOP, you have:

$$f(a^r, a^i) \cong f(a_L{}^r, a_L{}^i) + \frac{\partial f}{\partial a_S{}^r}(a_S{}^r) + \frac{\partial f}{\partial a_S{}^i}(a_S{}^i)$$

(7)

Use the following identities to rewrite (7) in terms of a_S and its complex conjugate a_S^*:

$$a_S{}^r = \frac{a_S + a_S{}^*}{2}$$

(8)

$$a_S{}^i = \frac{a_S - a_S{}^*}{2j}$$

(9)

Substituting (8) and (9) into (7), obtaining:

$$f(a) = f(a_L{}^r, a_L{}^i) + \frac{\partial f}{\partial a^r}\left(\frac{a_S + a_S{}^*}{2}\right) + \frac{\partial f}{\partial a^i}\left(\frac{a_S - a_S{}^*}{2j}\right)$$

(10)

Rearranging the terms involvinga_S and its complex conjugate a_S^*:

$$f(a) \cong f(a_L{}^r, a_L{}^i) + \frac{1}{2}\left(\frac{\partial f}{\partial a^r} + \frac{1}{j}\frac{\partial f}{\partial a^i}\right)a_S + \frac{1}{2}\left(\frac{\partial f}{\partial a^r} - \frac{1}{j}\frac{\partial f}{\partial a^i}\right)a_S{}^*$$

(11)

Further simplify equation (11) to show the parallels with equation (4). Let:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$b_0 = f(a_L^r, a_L^i)$$

(12)

$$S = \frac{1}{2}\left(\frac{\partial f}{\partial a^r} + \frac{1}{j}\frac{\partial f}{\partial a^i}\right)$$

(13)

$$T = \frac{1}{2}\left(\frac{\partial f}{\partial a^r} - \frac{1}{j}\frac{\partial f}{\partial a^i}\right)$$

(14)

The complex equivalent of equation (4) is the formula for calculating the response from a set of X-parameter data and incident waves:

$$b = b_0(a_L) + S(a_L)a_S + T(a_L)a_S^*$$

(15)

In words, b_0 is a function of the large-signal inputs, or more generally, of the LSOP, while $S(a_L)$ and $T(a_L)$ are matrices that represent the linearization of the small signal harmonics around the LSOP. The complex conjugate a_S^* is required to account for the phase differences between the harmonic components and the large signals.

When $||b_0|| = 0$, T=0and $b = S(a)$. Thus, X-parameters are a superset of S-parameters.

For each fundamental there is at least one large signal, and the LSOP includes just the absolute value of this signal. The dependence on phase of the large signal is determined on the time-invariance of the system. This dependence is captured by the use of three matrices, P_{b0}, P_S, and P_T, the entries of which are all the form $e^{jq\phi}$, with q an integer and ϕ the phase of a_L:

$$a_L = |a_L|e^{j\phi}$$

(16)

Using these matrices, the dependence of b_0, S, and T on a_L is written as:

$$b_0(a_L) = P_{b_m} b_0(|a_L|)$$

(17)

$$S(a_L) = S(|a_L|)P_S$$

(18)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$T(a_L) = T(|a_L|)P_T$$

(19)

The LSOP can also depend on *independent variables* supplied in the X-parameter file. The independent variables include biasing and load conditions (See Independent Variables for X-Parameters). Then, b_0, S, and T all depend on the independent variables that are used when the X-parameter data file was generated:

$$b_0 = b_0(x)$$

(20)

$$S = S(x)$$

(21)

$$T = T(x)$$

(22)

where $x$is a vector of the M independent variables

$$x = \begin{bmatrix} x_1 \\ x_2 \\ \cdots \\ x_M \end{bmatrix}$$

(23)

DC Equations

Equation (15) relates the scattered wave amplitudes to the incident wave amplitudes, at the fundamental frequency and at higher harmonics. However, nonlinear devices typically exhibit some degree of rectification, which means that even when the input is a single tone, the output includes a DC component.

There are two options for modeling the DC response. The X-parameter model approximates either the DC voltage at a port given the current going into it, or the DC current at a port given the voltage across it. From the first case, the port is designated as an IDC port, and selected to bias the port by an external current source. From the second case, the port is designated as a VDC port, and selected to bias the port by an external voltage source.

For both cases, follow a similar procedure leading to equation (15), except alter the approximated functions (i.e., the DC currents, i_{DC}, or the DC voltages, v_{DC}).

For the IDC ports,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$$v_{DC} = v_0(x) + 0.5Z(x)a_S + 0.5Z^*(x)a_S^*$$
(24)

where v_{DC} is a vector of the approximate DC voltages at all IDC ports. The vector $v_0(x)$ denotes the DC voltages at the LSOP, and the harmonic impedance matrix $Z(x)$ relates the small-signal amplitudes at all harmonics to the DC voltages. The LSOP must include the DC currents at all the IDC ports. For the VDC ports,

$$i_{DC} = i_0(x) + 0.5Y(x)a_S + 0.5Y^*(x)a_S^*$$
(25)

where i_{DC} is a vector of the approximate DC currents at all VDC ports. The vector $i_0(x)$ denotes the DC currents at the LSOP, and the harmonic admittance matrix $Y(x)$ relates the small-signal amplitudes at all harmonics to the DC currents. The LSOP must include the DC voltages at all the VDC ports.

What should be written is (24) and (25) in the same form as (15), but they can be written more succinctly as:

$$v_{DC} = v_0(x) + \mathrm{Re}(Z(x)a_S)$$
(26)

and

$$i_{DC} = i_0(x) + \mathrm{Re}(Y(x)a_S)$$
(27)

which also make it clear that v_{DC} and i_{DC} are real.

Independent Variables for X-Parameters

The independent variables in the X-parameter file are real values, indexed by fundamental, port, and harmonic numbers.

X-Parameter Independent Variables

Independent Variable	Description
fund_k	k^{th} fundamental frequency.
VDC_p	DC voltage applied to port *p*. Mutually exclusive with IDC_p at the same port.
IDC_p	DC current applied to port *p*. Mutually exclusive with VDC_p at the same port.
AN_p_n	Magnitude of Reference large-signal input to port p at harmonic n. One AN variable must be present for each fundamental.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Independent Variable	Description
AM_p_n	Magnitude of any other large-signal input to port p at harmonic n other than the Reference Signal AN_p_n. Required when AP_p_n is used at same port and harmonic.
AP_p_n	Phase in degrees of any other large-signal input to port p at harmonic n other than the Reference Signal AN_p_n. Required when AM_p_n is used at same port and harmonic.
GM_p_n	Magnitude of the reflection coefficient of the load at port p, harmonic n. Required when GP_p_n is used at the same port and harmonic. Mutually exclusive with the other formats for specifying load at the same port p and harmonic n.
GP_p_n	Phase in degrees of the reflection coefficient of the load at port p, harmonic n. Required when GM_p_n is used at the same port and harmonic. Mutually exclusive with the other formats for specifying load at the same port p and harmonic n.
GX_p_n **GY_p_n**	Real and imaginary parts of the reflection coefficient. Mutually exclusive with the other formats for specifying load at the same port p and harmonic n.
ZM_p_n **ZP_p_n**	Magnitude and phase of the load impedance. Mutually exclusive with the other formats for specifying load at the same port p and harmonic n.
ZX_p_n **ZY_p_n**	Real and imaginary parts of the load impedance. Mutually exclusive with the other formats for specifying load at the same port p and harmonic n.

State Space Model Support

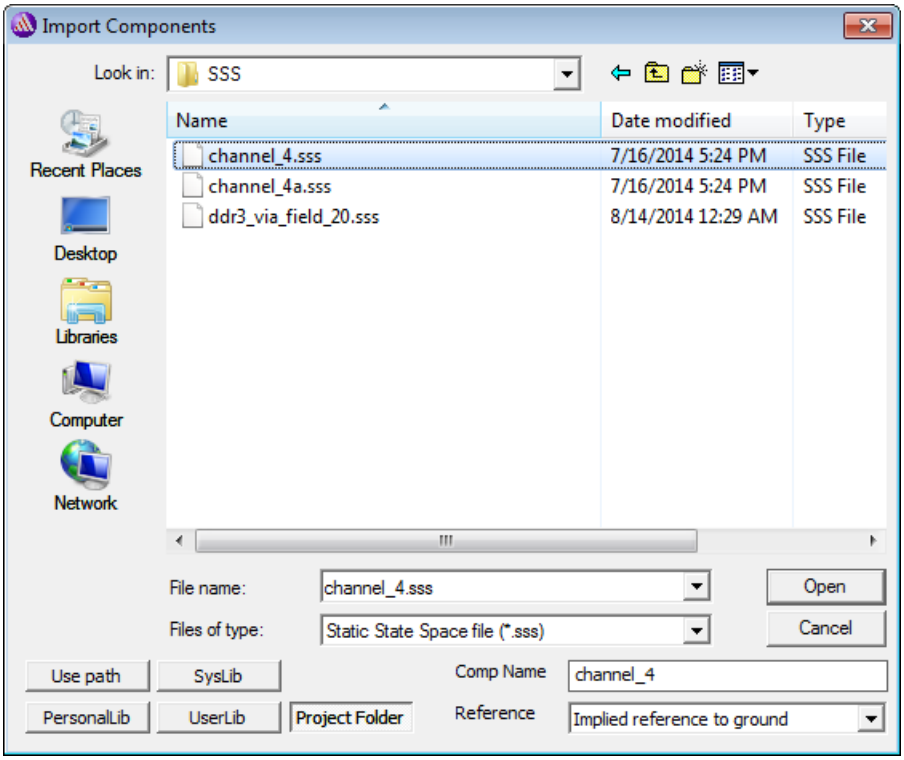
A state-space model is a representation of frequency-dependent transfer function data. Passivity and causality enforcement work best with state-space models. You can create a state-space model from a set of SYZ-parameters via the Network Data Explorer. See State Space Method in the Circuit Design Technical Notes for details.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Importing State-Space Models

Once the state-space data have been generated and saved, you can import it just like any other static model.

1. View the **Component Libraries**. Open the **Symbols** area. Click **Import Models**. From the area, select the **SSS** icon to open the **Import Components** window.



2. Select the file containing the state-space data.
3. In **Comp Name** in the lower-right, change the component name if selected.
4. Select a type for the **Reference** node:
   - **Implied reference to ground**: the global ground is the reference port for each N port connection. Its voltage is always 0V.
   - **Common reference port**: an additional reference pin is added that is a common reference for the definition of port voltages. This reference can have any voltage and corresponds to the net for that extra pin.
   - **Add individual hidden reference pin per port**: an additional reference pin is added for each port. These reference pins are hidden, set to 0V by default, and can each have their own reference voltage. You can connect each reference pin to its own net. Select this option if you do not want to see the reference pins.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Add individual reference pin per port**: an additional reference pin is added for each port. Every reference pin can have its own reference voltage and be connected to its own net.

> **Note:**
>
> See Reference Nodes on S-Parameter Elements in the S-parameter Technical Notes for how the Circuit solver handles reference node configurations.

5. Click **Open**. An instance of the state-space N-port component is attached to the cursor, so drag and place it in the schematic. When you are finished placing instances of the component, right-click and select **Finish** or press **Esc** on the keyboard to stop placing instances.

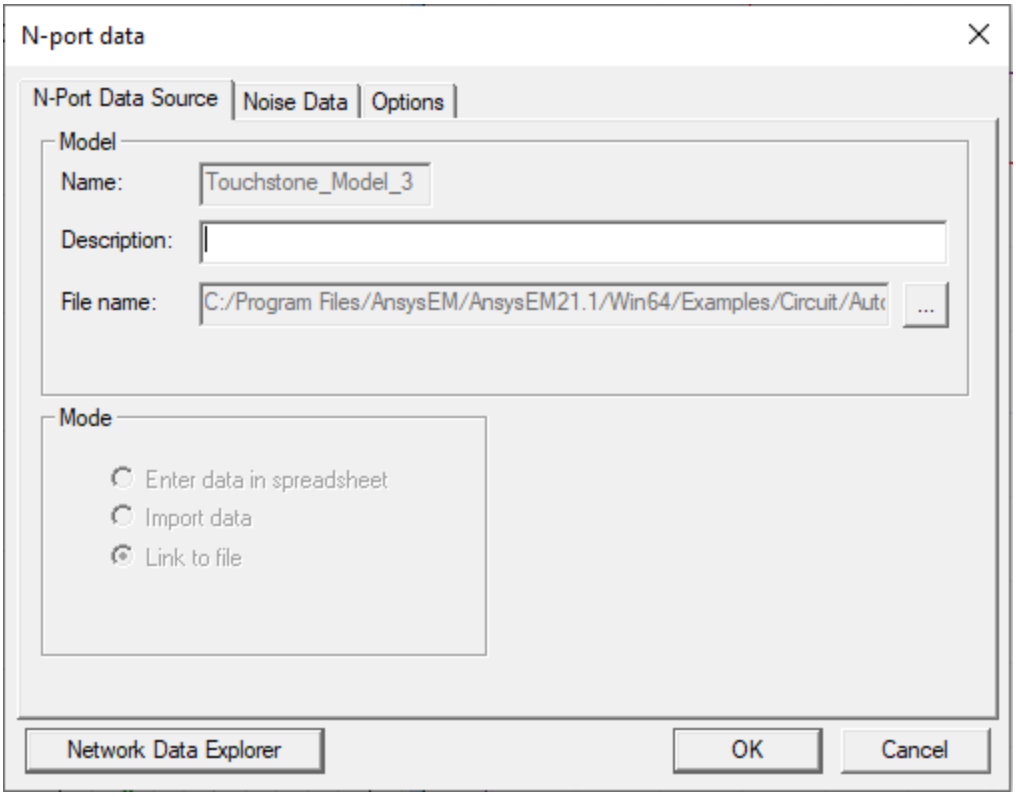
Editing a State Space Model

To view the details of the model, right-click the state space component in the schematic and select **Edit Model** to open the **N-port data** window. The **N-port data** window allows you to view or in some cases to change the name, number of ports, characterizing data, and other properties for the N-port.

State Space N-Port Data Source Tab

The **N-Port Data Source** tab is used to name the N-port device and specify the source for the data, typically an external file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **Name** — Displays the name of the imported solution as it appears in the **Project Tree**.
- **Description** – Used to set or change the description of the imported solution. To change the description, click in the box , then type the description you want.
- **File Name** – Used to display or change the file name of the imported solution. To change the file name, browse (...) for a file.
- **Mode** – The network solution data is read from an external **Link to file** at analysis time.
- **Network Data Explorer** allows you to view solution data by opening the Network Data Explorer.

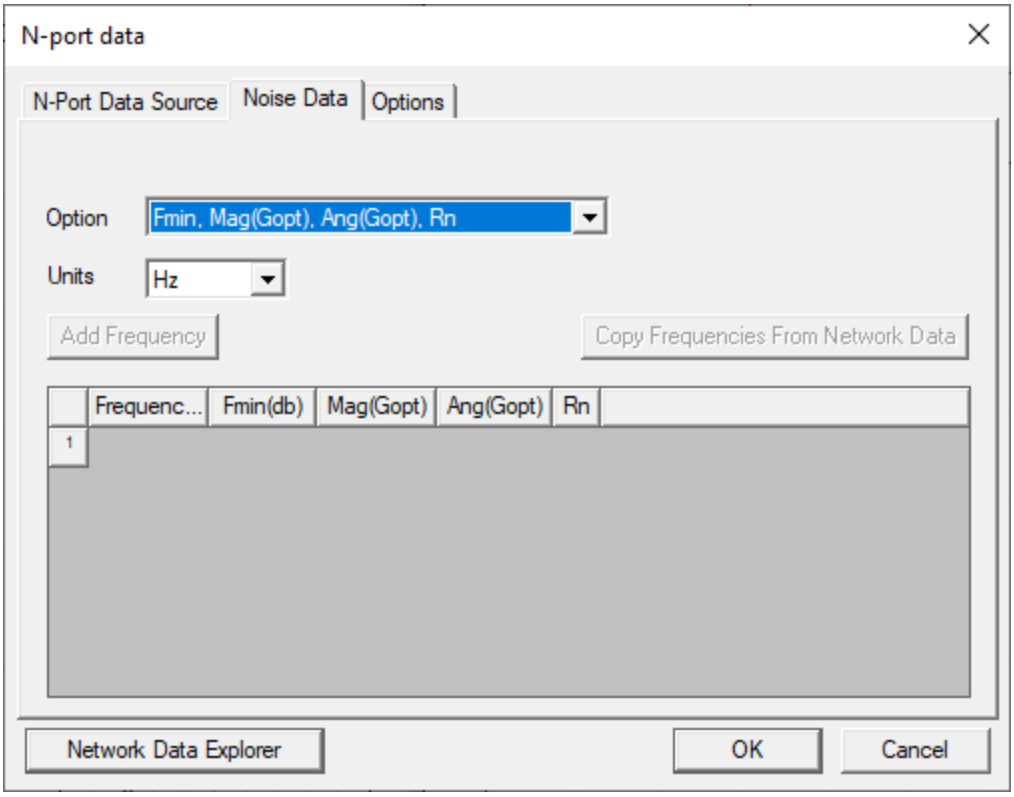
> **Note:**
>
> **Network Data Explorer** is not activated for State-Space models.

When the **N-Port Data Source** options have been entered, click **OK** or select another tab.

State Space N-Port Data Noise Data Tab

Click the **Noise Data** tab to enter frequency-dependent noise parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



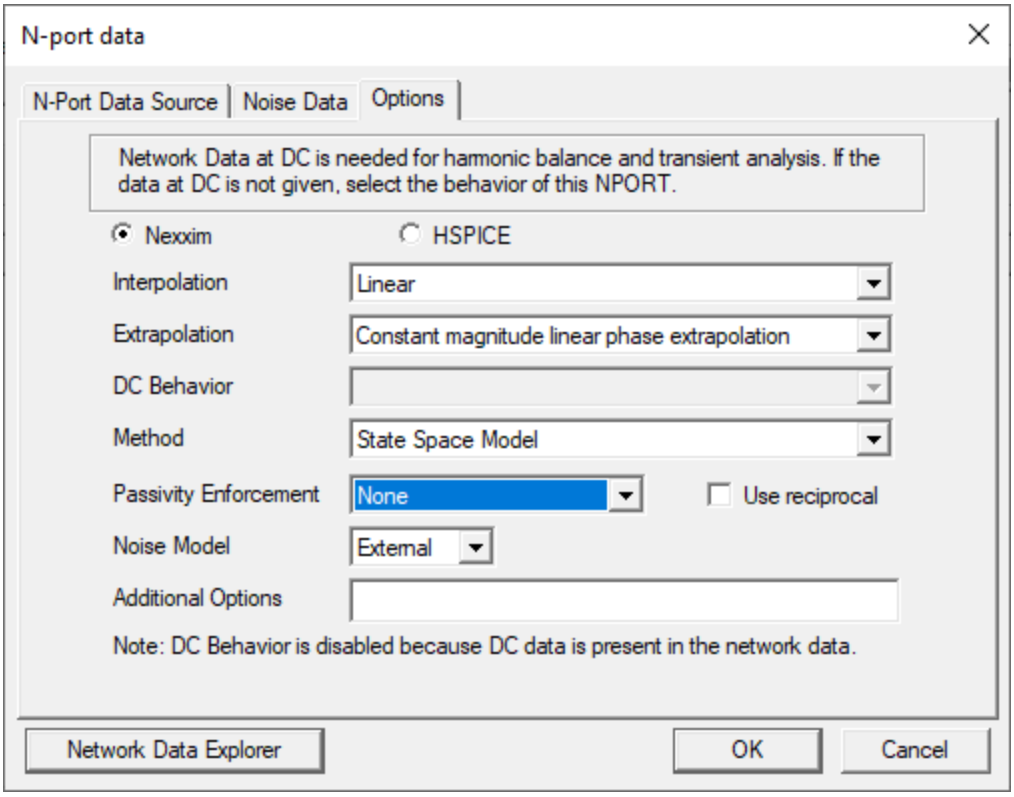
- The **Option** field selects the units for the noise parameters:
- The **Units** field selects the units of frequency: **Hz**, **KHz**, **MHz**, **GHz**, **THz**, or **rps**.
- click **Copy Frequencies from Network Data** to create a list of frequencies that correspond to the frequencies in the N-port data file.
- click **Add Frequency** to add a new frequency to the end of the list.

Enter the noise data for each frequency in the list, then click **OK** or select another tab.

State Space N-Port Data Options Tab

The **Options** tab is used to select the behavior of the selected NPort.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



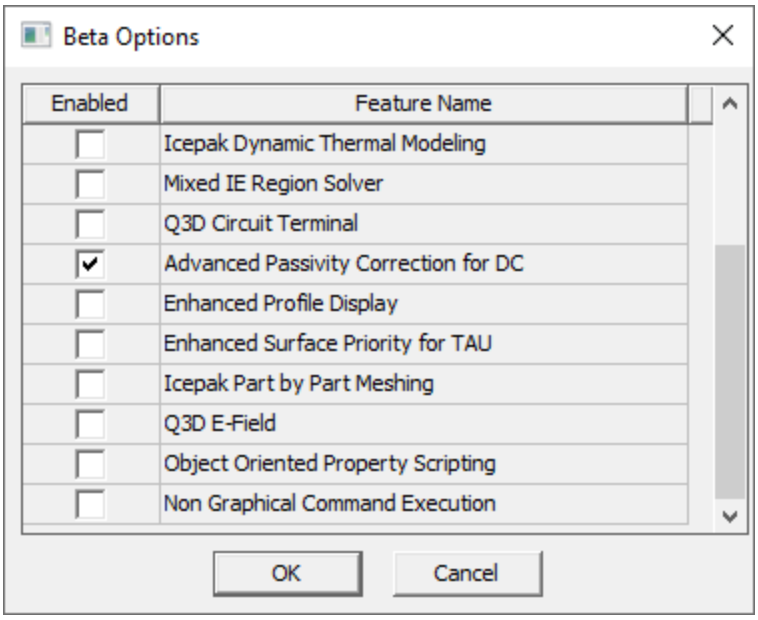
The following controls are available:

- **Nexxim/HSPICE** — Sets the NPort type. The selections for Interpolation, Extrapolation, DC Behavior, Method, and Passivity Enforcement depend on the NPort type selected.
- **Interpolation** — Specifies the interpolation method for data points in the frequency range of the Touchstone data.
- **Extrapolation** – Specifies the extrapolation method for data points outside the frequency range of the Touchstone data.
- **DC Behavior** — Specifies behavior of the N-Port at DC (zero frequency).
- **Method** – Specifies the method used to convert frequency domain data to the time domain. Choice of methods is available only for Nexxim Nports.
- **Passivity Enforcement** — Performs a passivity check on the S-parameter data and attempts to correct non-passive data. The options are None, IFPV, IFPVLF, Convex Optimization, and Passivity by Perturbation.

  Passive devices may dissipate or temporarily store energy, but never generate energy. Use the drop-down menu to select the method for enforcing passivity. Passivity enforcement is available only for Nexxim NPorts. See Passivity Checking and Enforcement. For details on passivity checking and enforcement, see S-Parameter Technical Notes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When applying IFPVLF, the passive DC fit to Scattering Parameter Data (S-data) can deteriorate to the point the inaccuracies of the (passive) fit to the corresponding Impedance Data (Z-data) at zero frequency (DC) and low-frequency may cause inaccurate time-domain steady state simulations. If preserving an accurate passive DC fit to S-data is important, like it is in power electronics applications, e.g., with DC-DC converters and power supply Voltage Regulator Module (VRM)), then click the **Advanced Passivity Correction for DC** beta option to enhance the passive DC fit to S-data using IFPVLF. The **Advanced Passivity Correction for DC** is located in the **Beta Options** in the Global Options.



- **Use reciprocal** – Computes the inverse, or reciprocal, at each frequency so the N-port can be used for de-embedding. See Deembedding S-Matrices.
- **Noise Model** – Specifies noise model for DC and frequency-domain analyses:
  - **None** – No noise analysis
  - **Internal** – Use internal noise model
  - **External** – Use noise data from Touchstone file if present, else use internal noise model
- **Additional Options** — Allows you to add model-level options for Nexxim or HSPICE.

When the N-port Options have been entered, click **OK** or select another tab.

- **Network Data Explorer** – Allows you to view solution data by opening the Network Data Explorer.

When the N-port Options have been entered, click **OK** or select another tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

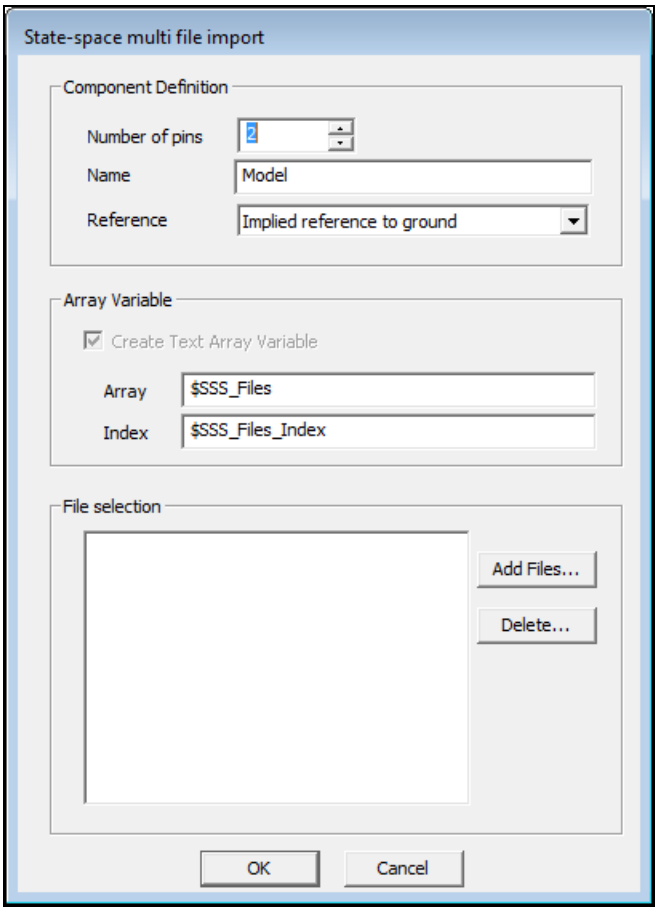
Editing State Space N-Port Symbol Pins

To edit the pins on the symbol for the N-Port component, right-click the component and select **Edit Symbol Bus Pins**. The procedure is identical for all flavors of N-Port. See Editing All N-Port Symbol Bus Pins for details.

Creating a Multi-File State Space Model

Instead of referencing a single file, an state-space model can reference an array of files, using a project array variable. For more information, see Adding a Project Variable Array. Follow these steps to create a multi-file model using array variables.

1. View the **Component Libraries** area, select the **Symbols** tab. Click **Import Models**.
2. Select the **SSS_Multi** icon. This opens the **State Space multi file import** window.



3. Enter a number of ports (from 1 to 1000). The number of ports determines what files select.
4. Enter a **Name** for the model if selected.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Select a type for the **Reference** node:
    - **Implied reference to ground**: the global ground is the reference port for each N port connection. Its voltage is always 0V.
    - **Common reference port**: an additional reference pin is added that is a common reference for the definition of port voltages. This reference can have any voltage and corresponds to the net for that extra pin.
    - **Add individual hidden reference pin per port**: an additional reference pin is added for each port. These reference pins are hidden, set to 0V by default, and can each have their own reference voltage. You can connect each reference pin to its own net. Select this option if you do not want to see the reference pins.
    - **Add individual reference pin per port**: an additional reference pin is added for each port. Every reference pin can have its own reference voltage and be connected to its own net.

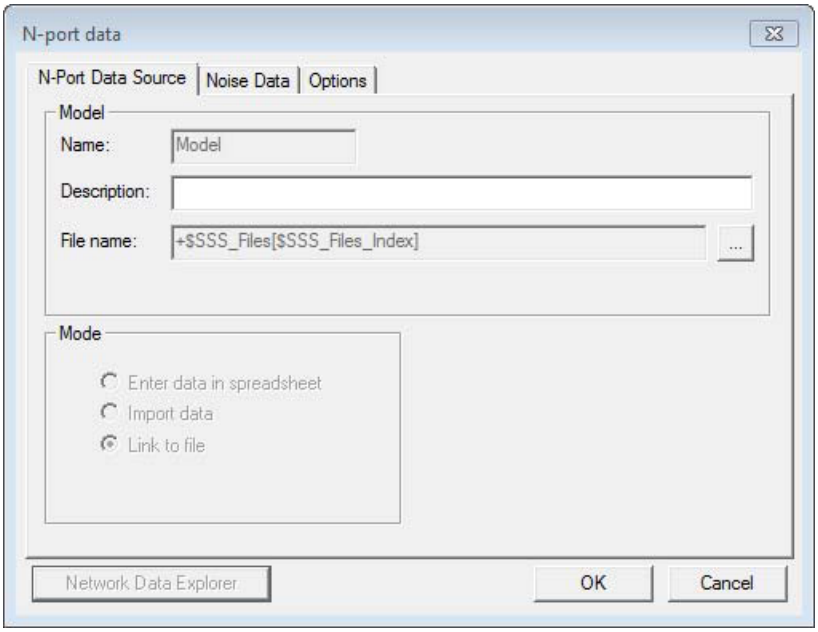
> **Note:**
>
> See Reference Nodes on S-Parameter Elements in the S-parameter Technical Notes for how the Circuit solver handles reference node configurations.

6. Click **Add Files** to browse and select multiple State Space (.sss) files to add to the list box.
7. Click **OK**. An instance of the state-space component is attached to the cursor, so drag and place it in the schematic. When instances of the component are placed, right-click and select **Finish** or press **Esc** on the keyboard to stop placing instances.
8. The simulation can sweep the entries in the created Text Array Variable. In this case, **$SSS_Files_Index** is the variable to sweep.

Editing a Multi-File State Space Model

To view or change the configuration of the N-Port model, right-click the component and select **Edit Model** on the menu. The **N-port data** window opens on its **N-Port Data Source** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **File name** field are populated with the new text array variable expression.

See Editing a State Space Model for details on the **Noise Data** and **Options** tabs.

Importing Network Design Data (SYZ-Parameters)

N-ports are generic components for which characteristics may be defined in the form of user-supplied network-parameter data. They are called *black box* elements because no information regarding their function is provided except for their network parameters. The network parameters may be supplied as complex scattering parameters (*S* parameters), complex admittances (*Y* parameters), complex impedances (*Z* parameters), complex propagation constants (gamma parameters), or complex terminal characteristic impedances (Z_0 parameters). The data may be given in either polar form or in rectangular form.

Generally, the characterizing network parameters are frequency-dependent and is supplied for several frequency points. A common application of this capability is to introduce measured data into the simulation for comparison or modeling, or to represent a part of a circuit for which modeling is difficult or inappropriate. User-supplied network-parameter data may be entered in spreadsheet form or called from external files. This data then may be extracted on the data files and used in the simulation. Three data file formats are supported:

- **Touchstone/EESof Data** — This format uses the **.sNp, .yNp**, **.zNp**, **.tou**, or **.ts** file name extension. Only one dataset may be present in each Touchstone data file.
- **Circuit (Compact FLP)** – This format uses the **.flp** file name extension, and may contain several data groups, each of which is preceded by a header. The data group header identifies the group by means of a label, which is used as a reference name.

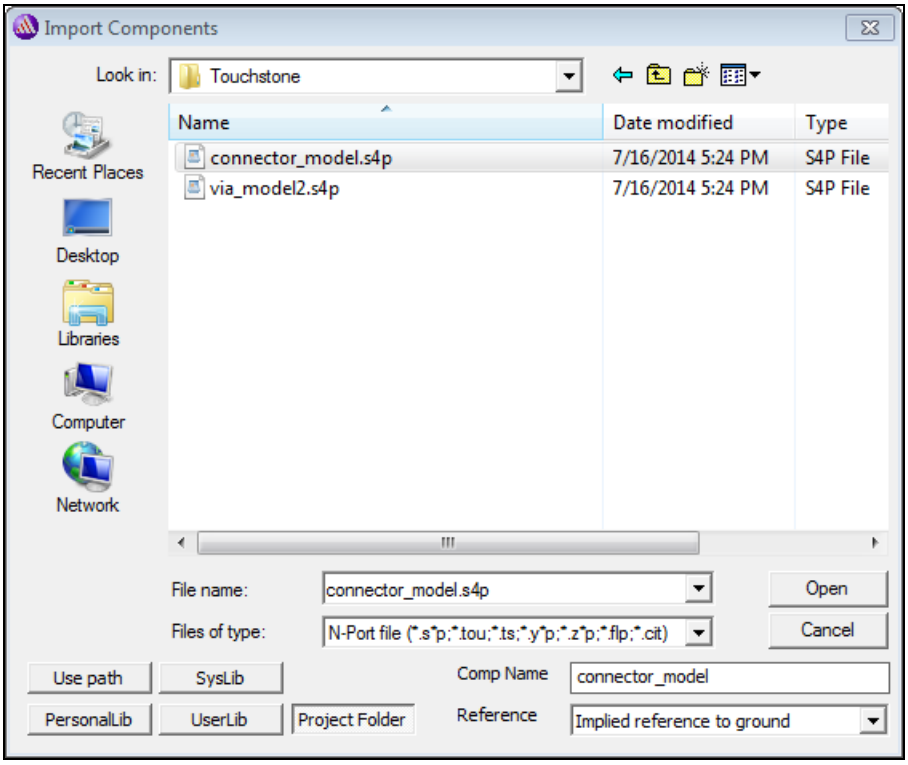
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **CITIfile** – This format uses the **.cit** file name extension, and contains S-parameter data in a proprietary format.

Creating an N-Port Model

An N-port is a component whose behavior is specified by a set of frequency-dependent data such as S-parameters. To create an N-port element to place, select the Circuit project that contains it.

1. View the **Component Libraries** area, select the **Symbols** tab. Click **Import Models**.
2. Select the **NPort** icon. The **Import Components** window opens.



3. Browse to the directory containing the N-port data file, and select the file.
4. In **Comp Name** in the lower-right, change the component name if selected.
5. Select a type for the **Reference** node:
   - **Implied reference to ground**: the global ground is the reference port for each N port connection. Its voltage is always 0V.
   - **Common reference port**: an additional reference pin is added that is a common reference for the definition of port voltages. This reference can have any voltage and corresponds to the net for that extra pin.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Add individual hidden reference pin per port**: an additional reference pin is added for each port. These reference pins are hidden, set to 0V by default, and can each have their own reference voltage. You can connect each reference pin to its own net. Select this option if you do not want to see the reference pins.
- **Add individual reference pin per port**: an additional reference pin is added for each port. Every reference pin can have its own reference voltage and be connected to its own net.

> **Note:**
>
> See Reference Nodes on S-Parameter Elements in the S-parameter Technical Notes for how the Circuit solver handles reference node configurations.

6. Click **Open** . An instance of the N-port component is attached to the cursor, so drag and place it in the schematic. When instances of the component are placed, right-click and select **Finish** or press **Esc** on the keyboard to stop placing instances.

Editing an N-Port Model

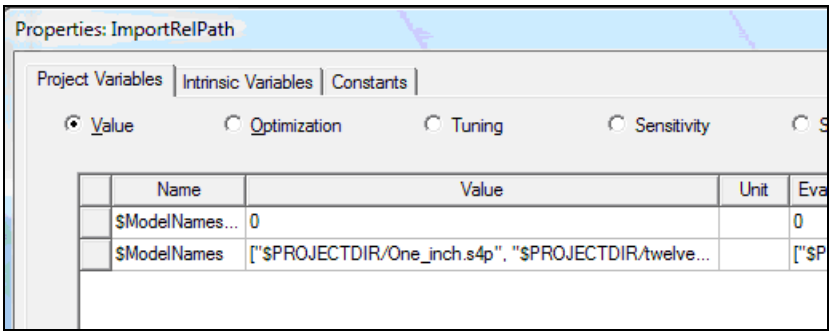
To view the details of the model, right-click the NPort component in the schematic and select **Edit Model** to open the **N-port data** window. The N-port data window allows you to view or in some cases to change the name, number of ports, characterizing data, and other properties for the N-port.

Creating a Multi-File N-Port Model

Instead of referencing a single file, an N-port model can reference an array of solution files, using a project array variable. For instance, the following can be used to specify the **File name**:

- +$ModelNames[1]
- +$ModelNames[$ModelNames_Index]

$ModelNames is a project level array variable and $ModelNames_Index is a project level array index variable.

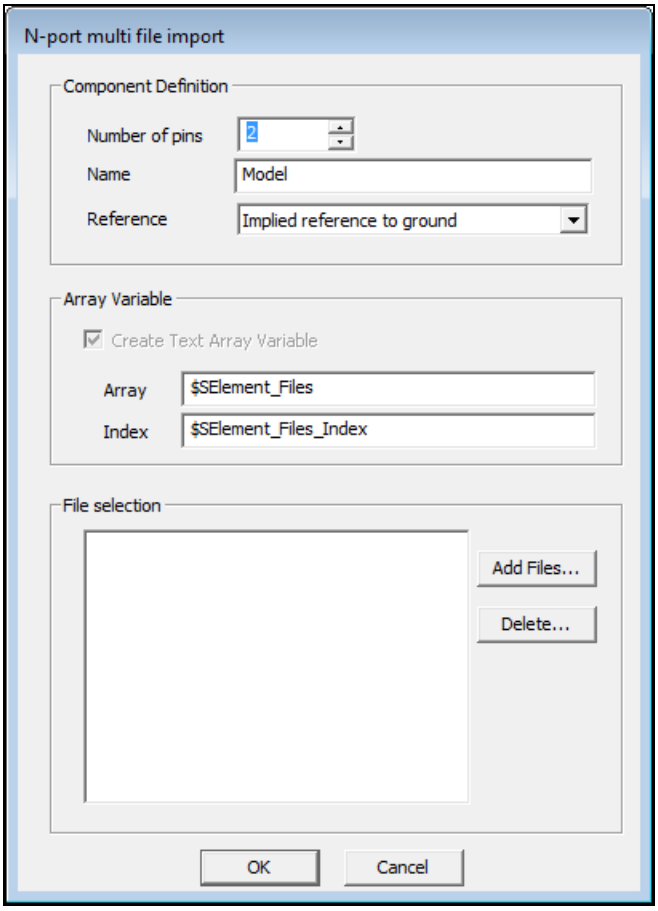


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For more information, see Adding a Project Variable Array.

To create a multi-file model using array variables:

1. View the **Component Libraries** area, select the **Symbols** tab. Click **Import Models**.
2. Select the **NPort_Multi** icon. This opens the **N-port multi file import** window.



3. Enter a number of pins or ports (from 1 to 1000). Files containing components with exactly the specified number of pins (and only those files) are displayed for selection in the **Add Files** window.
4. Enter a **Name** for the model if selected.
5. Select a type for the **Reference** node:
   - **Implied reference to ground**: the global ground is the reference port for each N port connection. Its voltage is always 0V.
   - **Common reference port**: an additional reference pin is added that is a common reference for the definition of port voltages. This reference can have any voltage and corresponds to the net for that extra pin.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

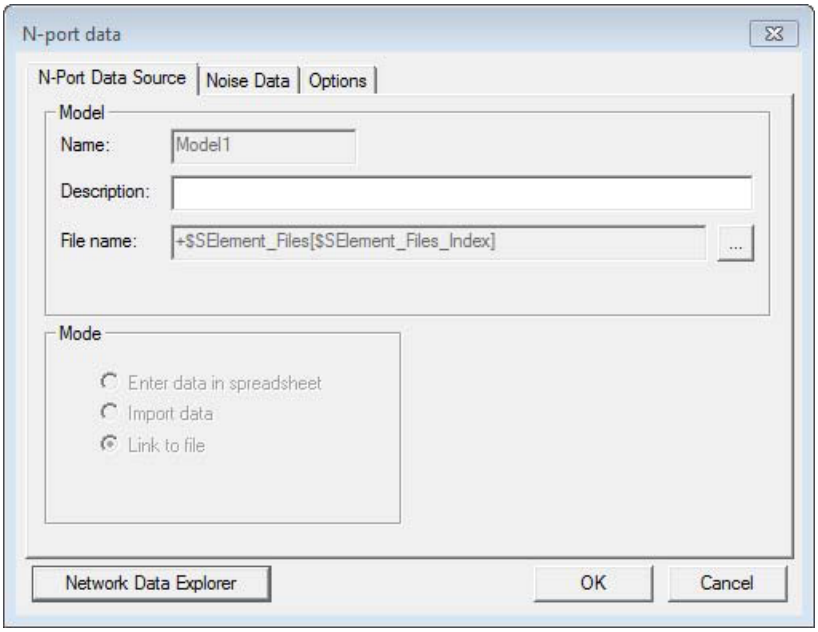
- **Add individual hidden reference pin per port**: an additional reference pin is added for each port. These reference pins are hidden, set to 0V by default, and can each have their own reference voltage. You can connect each reference pin to its own net. Select this option if you do not want to see the reference pins.
- **Add individual reference pin per port**: an additional reference pin is added for each port. Every reference pin can have its own reference voltage and be connected to its own net.

> **Note:**
>
> See Reference Nodes on S-Parameter Elements in the S-parameter Technical Notes for how the Circuit solver handles reference node configurations.

6. Clicking **Add Files** to browse and select multiple Touchstone (*.SnP) files to add to the list box.
7. Click **OK**. An instance of the N-port component is attached to the cursor, so drag and place it in the schematic. When instances of the component are placed, right-click and select **Finish** or press **Esc** on the keyboard to stop placing instances.
8. The simulation can sweep the entries in the created Text Array Variable. In this case, **$SElement_Files_Index** is the variable to sweep.

Editing a Multi-File N-Port Model

To view or change the configuration of the N-Port model, right-click the component and select **Edit Model** on the menu. The **N-port data** window opens on its **N-Port Data Source** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

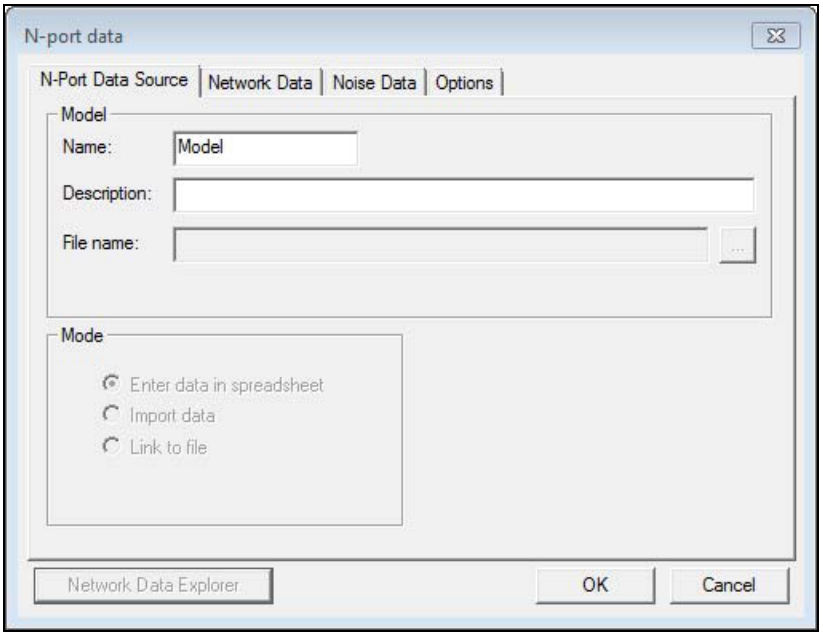
The **File name** field are populated with the new text array variable expression.

See Editing an N-Port Model for details on the **Noise Data** and **Options** tabs.

Creating an N-Port Model with No File

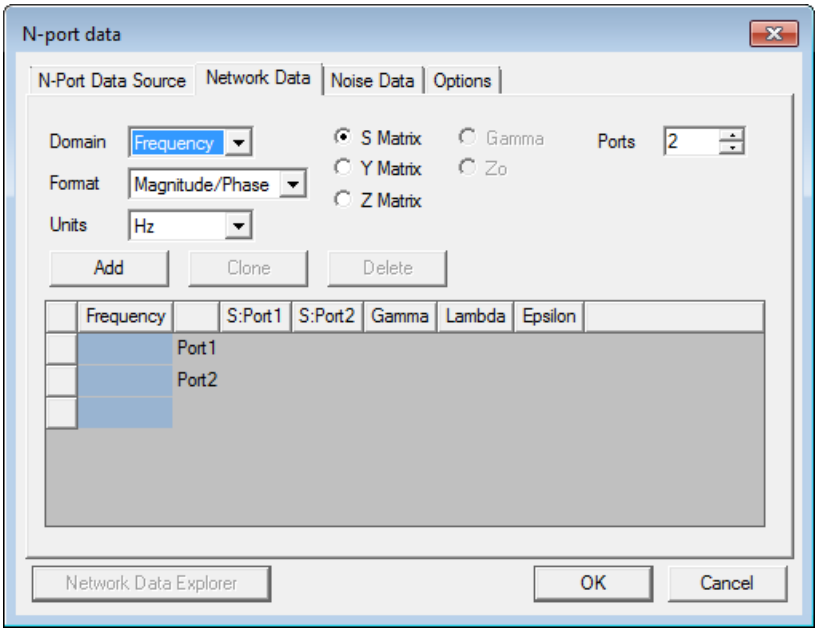
N-port frequency-dependent data such as S-parameters can be entered manually instead of reading it from a file. To create an N-port element to receive manually entered data, select the Circuit project that contains it.

1. View the **Component Libraries** area, select the **Symbols** tab. Click **Import Models**.
2. Select the **NPort_NoFile** icon to open the **N-port data** window. The **Mode** is set to **Enter data in spreadsheet**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Click **Network Data** tab.



The **Network Data** tab is used to view the data from an imported file, or to enter the N-port data manually.

- **Domain** – Selects the **Frequency** or **Time** domain.
- **Format** – Selects the **Format** to one of the following: Magnitude/Phase, Real/Imaginary, or dB Phase.
- **Units** – From the Frequency domain, selects the units of frequency: **Hz**, **KHz**, **MHz**, **GHz**, **THz**, or **rps**. From the Time domain, selects the units of time: **fs**, **ps**, **ns**, **us**, **ms**, or **s**.
- **S Matrix** – Identifies the data as S-parameter values
- **Y Matrix** – Identifies the data as Y-parameter values
- **Z Matrix** – Identifies the data as Z-parameter values
- **Gamma** – Identifies the data as Gamma values
- **Z0** – Identifies the data as Z0 values
- **Ports** – Sets the number of signal ports
- **Phase Rotation** — Click to set the **Phase Rotation** of the **N-Port Network Data** source.The **Noise Data** and **Options** tabs are the same as for the file-based N-port. See Editing an N-Port Model.

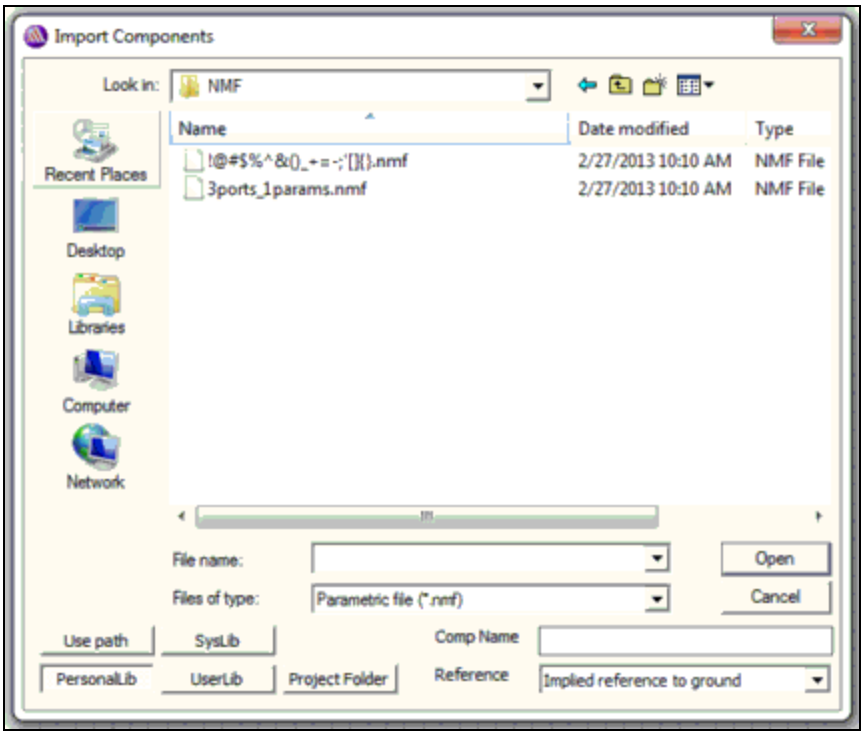
4. Click **OK**. An instance of the N-Port is attached to the cursor so drag and drop it in the schematic.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Creating a Parametric N-Port Model

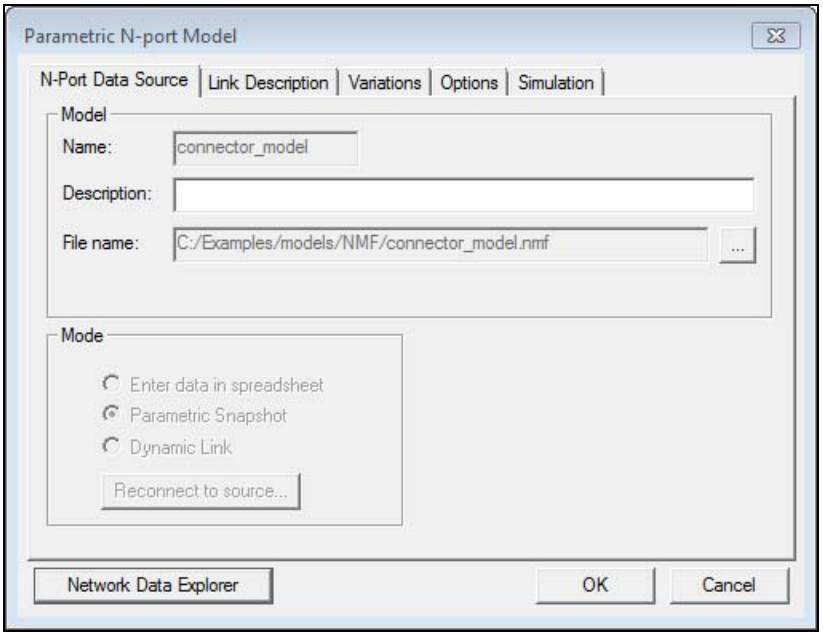
A parametric N-port contains multiple values of key variables suitable for sweeping. To create a parametric N-port model:

1. View the **Component Libraries** area, select the **Symbols** tab. Click **Import Models**.
2. Select the **NMF** icon. The **Import Components** window opens:



3. Browse to and select the file and click **Open**. An instance of the component is attached to the cursor so drag and drop it into the schematic. When you are finished placing instances of the component, right-click and select **Finish** or press **Esc** on the keyboard to stop placing instances.
4. Right-click the component and select **Edit Model** to open the **Parametric N-port Model** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The wizard has created the N-port in **Parametric snapshot** mode.

5. Click **OK**.

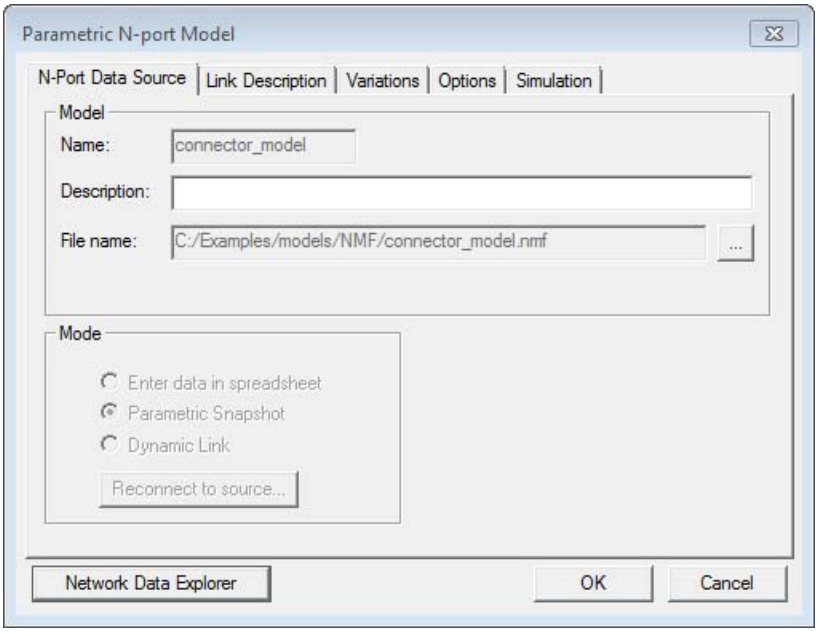
Editing a Parametric N-Port Model

From the **Parametric N-port Model** window, specify the basic characteristics of the Parametric *N*-port black boxes to place in a schematic or layout. To open the window, right-click the component and select **Edit Model** on the menu. The following tabs are available.

Parametric N-Port Data Source Tab

The **N-Port Data Source** tab is used to name the N-port device and specify the source for the data, typically an external file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



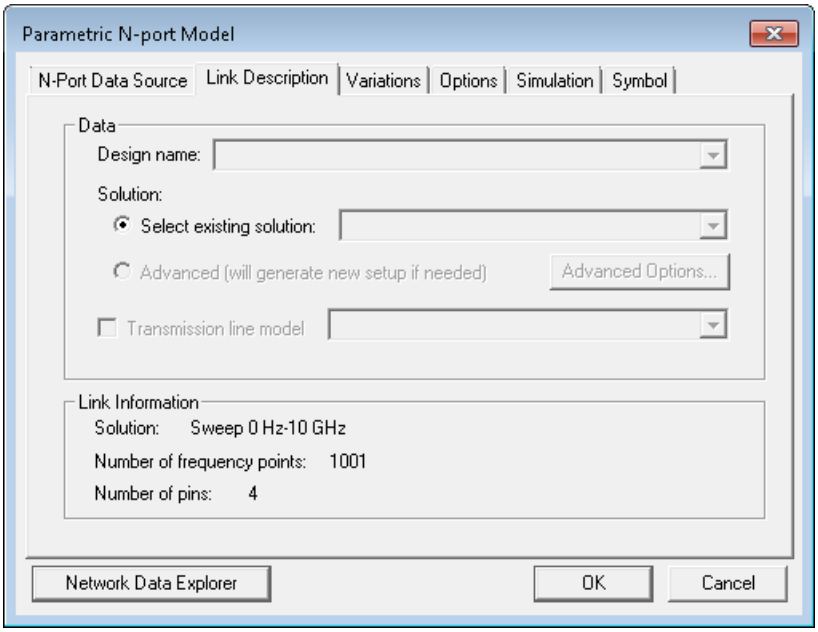
- **Name** — Displays the name of the imported solution as it appears in the **Project Tree**.
- **Description** – Used to set or change the description of the imported solution. To change the description, click in the box , then type the description you want.
- **File Name** – Displays the file name of the imported solution. To set the file name, click in the box , then type the file name you want, or browse (...) for a file.
- **Mode** – The network solution data has been copied into the project from an external file as a **Parametric Snapshot**.
- **Network Data Explorer** —Allows you to view and manipulate network data by opening theNetwork Data Explorer**.**

When the **N-Port Data Source** options have been entered, click **OK** or select another tab.

Parametric Link Description Tab

Click the **Link Description** tab to enter data and link information.

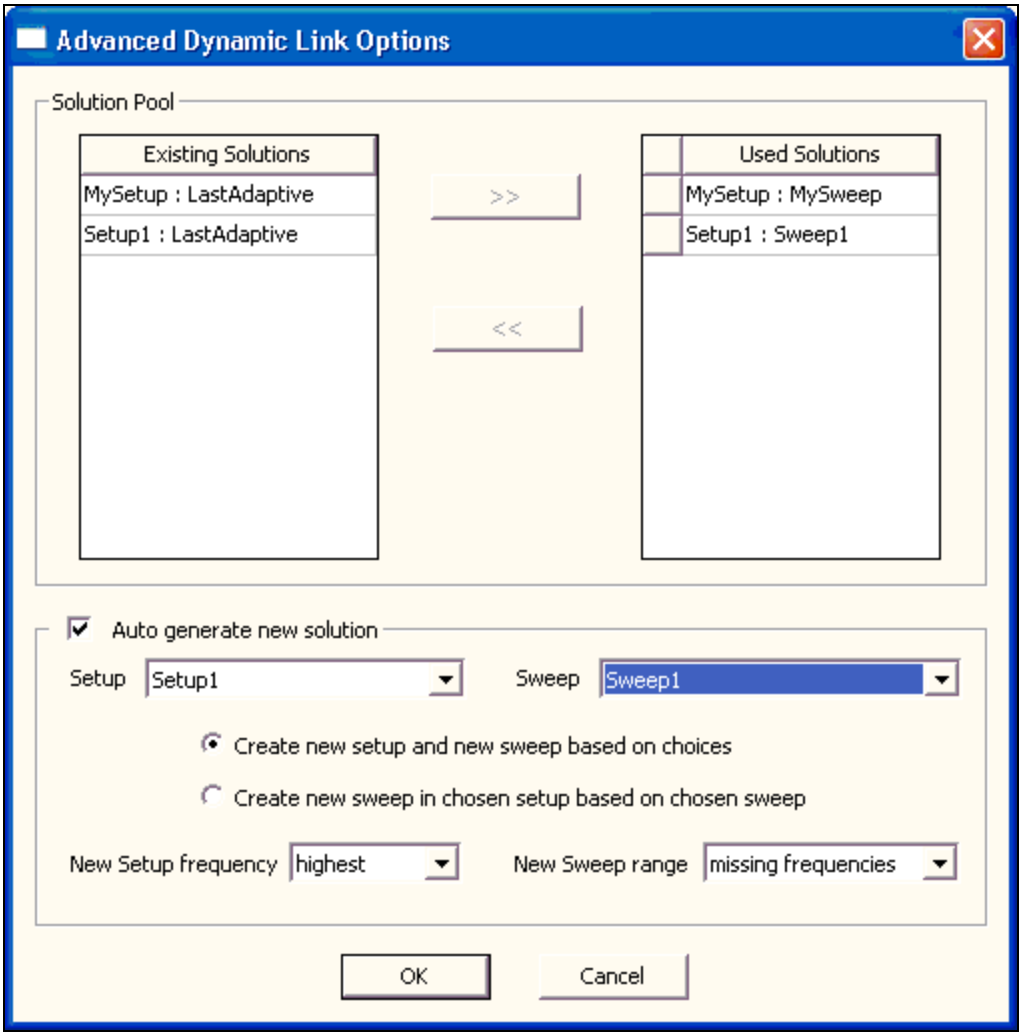
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **Design name** specifies the top-level design in the filed solver project.
- **Solution** specifies the solution to use for the Parametric component.
- Click **Select existing solution** to enable the selection field. Then make a selection on the HFSS solution drop-down menu.
- **Transmission line model** specifies that the model specified in the drop-down menu at right are used for transmission lines (HFSS import only)
- Click **Advanced** to specify a custom setup using **Advanced Options**. When **Advanced** setup has been selected, **Advanced Options** becomes active. Click on **Advanced**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options to open the **Advanced Dynamic Link Options** window:



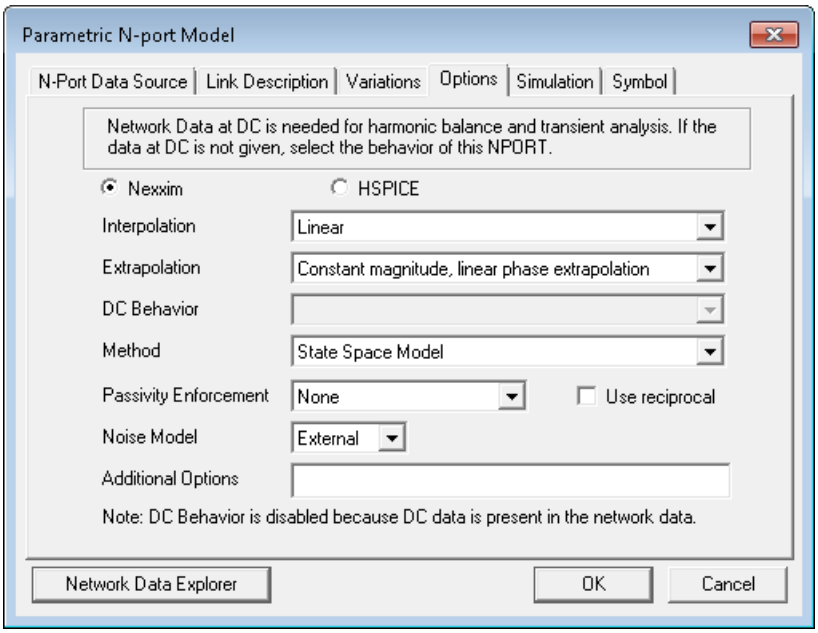
- Select one or more of the **Existing Solutions** to use in the simulation.
- Click **Auto generate new solution** to calculate missing frequency ranges.
- Select the selected **Setup** and **Sweep**.
- Use **Create new setup** to specify that a new setup specification are defined. This generates a new adaptive mesh for the analysis. Next, click the **New Setup frequency** field to select the new adaptive frequency for mesh generation: “highest” or “middle”.
- Use **Create new sweep** to specify that a new sweep specification are defined using an existing setup. This uses the existing adaptive mesh for the analysis, which saves simulation time. Next, select a **New Sweep range**: select “all frequencies” to simulate the entire range of frequencies selected, or select “missing frequencies” to simulate only the frequencies not listed in the **Used Solutions** area.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click **OK** to close the **Advanced Dynamic Link Options** window. When the **Link Description** has been completed, click **OK** or select another tab.

Parametric Options Tab

The **Options** tab is used to select the behavior of the selected NPort.



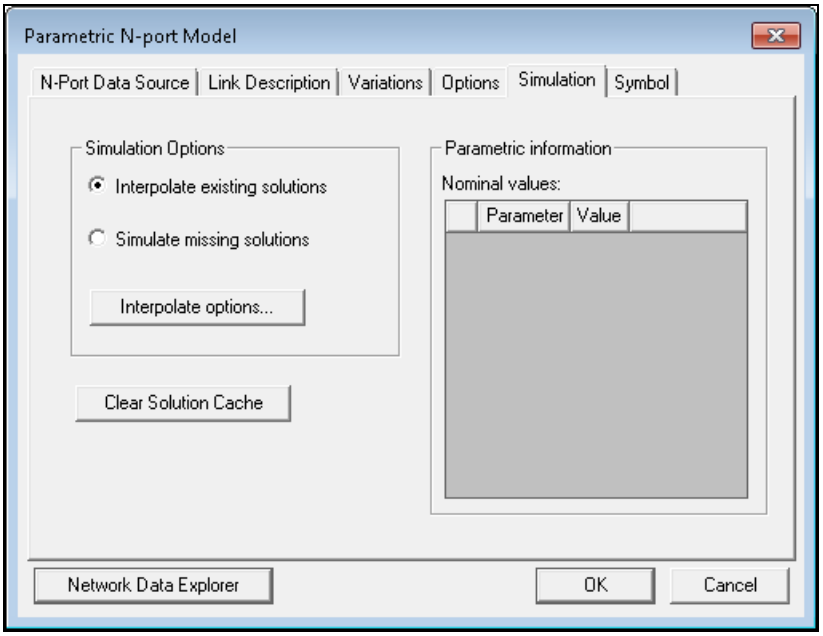
- **Interpolation** — Specifies the interpolation as **Step** or **Linear**
- **Extrapolation** – Specifies the type of extrapolation to use with the NPort
- **DC Behavior** — Specifies the type of DC behavior to use with the NPort
- **Method** – Specifies the method used to convert frequency domain data to the time domain
- **Passivity Enforcement** — Enforces a passivity check which tests whether the S-parameter data is passive or not. Passive devices can only dissipate, or temporarily store energy, but never generate it.
- **Use reciprocal** – Computes the inverse, or reciprocal, at each frequency so the N-port can be used for de-embedding. See Deembedding S-Matrices.

When the N-port behavior **Options** have been entered, click **OK** or select another tab.

Parametric Simulation Tab

From the **Simulation** tab, choose the simulation options of the N-Port.

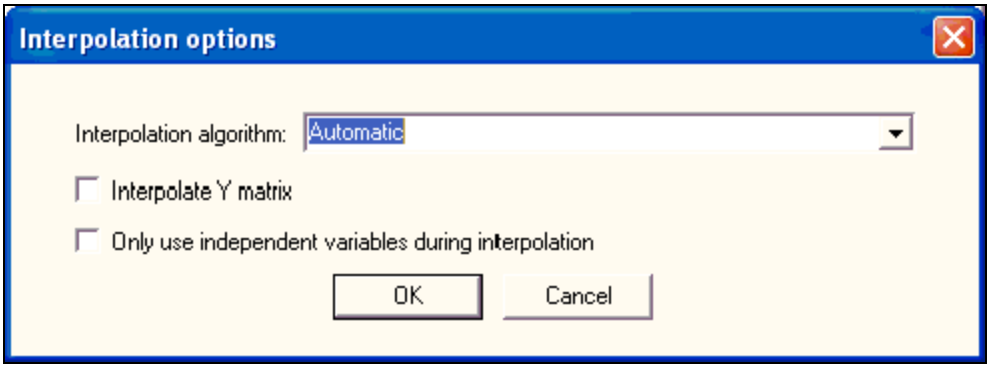
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **Interpolate existing solutions** interpolates existing solution data. When **Interpolate existing solutions** is not selected, the solver simulates or calculates any solution data that is needed.
- **Simulate missing solutions** asks HFSS or Q3D to simulate, if the solution is not available.
- **Clear Solution Cache** when clicked clears the solution cache memory.
- **Show available variations** queries HFSS and reports what parameter values have been simulated in HFSS. This information may help you to decide whether to solve additional variations in HFSS or to use interpolation when doing co-simulation with the Circuit solver and HFSS. Though the HFSS project may possess several variables, it may have run simulations only for certain values of those variables. (Each set of variable values defines a *variation*.)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Click **Interpolation options** to open the following window:



- Click the down arrow in the **Interpolation algorithm** field to select an interpolation algorithm option:

  Automatic – Linear interpolation is used if a full grid of solutions is present; otherwise, Inverse Least Squares with Shadowing and Hyperplanes is used.

  Linear – When a full grid of solutions is available, the cube of solutions which surrounds the solution to be interpolated is located. The corners of this cube are linearly averaged to determine the interpolated solution. If a full grid is not available, an error is reported and the interpolation fails.

  Inverse Least Squares with Shadowing and Hyperplanes – Least squares interpolation with shadowing and hyperplanes.

  Inverse Least Squares with Shadowing, no Hyperplanes – Least squares interpolation with shadowing, but no hyperplanes.

- **Interpolate Y matrix** uses the Y matrix as the basis for interpolation. When **Interpolate Y matrix** is not selected, the S matrix is used as the basis. **Interpolate Y matrix** is selected by default. Circuit particulars determine which basis (S or Y) yields better results, and it is not possible to decide beforehand which one works best.
- **Only use independent variables during interpolation** suppresses the calculation of dependent variable values during interpolation.

After choosing interpolation settings, click **OK** to close the **Interpolation options** window.
When the N-port Simulation options have been entered, click OK or select another tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The main difference between **Linear** interpolation and **Inverse Least Squares with Shadowing** (ILSS) is as follows:

- **Linear** works only with a full grid of solutions — ILSS works with arbitrary data.
- **Linear** considers only nearest data — ILSS considers data that could possibly be distant, although shadowing mitigates this effect.
- **Linear** is not first-order continuous — ILSS is first-order continuous.

Editing Parametric N-Port Symbol Bus Pins

To edit the pins on the symbol for the N-Port component, right-click the component and select **Edit Symbol Bus Pins**.

The procedure is identical for all the flavors of N-ports. See Editing All N-Port Symbol Bus Pins for details.

Touchstone Calibration Wizard

The Ansys Calibration Wizard is used to characterize the effect of a probe or fixture, and removes the effect from a device under test, by reading and writing Touchstone files. There are three methods of calibration: Two-line, Thru-reflect-line, and Short-open-load-thru. Please note that for measured data, it is often desirable to smooth the data before calibrating the fixtures.

Smoothing can be accomplished using the Network Data Explorer.

Two-Line Method

To implement the Two-Line Method, select **Tools > Calibration Wizard** to open the wizard window. Then select “Two-line method” on the **Type** drop-down menu. The “two line” calibration method removes the effect of the probe fixtures from a device under test and assumes the effect of fixture 1 is identical to fixture 2.

Note:

The two line method assumes the probe discontinuity can be represented as a simple shunt element. A larger probe will generate proportionally larger errors in calibration. Tolerance is at user discretion.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> There can be only one propagating mode on the transmission line. If there are multiple propogating modes, then calibration may fail.

The required input is:

1. Two Touchstone files (*.s2p), each of a thru-line of a given length plus the probe fixtures. The lines must be of different lengths.
2. The imported Zo uses Touchstone file (*.s2p) of an ideal line with no fixture effects. This Touchstone file may come from measurement or simulation. If no file is specified, the wizard approximates the Zo.
3. A Touchstone file (*.s2p) of the selected device under test with fixture effects.

The output is:

- A Touchstone file of the fixture.
- A Touchstone file of the device under test with effect of the fixtures removed.
- If "Export Zo" is selected, the frequency dependent Zo of the calibration lines are written to the designated file.

Thru-Reflect-Line Method

To implement the Thru-Reflect-Line method (TRL), select **Tools > Calibration Wizard** to open the wizard window. Then select "Thru-Reflect-Line" on the Type drop-down menu. The “Thru-Reflect-Line” calibration method removes the effect of the probe fixtures from a device under test. Probe 1 and probe 2 are not assumed to identical.

The required input is:

1. Two Touchstone files (*.s2p), each of a thru-line of a given length plus the probe fixtures. The lines must be of different lengths.
2. For each port users can specify either a single-ended (*.s1p) or a combined measurement (*.s2p) file. When a *.s2p file is specified, Port 1 uses the S11 values and Port2 uses the S22 values:
   - For a short or matched measurement, the surplus inductance must be specified.
   - For an open circuit reflection, excess capacitance must be specified.
   - If no value is given, an ideal reflect is assumed.
3. The imported Zo uses Touchstone file (*.s2p) of an ideal line with no fixture effects. This Touchstone file may come from measurement or simulation. If no file is specified, the wizard approximates the Zo.
4. A Touchstone file (*.s2p) of the selected device under test with fixture effects.

The output is:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Touchstone files for the fixtures corresponding to Port1 and Port2.
- A Touchstone file of the device under test with effect of the fixtures removed.
- If "Export Zo" is selected, the frequency dependent Zo of the calibration lines are written to the designated file.

Short-Open-Load-Thru Method

To implement the Short-Open-Load-Thru method (SOLT), select **Tools > Calibration Wizard** to open the wizard window. Then select "Short-Open-Load-Thru" on the Type drop-down menu. The "Short-Open-Load-Thru" calibration method removes the effect of the probe discontinuities from a device under test and does not assume the port 1 and port 2 are equal.

The required input is:

1. One Touchstone file (*.s2p) of a thru-line of any length.
2. Three Touchstone files for each port corresponding to each measurement configuration: shorted, open and loaded. Each file can either be a single-ended (*.s1p) or a combined measurement (*.s2p) file. When a *.s2p file is specified, Port 1 uses the S11 values and Port2 uses the S22 values:
- For a short or matched measurement, the surplus inductance needs to be specified.
- For an open circuit reflection, the excess capacitance needs to be specified.
- If no value is given, an ideal reflect is assumed.
3. A Touchstone file (*.s2p) of the selected device under test with fixture effects.

The output is:

- Touchstone files for the fixtures corresponding to Port1 and Port2.
- A Touchstone file of the device under test with effect of the fixtures removed.
- If "Export Zo" is selected, the frequency dependent Zo of the calibration lines are written to the designated file.

Paths for File Selection

For most models, the **File Open** window is the initial screen. This topic provides details of file pathnames common to all model imports.

The **PersonalLib** (personal library) folder is located at **<Project Directory>/PersonalLib** ; the **userlib** (user library) folder is located at **<Installation Directory>/userlib** ; and the **syslib** (system library) folder is located at **<Installation Directory>/syslib**, where **<Project Directory>** is the location you specified for the Ansys Electronics Desktop (AEDT)™ electronics systems design platform projects, and **<Installation Directory>** is the directory into which AEDT was installed during setup.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

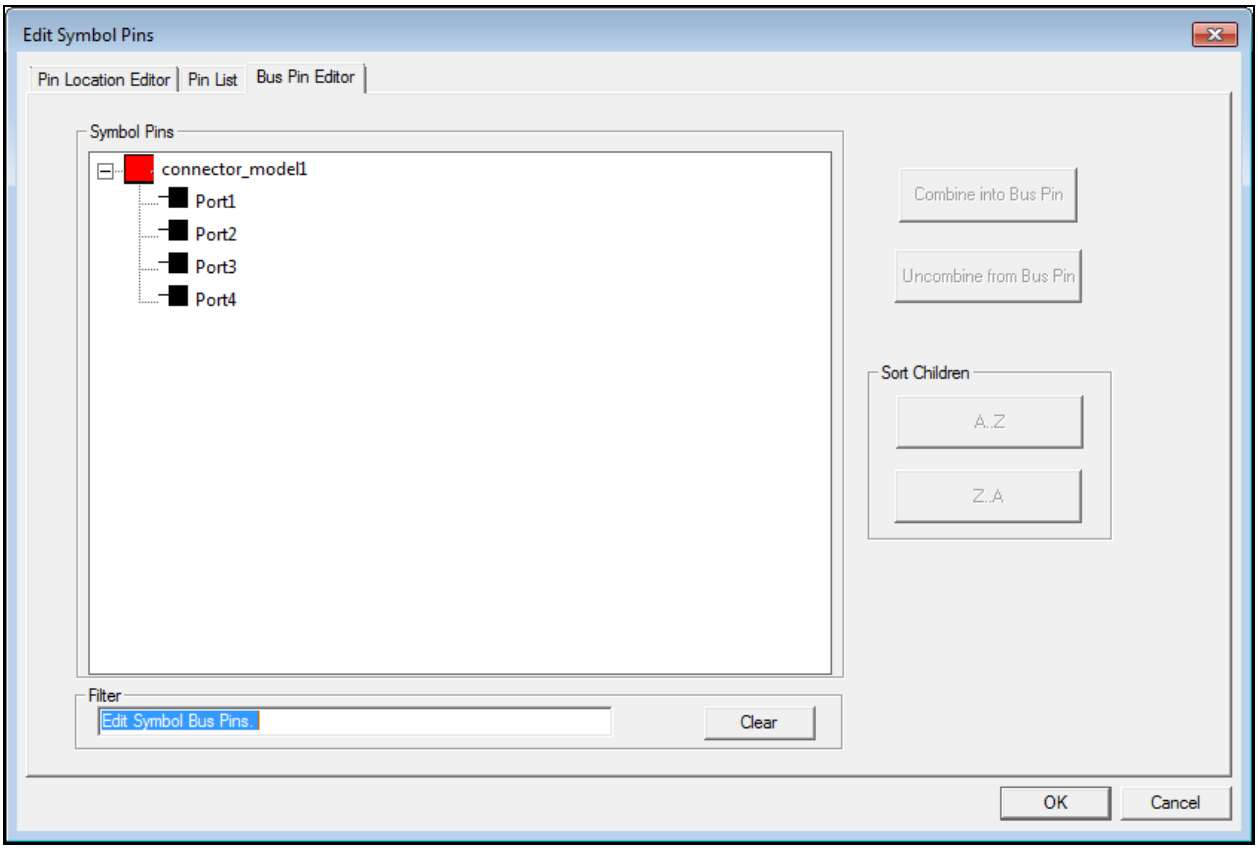
If you select **Use path**, type the name of the file in the **File Name** area, or click the **Look in** field to navigate to the file and record its name. Note that components or libraries imported with Use Path may not be portable when the project is moved to another machine.

When **In project folder** is selected, references to the file in the design are relative to the directory where the project resides. In this case, the path is saved in the project **.aedt** file as a variable (e.g., .lib '$PROJECTDIR/x_113854.lib').

The variable $PROJECTDIR are expanded to the current location of the project when the design is converted to a netlist and run by an analysis tool. Otherwise, an absolute path is saved. If you move a project and its library files together to a new directory, you can preserve the file references by selecting the **Project Folder** option.

Editing All N-Port Symbol Bus Pins

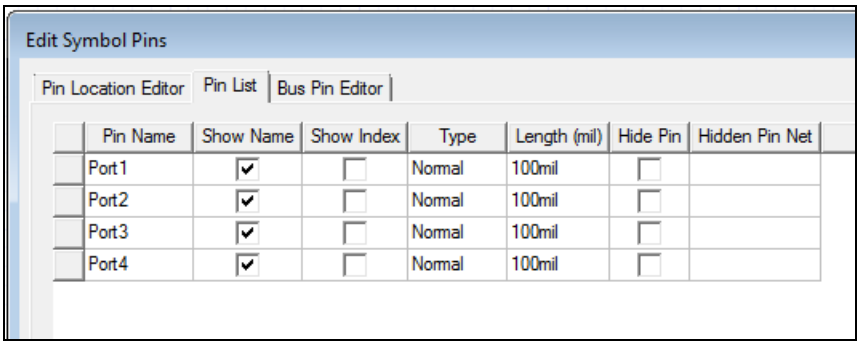
To edit the pins on the symbol for an N-Port, State-Space N-port, or Parametric N-Port component, right-click the component and select **Edit Symbol Bus Pins**. The **Edit Symbol Pins** window opens:



The **N-port data** window reads the file you specify for port information and updates the **Bus Pin Editor** tab display with port names.

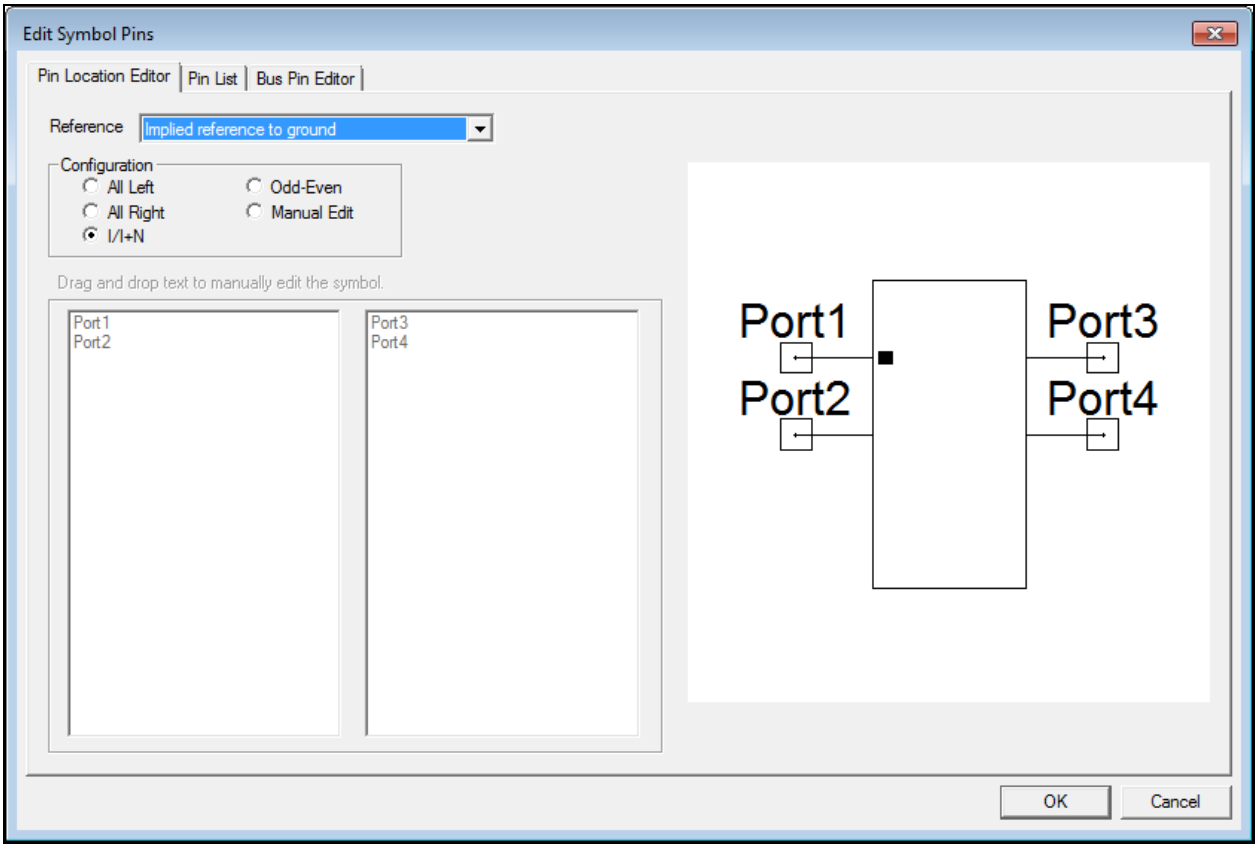
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Click Pin List tab:



You can control the display of the pin information (name, index, hidden) with the check boxes.

Click **Pin Location Editor** tab:



You can use the following controls to position pins on the symbol:

- **Reference:** This drop-down menu allows you to select on the following reference node options:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

— Implied reference to ground

— Show common reference port

— Add individual hidden reference pin per port

— Add individual reference pin per port

> **Note:**
>
> (See “Reference Nodes on S-Parameter Elements” in the S-parameter Technical Notes topic for details on how the Circuit solver handles reference node configurations.

- **Configuration:** The pin direction option may be set to one of the following:

  — All Left

  — All Right

  — I/I+N

  — Odd-Even

  — Manual Edit

  If you select Manual Edit, use the windows at lower left to **Drag and drop text to manually edit the symbol**.

Click **OK**.

Verilog Library Support

A Spectre® netlist can contain include-file references to Verilog® model files. Nexxim can access the definitions of any models that are instantiated in the Spectre netlist. Also create schematic components that instantiate Verilog library models.

The Nexxim implementation includes a built-in Verilog compiler. Compiled mode simulation is supported. Each VerilogA cell is compiled into a C++ file and linked into a DLL. This DLL is loaded during simulation. The precompiled cells are used for each subsequent simulation until a recompilation occurs. A cell is recompiled when a it is modified or when different parameter values are passed to it. You can force a recompile with the option **ahdl.compiled_mode.use_precompiled_cells=0**.

Nexxim also performs encryption and auto-decryption of model files.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The current release of the Ansys Electronics Desktop (AEDT)™ electronics systems design platform supports only the compiled mode of simulation for Verilog models. Interpretive mode simulation is not currently supported.

Verilog is not supported on Ubuntu Linux

Create a Verilog Symbol

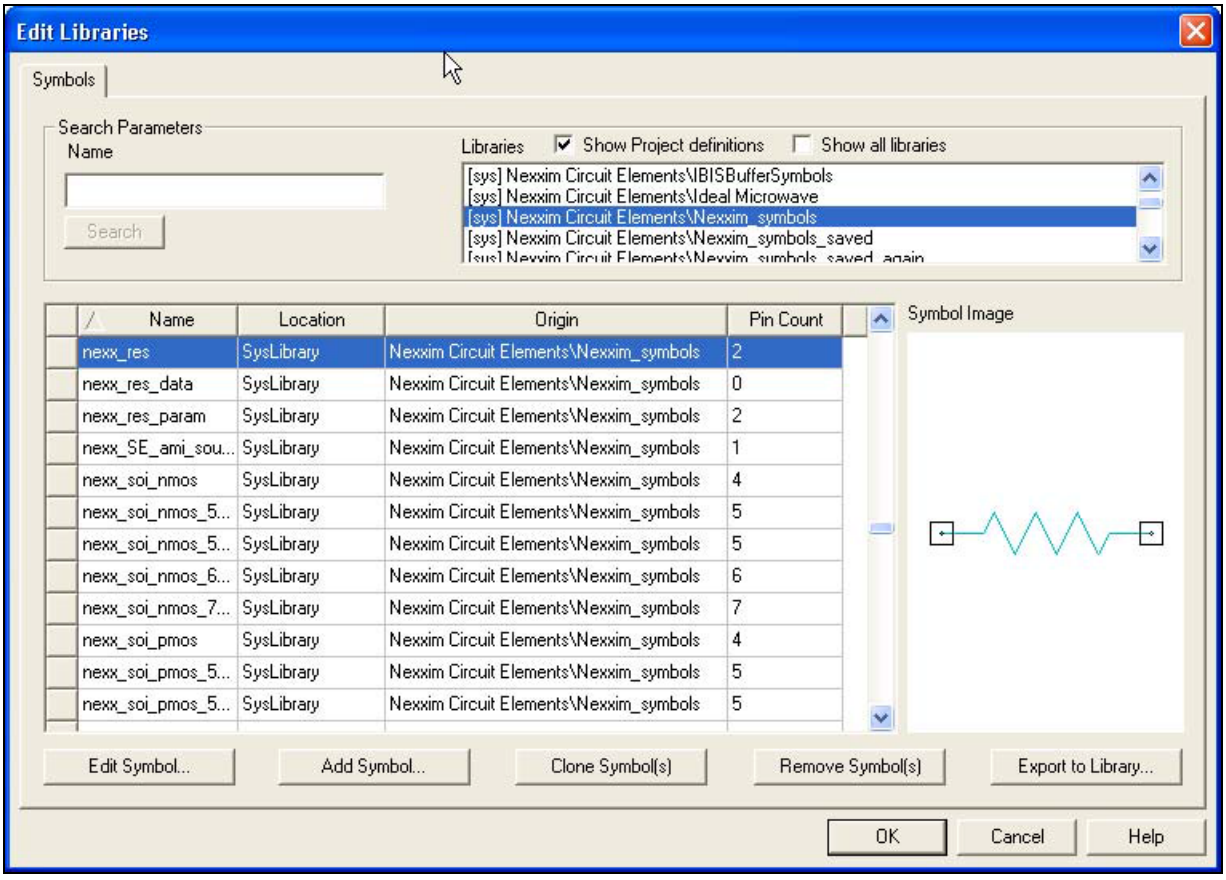
The first step is to create a schematic symbol to represent the Verilog component. A symbol consists of a graphic design with pins for the electrical nodes that connect the component to the circuit. In this example the Verilog symbol is a copy or “clone” of a Nexxim resistor symbol.

(See Using the Symbol Editor in the Component Libraries topic for additional details on creating a new symbol.)

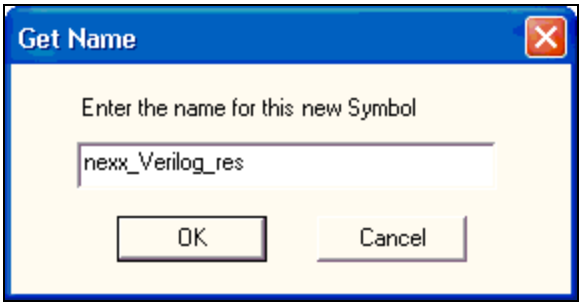
1. Start the Ansys Electronics Desktop (AEDT)™ electronics systems design platform. Insert a new **Circuit** design. Select **None** in the Choose Layout Technology window.
2. From the menu, select **Tools**>**Edit Libraries**>**Symbols**. The **Edit Libraries** window opens with the **Symbols** tab. Ensure both the **Show Project definitions** is checked (on)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

and the **Show all libraries** boxes are not checked.



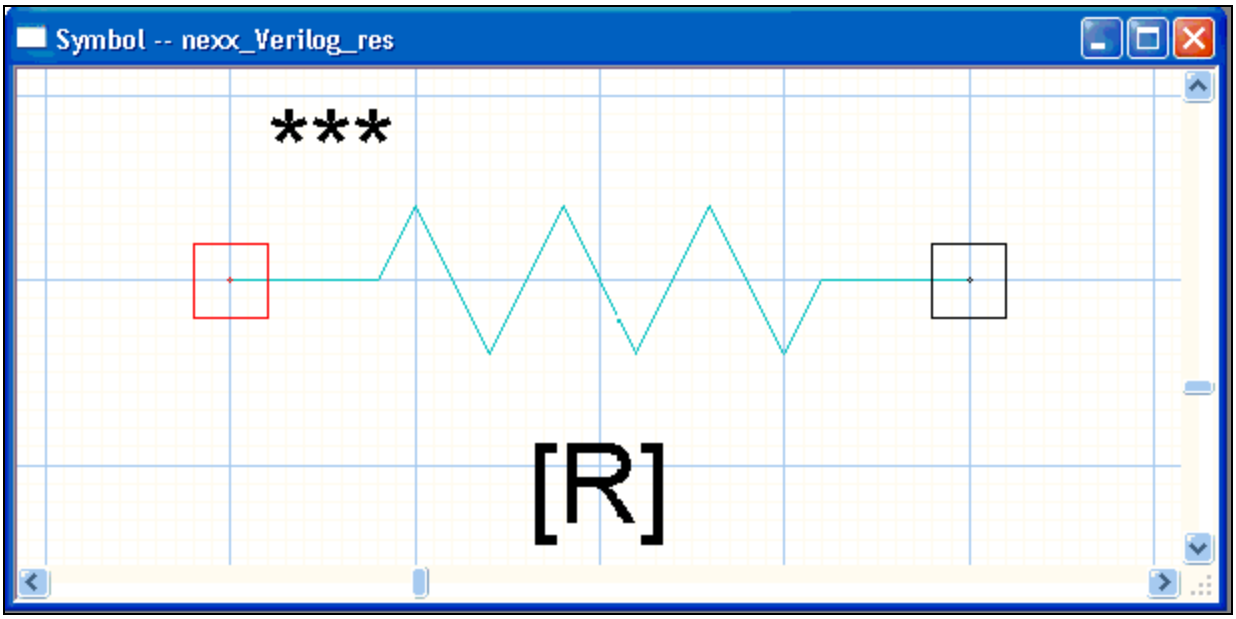
3. Scroll to the symbol library file containing the symbol to clone. In our example, the file is **Nexxim Circuit Elements/Nexxim_Symbols**. Scroll to the symbol, **nexx_res** in our example. Click on that symbol to select it, and click **Clone Symbol** to open the **Get Name** window. Enter the name for the Verilog symbol, in this example **nexx_Verilog_res**.



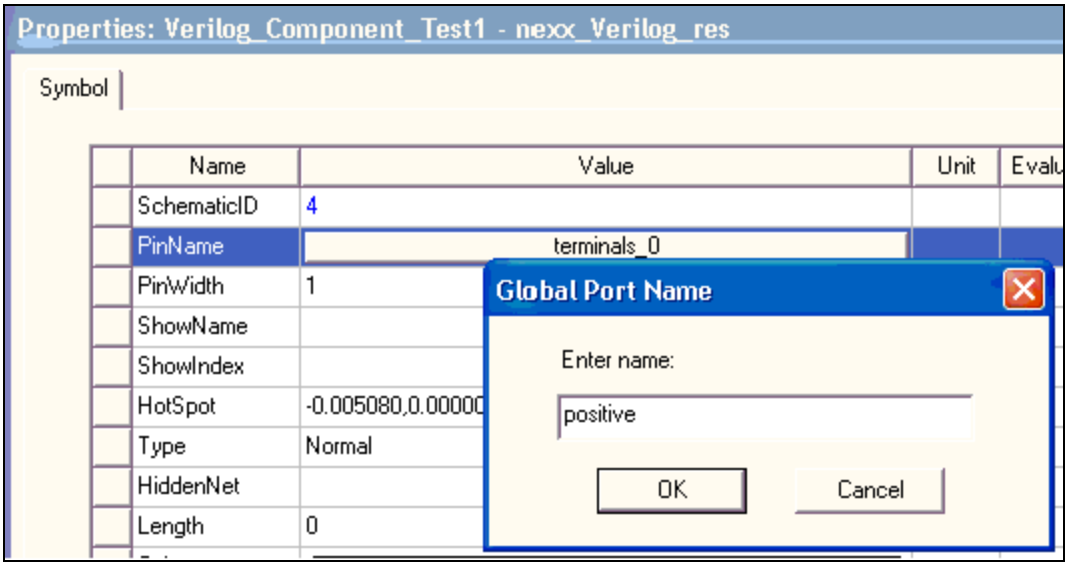
5. Click **OK** to close the **Get Name** window. The new symbol appears in the Edit Libraries window listing as a Project symbol.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Click new symbol and click **Edit Symbol** to open the **Symbol Editor** window with the resistor symbol displayed.
7. Click left terminal so the properties of the terminal appear in the **Properties** window.



8. Click **Value** for the **PinName** property to open the **Global Port Name** window. Rename the terminal to match the node name in the Verilog model. In this example, the terminal has been renamed to **positive**.



9. Select the other terminal and rename it. In our example the new name is **negative**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

10. From the menu, select **Symbol>Update Project**. Close the **Symbol Editor** window.
11. From the menu, select **Tools>Edit Libraries>Symbols**. The **Edit Libraries** window opens with the Symbols tab. Ensure the **Show Project definitions** is checked (on) and the **Show all libraries** boxes are unchecked (off).
12. Scroll to the symbol you just created, in our example, **nexx_Verilog_res** in the Project. Select the symbol and click **Export Symbol** to open the Export to user library window.
13. AEDT saves user-defined objects in a **PersonalLib** directory that is specified at install time. To change the location of the **PersonalLib** directory, select **Tools>Options>General Options**.
14. Click the **Create New Folder** icon at the upper-right of the window to create a new folder named **Verilog**. Click new directory to open it, then save the symbol in a new library file named **Verilog_Symbols.aslb**. AEDT prompts you to verify the creation of the new library file.

Now the symbol has been created, the next step is to create a component.

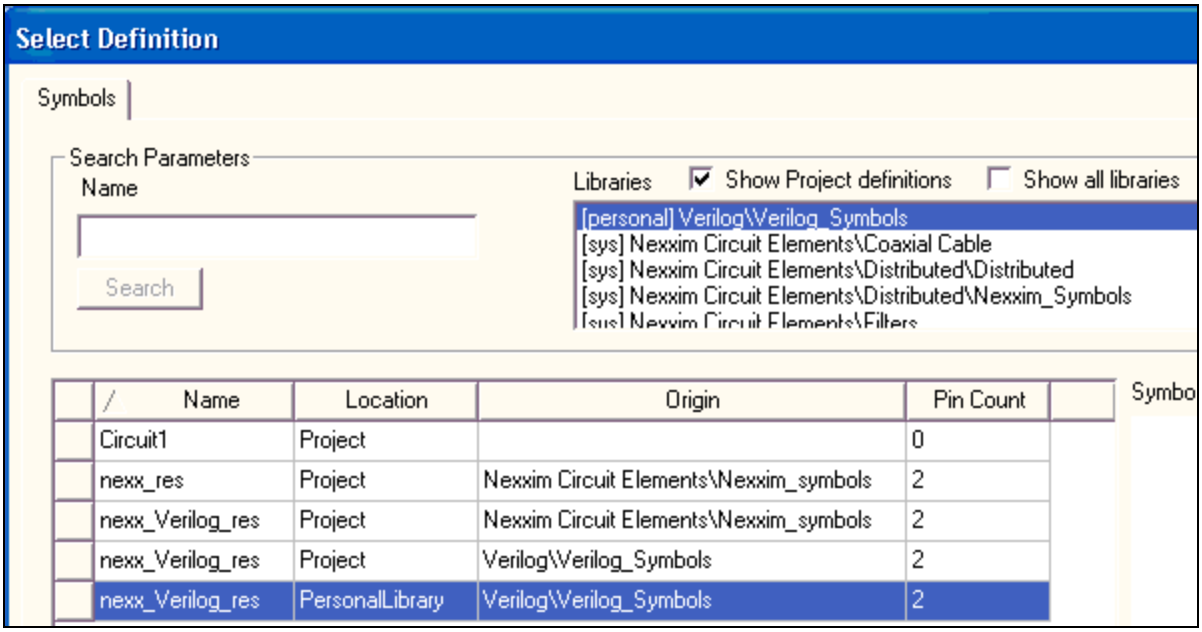
Create a Verilog Component

The component definition provides all the information needed to instantiate the component in the schematic and generate a correct netlist for Nexxim to simulate. In this example the component is copied (“cloned”) from a standard Nexxim resistor.

See Using the Component Editor in the Component Libraries topic for details on creating a new component.

1. From the menu, select **Tools**>**Edit Libraries**>**Components**. The **Edit Libraries** window opens on the **Components** tab. Ensure the **Show Project definitions** is checked (on) and the **Show all libraries** box is unchecked (off).
2. The **Libraries** area at the upper right lists all the categories of Nexxim components. Scroll to the **Nexxim Circuit Elements\Resistors** category, and click on that category. The window reopens to show the Nexxim resistor components. Click on the **RES_** component to select it, and click **Clone Component** to open the **Edit Component** window. Enter the name **RES_Verilog**.
4. From the **Edit Component** window, click the **Symbol [...]** button to open the **Select Definition** window. Ensure the **Show Project definitions** is checked (on) and the **Show all libraries** box is unchecked (off). Select **[personal]Verilog/Verilog_Symbols** on the libraries listing. From the **Personal Library**, select **nexx_Verilog_res**. Then click **OK** to close the **Select Definition** window.

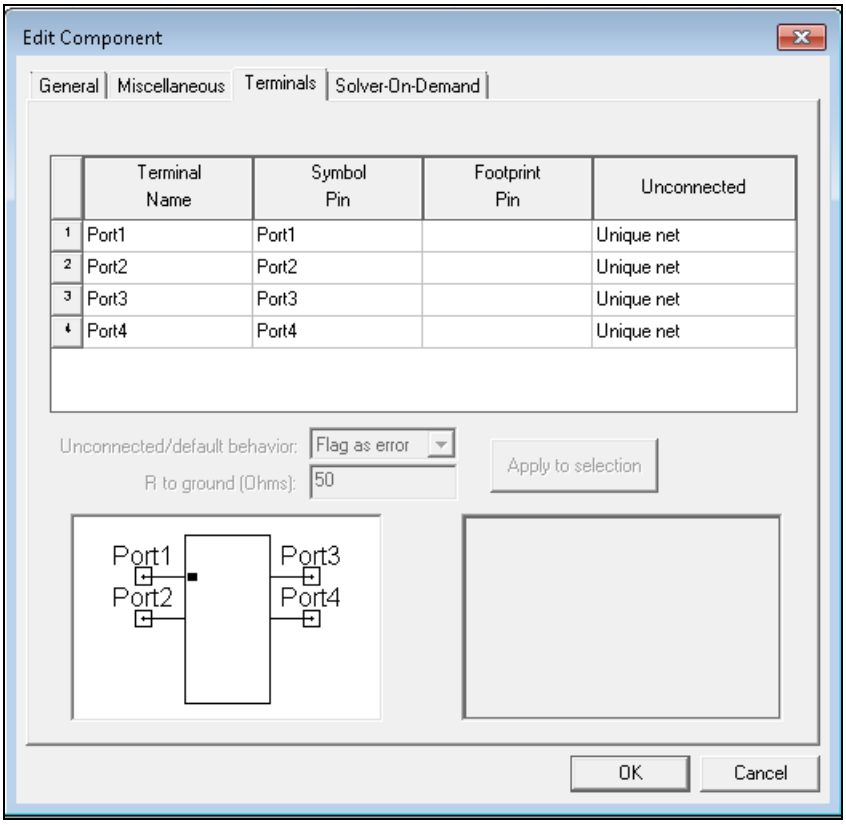
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. Select the **Miscellaneous** tab on the **Edit Component** window, and change the **Description** to **Resistor, Verilog**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Select the **Terminals** tab and verify the terminal names have been read on the symbol.



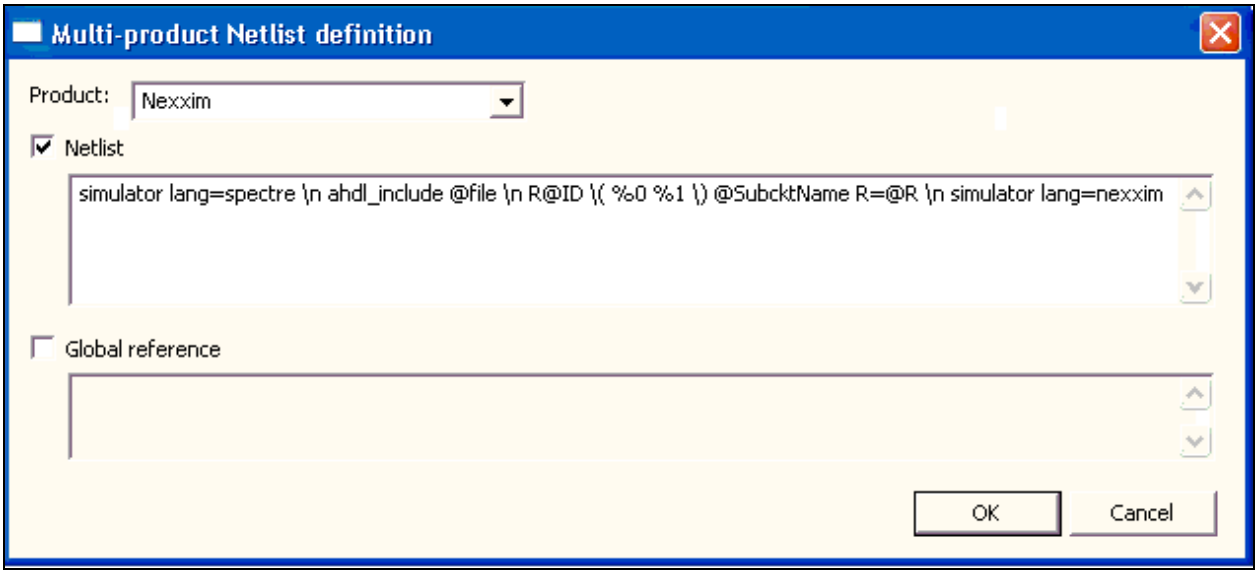
7. Select the **General** tab, and click **Properties** to open the **Edit Properties** window.
8. Select and Remove any properties that should not be used in the Verilog component. In the resistor example, **ADDNOISE** and **DTEMP** are the properties selected for deletion.
9. The component requires a **file** property to link to the Verilog model. Click **Add** to open the **Add Property** window. Enter **file** as the **Name**, click **FileName** for the property type, and enter **required** as the value. When the component is instantiated in the schematic, users set the **file** property by selecting the Verilog library file from a **Select File** window.
10. The component requires a unique name. Click **Add** again. Enter **SubcktName** as the **Name**, click **Text**, and enter **required** as the value. When the component is instantiated, users set the **SubcktName** property to a unique name.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

In general, the name given for the **SubcktName** property must be the same as the module name specified in the Verilog code, or the compilation process fails. If the **SubcktName** is specified as “resistor,” as in this example, the simulation runs successfully irrespective of the name of the Verilog-A module defined in the .va file. The statement “resistor” calls the default resistor model available in Spectre.

11. Add any additional parameters required as input variables in the Verilog model you are accessing. The resistor model in our example uses only variable **R** for the resistance. This property is already in the Nexxim resistor component. When the component is instantiated in the schematic, users set these parameters to the selected values. The instance values are passed to the Verilog model during simulation of the circuit.
12. Click **CosimDefinition** property **Edit** button (or click **Solver-on-Demand** tab of the **Edit Component** window, then click **Edit** for the **Default Netlist** entry). Edit the netlist string to the following:



The **Multi-product Netlist definition** specifies the format for the netlist entry that are generated by instances of the Verilog component. In this string:

- **simulator lang=spectre** turns on the Spectre interpretation of the entries. The equals sign may look like a hyphen.
- **[...]** entries are newlines.
- **@file** is the user-supplied name of the Verilog library file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **R@ID** is the reference designator, the letter **R** followed by a unique number (e.g., R23).
- **\(** and **\)** are literal left and right parentheses.
- **%0** and **%1** are filled in with the names of the circuit nodes attached to the resistor terminals. If your component has more than two terminals, add **%2**, **%3**, etc.)

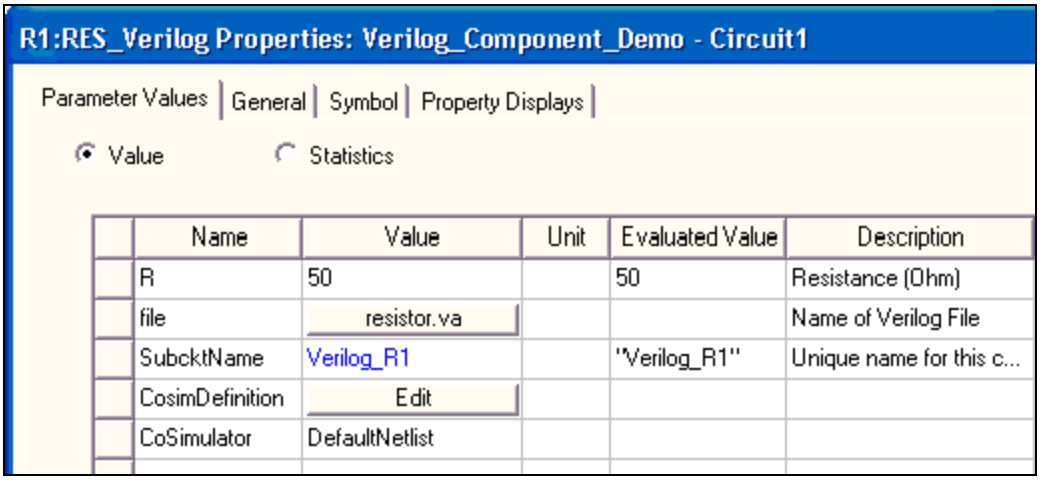
> **Note:**
>
> The spaces around the %0 and %1 separating them on the parentheses are REQUIRED.

- **@SubcktName** is the user-supplied name of the Verilog subcircuit.
- **R=@R** netlists the resistance value, the characters **R=** followed by the value of the **R** property (**@***property* puts the value of *property* in the netlist). Any other properties in the model should be added to the netlist string using this format.
- **simulator lang=nexxim** turns on the Nexxim interpretation of the resulting netlist. The equals sign may look like a hyphen.

13. Click **OK** to close the **Multi-product Netlist definition** window. Click **OK** to close the **Properties** window. Click **OK** to close the **Edit Component** window.
14. Select the new component in the **Edit Libraries** window and click **Export to Library**. Open the **Verilog** directory under **PersonalLib**, and save the resistor component in a new library file, **Verilog_Resistors.aclb**. The Ansys Electronics Desktop (AEDT)™ electronics systems design platform prompts you to confirm the creation of the new file.
15. This completes the process for creating the Verilog component.
16. View the **Component Libraries** window, and click the **Symbols** tab. Click **Proj** to display the Project components. The new component appears in the window.
17. To create an instance of the component, double-click the **RES_Verilog** entry, drag the cursor into the design area, and select **Place and Finish** on the menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

18. Select the resistor and open the **Properties** window:



19. Set the **R**, **file**, and **SubcktName** properties. Click **OK** to close the Properties window.
20. Here is a listing of file **resistor.va**:

```
// Simple resistor
`include "disciplines.vams"
module Verilog_R1(p,n);
input p,n ;
parameter real R=1.0 from (0:inf);
electrical p,n;
real ir ;
analog begin
ir = V(p,n)/R;
I(p,n) <+ ir ;
end
endmodule
```

21. Connect the component and simulate.

Supported Verilog Features

The following features of Verilog-A are supported in Nexxim (not supported on Ubuntu Linux).

1. Operators: all except replication operator '{{}}'
2. All built-in mathematical functions
    a. Basic functions—pow, sqrt, etc.
    b. Trigonometric functions
    c. Hyperbolic and inverse hyperbolic functions

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Natures: ‘voltage’
4. Disciplines: ‘voltage’, ‘electrical’
5. Current/Voltage access functions
6. Analog nodes and branches
7. Parameters
    a. ‘real’ and ‘integer’
    b. Scalar parameters
    c. Vector parameters with constant array initializations
    d. Value range specification —‘from’ and ‘exclude’, use of ‘inf’
8. Variables
    a. ‘real’ and ‘integer’
    b. scalar and vector
9. Genvars
10. Vectors
    a. Ports declared as vectors
    b. Vector variables
    c. Vector nodes
    d. Vector branches
    e. Bit-selects of vector variable/node/branch/parameter

- Index of the bit is a loop or generated index-variable
- Index of the bit is a parameter

11. Analog contributions, to assign currents or voltages
    a. A branch with a voltage contribution in one evaluation and a current contribution in another.
12. Analog sequential blocks containing analog statements
13. Behavioral statements
    a. Procedural assignment
    b. Control statements (‘if-else’, ‘case’)
14. Instantiations
    a. VerilogA instantiations
    b. Spectre device instantiations
15. User-defined functions
16. Analog operators
    a. Time derivative (‘ddt’)
    b. Derivative operator (‘ddx’)
    c. ‘transition’ operator
    d. ‘last_crossing’ function

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

e. Laplace filters (laplace_zp, laplace_nd)
f. Limited exponentiation (‘limexp’)
g. Absolute delay operator (‘absdelay’)
h. Slew filter (‘slew’)

17. Analog events
    a. Global events

- ‘initial_step’, ‘final_step’
- ‘timer’, ‘cross’

18. Noise analysis
    a. white noise
    b. flicker noise
19. Analysis-dependent functionality using ‘analysis’ function
    a. AC stimulus (‘ac_stim’)
20. Compiler directives
    a. 'include directive
    b. 'define directive to define constants
21. System functions
    a. $temperature
    b. $vt
    c. $abstime
    d. $realtime
    e. Table based interpolation and lookup function—$table_model (interpolation data either in data file or in VerilogA file).
22. System tasks
    a. Simulation control ($finish, $stop)
    b. Analog kernel control ($bound, $step, $discontinuity)
    c. Display tasks ($display, $write, $strobe, $monitor, $debug)
    d. $table_model

Supported keywords, functions, and system tasks

$abstime	asinh	if
$bound_step	atan	inf
$debug	atan2	initial_step
$discontinuity	atanh	inout
$display	begin	input
$finish	branch	integer

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$function	case	laplace_nd
$monitor	ceil	laplace_zp
$realtime	cos	last_ crossing
$stop	cosh	limexp
$strobe	cross	ln
$table_model	ddt	log
$temperature	ddx	max
$vt	default	min
$write	else	module
‘define	end	or
‘else	endcase	output
‘elseif	endfunction	parameter
‘endif	endmodule	pow
‘ifdef	exclude	real
‘ifndef	exp	sin
‘include	final_step	sinh
‘undef	flicker_ noise	slew
abs	floor	sqrt
absdelay		tan
ac_stim	from	tanh
acos	function	timer
acosh	genvar	transition
analog	hypot	white_ noise
analysis	generate	
asin	ground	

Keywords supported with workarounds

Parsing for these keywords is skipped.

abstol	discrete	nature
access	domain	idt_ nature
continuous	enddiscipline	potential
ddt_nature	endnature	units
discipline	flow	

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Spectre Compatibility

Nexxim VerilogA is compatible with Spectre.

The directive **ahdl_include** for specifying the hdl file is supported.

HSPICE Compatibility

Nexxim VerilogA is compatible with HSPICE.

The directive **ahdl_include** for specifying the hdl file is supported.

The option **hdlpath** for specifying the location of the hdl files is supported.

The environment variable **HSP_HDL_PATH** for specifying the location of the hdl files is supported.

Hdl files can be specified with or without the extension.

Parameter names to Verilog instances are case-insensitive.

NOTE: For, while, and repeat loops are NOT supported.

CPM Model Support

The **Pin Connectivity** window allows you to automatically connect CPM (Chip Power Model) components to existing components. Follow these steps to use this feature.

1. Load or generate a model containing a component with pins that can be connected to a CPM component.For fastest pin-matching, ensure the model component's pins possess names that correspond to the pins specified by the CPM component. If the pin names do not match, the Automated CPM Chip Connection attempts to match pins geometrically. When these models are created, they behave like SPICE models and have regular symbols in the schematic, but the corresponding footprints in the layout show the positions of the pins specified in the CPP (Chip Package Placement) header.
2. To place a CPM component, open the **Component Libraries** window, click the **Symbols** area, and click **Import Models**.
3. From the area, select the **CPM** icon to open the **Import Components** window. After that, follow the procedure for importing Spice components (See SPICE Library Support).

Once the component has been placed in the schematic, its Property Window will show a checkbox property named **NetlistAsSubcircuit**. Enabling the checkbox affects only what is written to the netlist for simulation. When the checkbox is enabled, the Spice model component will be netlisted inside its own subcircuit along with its file reference. This means the model name (taken from the Spice file) cannot conflict with the same model name in a different Spice file netlisted for a different component. If two Spice files with identical model names are read into the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

global scope, only data from one of the spice files will be used for all components referencing that model name, causing a simulation error. Checking the ”NetlistAsSubcircuit” property will move the file out of the global scope and prevent this problem.

Automated CPM Chip Connection And Placement

CPM (Chip Package Model) components can be created by importing special SPICE files that contain additional information that is encoded using the CPP (Chip Package Protocol).

- The CPP is a set of statements specifying the location, the net information, and the SPICE node name for each package pin (the landing pad of flip-chip bumps or the chip landing pad of bonding-wires).
- The CPP is embedded within a SPICE compatible file header as comments.

When these models are created, they behave like SPICE models and have regular symbols in the schematic, but the corresponding footprints in the layout show the positions of the pins specified in the CPP header.

To place a CPM component, open the **Component Libraries** window, click the **Symbols** area, and click **Import Models**. From the area, select the **CPM** icon to open the **Import Components** window. After that, follow the procedure for importing Spice components (See SPICE Library Support).

Exporting Network Design Data

Several tools generate frequency-dependent network design data as the result of the analysis. The results can be saved (exported) to files for use by other tools.

Exporting LNA Network Data

You can export the frequency-dependent network data that results from a linear network analysis to a Touchstone™ file for use by other analyses. Results can be exported from a design created with either the **Schematic Editor** or the Netlist Editor.

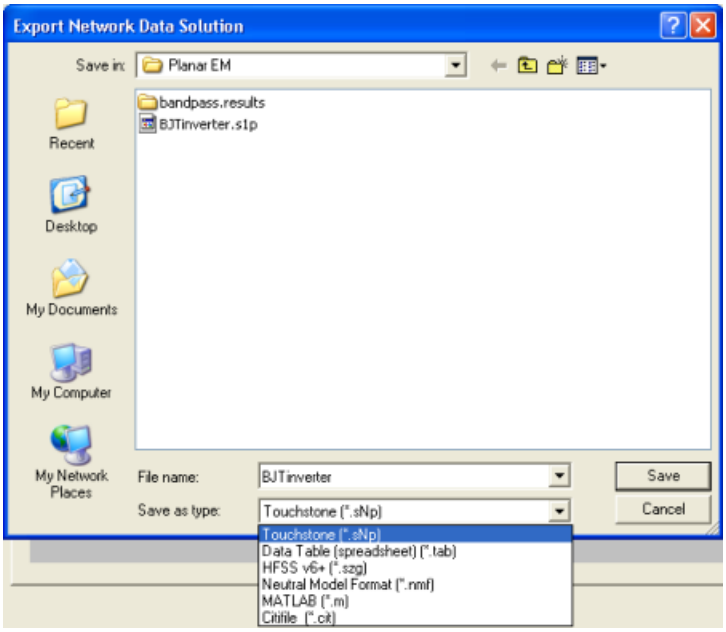
1. Define and run the Linear Network Analysis.
2. In a schematic design, expand the icon for the design. Expand the **Analysis** entry, right-click the LNA solution setup and select **Export Solution**.

   In a netlist design, right-click the icon for the netlist design and select **Export Solution** to open the **Solutions** window.
3. From a schematic, ensure the selected setup name and simulation name are shown in the listings in the **Simulation** fields. (With a netlist design, these fields are read-only.)
4. Select the type of data to save (S, Y, Z, Zo, or Gamma). The choices depend on the results that are available.
5. Select the frequencies for which data can be saved:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To save the data for all frequencies, check **Display All Freqs**.
- To save the data for selected frequencies, leave **Display All Freqs** unchecked and make a selection on the frequencies drop-down menu.

6. Optionally, select **Check Passivity**. EM Design reports any passivity violations in the matrix data. Optionally, set the **Passivity Tolerance** (default 0.0001 or .01%). (See the S-Parameter Technical Notes for details.
7. Select the results and frequencies to be exported, then click **Export**. The **Export Network Data Solution** window opens:



Select a directory for the export in the **Save in:** field. Select a file name for the exported data in the **File name:** field. Select a file type on the **Save as type:** list, , then click **Save**.

Options for file format are:

- Data Table (spreadsheet) (**.txt** file extension)
- Touchstone (**.sNp** file extension)
- Neutral Model Format (NMF) (**.nmf** file extension)
- MATLAB (**.m** file extension)
- CITIfile (**.cit** file extension)

8. The **Specify Export Reference Impedance** window opens to specify the reference impedance for the Touchstone data:

- Select **Override Solution Renormalization** (the default) and set the impedance as selected (50 Ohms is the default). The Touchstone file data are renormalized to the port impedance you specify, if the impedance is not the same as that used for the original

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

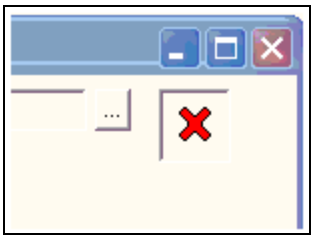
analysis. Selecting **Do Not Override Solution Renormalization** inactivates the Impedance field.

- Choose to Export Noise Data with Touchstone files in the Ansys Electronics Desktop (AEDT)™ electronics systems design platform.
- Choose to include Gamma and impedance comments in the Touchstone file (the default), or to omit them. Omitting the comments can make the Touchstone file much smaller.
- When the impedance information is complete, click **OK**.

9. Click **Close** on the **Solutions** window, or leave the window open to make multiple exports, as described next.

Making Multiple Exports

If you want to export several solutions representing variations on the design, leave the **Solutions** window open. Make the selected changes to the circuit. The box at the upper-right of the **Solutions** window displays a red X to show the solution is invalid:

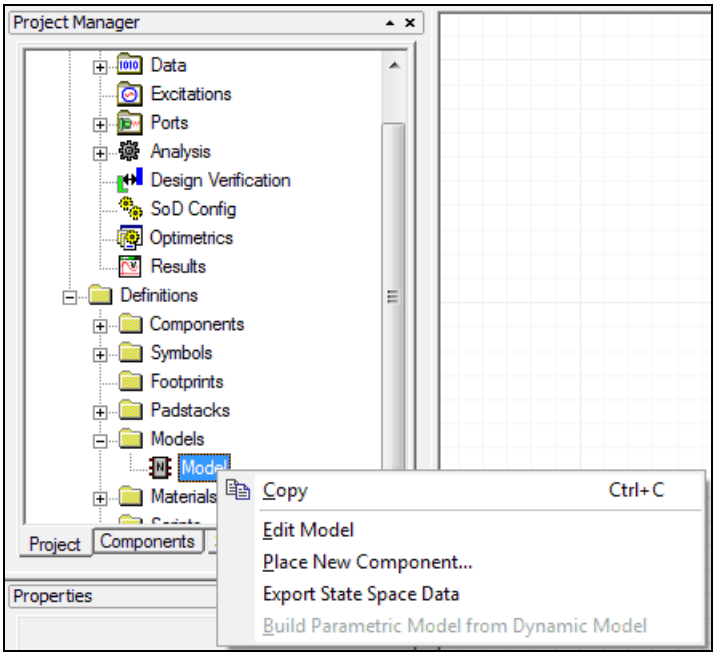


Now, rerun the analysis. The red X disappears to show that a valid solution is available for export. Save the new result as described earlier.

Exporting Network Data to a State Space File

You can export data to a State Space File (*.sss) by right-clicking and selecting **Export State Space Data** under the Definitions/Models folder in the **Project Manager** window. The **Export State Space Data** menu item is enabled only if the model has state-space data available. State space data is available when an SSS file is selected as the data source or when the model has an underlying SSS file associated with it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Choosing **Export State Space Data** opens a **Save File As** window. When you provide a file name and location, the .sss file is generated and updated with the port names in the model.

Importing and Exporting Netlist Data

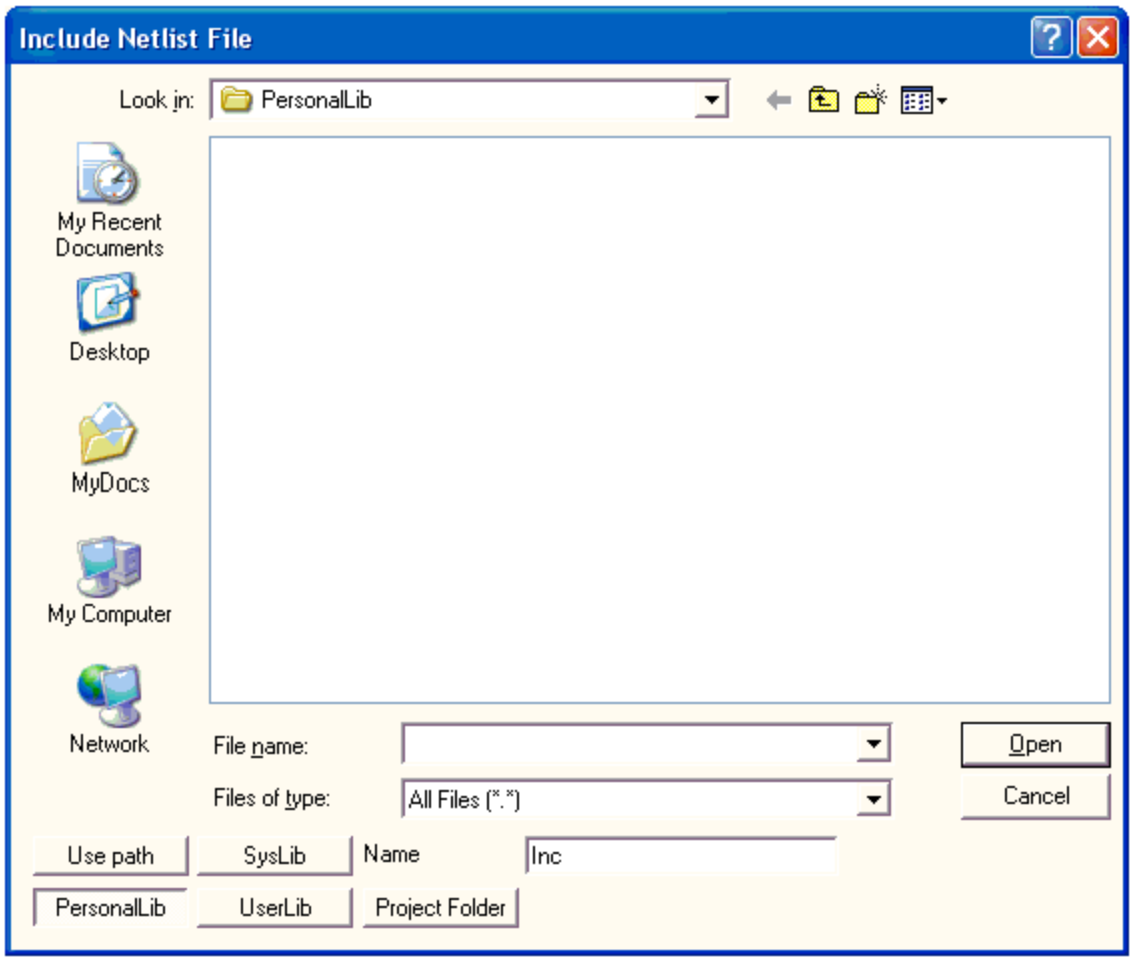
A Circuit schematic project can import netlist design information from netlist files, include files, and library files. A netlist representing a Circuit schematic or netlist project can be exported for future use.

This feature is deprecated but can be used to edit components with netlist models in legacy projects. Netlist models are renamed to Circuit models.

Accessing Netlist Files

A netlist file contains one or more netlist statements. To add a netlist file to a schematic, expand the icon for the design in the **Schematic Editor** by clicking on the plus sign (+) button (the design typically has a name such as “Circuit1”). Right-click the **Data** icon and select **Add Netlist File**. The **Include Netlist File** window opens:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Select one of the standard folders if applicable, select the file, then click **OK**.

> **Note:**
>
> The **syslib** directory is reserved for libraries supplied with the Ansys Electronics Desktop (AEDT)™ electronics systems design platform

If the netlist file is not in one of the standard folders, select **Use path**, enter the complete path and file name. Use the **Look in** field to browse for the directory. When the path and file name are correct, click **OK**. (Note that components or libraries that are imported with **Use Path** may not be portable if the project is moved to another machine.)

When **In project folder** is selected, references to the file in the design are relative to the directory where the project resides. In this case, the path is saved in the project **.adsn** file as a variable such as:

```
.lib '$PROJECTDIR/x_113854.lib'
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The variable $PROJECTDIR are expanded to the current location of the project when the design is converted to a netlist and run by an analysis tool. Otherwise, an absolute path is saved. If a project and its library files are moved to a new directory, preserve their file references by selecting the **Project Folder** option.

Include Files in Circuit Netlists

The **.INCLUDE** statement identifies a file to insert in its entirety into the netlist at the point of the **.INCLUDE** statement:

```
.INCLUDE file_reference
```

Include file pathnames, and all pathnames used in the Desktop, must refer to subdirectories using a syntax that is compatible with the platform operating system. Some operating systems use a forward slash (/) as a path separator, while others use a backslash (\). The following example uses a backslash, which is the valid separator used in Windows™ systems. The Desktop ensures the consistent and compatible use of slash designators in netlist file paths for each of the following platforms: Windows and Linux™. For more information see File References.

For example:

```
.INCLUDE 'diode_model_statements'
.INCLUDE 'models\diode_models'
.INCLUDE 'C:\simulator\model_statements\diode_model_statements'
```

The complete contents of the include file are added to the calling netlist. The included file can contain further **.INCLUDE** files to be processed.

> **Note:**
>
> None of the included files can refer to any other file in the sequence of included files. A loop of included files causes an unrecoverable error condition. However, Nexxim cannot detect this error in advance, so no warning message is given.

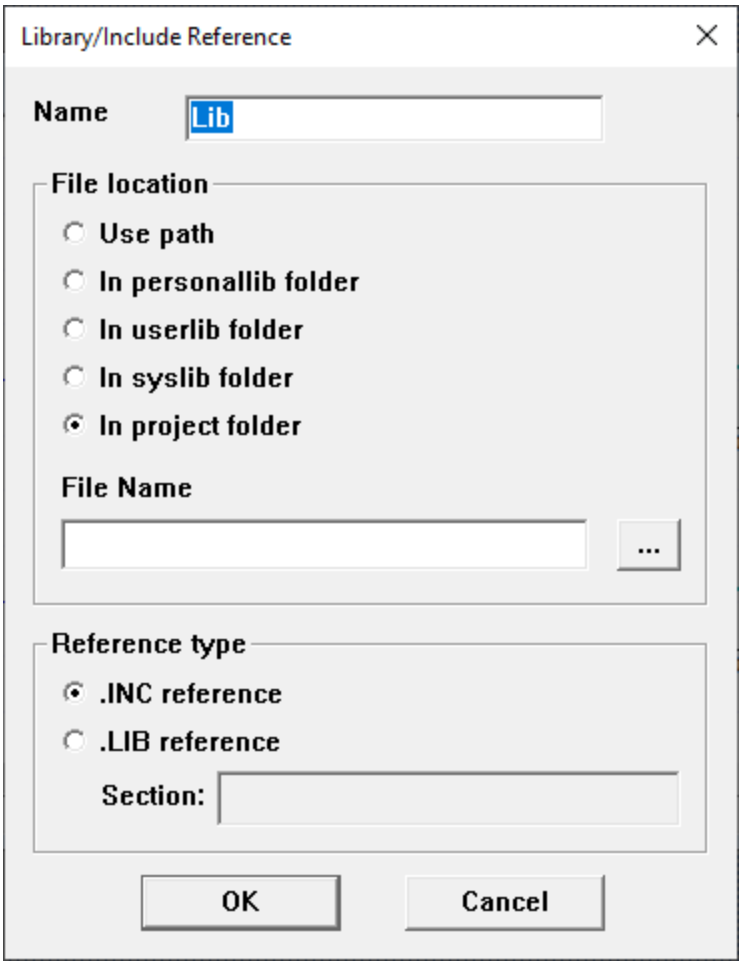
Accessing Include Files

A schematic design can reference an include file (e.g., frequency-dependent model data is commonly written into a separate file rather than entered into a **Property** window). To add an include fileto a design, follow these steps.

1. From the **Project Manager** window, expand the **Project Tree** and **[*Active Design Folder*]**. Then right-click **Data** and select **Add Library/Include Reference** to open the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Library/Include Reference window.



2. Enter a name for the *.inc* file in the **Name** field.
3. From the **File location** area, choose the folder in which the *.lib* library file is stored (e.g., **In project folder**). If the library file is not in one of the default folders, choose **Use path** and complete steps a-b. Otherwise, skip to step 3.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

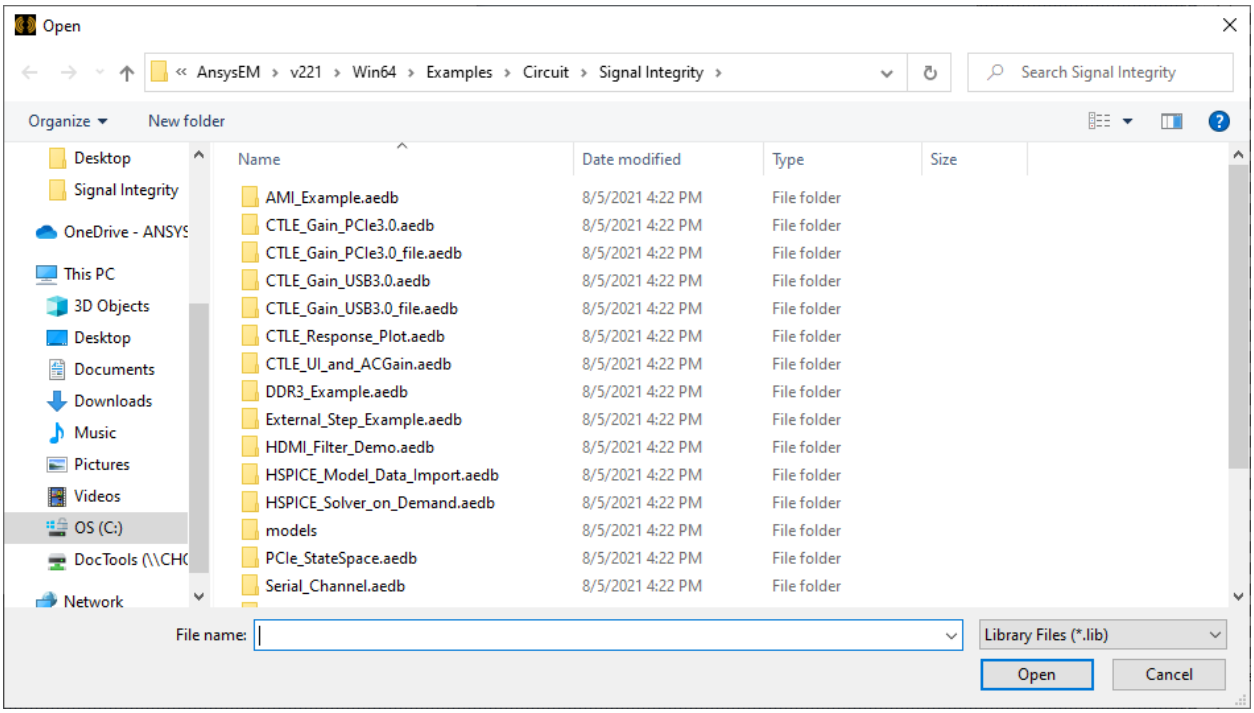
Note:

When **In project folder** is selected, references to the file in the design are relative to the directory where the project is saved (e.g., the path is saved in the project **.adsn** file as a variable: `.inc '$PROJECTDIR/x_113854.inc'`). The variable `$PROJECTDIR` is expanded to the current location of the project when the design is converted to a netlist and run by an analysis tool. Otherwise, an absolute path is saved. If a project and its include files are moved to a new directory together, select **In project folder** to preserve the file references.

Note:

In syslib folder is reserved for libraries supplied with the Ansys Electronics Desktop (AEDT)™ electronics systems design platform.

a. Click the **[...]** button to open an explorer window. Then navigate to and select the selected *.inc* include file.



b. Click **Open** to return to the **Library/Include Reference** window. The path to the *.inc* file is displayed in the *File Name* field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** Directories accessed with **Use Path** are not exported if the design is moved to another computer, and will be inaccessible.

4. Ensure **.INC reference** is selected in the **Reference type** area (the default). The **Section** field will remain blank/deactivated.
5. Click **OK** to add the library file data to the design.

The procedure is complete.

Library Files in Circuit Netlists

Library files contain one or more blocks of netlist statements. Each block in the library file has the format:

```
.LIBblock_name
lib_block_statements
.ENDL
```

The library file block can contain any valid netlist statements. LIB blocks are processed after all the other statements in the netlist have been processed, and the order of execution of LIB block statements cannot be predetermined.

To read and process in the statements from a library file block, the netlist uses a library call:

```
.LIBfile_referenceblock_name
```

The rules for *file_reference* are the ones given in the module on File References.

A **.LIB** block in a given library file can contain calls to blocks in the same library file or in other library files, but a **.LIB** block may not call a block with its own block name in its own file (that is, a **.LIB** block cannot call itself).

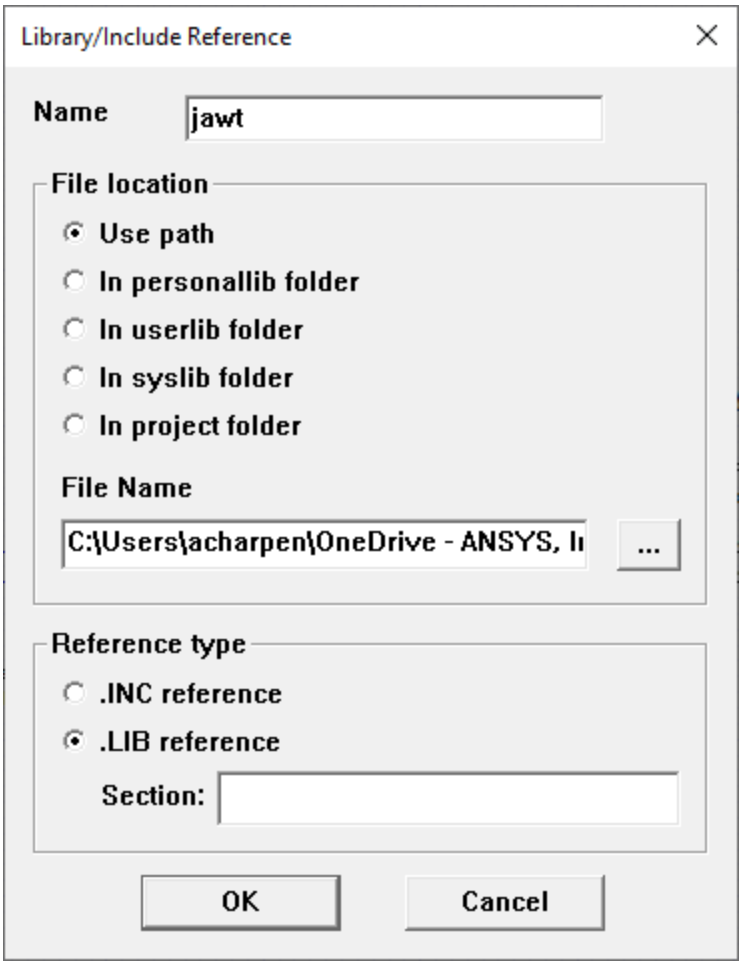
Accessing Library Files

A schematic design can reference a library file block. To add a library file to a design, follow these steps.

1. From the **Project Manager** window, expand the **Project Tree** and **[*Active Design Folder*]**. Then right-click **Data** and select **Add Library/Include Reference** to open the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Library/Include Reference window.



2. Enter a name for the *.lib* library file in the **Name** field.
3. From the **File location** area, choose the folder in which the *.lib* library file is stored (e.g., **In project folder**). If the library file is not in one of the default folders, choose **Use path** and complete steps a-b. Otherwise, skip to step 3.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

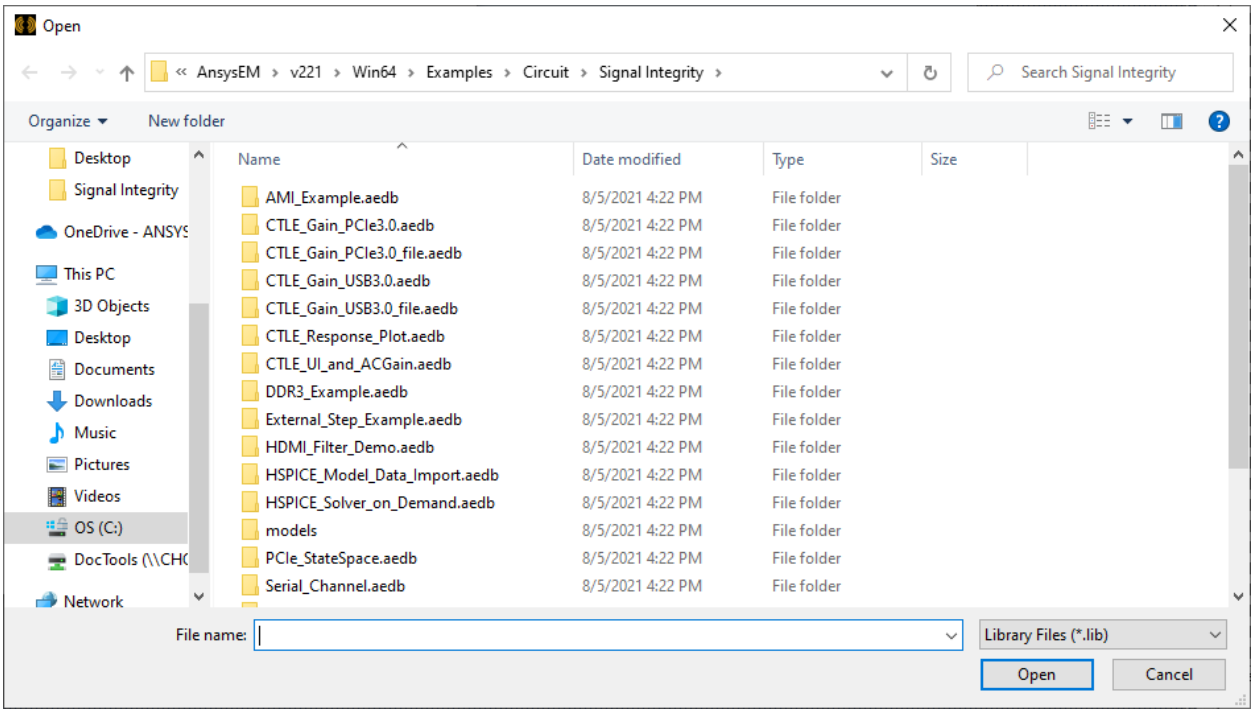
Note:

When **In project folder** is selected, references to the file in the design are relative to the directory where the project is saved (e.g., the path is saved in the project **.adsn** file as a variable: `.lib '$PROJECTDIR/x_113854.lib'`). The variable `$PROJECTDIR` is expanded to the current location of the project when the design is converted to a netlist and run by an analysis tool. Otherwise, an absolute path is saved. If a project and its library files are moved to a new directory together, select **In project folder** to preserve the file references.

Note:

In syslib folder is reserved for libraries supplied with the Ansys Electronics Desktop (AEDT)™ electronics systems design platform.

a. Click the **[...]** button to open an explorer window. Then navigate to and select the selected *.lib* library file.



b. Click **Open** to return to the **Library/Include Reference** window. The path to the *.lib* file is displayed in the *File Name* field

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** Directories accessed with **Use Path** are not exported if the design is moved to another computer, and will be inaccessible.

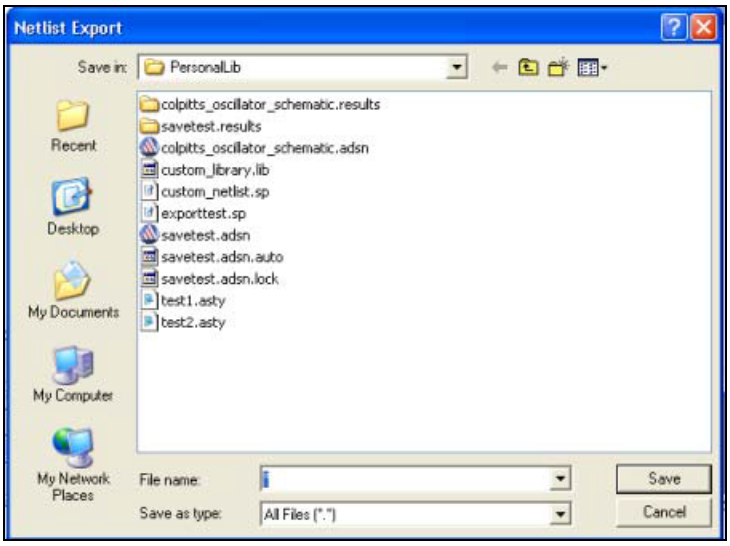
4. Ensure **.LIB reference** is selected in the **Reference type** area (the default) to activate the **Section** field.
5. Enter a name in the **Section** (block) field.
6. Click **OK** to add the library file data to the design.

The procedure is complete.

Exporting Netlist Data

Follow these steps to export the netlist representation of a schematic design to a file.

1. Click **Browse Netlist** to make the **Netlist Editor** the active window.
2. Click on **Netlist** in the top menu bar, and select **Export**. The **Netlist Export** window opens:



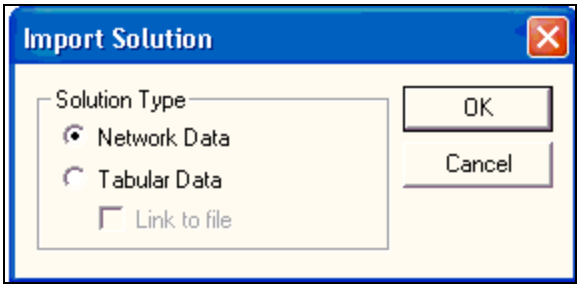
3. From the **Save in** field, browse to an appropriate directory to save the netlist file.
4. From the **File name** field, enter the complete name of the file, including the extension if any.
5. Click **Save** to save the netlist file and close the window, or click **Cancel** to cancel the export operation without saving anything.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Importing Solution Data for Postprocessing

All the Ansys Electronics Desktop (AEDT)™ electronics systems design platform simulators allow you to import solution data from other tools for reports and other postprocessing as available. Follow these steps to import solution data into a Circuit design.

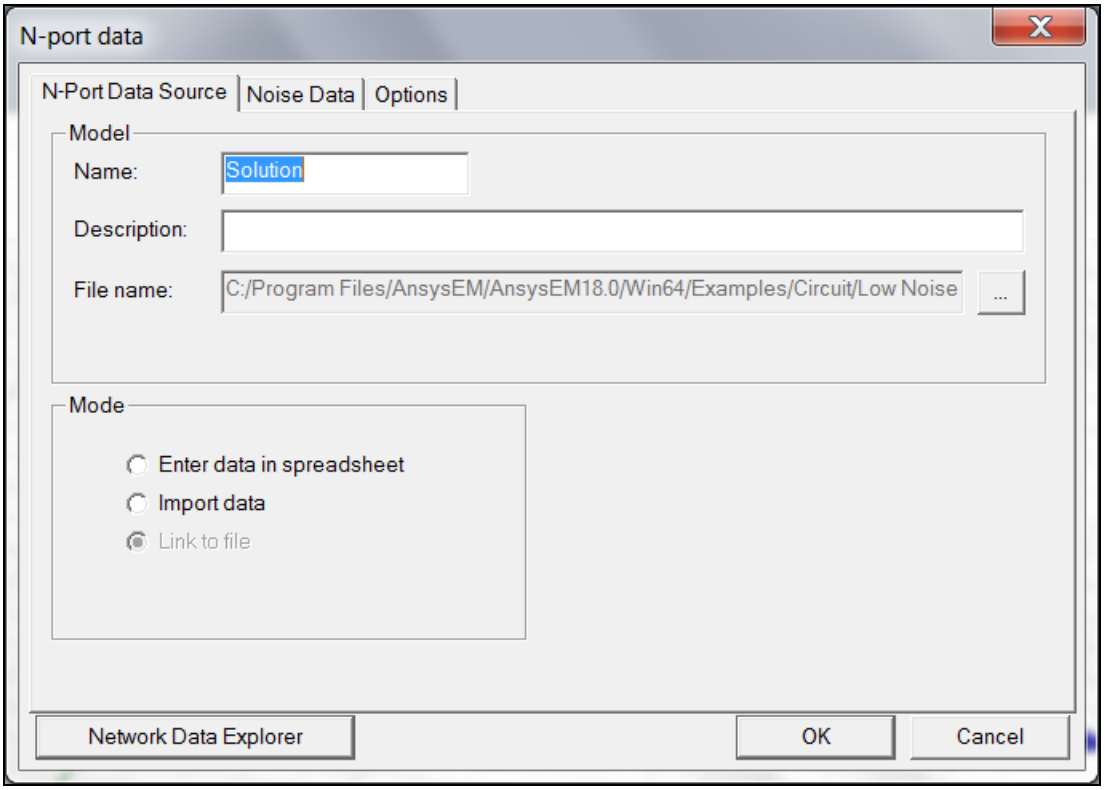
- Select **Circuit**> **Import Solution**
- From any design in the **Project Tree**, select **Analysis** > **Import Solution** to open the **Import Solution** window.



Importing Network Solution Data

If the imported solution includes network data (e.g., S-parameters), click **Network Data** on the **Import Solution** window. Then click **OK** to open the **N-port data** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **N-port data** window has the following tabs:

N-Port Data Source Tab

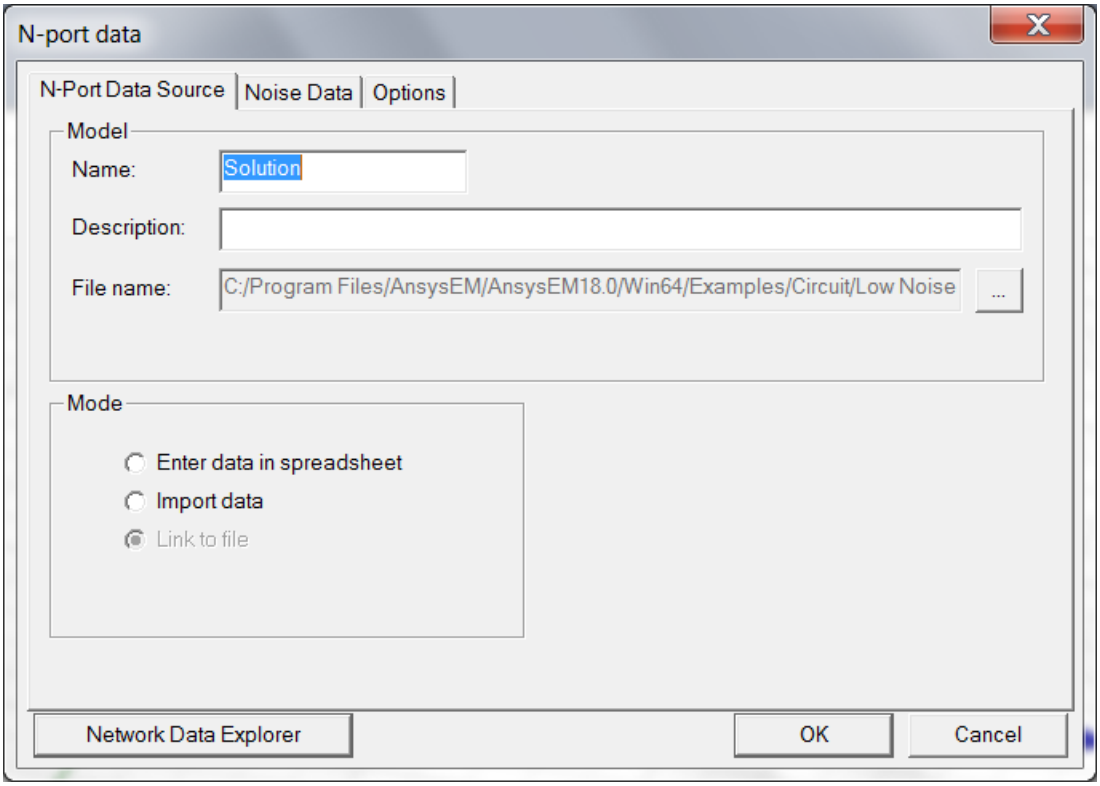
Noise Data Tab

Options Tab

N-Port Data Tab for Imported Solutions

The N-Port Data Source tab is displayed when the N-port data window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Name – Used to set or change the name of the imported solution as it appears in the **Project Tree**. To change the name, click in the box , then type the name you want.

Description — Used to set or change the description of the imported solution. To change the description, click in the box , then type the description you want.

File Name – Used to set or change the file name of the imported solution. To set the file name, click in the box and then type the file name you want, or click the **[...]** button to search for a file.

Multi-file selection — Used to import an S-element file.

Mode — The network solution data can be entered manually, copied into the project from an external file as **Import data**, or read from an external **Link to file** at analysis time. To manually enter solution data, click **Enter data in spreadsheet**, and enter the network data as described in the Noise Data Tab section.

To import an S-element file and copy it into the project from an external file:

1. Click **Import Data** in the **N-port data** window.
2. Specify the **File name** in one of the following ways:

- From the file name box, type the file name, including the full path, of the file that contains the network parameters you want to use.
- Click the **[...]** button to open the explorer window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

a. Select the selected file type from the **Files of type** area:
b. click the **Look in** field to browse to the directory containing the selected file.
c. Select the file in one of the following ways:

- Click the file's entry in the list.
- Type the file's name in the **File Name** box.

d. Click **Open**.

Once you have finished, the N-port data is copied into the project from an external file.

> **Note:**
>
> If you select multiple files using the Multi-file selection… and create a Text Array variable, the S-parameter data is NOT imported. It are the same as if you had selected the **Link to file** option.

To import solution data and copy it into the project from an external file:

1. Click **Import Data**.
2. Specify the file name in one of the following ways:

- From the file name box, type the file name, including the full path, of the file that contains the network solution.
- From the **File** group, select a file location option (Use Path, In PersonalLib folder, In userlib folder, or In syslib folder).
- Click the **[...]** button to open the explorer window.

a. From the explorer window, click the selected file type on the **Files of type** area.

— Touchstone (**.sNp**)

— HFSS v6.0 and higher (**.szg**)

— Touchstone (**.yNp**)

— Touchstone (**.zNp**)

— Touchstone (**.tou**)

— CITIfile (**.cit**)

— SSS file (**.sss**)

b. click the **Look in** field to browse to the directory containing the selected file.
c. Select the file in one of the following ways:

- Click the file's entry in the list.
- Type the file's name in the **File Name** box.

d. Click **Open**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Once you have specified a file, view its contents in the Noise Data Tab.

> **Note:**
>
> S-parameter SSS datafile names must be of the format
>
> "<file name>_ <ports> .sss"
>
> where:
>
> <file name> is an alphanumeric string
>
> <ports> is an integer that specifies the number of ports
>
> such as:
>
> SparamFile_4.sss

To specify an external file from which network parameter data are read at analysis time:

1. Click **Link to file**.
2. From the **File** group, select a file location option (Use Path, In PersonalLib folder, In userlib folder, or In syslib folder).
3. Specify a file name in either of the following ways:

- From the file name box, type the file name , including the full path, of the file that contains the network parameters you want to use.
- Click **Browse** to open the **Open** window.
    a. Select the selected file type in the **Files of type** area.
    b. click the **Look in** field to browse to the directory containing the selected file.
    c. Select the file in one of the following ways:
        - Click the file's entry in the list.
        - Type the file's name in the **File Name** box.
    d. Click **Open**.

Once you have specified a file, view its contents in the Noise Data Tab.

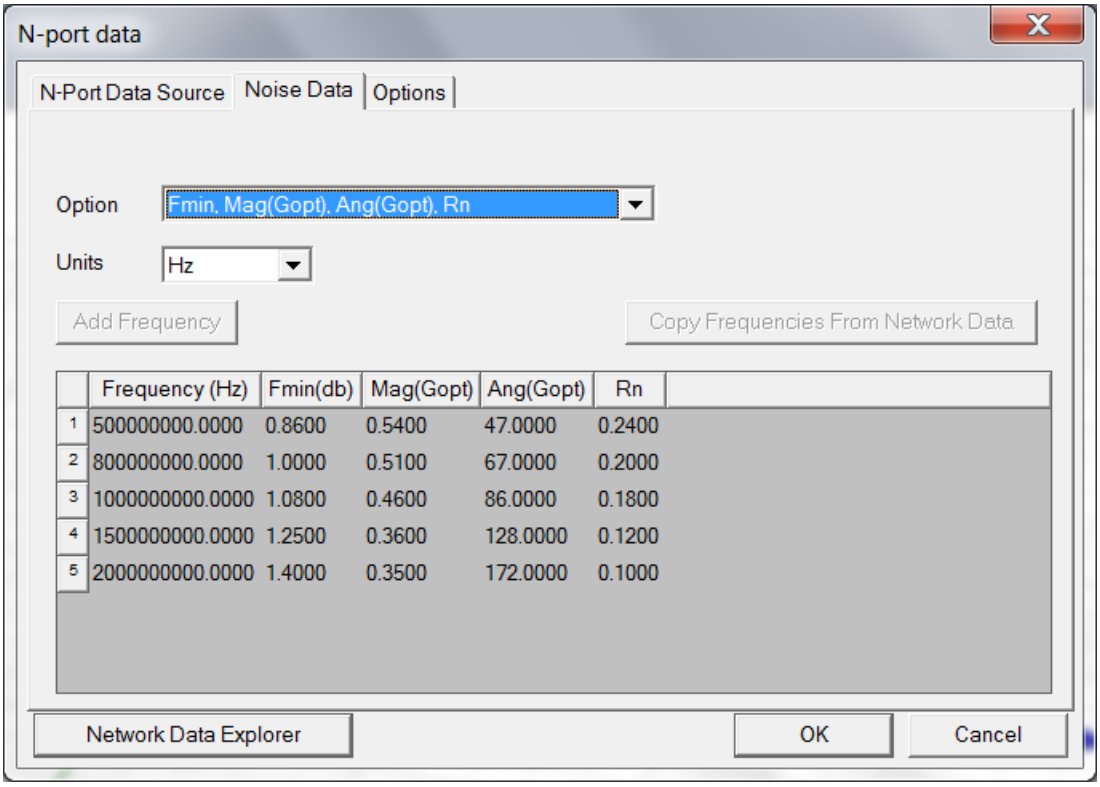
Noise Data Tab for Imported Solutions

The **Noise Data** tab can be used to enter solution data manually or used to view solution data from an imported file.

- To view the contents of an imported solution, double-click the solution in the **Project Tree** and select the **Noise Data** tab on the **N-port data** window.
- To manually enter solution data for post-processing, select **Enter data in spreadsheet**on

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the **N-Port Data** tab, then select the **Noise Data** tab on the **N-port data** window.



The following controls are available:

Domain – Sets the **Frequency** or **Time** domain.

Format – Sets the **Format** to one of the following: Magnitude/Phase, Real/Imaginary, or dB Phase.

Units – From the Frequency domain, sets the units of frequency: **Hz**, **KHz**, **MHz**, **GHz**, **THz**, or **rps**.From the Time domain, selects the units of time: **fs**, **ps**, **ns**, **us**, **ms**, or **s**.

S Matrix – Identifies the data as S-parameter values.

Y Matrix – Identifies the data as Y-parameter values.

Z Matrix – Identifies the data as Z-parameter values.

Gamma – Identifies the data as Gamma values.

Z0 – Identifies the data as Z0 values.

Ports – Sets the number of signal ports.

Phase Rotation — Click to set the **Phase Rotation** of the **N-Port Noise Data** source.

When the **Noise Data** options have been entered, click **OK** or select another tab.

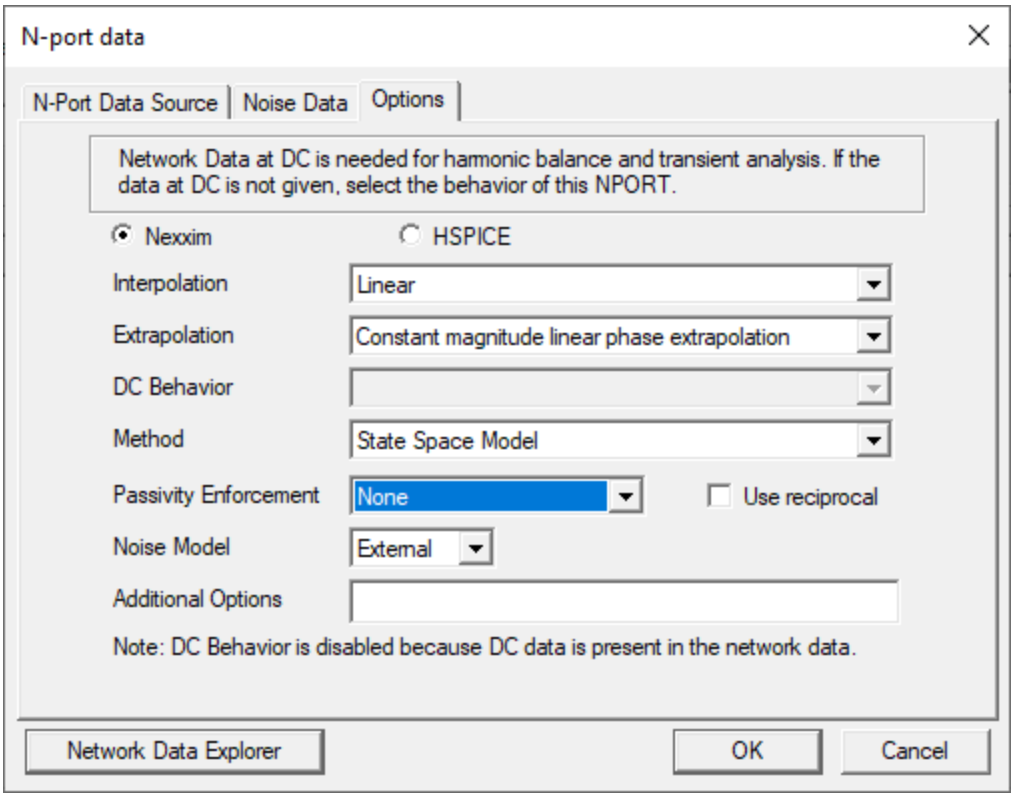
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

If the solution data file contains complex propagation constants or characteristic impedance values, select **Gamma** or $\mathbf{Z_o}$ to view the data — but to run a simulation in AEDT, the information is not required.

State Space N-Port Data Options Tab

The **Options** tab is used to select the behavior of the selected NPort.



The following controls are available:

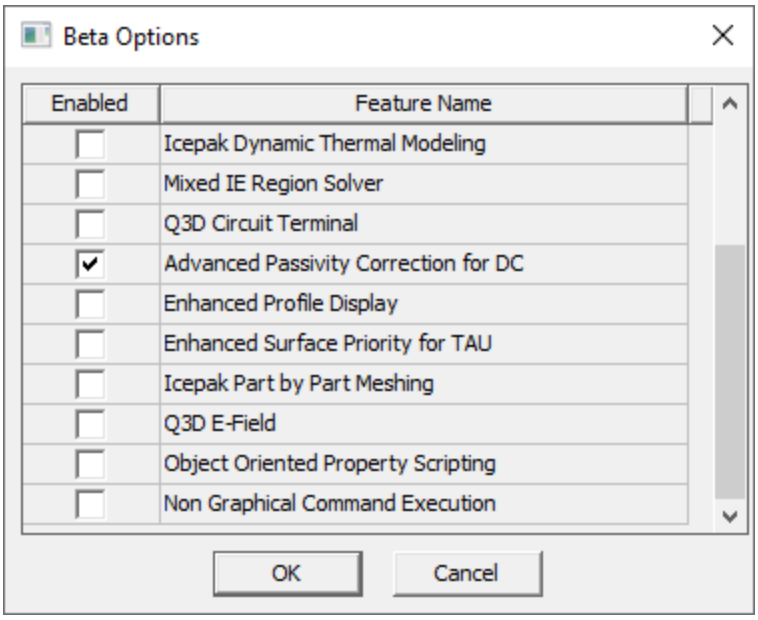
- **Nexxim/HSPICE** — Sets the NPort type. The selections for Interpolation, Extrapolation, DC Behavior, Method, and Passivity Enforcement depend on the NPort type selected.
- **Interpolation** — Specifies the interpolation method for data points in the frequency range of the Touchstone data.
- **Extrapolation** – Specifies the extrapolation method for data points outside the frequency range of the Touchstone data.
- **DC Behavior** — Specifies behavior of the N-Port at DC (zero frequency).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Method** – Specifies the method used to convert frequency domain data to the time domain. Choice of methods is available only for Nexxim Nports.
- **Passivity Enforcement** — Performs a passivity check on the S-parameter data and attempts to correct non-passive data. The options are None, IFPV, IFPVLF, Convex Optimization, and Passivity by Perturbation.

  Passive devices may dissipate or temporarily store energy, but never generate energy. Use the drop-down menu to select the method for enforcing passivity. Passivity enforcement is available only for Nexxim NPorts. See Passivity Checking and Enforcement. For details on passivity checking and enforcement, see S-Parameter Technical Notes.

  When applying IFPVLF, the passive DC fit to Scattering Parameter Data (S-data) can deteriorate to the point the inaccuracies of the (passive) fit to the corresponding Impedance Data (Z-data) at zero frequency (DC) and low-frequency may cause inaccurate time-domain steady state simulations. If preserving an accurate passive DC fit to S-data is important, like it is in power electronics applications, e.g., with DC-DC converters and power supply Voltage Regulator Module (VRM)), then click the **Advanced Passivity Correction for DC** beta option to enhance the passive DC fit to S-data using IFPVLF. The **Advanced Passivity Correction for DC** is located in the **Beta Options** in the Global Options.



- **Use reciprocal** – Computes the inverse, or reciprocal, at each frequency so the N-port can be used for de-embedding. See Deembedding S-Matrices.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Noise Model** – Specifies noise model for DC and frequency-domain analyses:
  - **None** – No noise analysis
  - **Internal** – Use internal noise model
  - **External** – Use noise data from Touchstone file if present, else use internal noise model
- **Additional Options** — Allows you to add model-level options for Nexxim or HSPICE.

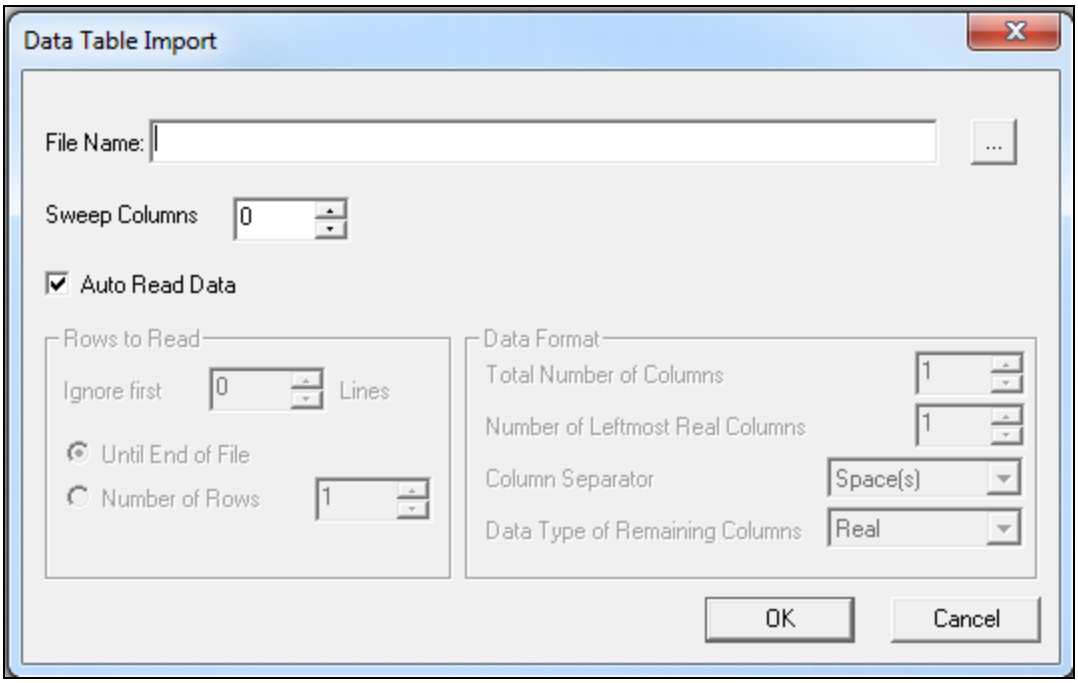
When the N-port Options have been entered, click **OK** or select another tab.

- **Network Data Explorer** – Allows you to view solution data by opening the Network Data Explorer.

When the N-port Options have been entered, click **OK** or select another tab.

Importing Tabular Solution Data

To import solution data in tabular format, select **Tabular Data** on the Import Solution window. (To specify the imported file should be read at analysis time rather than copied into the project, also click **Link to file**). Then click **OK** to open the **Data Table Import** window.



Enter the name of the tabular data file in the **File Name** window, or click the **[...]** button to look for the file. When you have entered all appropriate information into the **Data Table Import** window, click **OK** to import the data.

With Auto Read Data Selected

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When **Auto Read Data** is selected, the Ansys Electronics Desktop (AEDT)™ electronics systems design platform attempts to read the data in automatically, based on the following assumptions regarding the format of the tabular data:

- Rows that begin with a hash (#), star (*), exclamation point (!), or any non-number is ignored.
- Each comma, space, and tab is treated as a column separator.
- Numbers followed by an “i” or “I” are treated as complex values.
- The first column is always regarded as X data.
- All columns but the first are always regarded as Y data.
- Empty columns are zero filled.

With Auto Read Data Unselected

When **Auto Read Data** is not selected, the **Rows to Read** and **Data Format** subsections offer the following options:

Rows to Read

- **Ignore first** specifies the number of rows of data at the head of the file to ignore
- **Until End of File** specifies that all rows of data is to be read
- **Number of Rows** specifies the number of rows to be read

Data Format

- **Total Number of Columns** specifies the full number of columns of data
- **Number of Leftmost Real Columns** specifies the number of leftmost columns of real data
- **Column Separator** specifies the column separator: Space(s), Tab, Comma, or Period
- **Data Type of Remaining Columns** specifies the data type for the columns not included in the Number of Leftmost Real Columns:

Real	Real numbers
re/im	Complex numbers in real/imaginary format
mag/ang(deg)	Complex numbers in magnitude/angle format with angles in degrees
mag/ang(rad)	Complex numbers in magnitude/angle format with angles in radians

Sweep Columns

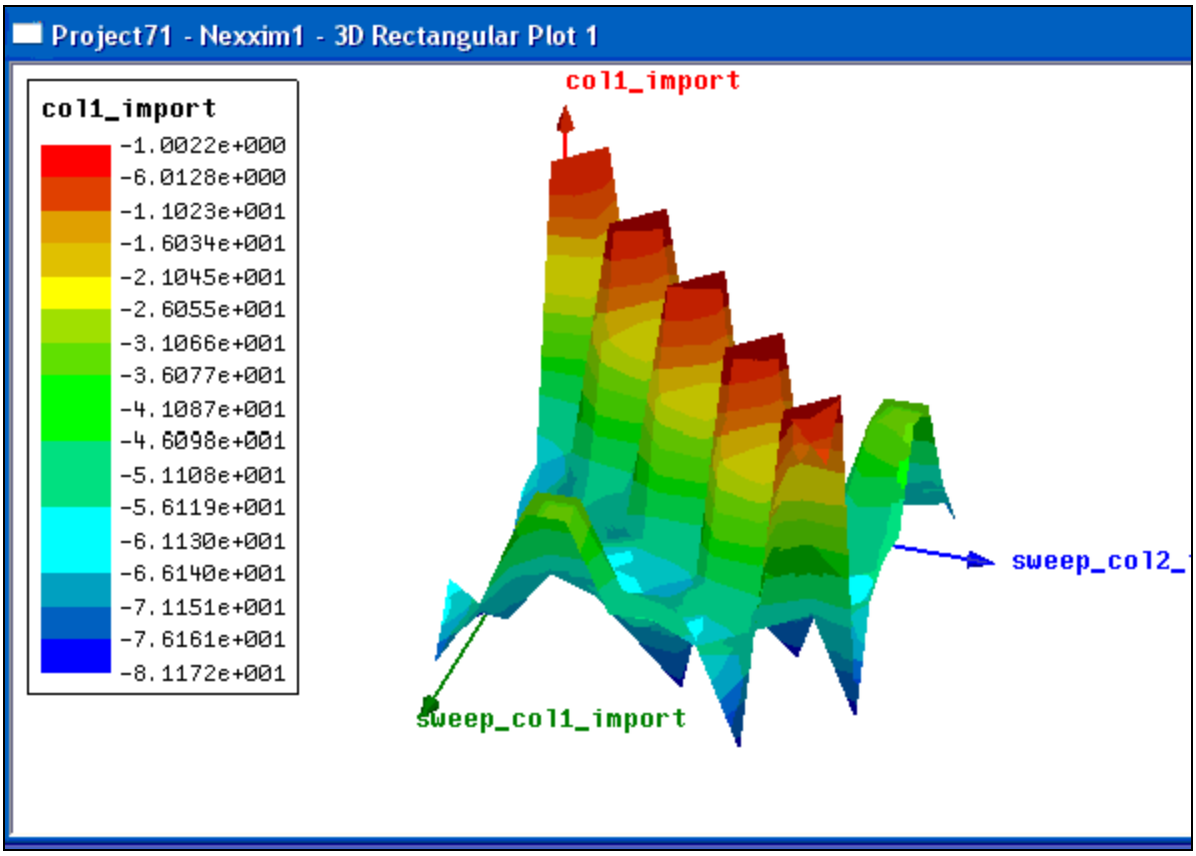
This option allows you to specify the number of leftmost columns in the imported file that can be treated as sweep data rather than quantity data. When **Sweep Columns** is non-zero, an implicit

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

sweep is created automatically as the file is read. For example, with **Sweep Columns** set to 2, the following imported data could be used to create the 3D Rectangular Plot shown in the following figure:

```
1 1 -11.9494901844939
1 2 -1.02976604277775
1 3 -65.0043850531982
1 4 -66.1547663779434
1 5 -76.5001257180356
1 6 -77.0620478855849
1 7 -78.7052860174241
1 8 -71.4292118632088
1 9 -59.271550467952
1 10 -73.4397348975777
2 1 -1.02976604277775
2 2 -13.7362474109939
2 3 -64.4351612784164
2 4 -63.9486697204035
2 5 -75.69071743575
2 6 -74.7859772914394
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

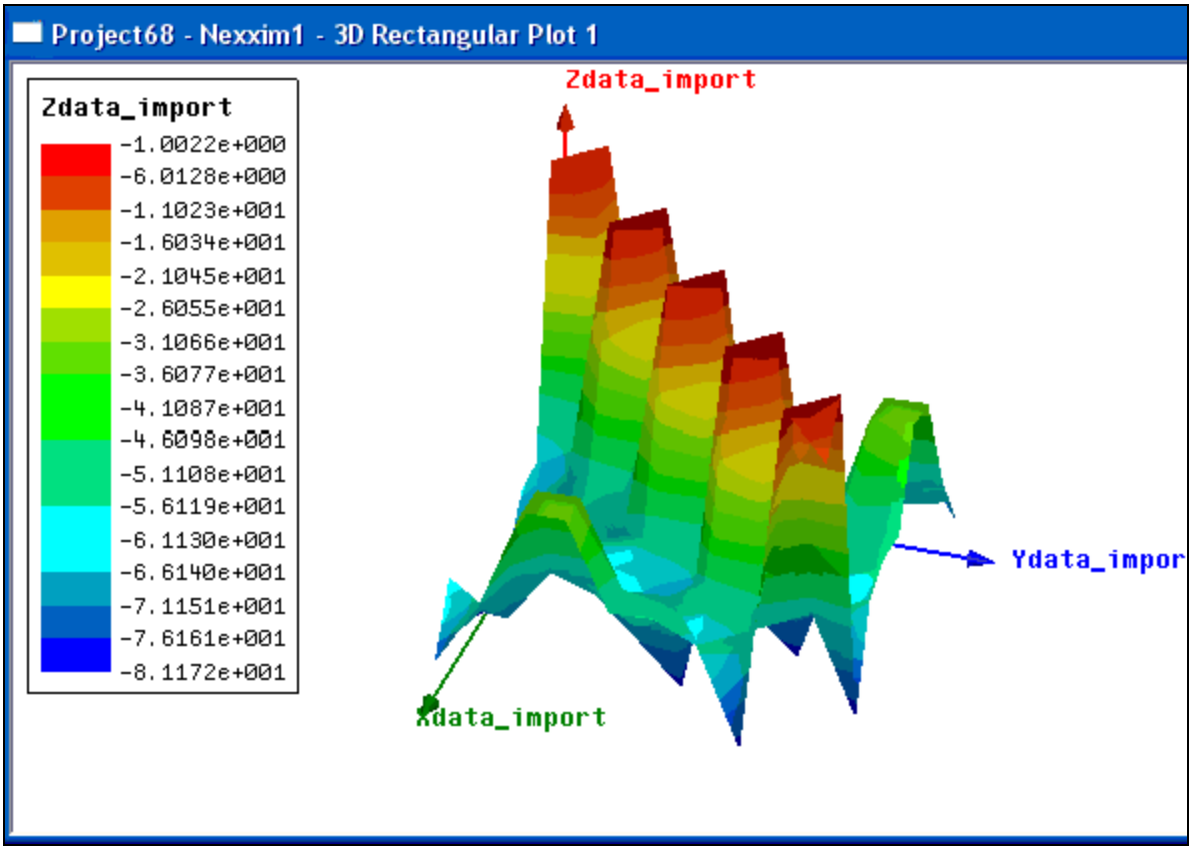


From the imported file, the line immediately preceding the start of numerical data is checked for column names. If this line contains the selected number of entries, these entries are then used as column-data annotations in the generated plot, as shown in the following example.

```
Xdata Ydata Zdata
1 1 -11.9494901844939
1 2 -1.02976604277775
1 3 -65.0043850531982
1 4 -66.1547663779434
1 5 -76.5001257180356
1 6 -77.0620478855849
1 7 -78.7052860174241
1 8 -71.4292118632088
1 9 -59.271550467952
1 10 -73.4397348975777
2 1 -1.02976604277775
2 2 -13.7362474109939
2 3 -64.4351612784164
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Each column name (Xdata, Ydata, Zdata) is appended with the string “import” before being added to the plot.



Post-processing Imported Solution Data

To generate a report on the imported solution data, do the following:

1. Expand **Analysis** in the Project tree. Verify the presence of the imported solution.
2. Click on **Results** in the Project tree and select **Create Report**. Select the report type and display type on the **Create Report** window,, then click **OK**.

From the **Traces** window, select the imported solution on the **Solutions** drop-down menu. Complete the data in the **Traces** window, then click **Done**. The **Report** window opens to display the imported solution.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6 - Geometry in HFSS 3D Layout

HFSS 3D Layout supports a variety of multi-layer structures and components that can be placed in those structures. Among the geometries are:

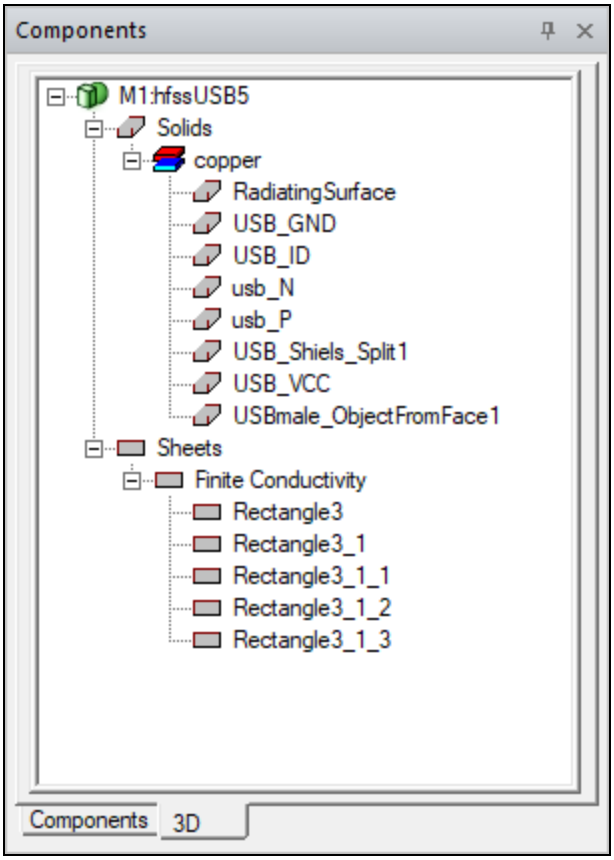
- Stride Lightweight Geometry
- Component Placement in HFSS 3D Layout
- Hierarchical Design
- 3D Component Library
- Stackup Definitions
- Programmatic EDB Cells
- Setting Uniform Temperature

Stride Lightweight Geometry in HFSS 3D Layout

Stride is a lightweight 3D geometry representation used for 3D CAD components within HFSS 3D Layout. Formats such as IGES and STEP can be imported, at which time they are converted to Stride for lightweight management.

After importing components, view them on the **3D** tab of the **Components** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



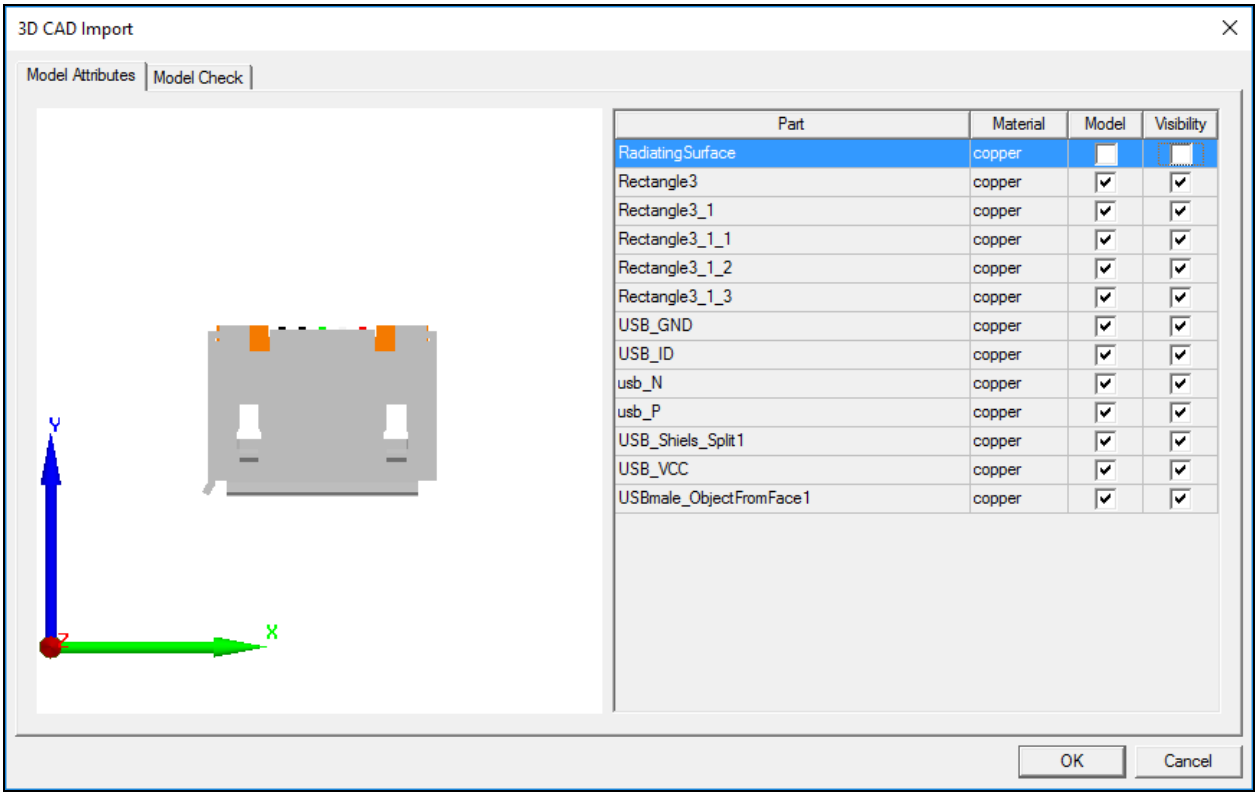
Selecting a component or part within a component highlights it in the design area. You can then edit certain properties in the **Properties** window and trace physical connections between components.

Importing 3D CAD Components into HFSS 3D Layout

To import a 3D CAD component into HFSS 3D Layout:

1. Click **Layout** > **Import** > **3D CAD**.
2. From the explorer window, click the component's file and click **Open**. The **3D CAD Import** window opens, on the **Model Attributes** tab.

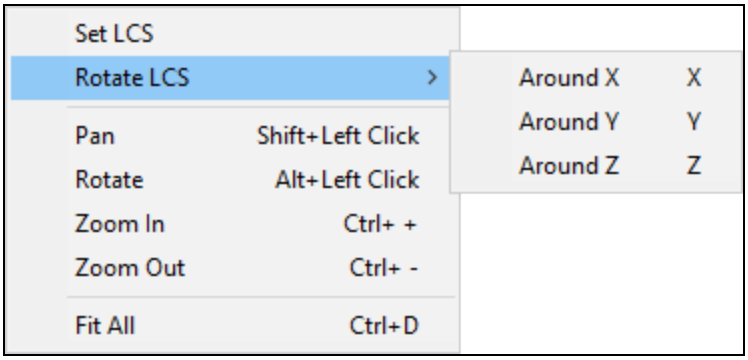
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The left pane contains a graphic representation of the MCAD component.

The right pane lists the component's parts and their materials.

3. Right-click in the left pane to open a shortcut menu.



From here, you can perform the following actions:

- **Set LCS** – turns the cursor into a crosshair that allows you to click a face, edge, or vertex and reposition the local coordinate system to that point.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The orientation of the Z axis is based on face normal. Placement of an MCAD component is simplified if a logical local coordinate system for the MCAD component is selected (e.g., select the center of a face that must be coincident with a pin in HFSS 3D Layout; when placing the MCAD model, the LCS origin snap to geometry based on the current snap settings).

To exit placement mode, right-click and deselect **Set LCS**.

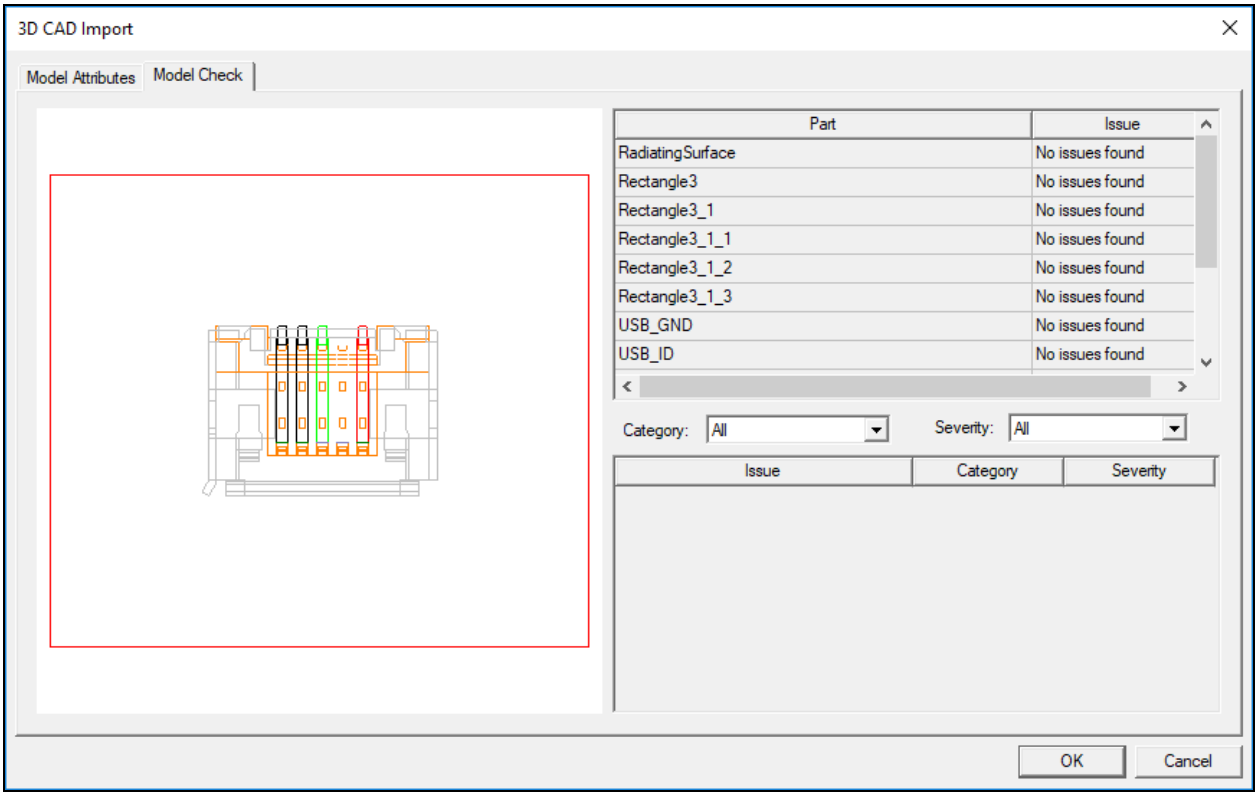
- **Rotate LCS** – reorients the local coordinate system by rotating it about the selected axis. Also press the **X**, **Y**, or **Z** keys.
- **Pan** – allows you to move the component in the pane. Also use **Shift**+**click**.
- **Rotate** – allows you to rotate the component in the pane. Also use **Alt**+**click**.
- **Zoom In / Zoom Out** – allows you to zoom the component in the pane. Also use **Ctrl**+**E** and **Ctrl**+**F**.
- **Fit All** – fits the component to the pane. Also use **Ctrl**+**D**.

> **Note:**
>
> Viewing operations only affect the display in the **3D CAD Import** window. They do not change the local coordinate system.

4. Click the material field to enable an **Edit** option, which allows you to change the material or its properties.
5. Click the **Model** check boxes to select and deselect parts for modeling, and the **Visibility** check boxes to alter the visibility of parts.
6. Click the **Model Check** tab.

   The **Model Check** tab displays.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Model Check** tab performs sanity checks on the MCAD component and displays the results. If any issues are found, you can sort them using the **Category** and **Severity** drop-down menus.

7. Click **OK** to import the component.

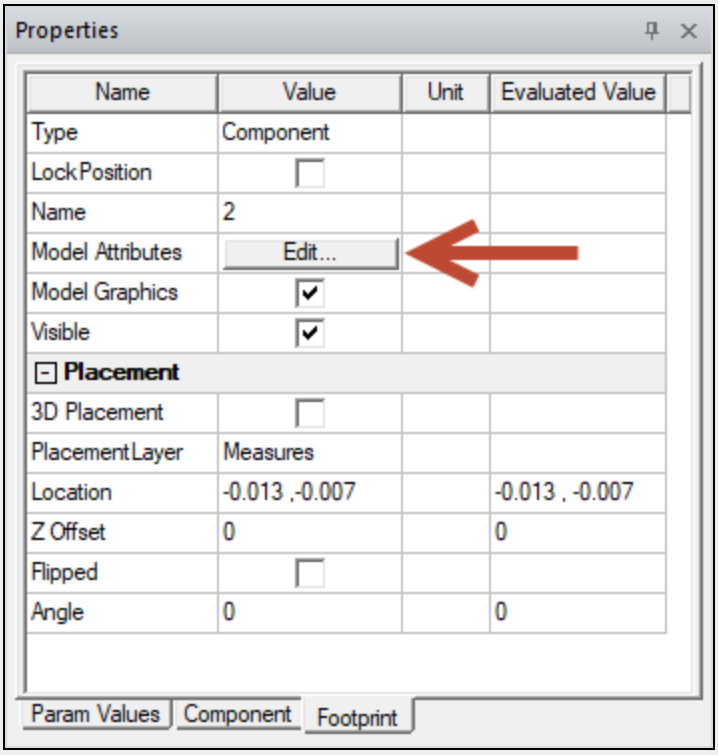
   The imported component appears in the **3D** tab of the **Components** window.

8. From the **Layout Editor**, click where the component should go.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important:

If you need to change the component properties after import, you can do so by selecting the component and clicking **Edit** on the **Footprint** tab of the **Properties** window:

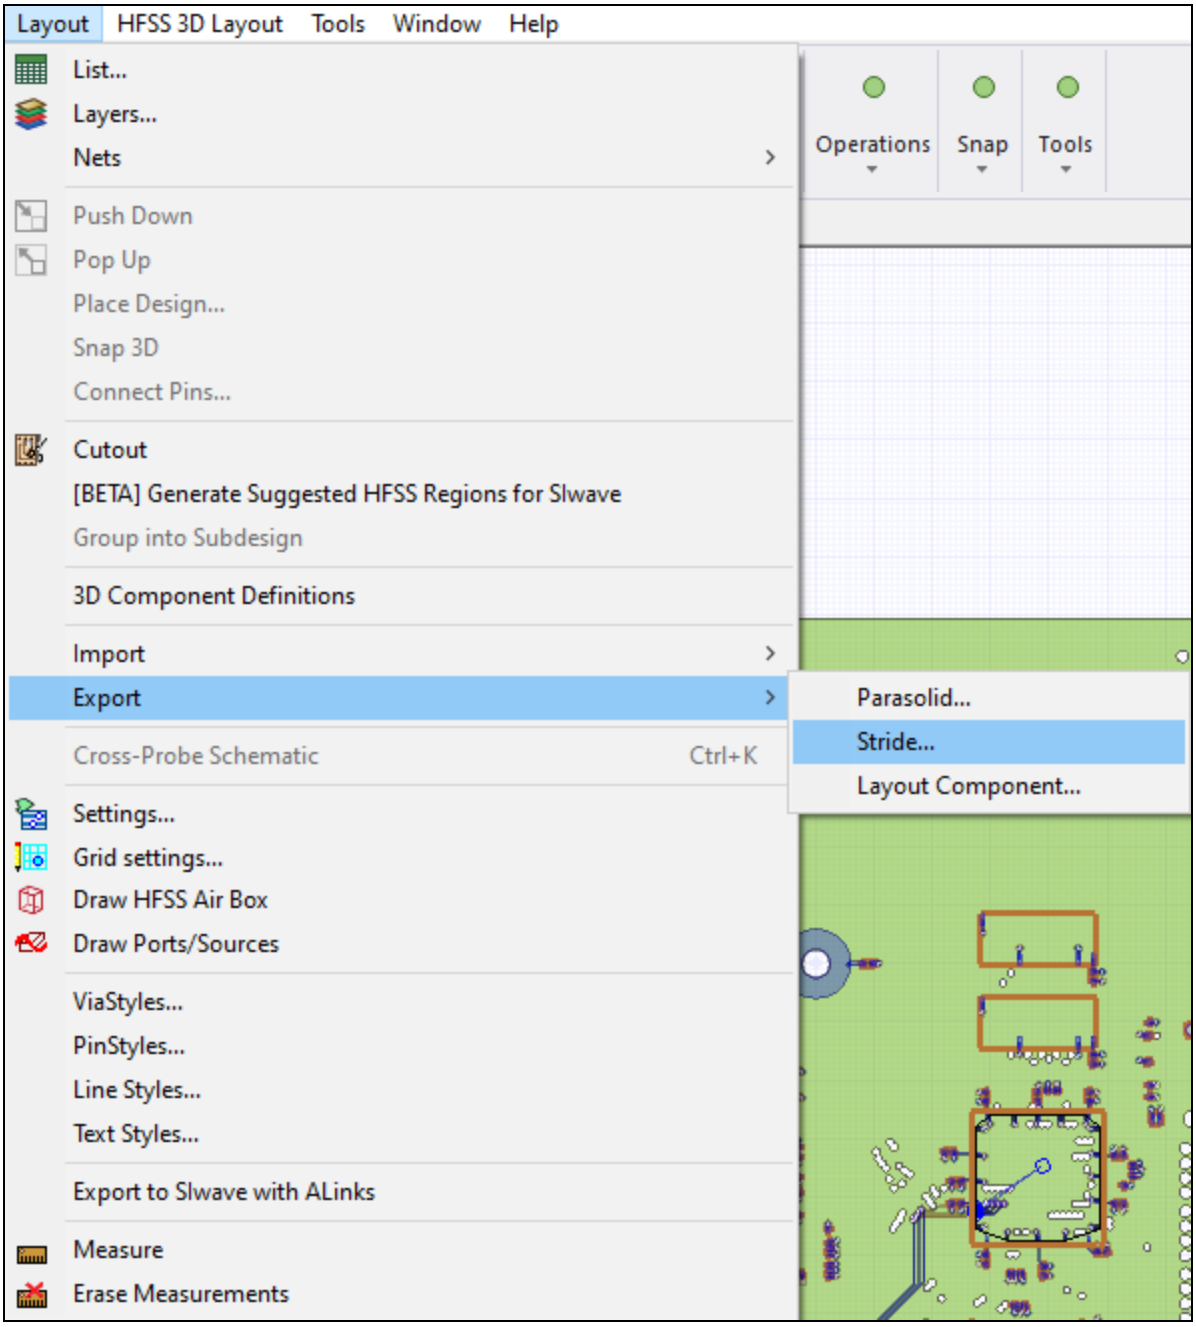


Exporting HFSS 3D Layout to Stride Format

HFSS 3D Layout can export Stride projects (*.project) files. Follow these steps to export a **Stride .project** file.

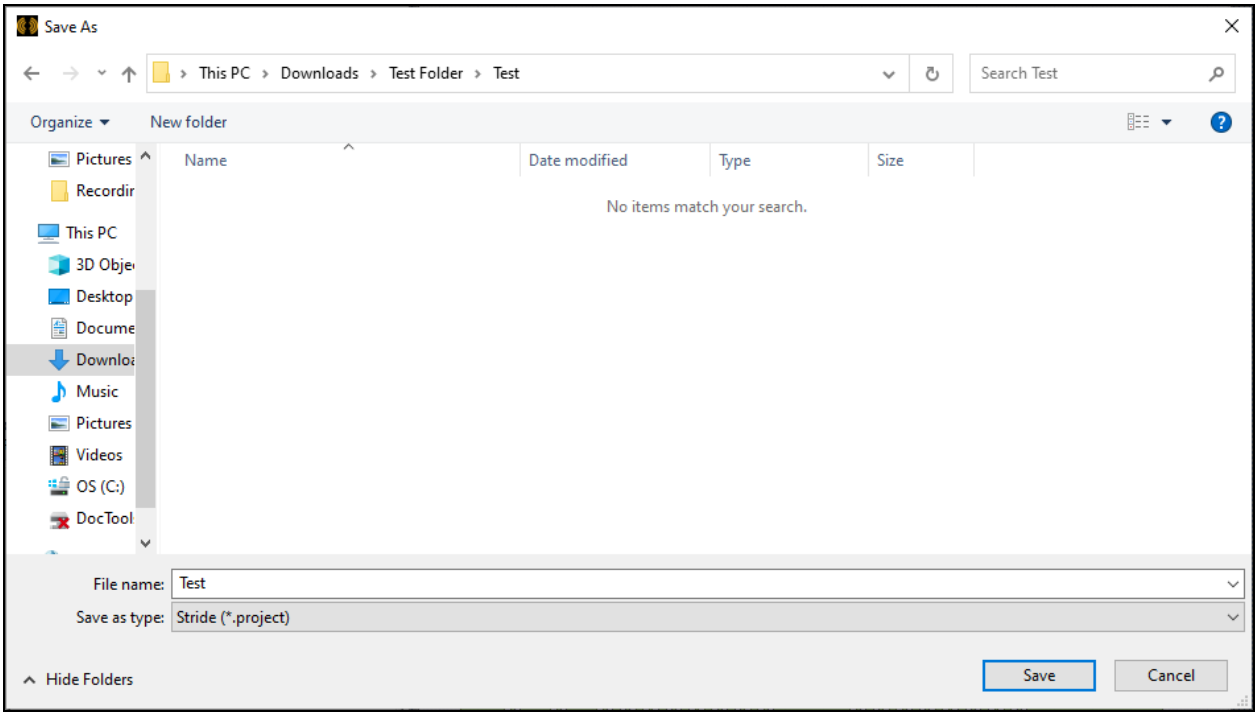
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From **Layout**, select **Export** > **Stride** to open an explorer window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Navigate to a selected directory to save the project.



3. Enter a selected **File name**.
4. Click **Save**.

Adding HFSS 3D Components to HFSS 3D Layout

HFSS 3D Layout allows for the use of HFSS 3D Components with the HFSS solver. Placement, setup, and options are similar to working with an HFSS 3D Dynamic Link in **Layout**.

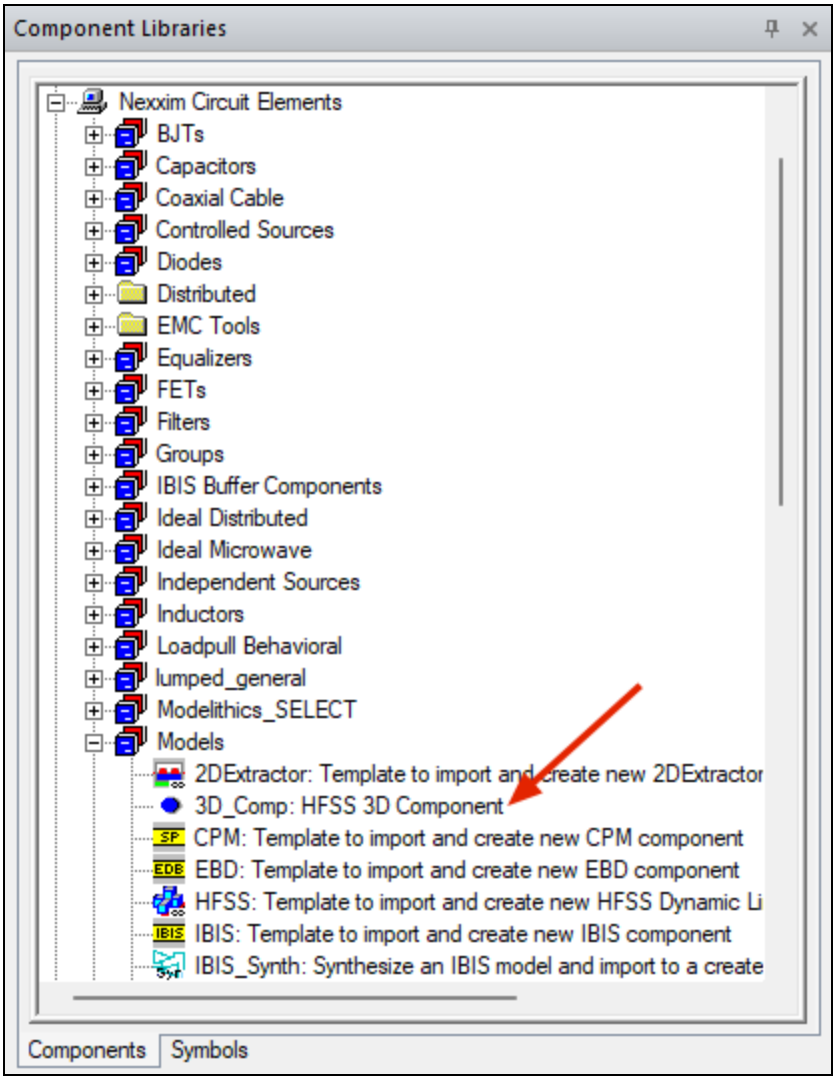
To import a 3D component into HFSS 3D Layout, either **click+drag** a *.a3dcomp file into an HFSS 3D Layout design or perform these steps:

1. Click **Layout** > **Import** > **3D Component**.
2. From the **Select Model File** window, navigate to and select the component's file and click **Open**.
3. From the **Layout Editor**, click where the component should be located. The imported component appears in the **3D** tab of the **Components** window.

To add a 3D component on the Component Libraries:

1. Open the **Component Libraries** window.
2. Double-click **Nexxim Circuit Elements** > **Models** > **3D_Comp: HFSS 3D Components**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. From the **Select Model File** window, click the component's file and click **Open**.
4. From the **Layout Editor**, click where the component should be located. The imported component appears in the **3D** tab of the **Components** window.

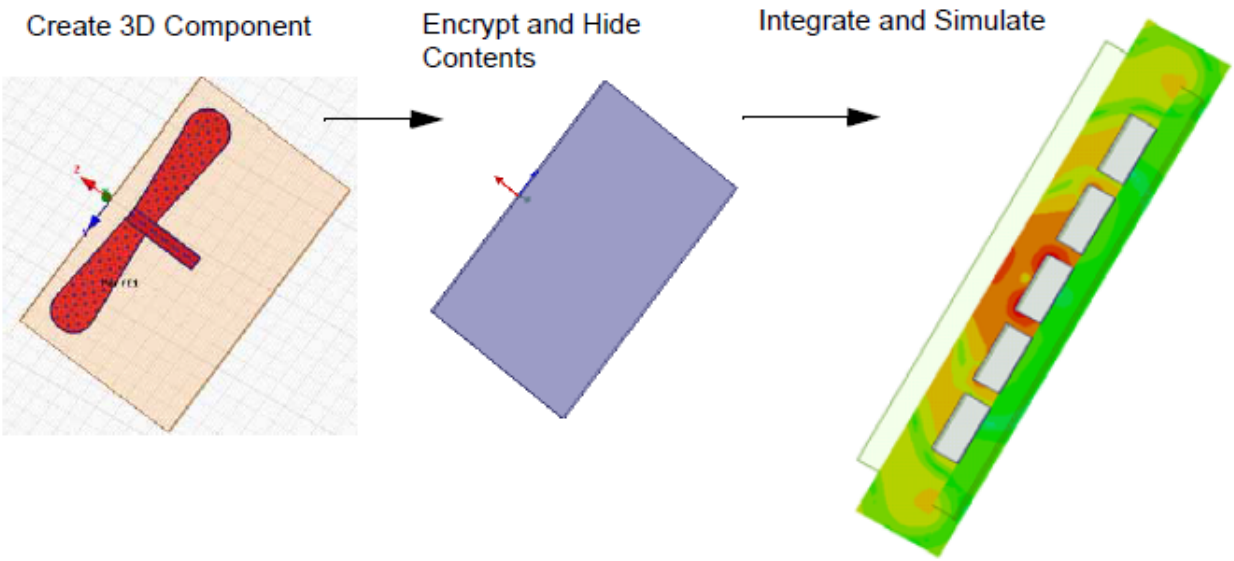
If a parameter was added to the 3D component in HFSS, the parameter appears on the **Param Values** tab of the **Properties** window where it can be updated.

3D Component Library

The 3D Modeler lets you access predefined 3D component libraries and custom 3D components using:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Geometry (objects and coordinate systems)
- Component parameter, including variables used by geometries, design data, and material properties
- Optional encryption with password definition or internal key as a password



3D Component Libraries may be included as part of Electronics Desktop, downloaded from third-party vendors, or created from scratch.

The ability to create components from models lets you easily share and reuse components. You can add components to a library and share components with other users. Once you insert a component into the target design, you can directly manipulate whole components.

In HFSS 3D Layout, custom 3D components must be created in HFSS and then imported into HFSS 3D Layout. 3D components appear in the **3D** tab of the **Components** window. Once in HFSS 3D Layout, the 3D components cannot be edited except for changes to their parameters. HFSS 3D Layout only supports 3D components with Driven Terminal solution types. In HFSS, this solution type is **Terminal** in the **Solution Type** dialog box.

A Beta Feature for **Parallel Component Mesh Adapt** improves the load balance across components by assigning different core counts and memory allocations for different size components. The workflow is applicable to all parallel component adapt features. Without the beta feature, all the components are assigned the same number of cores and same amount of memory during component adapt.

Local variables can be assigned to a 3D component's parameters in HFSS 3D Layout and then used in parametric simulations. Change the parameters in the **Param Values** tab of the **Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HFSS 3D Layout supports encrypted 3D components and 3D components with hidden content. If a 3D component has hidden content, it appears as **Encryption Settings** on the **3D** tab. Use the **3D** tab to select a 3D component when all contents of its component are hidden. If possible, keep something such as the bounding box visible in the 3D component. If nothing is visible, you can still select the bounding box, however you won't be able to see any part of the component. The parameters and excitations of a 3D component are visible even when all contents of the component are hidden.

The documentation includes the following sections:

Using the Component Libraries Window

Properties of 3D Components

Editing 3D Component Properties

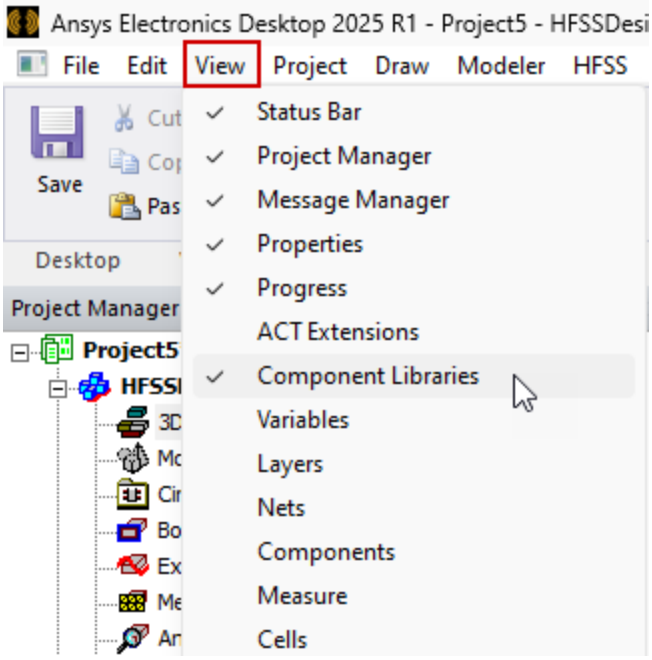
3D Component Agents

Using the Component Libraries Window

Once you save one or more components to a library, and create target coordinate systems in the design where you intend to place the component, you can right-click the 3D component icon ( ) in the Project Manager .

Toggle the visibility of the docked **Component Libraries** window from the menu bar by clicking **View** > **Component Libraries** and navigate the installed libraries from there. Visibility of the **Component Libraries** window is remembered for each design type so that, if context switches between different design types, the window is shown or hidden based on setting for new design type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

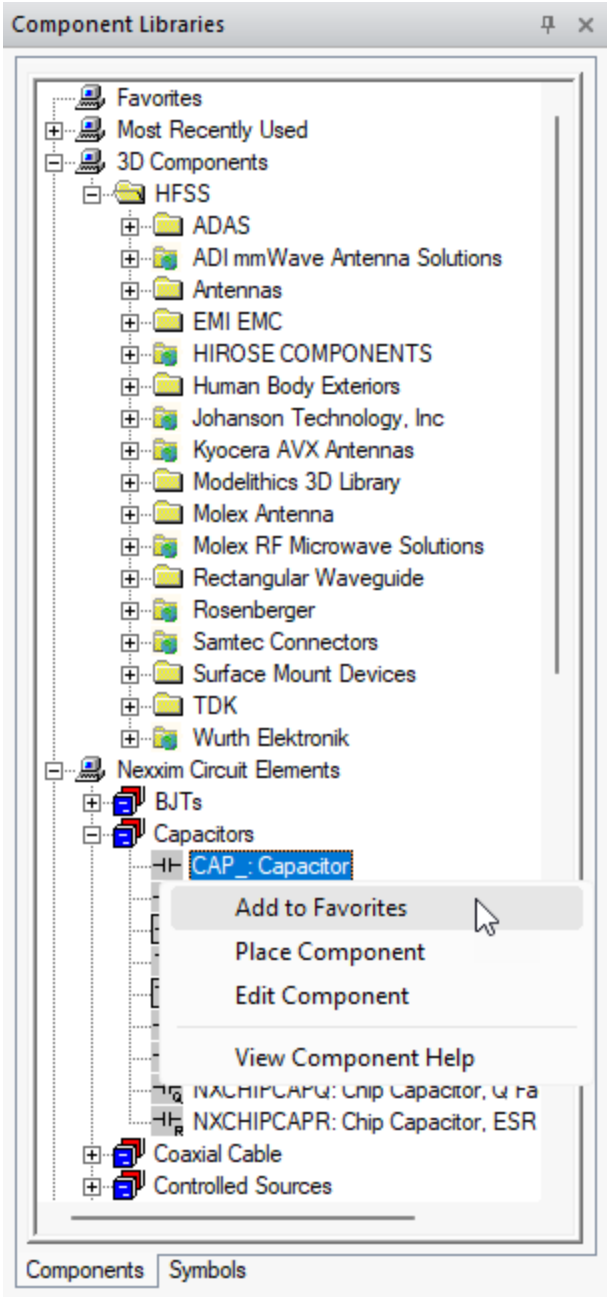


From the **Component Libraries** window, you can navigate the directory of installed components, as well as any in your Personal Library. The **Component Libraries** window lists all the 3D components available in syslib, UserLib and PersonalLib. It shows a folder corresponding to a library only if there are components for the active design type in that library folder. There are also additional optional folders for managing Favorites and Most Recently Used components. **Component Libraries** window contents, including Most Recently Used and Favorites correspond to the active design. When context is switched between different designs, the *Component Libraries* window will be refreshed so that it is relevant to the active design.

You can control whether to show the Favorites and Most Recently Used folders. Access the *Options* dialog box from the menu bar by clicking **Tools** > **Options** > **General Options**. The folder visibility options are on the General > Component Libraries Options page.

Right-click a component to view the **Add to Favorites** command for including frequently used components in the Favorites folder. Once a model is included in the Favorites folder, you can also right-click it to **Remove from Favorites**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



When you have added a component to a design, it also appears in the **Most Recently Used** folder. For HFSS 3D Layout designs, select this folder from the **Filter** drop-down menu.You can also right-click model there to view the **Add to Favorites** and **Place Component** commands.

You can select any component from the library, and drag and drop to insert it in the design. The component is inserted with default component parameter values and is placed in the currently active coordinate system.

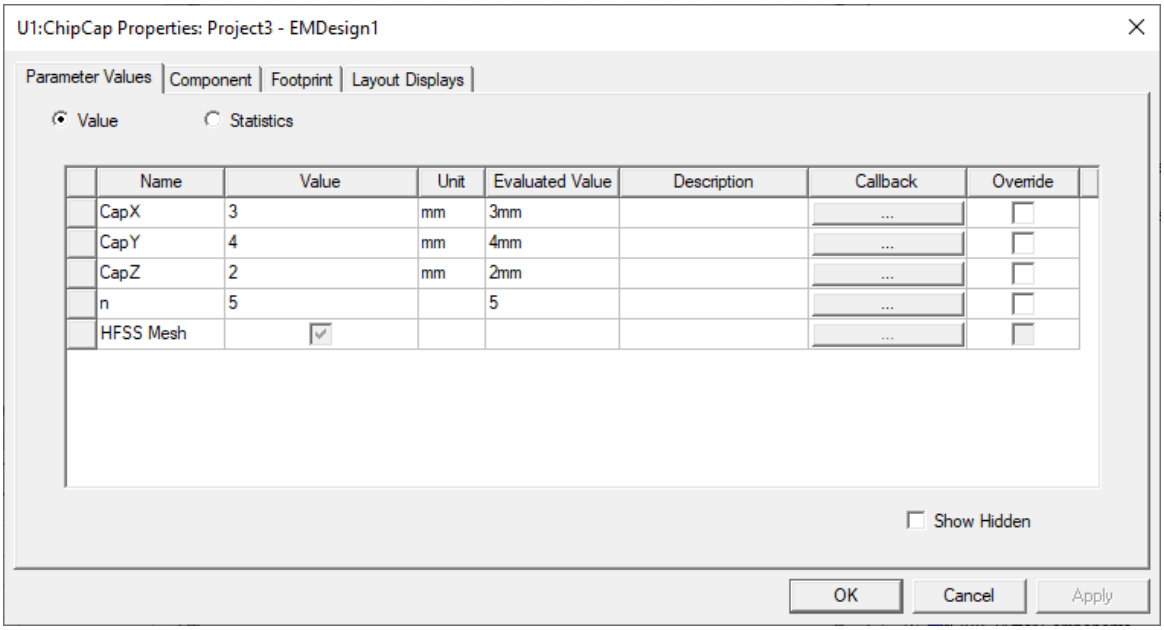
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Component file organization on the disk

3D Component files are organized in three libraries (that is, *syslib, UserLib,* and *PersonalLib*). 3D component files must be in a **3DComponents** folder under the appropriate library location. Files must be further organized by design type in the **3DComponents** folder. For example, component files for HFSS 3D Layout should be organized under 3DComponents\HFSS 3D Layout, as done for syslib. The 3D Component Libraries window looks for components under a folder corresponding to the active design type, and it ignores component files under folders corresponding to another design type. For example, HFSS 3D Layout will ignore component files placed directly under the Maxwell subfolder.

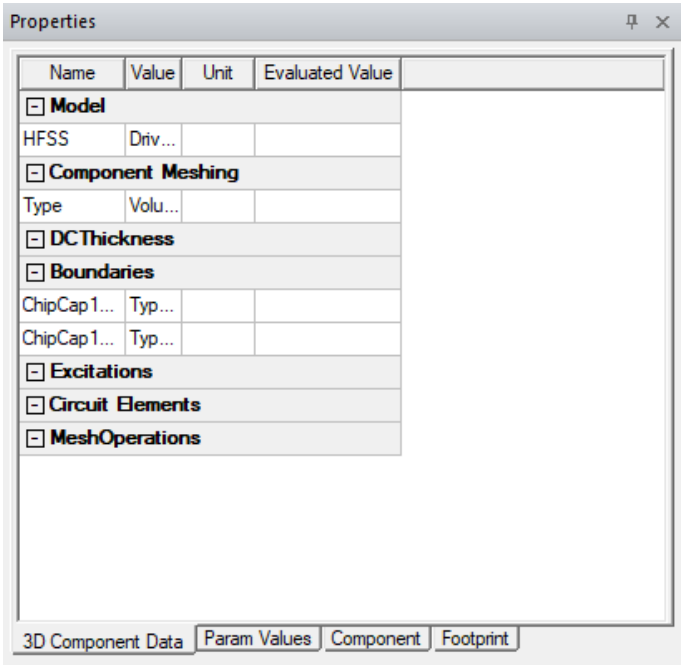
Viewing Properties of 3D Components in 3D Layout

The Properties displayed for a selected 3D component depend on how you select that component. For a complete display of Properties, double click the selected component in the **Layout** editor. Alternatively, click **Edit** > **Properties** using the menu bar. This action displays a window with tabs for all component properties.



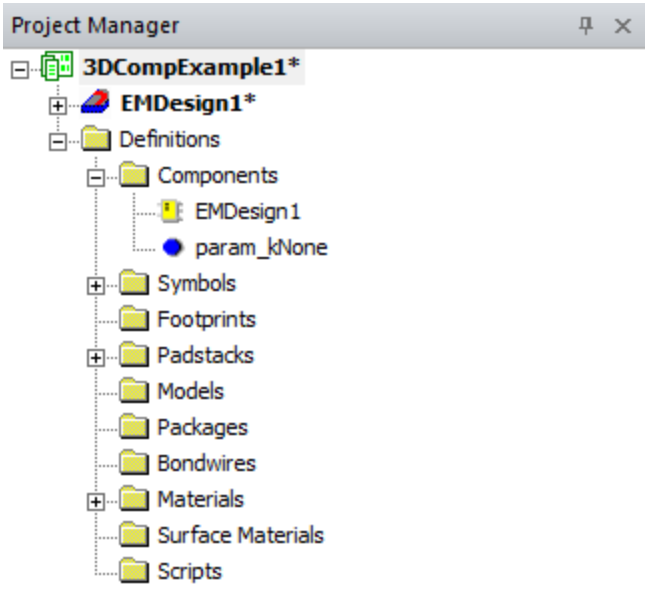
Selecting a 3D component in the **Layout** editor displays tabs for **3D Component Data**, **Param Values**, **Component**, and **Footprint** in the docked **Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3D Components in the Project Manager Window of HFSS 3D Layout

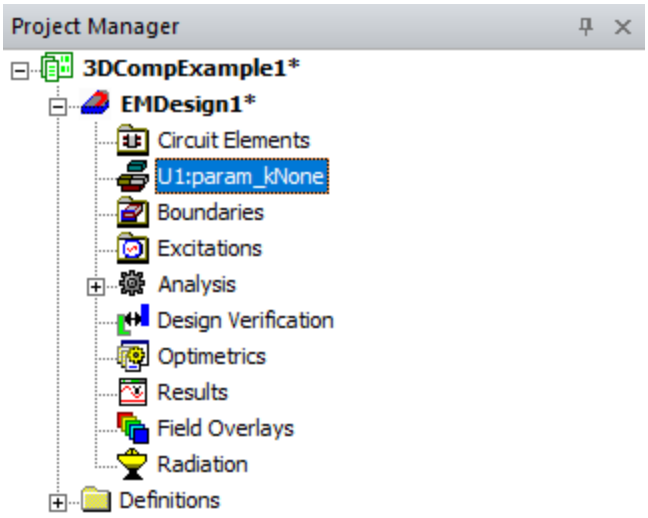
The **Project Manager** window organizes any 3D components added to the HFSS 3D Layout design under the **Components** folder in the **Project Tree**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

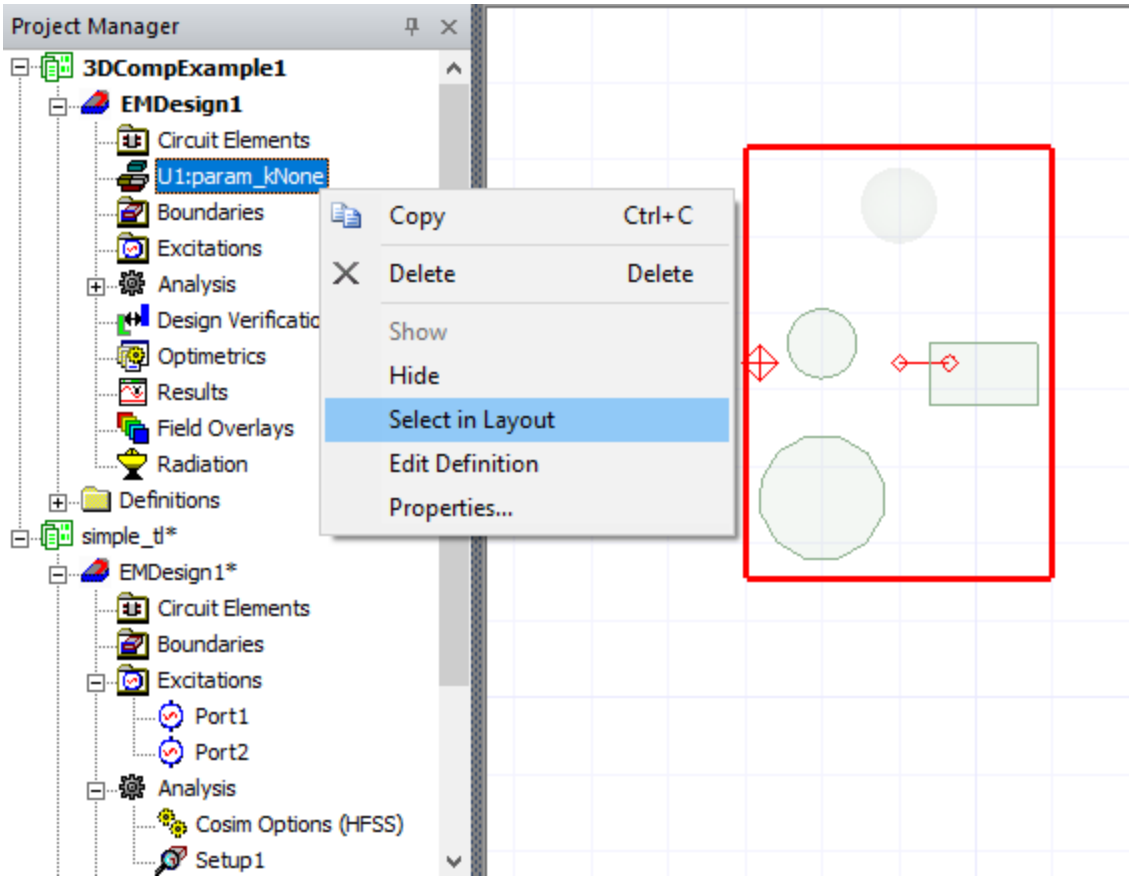
Click + drag a component to the **Layout Editor** to add it to the active design. Double-click a component in the **Project Tree** to open the Edit Component window.

Once a component is placed in the **Layout Editor**, it also receives a subfolder in the active design folder.



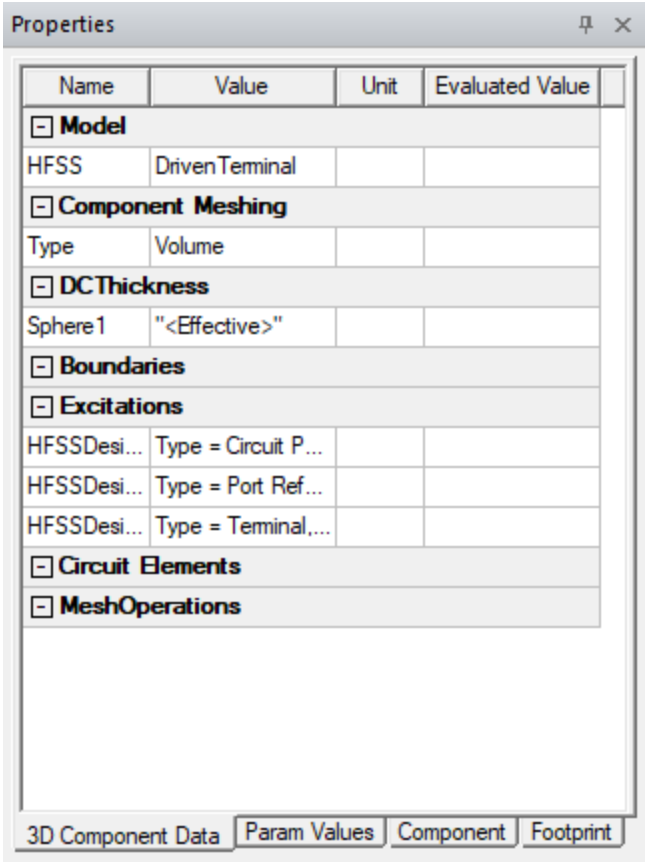
Right-click the 3D component in the active design folder and select **Select in Layout** to outline the placed component in red.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Boundaries defined inside the component do not appear in the **Project Manager**. However, boundary properties and other instance attributes will appear in the **Properties** window. Select the 3D component in the **Layout Editor** or right-click the component in the **Project Manager** > **Project Tree** > active design folder and the **Properties** window will populate with all of the component's instance attributes (e.g., find the component's defined boundaries under the *3D Component Data* tab in the **Properties** window).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

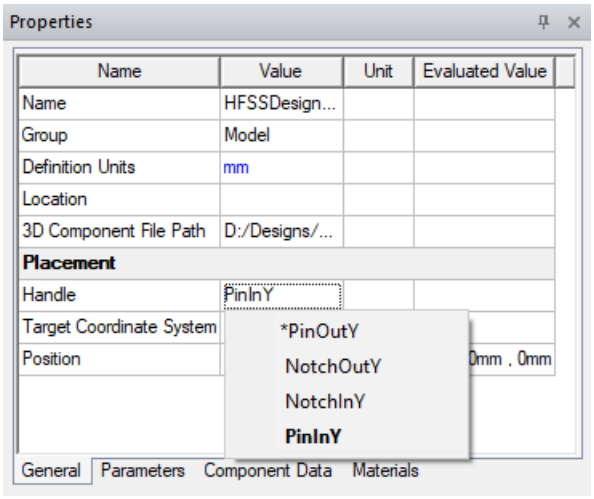


Editing 3D Component Properties

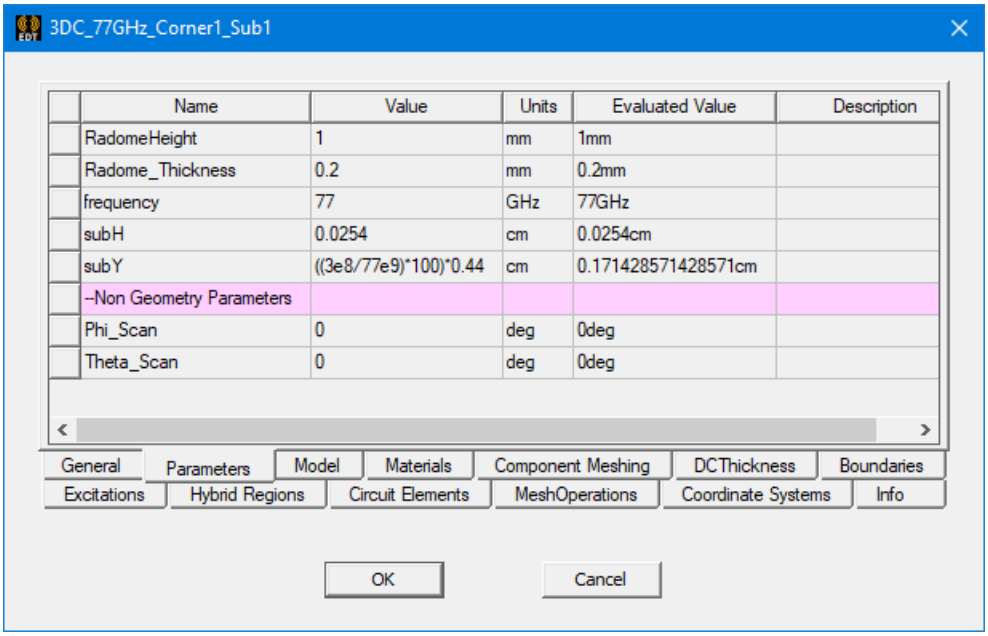
You can change and manipulate 3D components in several ways:

- Edit component handle and target CS in the General tab of component instance properties. All CS that are included in the component are available to be used as the handle. All coordinate systems in the assembly design that are eligible for component placement are available as target CS. Note that the default handle is shown with an asterisk.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Edit component parameters, if defined for that component. Editing the parameters of one component instance affects only that instance. If a component includes non-Geometry parameters, these are grouped separately on the Parameters tab.



- Copy/Paste component
- Delete component
- Arrange (Move, Rotate, Mirror) component
- Duplicate component (Along Line, Around Axis, or Mirror)
- Edit Attributes for Display Wire frame, Color, and Transparency.
- Use **Edit** > **Select** > **Submodel** to quickly select component

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Copy/Paste component
- Delete component
- Arrange component: Move, Rotate, and Mirror
- Duplicate component: Along Line, Around Axis, and Mirror
- Edit Attributes for Display Wire frame, Color, and Transparency
- Use **Edit** > **Select** > **Submodel** to quickly select component

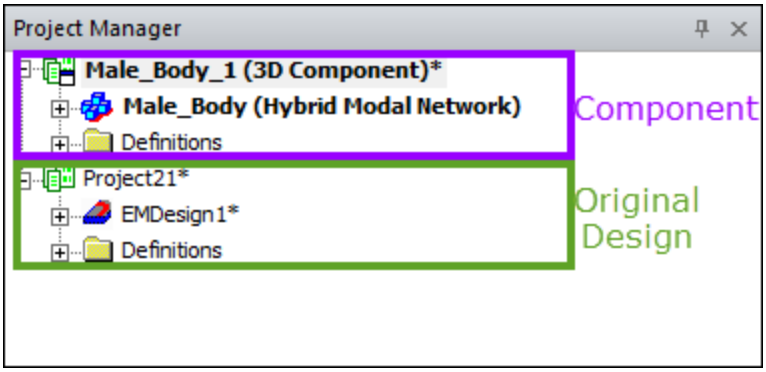
Editing a 3D Component Definition

> **Note:**
>
> If you reached this page looking for help on editing the definition of a **Layout Component**, as opposed to a *3D Component*, go here instead.

The **Edit Definition** feature allows the user to create new component definition using an existing, unencrypted 3D component file. This speeds up the task of creating new versions of components without having to start from the beginning. When **Edit Definition** is initiated, **Electronics Desktop** automatically creates a new project containing all 3D component data from the file in 'exploded' form. Component materials are added at the project level; variables are added at the project and design level; a detailed history is created for all objects in the component; and design data is added to the appropriate folders in the Project Manager.

> **Important:**
>
> Only 3D components that are **not encrypted** can be edited as described in this section.

The **Edit Definition** command creates a new project, named for the component, in the **Project Manager** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

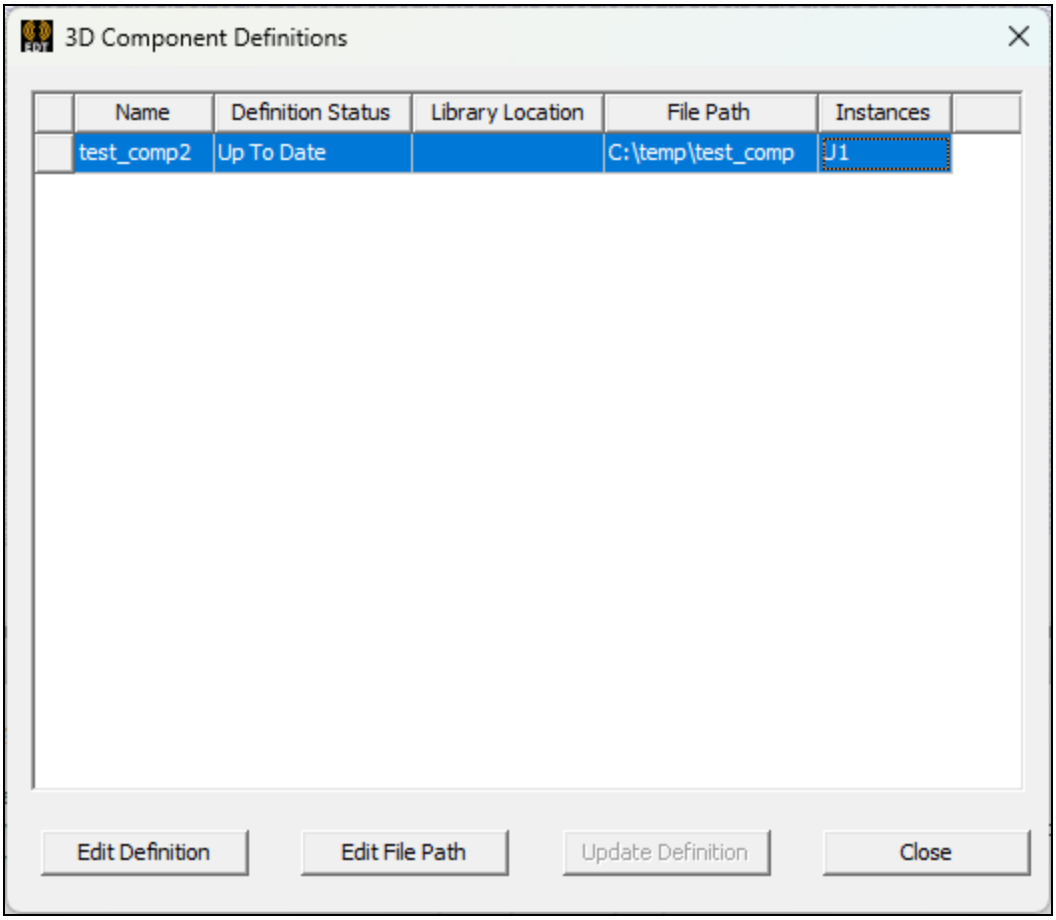
When the edited component is saved, an **Update 3D Component** window appears. From the **Update 3D Component** window, choose whether to save the edited component as a local instance or to the original library. To edit a 3D component definition, do one of the following:

1. Navigate to the **Edit Definition** window by following one of the following paths:
    - From the **Project Manager**, expand the **Project Tree** and active design folder. Then right-click the 3D component and select **Edit Definition**.

    - From the **Layout Editor**, right-click the 3D component and select **3D Components** > **Edit Definition**.
    - Click **Layout** > **3D Component Definitions** to open the **3D Component Definitions** window. From the **3D Component Definitions** window, select a

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

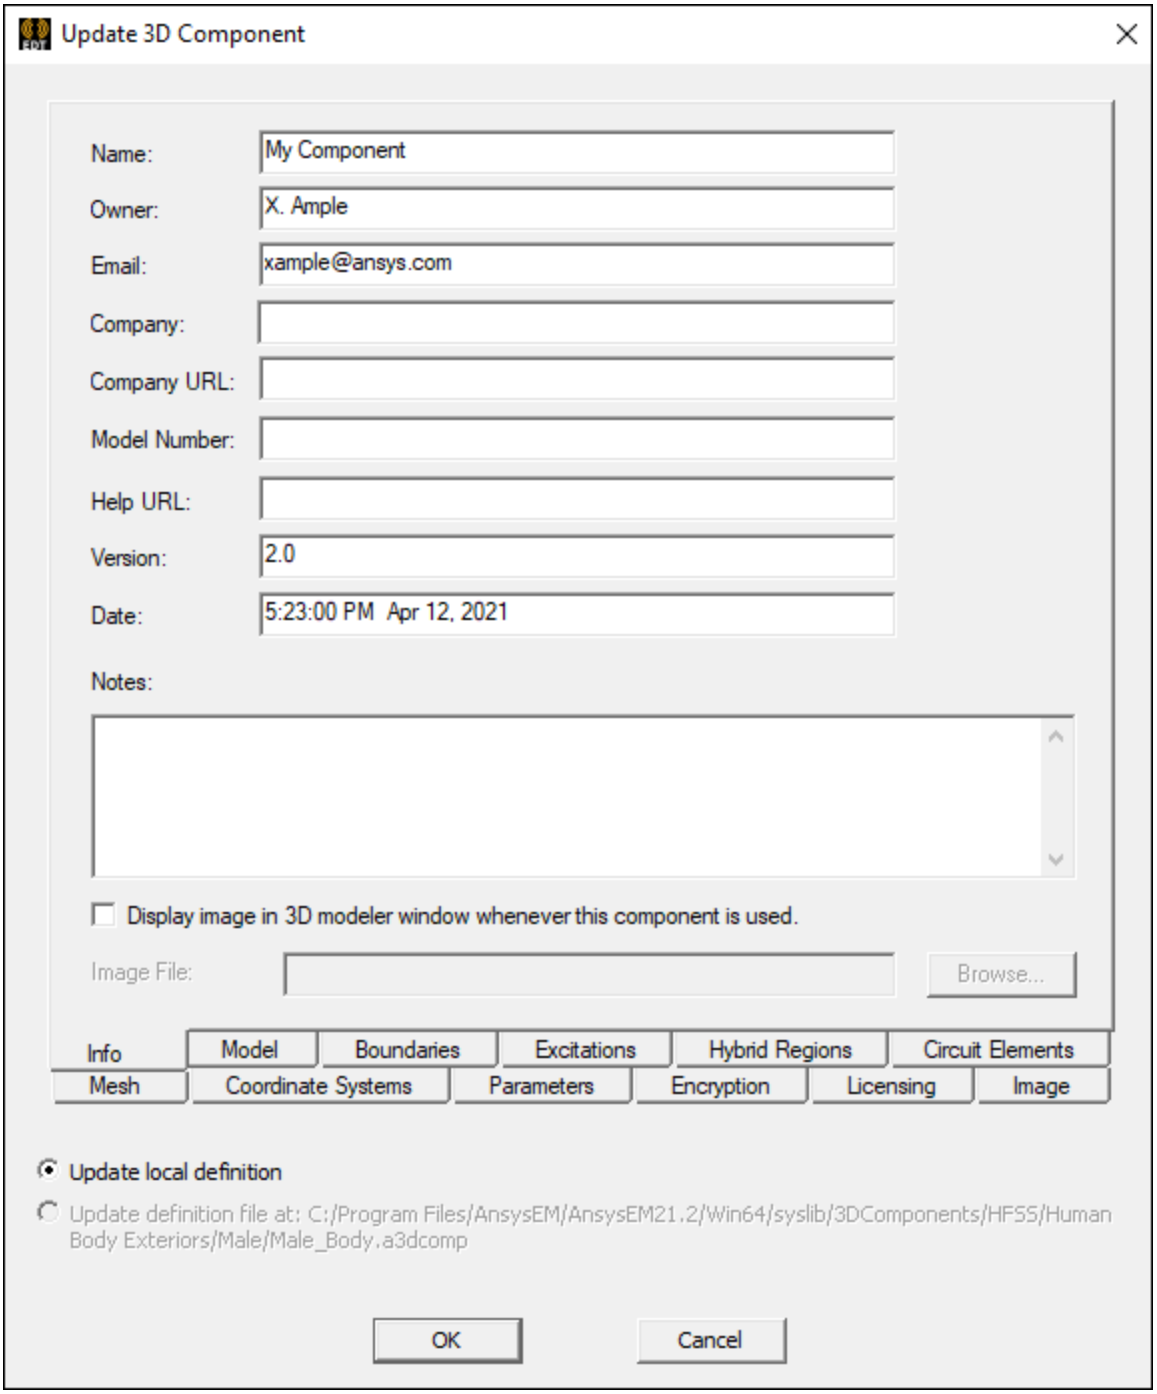
component and click **Edit Definition**.



Regardless of which path is taken, a copy of the 3D component opens in the **Layout Editor**, and a new project folder appears in the **Project Manager** window, containing a copy of the original design.

2. Edit the component as desired.
3. To save the component as a new component (*.*a3dcomp*) or as its own **Electronics Desktop** (*.*aedt*) file, click **File** > **Save As**. Specify a file name and destination and click **Save**.
4. To save the component in the current project or for all projects, click **File** > **Save** to open the **Update 3D Component** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This window is populated with all entities (objects, boundaries, excitations, etc.) in the component design.

5. Use the radio buttons to select one of the following options:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Update Local Definition** – updates the component definition for use in the original design only.
- **Update Definition File At <Path>** – updates the component in the component library, affecting all other instances.

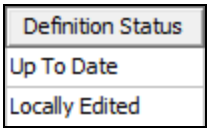
6. Click **OK**.

Verifying Updates to Components

To verify that a component has been edited:

1. Access the **3D Component Definitions** window:
   - From the **Project Manager**, right-click **3D Components** and select **Definitions**.
   - Click **Layout** > **3D Component Definitions**.

   The **Definition Status** column shows "Locally Edited" for any altered components.



2. Click **Close** to exit the window.

Updating Definitions

Once the updated component is saved, return to the original design and update all instances of that component. See: Updating 3D Component Definitions.

> **Note:**
>
> Definition update is not automatic even if **Edit Component** was initiated from that design. Instead, when an assembly design becomes active, a dialog box appears, prompting the user to update the 3D component definition. Then choose to update the definition from the prompt.

To update a component's definition:

1. Access the **3D Component Definitions** window:
   - From the **Project Manager**, right-click **3D Components** and select **Definitions**.
   - Click **Layout** > **3D Component Definitions**.

   Components with updates available display "Update Available" in the **Definition Status** column.

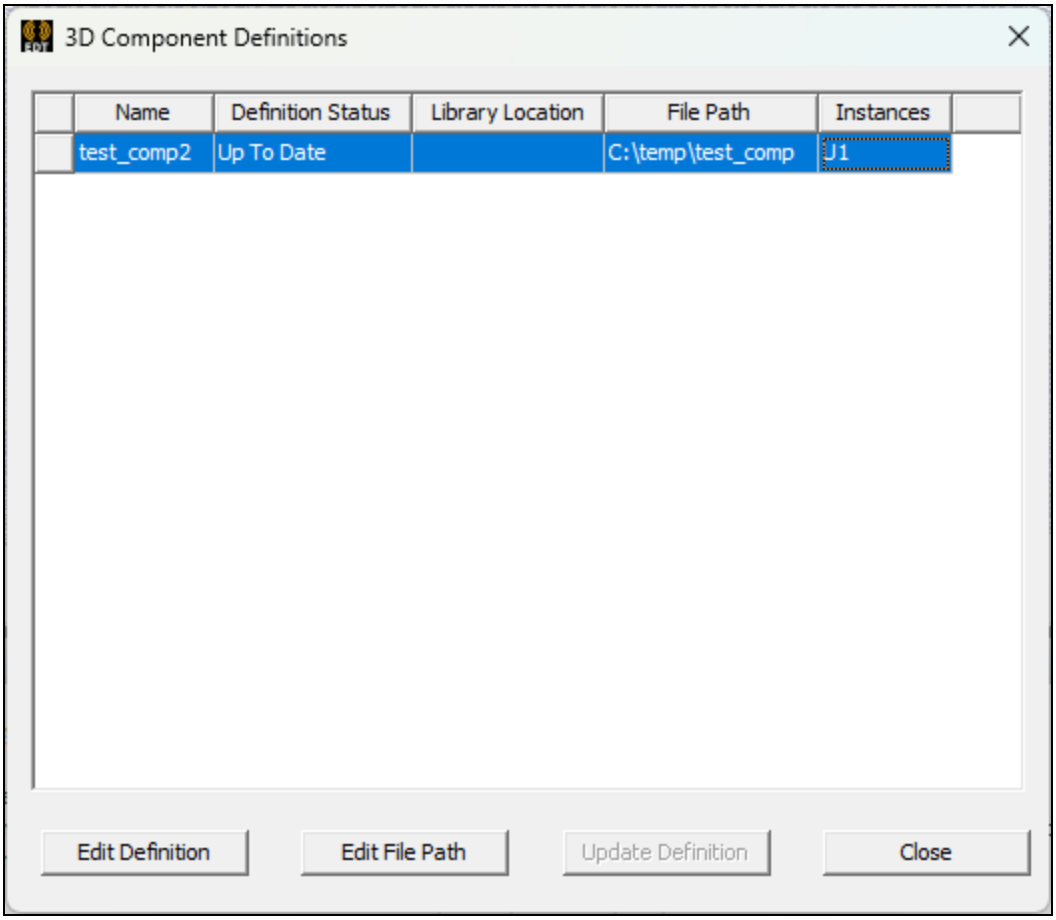
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Select the desired component and click **Update Definition**.
3. Click **Close** to exit the window.

Replacing 3D Components

3D components (and/or layoutcomponents) can be replaced everywhere they have been placed in a design simultaneously from the **3D Component Definitions** window. Complete these steps to make a replacement.

1. Navigate to **Layout** > **3D Component Definitions** to open the **3D Component Definitions** window.
2. Highlight a component and click **Edit File Path** to open an explorer window.



3. Navigate to the new component and either select it and click **Open** or double-click it to immediately replace the selected component. Keep in mind the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- All instances of the definition within the active design are replaced.
- All transformations (i.e., modifications) to the instance(s) are retained.
- All ports previously added to the instance(s) are also retained.
- Names are not retained.
- The replacement is irreversible.

Legacy Projects with 3D Components

Components created in earlier projects do not have the same degree of encapsulization and are not compatible with the current version and Ansys Electronics Desktop.

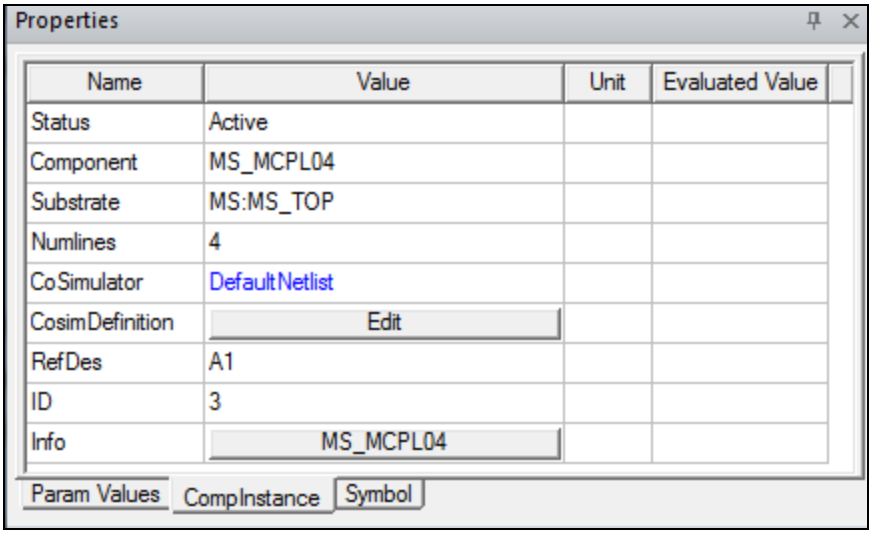
Legacy Projects: Do not encapsulate components

Stackup Definitions for HFSS 3D Models

The **Stackup** field on the **Define Co-simulation** window for an EM model is set to one of the following three values, in order to indicate which stackup definition are used to model a component when it is simulated by one of the EM solvers: Substrate Stackup, Layout Stackup, Footprint Stackup.

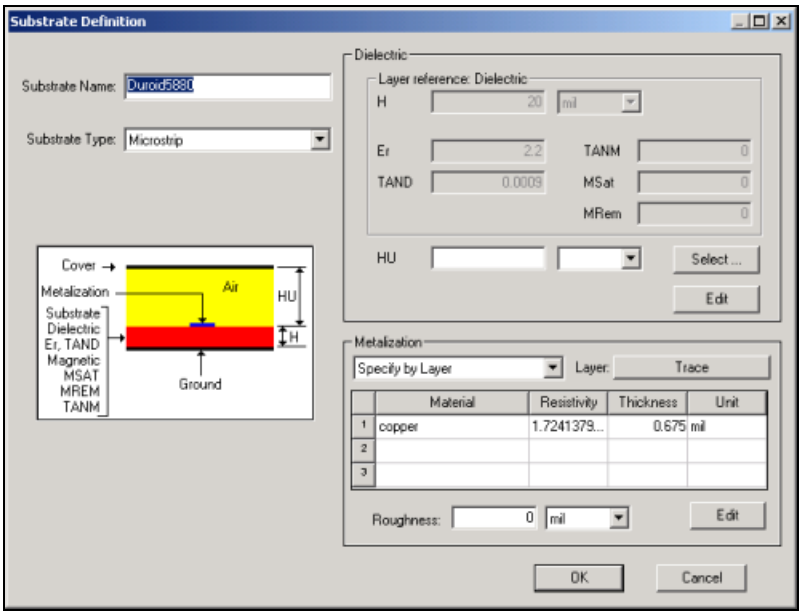
Substrate Stackup

By default, when a component is placed, the Ansys Electronics Desktop (AEDT)™ electronics systems design platform automatically associates a substrate definition with the CompInstance. Not all components need substrate definitions. If it is present, the **Substrate** definition are shown in the Substrate property in the **CompInstance** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **Substrate** property menu shows all defined substrates for this Circuit design. The menu may include the choice **<none>** to allow changing to a component that doesn't use a substrate definition (See Using Component Groups). The menu contains the **New** command which opens the **Substrate Definition** window.

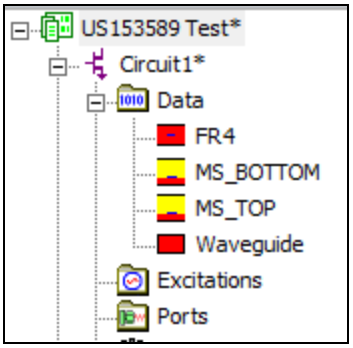


In this window, you have the option of either manually entering data describing the substrate or you can specify the data be taken from layers defined for the layout stackup (See Layout Stackup).

- To manually edit the Dielectric, click **Edit**.
- To pull data from a dielectric layer, click **Select**.
- To manually edit the metalization, click **Edit**.
- To pull data from a metalized layer, change the **Trace Metalization** drop-down menu to **Specify by Layer**, then click **Layer** to select the layer.

Substrate Definitions are all listed in the **Project Manager** window under the **Data** folder for the Circuit design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Double-click one of these icons to open the **Substrate Definition** window and edit the definition.

HFSS Etch Factor

Substrate manufacturing does not create exact geometry. The actual geometry of substrate manufacturing often results in different thicknesses in the dimensions of each geometry within a layer — and that difference is represented by an “etch” or “etch factor”. HFSS geometry allows for the presence of an etch factor in the design and modeling of different substrate layers. The specific etch factor that applies to a particular layer is usually available on the manufacturer. But in general, the etch factor is calculated by taking the ratio of the etch depth to the undercut, where the undercut is defined as being the part of the wafer that is etched away under the photoresist:

```
etch_factor = layer_thickness / (bottom_dimension - top_dimension) /
2
```

- When the bottom dimension of the stackup is larger than the top, the etch factor is positive.
- When the top dimension is larger than the bottom, the etch factor is negative.

For example, with a positive etch factor, a transmission line with a 2mm nominal width are 2mm wide on the bottom and narrower at the top. While the same transmission line with a negative etch factor are 2mm wide on the top and narrower at the bottom. An etch factor of 0 means no etch, and the top and bottom dimensions are the same. Also, very large etch factors — both positive and negative — result in little or no etch.

In HFSS, only signal layers can have an etch factor, dielectric and negative signal layers do not. HFSS supports an etch ratio that is referred to as the **HFSS Etch Factor**, and this etch is used when the mesh is created for an HFSS simulation. Note, however, the etch is not applied to geometry drawings in the 3D Layout view.

For more information see the Edit Layers window.

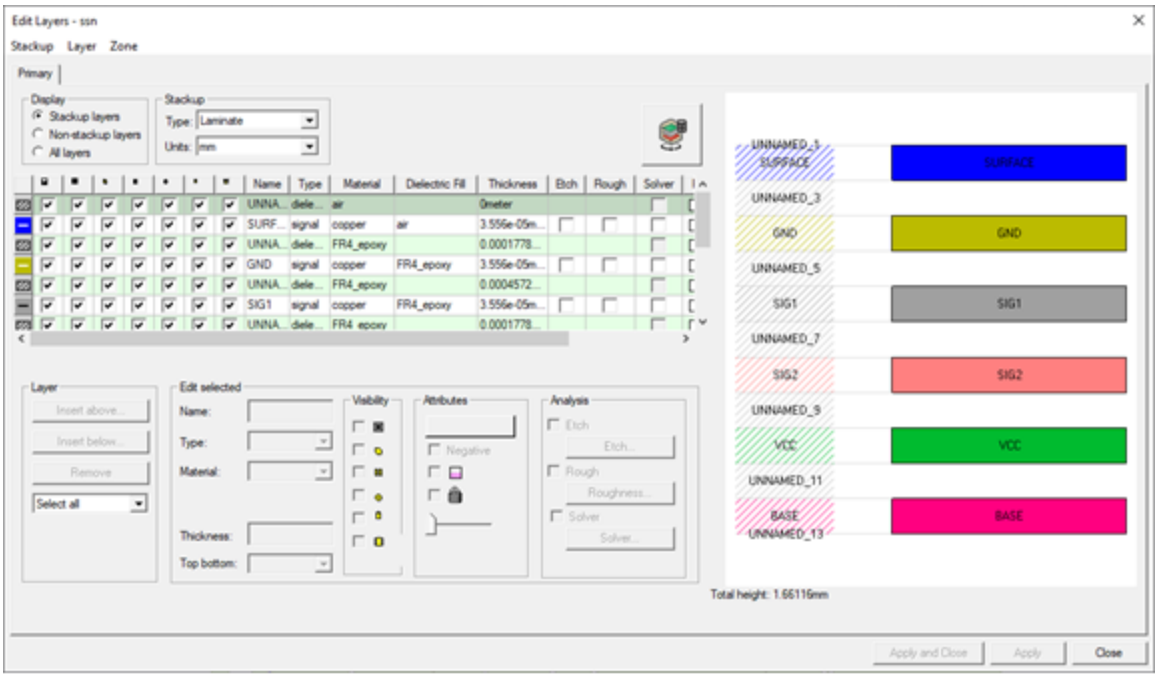
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Layout Stackup

A stackup is the list of physical layers in a circuit board. The Ansys Electronics Desktop (AEDT)™ electronics systems design platform offers three types of stackups:

- Laminate: All layers physically stack one another with no overlap on the Z-axis. This is the default type.
- Multizone: Layers physically stack on one another in the Z-axis but each layer can have zones made of different or no material.
- Overlapping: Layers can physically intersect one another on the Z-axis.

A stackup is defined in the Edit Layers window which you can use to add, configure, and remove layers on the stackup. To access this window on the **Layout Editor**, select **Layout** > **Layers**. If you are working in the **Schematic Editor**, select **Schematic** > **Layout Stackup**.



Configuring a Stackup

After adding a design to a project, the next step is to create the design's dielectric and signal layers using the **Layout Editor**. Layers are defined and modified in the **Edit Layers** window; use the window to import a stackup defined in an XML file. The XML file that defines the stackup is typically created using a third party text editor such as Microsoft Notepad or VI on Linux. For more information see Importing a Stackup.

Embedded Dielectric Layers

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A signal layer can be assigned a dielectric material. And since signal layers are permitted to overlap other layers, create a stackup with dielectric materials embedded within other layers.

HFSS Analysis

Meshes correct modeling, and the dielectric materials are sent to the HFSS solver.

To configure a stackup:

Click anywhere on the **Layout** view window to activate it.

From the **Layout** menu, select **Layers** to open the **Edit Layers** window.

3. Use the window to modify the stackup. Functionality available includes:
   - Import a new stackup from an xml control file.
   - Add a layer.
   - Remove a layer.
   - Specify whether a layer in the project is editable or visible. Select the color, pattern, and position of each layer in the project. Click on column headings to configure which columns to display.
   - Specify the name, material attributes, thickness, elevation, and roughness of each layer in the project. Click on column headings to configure which columns to display.

> **Note:**
>
> Click **Apply** in the Edit Layers window to apply the changes you make; click **Close** to close the window.

Laminate Stackup

In a laminate stackup, all layers physically stack one another with no overlap on the Z-axis. Laminate layers extend over the entire design space in the X-axis and Y-axis. Laminate stackups are the default type of stackup.

With a laminate stackups, all controls appear on a single tab of the **Edit Layers** window. Options are available in the **Stackup** and **Layers** menus but not the **Zone** menu. When a new layer is created, the window automatically offers the opposite type of layer from what is highlighted in the **Grid Control** pane (e.g., a new signal layer if a dielectric layer is highlighted).

The lower and upper elevation columns are not visible by default but can be activated by the user. The thickness of layers may be edited but not the lower elevation. Layers may be reordered by dragging a layer to a new position in the **Grid Control**. See Elevation in Laminate and Multizone Stackups.

When visible, a laminate stackup layer has its **Dielectric Fill** specified for signal layers.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Multizone Stackups and Rigid-Flex Bends

Creating a multizone stackup allows a design to be divided into areas called zones. Each zone contains a subset of layers available to the entire circuit board and is spatially defined by polygons on the **Outline** layer.

When an object (e.g., a primitive) is placed on a layer, it is also placed in a zone. Objects belong to the zone where their center point resides, even if part of the object is in another zone. Likewise, terminals and ports also belong to the zone in which they reside. If an object with terminals is placed over a zone boundary, the terminals are automatically assigned to the zone they are in. Those terminals may only be placed on the layers available in their zone. If a zone boundary changes, the zone placements of all terminals, padstacks, and objects are automatically recomputed. Objects in a zone may only be placed on layers in that zone (e.g., if a voltage source is placed over multiple zones, its individual terminals are assigned to the zones in which they are located).

> **Note:**
>
> You cannot remove a layer from a zone if there are objects on that layer and in that zone.

Follow the steps in each subsection to define a multizone stackup and add rigid-flex bends to a design model.

Continue to Creating a Multizone Stackup.

Creating or Importing a Multizone Stackup

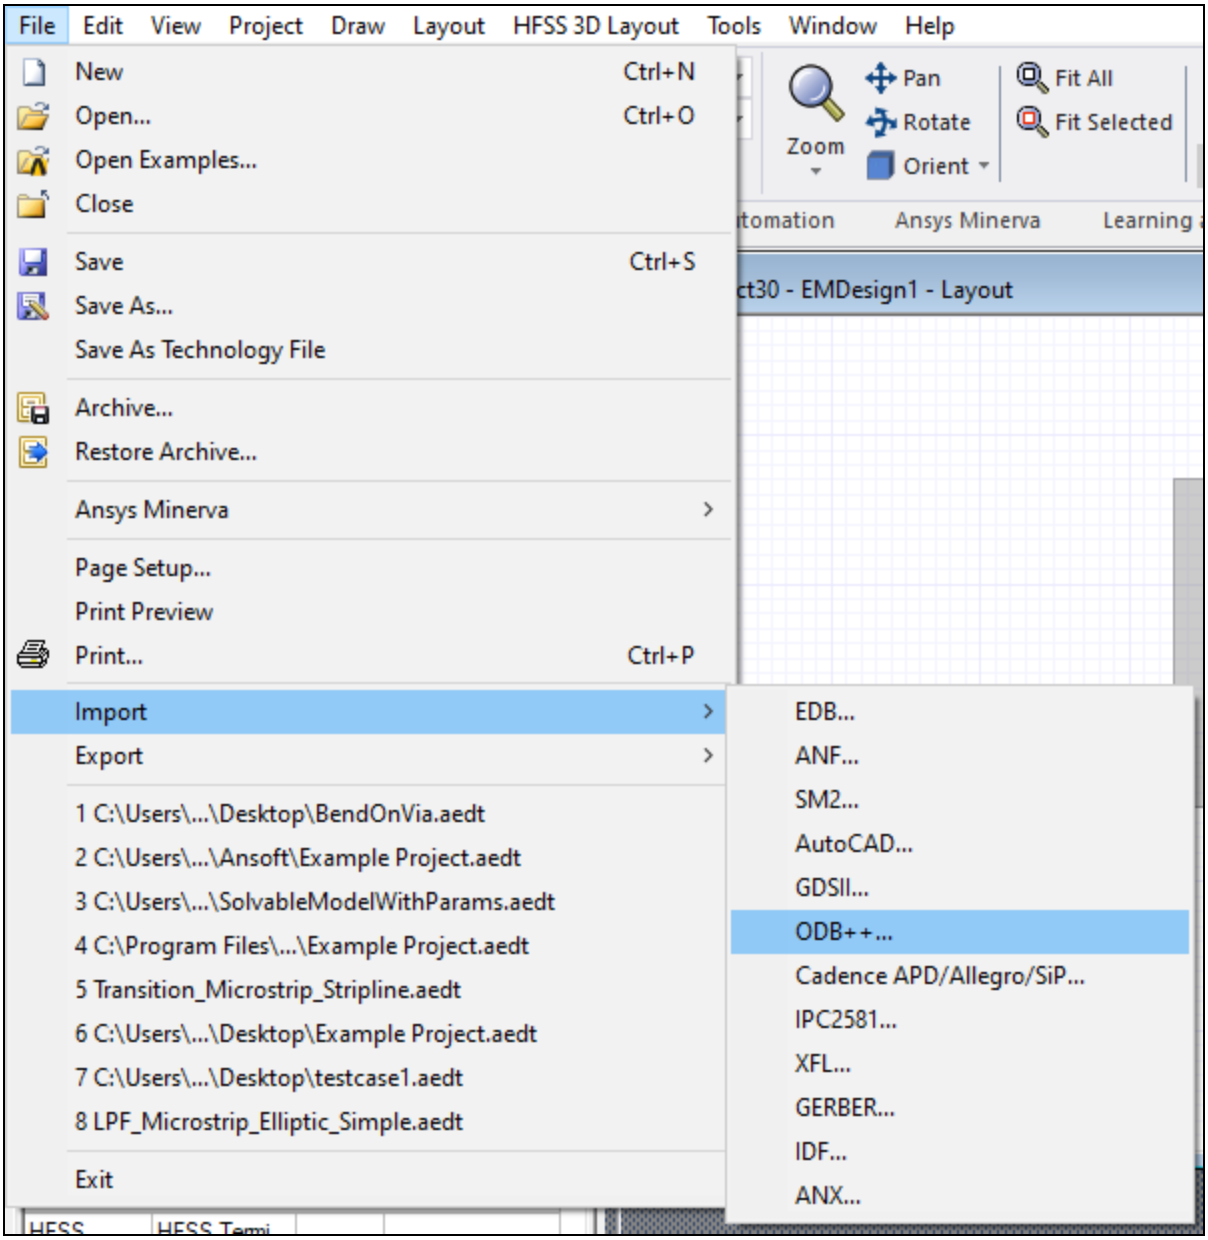
Follow the steps in either subsection to create or import a multizone stackup.

Importing a Multizone Stackup

Follow these steps import a multizone stackup.

1. From **File**, select **Import** > **ODB++**, **Cadence APD/Allegro/SiP**, or **IPC2581** to open an explorer window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Navigate to an appropriate file. Then double-click the file or select the file and click **Open**.

> **Note:**
>
> Multizone stackup import supports ODB++ *.*tgz*, Cadence *.*brd*, and IPC2581 rev. c *.*cvg* or .*xml* file types.

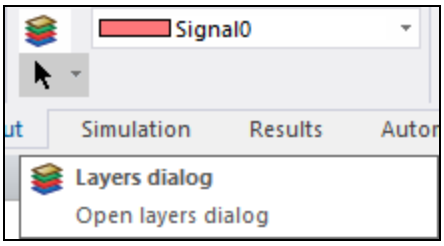
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. If applicable, refer to Importing ODB++ into the Layout Editor, Importing Cadence APD/ALLEGRO/SIP Files into the Layout Editor, or Importing IPC2581 Files into the Layout Editor.
4. Make further changes to the imported stackup by completing the steps in Creating a Multizone Stackup.

Creating a Multizone Stackup

Follow these steps to enable multizone editing and add zones to a project.

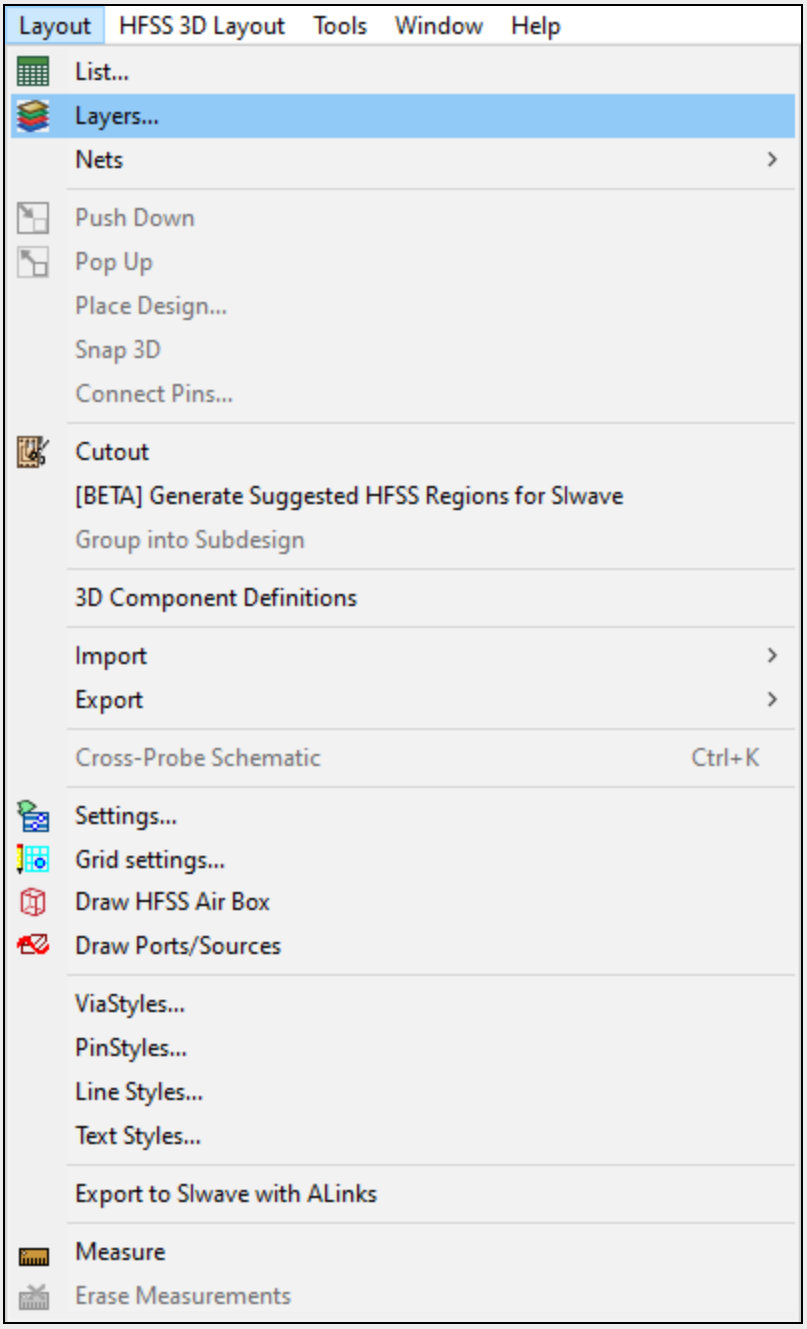
1. Once **Electronic Desktop** restarts, **Create** or **Open** a project. Refer to "Creating Projects" on page 3-76 or "Opening Projects" on page 3-70.
2. From the **Layout** tab, select **Layers dialog** to open the **Edit Layers** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

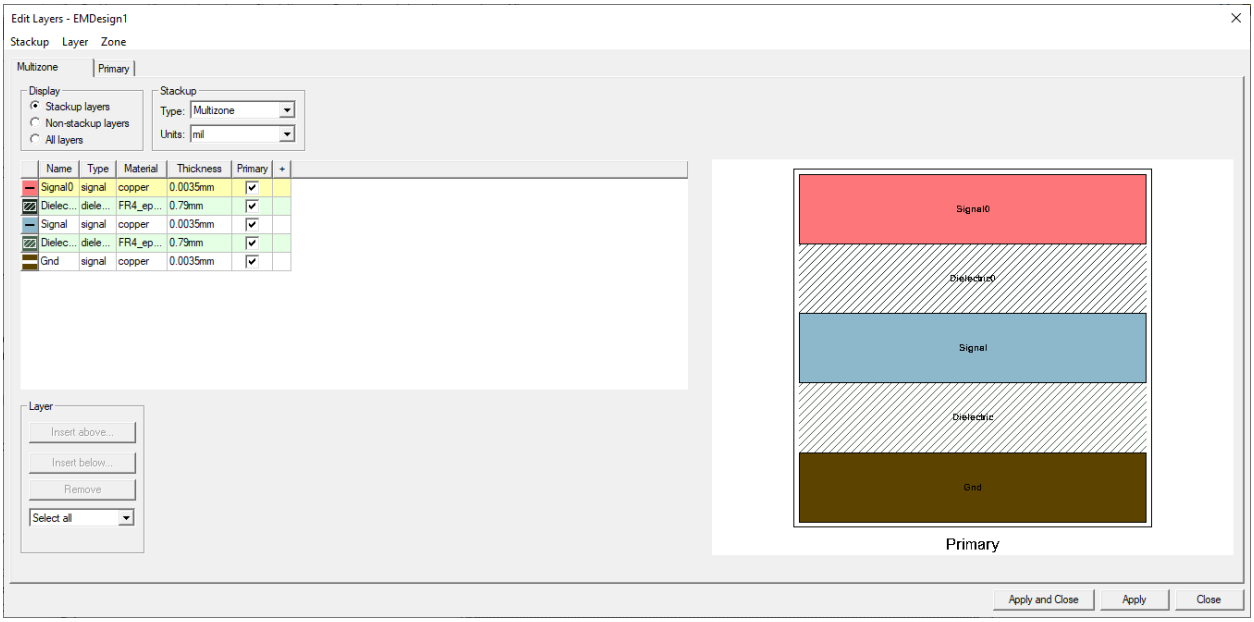
Note:

Alternatively, from **Layout**, select **Layers** to open the **Edit Layers** window.



3. Select **Multizone** on the **Type** drop-down menu and the **Multizone** tab appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. If the design was imported with multiple zones already active, make any appropriate changes using the same methods described in the The Edit Layers Window for editing layers.

Continue to Creating or Copying Zones.
w

Creating or Copying Zones

Follow the instructions in the subsections below to create or copy zones.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

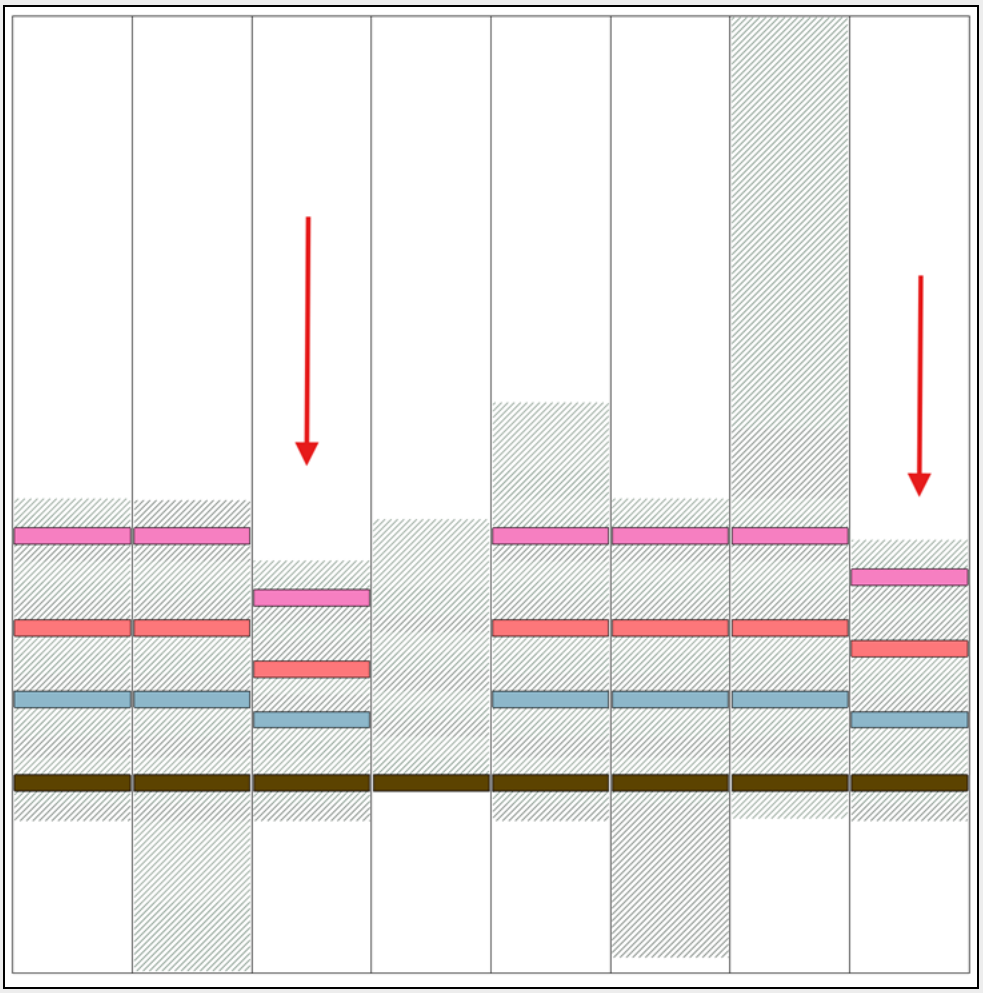
Note:

When creating a multizone stackup, it is important to ensure that signal layers align consistently between zones. Each zone has its own local stackup, which is a subset of the full board layer structure. If a signal layer in one zone does not align vertically with the corresponding signal layer in another zone, a discontinuity is introduced at the boundary between the zones.

For example, if "Signal Layer 1" exists at different vertical positions in Zone 1 and Zone 2, or is absent in one of them, the transition between zones may result in unintended electrical behavior (e.g., an open circuit). There is no automatic correction in pre-processing or meshing to resolve misaligned or discontinuous stackups across zone boundaries. These discontinuities are preserved in the mesh and can impact simulation results.

The following image shows a discontinuous signal layer transition between zones, indicated by red arrows.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Adding a New Zone

From the **Edit Layers** window, click **+** adjacent to the right-most column header to add a new zone with the same layers. Repeat as selected.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

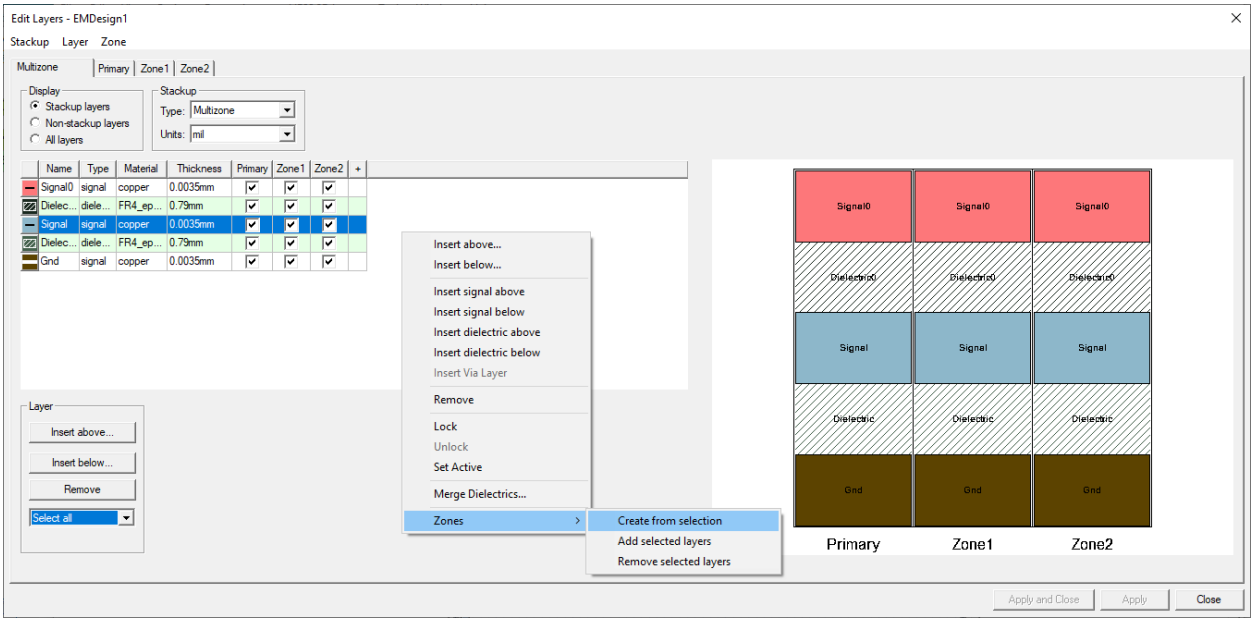
Zones will be added in sequence (i.e., to **Primary**, which appears by default, will be added **Zone 1**, **Zone 2**, et cetera). A new tab appears for each zone:

- **Multizone** – lists all layers and allows users to allocate layers to zones.
- **Primary** – controls layers in the **Primary** zone. The **Primary** zone may contain a subset of layers, but all components not contained in a **Zone** are treated as if they are in the **Primary** zone.
- **Zone*N*** – control layers in their respective zone. Each zone is labeled with the corresponding zone's designation.

Adding a New Zone With Specific Layers

From the **Edit Layers** window, **Ctrl**+**click** anywhere within the selected layer(s). Then either right-click and select **Zones** > **Create from selection** or navigate to **Zones** > **Create from selection**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



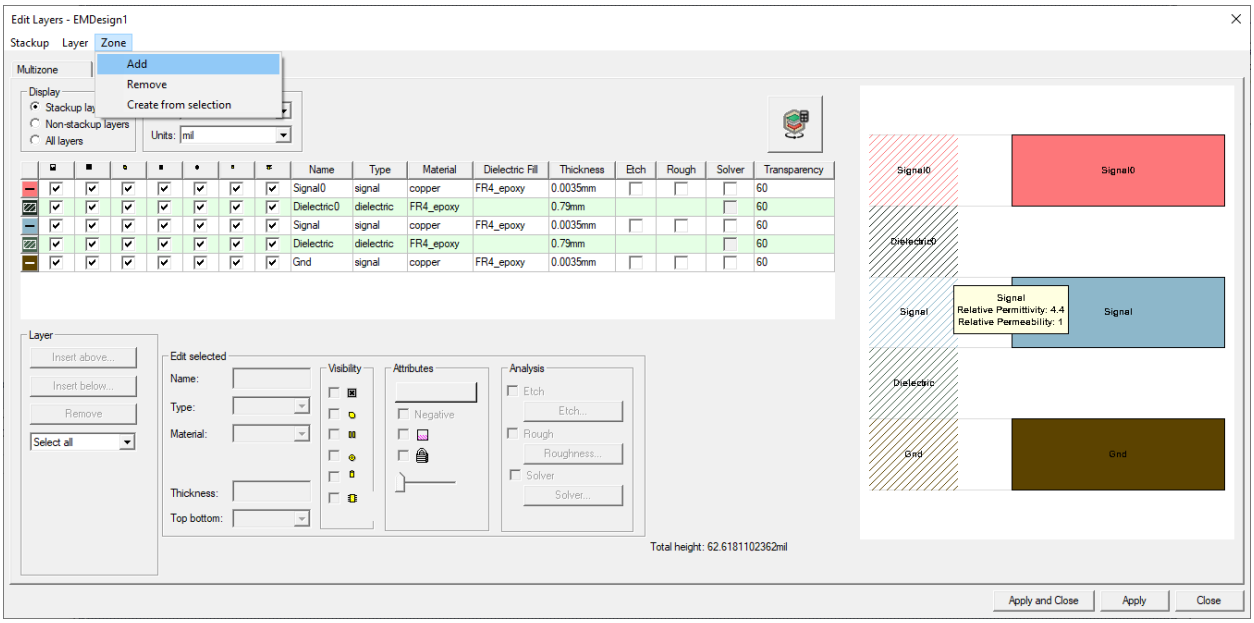
The new zone has only the highlighted layer(s).

Copying a Zone

From the **Edit Layers** window, navigate to the selected zone's tab and make any appropriate changes. Then navigate to **Zone** > **Add** to copy the selected zone to the next sequential number

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(e.g., copying **Zone 2**, when **Zone 3** has already been added, will designate the copy as **Zone 4**).



Continue to Editing Zones.

Editing Zones

Once zones are created, follow these steps to edit the zones.

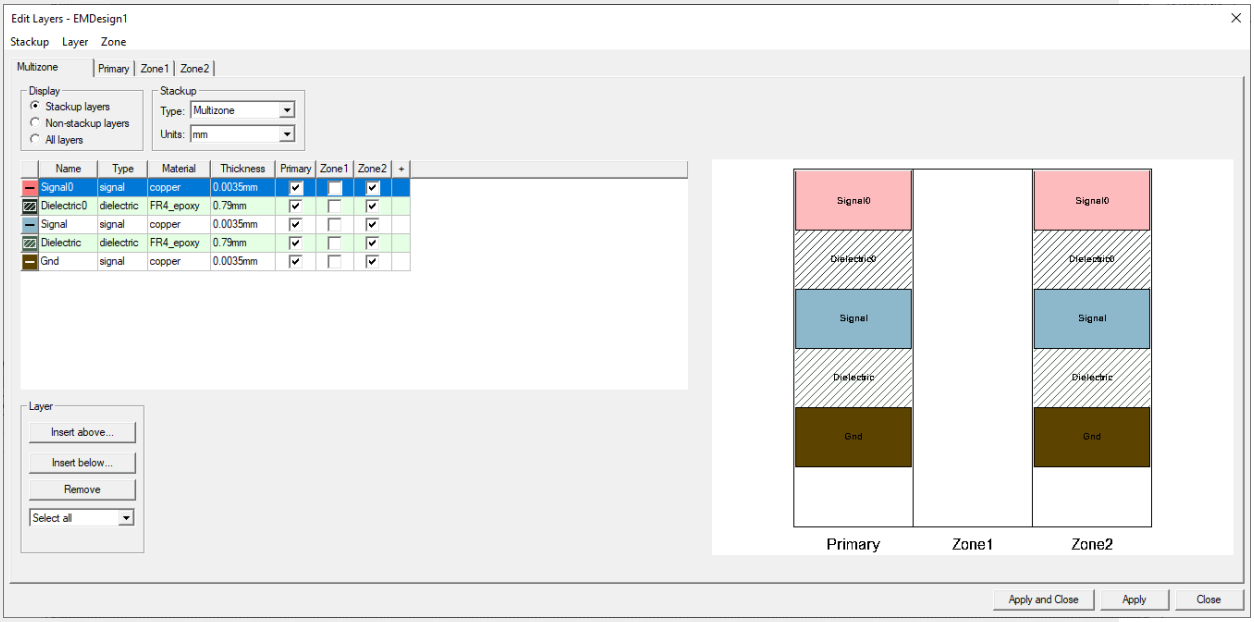
1. Edit the new zones (e.g., add or remove layers, et cetera) using the same methods described in the The Edit Layers Window for editing layers.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

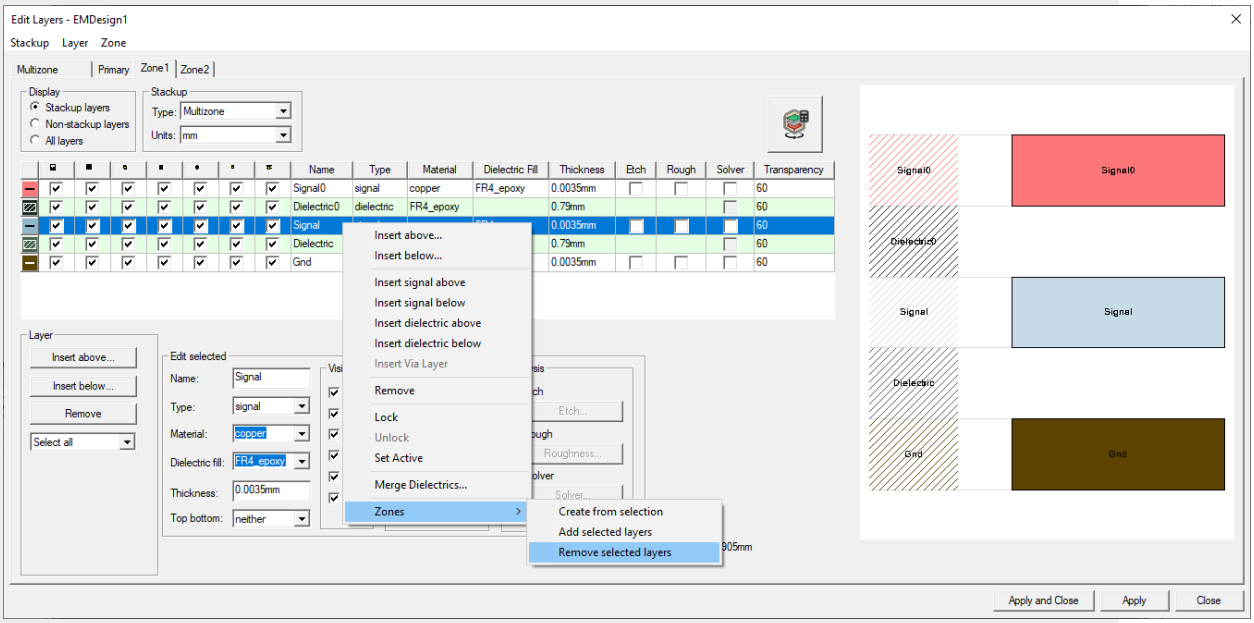
If a layer cannot be removed, check that an object (e.g., a primitive) is not still on that layer or in that zone. Then do one of the following:

- Remove the check on the box in the zone's column. View the change in the preview window.

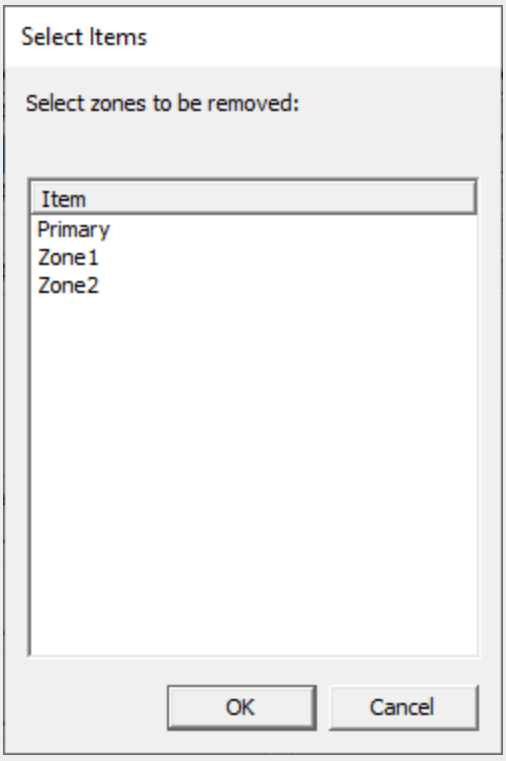


- Select the inappropriate layer or **Ctrl+click** to select multiple layers. Then right-click and select **Zones** > **Remove selected layers** to open the **Select Item** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Select the appropriate zone and click **OK** to close the window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Layers can also be removed from zones after bends have been created and defined (i.e., after Defining Rigid-Flex Bends).

2. Click **Apply and Close** to close the **Edit Layers** window and return to the **Layout Editor**.

Continue to Defining Zones.
will

Defining Zones

Follow these steps to outline and define the new zone(s) using the **Rigid-Flex Workflow**.

Note:

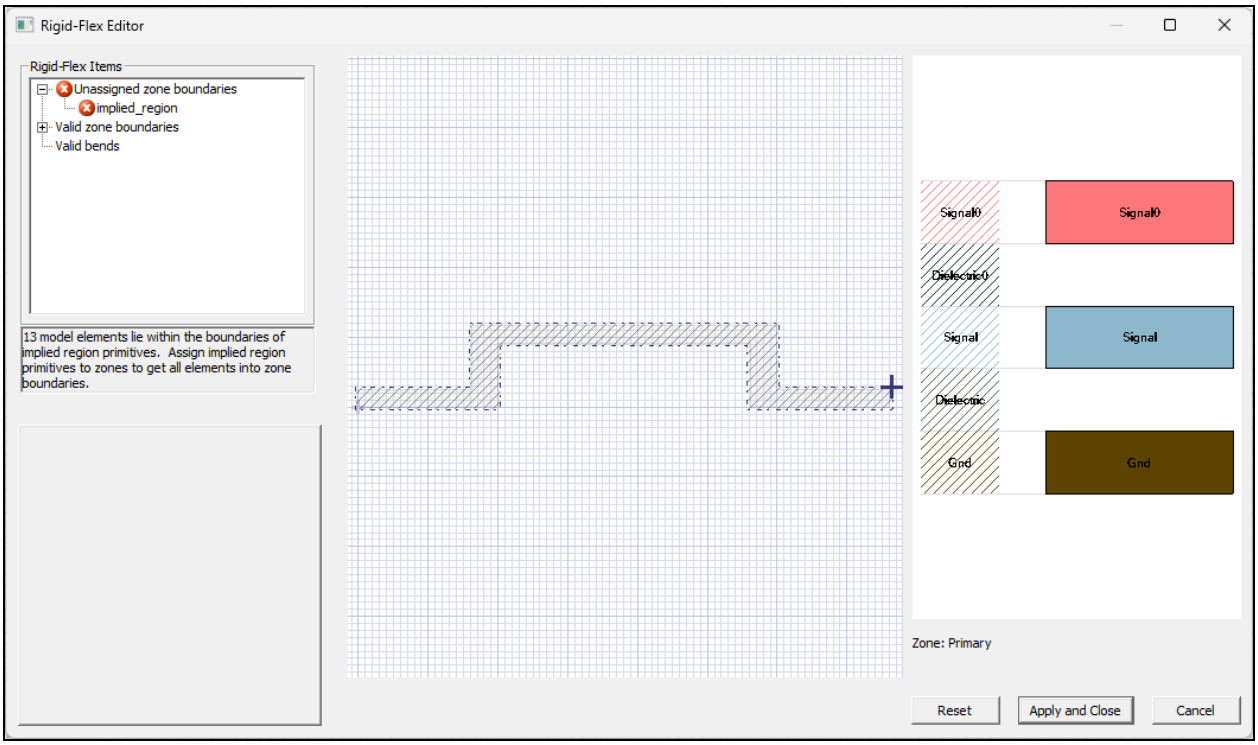
The **Rigid-Flex Workflow** is only available after a design has been imported or created, and **Multizone** is selected as the stackup's **Type**. Refer to the previous subsections of the "Multizone Stackups and Rigid-Flex Bends" on page 6-31.

Note:

Zones can be defined at the **Layout Editor**, but the **Rigid-Flex Editor** window provides a dedicated environment for managing rigid-flex zones and bends, and includes a specialized message window that displays warnings and setup-related messages not shown in the standard **Message** window. These additional messages can help identify potential configuration issues early in the design process, making the **Editor** a more robust option for preparing complex rigid-flex models.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

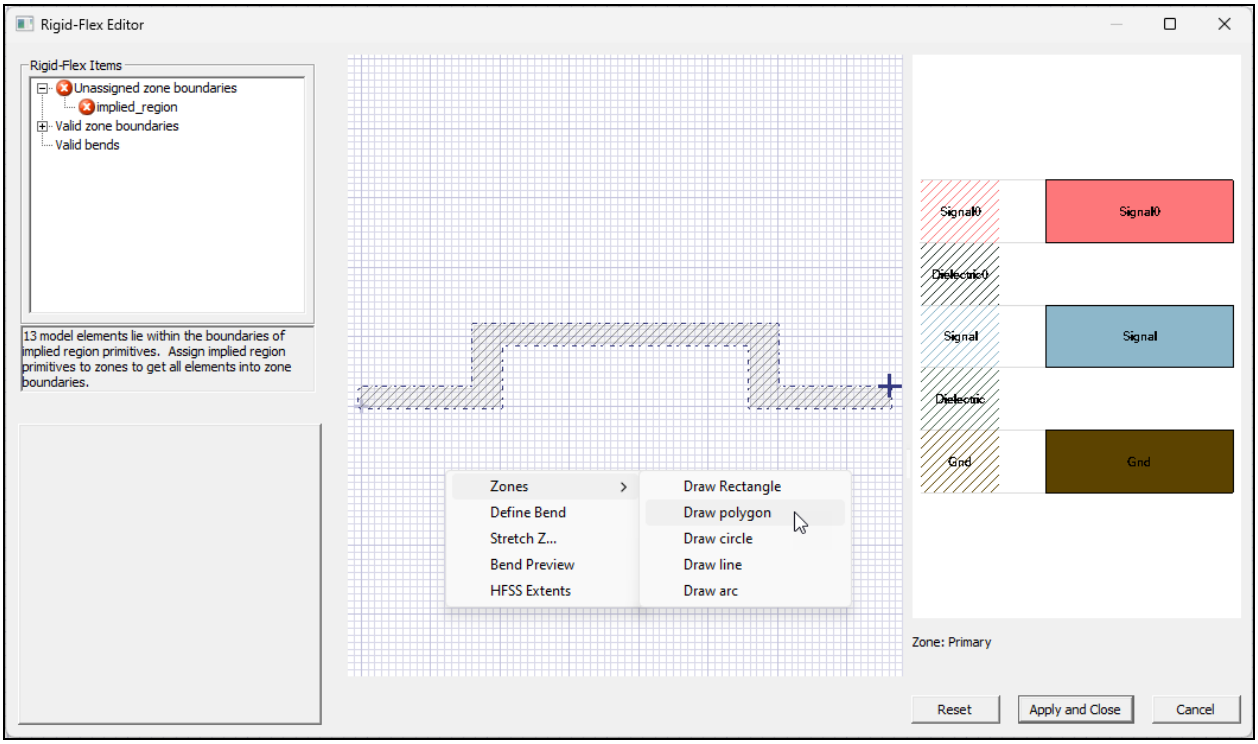
1. From the **Layout** tab, click **Rigid-Flex** to open the **Rigid-Flex Editor** window.



> **Note:**
>
> As zones are created, they will appear in the **Rigid-Flex Items** area. Outline primitives that are not assigned to a zone will be located in the **Unassigned zone boundaries** section as **implied region(s)**.

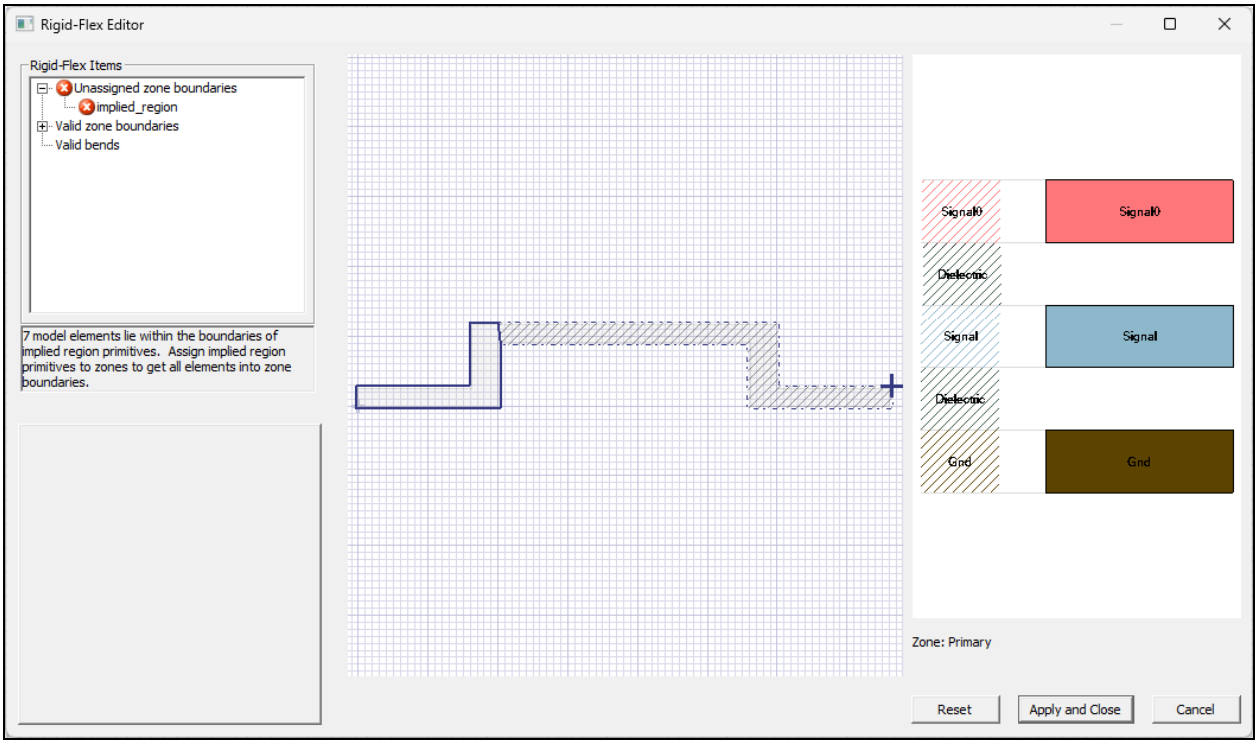
2. From the **Rigid-Flex Editor** window, define a zone by doing the following:
   a. Right-click within the preview window and select **Zones** > any primitive drawing tool (e.g., **Draw polygon**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



b. Click within the preview window to draw a zone using the same method described in the HFSS 3D Layout Getting Started Guides for drawing primitives in the **Layout Editor**.

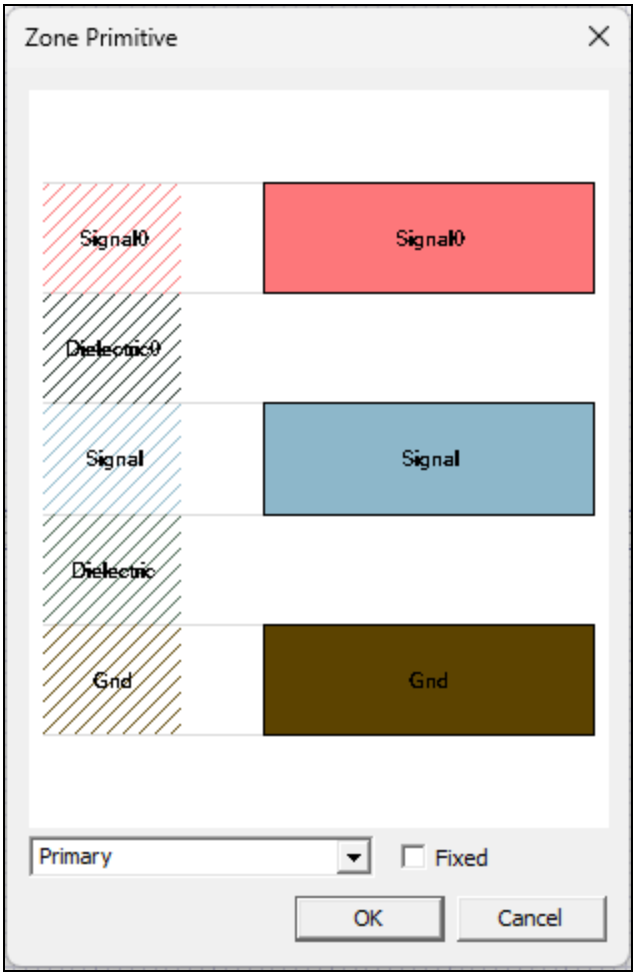
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



> **Note:**
>
> Click **Reset** at anytime to undo any changes and begin again.

c. Double-click to complete the outline and open the **Zone Primitive** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



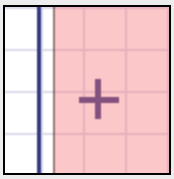
d. From the **Zone Primitive** window, select the appropriate zone designation from the drop-down menu (e.g., **Primary**).

e. Check the **Fixed** box, if applicable. A fixed primitive is used as reference during the bending process and contains the anchor point.

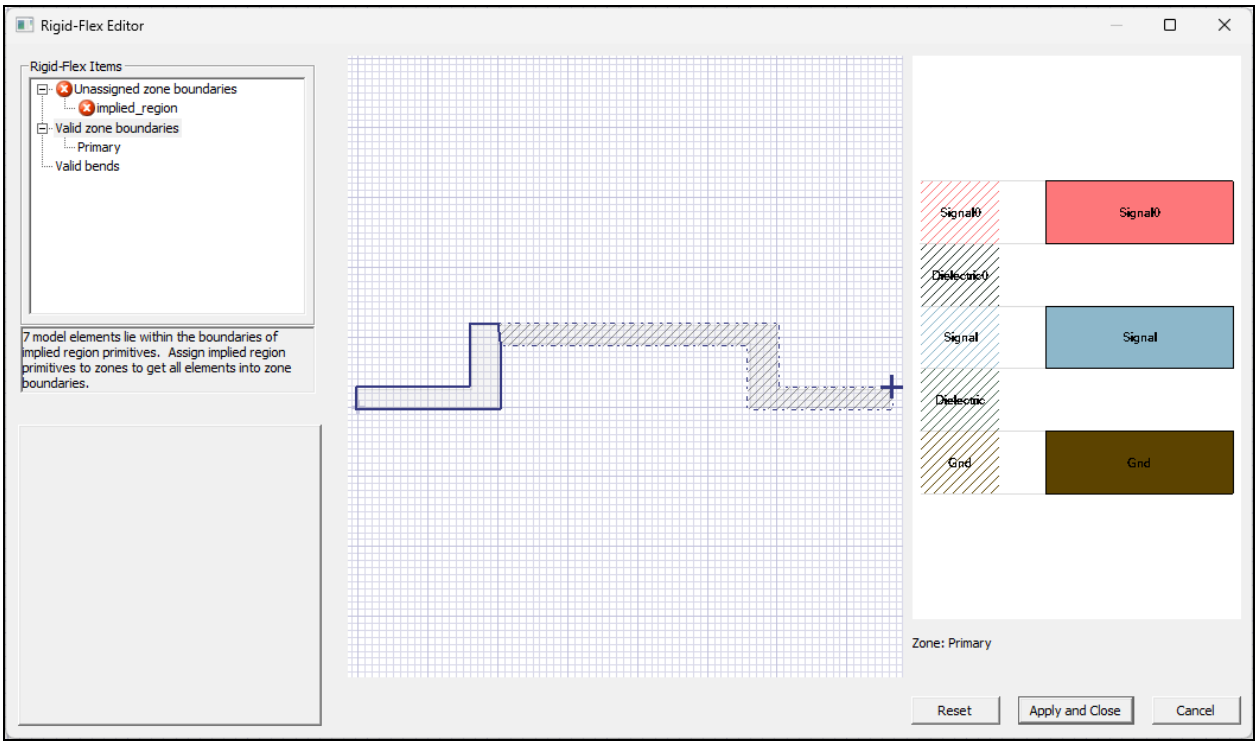
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The anchor point appears as a bold crossbar within the design. Its position will remain stationary during the bending process. Although a bend can be applied to the primitive that contains the anchor point, it cannot intersect the anchor point. The anchor point can be dragged to another location or even another primitive. Any primitive that contains the anchor point is **Fixed**. The anchor point is visible in the **Layout Editor** if the user is Defining Zones.



f. Click **OK** to close the **Zone Primitive** window.



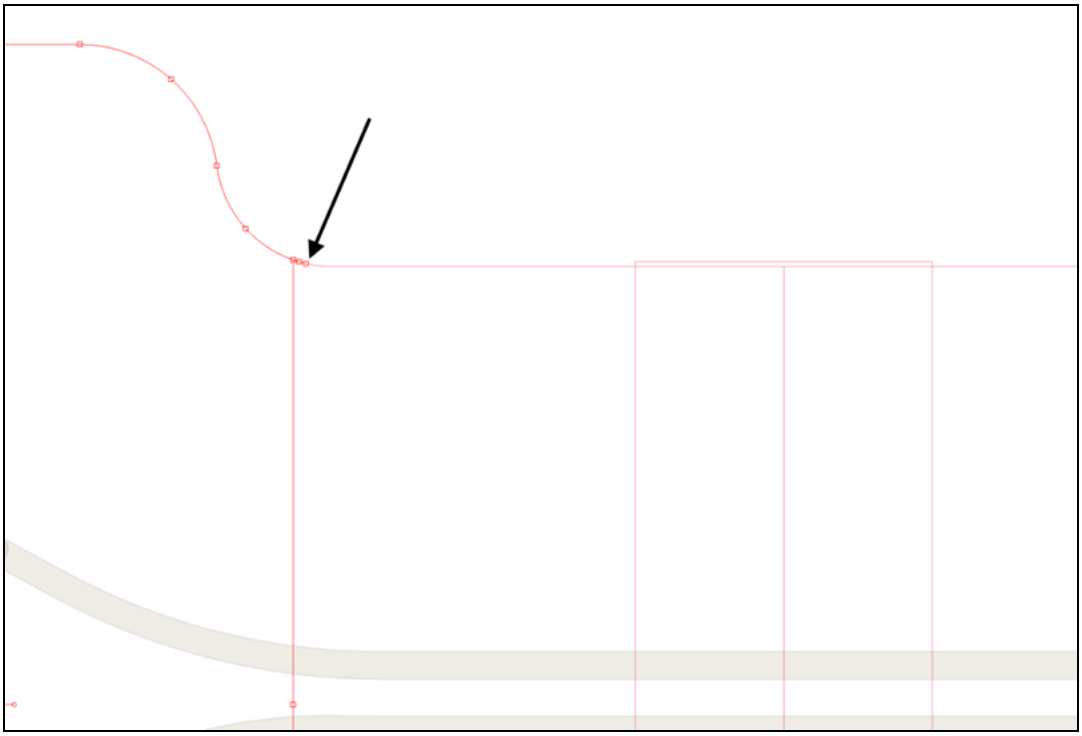
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Understanding Zone Boundaries

Although simulation includes a robust pre-processing routine to automatically clean up zone boundary definitions, *starting* with clean, well-defined zones greatly improves simulation reliability and performance. Rather than relying on implied regions, ensure proper behavior during simulation and meshing by verifying that zone boundaries are clearly defined on the **Outline** layer. Ensure the following:

- Zones are explicitly defined using polygons and no implied regions remain when the design is ready for simulation.
- Zone polygons are well-formed and do not contain gaps between adjacent regions.
- **No** components cross defined zones.
- Zone boundaries do not create zero-area regions.

The following image shows a zero-area region that could potentially cause meshing errors.



Using HFSS Model Extents to Modify Zones

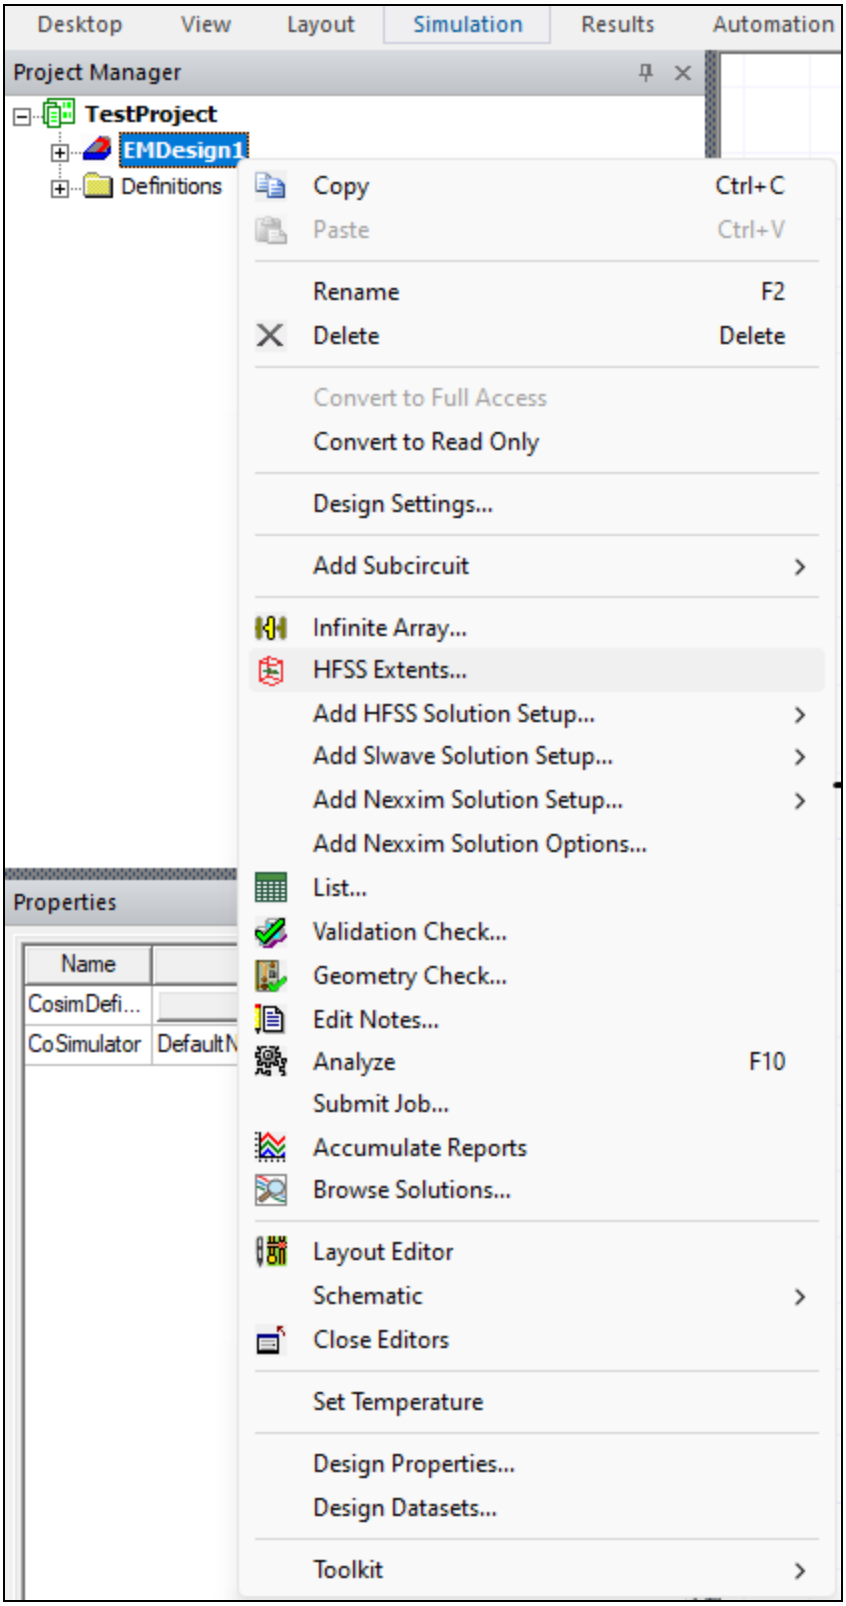
Follow these steps to use **HFSS Extents** to modify the dielectric and airbox extents. Refer to HFSS 3D Model Extents.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. To open the **Set HFSS Model Extents** window, do either of the following:
   - From the **Layout** ribbon, click **HFSS Extents**.

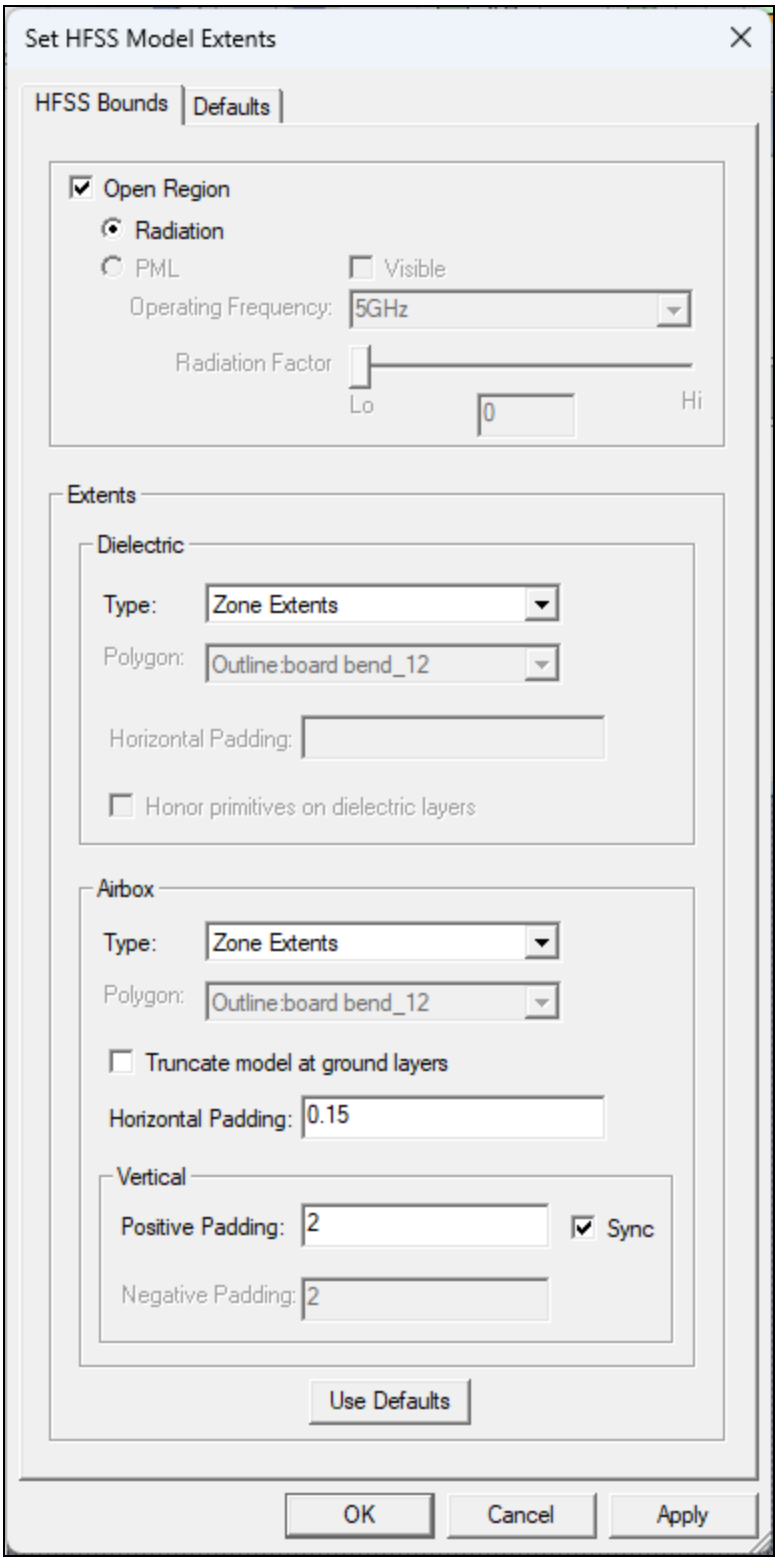
   - From the **Project Manager** window, expand the **Project Tree** (e.g., **TestProject**). Then right-click the active design (e.g., **EMDesign1**) and select **HFSS Extents**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **HFSS Bounds** tab displays by default.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

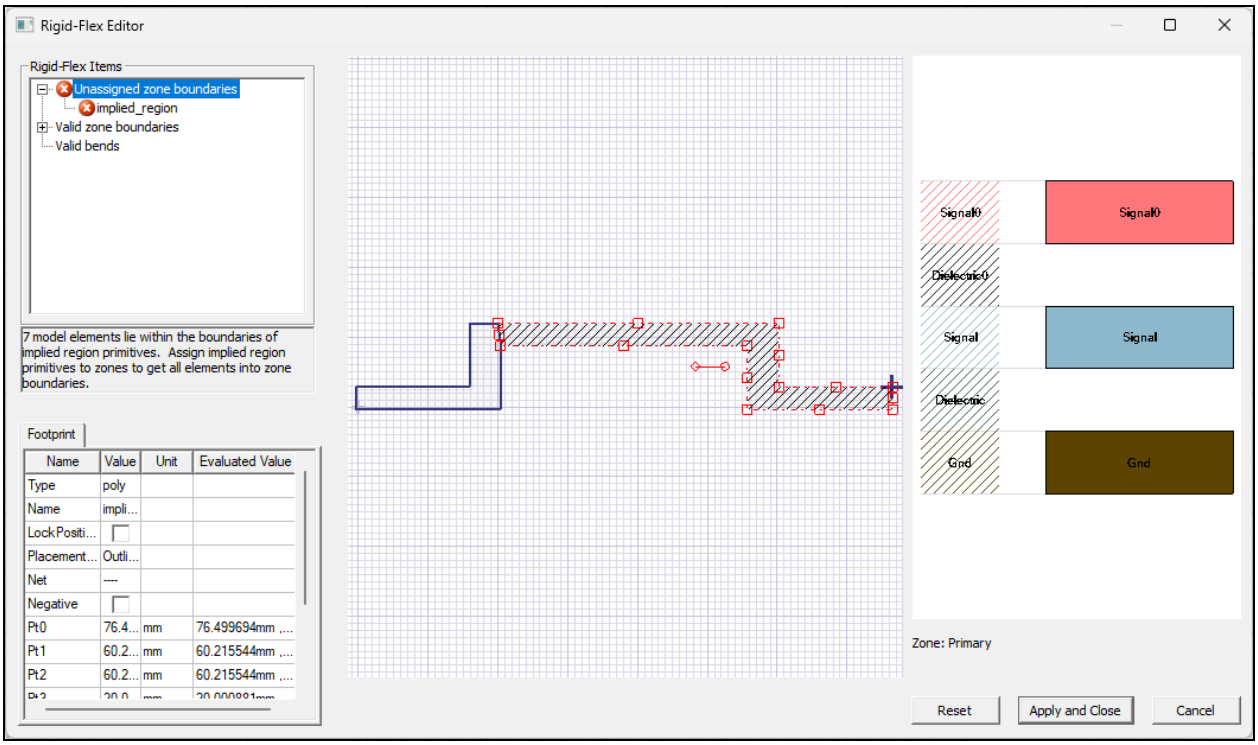
2. From the **Extents** area, select **Zone Extents** from the **Type** drop-down menu to affect the following changes:

- **Dielectric** – the base-polygon is defined by the exact dimensions of the zone extents input by the user on the **Outline** layer.
- **Airbox** – creates a union from the zone extent polygons on the **Outline** layer, expanded by the user-entered value in the **Horizontal Padding** field, to set the airbox extents.

> **Note:**
>
> Padding applied using **Zone Extents** affects **only** implied regions. It has no effect on zones with explicitly defined boundaries. For higher accuracy and more predictable modeling, always use explicit zone boundaries in conjunction with **Zone Extents**.

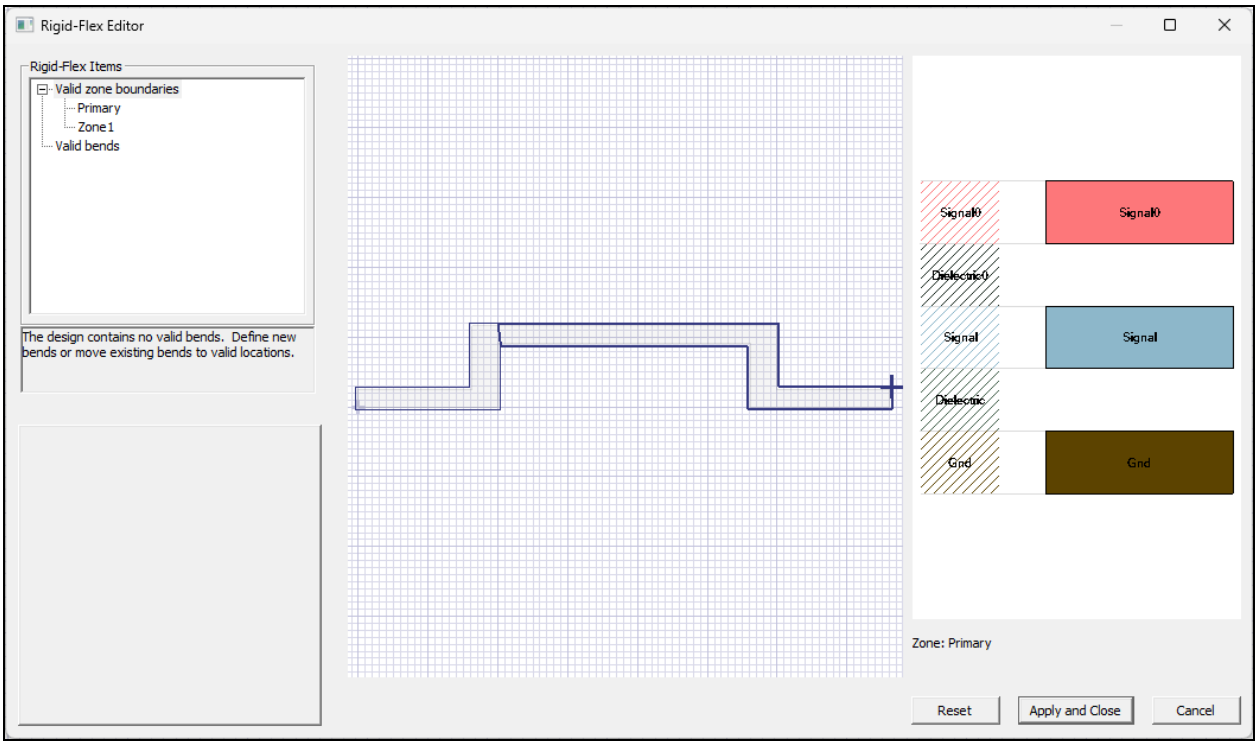
Using the Implied Regions to Assign Zones

The **Unassigned zone boundaries** section of the **Rigid-Flex Items** area includes all primitives that are not assigned to a zone. The primitives that *can* be assigned to a zone are **implied_region(s)**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Double-click any **implied_region** to open the **Zone Primitive** window. Then assign the primitive to a zone (e.g., **Zone1**).



Note:

Depending on whether the unassigned primitives are connected, there could be multiple **implied_regions** in the **Unassigned zone boundaries** section.

Changing the Zone Order

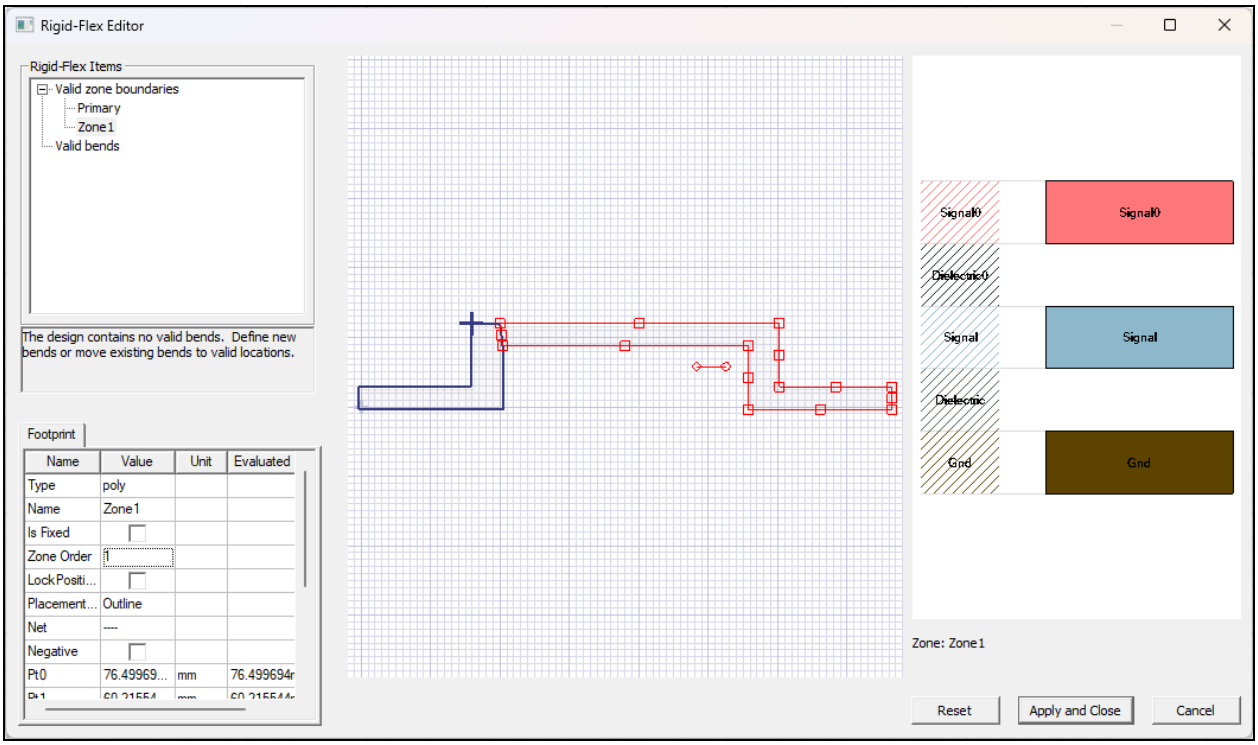
While creating a rigid-flex design, only a single zone stackup will be modeled in a location. If zones overlap, **Zone Order** is used to determine which zone the design will model and which zone(s) will be ignored. The zone with the most dominant position will take precedence. Follow these steps to change the **Zone Order** of any zone in the design.

Note:

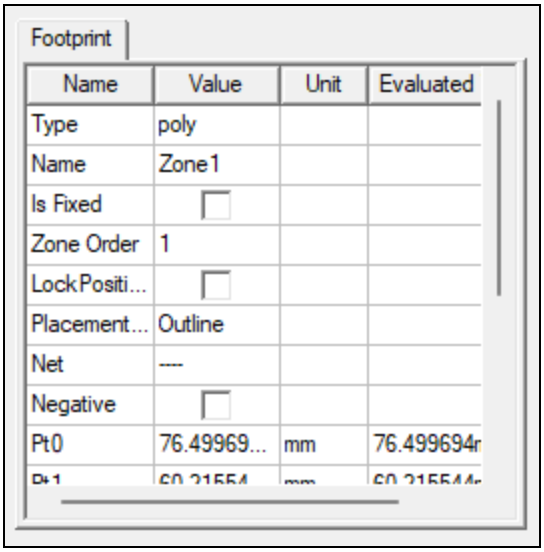
Zone Order can an also be changed at the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From the **Rigid-Flex Editor** window, select a zone.

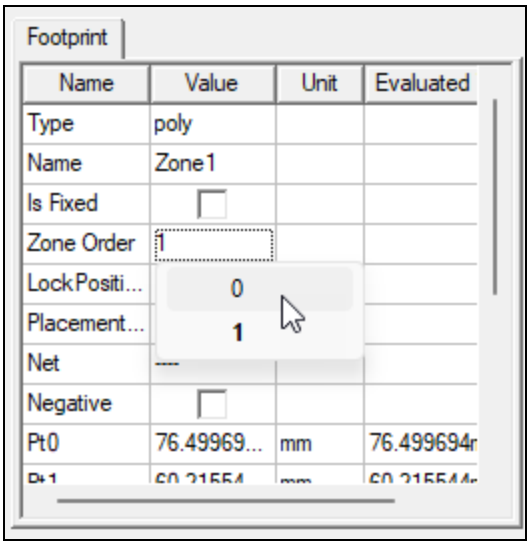


The selected zone's parameters populate the **Footprint** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

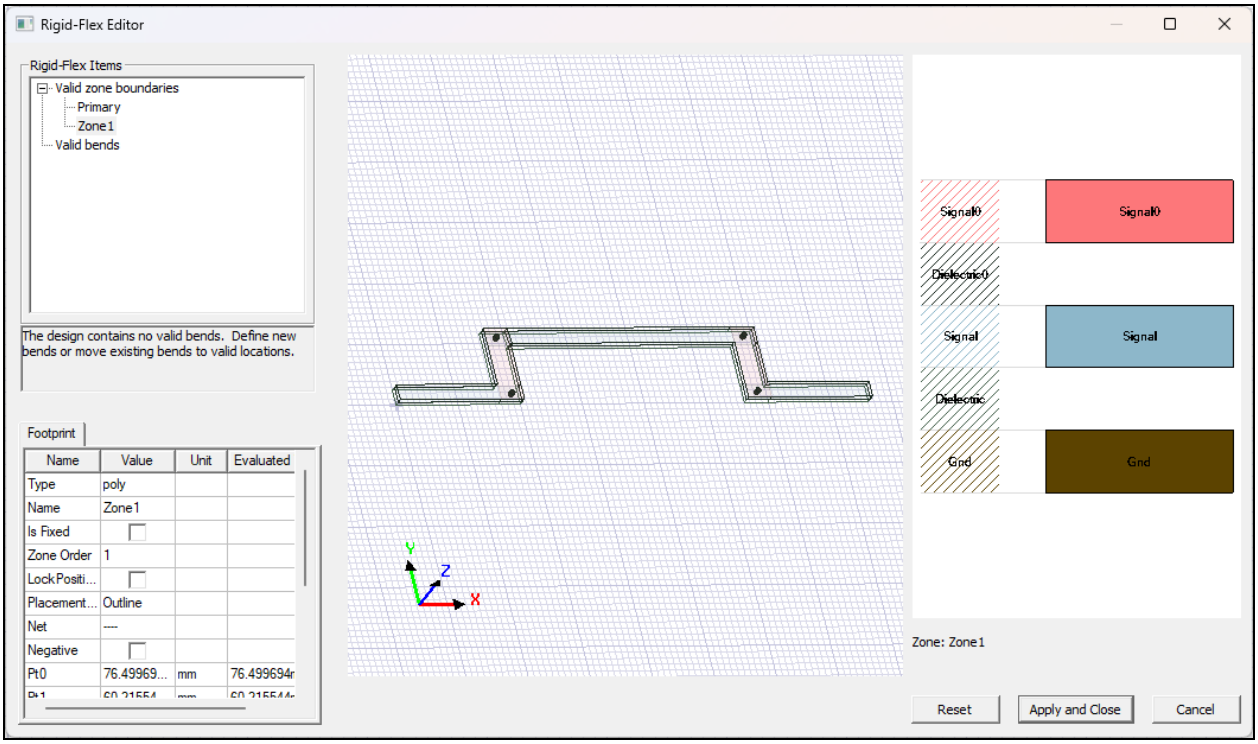
2. From the **Footprint** tab, click inside the **Zone Order** field to select a new position from the drop-down menu (e.g., from **0**, which has the highest priority in the hierarchy, to **1**, **2**, et cetera).



Reorienting the Model and Stretching Z

Reorient the model in the preview window using the same method of control common to the **Layout Editor**.

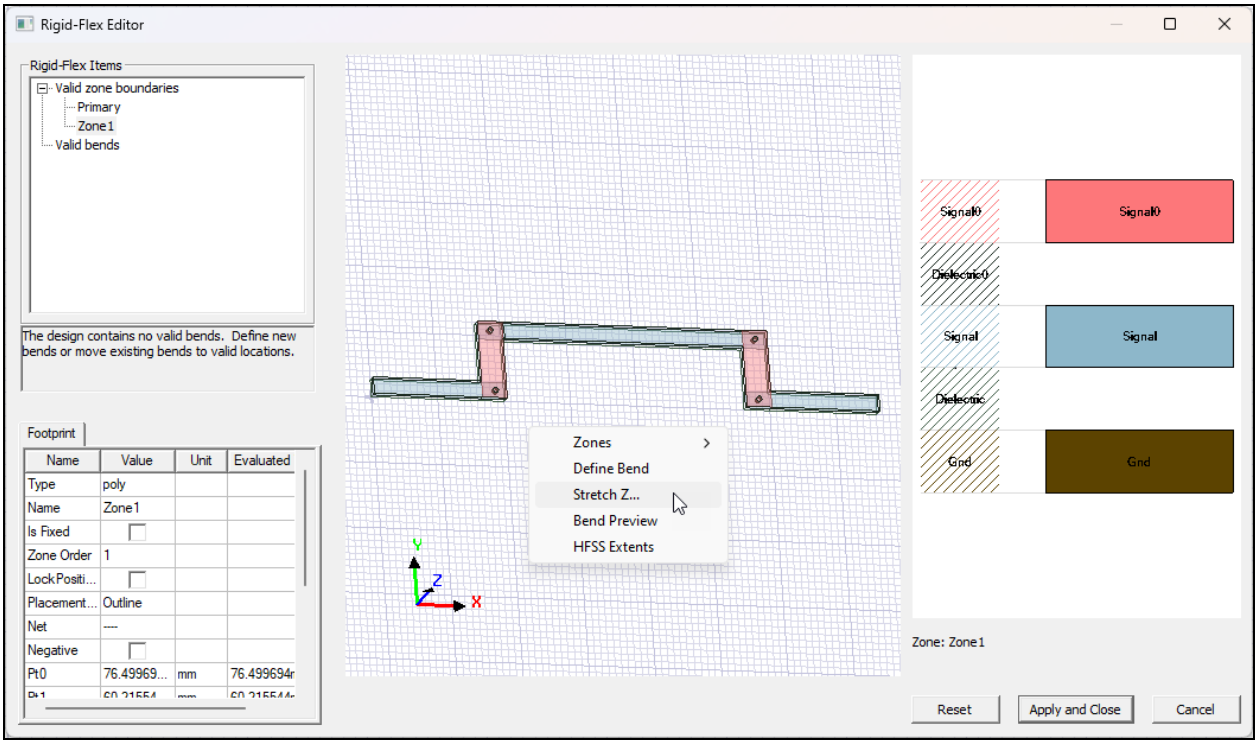
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



If applicable, follow these steps to artificially scale Z values, so thin models have a 3D appearance.

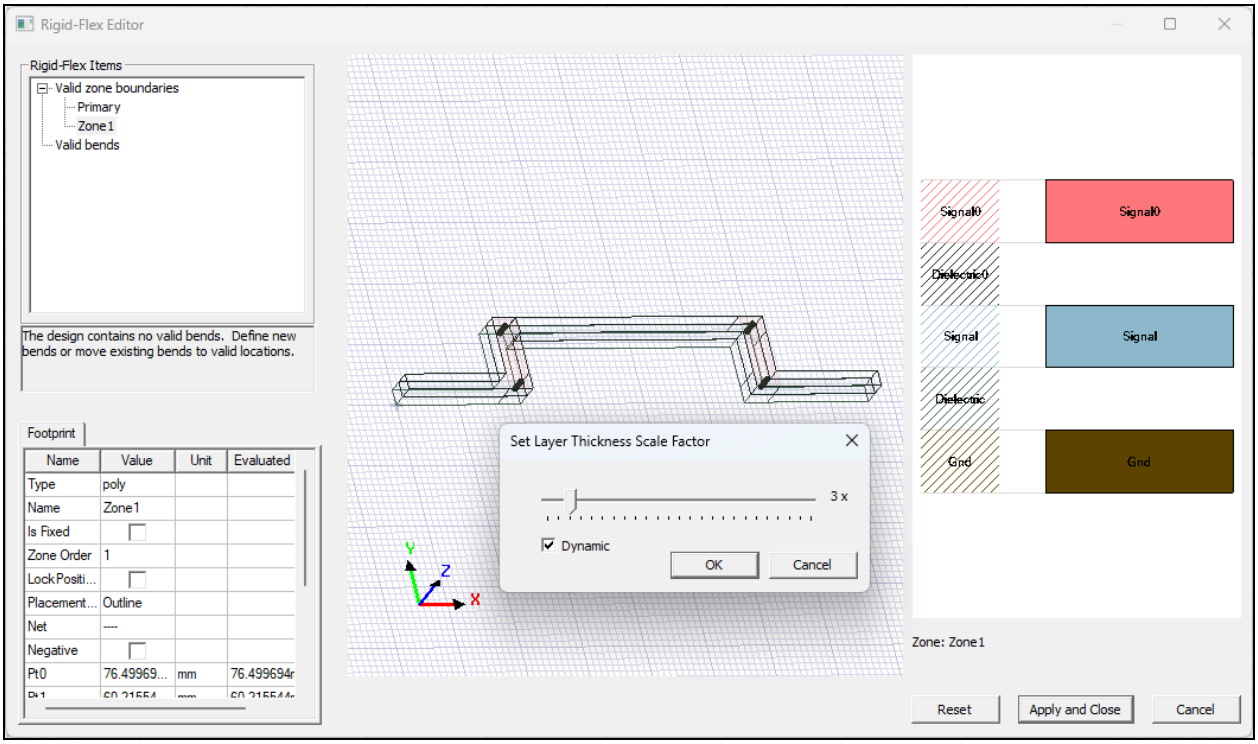
1. Right-click in the preview window and select **Stretch Z** to open the **Set Layer Thickness Scale Factor** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Use the slider to set the scaling factor to any discrete value between 1 and 25.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



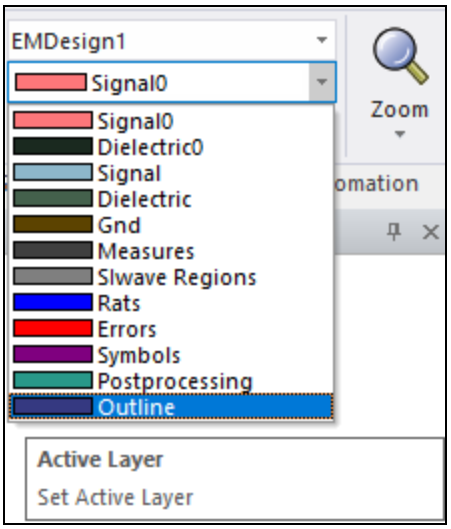
Continue to Defining Rigid-Flex Bends.

Defining Zones at the Layout Editor

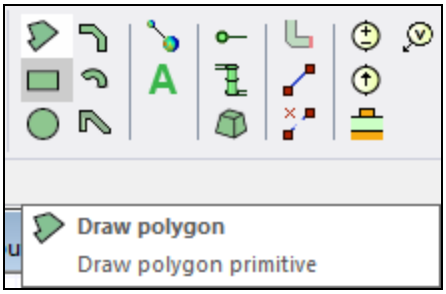
Follow these steps to outline and define zones from the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

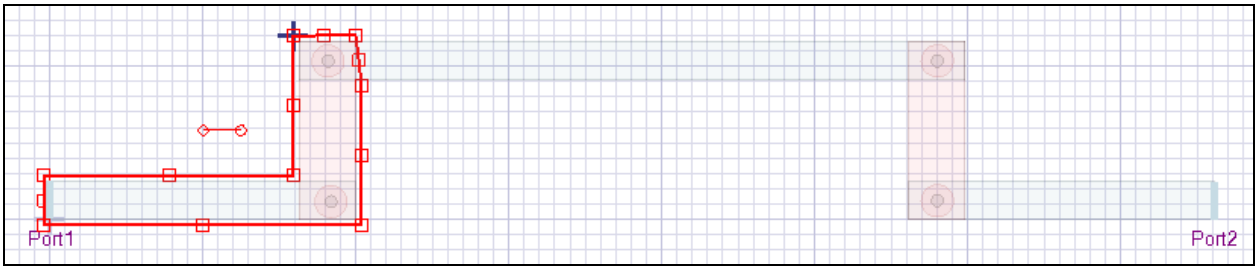
1. From the **Layout** tab, select **Outline** on the **Set Active Layers** drop-down menu.



2. From the **Layout** tab, select any primitive drawing tool (e.g., **Draw polygon**).



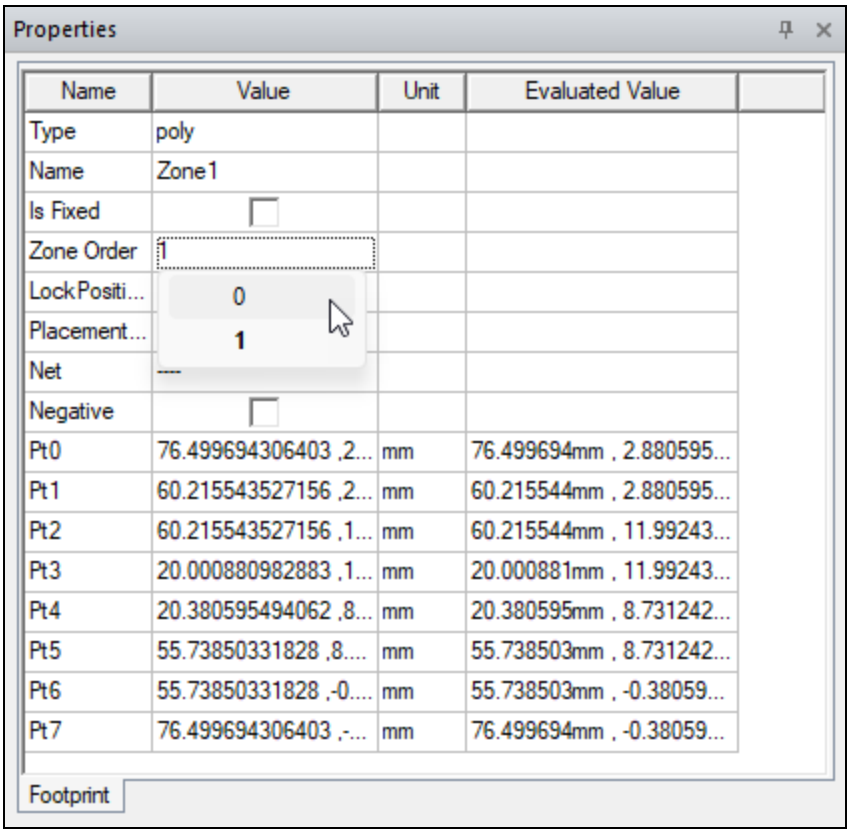
3. Draw a zone over the design using the same method described in the HFSS 3D Layout Getting Started Guides for drawing a primitive.



4. Repeat steps **2-3** for each zone. For best results, each successive zone should abut another zone.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. Select a zone. From the **Properties** window, select the appropriate zone designation on the **Name Value** field's drop-down menu.



6. Once the primitive is assigned to a zone, the **Is Fixed** and **Zone Order** rows appear. If selected, do either or both of the following:
   - Check the box in the **Is Fixed Value** field to designate the primitive as fixed.
   - Assign the primitive a new **Zone Order** from the drop-down menu in the **Zone Order Value** field.
7. Repeat steps **5-6** for each zone.

Continue to Defining Rigid-Flex Bends.
i

Defining Rigid-Flex Bends

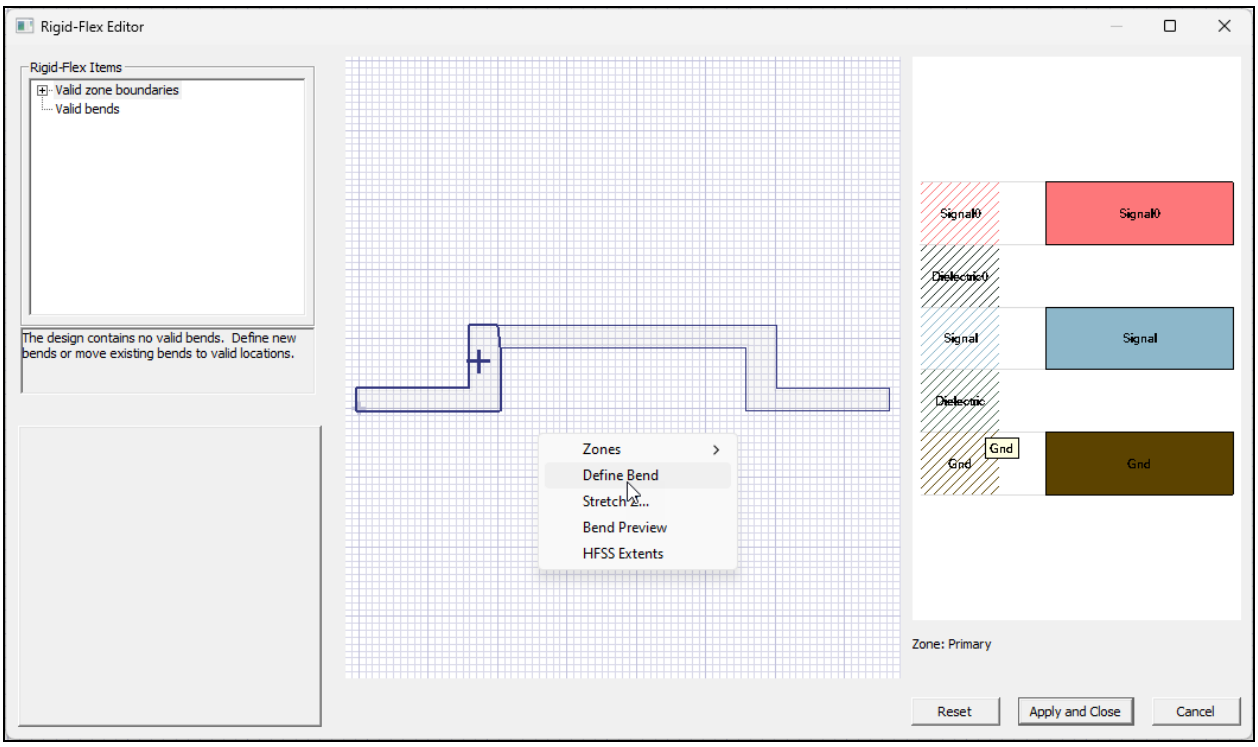
Follow these steps to create and define one or more rigid-flex bends using the **Rigid-Flex Workflow**. Refer to "Bend Restrictions" on page 6-68.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

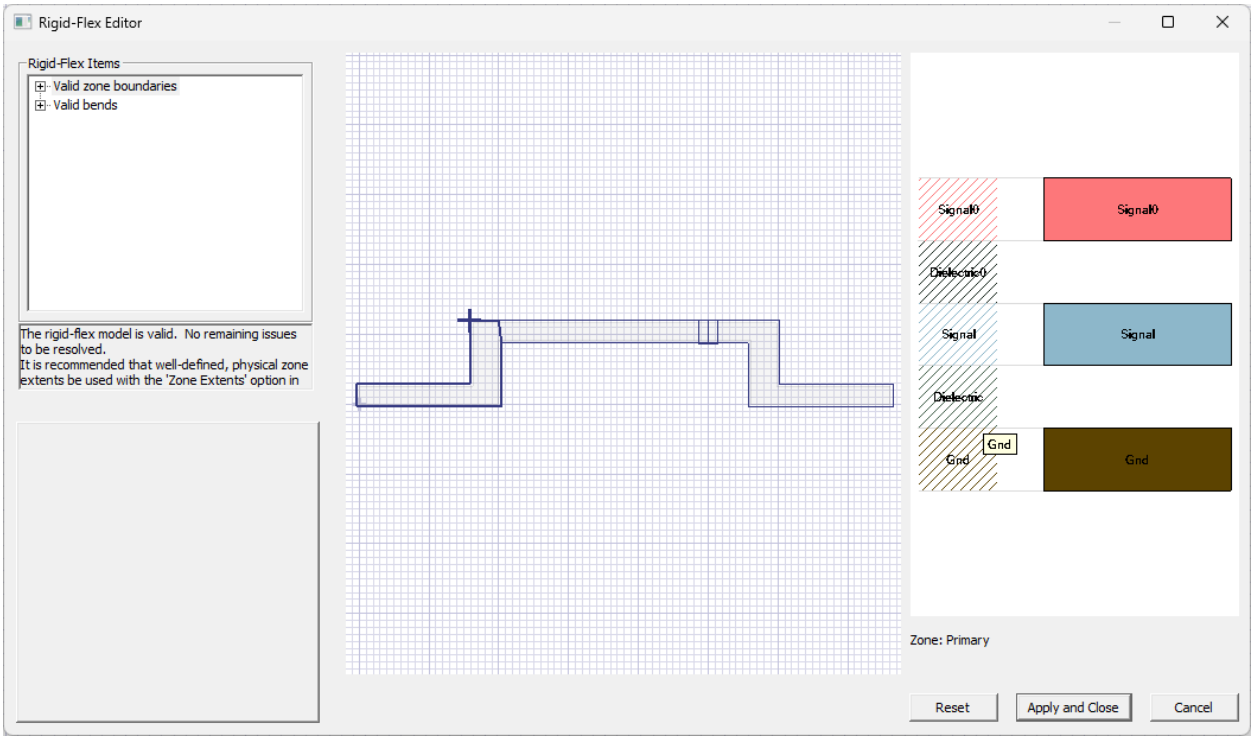
Zones can an also be defined at the **Layout Editor**. Refer to "Defining Bends at the Layout Editor" on page 6-72.

1. Right-click within the preview window and select **Define Bend**.



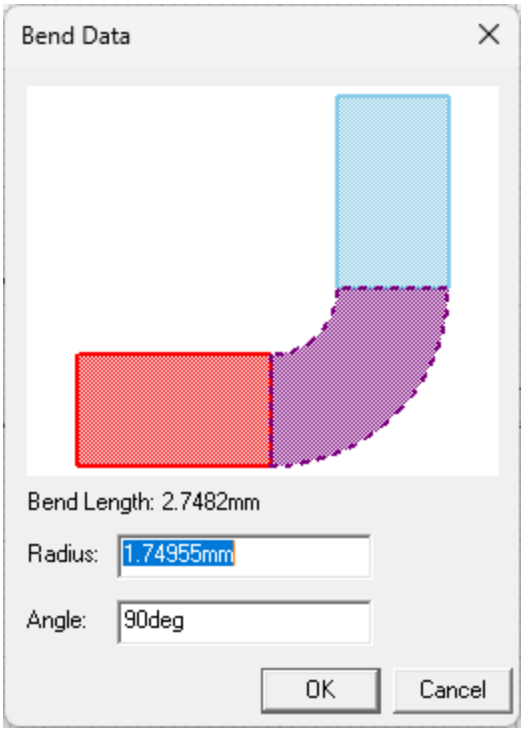
2. Click within any zone to begin placing a bend. Orient the bend, as appropriate, and click again to simultaneously place the bend and open the **Bend Data** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



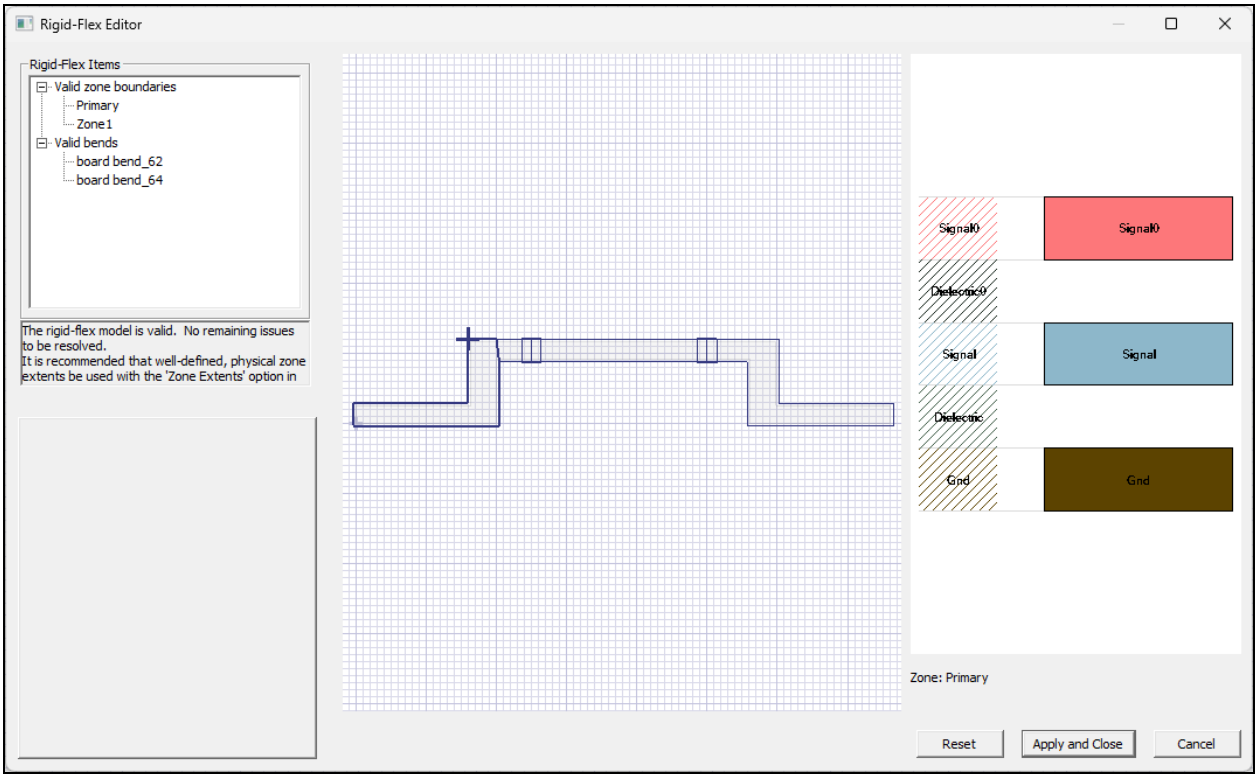
3. Enter the selected **Radius** (e.g., **3.181mm**) and **Angle** (e.g., **90deg**) in the appropriate fields.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



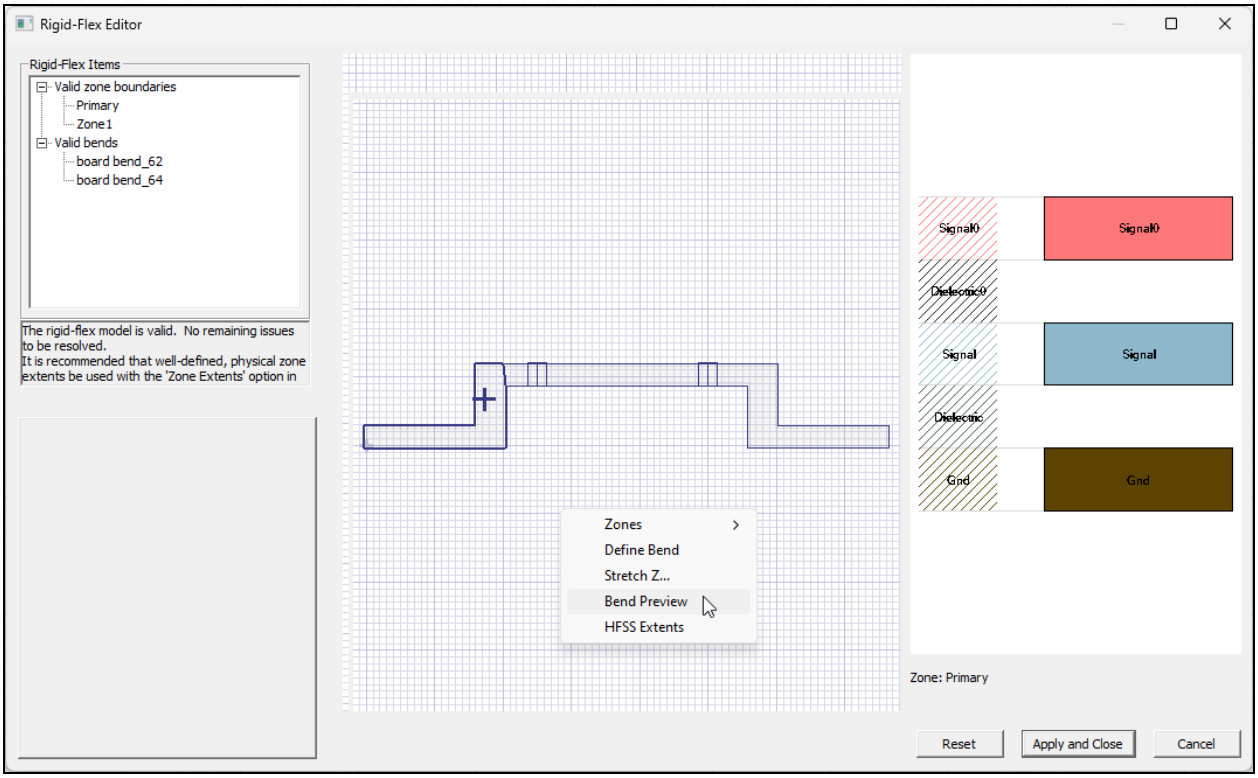
4. Click **OK** to close the **Bend Data** window and return to the **Rigid-Flex Editor** window.
5. Repeat steps **1-4** to create more bends, as appropriate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



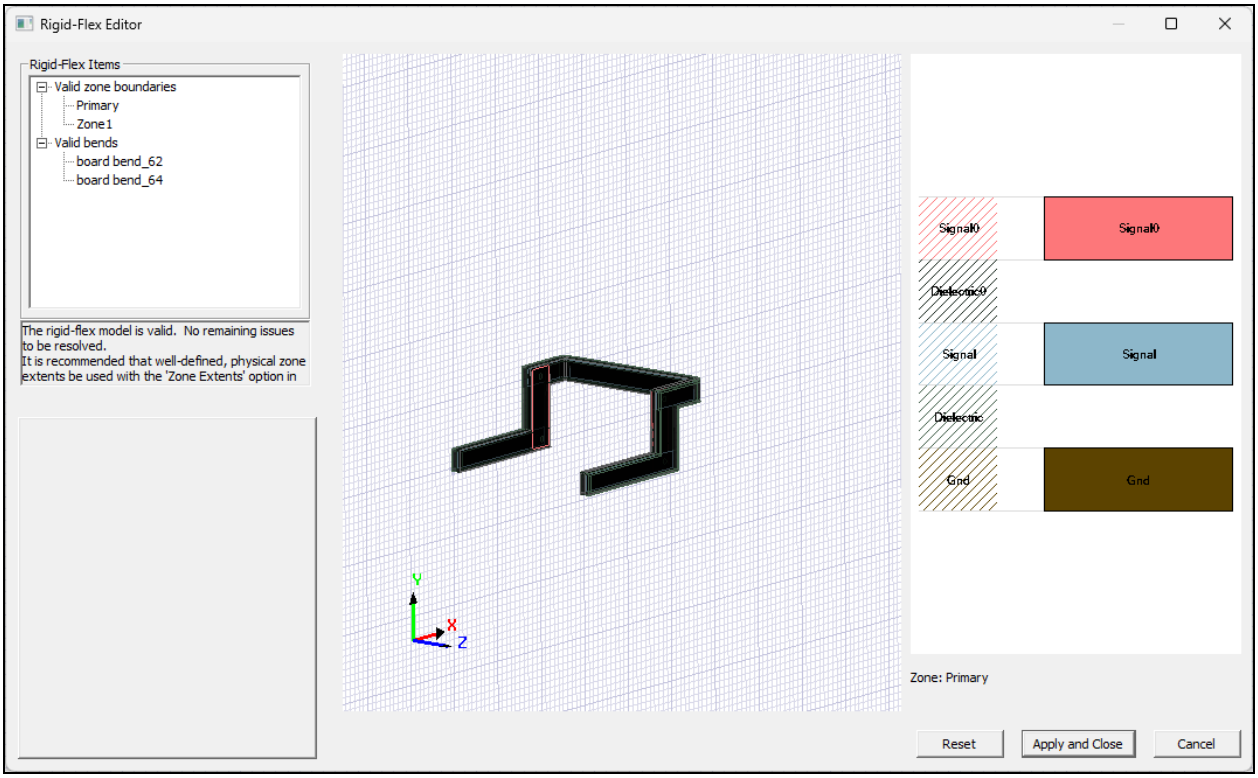
6. Right-click within the preview window and select **Bend Preview** to see the rigid-flex version of the design model.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



7. Reorient the model using the same control method as in the **Layout Editor**. Refer to the HFSS 3D Layout Getting Started Guides, if applicable.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

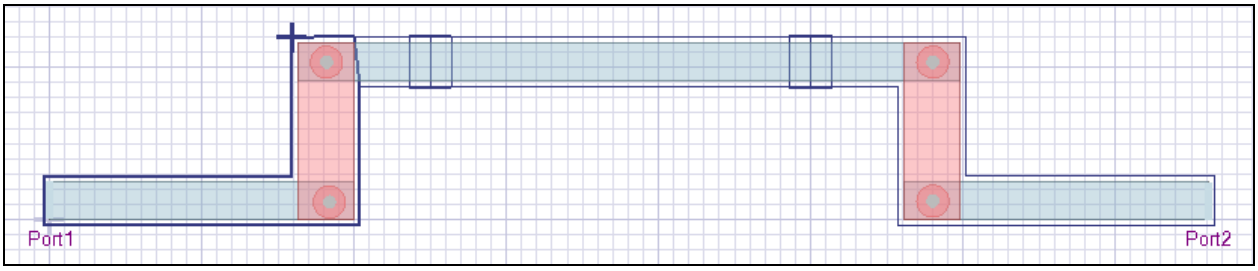


Note:

If bends appear incorrect in the UI (e.g., missing geometry in the bend, the bend (s) not visually applied whatsoever, et cetera), try changing the location of the fixed region. Certain UI-related issues are purely graphical and do not affect meshing or simulation results. The bend visualization is a lightweight representation of the deformed geometry. To verify the actual geometry used in simulation, plot the mesh or display **Pre-Process Geometry**.

8. Click **Apply and Close** to close the **Rigid-Flex Editor** window. The new zones and bends appear in the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

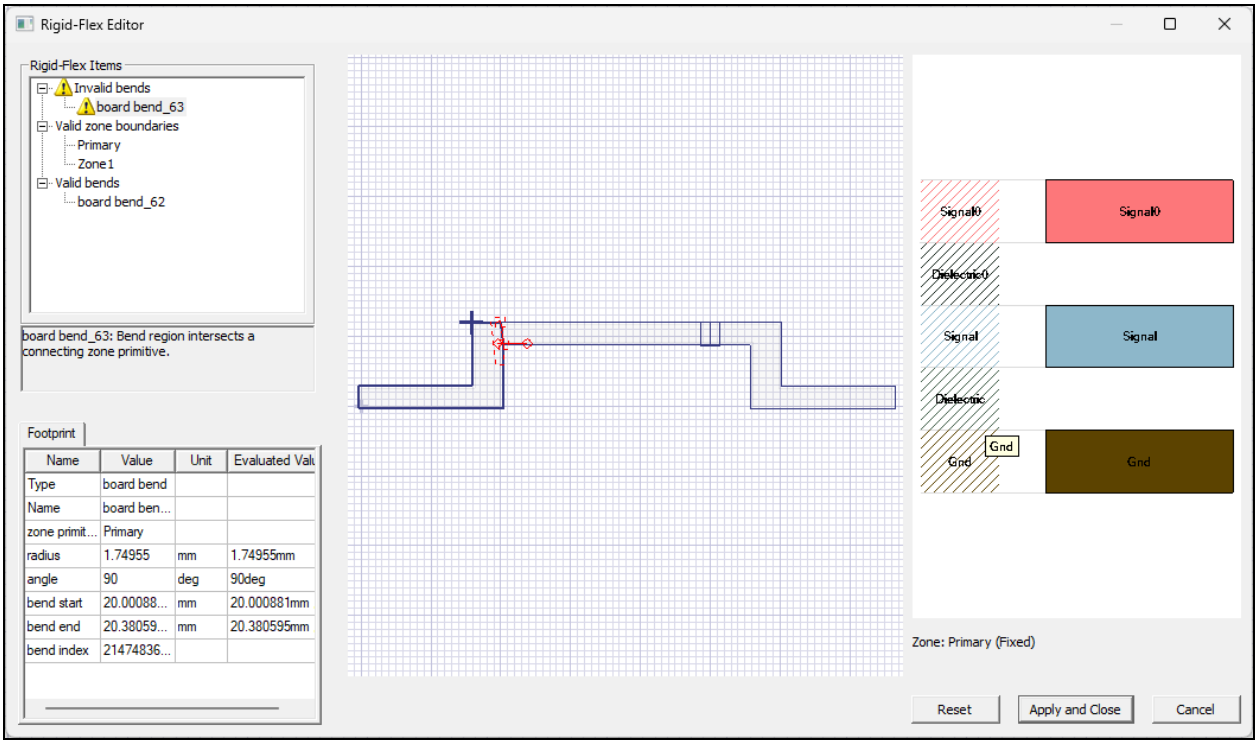


Continue to Analyzing a Design With Rigid-Flex Bends.

Bend Restrictions

Bends cannot overlap the anchor point, one another, ports or other components, or be placed across multiple zones. Bends are defined by two points in the x-y plane indicating their placement in the model, a radius value indicating the sharpness of the bend, and an angle. The magnitude of the angle indicates the extent of the wrapping while the sign of the angle indicates the bend direction (i.e., positive or negative angle implies a positive-z or negative-z bend direction respectively). When computing bent geometry, the software defines the neutral root as a point on the face where the bent region connects with the unbent region. To make the deformation consistent between positive and negative bends, the elevation of the neutral root is dictated by the sign. If the bend is positive, the neutral root is placed at the bottom of the zone stackup. If the bend is negative, the neutral root is placed at the top of the zone stackup. For geometry in bend regions at the same elevation as the neutral root, in-plane distances are preserved, but geometry is contracted at other elevations. The minimum bend radius is 1.1x the thickness of the zone on which the bend is placed. Invalid placement of bends results in error messages, which appear in the **Rigid-Flex Items** area.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Creating a bend with a bend radius that is too small can severely deform the model. The bends shown in the software are geometric deformations only; no mechanical physics are simulated. When a bend is applied, the outer surface of the bend becomes the reference and remains undistorted, while the inner surface is distorted to accommodate the curvature.

For example, consider a stack-up with a total thickness of 0.12mm.

Name	Type	Material	Thickness	Primary	Zone1	+
Signal	signal	copper	0.01mm	☑	☑	
Dielectric	dielectric	FR4_epoxy	0.1mm	☑	☑	
Gnd	signal	copper	0.01mm	☑	☑	

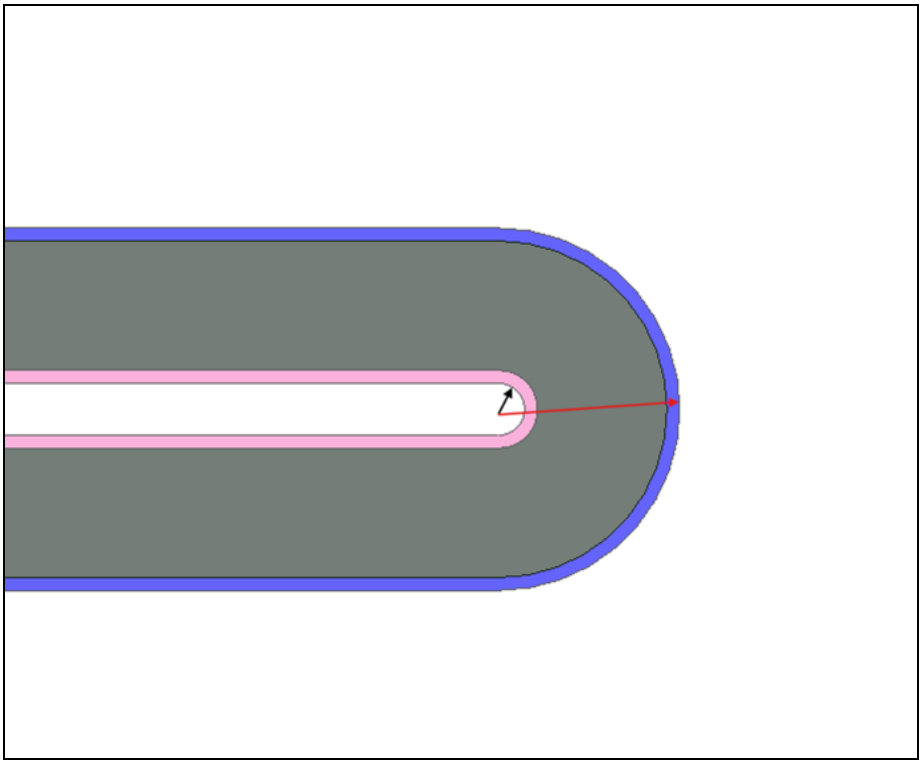
A 180° bend with a radius of 0.14mm is applied to the stackup (red arrow).

The length of the outer surface of the bend will be: $\pi \times 0.14 \text{ mm} \approx 0.4398 \text{ mm}$

This outer surface remains undistorted. However, the inner radius of the bend becomes: 0.14 mm – 0.12 mm = 0.02 mm (black arrow)

This means the inner (top) signal layer must compress to a length of: $\pi \times 0.02 \text{ mm} \approx 0.0628 \text{ mm}$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This results in more than a 7× contraction relative to the flat state, which can produce highly distorted geometry and lead to simulation issues.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

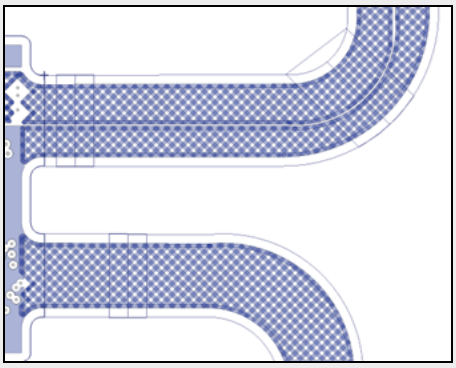
Note:

Setting a Defeaturing Tolerance (HFSS > Advanced Setup Only)

If arcs are defined with dense faceting in a design, consider applying a defeaturing tolerance to simplify the arc geometry. By enable **Use polygon defeaturing** and setting a **Tolerance as a ratio of the data extent** (available from the HFSS setup window on the **Advanced** tab), very close points, collinear points, and thin intrusions that do not contribute meaningfully to the geometry are removed during simulation. This is particularly useful if a design has highly faceted curves or geometry with excess detail. This can significantly reduce computational complexity and improve solver performance, especially during mesh generation.

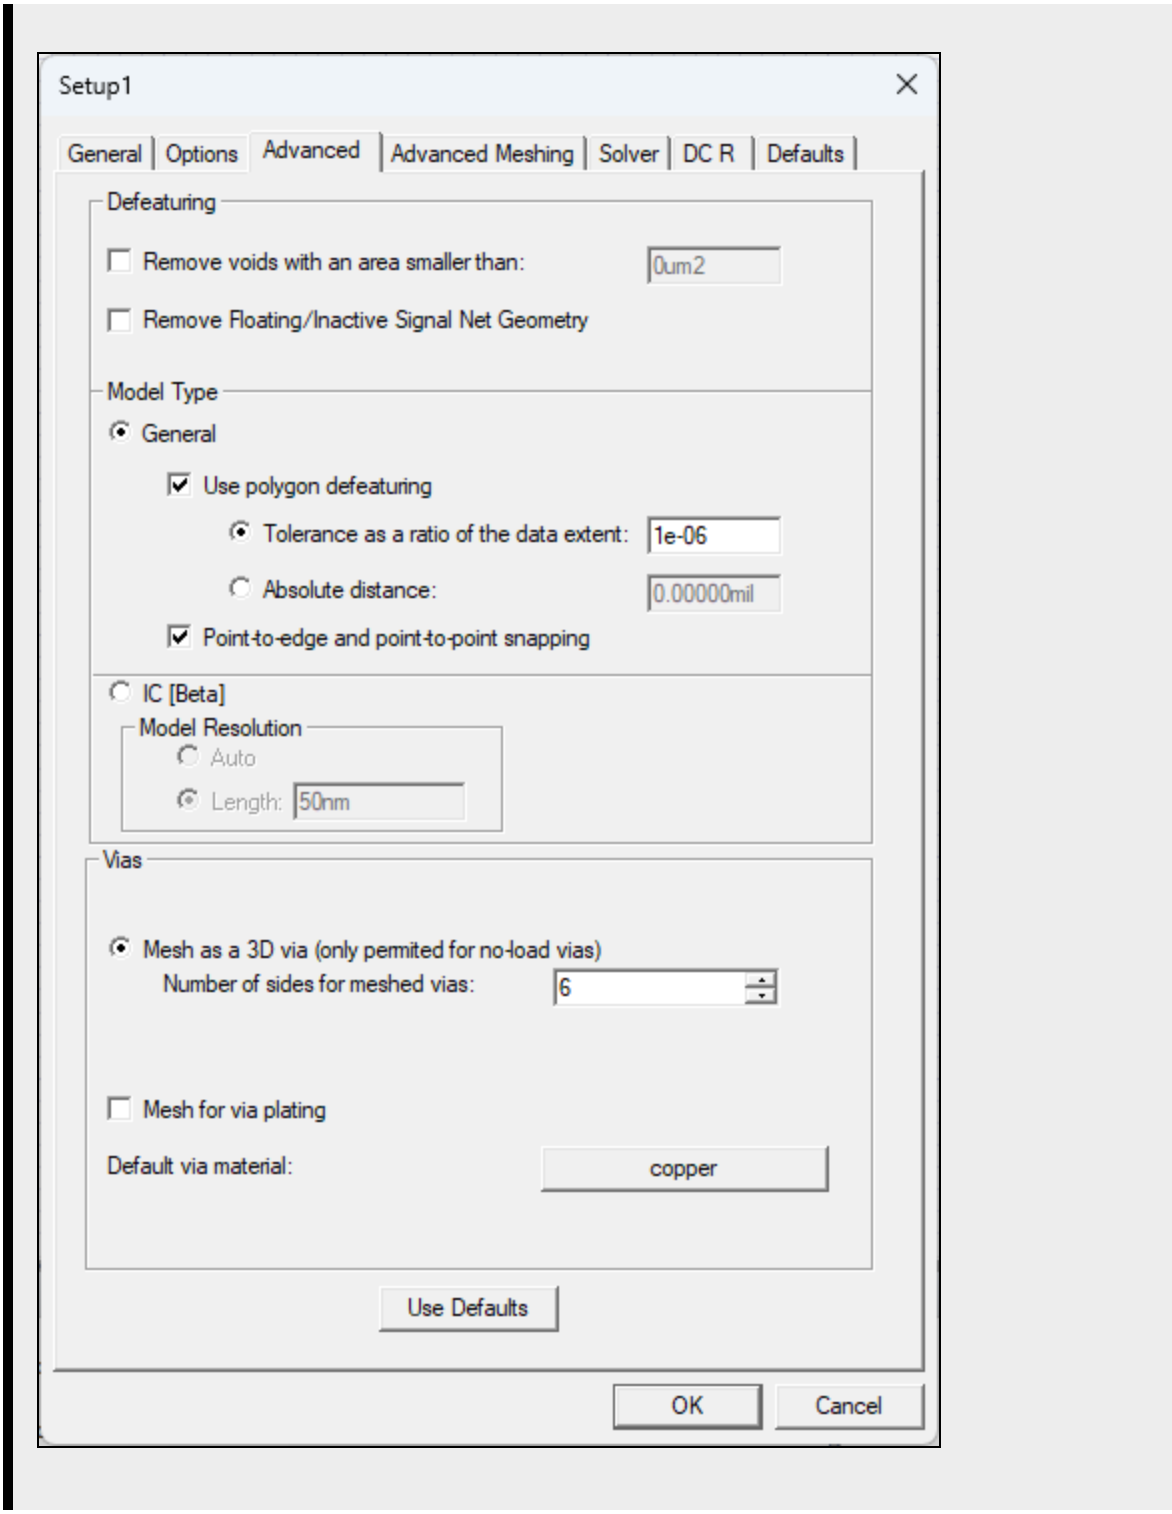
Removing Voids (HFSS > Advanced Setup Only)

Another option is to automatically defeature or remove voids contained inside bends, particularly when there is hatched geometry in the design. From the **Advanced** tab, check the **Remove voids with an area smaller than** box and then specify a value. Users should aim for balanced void removal, as excessive internal detail can contribute to mesh failures. While not all voids need to be eliminated, applying a sensible void removal tolerance can improve meshing robustness and overall simulation success.



To set a defeaturing tolerance or remove voids smaller than a specified value, refer to the Advanced tab in the HFSS setup window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

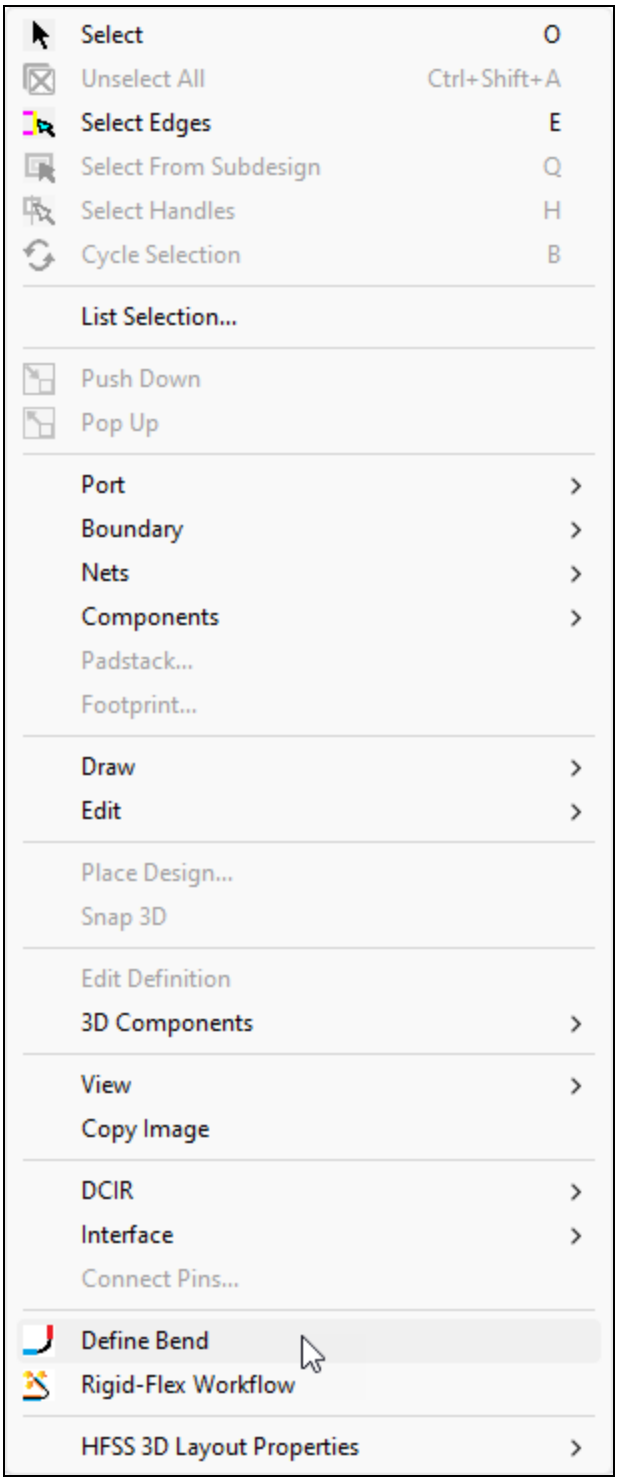


Defining Bends at the Layout Editor

Follow these instructions to create and define bends within the **Layout Editor**.

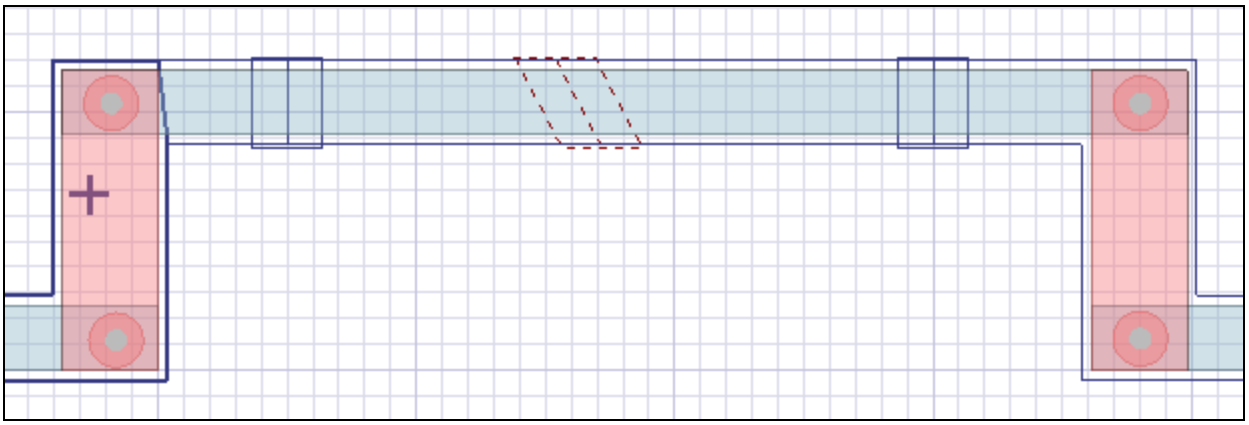
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From within the **Layout Editor**, right-click anywhere and select **Define Bend**.

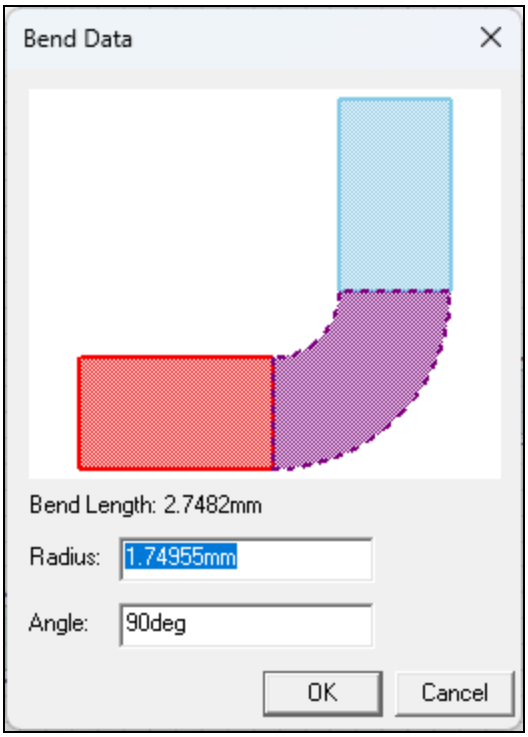


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Click within any zone to begin placing a bend. Orient the bend, as appropriate, and click again to simultaneously place the bend and open the **Bend Data** window.



3. Enter the selected **Radius** (e.g., **1.74955mm**) and **Angle** (e.g., **90deg**) in the appropriate fields.



4. Repeat steps **1-3** to create more bends, as appropriate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Rigid-Flex Bends can be animated. Refer to Animating Rigid-Flex Bends.

Continue to Analyzing a Design With Rigid-Flex Bends.

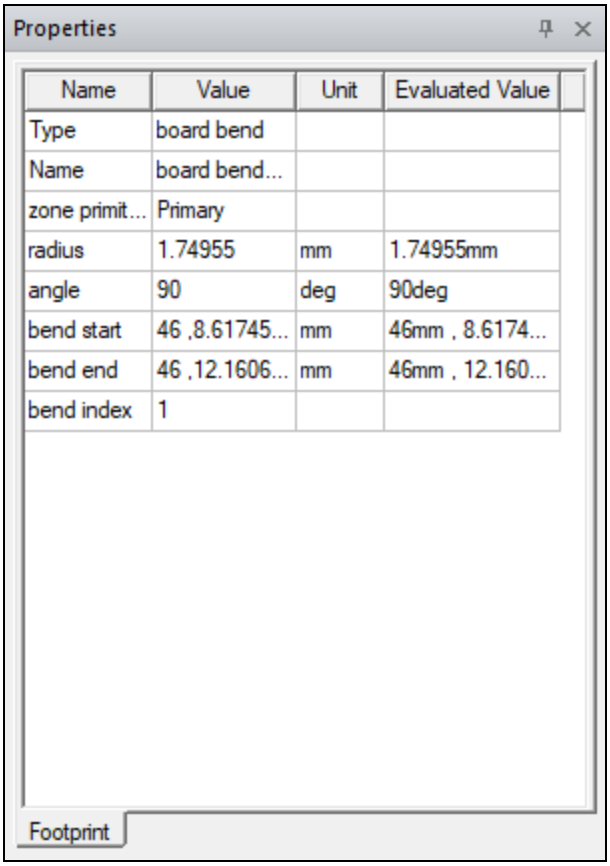
Animating Rigid-Flex Bends

Follow these steps to animate rigid-flex bends.

Note:

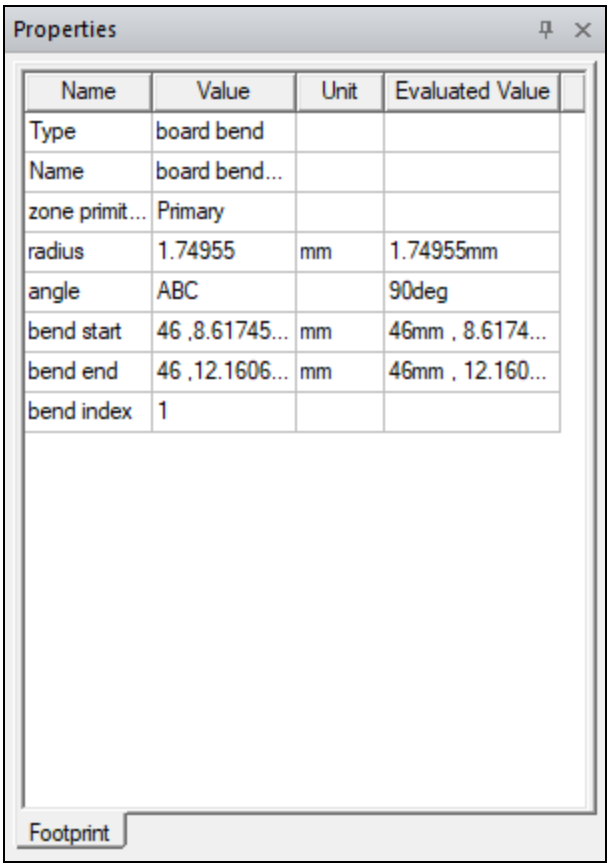
Before continuing, ensure rigid-flex are defined. Refer to "Defining Bends at the Layout Editor" on page 6-72.

1. From the **Layout Editor**, select a rigid-flex bend to populate the **Properties** window with its parameters.



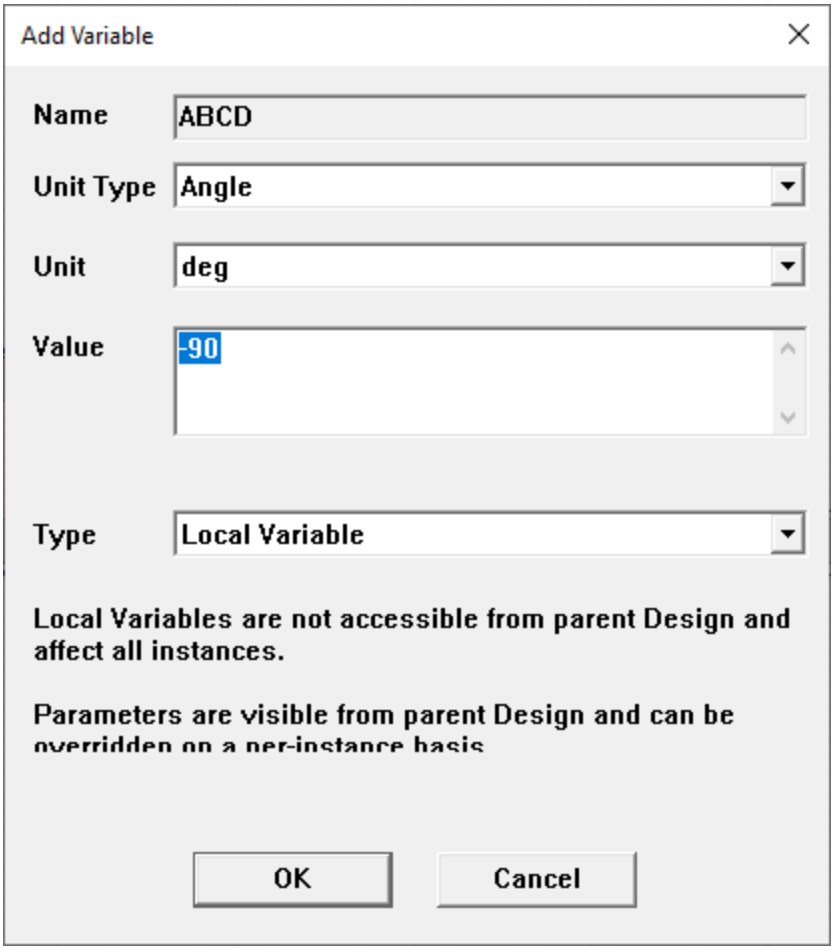
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Enter a variable in the angle field (e.g., **ABC**) and press **Enter** to open the **Add Variable** window.

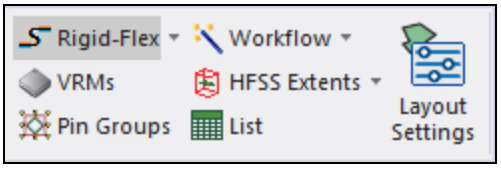


3. Enter an integer (positive or negative) in the **Value** field (e.g., **-90**) and **Angle**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

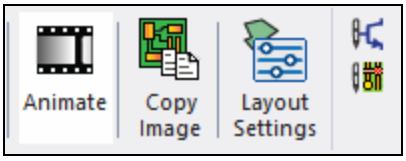


4. Click **OK** to close the **Add Variable** window and return to the **Rigid-Flex Editor** window.
5. Repeat steps **1-4** for each bend.
6. From the **Layout** tab, click **Rigid-Flex** to apply the rigid-flex bend to the design.

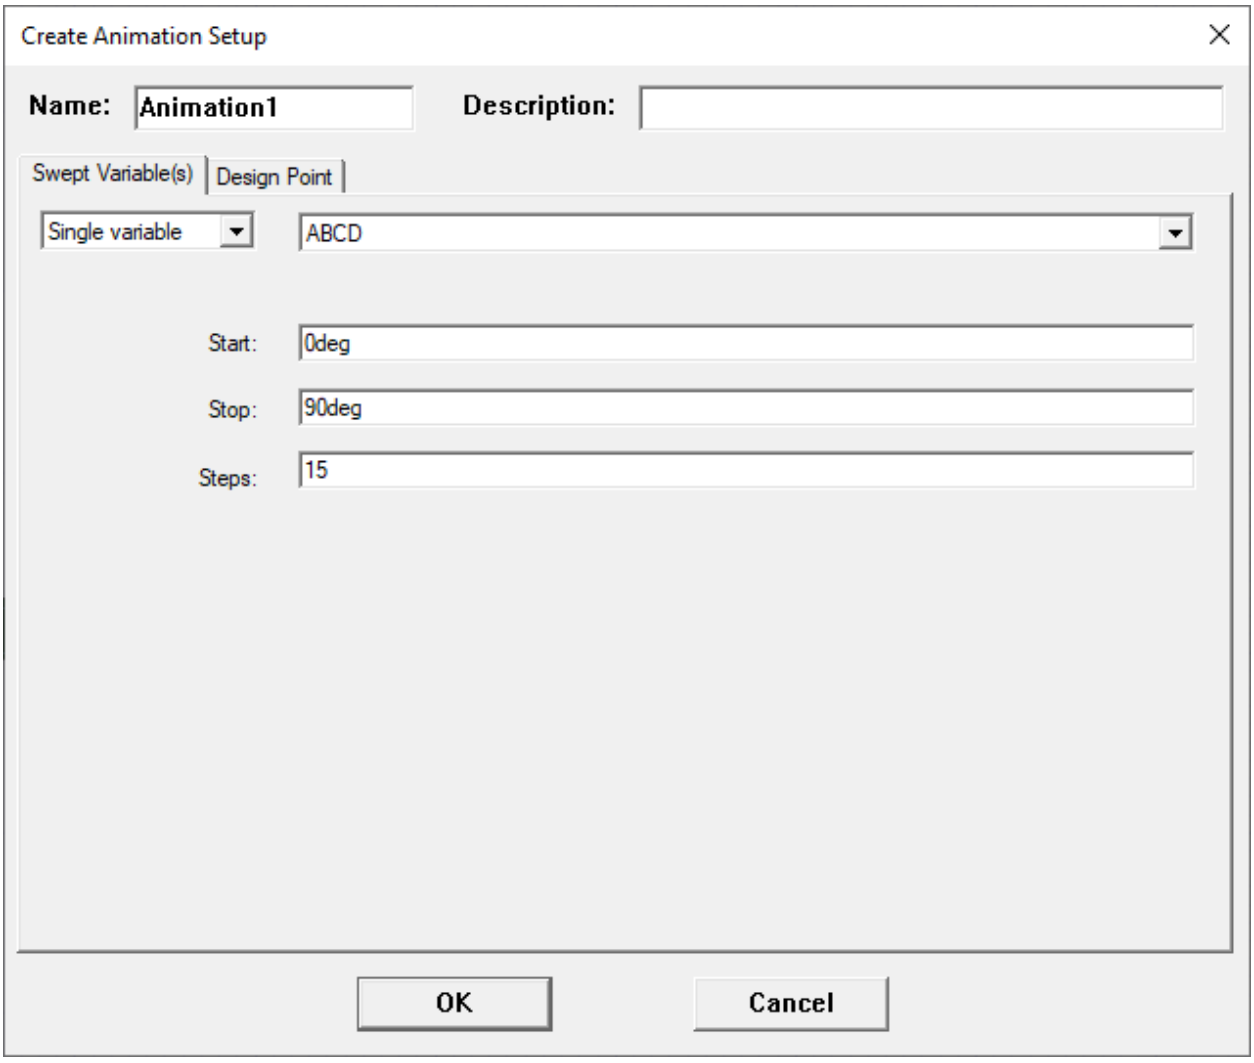


7. Navigate to the **View** tab and select **Animate** to open the **Create Animation Setup** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

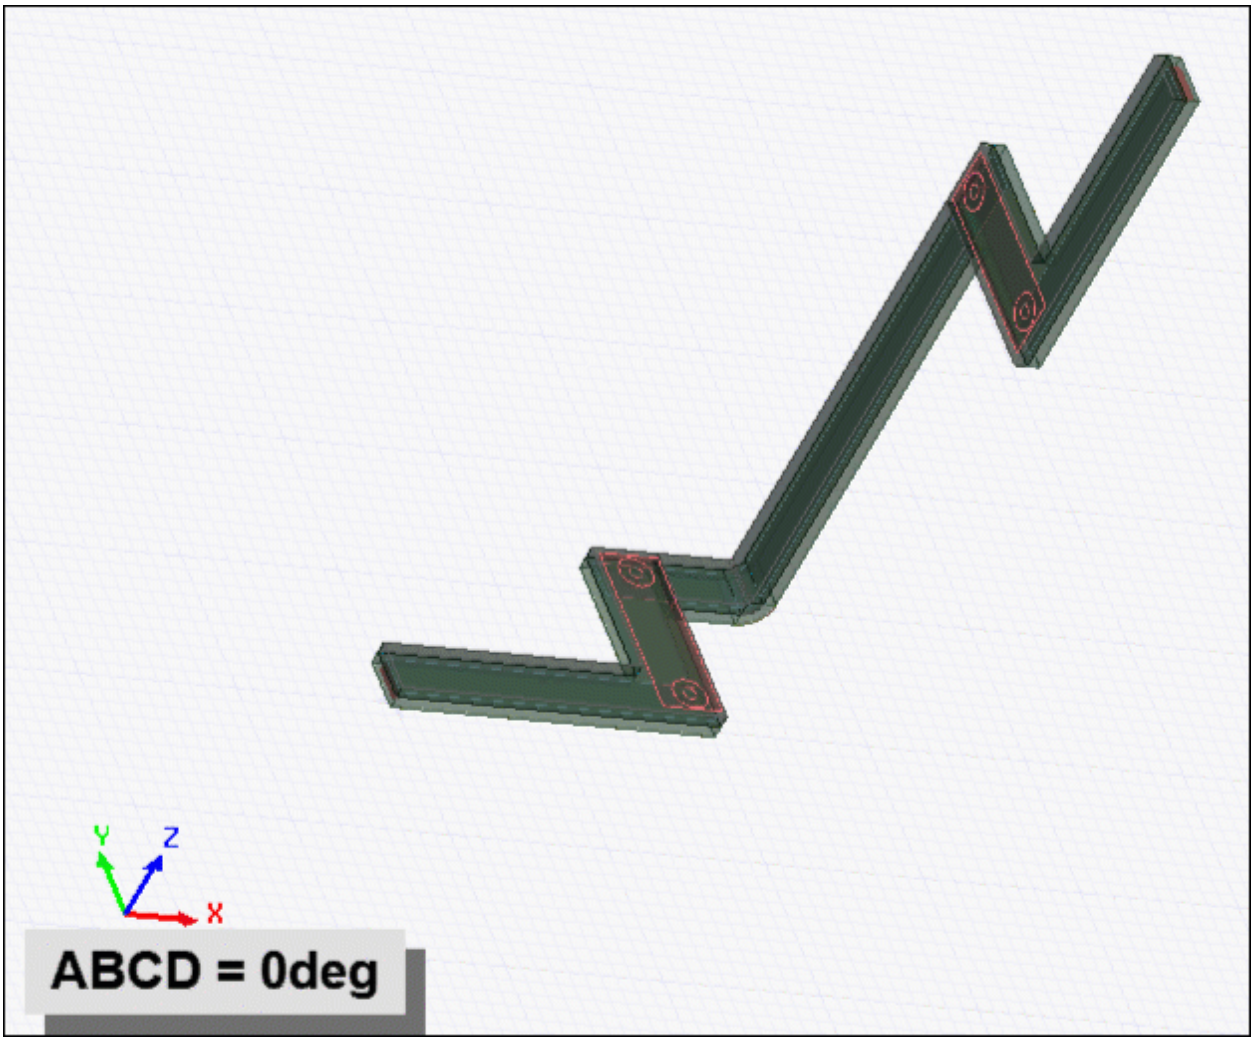


8. From the **Create Animation Setup** window, do the following:
    - Select the new variable (e.g., **ABC**) from the **Single variable** drop-down menu.
    - Enter an appropriate **Start** angle (e.g., **0deg**).
    - Enter an appropriate **Stop** angle (e.g., **90deg**).



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9. Click **OK** to create the animation. Refer to Creating Animations.



Continue to Analyzing a Design With Rigid-Flex Bends.

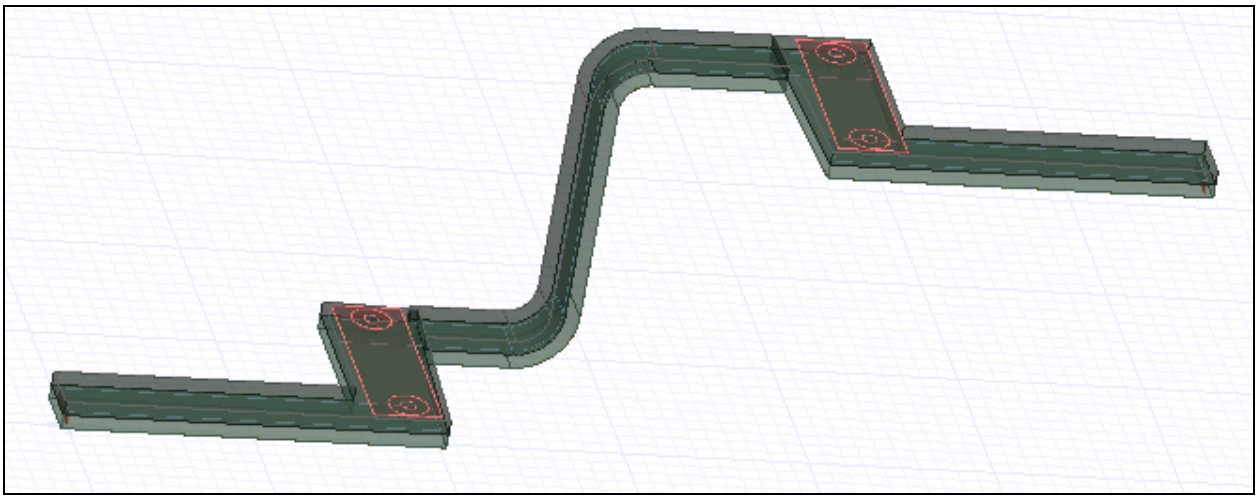
Analyzing a Design With Rigid-Flex Bends

Once rigid-flex bends have been defined, follow these steps to analyze the design in both its bent and flat states.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From the **Layout** tab, click **Rigid-Flex** to apply the rigid-flex bend to the design.

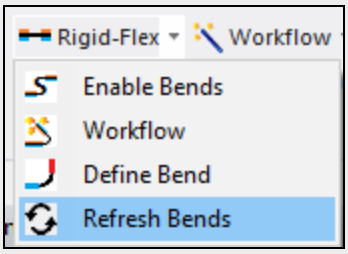
   The design in the **Layout Editor** will change to the rigid-flex version. Reorient, as appropriate.



2. Now that the bent model is generated, click **Rigid-Flex** to toggle between the bent and flat designs.

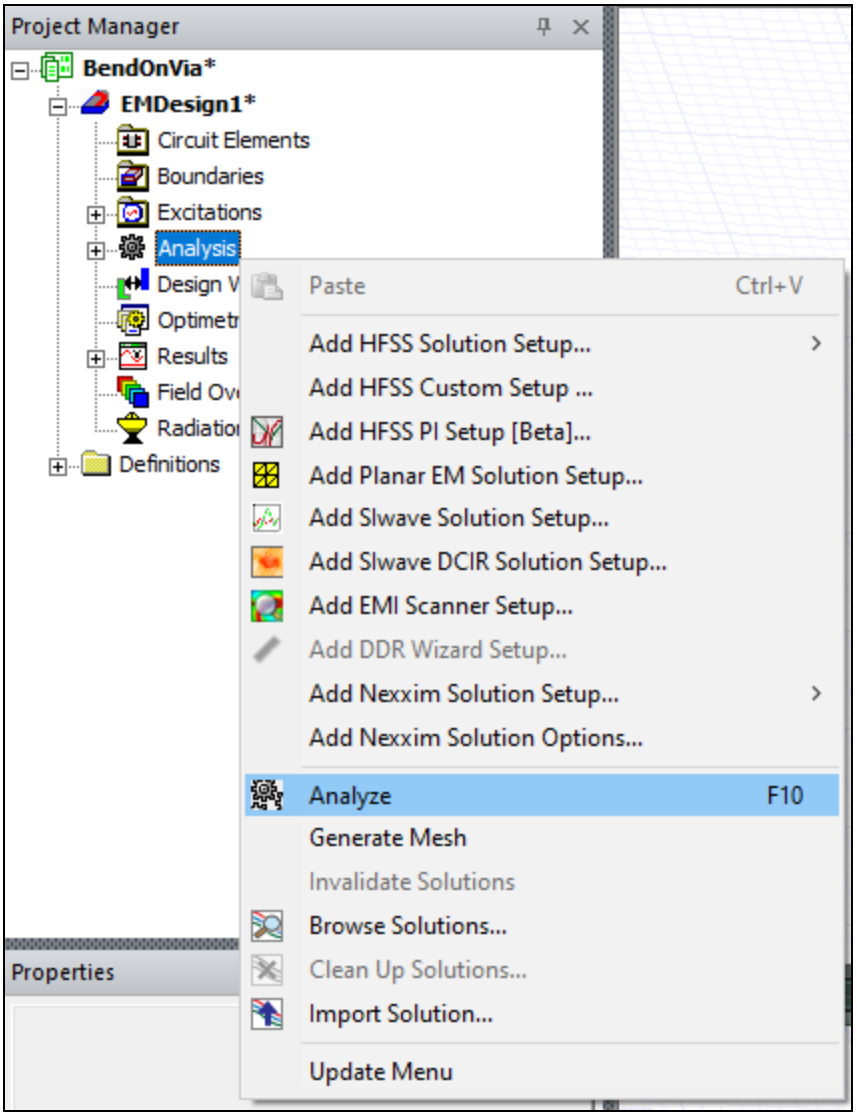
Note:

To return to the **Rigid-Flex Editor** window, click the **Rigid-Flex** arrow and select **Workflow**. If the design is altered, select **Refresh Bends** to overwrite the saved rigid-flex design.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. **Set up a Solution** to analyze. Refer to the Solution Setup in HFSS 3D Layout.
4. From the **Project Manager** window, expand the **Project Tree** and **[*Active Design Folder*]**. Then right-click **Analysis** and select **Analyze**. Wait for the analysis to complete.



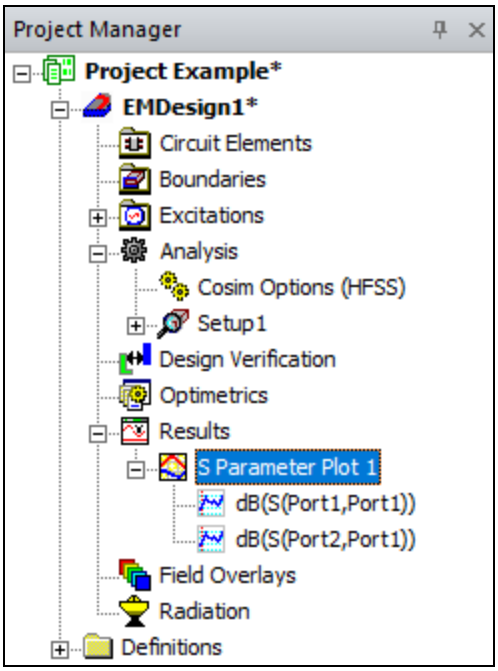
5. Click **Rigid-Flex** to change the model from the bent version to the flat version or vice versa. Then, on the **Project Manager** window, right-click **Analysis** and select **Analyze**, again.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The second time the design is analyzed is no more expedient because the entire analysis is conducted again for the design in its changed state. The solutions derived on the analyses do not invalidate one another.

6. From the **Project Manager** window, expand the **Project Tree** > **[*Active Design Folder*]** > **Results** > plot folder (e.g., **S Parameter Plot**). There is a solution for each (bent and flat) state.



7. Manually alter the model or bend angle to analyze different design variations, or parameterize the model to analyze and animate the design (refer to Design Variables and Animating Rigid-Flex Bends).

Deactivating Simplified Bend Graphics

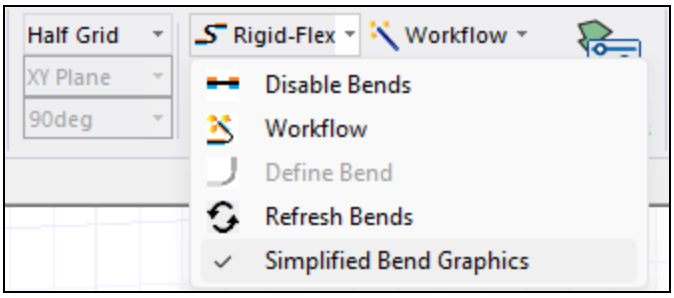
Depending on the complexity of the design, rendering a rigid-flex bend in the **Layout Editor** can take time and system resources. By default, **Simplified Bend Graphics** is active to more efficiently render the design. The basic shape of the design is maintained, but detail is not rendered. Follow these steps to deactivate **Simplified Bend Graphics**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

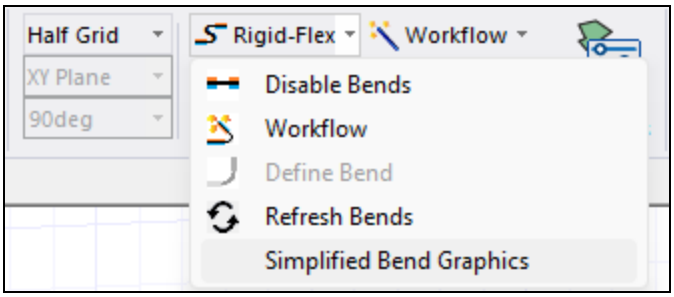
Note:

Simplification only affects rendering within the UI. It does not impact export of the bent design or simulation.

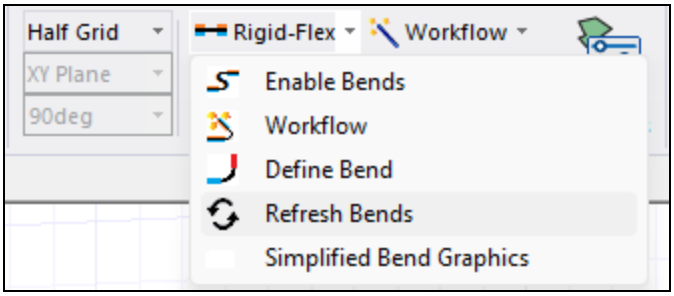
1. From the **Layout** tab ribbon, navigate to **Rigid-Flex** drop-down menu and select **Simplified Bend Graphics**.



The **Simplified Bend Graphics** check disappears.

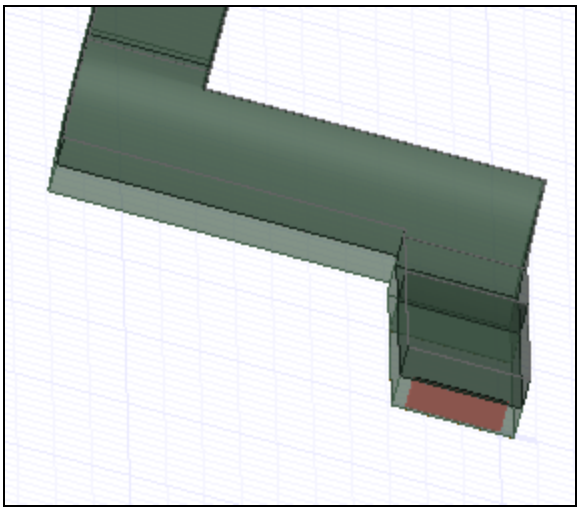


2. From the **Rigid-Flex** drop-down menu, select **Refresh Bends** to see the full rendering of the design in the **Layout Editor**.

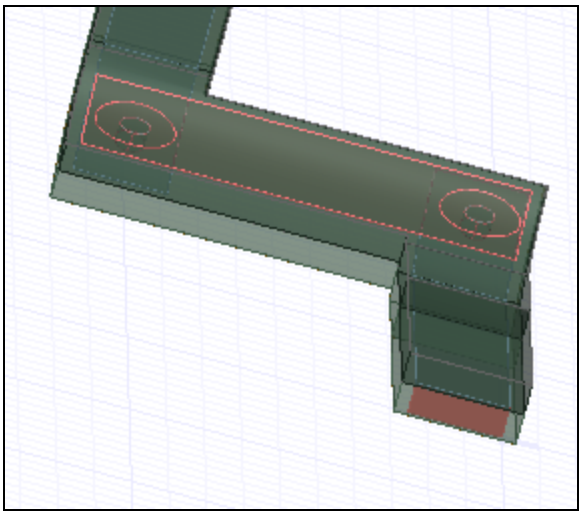


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Before **Simplified Bend Graphics** is deactivated, the model may look similar to the following example, maintaining the basic shape of the design.



After **Simplified Bend Graphics** is deactivated, the model will render completely.



3. To reactivate **Simplified Bend Graphics**, simply repeat steps **1**-**2**.

Continue to Exporting a Flexed Design Component

Exporting/Importing a Flexed Design Component

Follow the steps in these sections to export and import a design element with a rigid-flex bend as a component.

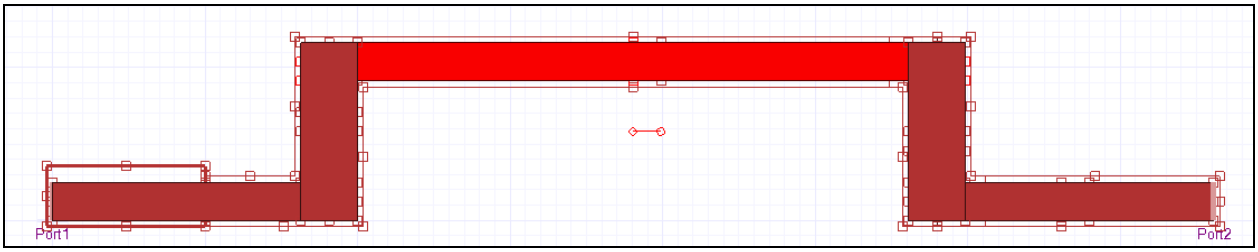
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Components with defined rigid-flex bends can be imported into a project as long the project does not already contain rigid-flex data.

Exporting a Flexed Design Component

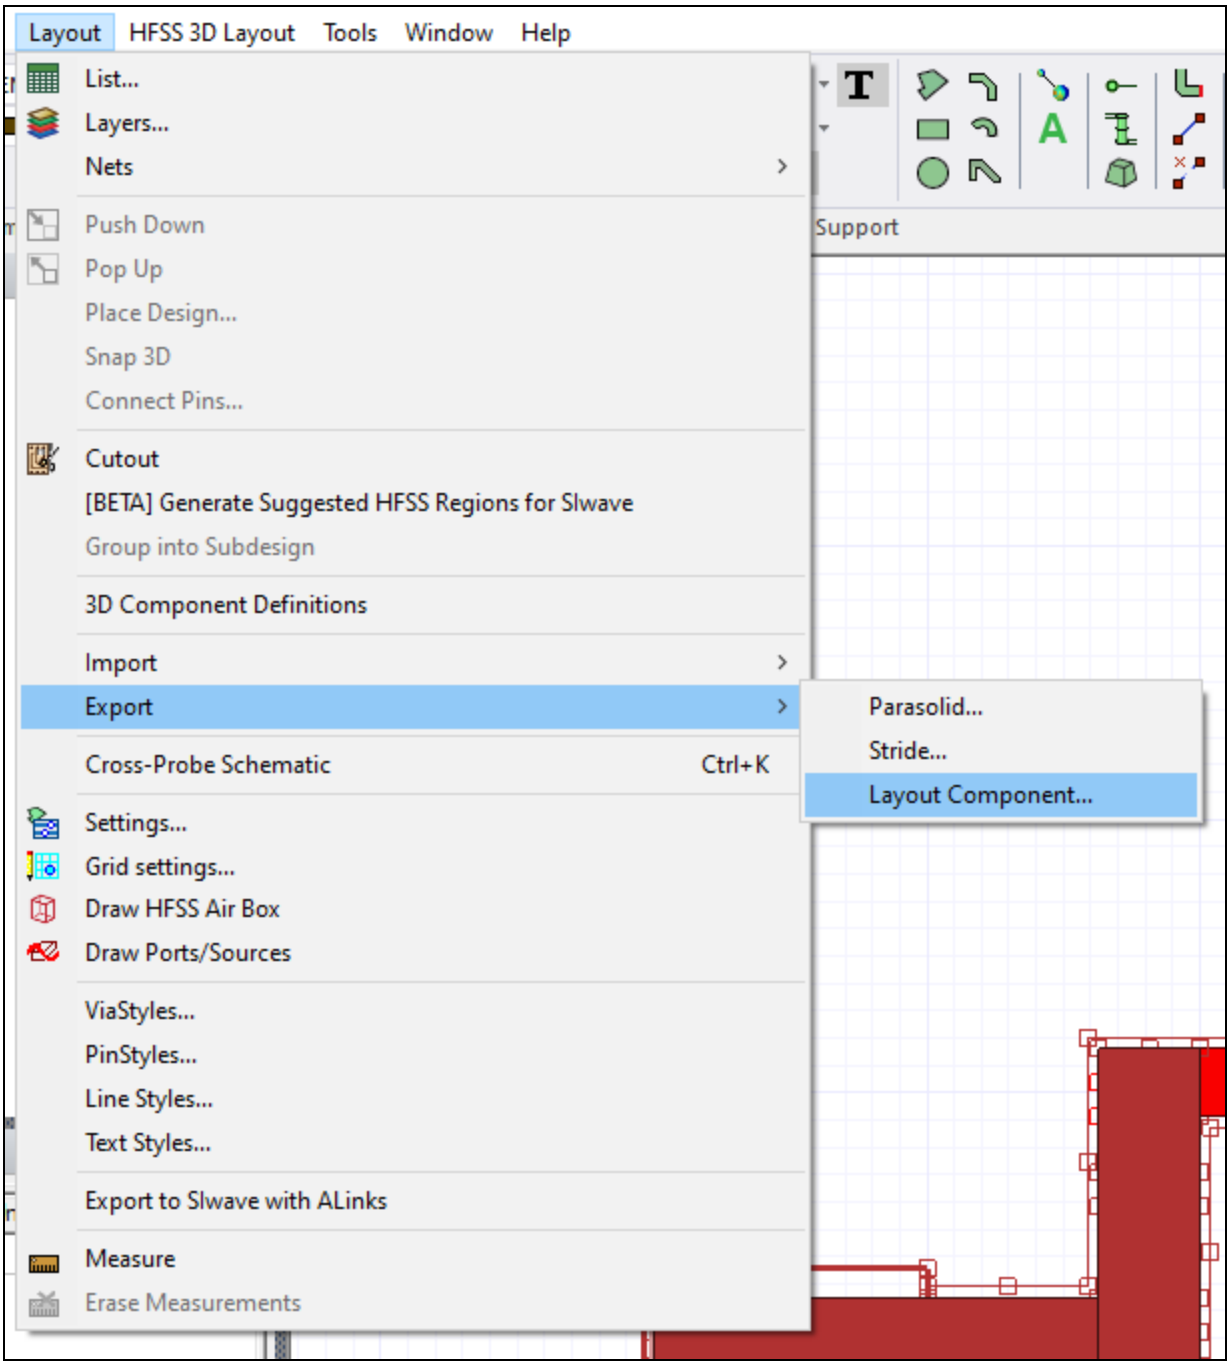
1. Select the design element(s) to export.



2. Navigate to **Layout** and select **Export** > **Layout Component** to open an explorer

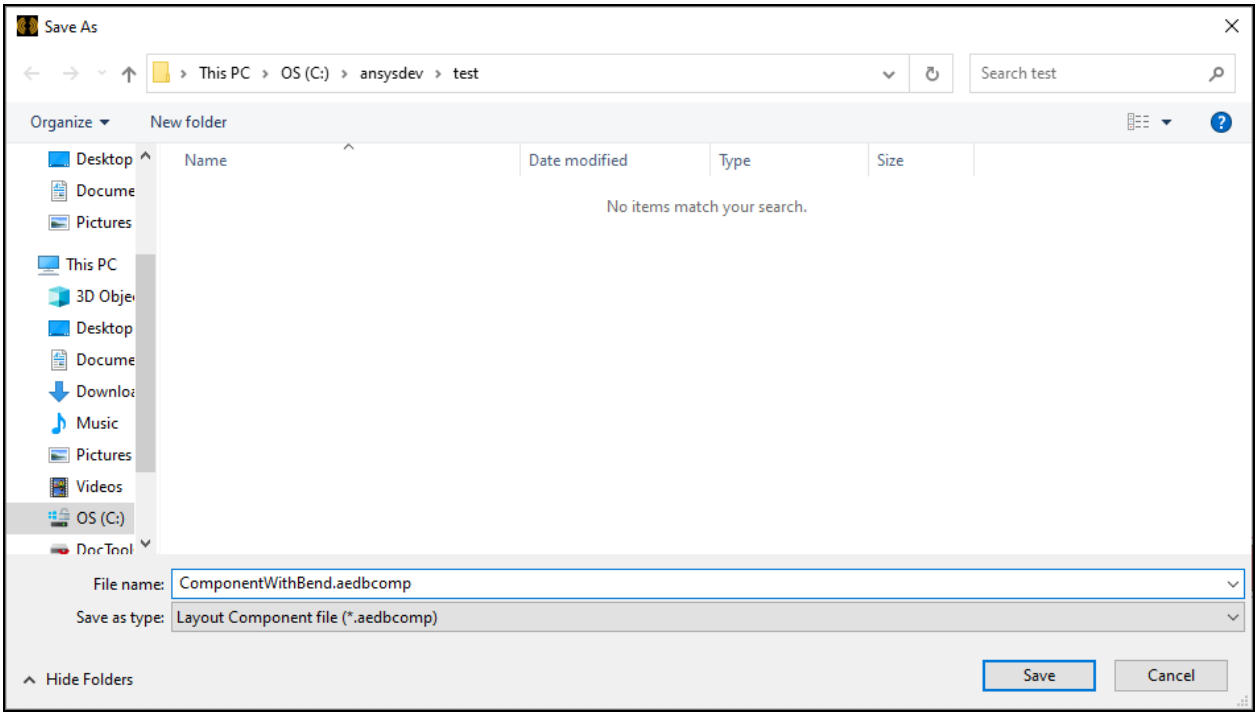
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

window.



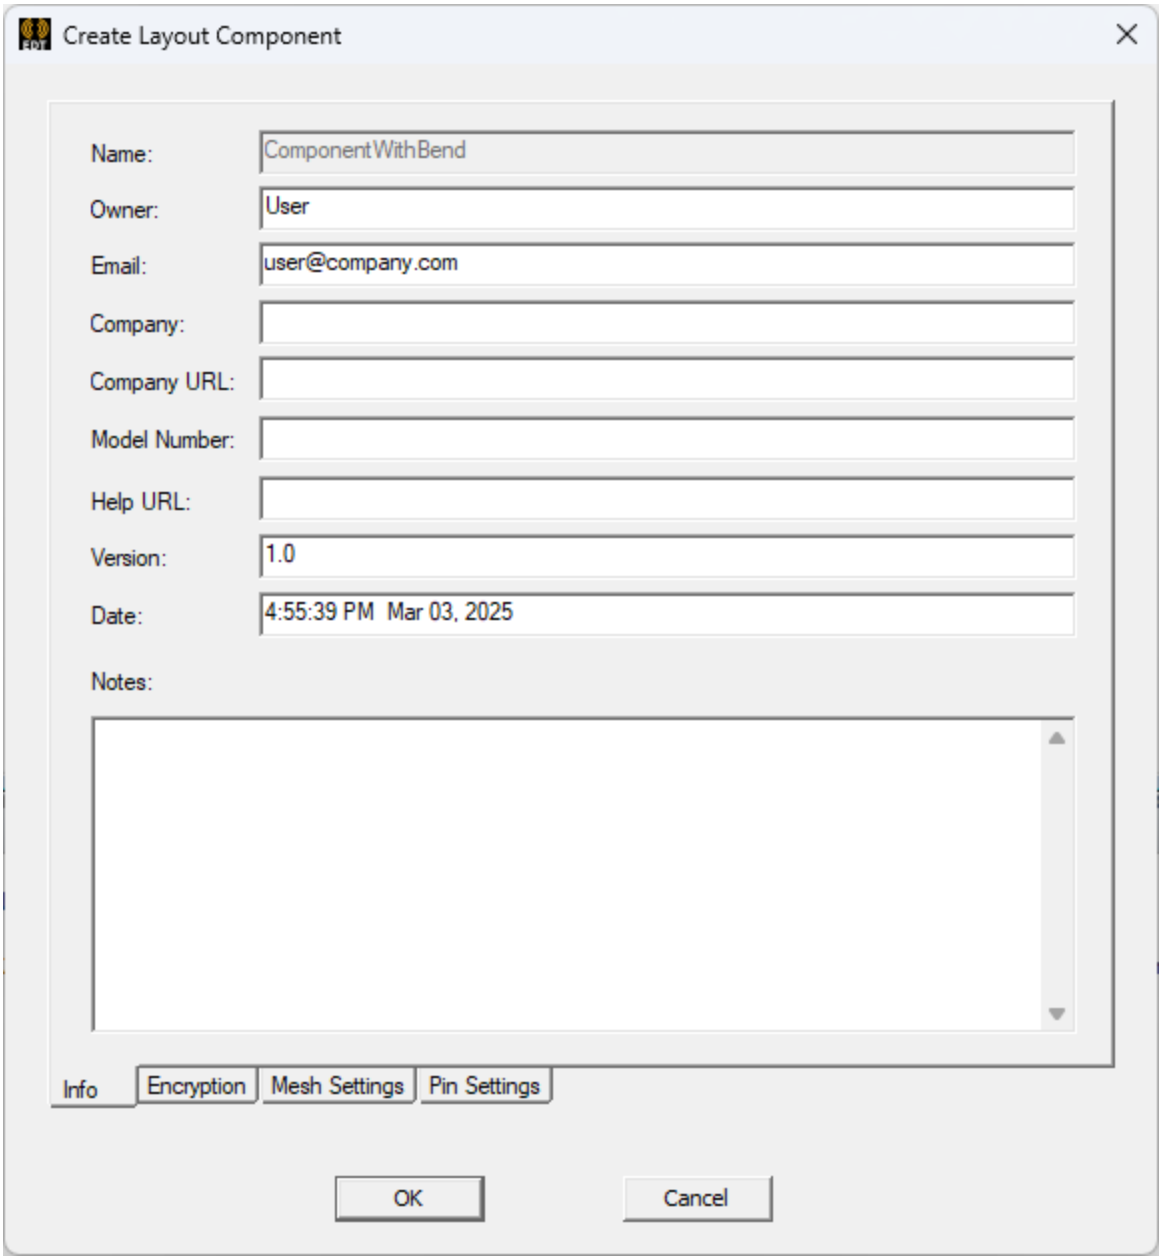
3. From the explorer window, enter a **File name** for the component (e.g., **ComponentWithBend.aedbcomp**). Then click **Save** to open the **Create Layout Component** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. The **Create Layout Component** window allows users to add meta data, encryption, and mesh settings to an HFSS 3D Layout design component before exporting it. From the **Info** tab, enter any metadata in the **Owner**, **Email**, **Company**, **Company URL**, **Model Number**, **Help URL**, **Version**, **Date**, and **Notes** fields. The **Name** field automatically populates with the component's file name.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

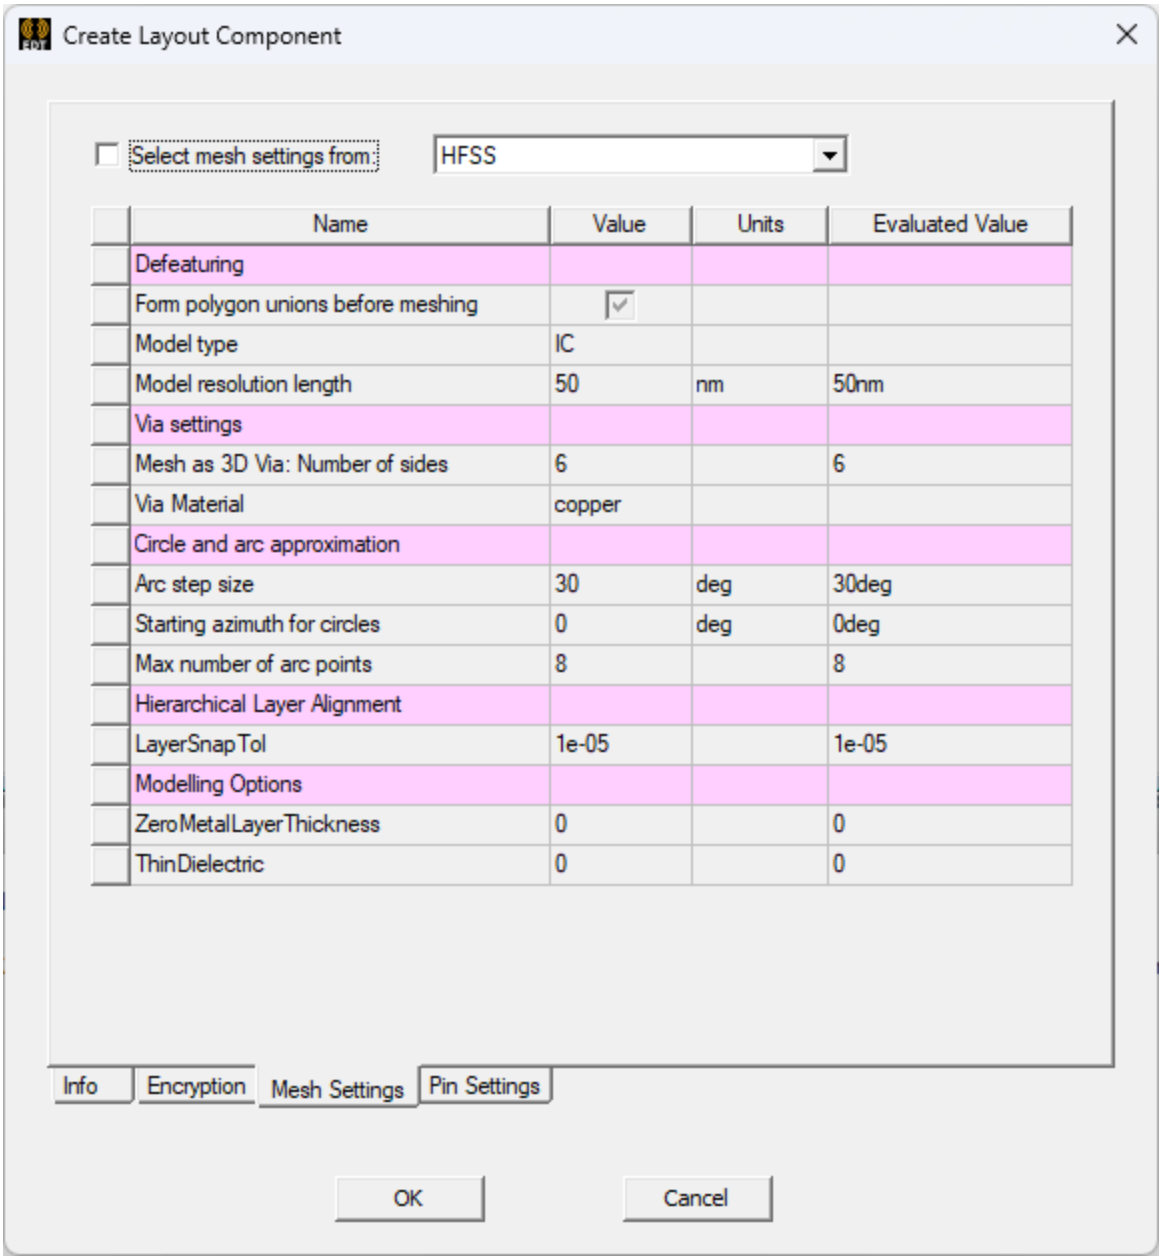


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> The **Encryption** and **Pin Settings** tabs are accessible but does not function if the design contains a rigid-flex bend. Attempting to set up encryption results in the following error message.
>
> Refer to the Importing and Exporting Components for more information about the **Encryption** tab.

5. Navigate to the **Mesh Settings** tab. From the **Mesh Settings** tab to export solve settings on the original component. To do so, check the **Select mesh settings from** box and make a selection from the drop-down menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



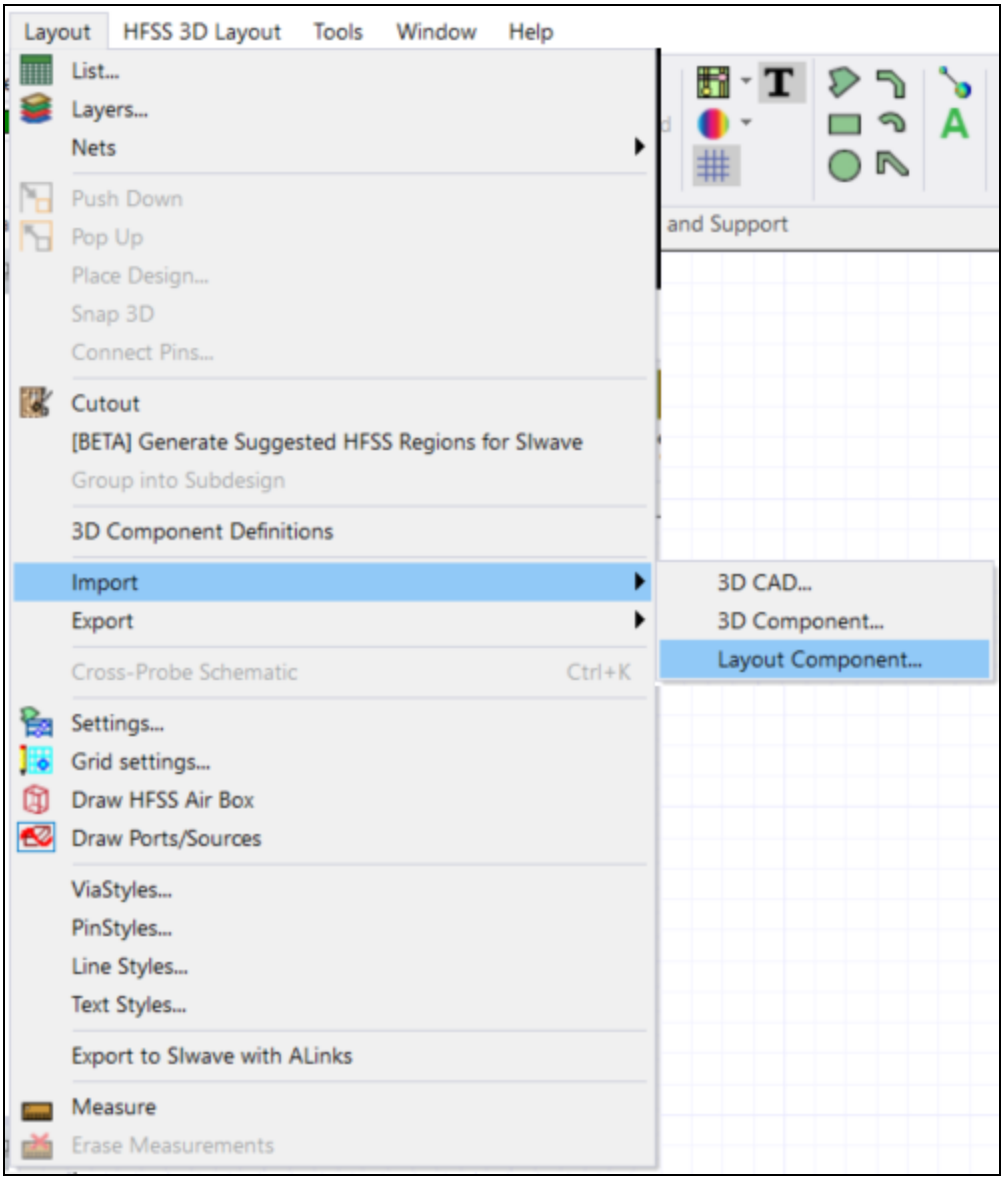
6. Click **OK** to export the component.

The procedure is complete.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

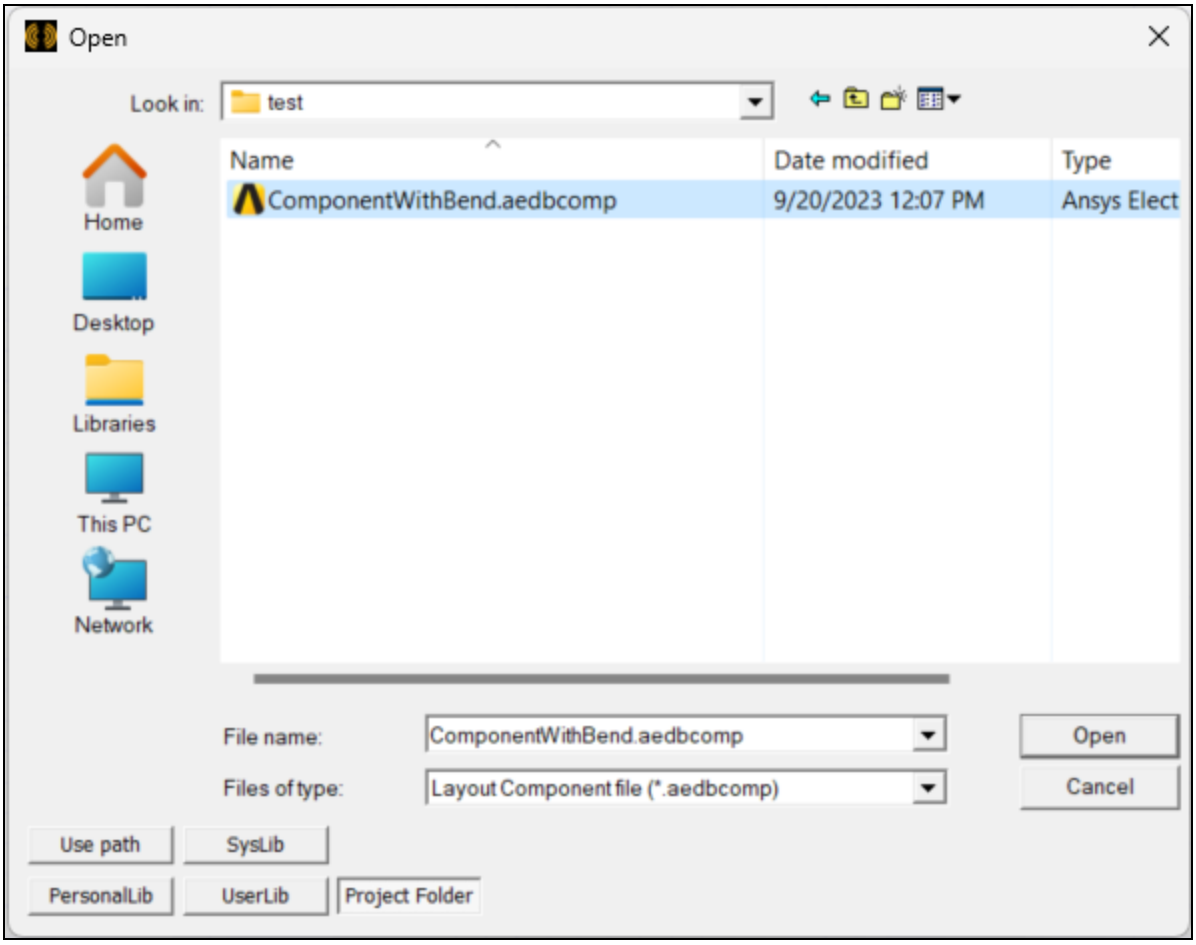
Importing a Flexed Design Component

1. Navigate to **Layout** and select **Import** > **Layout Component** to open an explorer window.

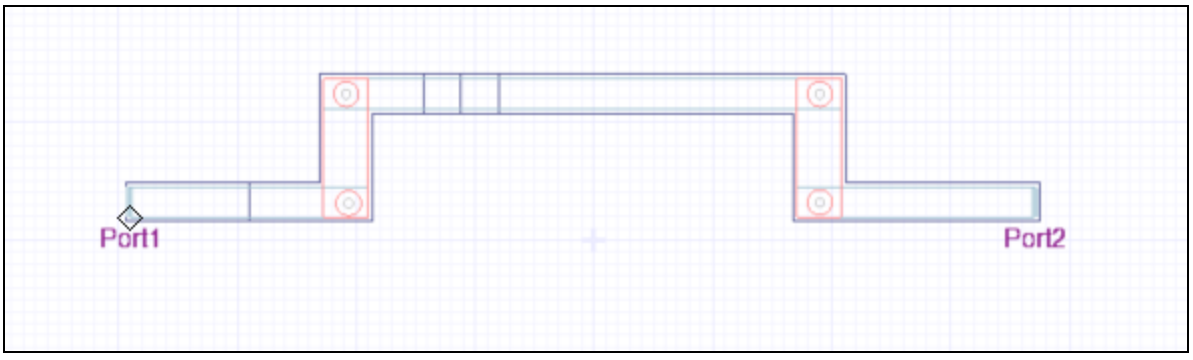


2. From the explorer window, navigate to an appropriate file (e.g., **ComponentWithBend.aedbcomp**). Select it, then click **Open** to import the component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

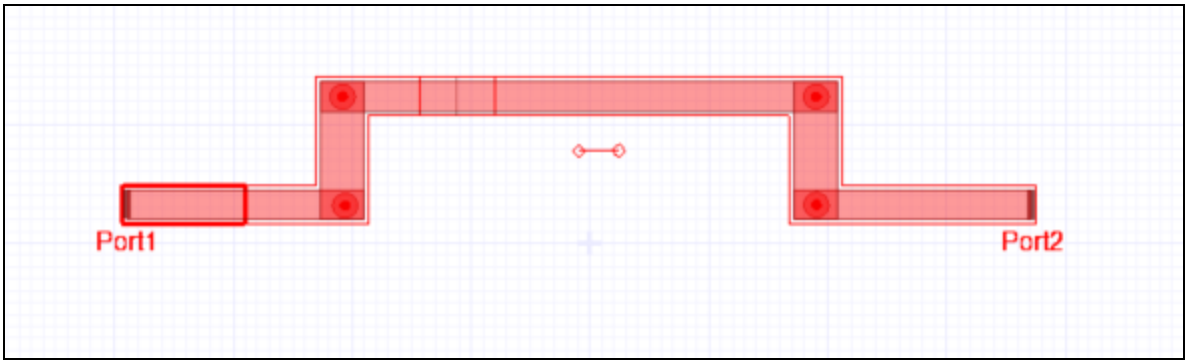


3. The new component appears in the **Layout Editor** attached to the cursor.

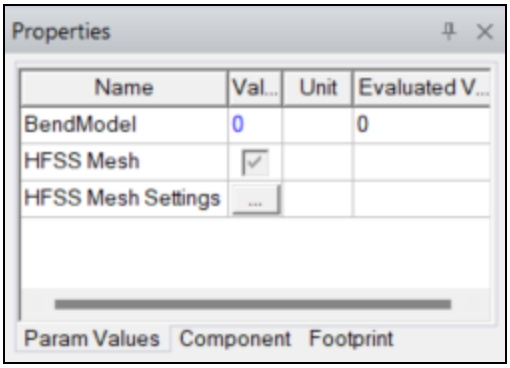


Navigate to an appropriate location to place the component, then click to set it.

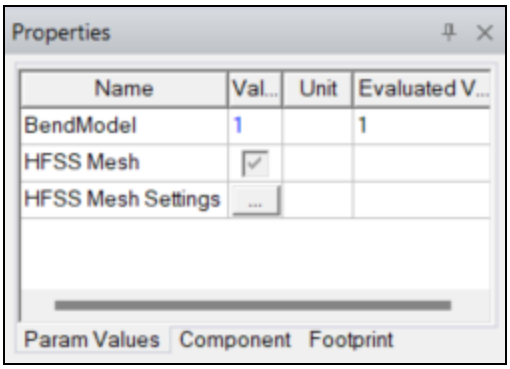
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. While the component is selected, navigate to the **Properties** window.

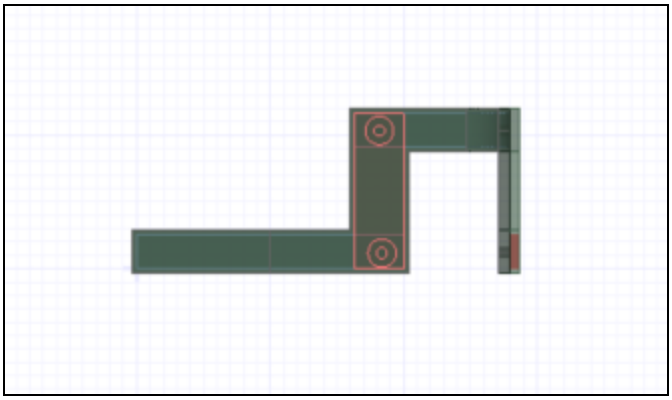


5. Enter **1** in the **BendModel** field.



Press **Enter** to apply the rigid-flex bend to the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



6. Enter **0** in the **BendModel** field and press **Enter** to revert the component to its unbent state.
7. If applicable, make changes to the component. Refer to Editing a Component Definition.

The procedure is complete.

Overlapping Stackup

In overlapping mode, signal layers can exist in the same location (i.e.,overlap one another) on the Z-axis. Each layer also extends over the entire design space in the X-axis and Y-axis.

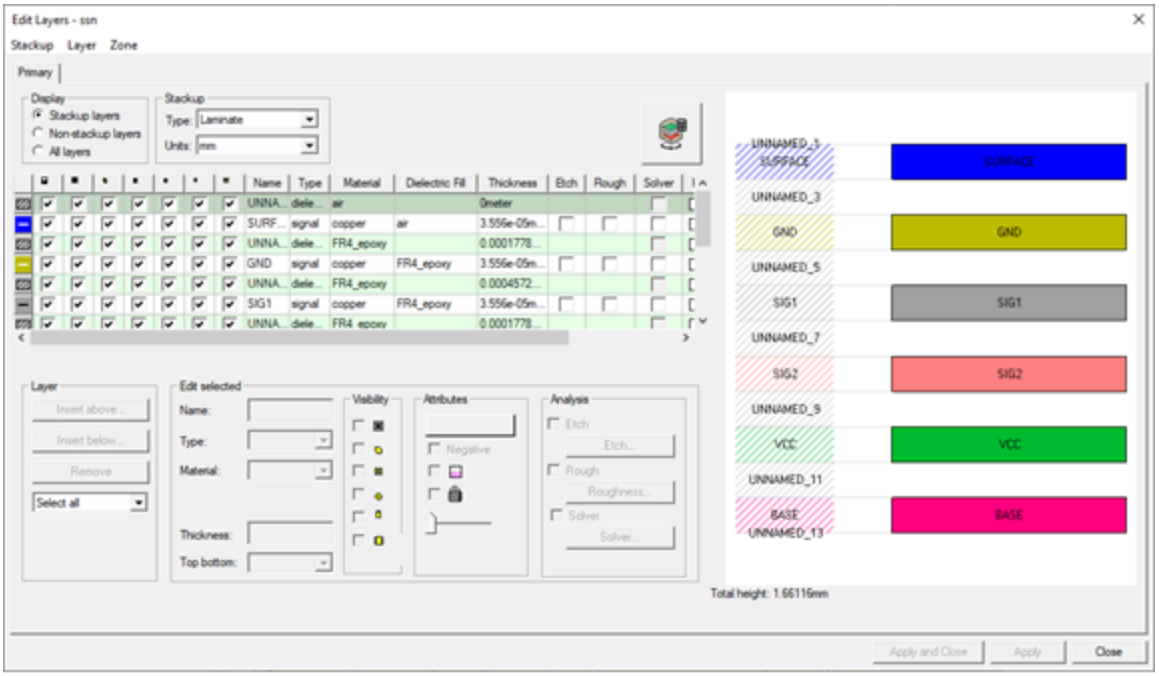
Dielectric layers must be contiguous (i.e., they cannot overlap nor have space between one another). Signal layers can reside at any elevation and can overlap dielectric and other signal layers. Via layers connect two signal layers. For rules on how layers may overlap, see Elevation in Overlapping Stackups.

When a new layer is created, the window automatically offers the same type of layer highlighted in the **Grid Control** pane.

Footprint Stackup

To access the footprint stackup, after the component has been placed in the **Layout Editor**, right-click the component and select **Edit Footprint** to open the **Footprint Editor**. Then, on the **Footprint** menu, select **Edit Layers**, which opens the Edit Layers window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can now use the Edit Layers window controls to insert or remove layers and configure the various layer attributes and configure stackup layers.

Model a Signal Layer as a Ground Plane

HFSS 3D Layout lets you model a signal layer as ground plane.

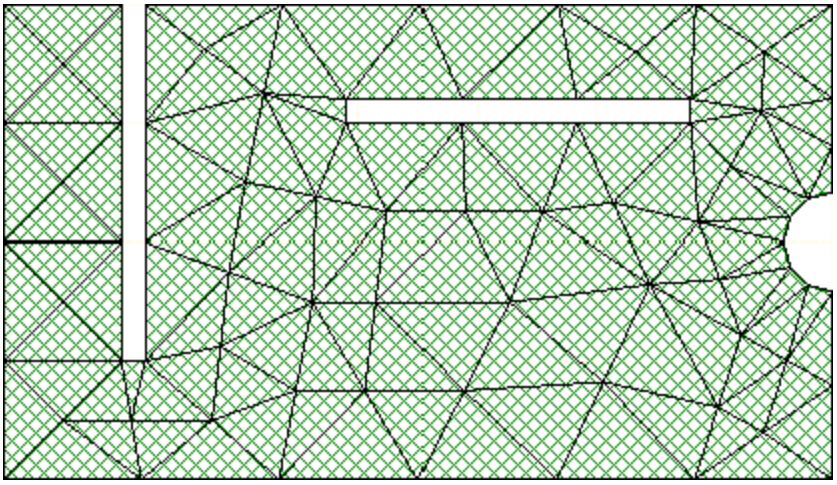
1. Open the **Edit Layers** window by:
   - On the menu bar, click **Layout** > **Layers** or **Footprint** > **Layers**.
   - In the **Layout** window, right click and chose **Edit Layers**.
   - On the **Layout** or **Footprint** ribbon, click the **Edit Layers** icon.
2. Add or select an existing signal layer.
3. From the **Analysis** area, select **Solver** to open the **Solver Options** window.
4. From the **Planer EM** tab, select **Treat as infinite ground** to model a signal as ground plane.
5. Click **OK** to close the **Solver Options** window.
6. Click **Apply** in the **Edit Layers** window.

The following diagrams illustrate the difference when a signal is modeled as a ground plane.

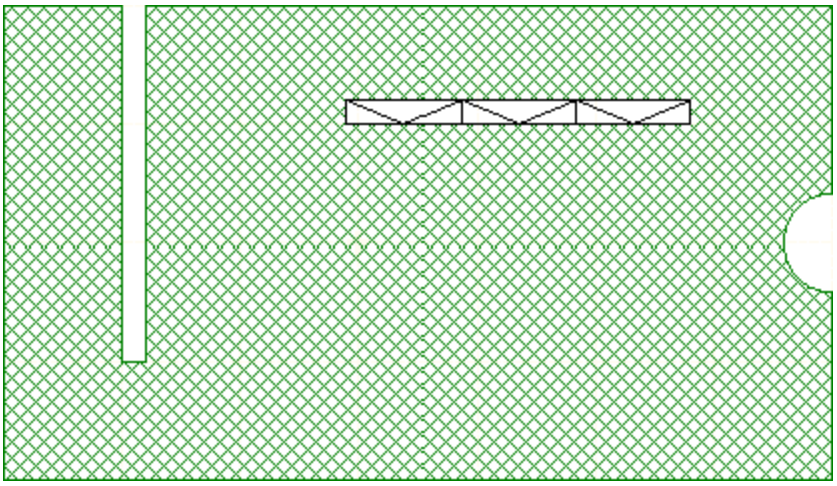
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> When a signal layer is modeled as a ground plane, only the holes are modeled.

Modeled as a Signal Layer



Modeled as a Ground Plane



Subcircuits with Independent Stackups

Subcircuits can be pasted into an HFSS 3D Layout design as an instance of the original, with an independent stackup. The vertical placement of the sub-design is determined by the placement layer of the cell instance:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select the sub-design in the layout editor (without pushing down into it).
2. Set the placement layer use the “PlacementLayer” attribute.

- The HFSS 3D Layout ignores sub-designs with independent stackups during analysis; a warning is issued.
- For HFSS, a consistent mesh that includes all sub-designs is constructed. If negative signal layers intersect, the mesh fails to generate.
- HFSS 3D Layout attributes in the black-boxes is ignored (e.g., boundary conditions).
- Ports must be added at the analysis level; ports internal to any sub-design is ignored.
- Ports can be referenced to negative signals or metal on a signal layer in the sub-design containing the physical port location or any parent design.

Note:

- The stackup cannot be inverted; the lower elevation of the black-box stackup is always aligned with the top of the placement layer.
- The entire combined geometry is simulated by HFSS; any existing results for the independent sub-design are not re-used.

Using the Layer Stackup Wizard (HFSS 3D Layout)

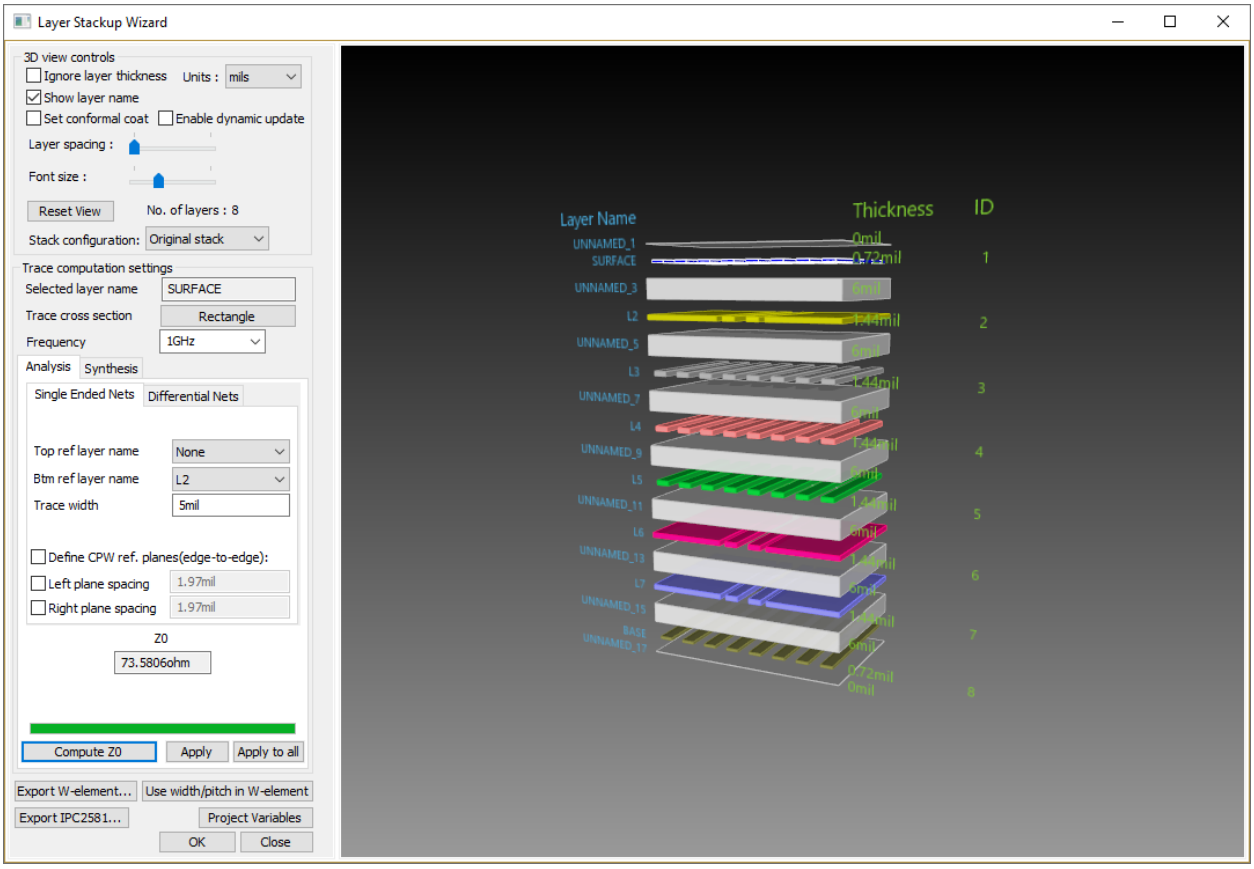
The Layer Stackup Wizard is a powerful utility that allows users to build and modify laminate layer stacks to meet precise impedance requirements for single-ended and differential microstrips and striplines. SIwave’s fast and accurate method-of-moments transmission line solver is used in all calculations and fully accounts for frequency-dependent dielectrics, non-uniform (e.g., trapezoidal) trace cross-sections, and surface roughness parameters. In Analysis mode, users can assess the impact of changing material parameters, layer thicknesses, etc., on the impedance of single-ended and differential lines whose width and separation are fixed. In Synthesis mode, users can compute trace width required to achieve a specified impedance value on a given layer. For differential nets, users can compute either trace width or trace separation to achieve a given impedance and trace separation (or width) values. Computed trace widths can then be applied to SIwave’s layout editor. Traces that are subsequently routed on layers with updated width values has the exact impedance value specified in the Stackup Wizard

A key component of this utility is the interactive, 3D visualization of the layer stack. This view, which can be panned, zoomed, and rotated using the mouse, provides users with an intuitive understanding of the dimensions and composition of their layer stack.

Opening the Layer Stackup Wizard

From **Layout**, select **Layers** to open the **Edit Layers** window. Then click the **Layer Stackup Wizard** icon to open the **Layer Stackup Wizard** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Layer Stackup Wizard** window contains two panes:

- **Control Pane** – located on the left, this pane allows you to configure the layer stack, and to calculate Impedance, Differential Impedance, and Trace Width/Pitch.
- **View Pane** – located on the right, this pane displays the current layer stack. The pane automatically updates as you change settings in the Control Pane, and you can add, remove, or edit certain layer properties directly from this pane. Use the mouse or hot keys to rotate and zoom the model. Use Ctrl+D to auto-zoom.

Configuring the Layer Stackup

From the **3D View Controls** area, make the selected selections on the following options.

- **Ignore layer thickness** – Checking this renders all layers at the same thickness. If this option is unchecked, layers display at their actual thicknesses.
- **Show layer name** – Checking this displays layer names. If this option is unchecked, layer material names display instead.
- **Set conformal coat** – Select this check box to add conformal coat layers. These layers are a set of dielectric layers on the top and bottom of all packages and PCBs in

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the design. They have a default material of "SolderMask" and a default thickness of 15 microns. They are shown with a Layer Type of "CONFORMAL_COAT". If dielectric layers are already present above the top layer and below the bottom layer, their material is changed to SolderMask and the layer type is changed to Conformal Coat.

- **Units** – Use this drop-down menu to update the units displayed in the View Pane, and in the impedance calculator.
- **Enable Dynamic Update** – when enabled, dynamic update performs the following actions when any change is made in the Layer Stackup window:
  - The design updates.
  - Impedance and differential impedance are recalculated.
  - W-element plots are recalculated and replotted.
- **Layer spacing** – Use the slider to increase or decrease the space between layers.
- **Font size** – Use the slider to increase or decrease the size of the font in the View Pane.
- **Reset View** – Click to reset the View Pane to its default view.

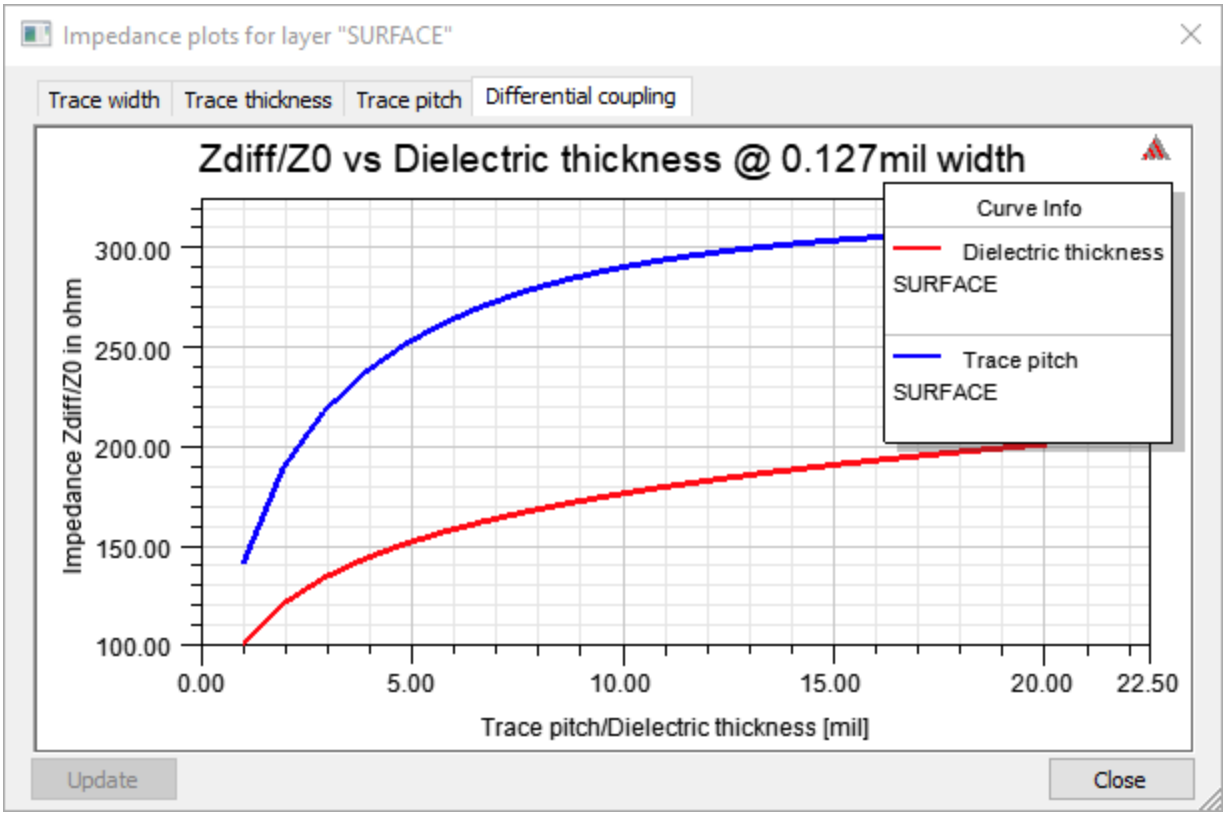
Exporting Data

- **Export IPC2581 File** – prompts you to select an *.xml or *.cvg file for export.
- **Export W-Element** – allows you to export the w-element.
- **Use width/pitch in W-element** – uses the calculated trace width or pitch in the w-element analysis.
- **Project Variables** – allows you to edit design variables.

Viewing Impedance Plots

Right-click a layer in the **View** tab and select **Show Impedance Plots** to open the **Impedance Plots for [Layer Name]** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This plot is modelless. Make any change in the **Layer Stackup Wizard** to enable the **Update** button and use the tabs to navigate between plots.

Other Capabilities of the Layer Stackup Wizard

From the **Layer Stackup Wizard**, you can also:

- Calculate trace width or pitch
- Calculate impedance (Z0)
- Calculate differential impedance (Zdiff)
- Export W-element
- Compute insertion/return loss and time domain crosstalk

Calculating Trace Width and Pitch Using the Layer Stackup Wizard (HFSS 3D Layout)

From the **Trace Computation Settings** area of the Layer Stackup Wizard, you can configure and perform a trace width (or pitch) calculation.

Prerequisites:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Use the View Pane to select a layer. The **Selected Layer Name** field displays the currently selected layer.
- Click **Trace Cross Section** to open the Trace Cross Section editor.
- Click the **Frequency** drop-down menu to select the frequency used for trace width calculations.

To calculate trace width or pitch:

1. Select the **Synthesis** tab.
2. Select the **Single Ended Nets** or **Differential Nets** tab.
3. Use the drop-down menus to select the required impedance or differential impedance (in ohms), and as reference layers.
4. If you are using the **Differential Nets** tab, select *either***Fix trace width at** or **Fix trace pitch at** and enter a value.

> **Important:**
>
> By default, **Fix Trace Pitch** is selected. Selecting **Fix Trace Width** changes the calculator so that it computes pitch instead of width.
>
> >

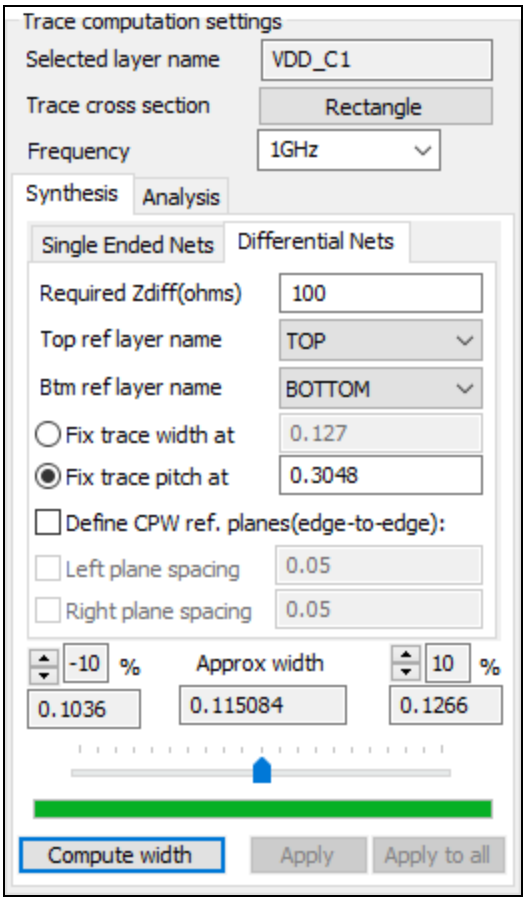
5. Select **Define CPW ref. planes (edge-to-edge)** to enable additional options (e.g., define coplanar waveguide reference planes).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

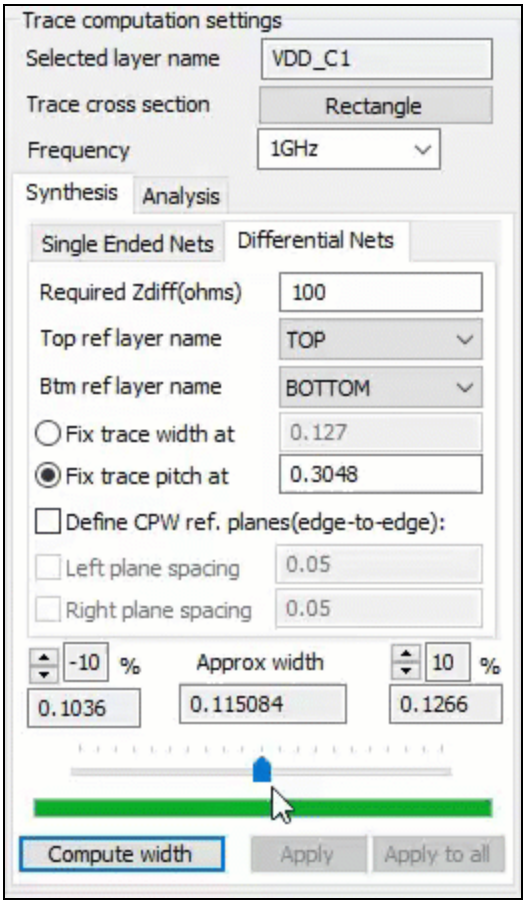
- You may select **Left plane spacing**, **Right plane spacing**, or both.
- For W-element export, selecting **Left plane spacing** means that aggressors may only be added to the right of a victim trace; any traces to the left are removed. Selecting **Right plane spacing** means that aggressors may only be added to the left of a victim trace; any traces to the right are removed.

6. To perform the calculation, click **Compute width**. The green progress bar shows the calculation's progress. When the calculation is complete, the **Approx width** area updates to show the calculated result.



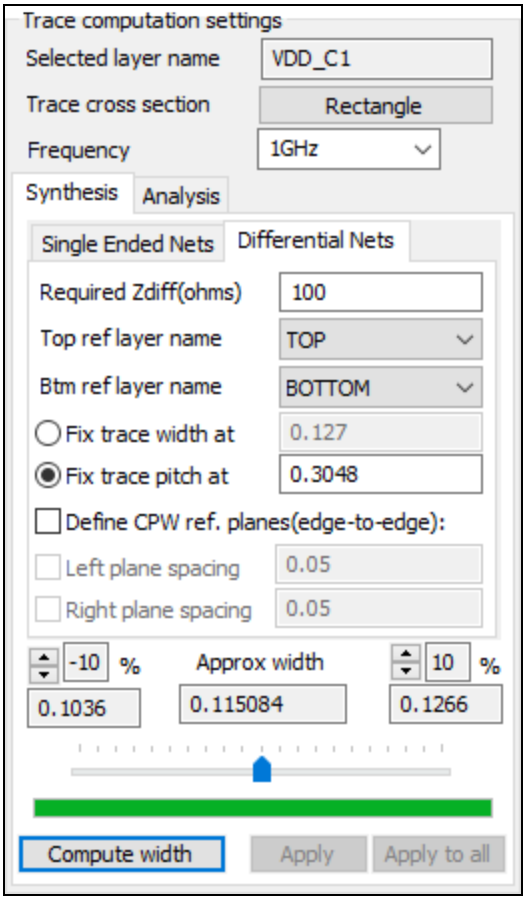
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. Use the slider above the progress bar to update trace width and the required Zdiff value.



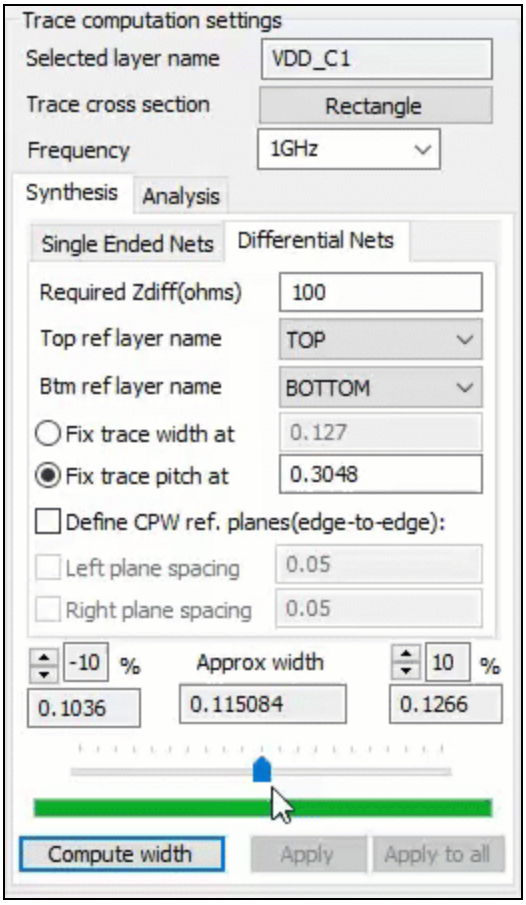
8. To perform the calculation, click **Compute width**.
9. The **Approx width** area updates to show the result.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

10. Use the slider above the green bar to update trace width and the required Zdiff value.



Calculating Impedance Using the Layer Stackup Wizard (HFSS 3D Layout)

From the **Trace Computation Settings** area of the Layer Stackup Wizard, you can configure and perform an impedance calculation.

Prerequisites:

- Use the View Pane to select a layer. The **Selected Layer Name** field displays the currently selected layer.
- Click **Trace Cross Section** to open the Trace Cross Section editor.
- Click the **Frequency** drop-down menu to select the frequency.

To calculate impedance:

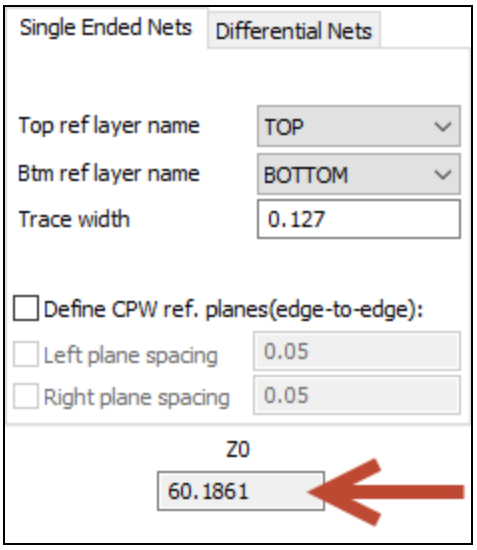
1. Select the **Analysis** tab.
2. Select the **Single Ended Nets** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Select your reference layers.

> **Note:**
>
> Top and bottom reference layer must be selected in order to use multi-layer features of W-element export.

4. From the **Trace Width** field, enter a trace width.
5. Select **Define CPW ref. planes (edge-to-edge)** to enable additional options (e.g., define coplanar waveguide reference planes).
   - You may select **Left plane spacing**, **Right plane spacing**, or both.
   - For W-element export, selecting **Left plane spacing** means that aggressors may only be added to the right of a victim trace; any traces to the left are removed. Selecting **Right plane spacing** means that aggressors may only be added to the left of a victim trace; any traces to the right are removed.
6. Click **Compute Z0**.
7. The **Z0** field updates to show the result.



8. To apply this setting to one layer or all layers, click **Apply** or **Apply to all**.

Calculating Differential Impedance Using the Layer Stackup Wizard (HFSS 3D Layout)

From the **Trace Computation Settings** area of the Layer Stackup Wizard, you can configure and perform a differential impedance calculation.

Prerequisites:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

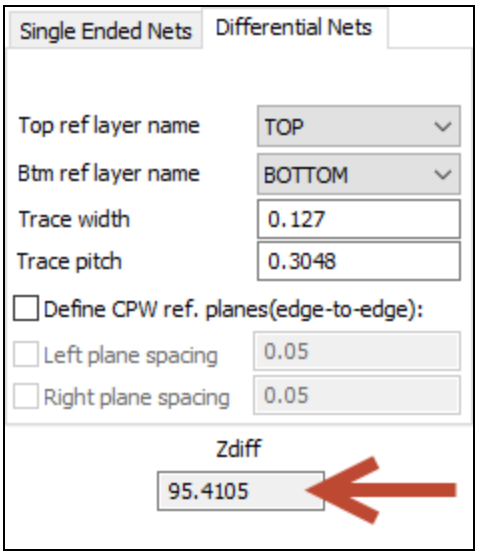
- Use the View Pane to select a layer. The **Selected Layer Name** field displays the currently selected layer.
- Click **Trace Cross Section** to open the Trace Cross Section editor.
- Click the **Frequency** drop-down menu to select the frequency.

To calculate differential impedance:

1. Select the **Analysis** tab.
2. Select the **Differential Nets** tab.
3. Select your reference layers.

> **Note:**
>
> Top and bottom reference layer must be selected in order to use multi-layer features of W-element export.

4. From the **Trace Width** and **Trace Pitch** fields, enter a trace width and pitch.
5. Select **Define CPW ref. planes (edge-to-edge)** to enable additional options (e.g., define coplanar waveguide reference planes).
   - You may select **Left plane spacing**, **Right plane spacing**, or both.
   - For W-element export, selecting **Left plane spacing** means that aggressors may only be added to the right of a victim trace; any traces to the left are removed. Selecting **Right plane spacing** means that aggressors may only be added to the left of a victim trace; any traces to the right are removed.
6. Click **Compute Zdiff**.
7. The **Zdiff** field updates to show the result.



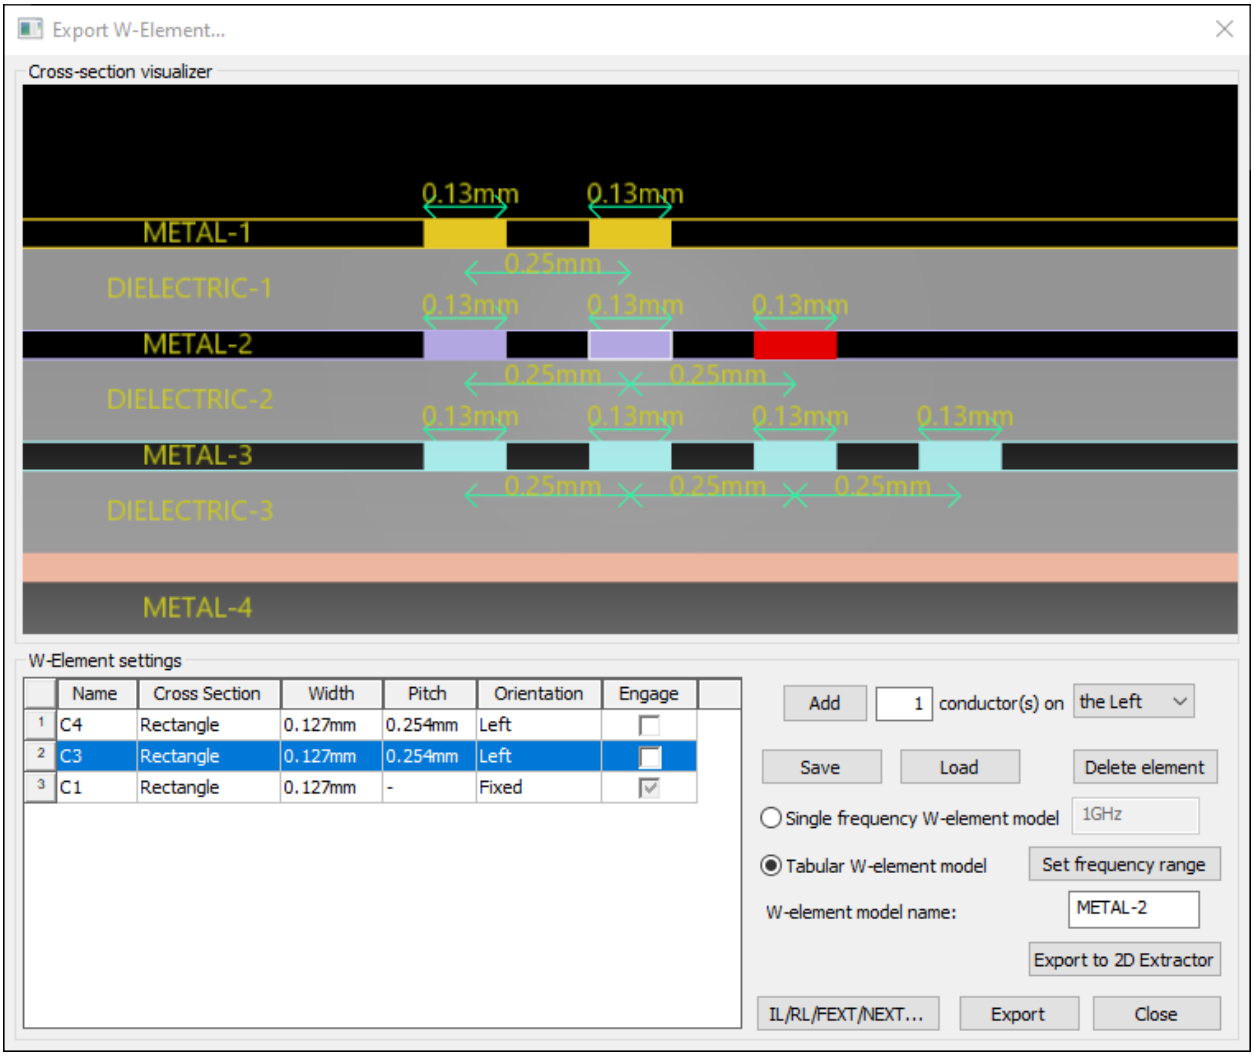
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Exporting the W-element from Layer Stackup Wizard (HFSS 3D Layout)

After you have used the Layer Stackup Wizard to calculate impedance, differential impedance, or trace width/pitch, the **Export W-Element** window allows you to set up aggressor traces around a victim trace and export the corresponding w-element.

To configure a w-element export:

1. From the **Layer Stackup Wizard**, click **Export W-element** to open the **Export W-Element** window.



The **Cross-section Visualizer** displays a graphical representation of the **W-Element Settings**, including dielectric blocks and the top and bottom reference layers.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> Also access this window by drawing a cross-section for w-element analysis.

2. Click a conductor in the visualizer or select it from the list in the **W-Element Settings** area.

   The grid displays the following for each conductor:

   - **Name** – conductor name.
   - **Cross Section** – indicates the shape of the cross section.
   - **Width** – can be edited here directly, or imported on the Layer Stackup Wizard by selecting **Use width/pitch in W-element**.
   - **Pitch** – can be edited here directly, or imported on the Layer Stackup Wizard by selecting **Use width/pitch in W-element**.
   - **Orientation** – fixed, left, or right.
   - **Engage** – enabling this check box engages the conductor in IL/RL/FEXT/NEXT simulations.

   The following options are available:

   - **Add** – Enter the number of aggressors to add, and use the drop-down menu to select whether to add them on the **right**, **left**, or on **both sides**. Then click **Add**.

     > **Note:**
     >
     > If you previously enabled CPW settings during trace width, impedance, or differential impedance calculation, your options will be limited.
     >
     > - If you selected **Left plane spacing**, aggressors may only be added to the right of a victim trace.
     > - If you selected **Right plane spacing**, aggressors may only be added to the left of a victim trace.

   - **Delete Element** – Click to remove an element.
   - **Single Frequency / Tabular Model** – Select **Single frequency** and enter the frequency in Hz, or select **Tabular** and click **Set frequency range** to set up a range of frequencies.
   - **W-Element Model Name** – If selected, enter a new model name for the w-element.
   - **Export to 2D Extractor** – generates a script to export the selected layer's cross-section to 2D Extractor.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The layer thickness, conductor width, pitch, etching, conformal coat thickness are all defined using design variables.

Consult the Q3D Extractor/2D Extractor help for instructions on running an analysis in 2D Extractor.

3. Click **IL/RL/FEXT/NEXT** to compute insertion/return loss and time domain crosstalk.
4. Make then selected selections, then click **Export** to open the **Select Spice File to Export** window.

> **Note:**
>
> Selecting **Tabular W-element model** but not specifying the frequency range will automatically open the **Frequency Sweep** window. You must specify the frequency range before you can save.

5. Browse to a save location, name your file, and click **Save**. The file is saved in Spice (*.sp) format.

Computing Insertion/Return Loss and Time Domain Crosstalk (HFSS 3D Layout)

From the **Export W-Element** window, you can compute and plot insertion loss (IL), return loss (RL), far-end time domain crosstalk (FEXT), or near-end time domain crosstalk (NEXT).

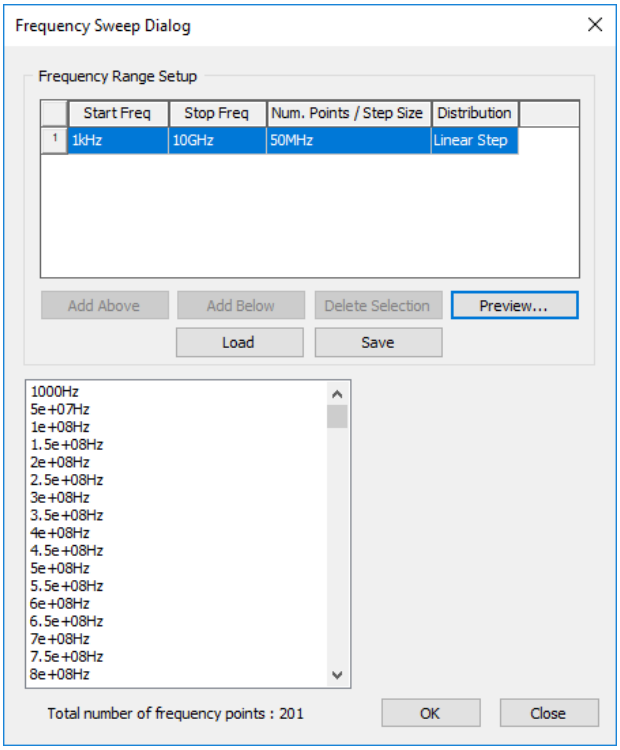
Prerequisites:

- Use the Layer Stackup Wizard to calculate trace width/pitch, impedance, or differential impedance.
- Export W-element.

To calculate and plot IL/RL/FEXT/NEXT:

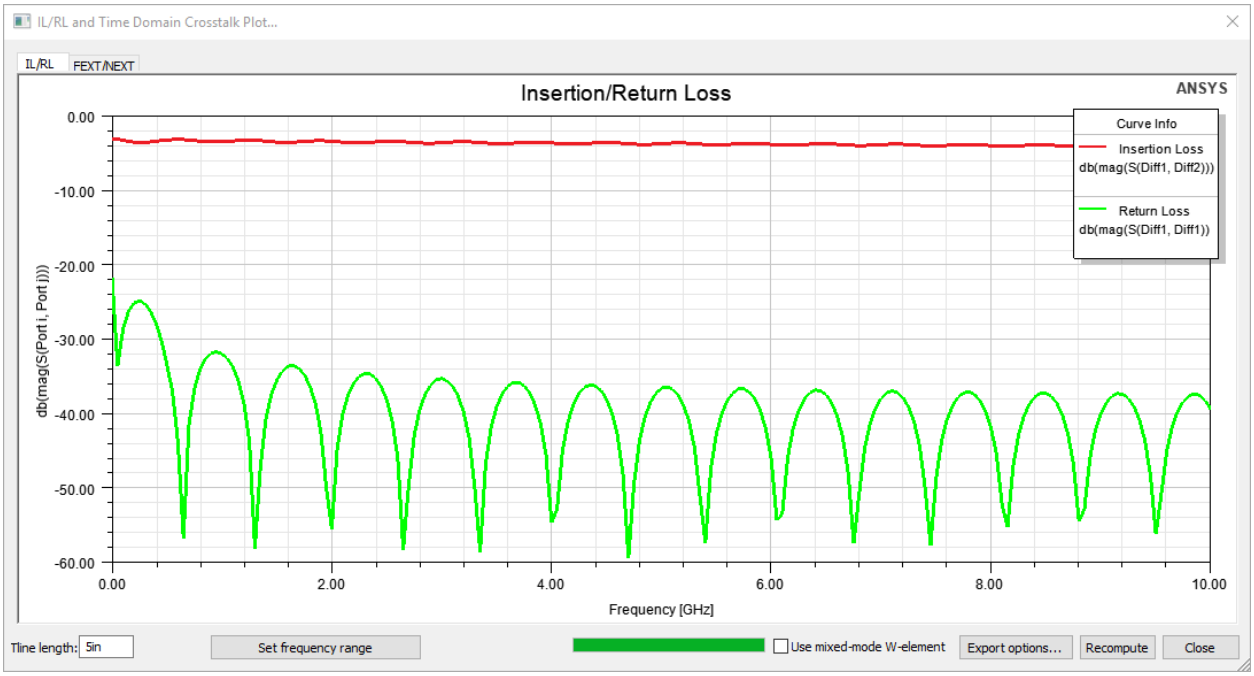
1. From the **Export W-Element** window, click **IL/RL/FEXT/NEXT** to open the **Frequency Sweep** window.

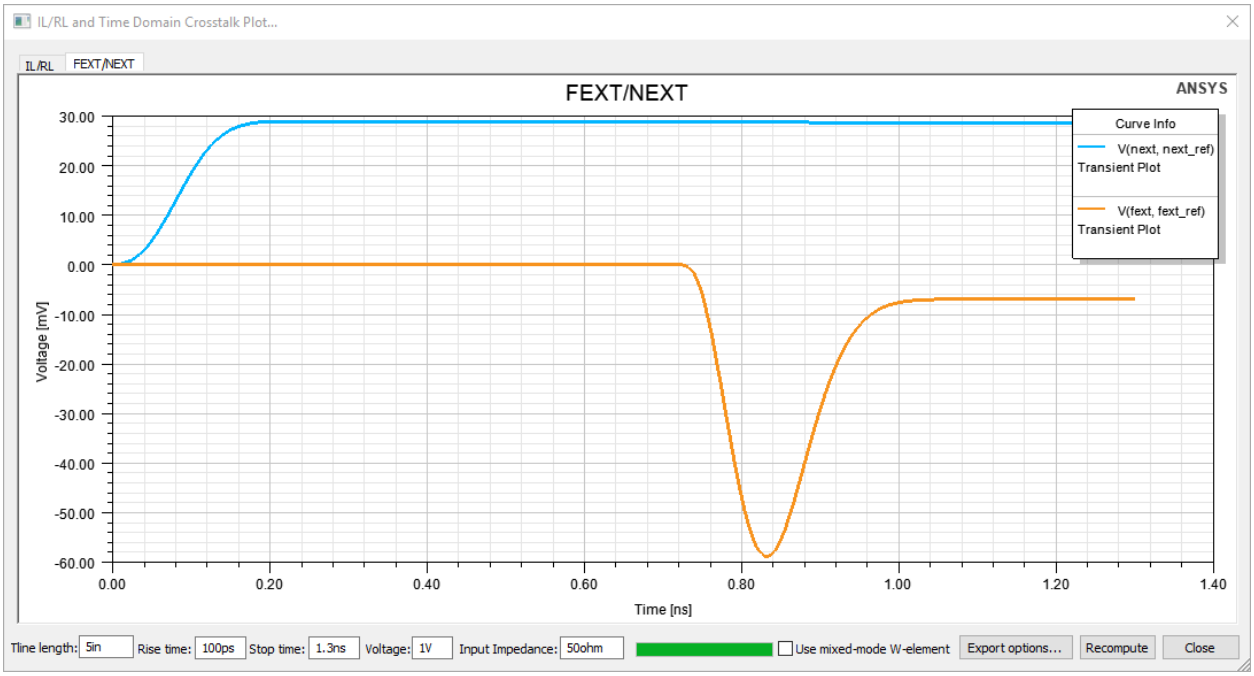
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Add, remove, and edit frequencies as appropriate. Click **Preview** to preview the number of frequency points.
3. Click **OK** to open the **IL/RL and Time Domain Crosstalk Plot** window to the **L/RL** tab.
4. Select the **FEXT/NEXT** tab to view the crosstalk plot instead. While the plot computes, a green progress bar displays the progress. When it is finished, the selected plot appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





For IL/RL plots, you can adjust the **Length** or click **Set frequency range** to change the frequency range of the plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For FEXT/NEXT plots, you can adjust the **Tline length** (trace length); edit the **Rise time**, **Stop time**, and peak **Voltage** of the driver attached to the aggressor net; or modify the driver **Input Impedance** value. This impedance is also used to terminate all transmission lines in the specified cross-section.

Click **Export Options**: to export plot data:

- For IL/RL plots, select **Export w-element schematic to circuit** (in *.aedt format) or **Export touchstone file**.
- For FEXT/NEXT plots, select **Export w-element schematic to circuit** (in *.aedt format) or **Export .csv file**.

If you change values and need to regenerate the plot, click **Recompute**.

Right-clicking in the plot enables additional plotting actions.

5. Click **Close** to exit the plot window.

Adding Programmatic EDB Cells to HFSS 3D Layout

1. From the **Project Manager** window, expand **Definitions** and right-click **Components**.
2. Choose **Add Scripted Component**.
3. From the explorer window, click one or more Python script files (.py) to generate a set of component, footprint, and symbol definitions.

> **Note:**
>
> Each Python script file must possess two elements:
>
> - A component, “MyNewComponent”, that is derived from IScriptedComponent. The IScriptedComponent file is located in the executables directory in PythonFiles\HFSS3DLayoutDesign\ScriptedComponent\IScriptedComponent.py either within Win64 or Linux64.
> - A function similar to the following that returns an instance of the new component class:
>
> def GetComponent():
>
> return MyNewComponent()
>
> Issues that arise upon import are reported through the Message Manager.

Creating a Component

Define all functions that return “NotImplementedError”.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **GetVersion**: Should return a floating point number.
- **GetParameters**: Returns a list of Property objects (defined in the IScriptedComponent.py folder).
- **Property**: Is in the list returned by GetParameters.
- **MenuProperty**: Is in the list returned by GetParameters. MenuProperty expects a list of values as its argument list — not a list of strings. These are the default values used to generate the footprint, component and symbol. These values can only be edited at the Component Instance level. MenuProperty is a class derived from "Property". Both "Property" and "MenuProperty" are in the list returned by GetParameters.
- **GetTerminalNames**: Returns a list of terminal names that are used to establish the terminal order for the resulting component.
- **CreateMaterialDefinitions**: Must be defined even if the plan is to use the default definitions. Materials are created at the project level.
- **CreatePadstackDefinitions**: Must be defined even if it does nothing but “return”. Padstack definitions are added at the project level.
- **GetLayerList**: Should return a list of StackupLayers in order from top to bottom.
- **CreateFootprint**: where the data is available to use. Add geometry, padstacks, ports, etc. The ports should match up with the terminal list. The behavior is not well defined if that is not the case.

Editing the Python Script

Under **Footprints**, double-click or right-click to edit the footprint. This modifies the main menu. Then select **Footprint** and **Edit Script**. This allows modification of the Python script that is saved in the project. When finished making edits, select “Save/Run Script” under “Script” and all elements of the component are regenerated, as are component instances. Scripting issues are reported through the Message Manager.

Saving to Libraries

EDB Scripted Components can be saved just like any other component, footprint, or symbol. However, hand editing these libraries is not recommended.

Component Instances

Just like when any parametrized component is edited, modifying the parameters of the component are reflected in the component instance. If the “VerifyParameters” function is overloaded, any invalid parameter results in the parameter reverting to its previous state. This are reported through the Message Manager.

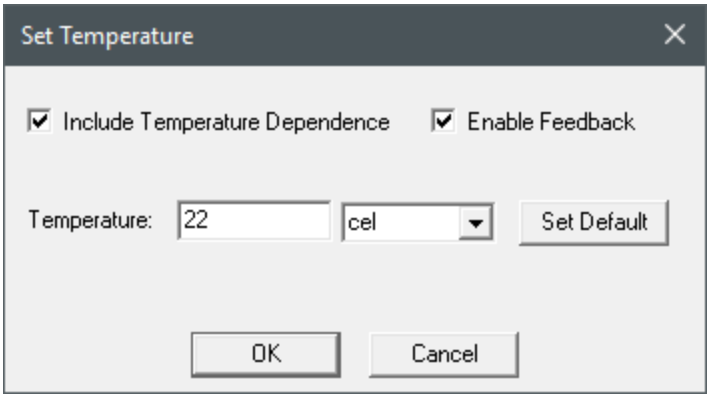
Setting Uniform Temperature in HFSS 3D Layout

To set a uniform temperature and enable feedback for use two-way coupling:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Click the **HFSS 3D Layout** > **Set Temperature** command to display the **Set Temperature** window. Also, right-click the design in the **Project Tree** and select.

   This window allows you to set a global design temperature, which is used to modify the conductivity of metallization during the DC IR simulation. In general, the higher the temperature, the lower the conductivity (implying a higher resistance).



2. To enable the editing features, check **Include Temperature Dependence**.
3. Enter a value for Temperature, or an existing variable in the field.
4. Make a selection on the units drop-down menu.
5. If needed, **Set Default** to make the specified values the default.
6. To enable coupling with thermal designs, select **Enable Feedback**.

   You can perform two-way coupling between an HFSS 3D Layout design with an Ansys SIwave™ DC IR solution setup and an Icepak design in the Ansys Electronics Desktop (AEDT)™ electronics systems design platform. In an Icepak design, you can specify the number of coupling iterations to be run. DC IR loss data calculated by the source HFSS 3D Layout design is consumed by Icepak when calculating thermal data in the current coupling iteration. The thermal data is then consumed by the source design in the next coupling iteration's calculation.

7. To close the window and accept the changes, click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7 - Layout Editor

The **Layout Editor** shows a physical representation of a circuit. Layers are used in the editor to organize and manipulate sets of geometry and other visual indicators.

- Signal, negative signal, and dielectric are common physical layers.
- Symbol, error, and rats are non-physical layers.

The **Edit Layers** window stackup contains additional properties of the physical layers, such as material, thickness, and elevation. Geometrical information on these layers is used to generate masks for manufacturing.

IC Mode

The Layout Editor opens in either General mode (i.e., default) or IC mode. IC mode integrates ECAD Xplorer into the HFSS 3D Layout environment, preserving ECAD Xplorer's capabilities while allowing users direct access to most General mode, such as:

- HFSS 3D Model Extents
- Meshing
- Clip Planes
- Post Processing and Generating Reports
- Recording a Script to a File
- Parametrics
- Components (except for 3D Components)

In other circumstances, ECAD Xplorer features have been expanded to include HFSS 3D Layout capabilities, such as in the Edit Components window.

Finally, all of ECAD Xplorer's native features have been integrated and are accessible through shared topics, as well as through the following IC Mode-specific topics:

- Creating Circuit Ports in IC Mode
- Adding a Solution Setup
- Uniting Primitives in IC Mode

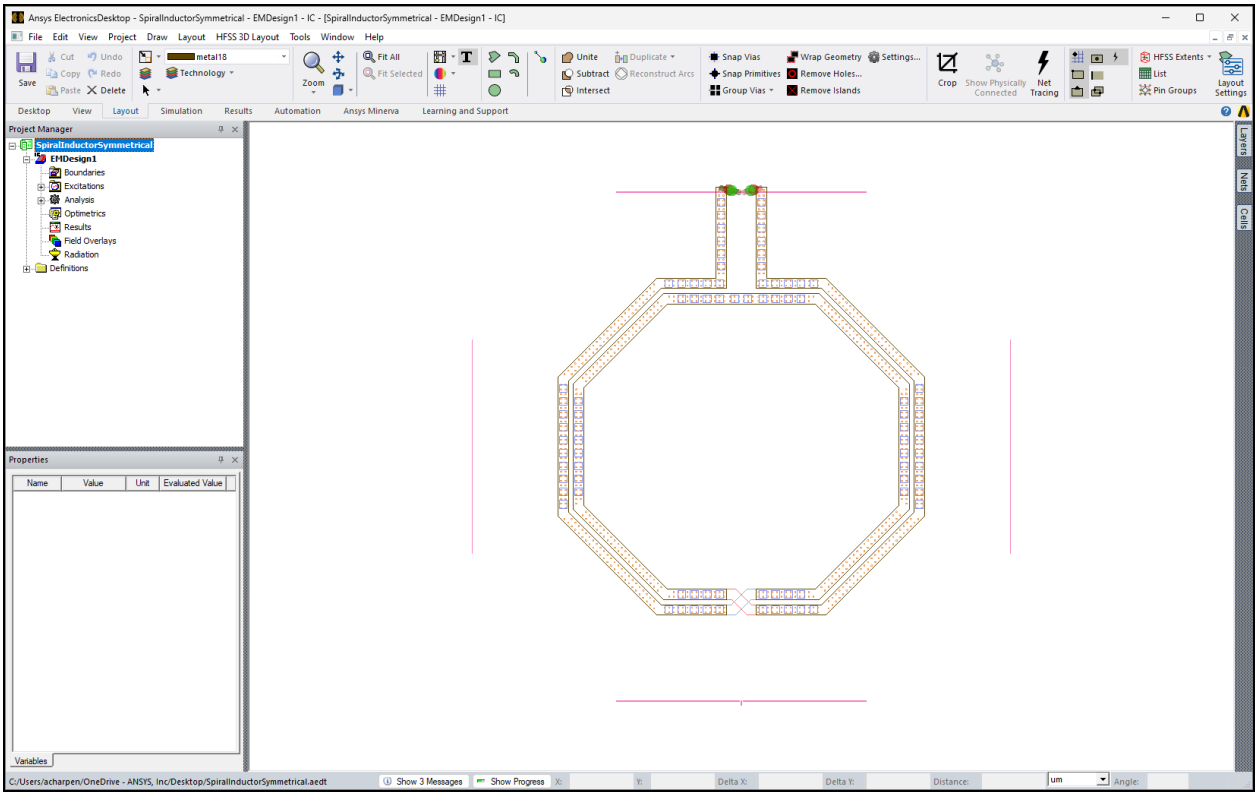
Refer to Switching to IC Mode.

IC Mode Workflow

IC mode typically uses this workflow:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Import a GDSII file with a control file.
2. Simplify the design using the tools available in IC mode:
    a. Crop and/or delete inappropriate objects.
    b. Group vias.
    c. Snap vias.
    d. Wrap geometry.
    e. Snap primitives.
    f. Trace nets.



Switching to IC Mode

The Ansys Electronics Desktop (AEDT)™ electronics systems design platform will automatically reconfigure the HFSS 3D Layout ribbon and surrounding windows for the IC mode layout environment whenever a GDSII file is imported. Users can also switch between General and IC mode from either the **HFSS 3D Layout** menu or the active design's **Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

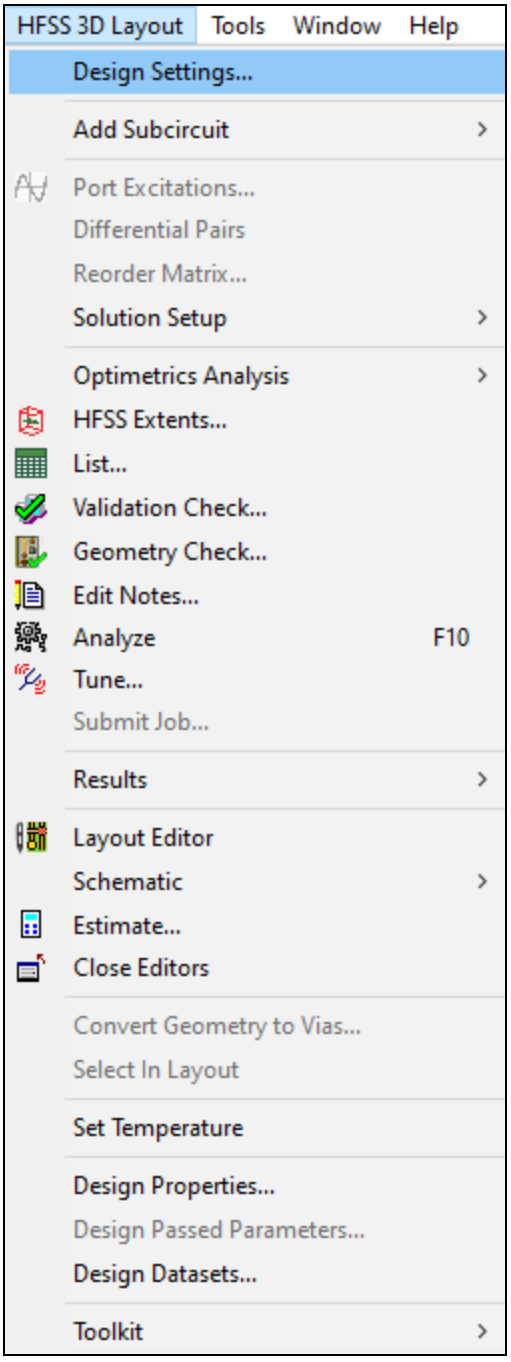
Note:

If users attempt to open a design in IC mode that fails to meet the required parameters, or includes hierarchy that IC mode cannot interpret, the design remains active in General mode only. Refer to Opening a Design in IC Mode.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

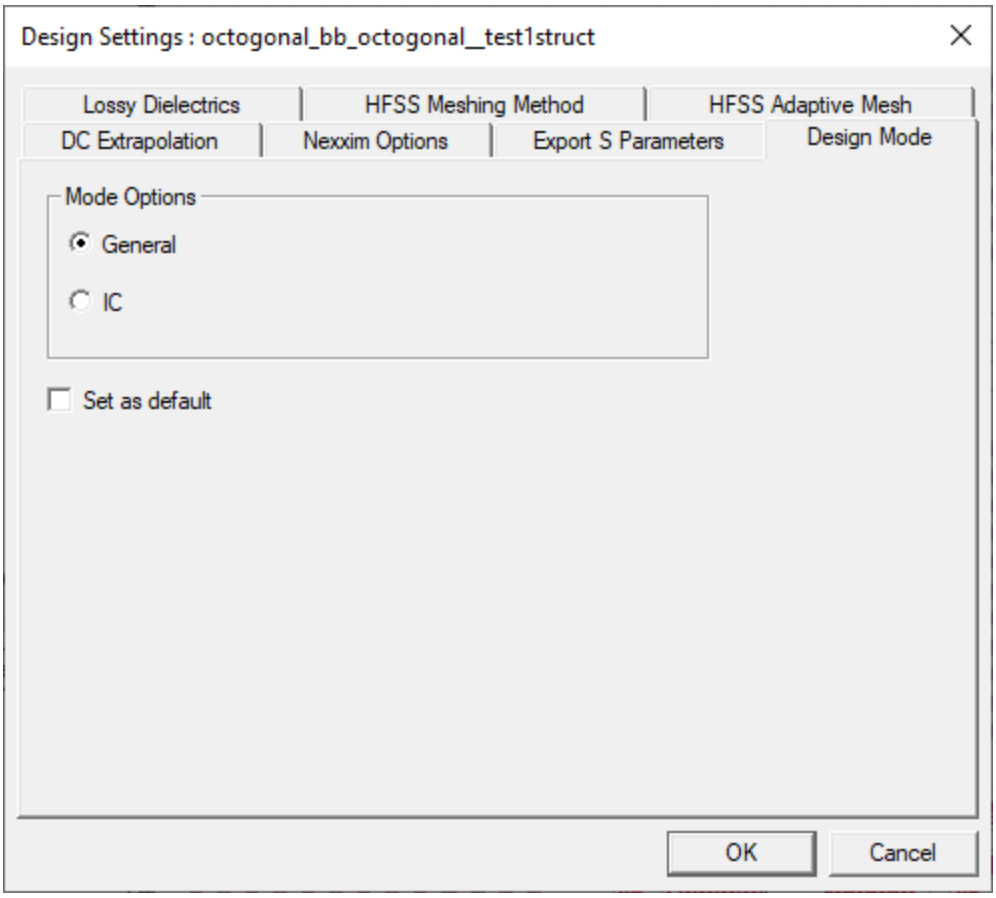
Switching to IC Mode from the HFSS 3D Layout Menu

1. Navigate to **HFSS 3D Layout** > **Design Settings** to open the **Design Settings** window.



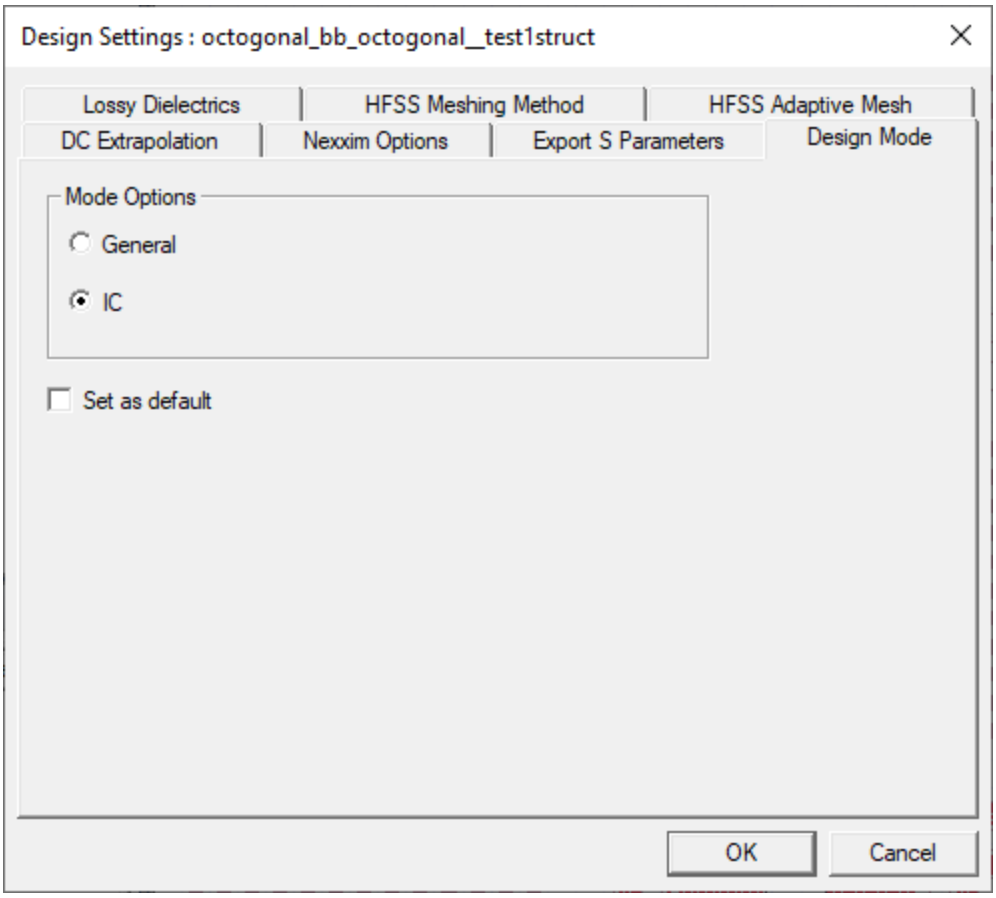
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Navigate to the **Design Mode** tab.

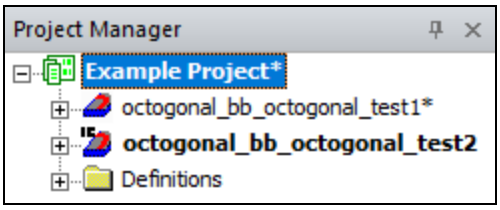


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Select **IC** from the **Mode Options** area.



4. Click **OK** to close the **Design Settings** window.
5. The ribbon and windows will reconfigure to reflect the selected mode. Users will also see their selection reflected in the **Project Manager**. As long as a design is in IC mode, a small "**IC**" appears in the upper left-hand corner of the design icon (e.g., **octogonal_bb_octogonal_test2**).

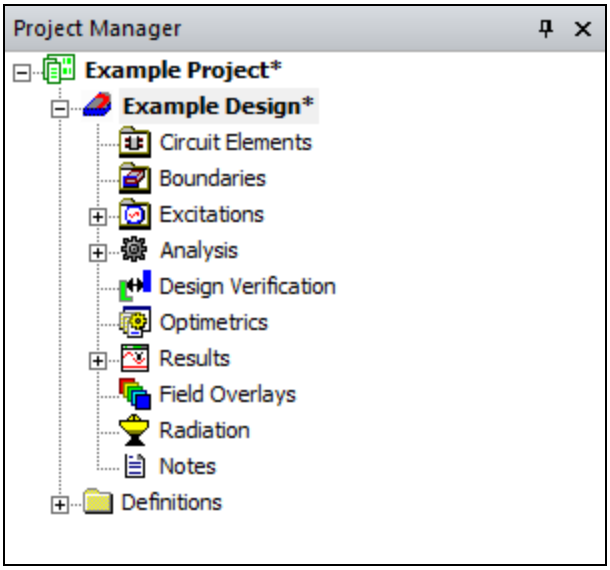


The procedure is complete.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

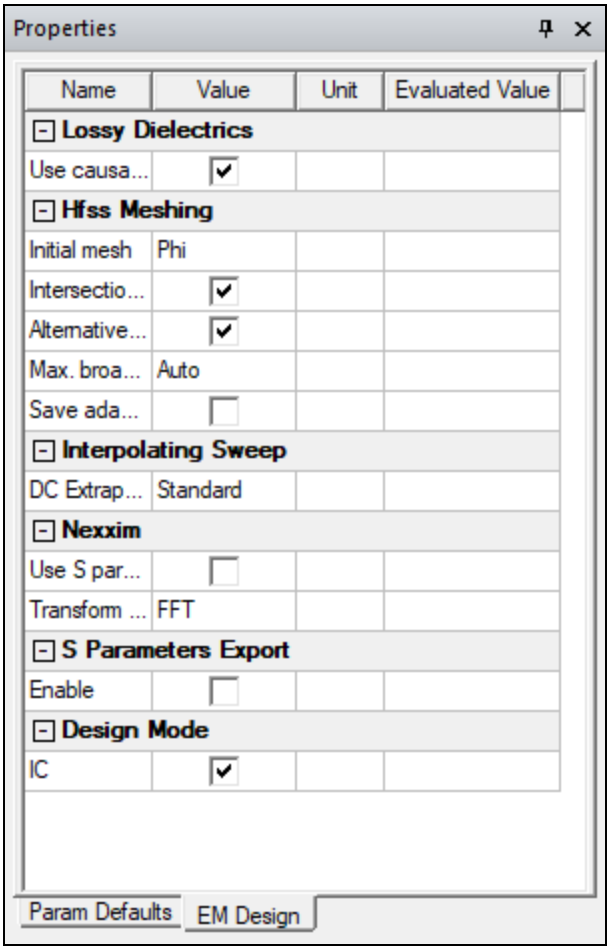
Switching to IC Mode from the Properties Window

1. From the **Project Manager**, expand the **Project Tree** and select the **[*Active Design Folder*]** (i.e., **Example Design**) to populate the Properties window with the design's parameters.



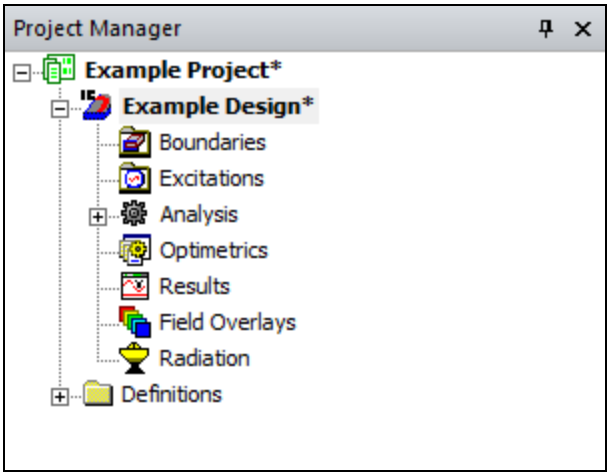
2. Check the box in the **Design Mode** > IC mode.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. The ribbon and windows will reconfigure to reflect the selected mode. Users will also see their selection reflected in the **Project Manager**. As long as a design is in IC mode, a small "**IC**" appears in the upper left-hand corner of the design icon (e.g., **Example Design**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Opening a Design in IC Mode

The following lists explain why a design may be inactive in IC mode or General mode:

Inactive in IC mode if

- GDSII file is imported

  Design contains hierarchy
- Design contains a multizone stackup
- Design is a symbolic footprint
- Design is a component
- Design contains a component
- Design contains a wave port
- Design contains a hierarchical port.
- Design contains a padtack instance across layers
- Design contains a negative primitive

Inactive in General mode if

- Design includes hierarchy
- Design contains encrypted technology
- Design contains a RaptorX setup
- Design contains a Q3D setup

Layout Editor Display and Menus

The following topics describe the display, menus and options that are available for viewing and editing in the Layout Editor.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Layout Editor Display

The default display of the **Layout Editor** is 3D, with a view in a top-down 2D Cartesian coordinate orientation. The view can be changed by holding the left mouse key, dragging the cursor, in combination with the following keystroke(s):
Shift — **PanShift**+**Alt** — **Zoom**

Double-click while pressing **Shift**+**Alt** performs a fit-all operation.
Alt — **Rotate** Double-click while pressing **Alt** snaps the view to various predefined orientations. Double-clicking in the screen region at:

- Top-left, top-right, bottom-left, or bottom-right — **orientates the view obliquely**.
- Right-center — orientates the view down the positive Y axis; positive X is to the left (**side-on view**).
- Left-center — orientates the view down the negative Y axis; positive Y is to the right (**side-on view**).
- Center-top — orientates the view down the positive Z axis with the X axis facing up (**top-down view**).
- Center-bottom — the resulting view looks down the negative Z axis with the X axis facing down (**bottom-up view**).
- Center — **resets the view to a standard 2D Cartesian orientation** with X to the right and Y up.

All object drawing occurs in the plane of the layer. Object manipulation, such as dragging, occurs in the plane of the object. Drawing in an oblique view places 2D objects on the active layer, even if a snap occurs to a point that is off-layer. The background grid is drawn at the layer elevation, unless the view is too horizontal. To select from several vertically layered objects, use the B key to cycle through all the objects that exist directly beneath the cursor.

Layout Editor Options

Layout options control the display, drawing, and editing of models in the Layout Editor. All layout options have installed default values. Option values may be changed on their installed defaults either globally (for all new layouts) or locally (for a particular existing layout).

> **Note:**
>
> Local options for a layout may be changed only on the top level of the layout hierarchy, not from within a subcircuit.

When a new layout is created, options assume their global values, unless there is an installed default which overrides the global default. Changes to global options only affect **new** layout designs (i.e., navigating to **Tools** > **Options** > **General Options** to open the global **Options** window, and choosing on the options in the **Layout Editor** tab) . To configure options for

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

existing designs, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Choose options on the associated tabs, then click **OK** to save changes. All changes made in the **Design Options** window affect **only** the active design).

Setting Global Layout Options

The following options are set in the **Layout Editor** area of the Tools > Options > General Options window.

> **Note:**
>
> No project or layout design needs to be open to change global options. However, changes to global options only affect **new** layout designs (i.e., navigating to **Tools** > **Options** > **General Options** to open the global **Options** window, and choosing on the options in the **Layout Editor** tab) . To configure options for **existing** designs, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Then choose options on the associated tabs, and click **OK** to save changes. All changes made in the **Design Options** window affect **only** the active design).

The following buttons control changes made to the global layout options:

- **Reset From Global Defaults** is used to change the settings of all the tabs to those of the current Global settings. The reset affects only the window contents.
- **Reset From Installed Defaults** is used to change the settings of all the tabs to those of the initial-install defaults. The reset affects only the window contents.
- **OK** saves the currents settings of all the tabs to the Global defaults registry. This action is not undoable and is not scriptable. A window appears to allow you to confirm the changes in the global options by clicking **Yes**.
- **Cancel** closes the window without affecting the Global default settings. (Clicking **No** on the confirmation window also closes all window without changing the settings.)

Both the global and local **Layout Options** windows have six tabs. The options in each area are much the same for both global and local settings. The differences are:

- **Save as Global Defaults** is present only for each of the local options tabs.
- **Always Show Layer Merging window** on the **Other** area is present only for global options.
- **Fit to Contents** on the **Display** area is present only for local options.
- The **Set based on page extent** button on the **Advanced** area is present only for local options.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> Saving global defaults is not undoable. When global defaults are saved, HFSS immediately writes them to the registry , then uses these new default values for all subsequent applications. The only way to revert to previous global values is to once again modify the default values , then do another global save.

Layout Editor Options: Object Panel

Set the following options from the **Design Settings** window by navigating to **Tools**> **Options**> General Options. From the options tree, expand **Layout Editor** and select **Object**.

> **Note:**
>
> Changes to global options only affect **new** layout designs (i.e., navigating to **Tools** > **Options** > **General Options** to open the global **Options** window, and choosing options from the **Layout Editor** tab) . To configure options for **existing** designs, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Then choose options on the associated tabs, and click **OK** to save changes. All changes made in the **Design Options** window affect **only** the active design).

Drawing

- **Draw connection points** — when selected, enables the display of pin symbols in the layout. Unselected by default.
- **Label vertices on selected polygons and lines** — when selected, enables the display of labels (Pt_0, Pt_1, etc.) on vertices of selected polygons and lines in the layout. Unselected by default.
- **Color by net** — color geometry by net rather than layer. Colors are assigned in the net list window.
- **Display package graphics** — displays the outlines of the 3D component packages in use.

Symbol

- **Auto scale** — use the check box to toggle whether to auto scale the axis.
- **Scale factor** — scale factor for symbol footprints placed in the layout. Default is 0.1.

Rectangle description style

- Specifies the method for describing rectangles. Default is to use **Two points**. Alternative method uses **Center** /**width** /**height**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Measurement distances

- Controls whether measurement displays in layout include a **Label with units**, and also how many **Significant digits** are displayed.

Vias

- **Suppress non-functional internal pads** — when this option is enabled, padstack pads are affected in the following ways:
  - Top/Bottom pads always draw
  - Pads connected to traces on the same net appears
  - Pads intersecting fill material draws
  - Pads not connected to fill or to traces on the same net are suppressed; they are draw and are not modeled
- From the drop-down menu, select one of the following:
  - **Render antipad for center point intersection** — when this option is selected, antipads are only rendered if the via center falls within fill material from another net. A via placed outside of a fill region still generates a clearance, even if the antipad would otherwise extend into nearby fill regions.
  - **Antipad always enabled** — when this option is selected, antipads are always rendered for all vias, regardless of their placement or surrounding fill material. This ensures that a clearance is created in all cases where a via is present.
  - **Render antipad for pad intersection** — when this option is selected, antipads are only rendered when the via's pad intersects with fill material from another net. If the via's pad does not make contact with another net's fill region, no antipad is generated.

Other

- **Auto place components in free space** — when selected, components placed in a schematic are positioned in Layout in the first available empty position. With regards to CPU time, the empty-position algorithm is relatively expensive. Consequently, if the physical layout of the components is irrelevant, placement of components is faster when this option is deactivated.
- **Auto position microwave components** — when selected, enables the automatic alignment of microwave components placed in the layout. Selected by default.

Layout Editor Options: Snapping Panel

When creating or placing a component initially in the **Layout Editor**, it is the cursor that snaps to the target. As you move and place objects, the shape of the cursor changes to indicate the target being snapped to. When multiple sources or targets are selected, the closest of these snap to each other as you create and move objects. **Sources** defines the part of the object you are

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

placing that snap, and **Targets** defines what is snapped to. The options you may select under **Targets** and **Sources** are not mutually exclusive, and you may select none, some, or all them. The following options are set in the **Snapping** area under **Layout Editor** in the **Tools** > **Options** > General Options... window. These options control automatic snapping to objects, grid points and directions.

> **Note:**
>
> Changes to global options only affect **new** layout designs (i.e., navigating to **Tools** > **Options** > **General Options** to open the global **Options** window, and choosing on the options in the **Layout Editor** tab) . To configure options for **existing** designs, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Then choose options on the associated tabs, and click **OK** to save changes. All changes made in the **Design Options** window affect **only** the active design).

Constraints

- **Snap To Grid** — targets that are not on the grid is ignored. If there are no usable targets in the snapping distance, the closest grid location is used.
- **Snap Across Hierarchy** — any object in the hierarchy becomes a target for snapping; this does not affect the sources.

Directional Constraint

- **None** — no directional drawing/snapping constraint
- **Orthogonal** — forces directional drawing/snapping to the orthogonal (x or y)
- **45 Degree** — forces directional drawing/snapping to 45 degrees

For more information see Directional Drawing.

Distance

Select the distance in pixels within which snapping occurs. Default is 20 pixels.

Targets

Select the types of targets to which objects can snap. By default, all targets are subject to snapping except **Any Edge Location** and **Edge Intersection**.

Sources

Select the types of source points that can be snapped. When **Object Center** is selected, it is the *center* of an object that snap to a target. For instance, with an arc, when **Object Center** is selected, the center of the arc snap to the nearest target point. By default, all sources are subject to snapping except **Any Edge Location**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

All snapping modes can be controlled via the **Layout Snaps** toolbar, which are active during an operation.

Layout Editor Options: Display Panel

The following options are set in the **Display** area under **Layout Editor** in **Tools** > **Options** > General Options. These options control the grid display, the drawing area, and the drawing mode.

> **Note:**
>
> Changes to global options only affect **new** layout designs (i.e., navigating to **Tools** > **Options** > **General Options** to open the global **Options** window, and choosing on the options in the **Layout Editor** tab) . To configure options for **existing** designs, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Then choose options on the associated tabs, and click **OK** to save changes. All changes made in the **Design Options** window affect **only** the active design).

- **Major Divisions** – by default, the major grid divisions are spaced 10mm apart, and are a medium grey color. Reset the spacing by entering a value in the **Size** area. Select a new color on the palette that appears when you click in the color rectangle.
- **Minor Divisions** – by default, the major grid divisions are spaced 1mm apart, and are a light grey color. Reset the spacing by entering a value in the **Size** area. Select a new color on the palette that appears when you click in the color rectangle.
- **Background** – by default, the layout editor background is white. Select a new color on the palette that appears when you click in the color rectangle.
- **Show Grid Divisions** – toggles the grid display on and off. Default is on.
- **Drawing Extent** – specifies the size and extent of the layout. Defaults are Left, -100mm, Right, +100mm, Top, +100mm, Bottom, -100mm. Scroll bars indicate the extent of the full drawing area.
- **Drawing** – by default, the drawing mode for planar objects is to fill them with a crosshatched pattern. You can also select **Sketch Mode** (show outlines only) or **Solid Mode** (solid fill color)

Layout Editor Options: Selection Panel

These options control the colors and mode for selected objects.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

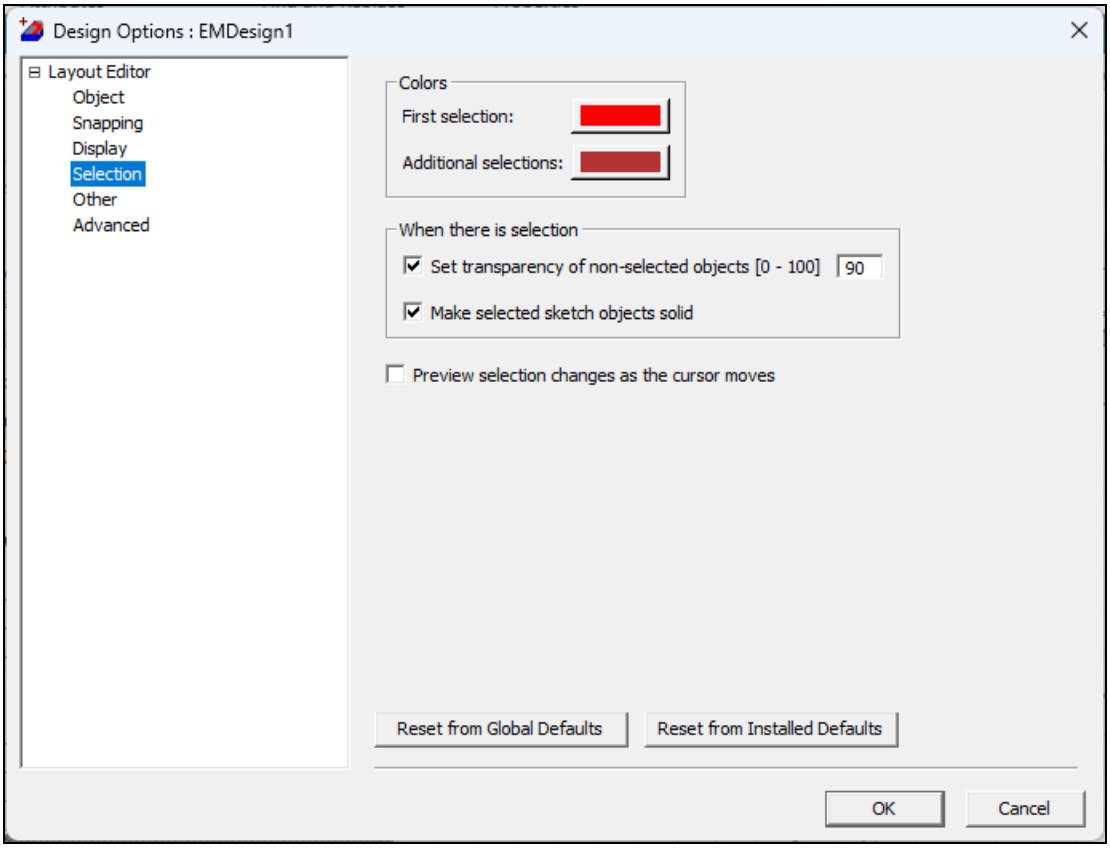
Changes to global options only affect **new** layout designs (i.e., navigating to **Tools** > **Options** > **General Options** to open the global **Options** window, and choosing from the options in the **Layout Editor** tab). To configure options for the **active** design, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Then choose options on the associated tabs, and click **OK** to save changes.

Follow these steps to reach the **Layout Editor Selection** options.

1. Navigate either of the following paths:

- To change new layout designs, navigate to **Tools** > **Options** > **General Options** > **Layout Editor**.
- To change an active design's settings, navigate to**Layout** > **Settings**.

2. From the **Layout Editor** tree, click **Selection**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Colors** – by default, the first object selected (i.e., **First Selection**) is colored bright red, and **Additional Selections** turn dark red. Click the adjacent palette icons to select new colors.
- **When there is selection** area – specified objects can be set to transparent or solid to highlight them. Check both/either of the following boxes, as appropriate:
  - **Set transparency of non-selected objects** – automatically differentiates between the selected object and non-selected objects by making non-selected objects transparent. Enter a transparency percentage in the adjacent field (default is **90**).
  - **Make selected sketch objects solid** – makes selected objects solid, while non-selected objects remain outline only.
- **Preview Selection Changes as the Cursor Moves** — changes the color of an object to the **First Selection** color as the cursor moves across it.

Layout Editor Options: Other Panel

The following options are set in the **Other** area under **Layout Editor** in the **Tools** > **Options** > General Options window. These options control dragging, the Merge layers window, and rotation. Not all these options appear in the local Layout options.

> **Note:**
>
> Changes to global options only affect **new** layout designs (i.e., navigating to **Tools** > **Options** > **General Options** to open the global **Options** window, and choosing on the options in the **Layout Editor** tab) . To configure options for **existing** designs, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Then choose options on the associated tabs, and click **OK** to save changes. All changes made in the **Design Options** window affect **only** the active design).

- **Allow drag on first click** — when selected, holding down the mouse button on an object selects and attaches the object to the cursor. Drag the object to the selected location and release the mouse button. When unselected, first click to select the object, then click and hold down the mouse button to drag the object. Unselected is the default.
- **Show pin connectivity window on drag to matching component** — when selected, the **Pin Connectivity** window appears during a drag to a matching component.
- **Create ports when placing new component** — when selected, newly placed HFSS 3D Layout sub-designs, 3D Components, and HFSS dynamic links has ports. This is similar to adding ports on an existing component.
- **Always Show Layer Merging Window** — when selected, the **Merge Layers** window appears every time an object with layers is placed in the layout (or in a schematic). When unselected, the **Merge Layers** window appears only when automatic layer mapping cannot be performed. See the Merge Layers window. Unselected is the default.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Show select technology window on new design** — when inserting a new HFSS 3D Layout or Circuit Design, users are prompted to **Choose Technology**. This option suppresses the display of the Choose Technology window upon the insertion of a new design. For more information see Inserting an HFSS 3D Layout.
- **Specify default technology** — allows users to select a default technology on the pull down menu.
- **Naming Convention** — allows users to control the generation of port and pin group names when using the interactive commands.
- **Rotation increment** — during rotation using handles (**View** > **Rotate**), objects are rotated by multiples of this amount. The default rotation amount is 5 degrees. 2D rotations using **Draw** > **Rotate** always rotate 90 degrees counterclockwise.

Changing Naming Conventions

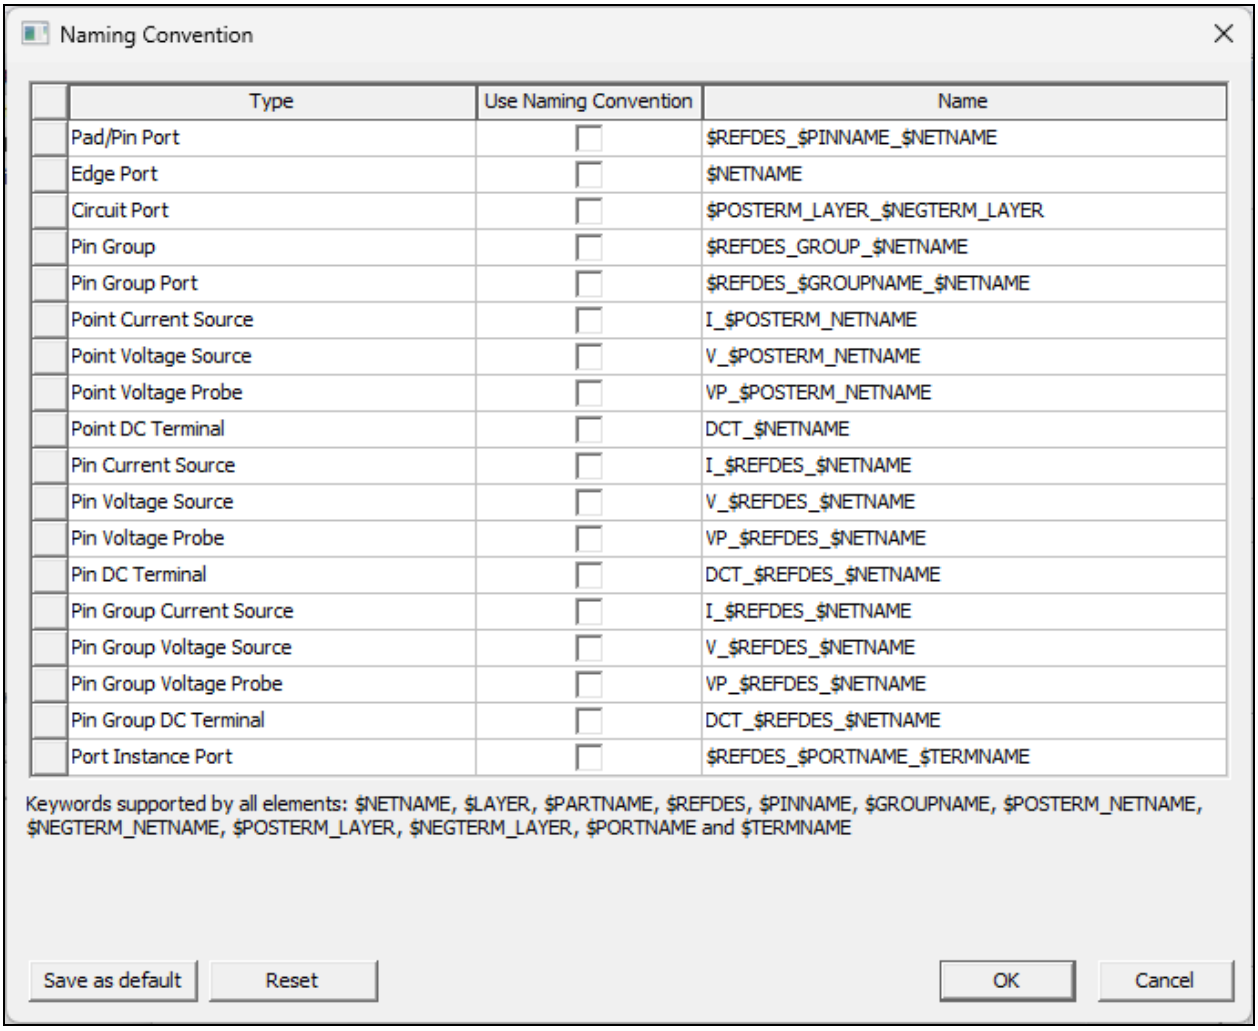
There are multiple ways to access the Naming Convention window:

- From **Tools** > **Options** > **General Options** > **Layout Editor**.
- From the **General Options** icon on the **Desktop** tab.
- Through the SIwave Workflow Wizard, using either **Configure DC Drop Analysis** or **Configure PI Analysis**.

> **Note:**
>
> Only relevant naming convention types appear (e.g., if you access this window through **Configure PI Analysis**, only **Pin Group Port** naming conventions are editable). Access **Naming Conventions** through **General Options** for the greatest number of options.

The **Naming Convention** window lists the types of naming conventions that are editable:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



1. Selecting a row displays its supported keywords underneath the list.
2. Double-click in the **Name** field to type your preferred naming configuration using the supported keywords.
3. Select a row's **Use Naming Convention** check box to apply the setting.
4. Click **Save as Default** to make your changes the default. Click **Reset** to restore default settings.

Example Naming Convention - Port Instance Port

HFSS 3D Layout has implemented naming convention support for multi-terminal ports exposed from MCAD (i.e., **Port Instance Port**). Assuming the convention is enabled, when a port is attached to an HFSS dynamic link or component (e.g., with Configuring Port-Instance Ports) the following default conventions are used.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Single port:

`$REFDES_$PORTNAME_$TERMNAME`

Multi-terminal ports:

`$REFDES_$PORTNAME_$TERMNAME:T1`

`$REFDES_$PORTNAME_$TERMNAME:T2`

Example — `S1_Port1_T1:T1, S1_Port1_T2:T2`

When a port name (e.g., `Port`*N*) is a prefix for a terminal name, the prefix is removed (e.g., if a terminal is named `Port1_T1, Port1` is removed, so that its port name will be `S1_Port1_T1` rather than `S1_Port1_Port1_T1`).

Users can also modify the assigned name for single and multi-terminal ports by adding additional keywords, such as the following: `$REFDES_$PORTNAME:T$TERMINDEX`

Example — `S1_Port1:T1, S1_Port1:T2`

Only the first part of the name is used for single terminal ports (i.e., the half of the name preceding the colon).

Example — `$REFDES_$PORTNAME`

If the specified convention is given a name without a colon (e.g., `$REFDES_$PORTNAME`), `:T1`, `:T2`, et cetera are automatically appended to the name to validate the multi-terminal port names.

Layout Editor Options: Advanced Panel

The following options are set in the **Advanced** area under **Layout Editor** in **Tools** > **Options** > General Options. These options control internal tolerance and resolution values.

> **Note:**
>
> Changes to global options only affect **new** layout designs (i.e., navigating to **Tools** > **Options** > **General Options** to open the global **Options** window, and choosing on the options in the **Layout Editor** tab) . To configure options for **existing** designs, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Then choose options on the associated tabs, and click **OK** to save changes. All changes made in the **Design Options** window affect **only** the active design).

- **Tolerance** – specifies the tolerance used internally by the layout editor. Distances are considered equal if they differ by no more than the tolerance value. Default is 1e-9 mm. Normally, this tolerance should not be changed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Arc Drawing Resolution** – by default, arc resolution is dynamically adjusted depending on the zoom factor. You can instead specify a fixed resolution in the current drawing units (default units are mm).

Setting Local Layout Options

To change local layout options for a particular layout, on the **Layout** menu, select **Settings** or **Grid Settings** to open the **Tools** > **Options** > **General Options** window to the **Layout Editor** tab. Local options for a layout may be changed only on the top level of the layout hierarchy, not from within a subcircuit.

> **Note:**
>
> Changes to global options only affect **new** layout designs . To configure options for **existing** designs, navigate to the **Design Options** window (i.e., from **Layout**, select **Settings**). Then choose options on the associated tabs, and click **OK** to save changes. All changes made in the **Design Options** window affect **only** the active design).

When the window is accessed via **Grid Settings** it opens on the **Display** area. When the window is accessed via **Settings** it opens on the **Object** area.

> **Note:**
>
> Saving global defaults is not undoable. When global defaults are saved, HFSS immediately writes them to the registry , then uses these new default values for all subsequent applications. The only way to revert to previous global values is to once again modify the default values , then do another global save.

The following buttons control changes made to the local layout options:

- **Reset From Global Defaults** is used to change the settings of all the tabs to those of the current Global settings. The reset affects only the window contents.
- **Reset From Installed Defaults** is used to change the settings of all the tabs to those of the initial-install defaults. The reset affects only the window contents.
- **Save As Global Defaults** saves the currents settings under all tabs to the Global defaults registry. This action is not undoable and is not scriptable. The save takes place immediately and does not close the window. Use of **Cancel** after **Save As Global Defaults** does not restore the registry.
- **OK** saves the settings of all the tabs to the current layout to be used locally, then closes the window. The action is undoable and is scriptable.
- **Cancel** closes the window without affecting the local settings of the layout.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Both the global and local **Layout Options** windows have six tabs. The options on each area are much the same for both global and local settings. The differences are:

- **Save as Global Defaults** is present only for each of the local options tabs.
- **Always Show Layer Merging window** on the **Other** area is present only for global options.
- **Fit to Contents** on the **Display** area is present only for local options.
- The **Set based on page extent** button on the **Advanced** area is present only for local options. This button calculates a distance tolerance based on the page extent.

Edit Menu

When a **Layout Editor** design is active, click the **Edit** menu. There are multiple varieties of this menu depending on the type of design being edited (Circuit, HFSS 3D Layout, etc). The following descriptions are a superset of the commands that may appear on the **Edit** menu, though they may appear in different order on the menu than the order in which they are presented here. For more information, search the Help or use the Help Index to find information on any of the commands that appear on the **Edit** menu for the Layout Editor.

Undo<*last edit operation*> — undo the last edit operation.

Redo<*last edit operation*> — redo the last edit operation.

Cut — delete the selected object, and retain a copy for pasting into a layout in the same application.

Copy — create a local copy for pasting into a layout in the same application.

Paste — put the object on the last cut or copy into the layout.

Delete — delete the selected object without retaining a copy.

Rename — click to rename the selected object in the layout.

Select All — select all objects in the layout.

Unselect All — unselect all objects in the layout.

Cycle Selection — cycle selection of two or more objects that overlap. Each time you click Cycle Selection, a different one of the overlapping objects is selected.

Invert Selection — unselect all objects that are currently selected, and select all the other objects.

Select by Polygon Region — selects entities intersecting a polygonal region.

Copy Image — create a global copy of the selected objects on the clipboard for pasting into a different application.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Copy to HFSS 3D Layout — copy the selected objects to the clipboard and paste into an HFSS 3D Layout Design.

Paste in Place — paste object to same location, without any X,Y offset/displacement.

Select — sets cursor mode to selection of objects.

Select Handles — sets cursor mode to selection of object handles.

Select Edges — sets cursor mode to selection of object edges.

Properties — opens the **Properties** window to view and edit the properties of the selected object.

Activate — causes the activation of one or more selected components.

Deactivate (Open) — temporarily converts the component into an open circuit. Activate restores a deactivated component to the circuit.

Deactivate (Short) — temporarily converts the component into a short circuit. Activate restores a deactivated component to the circuit.

Pop Up — switches the active coordinate system (CS) to the next higher level. Relative CSs can be created within other relative CSs to form multiple relative levels.

Push Down — switches the active CS to the next lower level.

Port — opens a drop-down menu that contains commands for operating on Ports.

Padstack — opens the Edit Padstack Definition window.

Footprint — opens the Footprint Editor.

View — opens the **Layout Editor** View drop-down menu.

Draw — opens the **Layout Editor** Draw drop-down menu.

Edit — opens the **Layout Editor** Edit drop-down menu.

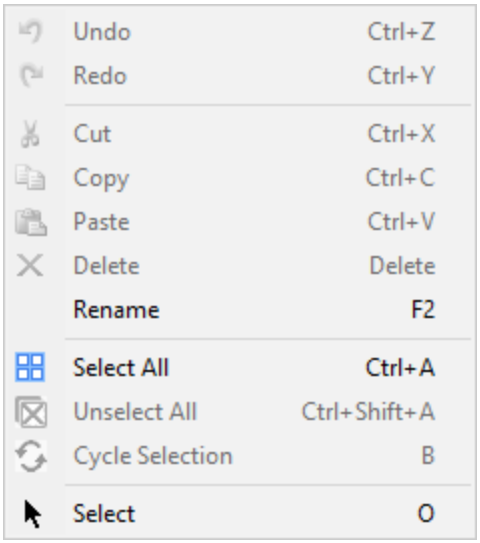
Copy Image — create a global copy of the selected objects on the clipboard for pasting into a different application.

EM Design Properties — set EM design properties via the **EM Design Properties** drop-down menu.

IC Mode Commands

The following options appear when the IC mode environment is active.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Undo*<last edit operation>* — undo the last edit operation.

Redo*<last edit operation>* — redo the last edit operation.

Cut — delete the selected object, and retain a copy for pasting into a layout in the same application.

Copy — create a local copy for pasting into a layout in the same application.

Paste — put the object on the last cut or copy into the layout.

Delete — delete the selected object without retaining a copy.

Rename — click to rename the selected object in the layout.

Select All — select all objects in the layout.

Unselect All — unselect all objects in the layout.

Cycle Selection — cycle selection of two or more objects that overlap. Each time you click Cycle Selection, a different one of the overlapping objects is selected.

Select — sets cursor mode to selection of objects.

View Menu

When a **Layout Editor** design is active, clicking the **View** button on the menu to open the view drop-down menu for the Layout editor. There are multiple varieties of this menu depending on the type of design being edited (Circuit, HFSS 3D Layout, etc). The following descriptions are a superset of the commands that may appear on the **View** menu, though they may appear in different order on the menu than the order in which they are presented here. For more

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

information, search the Help or use the Help Index to find information on any of the commands that appear on the **View** menu for the Layout Editor.

Display — control the display by selecting the check box of the following: **Status Bar**, **Project Manager** window, **Message Manager**, **Project Manager**, **Properties Window**, **Progress Window**, **Component Manager**, **Layout Window.**

Variables — view the project and design variables with their values in a grid view.

Display Mode — select on the following rendering options:

- **Default** — honors transparency settings configured in stackup
- **Sketch** — very similar to wireframe
- **Solid** — honors the wireframe settings per layer

Rotate — **click+drag** in any direction to rotate the view; the same double-click options hold true for the **Alt** +drag editor display options. For more information see Layout Editor Display.

Zoom — change the zoom display by selecting one of the following: **Zoom In, Zoom Out, Zoom Area, Zoom Previous.**

Fit or Pan — fit or pan by selecting: **Fit Drawing, Fit Selection, Pan.**

ResetOrientation — reset the rotation to a simple top-down view: positive Y up, positive X to the right.

Faster Transformations — deactivate the rendering of padstacks (vias and pins) during panning, zooming, and screen rotations; this increases the responsiveness of these interactive operations.

Stretch — selecting **Stretch Z** opens a window that allows you to apply a scaling factor. Dragging the slider applies a Z scaling factor to the current view. If **Dynamic** is selected, the scaling happens in real time; otherwise, it is applied when **OK** is selected.

IC Mode Commands

The following options appear when the IC mode environment is active.

Display — control the display by selecting the check box of the following: **Status Bar**, **Project Manager**, **Message Manager**, **Properties**, **ACT Extensions**, **Component Libraries**, **Variables**, **Layers**, **Nets**, **Components**, and **Cells**.

Docking Window Layouts — choose either to open the **Default** windows, **Save Current Layout** (i.e., save the current **Display** configuration), or **Remove Saved Layouts**.

Display Mode — select on the following rendering options:

- **Default** — honors transparency settings configured in stackup
- **Sketch** — very similar to wireframe

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Solid** — honors the wireframe settings per layer

Rotate — **click**+**drag** in any direction to rotate the view; the same double-click options hold true for the **Alt** +drag editor display options. For more information see Layout Editor Display.

Zoom — change the zoom display by selecting one of the following: **Zoom**, **Zoom Area**, **Zoom In**, **Zoom Out**, or **Zoom Previous**.

Fit or Pan — fit or pan by selecting: **Fit All**, **Fit Selection**, or **Pan**.

Stretch Z — opens a window that allows you to apply a scaling factor. Dragging the slider applies a Z scaling factor to the current view. If **Dynamic** is selected, the scaling happens in real time; otherwise, it is applied when **OK** is selected.

Reset Orientation — resets the rotation to a simple top-down view: positive Y up, positive X to the right.

Clip Plane — see Clip Planes.

Draw Menu

When a **Layout Editor** design is active, click the **Draw** menu. There are multiple varieties of this menu depending on the type of design being edited (Circuit, HFSS 3D Layout, etc).

The following descriptions are a superset of the commands that may appear on the **Draw** menu, and depending upon the context of the Ansys Electronics Desktop (AEDT)™ electronics systems design platform's state, they may appear in different order and number on the menu than the order in which they are presented here.

For more information, search the Help or use the Help Index to find information on any of the commands that appear on the **Draw** menu for the Layout Editor.

Primitive — opens a drop-down menu that allows you to create a primitive object including bondwires in the Layout Editor.

Void — opens a drop-down menu that allows you to create a void in the Drawing Region.

Merge Polygons — opens a drop-down menu that allows you to operates on two or more objects that overlap.

Port — opens a drop-down menu that allows you to place a port in the Drawing Region.

Boundary — opens a drop-down menu that allows you to place or remove a boundary excitation on the Drawing Region.

Pin — place a Pin in the Drawing Region.

Create/Manage Pin Groups — opens a window that allows you to create pin groups for various components.

Via — place a Via in the Drawing Region.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Via Groups — allows primitives to be grouped together and represented by a single primitive.

3D Structure — opens a drop-down menu that allows you to create and perform operations on a 3D structure in the Drawing Region.

Coordinate System — opens a drop-down menu that allows you to create and perform operations on a coordinate system in the Drawing Region.

Component — opens a drop-down menu that allows you to create and remove a component.

Rotate — rotate a selected object in the Drawing Region.

Flip Vertical — vertically flip a selected object in the Drawing Region.

Flip Horizontal — horizontally flip a selected object in the Drawing Region.

Reverse Line — reverses the direction of selected Bond Wires, Lines and Arcs.

Align — align selected objects in the Drawing Region.

Position Relative — when a relative coordinate system (CS) and an object independent of that coordinate system (CS) are selected, this command positions the CS relative to that object. The 0,0 origin of the relative CS is placed alongside the positioning object. There are three types of objects select and position the CS relative to: an edge port, a pin, or an edge.

Clear Relative Position — when a relative CS and an object are selected, this command positions the CS unrelative to that object.

Duplicate — duplicate a selected object in the Drawing Region via the Duplicate drop-down menu.

Expand — expand a selected object in the Drawing Region.

Split Polygon Region — split primitives at a polygon boundary; primitives are split and not clipped.

Geometry Healing — heal and repair selected objects in the Drawing Region.

Sanitize Layout - fixes alignment problems and other complexities in power and ground nets that may slow down simulation

Convert — opens a drop-down menu that allows you to create vias, pins, and padstack definitions from primitives, convert traces to planes, and convert planes to traces.

Stitch Lines — stitch together connected/crossing lines into polygons and lines.

Connection — connect selected objects to the Net.

Disconnect from Net — disconnect selected objects on the Net.

Route — Deprecated. Opens a drop-down menu that allows you to establish traces between different circuit elements and set Automatic Trace Drawing Options.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Align MW Ports — align selected MW ports in the Drawing region.

HFSS 3D Layout Properties — opens a drop-down menu that allows you to define HFSS 3D Layout Properties.

IC Mode Commands

The following options appear when the IC mode environment is active.

Primitive — opens a drop-down menu that allows you to create a primitive object in the **Layout Editor**.

Void — opens a drop-down menu that allows you to create a void in the **Layout Editor**.

Merge Polygons — opens a drop-down menu that allows you to operates on two or more objects that overlap.

Port — opens a drop-down menu that allows you to place a port in the **Layout Editor**.

Boundary — opens a drop-down menu that allows you to place or remove a boundary excitation on the **Layout Editor**.

Create/Manage Pin Groups — opens a window that allows you to create pin groups for various components.

Via Groups — allows primitives to be grouped together and represented by a single primitive.

Component — opens a drop-down menu that allows you to create and remove a component.

Duplicate — duplicate a selected object in the **Layout Editor** via the **Duplicate** drop-down menu.

Expand — expand a selected object in the **Layout Editor**.

Convert — opens a drop-down menu that allows you to create vias, pins, and padstack definitions from primitives, convert traces to planes, and convert planes to traces.

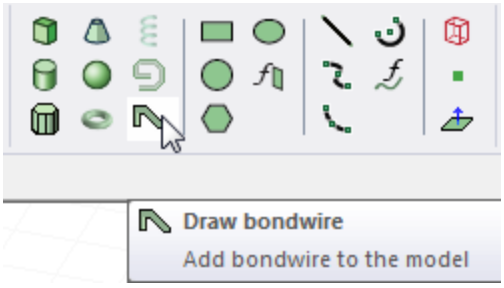
HFSS 3D Layout Properties — opens a drop-down menu that allows you to **Add Modeling** or **Remove Modeling** from a design component.

Drawing a Bondwire in HFSS 3D Layout

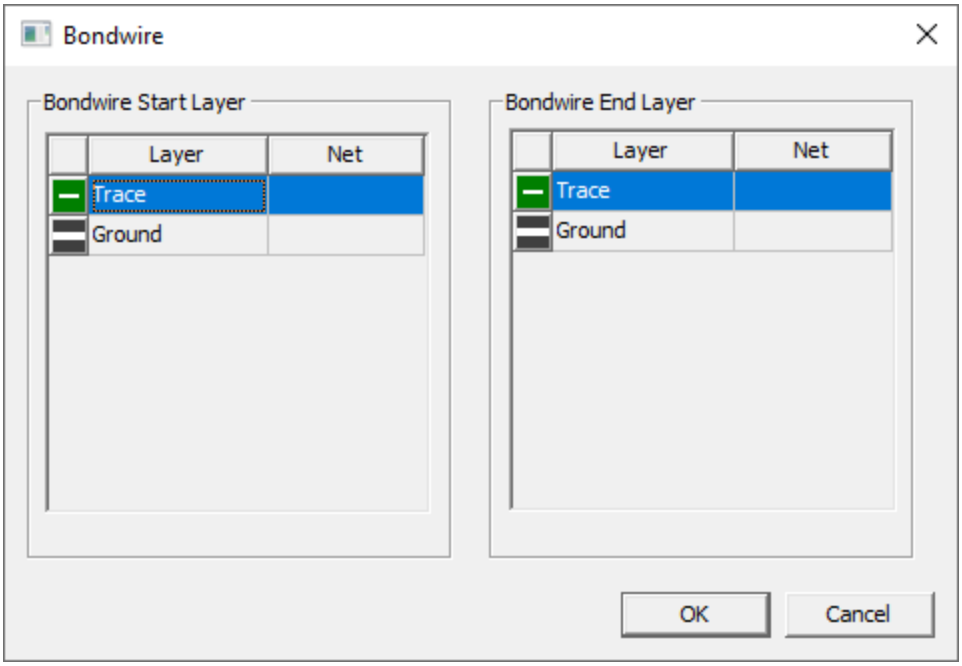
A bondwire is a thin metal wire that connects a metal signal trace with a chip.

1. From the menu bar, click **Draw** > **Primitive** > **Bondwire** or, on the **Draw** ribbon tab, click the **Draw bondwire** icon:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Select the bond pad point in one of the following ways:
   - Click the point.
   - Type the point's coordinates in the text boxes in the status bar.
3. Select the lead point by clicking the point or typing the coordinates in the text boxes in the status bar. The **Bondwires** dialog box opens.

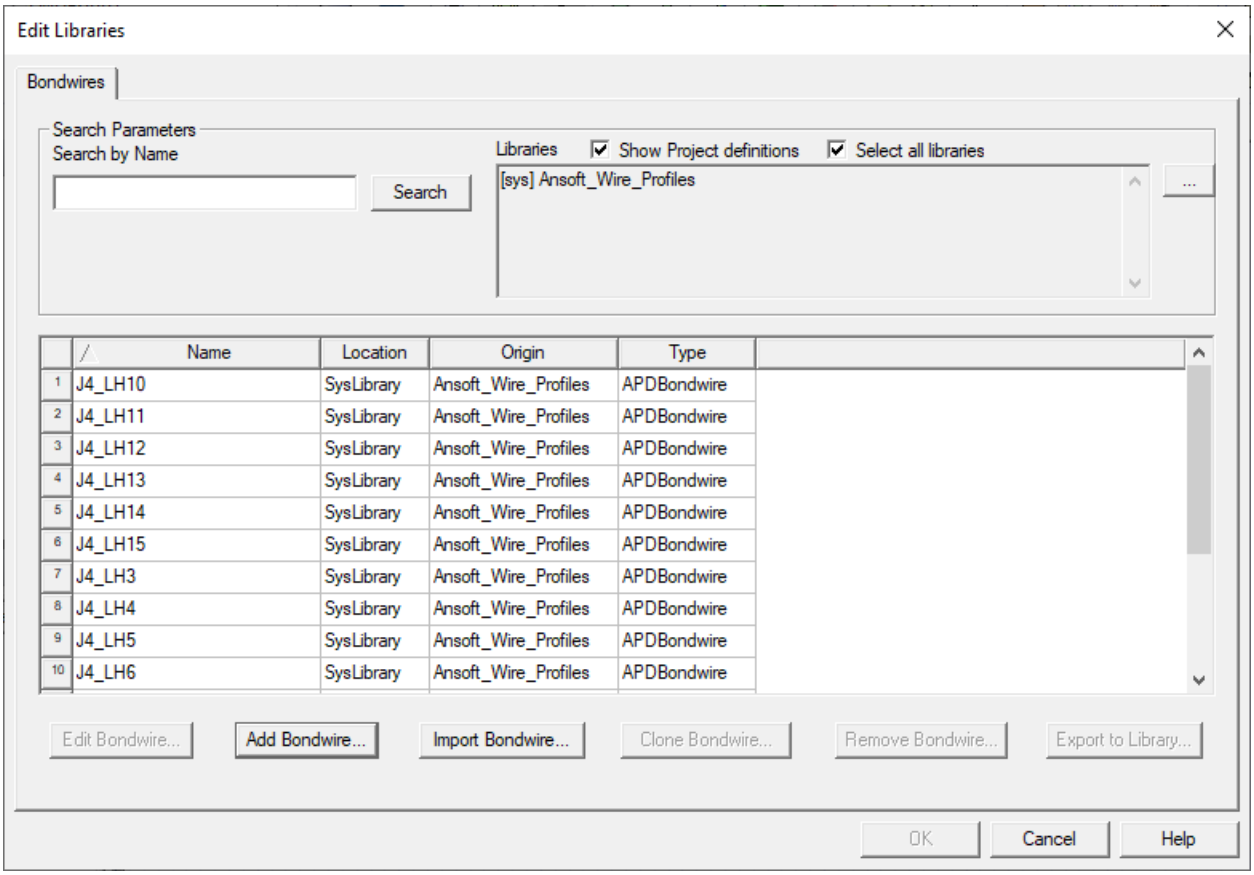


4. Select which layers you want the bondwire to start and stop on.
5. Click **OK**. The bondwire appears in the Layout editor.
6. To select a new profile definition, click in the **Type** row of the **Properties** window and select a modeling standard shape. The choices are **APDBondwire**, **JEDEC4Bondwire**, and **JEDEDC5Bondwire**.
7. To change the underlying profile definition, click in the **Profile** row of the **Properties** window and click **Edit**. The **Bondwires** tab of the **Edit Libraries** window opens where you can add, edit, import, export, and delete bondwire profile definitions.

Bondwire Definitions

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To view a list of bondwire definitions, on the menu bar click **Tools** > **Edit libraries** > **Bondwires** to open the **Bondwires** tab of the **Edit Libraries** window. From this window, add, edit, import, clone, remove, or export a bondwire definition.

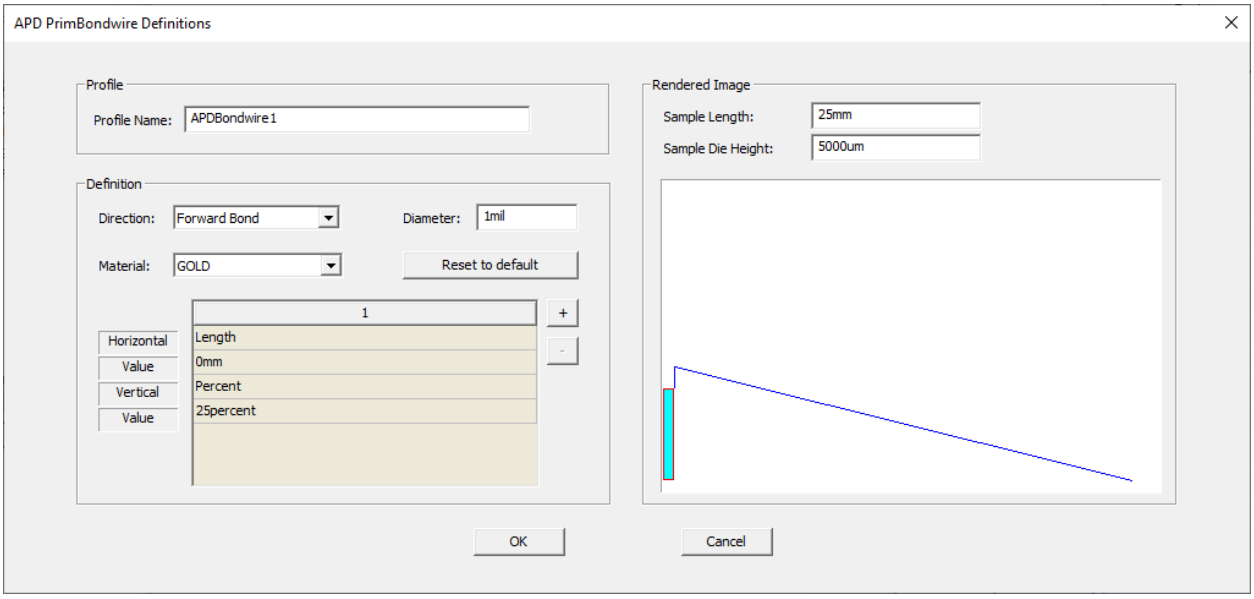


Add a Bondwire Definition

1. Click **Add Bondwire** to open the **New Bondwire Definition** window.
2. Optionally, enter a new name for the definition to replace the default.
3. From the **Type** field, select a type of bondwire profile definition.
4. Click **OK** to open the **Bondwire Definitions** window with default values.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. For **APD PrimBondwire Definitions**:



a. Select a **Direction**.
b. Enter a **Diameter** with its units.
c. Choose a **Material**.
d. Select **Edit** to open the **Materials** tab of the **Select Definition** window.
e. To add a segment, click **+** and adjust the segment's settings. All the changes are reflected in the bondwire graphic.
f. To remove a segment, the number of the segment and click **–**.
g. Click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. For **JEDEC4 Prim Bondwire Definitions**:

   a. Enter the height from **Top to Die** including its unit of length. This is the height between the bond pad and the top of the loop.
   b. Click **OK**.

7. For **JEDEC5 PrimBondwire Definitions**:

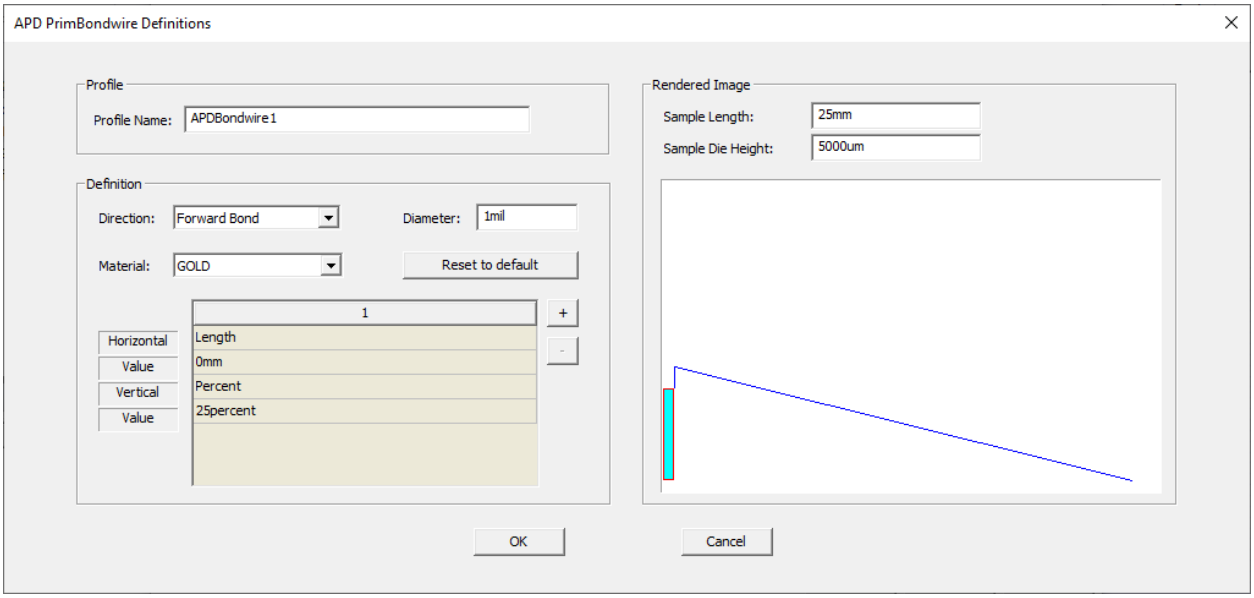
   a. Enter the height from **Top to Die** including its unit of length. This is the height between the bond pad and the top of the loop.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. Enter the **Die Pad Angle** which is the angle between the horizontal plane and the wire at the bond pad point. Include the unit **deg**.
c. Enter the Lead Pad Angle which is the angle between the horizontal plane and the wire at the lead point. Include the unit **deg**.
d. Click **OK**.

Editing a Bondwire Definition

1. Select the profile definition you want to edit and click **Edit Bondwire** to open th **Bondwire Definitions** window.
2. For **APD PrimBondwire Definitions**:



a. Choose a **Direction**.
b. Enter a **Diameter** with its units.
c. Choose a **Material**.
d. Select **Edit** to open the **Materials** tab of the **Select Definition** window.
e. To add a segment, click **+** and adjust the segment's settings. All the changes are reflected in the bondwire graphic .
f. To remove a segment, the number of the segment and click **–**.
g. Click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. For **JEDEC4 Prim Bondwire Definitions**:

   a. Enter the height from **Top to Die** including its unit of length. This is the height between the bond pad and the top of the loop.
   b. Click **OK**.

4. For **JEDEC5 PrimBondwire Definitions**:

   a. Enter the height from **Top to Die** including its unit of length. This is the height between the bond pad and the top of the loop.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. Enter the **Die Pad Angle** which is the angle between the horizontal plane and the wire at the bond pad point. Include the unit **deg**.
c. Enter the Lead Pad Angle which is the angle between the horizontal plane and the wire at the lead point. Include the unit **deg**.
d. Click **OK**.

Importing Cadence Bondwire Profiles

1. Click **Import Bondwire** to open an explorer window.
2. Navigate to and select a Cadence XML wirebond type definition files
3. Click **OK**.

Cloning a Bondwire Definition

1. From the grid, select a bondwire definition to clone.
2. Click **Clone Bondwire**. The **Bondwire Definitions** window opens with values identical to the selected definition.
3. Click **OK**.

Removing a Bondwire Definition

1. From the grid, select a bondwire definition to delete. *Only project definitions can be deleted.*
2. Click **Remove Bondwire**.
3. Confirm the removal. The definition is deleted on the grid.

Export Bondwire Definitions to File

1. From the grid, select a bondwire definition to export. *Only project definitions can be exported.*
2. Click **Export To Library**.
3. From the **Export to Library** window, navigate to where you want the file to go and click **Save**.
4. Confirm the export.

Drawing a Void in the Layout Editor

Follow these steps to create a void, or remove material from an object in the shape of a circle, rectangle, polygon, or line.

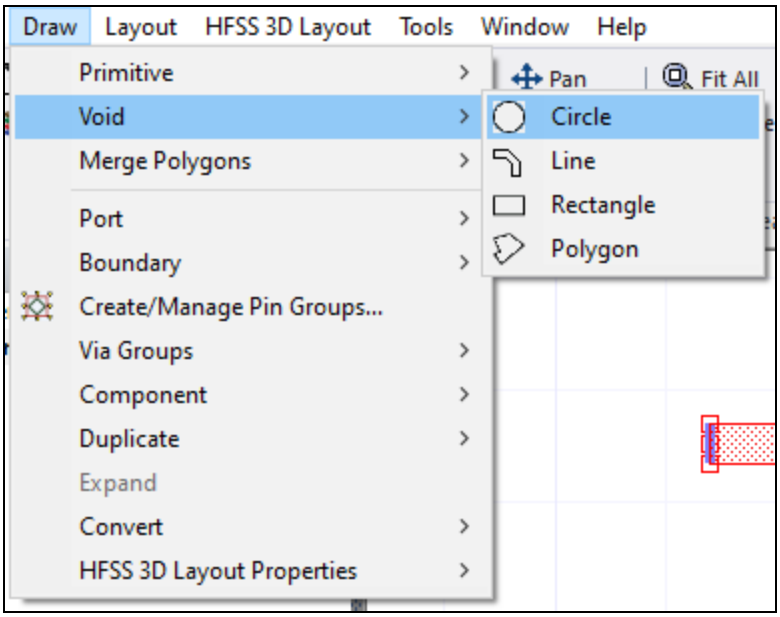
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

One object can have multiple voids but each void can only be associated with one parent object (e.g., to create two concentric rings, draw the outer circle, then add a circular void within it).

1. Select a parent object.

   a. Navigate to **Draw**, then select **Void** and one of the following:

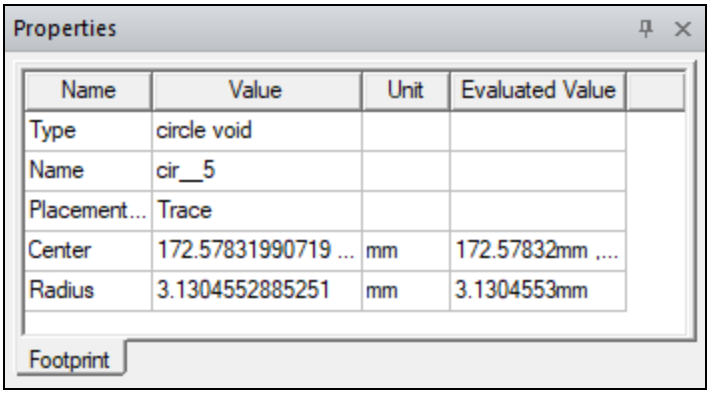


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Circle**. Then follow the procedure for drawing a circle.
- **Rectangle**. Then follow the procedure for drawing a rectangle.
- **Polygon**. Then follow the procedure for drawing a polygon.

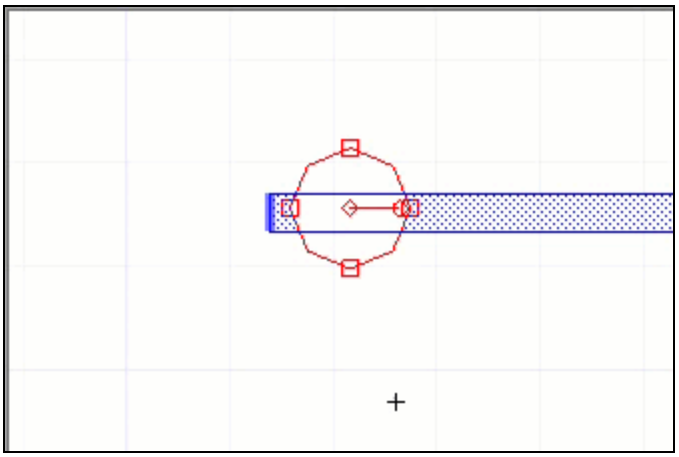
> **Note:**
>
> To **Remove a Line**, navigate to **Draw** menu, then select **Void** > **Line**. Follow the procedure for drawing a polygon. A void cannot be created in the shape of a line on an existing line object. Material is removed from the object in the shape and dimensions of the void.

2. Repeat steps **1-2** to create additional voids in an object.
3. View or edit a void's properties in the **Property Control** window or use the mouse to drag the void's handles.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. **Click+drag** the void's handles to change its shape.



> **Note:**
>
> 3D vias may contain voids. Voids in 3D vias can be placed entirely or partially in the outer contour. No attempt is made to geometrically align voids in the upper polygons with those in the lower. The order in which voids on different layers are created is used to control their alignment.

Merge Polygons

Merge Polygons operates on two or more objects that overlap. Select the objects you want to merge, then click the **Layout** >**Merge Polygons** drop-down menu to select the operation:

- **Union** joins the objects into one object. See Uniting Objects.
- **Intersection** creates a new object from the intersection of the objects. See Creating Objects from Intersections.
- **Subtract** takes the object that was selected first as the positive object, then subtracts from it any overlapping areas on the other selected objects. See Subtracting Objects.

Union and **Intersection** operations support using selected objects on multiple layers, and each layer object is operated on separately. However, **Subtraction** is only allowed if the selected objects are on the same layer. Selected objects may be negative objects.

- If only negative objects are selected, the merge operation is performed the same as with positive objects, but the resulting objects remain negative objects.
- If both negative objects and positive objects are selected:
  - Complete the union/intersection/subtraction operation on the positive objects
  - Always union the negative objects

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

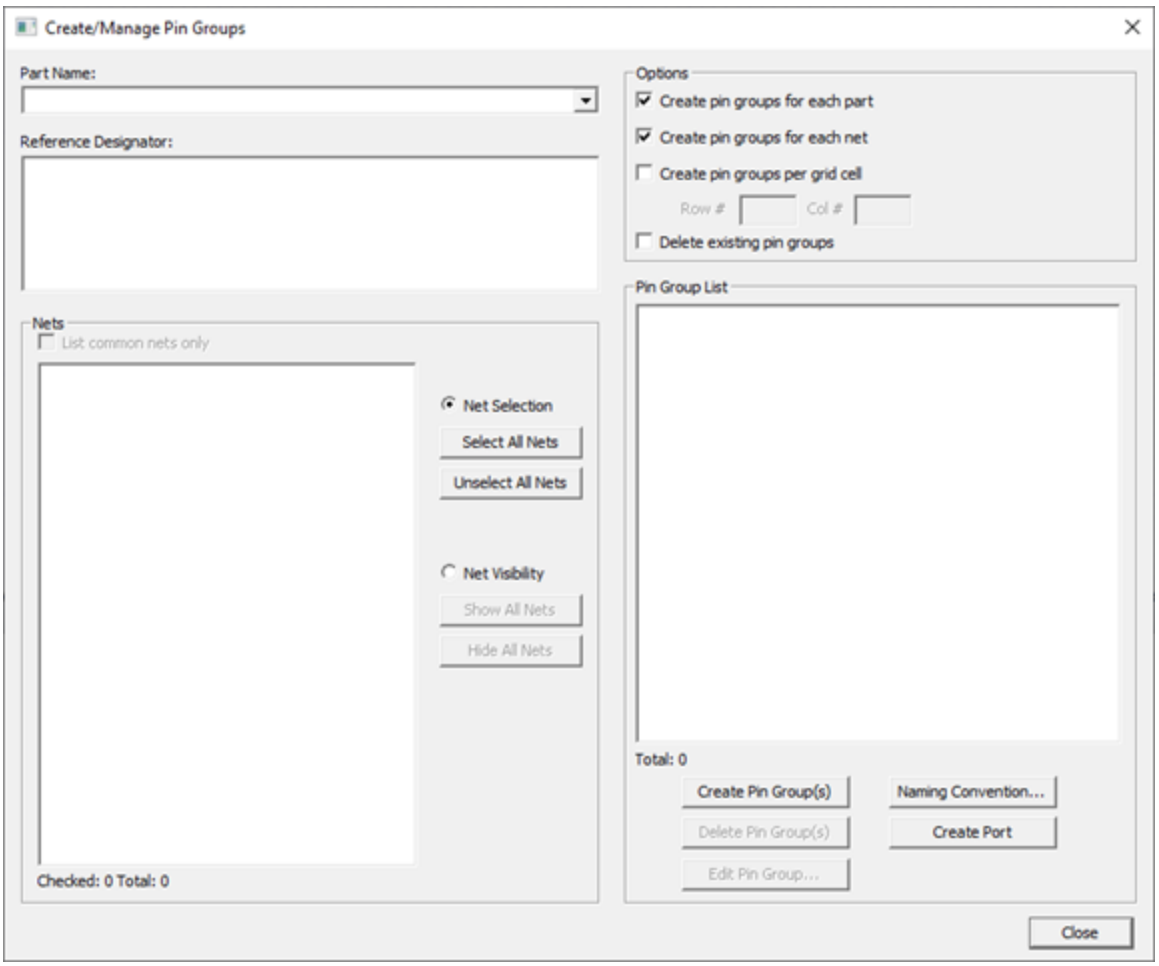
- Subtract the negative object result on the positive object result

Pin Groups in 3D Layout

Pin groups are groups of pins created for various components. Each pin group is treated as if it is electrically connected during analysis. You can connect circuit elements (e.g., ports, sources, RLCs) to any generated pin groups.

Pin groups are listed in the Components window. You can select a pin group or a pin in a group by clicking on the entity in the **Components** window.

Most of a pin group's configuration is in the **Create/Manage Pin Groups** window.

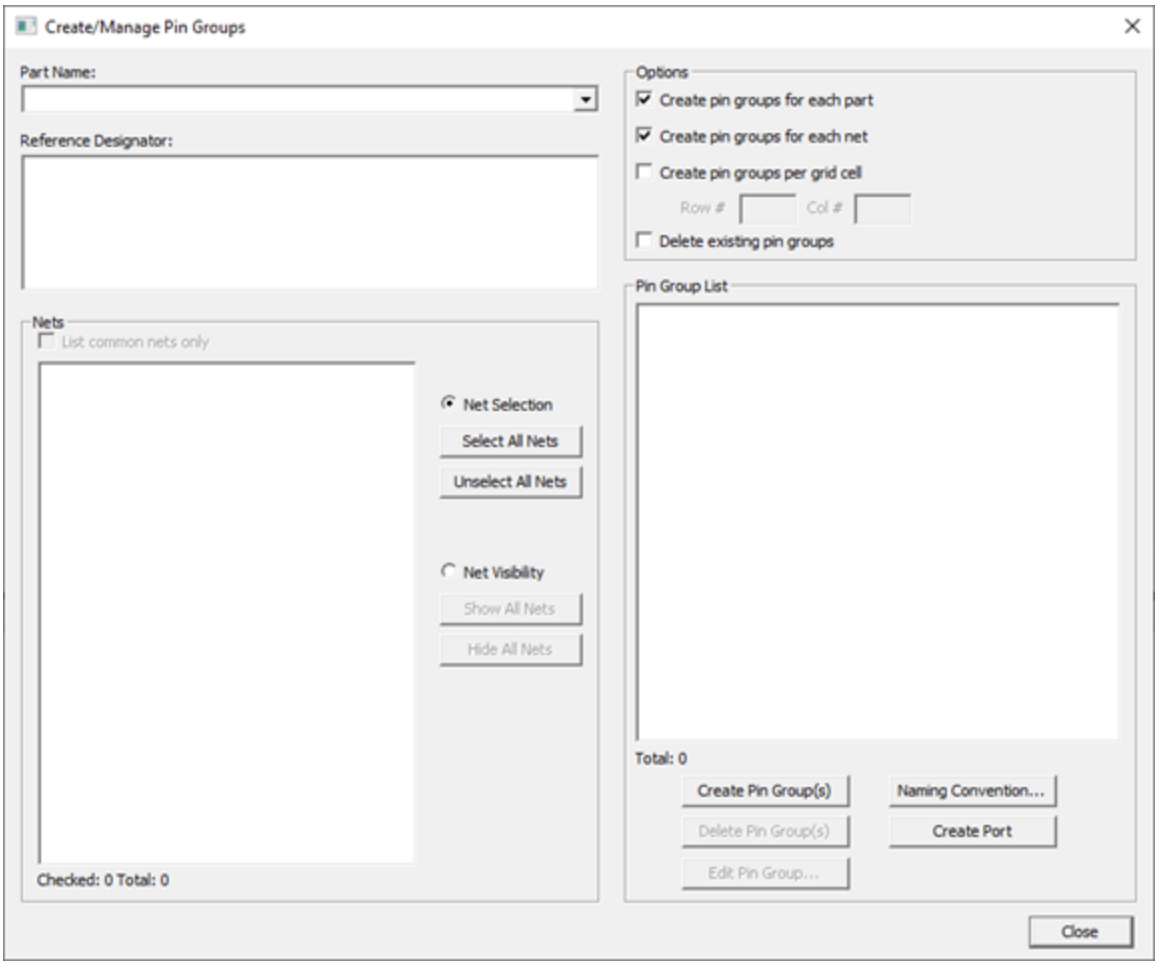


Creating a Pin Group

Pin groups can be created from pins that are both in components and assigned to a net. If a pin is not assigned to a net or a member of a component, it cannot join a group.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Create any appropriate components or nets.
2. Click **Draw** > **Create/Manage Pin Groups** to open the **Create/Manage Pin Groups** window.



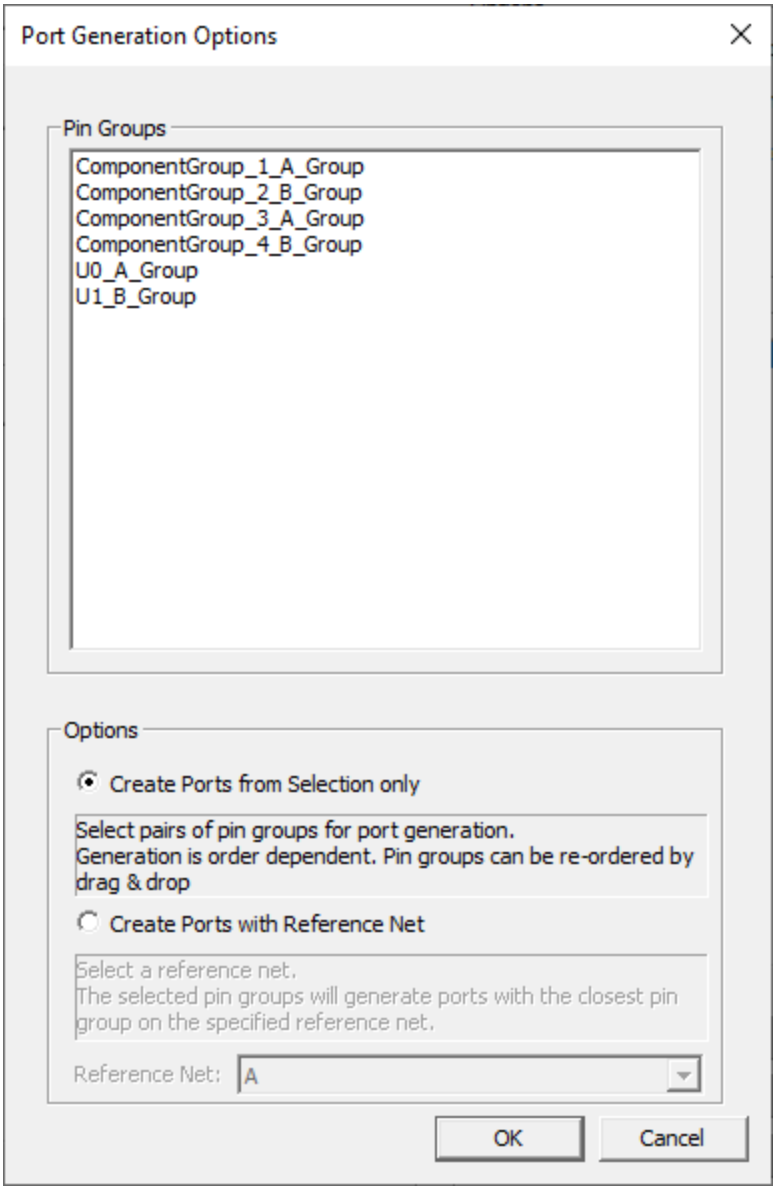
3. Make a selection on the **Part Name** drop-down menu. This is the component name. Select **Don't know** to display existing pin groups in the design.
   Nets that do not "overlap" with a component do not appear in this window.
4. Select the **Reference Designator** (s).
5. Select the **Net Selection** or **Net Visibility** options:
   - To select all nets that overlap with the component, click **Net Selection**, then click **Select All Nets**. The pins associated with the selected nets are shaded.
   - To show all the nets in the drawing area, click **Net Visibility**, then click **Show All Nets**.
6. To show only the common pins when multiple reference designators are selected, click **List common nets only**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. If a selected **Part Name** contains multiple **Reference Designators**, select any or all them and click **Create pin groups for each part** to have identical pin groups created on each Reference Designator.
8. If multiple nets are selected, click **Create pin groups for each net** to generate multiple pin groups; one for each of the nets that are selected.
9. To specify the grid locations to create pin groups, select **Create pin groups per grid cell** and enter the **Row #** and **Col #**. The **Drawing Area** is updated.
10. To create pin groups from a reference designator:
    a. Select the nets you want to include in the pin group on the **Nets List**. All pins associated with the net(s) are included. When nets are selected on the net list box, the associated pins are marked with black mesh boxes.
    b. Specify if you want to use the naming conventions. Click **Naming Convention** to open the **Naming Convention** window. Select if you want to **Use the Naming Convention** for the particular circuit element. Click **OK** to close this window.
    c. Click **Create Pin Group**.
11. To create a pin groups of pins from multiple reference designators:
    a. Select the pins you want to include in the pin group on the **Drawing Area**.
    b. Clear the **Create pins groups for each part** and **Create pins groups for each net** to create a pin group.
    c. Click **Create Pin Group**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

12. To create ports, click **Create Port** to open the **Port Generation Options** window.



a. Drag the pin groups in the **Pin Group** list into the order that you want them to pair up. The first group pairs with the second, the third with the fourth, etc.
b. To create ports between selected pin groups, select an even number of groups in the list and click **Create Ports from Selection only**.
c. To create a port from a net, select one or more pin groups, click **Create Ports with Reference Net**, and select a net to reference. If you select multiple pin groups, each selection creates a port with that pin group and the closest pin group on the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

selected net.

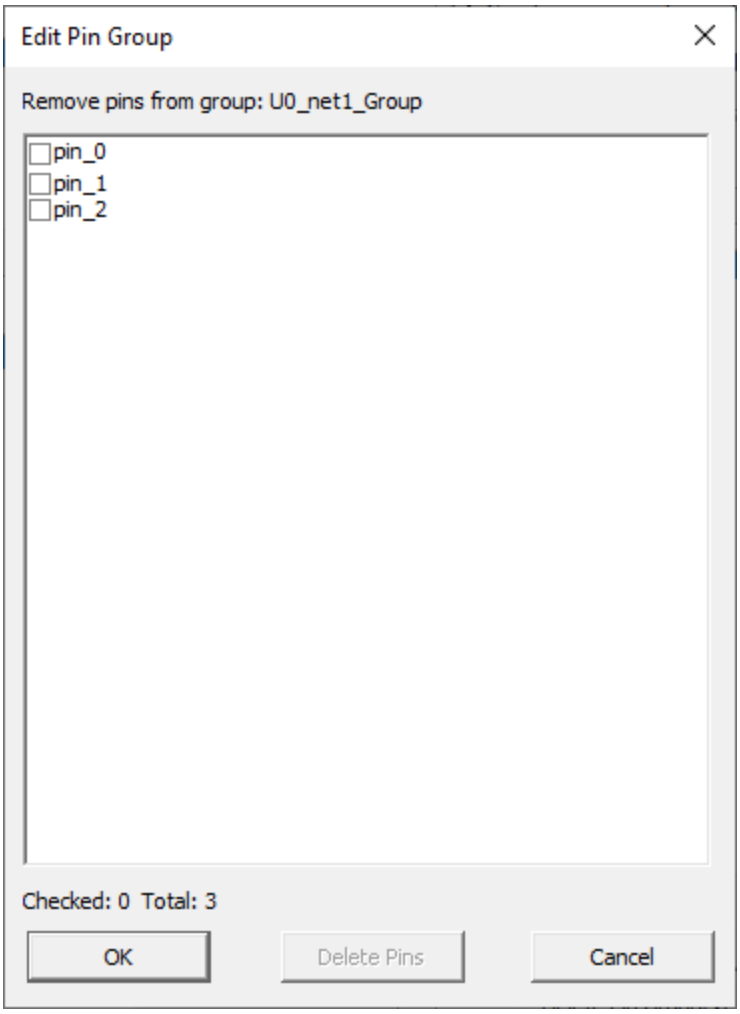
d. Click **OK**.

13. Click **Close**.

Editing a Pin Group

The only changes that can be made to a pin group is to remove member pins. Also rename a pin group in the **Components** window.

1. Click **Draw** > **Create/Manage Pin Groups** to open the **Create/Manage Pin Groups** window.
2. Select the selected pin group on the **Pin Group List** area.
3. Click **Edit Pin Group** to open the **Pin Group Editor** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Select unwanted pins and click **Delete Pins** to remove them on the group.
5. Click **OK** to close the window.
6. Click **Close**.

Renaming a Pin Group

1. Open the Components window.
2. Click **Pin Group** > *GroupWithOldName*.
3. From the **Properties** window, click the **Pin Group** value.
4. Enter the new name of the pin group

Deleting a Pin Group

Pin groups can be deleted in two ways, on the **Components** window or the **Create/Manage Pin Groups** window.

From the **Components** window, right-click **Pin Group** > *UnwantedGroup* and click **Delete**. Alternatively:

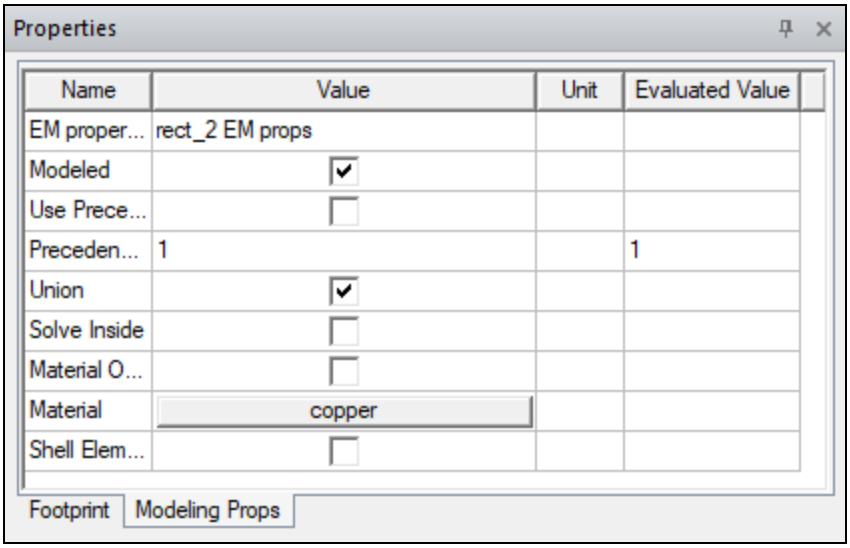
1. Click **Draw** > **Create/Manage Pin Groups** to open the **Create/Manage Pin Groups** window.
2. Select the unwanted group on the **Pin Group List** area.
3. Click **Delete Pin Group(s)**.
4. Click **Close**.

HFSS 3D Layout Properties

Meshing Properties

For most components, the following meshing controls are available under the **Modeling Props** tab of the **Property** window. Select items one by one in the **Properties** window and modify their **Modeling Properties**, as appropriate. To remove the **Modeling Properties** tab on the **Property Window**, click **Draw** > **Remove Modeling Properties**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Select from the following:

- **EM properties** field — the editable name of the primitive.
- **Modeled** check box — specifies the object is meshed when the circuit is modeled.
- **Use Precedence** check box — specifies the mesher examines the **Precedence Value** when deciding object precedence.
- **Precedence Value** field — when **Use Precedence** is checked, enter any integer. Where polygons from different layers/materials overlap, the mesher decides precedence on the basis of Precedence Prioritizing.
- **Union** field — merges overlapping polygons into a single object.
- **Refined** check box — causes the object to be refined. When unchecked, the object are not refined.
- **RefineFactor** field — enter a positive integer or variable value that specifies the level of refinement. The larger the value, the greater the refinement. A value of one specifies the same refinement relative to other objects. One-half specifies half as much refinement relative to other objects, and two specifies twice as much refinement. If a zero value is entered, the **Refined** area is automatically unchecked. If a value less than zero is entered, the value is automatically changed to 1.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Data with different meshing characteristics cannot overlap. Overlapping objects must possess the same **RefineFactor** and **NoEdgeMesh** values. If the values differ, the following warning message is displayed: “Data on Layer trace intersects data on the same layer with different properties.”

A warning message is also displayed if self-intersecting components yield unexpected results. Self-intersecting polygons and voids are allowed, but they may not mesh as expected.

- **NoEdgeMesh** — when checked, specifies that no special rectangular-edge mesh is used during modeling.
- **Solve Inside** — when checked, enables the HFSS **“** solve inside**”** option for that particular mesh body. All intersecting mesh bodies should have a common set of modeling properties. If a touching polygon does not have “solve inside” set, the attribute is ignored (and a warning is issued).
- **Material Override** — specifies a material override for the HFSS solver. By default, this material is the same as the object or layer the selected object is drawn on. Click the button to open the materials editor. For a new primitive object, the default material is copper.
- **Material** — Click the button to open the materials editor. For a new primitive object, the default material is copper.
- **Shell Element** — assign a volumetric shell element to the primitive object.

SIwave

- **DC IR Equipotential Region** — when checked, the DC IR solver uses equipotential regions to force equal voltage across the object. Equipotential regions may be defined as rectangular areas on surface signal layers (i.e., top or bottom).
- **Material** — specifies a material override for the HFSS solver. By default, this material is the same as the object or layer the selected object is drawn on. Click the button to open the materials editor. For a new primitive object, the default material is copper.

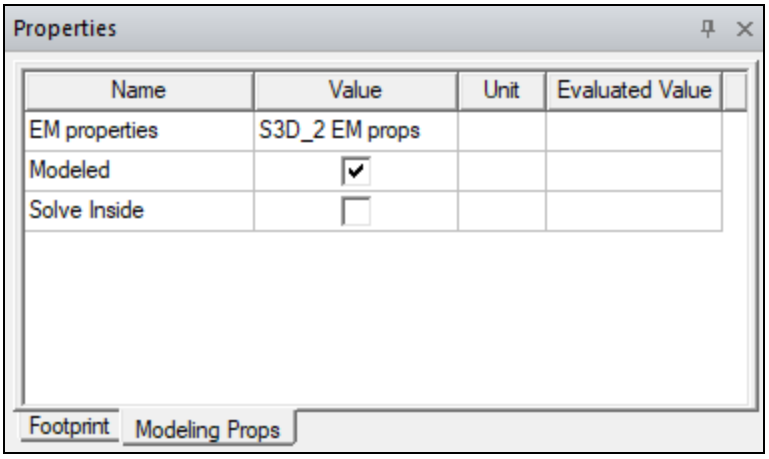
Note:

Text should be placed in the symbol layer. Text placed in the signal layer, unless part of the electrical design, must have **Modeling Properties** added with the “Modeled” option unchecked — however, this is not the recommended method and may result in the meshing error “Polygon Meshing Failed”. The preferred method is to locate text in the nearest symbol layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Modeling Props for 3D Structures

When a 3D structure is selected, only the **Modeled** and **Solver Inside** controls appear under the **Modeling Props** tab of the **Property** window.



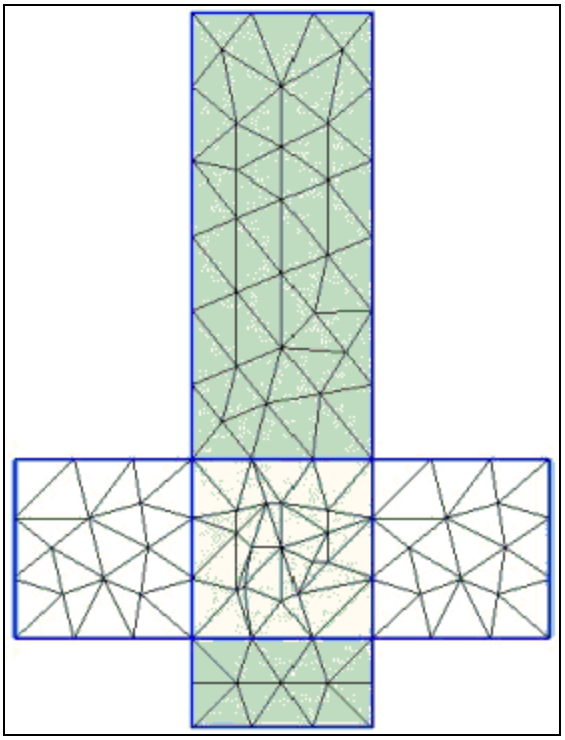
Precedence Prioritizing

Where polygons from different layers/materials overlap, the mesher decides on the material in the area of intersection based on the following rules:

1. For polygons with precedence numbers, the polygon with lower precedence takes priority over those polygons with higher precedence.
2. If the mesher cannot resolve the priority using the precedence attribute, it considers conductivities. The polygon with the higher conductivity takes priority over those polygons with lower conductivity.
3. If conductivities are the same, the stackup index is used. Objects higher in the stackup table (those with a lower stackup index) take precedence over objects lower in the stackup table (those with a higher stackup index).

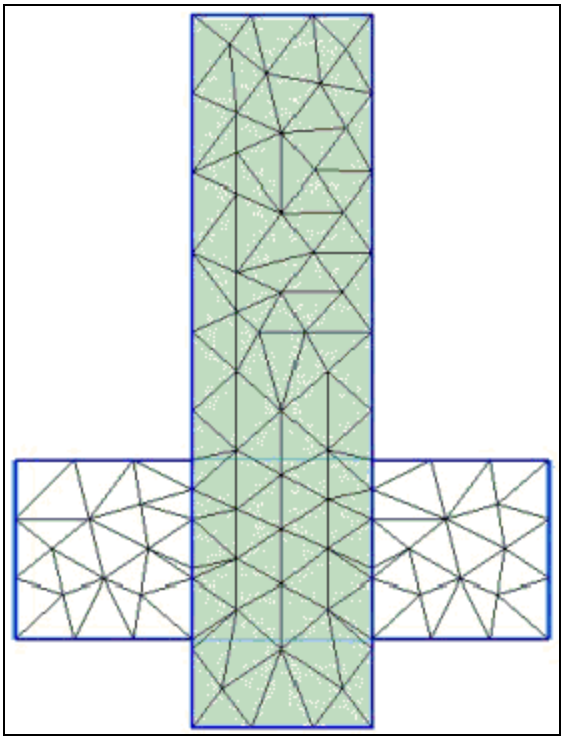
For example, if a blue rectangle (a thin metal) has a lower precedence value than a green rectangle (a thick metal), so its material (blue) takes priority where the two come in contact.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

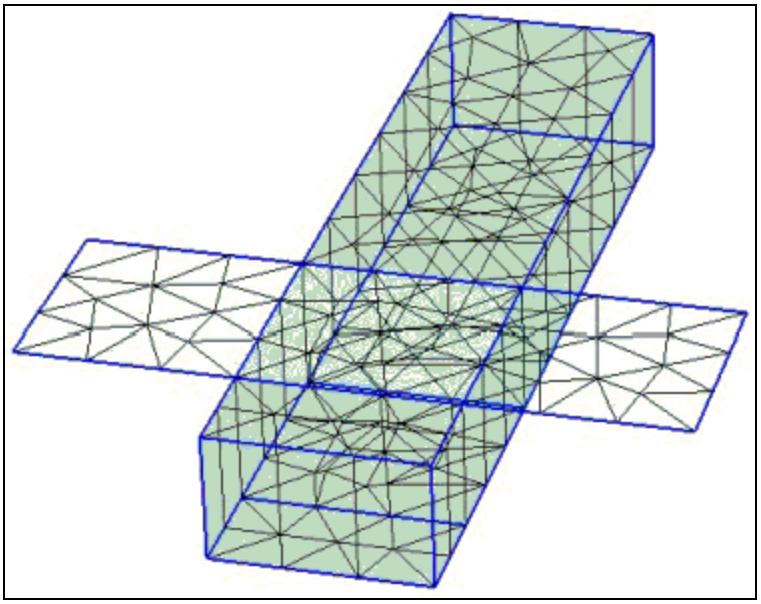


But in this next example, the blue rectangle has a higher precedence value than the green rectangle, so now the green material takes priority.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Following is a 3D view of the first preceding example (e.g., where the blue rectangle has the higher precedence value).



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Thin Film Properties

To define an object as a Thin Film Resistor, select one or more objects in the **Layout Editor** and click **Draw** > **HFSS 3D Layout Properties** > **Convert to Thin Film Resistor**. This defines the object(s) as a resistor and adds the **Modeling Props** tab to the **Property Window**:

The following meshing controls are available under the **Modeling Props** tab of the **Property** window:

- **SheetImpedance** specifies the object impedance value

Select items one by one in the editor to modify their **Modeling Properties** in the **Property Window**. To remove the **Modeling Properties** tab on the **Property Window**, click **Draw** > **HFSS 3D Layout Properties** > **Remove Thin Film Resistor Property**.

Selecting the Sweep Type

1. From the **Project Manager** window, expand the **Project Tree** and select the active design to make the **HFSS 3D Layout** menu appear.
2. From the **HFSS 3D Layout** menu, select **Solution Setup** > **Add Frequency Sweep** to open the **Edit Frequency Sweep** window.
3. Select one of the following sweep types:

Interpolating Sweep Options (Default)	Generates a solution for an entire frequency range. Best for models when the frequency range is wide and the frequency response is smooth, or if the memory requirements of a fast sweep exceed available resources. All discrete basis solutions are solved prior to interpolating sweeps because it is possible that an interpolating sweep can re-use already solved frequencies from a discrete sweep. An interpolating sweep must be used for Time Domain Reflectometry plots (TDR). When you select interpolating sweep, the **Options** tab is activated. This lets you specify a maximum number of solutions, and other interpolation values.
Discrete Sweep Options	Generates field solutions at specific frequency points in a frequency range. Best when only a few frequency points are appropriate to accurately represent the results in a frequency range.
"Options for Broadband Fast Sweeps" on	Generates a unique full-field solution for each division within a frequency range. Best for moderately-sized

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

page 10-443	models when the frequency range is wide and the frequency response is complicated, where interpolating or discrete sweeps would require too many specific frequency points. When you select Broadband Fast Sweep, the **Options** tab is activated. This lets you specify a maximum number of solutions and error tolerance.

Generating the Surface Current

From the sweep window, select **Generate Surface Current** and the Ansys Electronics Desktop (AEDT)™ electronics systems design platform saves the surface current data at every discrete frequency point. This allows you to plot the current and compute near- and far-field quantities at more than one frequency point. Otherwise, the surface current data is saved at the **adaptive frequency** point of the last adaptive pass, if specified.

> **Note:**
>
> If **Generate Surface Current** is not selected and an adaptive solution is not being performed, surface current data is not saved.

Keep the following things in mind when generating the surface current:

- Gain, axial ratio, far fields, and near fields require the surface current. If you select not to save the surface current and do not perform an adaptive solution, commands associated with these values are not available.
- The **Generate Surface Current** option is only available if you select **Discrete** as the type of frequency sweep. For a Fast Interpolating frequency sweep, the surface current data is only saved at the adaptive frequency. Note that if you are simulating over many frequency points, it is recommended that you do not select **Generate Surface Current**, since the resulting surface current file may become very large.
- For problems with plane waves (HFSS 3D Layout only), the **Generate Surface Current** option is always selected.

Setting up a Full-Wave SPICE Analysis

To determine a suitable frequency range for a solution that are used for a Full-Wave SPICE analysis:

1. Click **Setup Full-Wave Spice** in the sweep setup window to open the **Setup for Full-Wave Spice** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Type a value in the **Signal Rise Time** field. This value represents the time scale that characterizes the rate of change of the input time signal to be applied in the circuit simulator. By default, this value is set to 1.
3. Type a value in the **Time Steps Per Rise Time** field. By default, this value is set to 5. The time sampling increment for the entire signal is calculated using: $\Delta t = \frac{\tau}{N_\tau}$ where
   - Δt is the time sampling increment.
   - τ is the signal rise time.
   - N_τ is the number of time steps per signal rise time.
4. Enter a value in the **Number of Time Points** field. By default, this value is set to 500. The input time signal duration is determined using: $N' \Delta t$ where *N* is the number of time points.
5. Click **Calculate**. The Ansys Electronics Desktop (AEDT)™ electronics systems design platform determines the **Maximum Frequency** using: $F_{\max} = \frac{0.5}{\Delta t}$ where F_{max} is the maximum frequency. It determines the **Frequency Step Size** using $\frac{F_{\max}}{N}$ and determines the **Number of Frequency Steps** using N-1.
6. Click **Accept** to transfer the new frequency sweep data to the frequency sweep fields in the sweep setup window.
   - Optionally, click **Cancel** to return to the sweep setup window and maintain previously entered frequency sweep settings.

Guidelines for Calculating Frequencies for a Full-Wave SPICE Analysis

When S-parameter dats is exported on the Ansys Electronics Desktop (AEDT)™ electronics systems design platform to PSpice, HSpice, or Maxwell Spice software, a Full-Wave SPICE analysis can be performed. A Full-Wave SPICE analysis includes full-wave effects in a circuit simulation. If you plan to perform a Full-Wave SPICE analysis, use the **Setup for Full-Wave Spice** window to help determine a suitable frequency sweep range for the solution - one that captures the spectral content of a selected impulse response.

> **Note:**
>
> The frequency sweep ranges suggested in the **Setup for Full-Wave Spice** window box are estimates. You may have a pulse with a wider frequency content and AEDT recommended frequency sweep range may miss some of the high frequencies.

The maximum frequency of the frequency sweep range should be at least five times the inverse of the rise and fall times. If the specified frequency band is too wide, a frequency sweep may have convergence problems. If this happens, try to decrease the maximum frequency until the solution converges.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

It is recommended, though not required, the minimum frequency of the frequency sweep be less than the maximum frequency divided by the number of frequency steps. It is usually recommended to have at least 500 frequency steps. A higher number slightly improves the Full-Wave Spice solution accuracy, but also increases CPU and memory requirements to solve the problem. For most cases, using 1000 frequency steps provides a good trade-off between the accuracy and computational requirements.

> **Warning:**
>
> Occasionally, AEDT can fail to solve for the minimum frequency during a Discrete frequency sweep due to a failure of the port solver to converge. If this happens, try to increase the minimum frequency until the solution process completes successfully. However, the minimum frequency should be as low as possible because the low-frequency response determines the steady-state time response.

Clip Planes

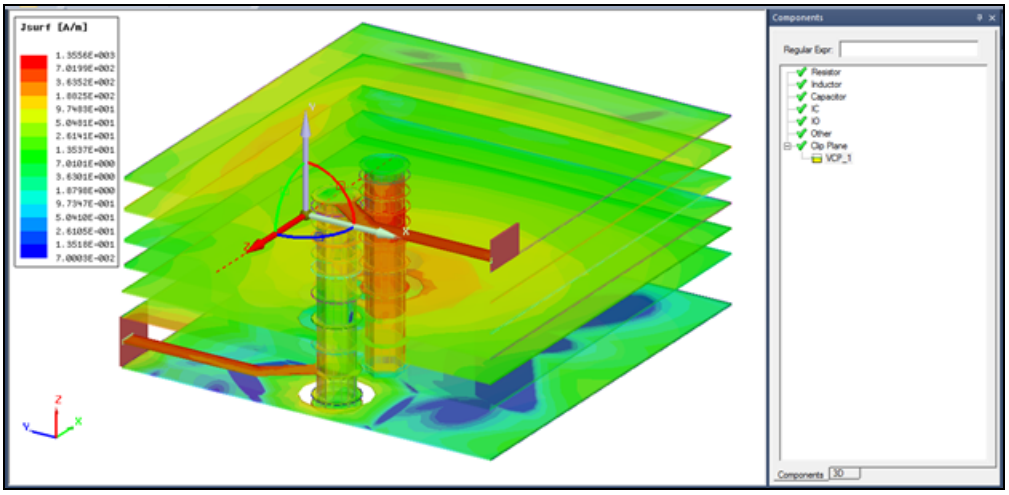
Clip planes can be used to truncate graphics in the Layout view, including mesh and fields plots.

To define a clip plane for the Layout View, click **View** > **Clip Plane**. This places a 3D coordinate-system manipulator into the Layout View. When the clip plane is enabled, graphics are truncated at the XY-plane in the +Z direction.

- To move the clip plane graphically, grab the manipulator's origin and drag/snap to the applicable, position.
- To rotate the clip plane, grab one of the manipulator's origin handles and rotate to the applicable, plane. The incremental angle of rotation can be set in the Toolbars or the shortcut menu's **3D Components** > **Rotation Step** command.
- Position and rotation can also be set explicitly by editing the clip plane's properties directly.

More than one clip plane can be created and, when present, can be applicable, under the **Clip Plane** tree item in the **Components Tab**, are shown in the following diagram.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Convert Traces to Planes

Follow these steps to convert traces to planes.

1. Select the trace.
2. Do one of the following:
   - From the **Draw** menu, select **Convert** > **Traces to Planes** or
   - Right-click in the **Layout Editor** and click **Draw** > **Convert** > **Traces to Planes**.

   The trace is converted into a plane. Edit its boundary points.

Convert Planes to Traces

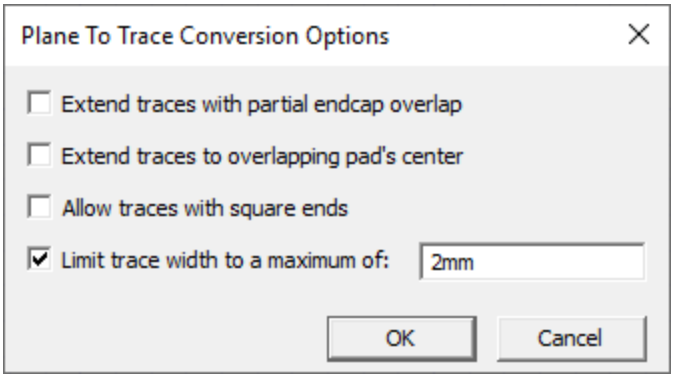
To configure options for converting traces and planes, either:

- From the **Draw** menu, select on the **Convert** drop-down menu or
- Right-click in the **Layout Editor** and select on the **Draw** > **Convert** drop-down menu.

To convert a plane to a trace:

1. Select the plane and navigate to **Draw** > **Convert** > **Planes to Traces Options** to open the **Plane to Trace Conversion Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Select an appropriate options and click **OK**.

   If the round endcap of a trace overlaps a plane, but the center line of the trace does not intersect the plane, select the **Extend traces with partial endcap overlap** option. This lengthens the trace so the center line touches the bound of the plane and fixes misalignment issues. However if there is other geometry in the small gap that gets filled, it can introduce DC shorts.

3. From the **Draw** menu or the **Layout Editor** right-click **Draw** drop-down menu, select **Convert** > **Planes to Traces**. The selected planes are converted into traces.

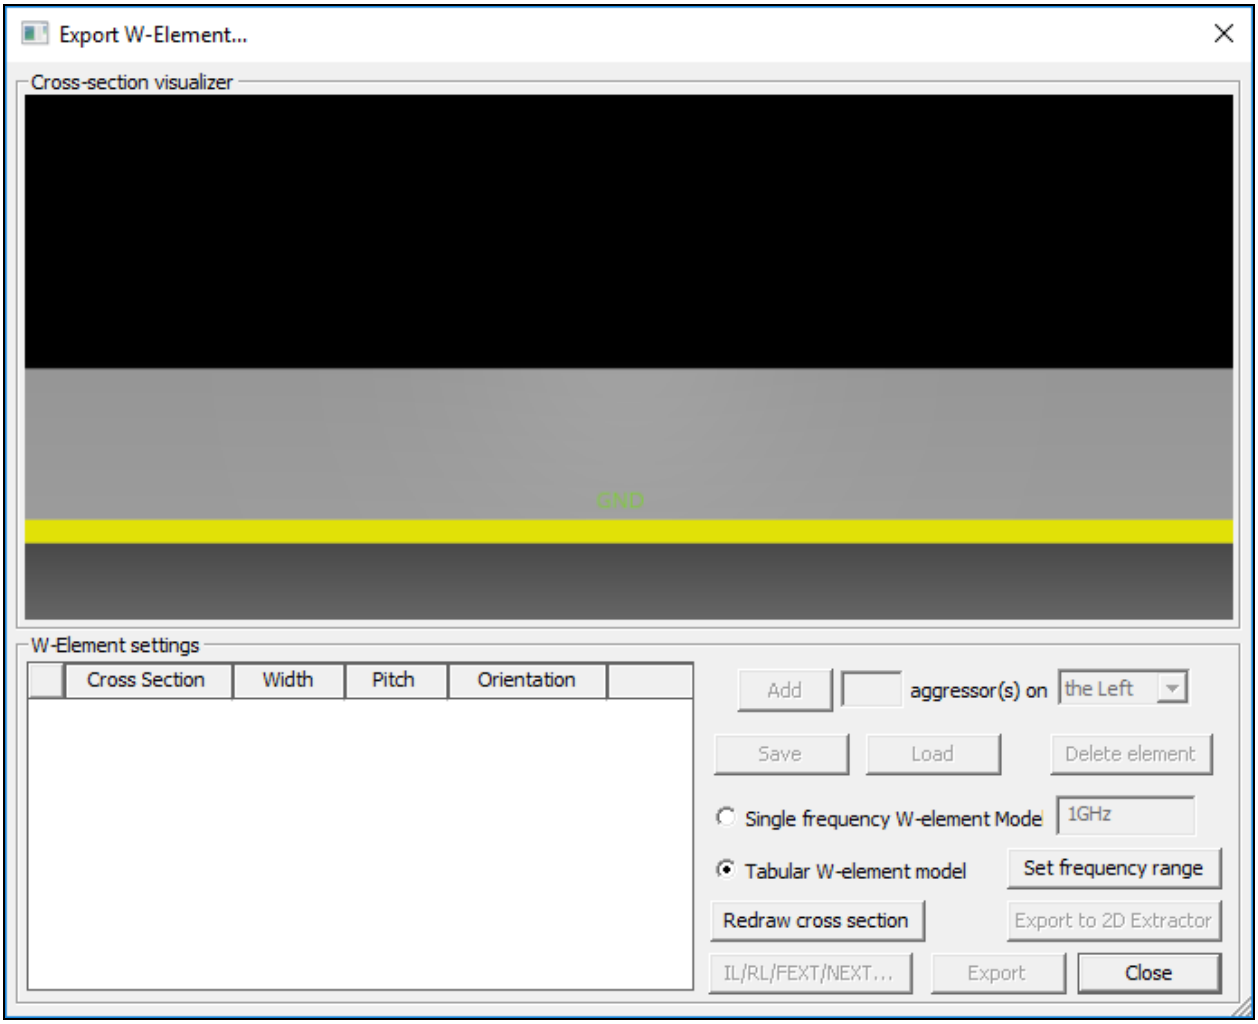
Drawing a Cross-Section for W-element Analysis (HFSS 3D Layout)

The **Export W-Element** window allows you to set up aggressor traces around a victim trace and export the corresponding w-element. Begin by drawing a line in the design area across which the selected cross-section of trace lines are extracted.

To draw the cross-section:

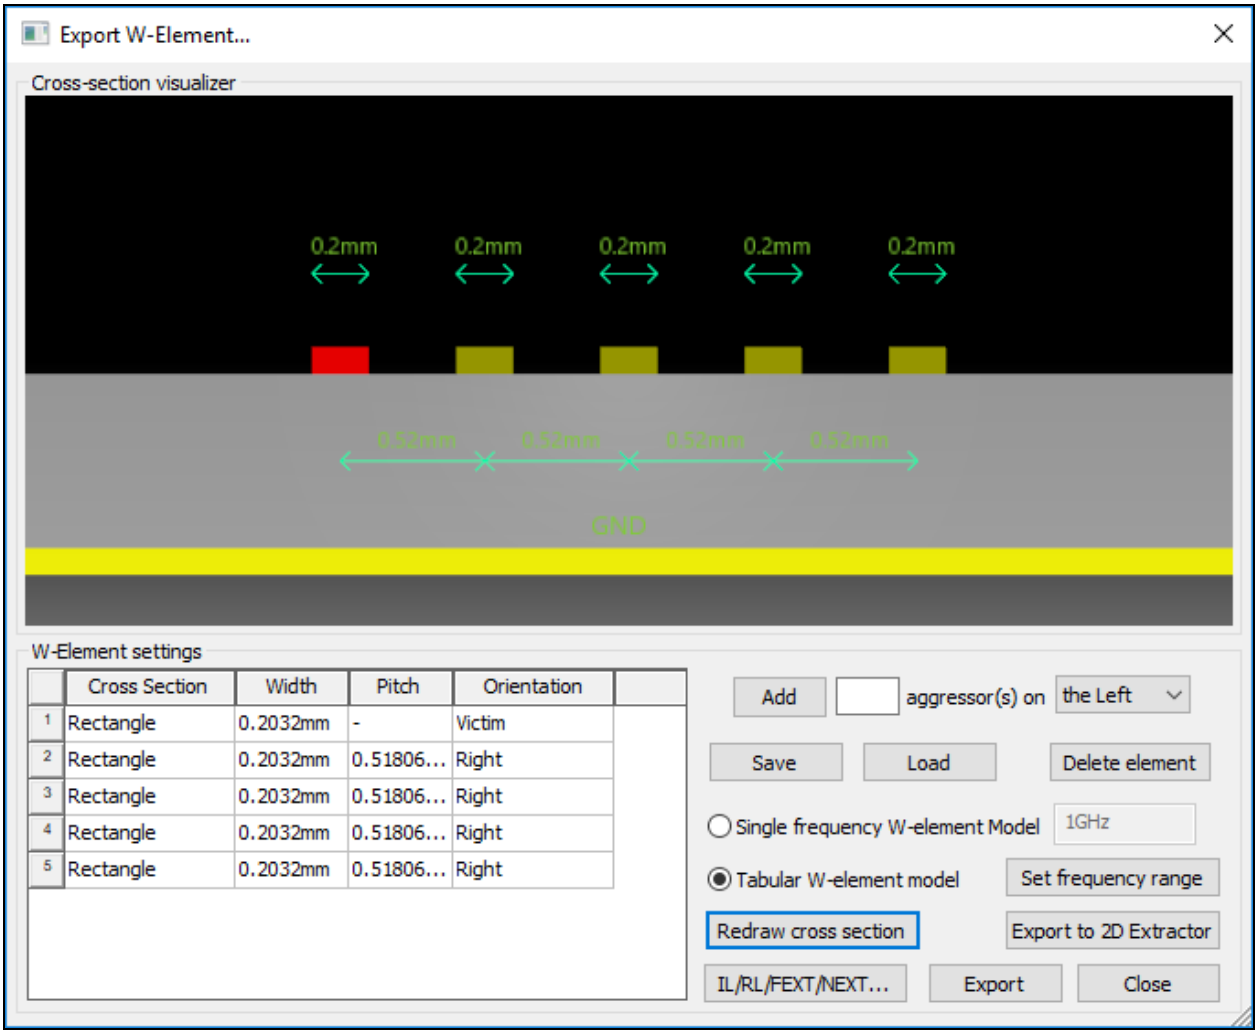
1. Click **Draw** > **Cross Section for W-element Analysis** to open the **Export W-Element** window. The cursor turns into a crosshair.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Click the location in the design where you want the line to begin. Move the cursor and click again to end the line. The **Export W-element** window updates.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Click an element in the visualizer or select it from the list in the **W-Element Settings** area. The following options are available:
    - **Add** – Enter the number of aggressors to add, and use the drop-down menu to select whether to add them on the **right**, **left**, or on **both sides**. Then click **Add**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> If you previously enabled CPW settings during trace width, impedance, or differential impedance calculation, your options are limited.
>
> - If you selected **Left plane spacing**, aggressors may only be added to the right of a victim trace.
> - If you selected **Right plane spacing**, aggressors may only be added to the left of a victim trace.

- **Delete Element** – Click to remove an element.
- **Single Frequency / Tabular Model** – Select **Single frequency** and enter the frequency in Hz, or select **Tabular** and click **Set frequency range** to set up a range of frequencies.
- **Redraw cross-section** – click this button to clear all information. The cursor transforms into a crosshair again, and you can redraw the line.
- **Export to 2D Extractor** – generates a script to export the selected layer's cross-section to 2D Extractor. Microstrips, stripline and conformal coats are supported. Generating this script launches a prompt asking if you want to run the script. Consult the Q3D Extractor/2D Extractor help for instructions on running an analysis in 2D Extractor.

Also double-click in the **W-Element Settings** area to change width and pitch.

4. Click **IL/RL/FEXT/NEXT** to compute insertion/return loss and time domain crosstalk.
5. Make your selected selections, then click **Export** to open the **Select Spice File to Export** window.

> **Note:**
>
> Selecting **Tabular W-element model** without specifying a frequency range will cause the **Frequency Sweep** window to open. You must specify the frequency range before you can save.

6. Browse to a save location, name your file, and click **Save**. The file is saved in Spice (*.sp) format.

Layout Menu

When a **Layout Editor** design is active, click **Layout** on the menu bar to open the menu for the Layout editor. There are multiple varieties of this menu depending on the type of design being edited (Circuit, HFSS 3D Layout, etc). The following descriptions are a superset of the commands that may appear on the **Layout** menu, though they may appear in different order on

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the menu than the order in which they are presented here. For more information, search the Help or use the Help Index to find information on any of the commands that appear on the **Layout** menu.

List — opens the Design List window, which lists the objects in the layout.

Layers — opens the Edit Layers window. Also see Configuring a Stackup.

Nets — opens the **Layout Editor** Nets drop-down menu; the same options are available after right-clicking in the **Layout Editor**.

Push Down — switches the active CS to the next lower level.

Pop Up — switches the active coordinate system (CS) to the next higher level. Relative CSs can be created within other relative CSs to form multiple relative levels.

Place Design — opens the Place Design window.

Connect Pins — connects the selected pins.

Cutout Subdesign — creates a new subdesign from extracted data by cutting out part of a Layout using a selection polygon and/or a net selection. Click subdesign name to rename the new design. The original design is not affected by this operation. See Cutout Subdesign.

Group into Subdesign — creates a subdesign by combining all the selected objects in the current layout. The Project tree shows the subdesign with a default name. Click name to rename the subdesign.

Cross-Probe Schematic — allows you to cross-prob selected schematic and layout elements. When both the **Layout Editor** and the **Schematic Editor** are displaying the same design, select one or more component instances and interface ports in both editors. Select the schematic elements or layout elements to be cross-probed, then select **Cross-Probe Schematic**. For more information, see Cross-Probing Elements and Cross-Probing Selected Elements.

Settings — opens the **Settings** tab of the **Options** window to configure the local option settings in the Layout Editor. See Setting Local Layout Options.

Grid settings — opens the **Display** tab of the **Options** window. The settings on this window control the grid in the drawing area. See Layout Editor Options: Display Panel.

Draw HFSS Air Box — invokes the HFSS Air Box drawing tool.

Draw HFSS Ports — invokes the HFSS Port drawing tool.

Via Styles — opens the **Select Definition** window for **Padstacks**, with the via padstack selected. See Using the Padstack Editor for information on adding or modifying padstack definitions.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Pin Styles — opens the **Select Definition** window for **Padstacks**, so that you can add a stackup definition for pins. See Using the Padstack Editor for information on adding or modifying padstack definitions.

Line Styles — opens the Line Styles window that specifies the lines to use on the various layers.

Text Styles — opens the Text Styles window that specifies the fonts to use on the various layers.

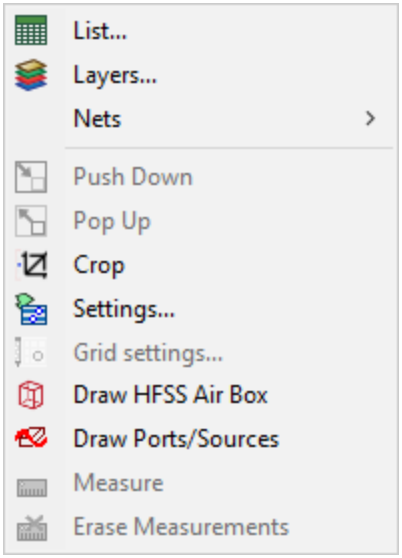
Export to Ansys SIwave™ with ALinks — initiates the export of layout data.

Measure — invokes measurement mode. The cursor changes to a small diamond shape. Click on any two grid-points to display the linear distance between the two points in the current units.

Erase Measurements — clears measurement lines.

IC Mode Commands

The following options appear when the IC mode environment is active. For more information, search the Help or use the Help Index to find information on any of the commands that appear on the **Layout** menu.



List — opens the Design List window, which lists the objects in the layout.

Layers — opens the Edit Layers window. Also see Configuring a Stackup.

Nets — opens the **Layout Editor**Nets drop-down menu; the same options are available after right-clicking in the **Layout Editor**.

Push Down — switches the active CS to the next lower level.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Pop Up — switches the active coordinate system (CS) to the next higher level. Relative CSs can be created within other relative CSs to form multiple relative levels.

Crop — enters cropping mode in the **Layout Editor**. See Cropping and Removing Small Fragments in IC Mode.

Settings — opens the **Settings** tab of the **Options** window to configure the local option settings in the Layout Editor. See Setting Local Layout Options.

Grid settings — opens the **Display** tab of the **Options** window. The settings on this window control the grid in the drawing area. See Layout Editor Options: Display Panel.

Draw HFSS Air Box — invokes the HFSS Air Box drawing tool.

Draw HFSS Ports — invokes the HFSS Port drawing tool.

Measure — invokes measurement mode. The cursor changes to a small diamond shape. Click on any two grid-points to display the linear distance between the two points in the current units.

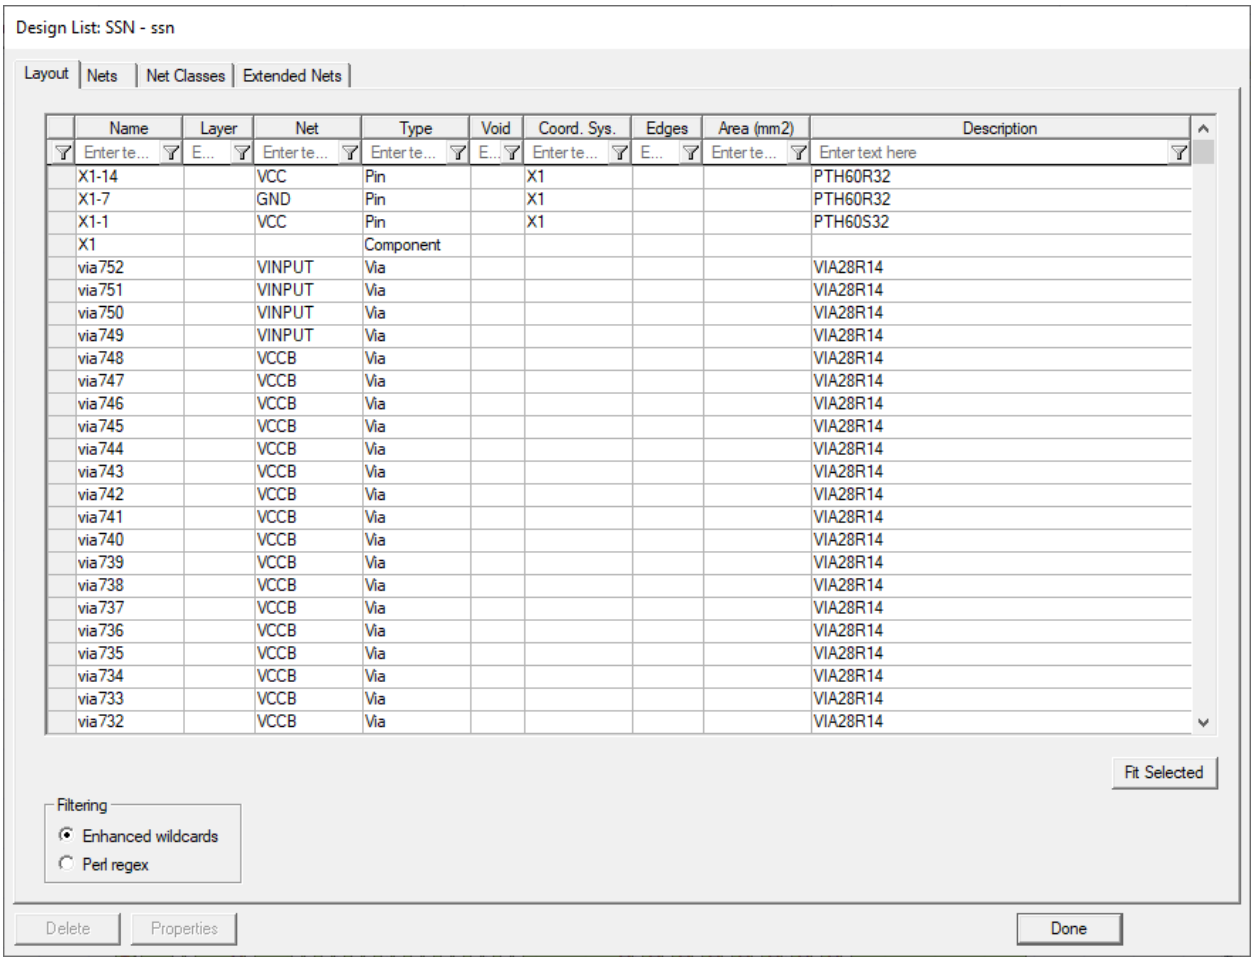
Erase Measurements — clears measurement lines.

The Design List

The **Design List** window lists the objects in the **Layout** window, nets used in that window, net classes, and extended nets. Select **Layout** > **List** on the menu bar to open it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Layout Tab



This tab lists layout objects with descriptive information. On this tab, you can:

- Sort each column by clicking on its title. Click again to reverse the order of the sort.
- Filter a column by selecting the type of filtering you want in the **Filtering** area , then entering a search string in the editable cell underneath the column's title:
  - **Enhanced wildcards** uses the wildcard symbols * and ? to select which objects appear in the list. You can use pattern matching to search a column:
  - * matches any number of characters. For example, **net*** selects objects **net_1a**, **net_1b**, **netLength**.
  - ? matches any one character. For example, **net_?** selects objects **net_1**, **net_2**, **net_a**, **net_b**.
  - **Perl regex** matches a pattern using Perl Regular Expression. You can use pattern matching to search a column:

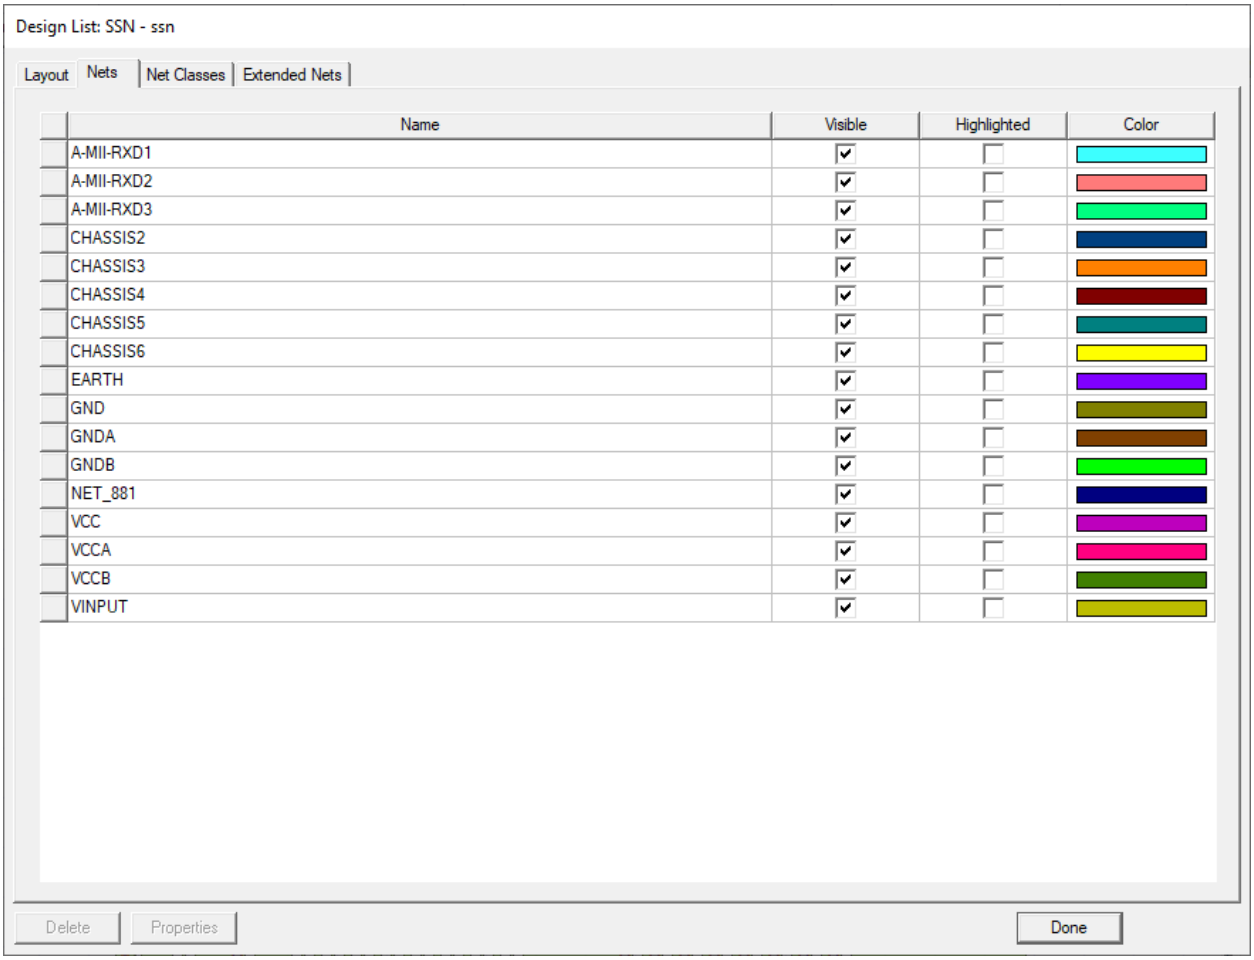
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

.* matches any character zero or more times. For example, **net.*** selects objects **net_1a**, **net_1b**, **netLength**.

.? matches any character one or zero times. For example, **net_.?** selects objects **net_1**, **net_2**, **net_a**, **net_b**.

- Click a row to select its corresponding object in the layout. click **Shift** or **Ctrl** to select multiple rows.
- Click **Fit Select** to focus the Layout window on your selected object.
- Click **Properties** to change the properties of selected objects.
- Click **Delete** to remove selected objects on the layout. Warning: there is no confirmation.

Nets Tab



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This tab lists all the nets in the layout. On this tab, you can:

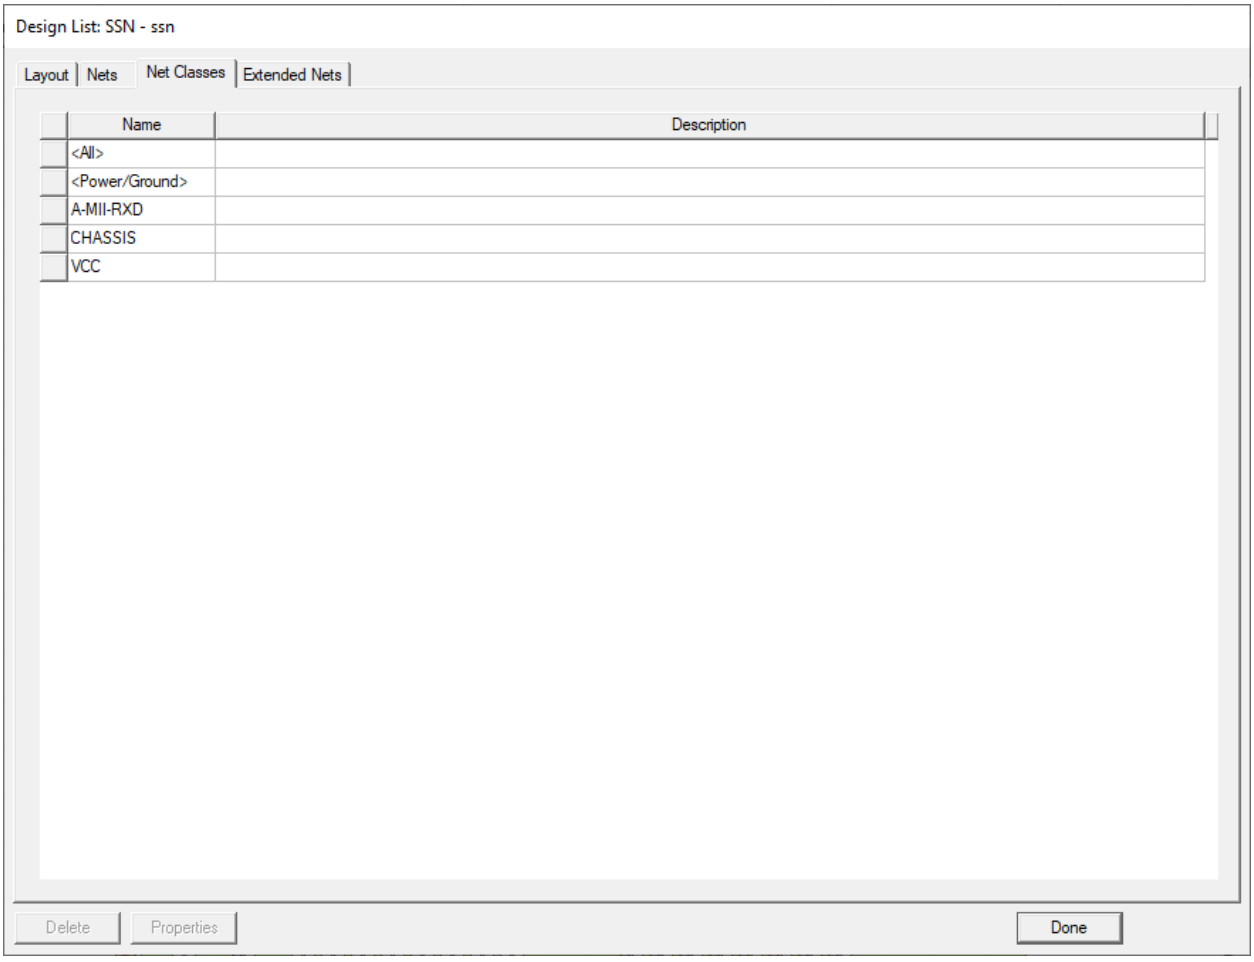
- Show or hide a net by checking or clearing its row's **Visible** check box.
- Highlight the objects in a net by clicking its row's **Highlighted** check box. The objects in that net are drawn in a highlight color. Highlighting is independent of the selection and persists between sessions. Remove highlights from a net's objects on this tab or by selecting a single object in the net and choosing the menu option **Layout** > **Nets** > **Toggle Net Highlight**.
- Identify and change the color of a net. Layouts use color to highlight and distinguish between net, each of which has an assigned color. Double-click a net's **Color** cell to open the **Color** window and select a new color.
- Click a row to select all the objects in that net.
- Remove all items from a net by selecting its row and clicking **Delete**. This does not delete the objects.
- Edit properties common to all elements in a selected net by clicking **Properties** and using the property editor.

> **Note:**
>
> **Shift** +**Ctrl** +selecting an object in the **Layout Editor** selects everything that is in the same net as the object.

Net Classes Tab

The **Net Classes** tab has a list of net classes and their descriptions:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



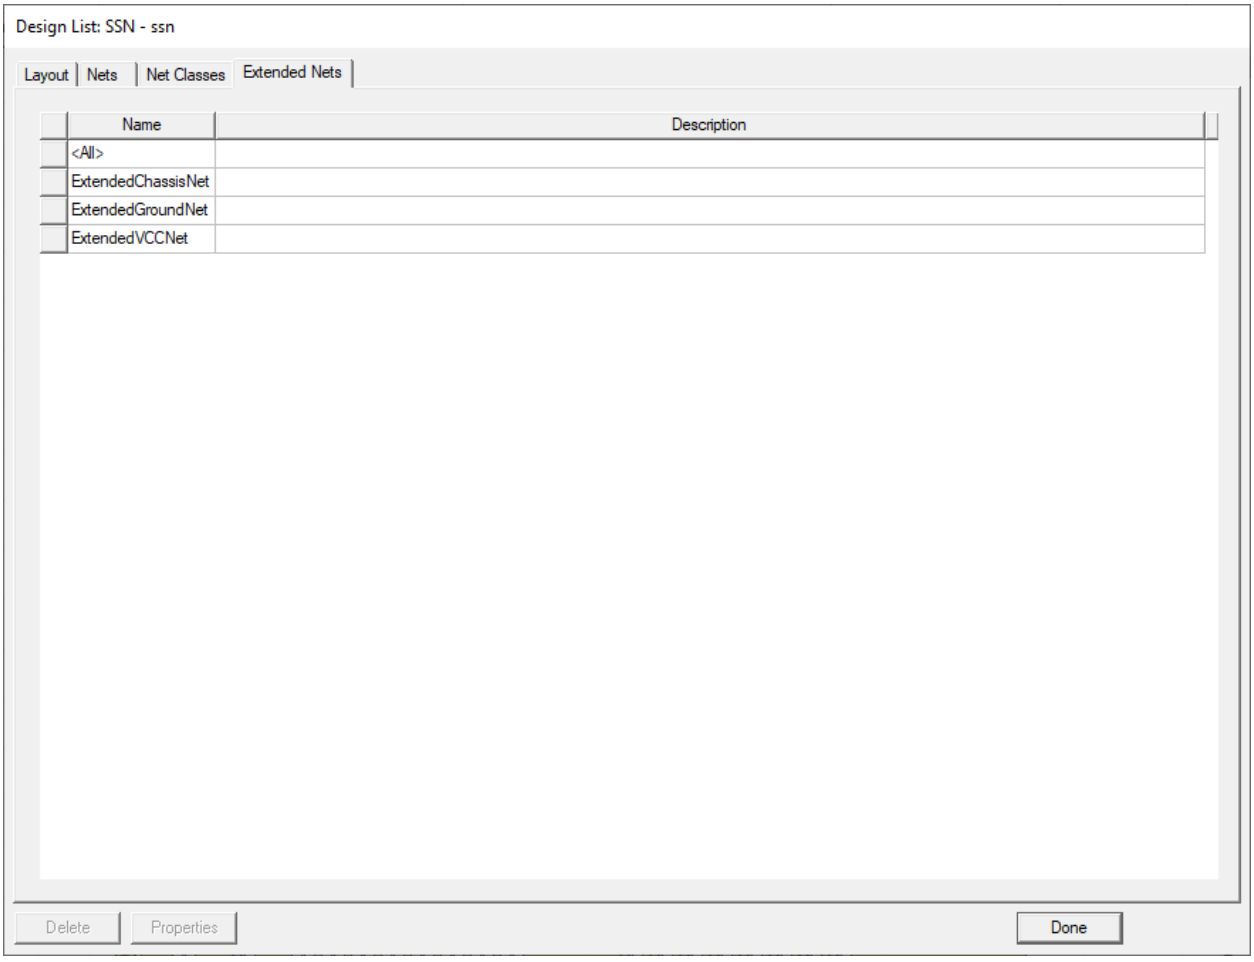
This tab lists all the net classes in the layout. On this tab, you can:

- Click a row to select all the objects in that net.
- Remove all items from a net by selecting it row and clicking **Delete**. This does not delete the objects.
- Edit properties common to all elements in a selected net by clicking **Properties** and using the property editor.

Extended Nets Tab

The **Extended Nets** tab has a list of extended nets and their descriptions:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



This tab lists all the extended nets in the layout. On this tab, you can:

- Click a row to select all the objects in that extended net.
- Remove all items from an extended net by selecting it row and clicking **Delete**. This does not delete the objects.
- Edit properties common to all elements in a selected extended net by clicking **Properties** and using the property editor.

Nets

Layout > **Nets** opens the **Nets** dropdown menu; the same drop-down menu is also available via the right-click context menu of the **Layout Editor**. Make choicesfrom the following commands to select nets and view net violations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> Only **List**, **Select Physically Connected**, **Select Net Connected**, and **Toggle Net Highlight** are available in IC Mode.

List

Opens the **Design List** window. The **Design List** window lists the name of each net, along with **Color** and **Highlighting** controls. Each net has an assigned color. The color is used when the geometry is colored by net or when a net is highlighted. Each net has a check box to activate **Highlighting**. A highlighted net is displayed opaque when transparency is active.

Select Physically Connected

Selects all primitives, vias and pins physically connected to the currently selected items in the currently active design instance (selections in the **Layout Editor** cannot cross multiple levels of hierarchy). Vias and pins with plated holes are followed across layers. Connectivity through primitives in subcircuits and footprints is also followed (unless the subcircuit is a blackbox, in which case it owns its own independent stackup).

> **Note:**
>
> The starting object cannot be an integrated circuit subdesign.

Select Net Connected

Selects all items on the same nets as the currently selected items.

Toggle Net Highlight

Toggles the highlighting for all objects in the same nets as the currently selected items.

Select All Net Violations (General Mode Only)

Starting at the selected objects, the physically connected objects are checked for net violations. An error is reported for all physically connected objects belonging to a different net and the item in error is selected.

Select First Violation (General Mode Only)

Starting at the selected objects, the physically connected objects are checked for net violations. As soon as a physically connected object belonging to a different net is detected, an error is reported and the item in error is selected. At this point the check stops.

Show Selected Nets Only (General Mode Only)

This command results in making only selected nets visible.

Show All Nets (General Mode Only)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This command results in making all nets visible.

Cutout Subdesign

Cutout Subdesign can be used to filter nets and/or clip a design by a polygon. To process the operation in the active design, select **Use Current**. To create a new design, select **Create new** and select whether the result should be created as a sub-design.

- If a polygon is selected before the operation is performed, it becomes the default extent polygon.
- If the selection is made entirely by net, then no geometry should be selected before invoking the operation. If multiple polygons are selected, the union of these polygons forms the extent.
- If no data is selected, a new design is created with a stackup identical to the source design, but no geometry is transferred. Note, however, that **filter geometry by net** must also be selected.
- **Cutout Subdesign** works on hierarchy and footprints, however, everything is **flattened** into the sub-design that is created.

Select **Layout** >**Cutout Subdesign** to open the cut out window:

- **Destination parent design** — select "Use Current" to process the cutout in the active design, or choose an existing top-level design from the drop-down menu, or use "Create new parent Circuit Design" or "Create new parent EM Design". Only top-level designs with a stackup that matches the source design appear in the drop-down menu. If a new design is created, it takes its name on the original source design.
- **Create the cutout as a sub-design in the parent** — when selected, data is copied to a new sub-design within the parent; otherwise, the extracted data is inserted into the top-level design.
- **Filter geometry by net** — when selected, the net data is used to control the data selection and clipping; otherwise, the data in the net table is completely ignored.
- **Nets**:
    - **Net** — the name of the net.
        - **<no net fill>** — refers to polygon data without a net association.
        - **<no net trace>** — refers to trace geometry (wide-line or plugin) without a net association.
    - **Include** — when selected, the net is included in the data transferred.
    - **Clip at extents** — when selected, the net is clipped against the extent polygon.
- **Net name filter** — limits the data displayed in the net table. Use the filter to build up a selection of nets. The filter has no affect on the final outcome of the operation (e.g., if "Y" is entered, only those nets beginning with the letter "Y" are displayed; if "C*0" is entered,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

then all nets matching the wild-carded pattern are displayed). Nets that are not visible retain their "include" and "clip" settings.

- **Extent polygon** — name of the extent polygon.
- **Reset** — resets the extent polygon back to the original polygon; if there was no original polygon, then reset clears the auto-generated polygon.
- **Create a sub-design for the included region** — only applicable if you are creating a sub-design in the top-level design and after an extent polygon has been defined. This option represents the typical use of the Cutout Subdesign tool. The sub-design inserted into the top-level design consists of the data contained in the extent polygon (and filtered by the net selection). All geometry in the nets that is designated as "clipped" are truncated at the boundary of the extent polygon.
- **Create a sub-design for the excluded region** — same as the previous option, however, the sub-design contains the data outside of the extent polygon, filtered by the net selection and clipped as appropriate. It is possible to select both options; in which case two sub-designs are created: one of data in the extent and the other of data outside of the extent.
- **Auto Generate Extent** — displays a second window that permits one to create an extent polygon derived either from the non-clipped nets selected or the current extent polygon. The auto-generated polygon is displayed in the Layout (though it may be difficult to see). It is possible to execute this option as many times as one wishes, adjusting the parameters as needed.
    - **Data source** — the auto-generated extent can use either the current polygon selection or the non-clipped nets as the basis for generating a new extent polygon.
    - **Expansion Type** — the derived region can be defined as a bounding box, a conformal polygon, or a convex hull of the selected data source.
    - **Expansion** — the auto-generated extent polygon is an expansion of the selected data source; the expansion is either a factor (unitless fraction) of the overall source polygon extent or an absolute offset (e.g., 1mm, 20um).
    - **Cornerstyle** — the type of corner to insert in the expanded polygon. Where a "corner" (the simple intersection of the offset edges) can result in rather poor results if there are acute or near-acute angles in the source polygon.
    - **Expansionincrements** — at times, a single, large offset can generate a poorly formed polygon (a preview of the resulting polygon can be observed in the Layout window). The suitability of a polygon is entirely subjective. Improve the general quality of a polygon by breaking up the expansion into a series of steps (increments of 2, 3, 4, etc.). Such increments represent the number of iterations used to reach the full expansion distance. To improve the general quality of a polygon, the number of increments need not be large; you can start with a small number and increase them as appropriate. However, it is important to understand that increasing the number of iterations also increases the time to compute the expansion. So obviously, a very large number of iterations has a significant impact on computation time.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Line Styles

Line Styles opens the **Line Styles** window box. Use the radio buttons to select a line style:

- Click in the **Width** field for a line style to change the width for that style, including the units. Press **Enter** to complete the change.
- Click in the **Bend Type** field to change the bend type (Corner or Round). Press **Enter** to complete the change.
- Click in the **Cap Type** field to change the cap or line-ending type (Flat, Extended, or Round). Press **Enter** to complete the change.

Since a line has nonzero width, its CapType determines how its ends behave:

- **Extended** — extends the line by its own width past the endpoint you click.
- **Flat** — cuts the line perpendicularly at the endpoint you click.
- **Round** — ends the line with a semicircle.

The existing technology files define line/trace styles, including a CapType (typically Flat) for each style. If you select None as the technology type, you'll automatically get a palette of four styles with a variety of widths, BendTypes and CapTypes.

- Click **Add Style** to add a new line style to the table.
- Click **Delete Style** to remove the selected style on the table.
- Click **OK** to save your changes, or **Cancel** to close the window without changing anything.

Legacy Line Style Attributes

The attributes "Corner" and "Round" appear in the BendType menu. The legacy attributes "Mitered (Legacy)" and "Curved (Legacy)" also appears if present in the design.

APDPath

- The "Round" BendType is the same as the bend type used in APDPath.
- The legacy APDPath is replaced by a line with a "Round" CapType and “Round" BendType.
- The APDPaths imported from Cadence APD/Allegro files via **File** > **Import** > **Cadence APD/Allegro/SiP**, and the APDPaths stored in old adsn files, are regarded as lines with "Round" CapType and "Round" BendType.
- To change a path Type to "Cadence APD/Allegro:APDPath", change the path Type to "line". Then set the CapType and BendType to "Round".

Scripting

- Any scripting command that converts any kind of path to APDPath, converts the target path to a line with "Round" CapType and "Round" BendType.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Any scripting command that converts Bend Type of a line to "Mitered" or "Curved", converts the BendType of target line to "Corner".

Specifying Line Ending Types

HFSS offers independent CapType settings for specifying the start and end of lines with new trace rendering.

- There are two separate properties for specifying the ends of a line: "**StartCapType** " and "**EndCapType** ".
- You can set **EndCapType** as "Same as Start", and the **EndCapType** is binded to **StartCapType**.
- If you change **StartCapType** to Extended, the end cap type also changes to Extended.

Text Styles

Text Styles opens the **Text Styles** window. The window specifies the fonts to use on the various layers. The following subsections provide guidelines to use when assigning a font.

System and Plotter Layers

A font must support mirroring, rotation, and scaling to be capably rendered on a photoplotter. There are two categories of layers as they relate to the ability to plot a font.

System Layers

System Layers text does not need to be plottable. The stackup, service, and user layers are system layers.

Plotter Layers

Plotter Layers text must be capable of being plotted. All layers that are not system layers are plotter layers.

Stroke and TrueType Fonts

There are two categories of fonts:

- **Stroke** — (Hershey) fonts can be mirrored and rotated. A stroke font can be scalable or nonscalable. To indicate a Stroke font, select its **Stroke Font** check box in the **Text Styles** window.
- **TrueType** — (Win) fonts cannot be mirrored, rotated, or scaled. To indicate a TrueType font, leave its **Stroke Font** check box unchecked in the **Text Styles** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Scalable and Nonscalable Fonts

- **TrueType** fonts cannot be scaled (enlarged or shrunk in size). The height of a TrueType font is always specified in points.
- A **Stroke Font** can be scalable or nonscalable. To indicate that a stroke font is scalable, specify its height in the current units (e.g., cm). The height of a nonscalable stroke font is specified in points.

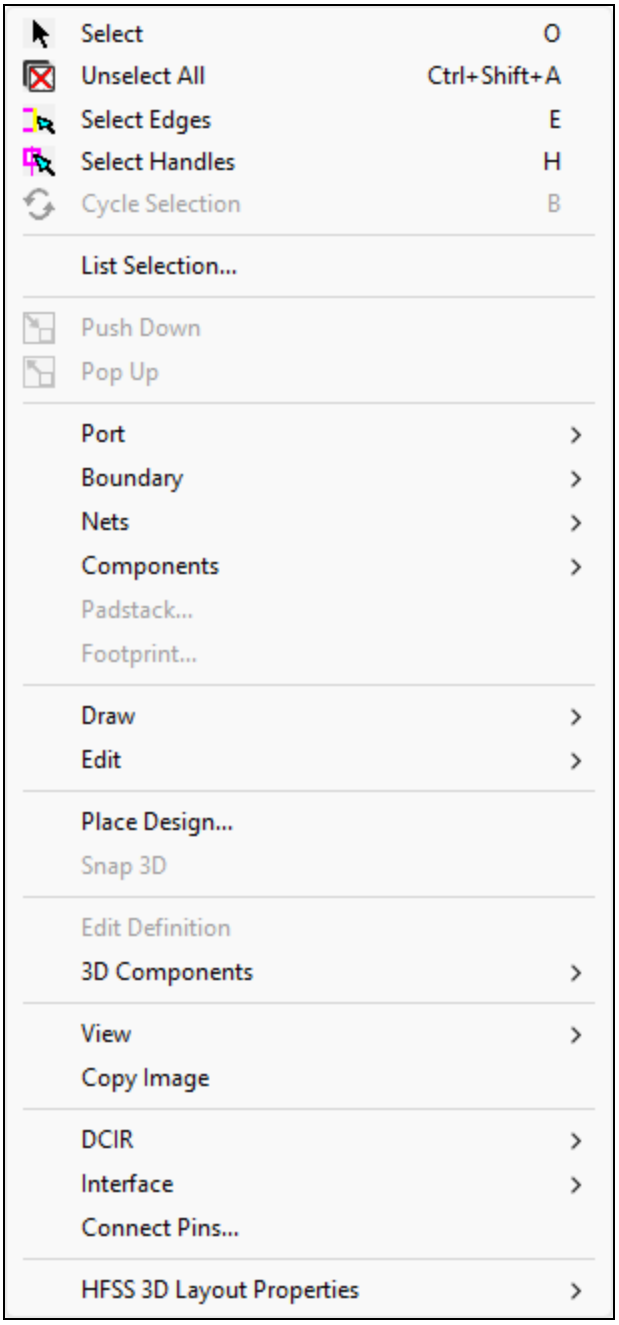
Font Requirements for System and Plotter Layers

- A text style for **System Layers** must be nonscalable (height specified in points). The font can be either a TrueType or a Stroke font.
- A text style for **Plotter Layers** must be scalable (height specified in the current units). Scalability is available only with Stroke fonts. Stroke fonts can also be mirrored and rotated (features which are also required to plot a font.

Layout Editor Context Menu

When a **Layout Editor** design is active, right-click in the design to open the **Context Menu** menu. There are multiple varieties of this menu depending on the type of design being edited (Circuit, HFSS 3D Layout, etc). The following descriptions are a superset of the commands that may appear on the **Context Menu** menu, though they may appear in different order on the menu than the order in which they are presented here. For more information, search the Help or use the Help Index to find information on any of the commands that appear on the **Context Menu** menu for the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Select — sets cursor mode to selection of objects.

Unselect All — unselect all objects in the layout.

Select Handles — sets cursor mode to selection of object handles.

Select Edges — sets cursor mode to selection of object edges.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cycle Selection — cycle selection of two or more objects that overlap. Each time you click Cycle Selection, a different one of the overlapping objects is selected.

List Selection — Opens the **Design List** window.

Push Down — switches the active CS to the next lower level.

Pop Up — switches the active coordinate system (CS) to the next higher level. Relative CSs can be created within other relative CSs to form multiple relative levels.

Snap to Nearest Signal Layer — snaps the selected object to the nearest signal layer. Enabled when the active selection is a layout subdesign object.

Port — opens a drop-down menu containing commands for operating on ports.

Boundary — choose to **Create PEC**, **Create RLC**, or **Remove** a boundary.

Nets — opens the **Layout Editor** Nets drop-down menu.

Components — choose to **Create** or **Dissolve** a component.

Padstack — opens the **Edit Padstack Definition** window. Enabled when the active selection includes a padstack.

Footprint — opens the **Footprint Editor**. Enabled when the active selection includes a footprint.

Draw — opens the **Layout Editor** Draw drop-down menu.

Edit — opens the **Layout Editor** Edit drop-down menu.

Place Design — opens the **Place Design** window. Select two components to activate.

Snap 3D — after selecting a 3D component, select to change the component's 3D origin to the electrical connection point (for pins or vias) or the center of the Layout geometry or edge, in the absence of an electrical connection point.

Edit Definition — creates a separate, editable version of the selected component.

3D Components — opens a drop-down menu containing commands for rotating or restricting the orientation of a selected 3D component.

View — opens the **Layout Editor** View drop-down menu.

Copy Image — create a global copy of the selected objects on the clipboard for pasting into a different application.

DCIR — opens a drop-down menu containing DCIR elements to add to a design (i.e., **Voltage Source**, **Current Source**, **Terminal** and **Voltage Probe**). The same elements are available from the **Layout** ribbon.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Interface — opens a drop-down menu containing interface ports and ground point to add to a design (i.e., **Create Interface port**, **Create Ground**, **Add Interface Ports at Unconnected Pins** and **Add Grounds at Unconnected Pins**). Interface ports/grounds are also available from the **Layout** ribbon.

Connect Pins — after selecting one component and one subdesign (or a subdesign close to a component with matching pins), opens the Pin Connectivity window.

Activate — causes the activation of one or more selected components.

Deactivate (Open) — temporarily converts the component into an open circuit. Activate restores a deactivated component to the circuit.

Deactivate (Short) — temporarily converts the component into a short circuit. Activate restores a deactivated component to the circuit.

IC Mode Commands

The following options appear when the IC mode environment is active.

List Selection — Opens the **Design List** window.

Port — opens a drop-down menu containing commands for operating on ports.

Boundary — choose to **Create PEC**, **Create RLC**, or **Remove** a boundary.

Nets — opens the **Layout Editor**Nets drop-down menu.

Components — choose to **Create** or **Dissolve** a component.

Padstack — opens the **Edit Padstack Definition** window. Enabled when the active selection includes a padstack.

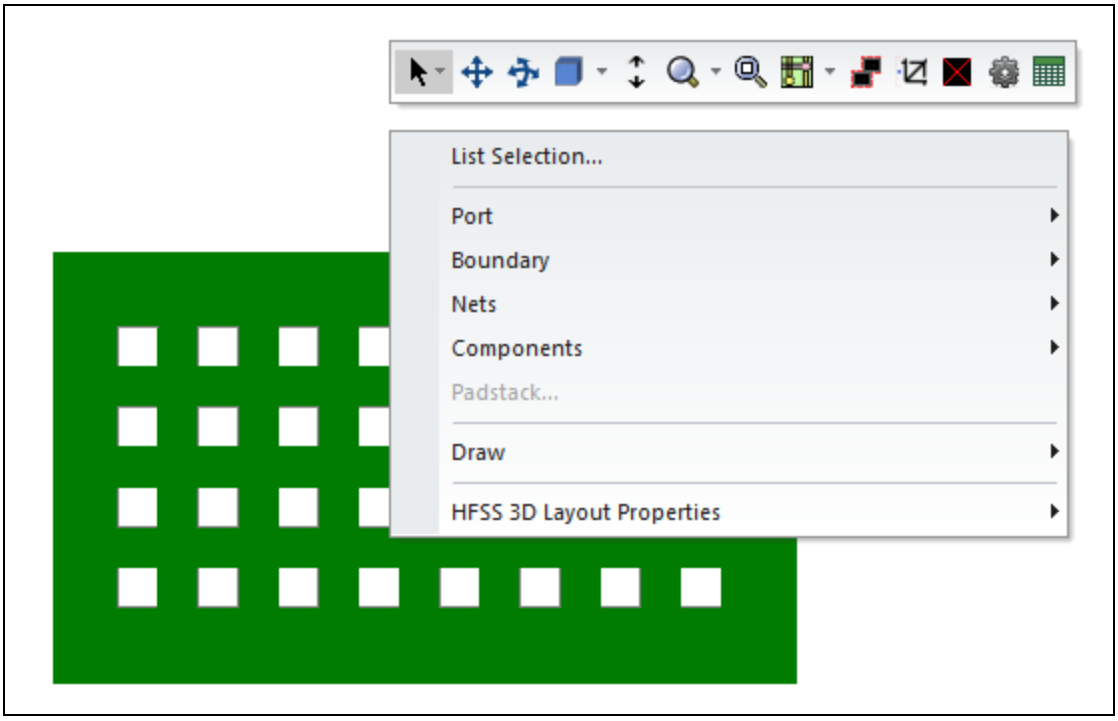
Draw — opens the **Layout Editor** Draw drop-down menu.

HFSS 3D Layout Properties — opens a drop-down menu that allows you to define HFSS 3D Layout Properties.

Shortcut Ribbon (IC Mode)

The shortcut ribbon is unique to IC mode. Right-click anywhere in the Layout Editor to view an additional toolset atop the expected shortcut menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The shortcut ribbon provides quick access to a variety of features, which differ depending on whether an element in the **Layout Editor** is currently selected.

Shortcut Ribbon Buttons - No Selection

- **Select** - choose from applicable selection modes (i.e., **Select**, **Select Edge**, **Select All**, **Unselect All**, and **Cycle Selection**). Refer to Selection Modes in the Layout Editor.
- **Pan** - **Click+hold** and drag to move around on the **Layout Editor**. Refer to Panning the View.
- **Rotate** - **Click+hold** and drag to rotate the **Layout Editor** along the X, Y, and Z axes. Refer to Rotating the View.
- **Reset orientation** - reset the current view to several default orientations (i.e., **Top**, **Bottom**, **Left**, **Right**, **Front**, **Back**, **Trimetric**, **Dimetric**, and **Isometric**). Refer to Apply an Orientation to the Current View.
- **Stretch Z** - opens the **Set Layer Thickness Scale Factor** window, which allows users to change layer thickness, or check the **Dynamic** box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Dynamic zoom** - choose from several modes (i.e., **Zoom**, **Zoom Area**, **Zoom In**, **Zoom Out**, and **Previous Zoom**), then **click+hold** and drag to scale the **Layout Editor** accordingly. Refer to Zooming In and Out.
- **Fit All** - reset the current view and zoom modes to best view all of the design elements at once. Refer to Fitting All Objects in a View Window.
- **Display Mode** - choose from several display modes (i.e., **Display Default** maintains current transparency settings, **Display Sketch** adjusts to display a wireframe of the design, **Display Solid** maintains the wireframe settings per layer).
- **Wrap Geometry** - all geometry elements are compared to the set **Tolerance**. Every element that meets or falls within the value is wrapped. Refer to Wrap Geometry in IC Mode.
- **Remove small metal islands** - all elements of the design are compared to the set **Tolerance**. Any piece of metal the same size or smaller than the set value is removed from the design. Refer to Removing Small Islands in IC Mode.
- **Settings** - opens the **Geometry Simplification Settings** window, which gives user access to most of IC mode's unique settings. Refer to The Geometry Simplification Settings Window.
- **Layout list** - opens the **Design List** window, displaying all of the designs current primitives (i.e., via the **Layout** tab) and nets (via the **Nets** tab).

Shortcut Ribbon Buttons - Selection

- **Group Vias** - choose from four methods to group the selected vias (i.e., **Persistent**, **Non-Persistent**, **Combine**, and **Dissolve**). Refer to Via Grouping in IC Mode.
- **Snap Vias** - align the selected vias. Refer to Via Snapping in IC Mode.
- **Snap Primitives** - align the selected primitives. Refer to Primitive Snapping in IC Mode.
- **Wrap Geometry** - all geometry elements are compared to the set **Tolerance**. Every element that meets or falls within the value is wrapped. Refer to Wrap Geometry in IC Mode.
- **Remove small metal islands** - all elements of the design are compared to the set **Tolerance**. Any piece of metal the same size or smaller than the set value is removed from the design. Refer to Removing Small Islands in IC Mode.
- **Settings** - opens the **Geometry Simplification Settings** window, which gives user access to most of IC mode's unique settings. Refer to The Geometry Simplification Settings Window.
- **Fit All** - reset the current view and zoom modes to best view all of the design elements at once. Refer to Fitting All Objects in a View Window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Zoom to selection** - reset the current view and zoom modes to best view the selected design element.
- **Show Physically Connected Filtering** - every element physically connected to the selected element is immediately highlighted. Refer to Viewing Physically Connected Elements in IC Mode .
- **Erase** - remove the selected element from the design.
- **Flatten Component** - flatten the heiarchy of the selected components.
- **Union** - combines selected polygons, removing internal boundaries.
- **Subtract** - remove all selected polygons except the first placed, as well as all parts of the original polygon that were intersected.
- **Intersection** - remove all selected polygons except for the intersecting region.
- **Duplicate the selected items along a line** - create a copy of the selected component on either the same layer or across multiple layers (i.e., select either **In Layer** or **Across Layers...**.
- **Convert Polygons to Circles** - selected polygons are compared to the set **Minimum Area Ratio**. Every polygon that meets or falls within the value is formed into a circle. Refer to Convert Polygons to Circles.

Layout Windows

The following topics describe the windows available for viewing and editing configuration settings in the Layout Editor.

Merge Layers Window

When a component or object that has a footprint is placed in the layout or in a schematic, HFSS must map the layers in the component object to the layers that have been defined for the design.

- In a mapping, each layer in the component is either merged with an existing layer in the design or inserted as a new layer in the design.
- The mapping is controlled by the **Merge Layers** window. You can specify (with the “Always Show Layer Merging window” Layout Editor option; see Layout Editor Options) the **Merge Layers** window is to be displayed every time a component is placed (the default), or you can have the window display only when mapping of layers cannot be done automatically.
- Automatic mapping can be performed when the design has no layers defined; in this case, all the layers in the component can be inserted as new layers in the design. Automatic mapping is also possible when there is only one choice available for merging layers (e.g., if you have selected the “Top” signal layers as the active layer in the layout , then place a microstrip component (which has only one signal layer associated with it), HFSS maps the object layer to the active layer. If the “Always Show Layer Merging window” option has been deactivated, the automatic mapping is performed and no window appears.).

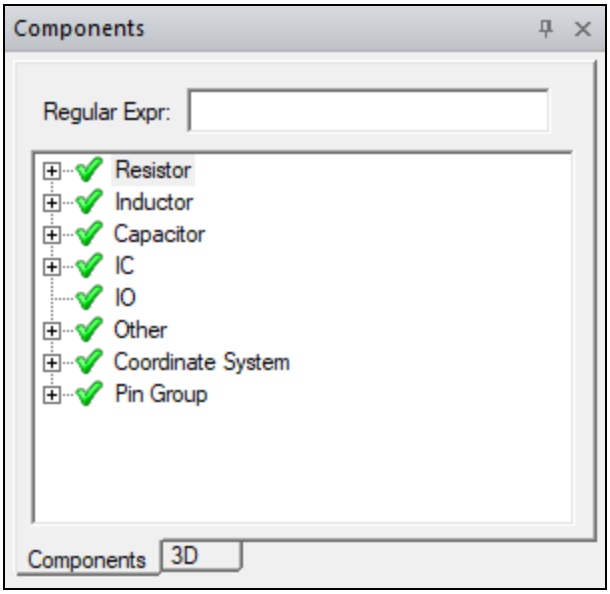
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- When automatic mapping is not possible or when automatic mapping has been deactivated by turning on the “Always Show Layer Merging window” option, the **Merge Layers** window appears after a component has been selected but before it can be placed in the layout or schematic.
- The window shows the object layers on the left and the design layout layers on the right. From the preceding example, the object has just one layer (Top) while the layout has three layers (Trace, Dielectric, and Ground).
- When an object layer is adjacent to a layout layer (e.g., the Top and Trace layers), the **M** button is displayed, and the layers are merged.
- When an object layer is adjacent to a blank cell on the layout, the **I** button is displayed, and the object layer are inserted.
- Clicking on an **M** or **I** button toggles the layer between the Merge state and the Insert state. An error occurs if you try to change an Insert layer to a Merge layer when no layers are free for merging.
- **Click+drag** an object layer to a different vertical position. Changing position retains the Merge or Insert state. If an Insert layer is dragged, the layout layers rearrange to leave an empty cell adjacent to the Insert layer. If a Merge layer is dragged, it snaps adjacent to the nearest free layout layer.
- Check the **Flip Source Layers** area to invert the order of the object layers (the order of the layout layers in not changed) (e.g., use this operation can be used to match the layers of a soldered-on object (signal, solder, assembly) on the top to the bottom of a two-sided board).
- When the layer mapping is set up as selected, click **Merge Layers** to execute the mapping. The component is now attached to the cursor for placement in the layout or schematic.
- Clicking **Cancel** cancels the placement of the component.

Working with the Components Window

The **Components** window is a dockable window that is used to view and configure various component settings for Layout components. Use the **Components** window to select a component or a component class, add ports to a component, and configure multiple ports across components. You can also select multiple components in the Layout editor to configure pins and ports for each simultaneously. The window can be resized and relocated.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



To show or hide the **Components** window on the desktop, click **View** > **Components**. A check box appears next to the command if the **Components** window is visible.

With a component selected, the following configuration controls are available from the right-click menu:

- **Type** – reclassifies the component type to **Resistor**, **Inductor**, **Capacitor**, **IC**, **IO**, or **Other**.
- **Enable**/**Disable** - enables or disables the component.
- **Model** – opens the Component Model window, where you can change the component model definition, including die, solder ball, and port properties. Changing the model scope will update every reference designator that belongs to the model definition.
- **Create Ports on Component** – adds ports for the component
- **Remove Ports on Component** – removes ports for the component.
- **Fit Selected** – fits the selected component in the active view window.

> **Note:** When a component classification is selected, any changes are applied to all components within the class.

For more information, see Layout-based Component Encapsulation.

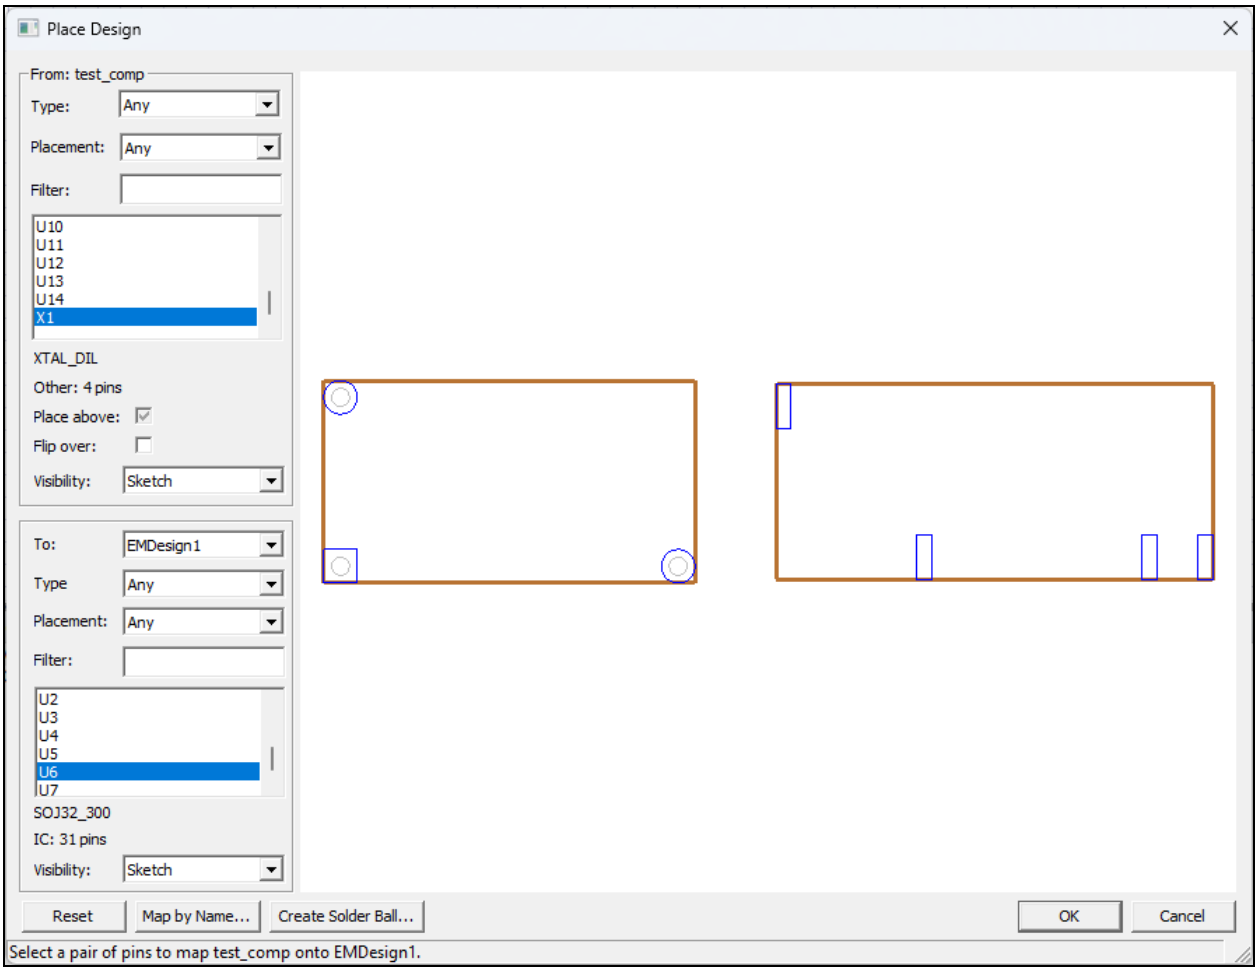
Place Design Window

The **Place Design** window configures how a layout component or a subdesign is positioned within an HFSS 3D Layout design. Use this window to capture or merge the relative positioning

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

of one component or design to another. To open the **Place Design** window, select a component or subdesign along with the component it connects to. Then right-click in the **Layout Editor** and select **Place Design**, or navigate to **Layout** > **Place Design**. The **Place Design** window opens with one or two pairs of pins pre-selected in the preview window adjacent to the parameter drop-down menus.

> **Note:**
>
> If the selected component is fully encrypted and contains exposed components or component groups, the **Place Design** window displays a list of these components/groups. If no component/groups are exposed, the list is empty. Fully encrypted components cannot be edited. Their exposed components are permanent.



Filters and Orientation

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

From: the component or subdesign being positioned. The component **To** is what the component/subdesign is being connected to. Both panes contain controls that allow the user to filter and orient components. Make *no* selections to see all components. The following settings are available to configure:

- **Type**: Filter by component type (i.e., **Any**, **IC**, **IO**, **Resistor**, **Capacitor**)
- **Placement**: Filter by placement layer. The list shown is specific to its model. The filter includes **Any** plus all stackup layers in the model (e.g., **Any**, **TOP**, **GND**, et cetera).
- **Filter**: Field where users can filter components by name. Components with the specified **Name**, **Type**, and **Placement** layer are displayed in the list box.
- **Place above**: Controls whether the component/subdesign is placed on and connects to the top layer of the **To** component. The control's default adjusts based on the selected components. This control is not available in the Footprint editor.
- **Flip over**: When checked, this control flips the component/subdesign along the X axis , then rotates it to correctly map the pins of the **To** component. The control's default adjusts based on the selected components. This control is not available in the Footprint editor.
- **Visibility**: Determines how the components are rendered in the window.

> **Note:**
>
> HFSS 3D dynamic link components/subdesigns are not yet linked to components, so a **Port Plane** drop-down menu is shown instead of the component filter controls. A list is displayed showing the port instances in the selected port plane. The **Port Plane** drop-down menu can be used to filter port instances to a specific z plane (or **Any** can be selected to show all port instances). Port instances may be selected in the listbox or graphically selected in the previewer.

Preview Window

A preview of the component/subdesign placement is displayed. As pin pairs are selected, the preview is updated to show the new placement.

Mouse operations are supported similar to the main layout window:

- **Shift**+**click** and drag to move
- **Ctrl**+**Shift**+**click** and drag to zoom in/out
- **Ctrl**+**click** and drag to rotate
- **Ctrl**+**click** to rotate to predefined angles

A shortcut menu on the previewer provides additional controls.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **From** component/subdesign can be dragged. When selected in plane, it can also be rotated with the handle that appears. Manual dragging/rotating is only used to assist pin pair selection in the previewer and doesn't actually impact placement once the window is closed.

Reset reverts to the initial preview orientation/placement

Map By Name

Upon opening the **Map by Name** window with the corresponding button, the design is automatically placed by any matching pin pair names (using the full name, net name, and/or suffixes). Users can manually select pin names from the list boxes. The preview in the main window updates as pins are selected in the **Map by Name** window.

Create Solder Ball

Click **Create Solder Ball** to add and configure solder balls to the pins of the **From** component that connect to the **To** components.

Pin Connectivity Window

The Pin Connectivity window is used to connect (or disconnect) components, ECAD and MCAD subdesigns, and symbolic footprints. The Pin Connectivity window is often useful after placing a subdesign with the Place Design window.

Connectables (port instances, pins, and pin groups) are connected between the two selected objects; the first selected object is displayed on the left and the second on the right. When a connection is formed, the left side of the connection's net is updated to the net of the right side of the connection. The net connections are shown as lines drawn on the Rats layer. Connections can be automatically formed by proximity and/or by name. The Place Design window can be used to place a subdesign so that many connections can automatically be formed by proximity.

Basic Usage

1. Open the Pin Connectivity window using one of the following methods:
   - Make two selections (e.g., a subdesign and a component), then select **Connect Pins** on the Layout menu or the shortcut menu
   - Select a subdesign that has already been placed onto a component. The **Connect Pins** window automatically opens if a component is sufficiently close.
2. Manually connect using the right and left arrow buttons:
   - After making a left and right selection, click the right arrow to connect them.
   - Select a grid row and click the left arrow to disconnect.
   - Multiple rows can be selected in the grid to connect/disconnect multiple at once.

Controls

Previewers — Multiple preview panes graphically show the selections being connected:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The left previewer is for the first selection and the right previewer is for the second selection.
- Clicking a port instance, pin, or pin group highlights the corresponding item in the list box or grid (and vice versa).
- Mouse operations are supported in a manner similar to the main layout window:
  - **Shift** +**drag** to move
  - **Ctrl** +**Shift** +**drag** to zoom in/out
  - **Ctrl** +**drag** to rotate dynamically linked HFSS 3D subdesigns
  - **Ctrl** +**click** to rotate to predefined angles for dynamically linked HFSS 3D subdesigns
  - **Ctrl** +**click** to select multiple pins in the component
  - shortcut menu to Zoom In, Zoom Out, or Fit All
- In general, visibility/display settings from layout transfer to the previewer, except:
- HFSS 3D subdesign symbols layer is always displayed.
- 2.5D subdesigns and components are always drawn in solid mode.

List at Left — Shows the left-preview connectables:

- Connectables that are used in one or more connections are displayed in gray.

Connection grid at right — Shows the left-right connections:

- Any connectables in the <Power/Ground> net classification are displayed in red.

Connect by Proximity — automatically connects overlapping connectables:

- Connectables overlapping tolerance depends on the zoom level and the snapping pixel setting. They must also be close in z/layer positions.
- If only a subset of the connections is selected, it may be useful to first click **Connect by Proximity**, then multi-select those rows not selected to be connected and click the left arrow to disconnect them.

Connect by Name — forms connections between left and right connectables that have a matching name or suffix.

Configuration, shortcuts, and additional notes

- Automatic pop-up
- If automatic pop-ups are enabled:
  - When dragging a subdesign onto a component, the Pin Connectivity window automatically appears (if a component is sufficiently close)
  - Place a subdesign in the Place Design window to open the Pin Connectivity window.
  - whether a component is considered "sufficiently close" depends on whether pins/ports overlap.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- By default, the Pin Connectivity window never appears.
- For new designs, the setting is specified via **Tools > Options > General Options > Layout Editor > Other > Show Pinconnectivity window on drag to matching component**.
- For the active design, the setting is specified in **Layout > Setting > Layout Editor > Other > Show Pin connectivity window on drag to matching component**.
- If the Pin Connectivity window automatically pops up, the "Connect by Proximity" feature is automatically triggered.
- Double-clicking a port instance row connects it to the selected connection grid pin.
- Double-clicking a connection grid row highlights any connected port instance.
- [Net]: the net shows in brackets.
- To disconnect all:
  - From the Pin Connectivity window, select all the rows in the grid (select the first row then hold the shift key while selecting the bottom row). With all grid rows selected, click the left arrow.
  - In layout (outside of the Pin Connectivity window), select a subdesign then click **Draw > Disconnect from Net**.

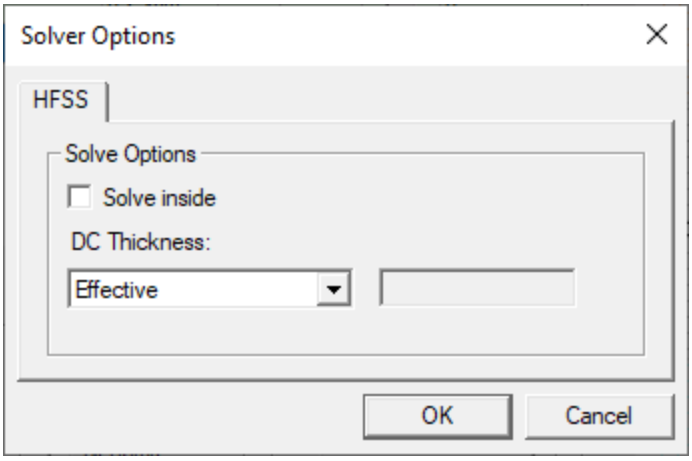
Solver Options Window

Configure solver options on the **Solver Options** window.

Follow these steps to reach the Solver Options window.

1. Navigate to and select **Layout** > **Layers** to open the **Edit Layers** window.
2. Choose **Select signal** from the drop-down menu to enable the options in the **Analysis** area.
3. Check the **Solver** check box to enable **Solver** .
4. Click **Solver** to open the **Solver Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



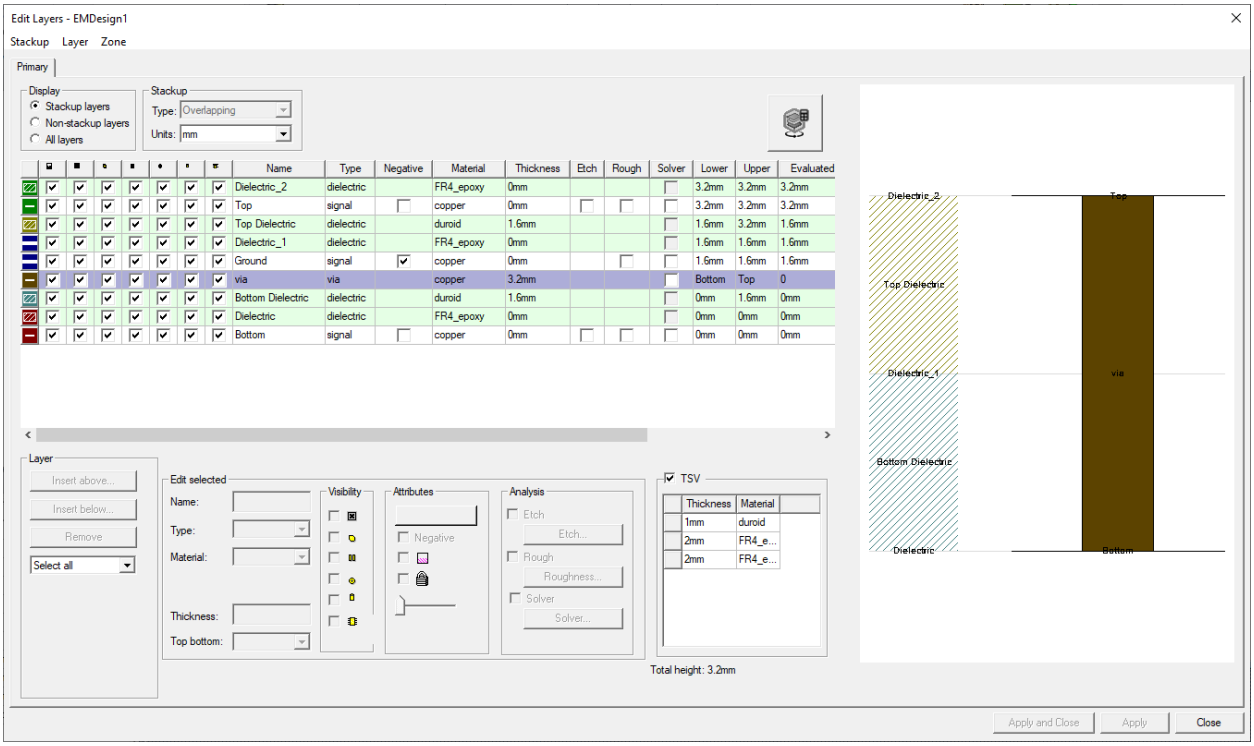
5. Make selections from the following options:

   - **Solve inside** — enables all objects in the layer to have "solver inside" attribute for HFSS solver. It is possible to perform solve inside on an object-by-object basis. See HFSS 3D Layout Properties for more information.
   - **DC Thickness** — Controls how DC thickness is calculated for the conductor lumps on the layer.
     - **Effective**: Calculates as twice the volume/surface area
     - **Layer**: Use layer thickness
     - **Manual**: Use user specified value

The Edit Layers Window

A stackup is a list of physical layers in a circuit board. It can be laminated, overlapping, or multizone. The layers of a stackup are configured in the **Edit Layers** window which contains information about both the stackup layers and the non-stackup (i.e., non-physical) layers. The **Edit Layers** window describes the type, properties, visibility, attributes and analysis of each layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



To open the **Edit Layers** window, do one of the following from the **Layout** tab.

- From the **Layout** ribbon, select **Layers dialog**.
- From the **Layout** or **Footprint** menu, select **Layers** .
- Right-click in the **Layout Editor** and select **Edit Layers**.

The **Edit Layers** window is divided into the following group boxes.

- **Display** – choose which layers appear in the table (e.g., Stackup layers, Non-stackup layers, or All layers).
- **Stackup** – select the Type (e.g., Laminate, Overlapping, Multizone [Beta]) and Units (e.g., centimeters, millimeters, meters, etcera) displayed in the Grid Control Table.
- **Grid Control Table** – view type, properties, visibility, attributes and analysis of each layer
- **Layer** – Insert a new layer above or below, remove a layer, or select either all the Remove, pane adds, removes, and selects types of layers.
- **Edit selected** – After selecting a layer in the Grid Control Table, edit the layer's Name, Type, Material, Thickness, and Top bottom attributes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Visibility** – After selecting a layer in the Grid Control Table, edit the layer's Name, Type, Material, Thickness, and Top bottom attributes.
- **Attributes** – After selecting a layer in the Grid Control Table, edit the layer's Name, Type, Material, Thickness, and Top bottom attributes.
- **Analysis** – After selecting a layer in the Grid Control Table, edit the layer's Name, Type, Material, Thickness, and Top bottom attributes.
- **TSV** – Activate and deactivate TSV layers.

> **Note:**
>
> If the **TSV** area does not appear, ensure a via layer is selected or reselected in the Grid Control Table. To create a via layer, refer to **Via Layers**.

- **Stackup Viewer** – Displays a diagram of the layers.

When the **Edit Layers** window opens, it displays the current type of stackup and its most recent display options.

All of the **Edit Layers** window's functionality appears on its **Primary** tab, unless the stackup is multizone. A multizone stackup has a tab for each zone with its controls are spread across the tabs.

From this window, you can import a stackup from an XML file and export an existing stackup to an XML file. Also use the Layer Stackup Wizard.

Stackup Type

AEDT offers three types of stackups in the **Type** drop-down menu:

- Laminate: all layers physically stack one another with no overlap on the Z-axis. This is the default type.
- Multizone: layers physically stack on one another in the Z-axis but each layer can have zones made of different or no material.
- Overlapping: layers can physically intersect one another in the Z-axis.

The **Edit Layers** window offers different controls bases on what the type of stackup. It is generally possible to switch between stackup types. When that cannot happen, the **Type** drop-down menu becomes unavailable.

Display Options and Units

The **Edit Layers** window can display **Stackup layers**, **Non-stackup layers**, or **All layers** in the **Grid Control** pane.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

All measurements in this window use the same units. These units are set in the **Units** drop-down menu in the **Stackup** pane. The default is millimeters. Your choice of **Units** affects the physical layers' thickness and elevations.

Grid Control Pane

The **Grid Control** displays the physical and non-physical layers, as determined by the **Display** radio buttons. Layers are color coded:

- Blue: highlighted
- Gray: locked
- Green, light: dielectric layer
- Green, dark: active dielectric layer
- Pink: divider between physical and non-physical layers
- White: signal or non-physical layer
- Yellow: active signal or non-physical layer

A variety of columns allow users to see and edit information about each layer. What can be seen and edited varies by type of layer and stackup. Some columns are hidden by default. Right-click the column labels of the Grid Control pane to see a complete list of columns. If a column does not apply to a layer, it is blank in that layer's row. Thus many columns are empty for non-physical layers.

The Grid Control pane's shortcut menu provides actions for the selected layers. A new layer can be inserted, or the selected layer can be activated. A layer can be locked in place or assigned to a specific zone in a multizone stackup. If multiple dielectric layers are selected, they can be merged.

Grid Control Columns

- **Row Color/Type Icon**: This matches what is shown for the layer in the **Layout Editor**. Clicking this cell to select the row.
- **Wireframe**: Check box to set drawing on the layer as wireframe outlines or solid.
- **Visibility settings**: Controls what is visible on each layer. The visibility settings determine what types of objects are shown on a layer. Similar settings are in the Layers window.
  - **Visibility** - Sets visibility for all objects on the layer
  - **Shape visibility** - Sets visibility for shapes on the layer
  - **Line visibility** - Sets visibility for lines on the layer
  - **Pad visibility** - Sets visibility for padstack pads on the layer
  - **Hole visibility** - Sets visibility for padstack holes on the layer
  - **Component visibility** - Sets visibility for components and black boxes placed on the layer
- **Name**: Editable name of the layer

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Type**: Editable type of the layer. Choices are given in a drop-down menu that varies for stackup and non stackup layers. Ground is no longer a layer type choice. To create what was previously described as a ground or metalized signal layer, set the type to signal and the **Negative** state on.
- **Negative**: Type of geometry to draw on the layer. Geometry on a negative layer cuts away on the layer. Geometry on a positive layer adds to it. This setting is used in conjunction with the signal type to create a layer used as a ground layer. This column is visible if the stackup contains a layer set to negative. Hidden by default.
- **Material**: Editable choice of material for the layer. The drop-down menu contains names of materials already in the project that are allowed for the given type of layer. The first choice in the menu is **Edit**, which allows users to open the **Materials** tab of the **Select Definition** window. Users can type in a project variable that is a text array reference. This allows parameterization of the material (e.g., there is a project array variable $mat that is defined to have the strings "copper" and "Cu_Pkg" and there is a project array $i defined as 1. The user may set the material for a layer to be $mat[$i]. The material used are copper.).
    - **Dielectric Fill** - specifies the material to use to fill in around geometry on the layer. The dielectric material can be selected in the same way that layer material is selected. Hidden by default and not available for overlapping stackups.
    - **Dielectric Constant** - Hidden by default.
    - **Loss Tangent** - Hidden by default.
- **Thickness**: Editable thickness of the layer. It can contain variables or expressions.
- **Evaluated Thickness**: the calculated value of the thickness. Hidden by default.
- **Top Bottom Association**: Allows users to set top bottom association for the layer. Hidden by default.
- **Etch**: Allows etching on signal layers.
- **Rough**: Allows roughness on signal layers.
- **Solver**: Enables the use of specified solver options. Solver options are available for signal and dielectric layers.
- **Lower**: In an overlapping stackup, the lower elevation of signal layers can be user-defined with a number, variable, or expression. The lower elevation of dielectrics is displayed, but not editable.
- **Upper**: Contains of the upper elevation of the layer based on the lower elevation and the thickness of the layer. It is not editable.
- **Lower elevation**: The calculated value of the lower elevation. This is useful if the **Lower** value contains a variable or expression.
- **Upper elevation**: The calculated value of the upper elevation. This is useful if the **Lower** value contains a variable or expression.
- **Pattern**: Fill pattern used on the layer. Hidden by default.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Transparency**: Transparency values lie between 0 (completely opaque) and 100 (completely transparent). Values may be entered directly into the column or using the **Attributes** slider bar. The slider bar may be used to adjust the transparency for multiple layers. Select multiple rows either directly or through the selection pull-down.

Layer Pane

From the **Layer** pane, you can insert a layer, remove layers, and select layers based on their type. These operations can affect multiple layers simultaneously.

Edit Selected Pane

The **Edit Selected** pane offers controls that can edit multiple layers simultaneously. Select the layers in the Grid Control pane or **Layers** pane first. Controls are only available for the layers to which they apply. A control duplicated by a Grid Control column is always visible, even if its column is hidden. The controls are:

Control	Also available in	Icon or Control
Name	Grid Control column	
Type	Grid Control column	
Material	Grid Control column	
Thickness	Grid Control column	
Top bottom	Grid Control column	
Visibility controls	Grid Control column and Layers window	
Layer color		(color may vary)
Negative	Grid Control column	
Wireframe	Grid Control column	
Transparency	Grid Control column	
Locked	Grid Control shortcut menu	
Etch	Grid Control column	
Rough	Grid Control column	
Solver	Grid Control column	

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

HFSS geometry allows for the presence of an etch factor in the design and modeling of different substrate layers. Check the **Etch** check box to use an etch factor when the mesh is created and check the **Etch** check box to set the etch factor.

By default, layers do not have roughness. To add surface roughness a layer, check its **Rough** column check box. The roughness is added to the layer when its mesh is created. For more information, see Setting the Layer Surface Roughness.

Signal layers may have solver options including Solve Inside Solver. Click the **Solver** check box in the **Analysis** pane to activate the solver options and the Solver button to open the Solver Options window.

Stackup Viewer

The Stackup Viewer is a 2D diagram that displays stackup layers. A column of dielectric layers is on the left with columns of signal and via layers on the right. Via layers are thinner than signal layers. The Stackup Viewer can be customized for useability, to show elevation lines separating signal and dielectric layers, to display only visible layers, and show or hide tool tips and layer names.

Each stratum has a name and color that corresponds to a layer in the Grid Control. Click on a stratum to select its layer in the grid. To show or hide layer names, right-click Stackup Viewer and click **Layer Names**. If layers in the stackup are hidden, they can be shown or hidden in the Stackup Viewer. Right-click the Stackup Viewer and click **Show Only Visible Layers**.

Strata are divided by elevation lines. The elevation lines for signal layers are dotted and for dielectric layers are solid. These lines may overlap depending on the type of stackup displayed. To show or hide the elevation lines, right-click Stackup Viewer, click **Elevation Lines**, then select the type of line.

The Stackup Viewer can be normalized for usability. Normalizing spaces dielectric layers evenly and normalizes the spacing of signal layers relative to the dielectric layers they overlap with. The normalized view emphasizes how the layers stack on one another, instead of the layers' relative size. Remove the normalization to view the layers in their proportional sizes. To use or deactivate normalization, right-click Stackup Viewer and click **Normalize**. You can zoom in on the diagram by using your mouse. To reset the zoom, right-click Stackup Viewer and click **Reset Zoom**.

When tool tips are activated, you can hover over a stratum to see its name, relative permittivity, relative permeability, and/or conductivity. To deactivate or activate tool tips, right-click Stackup Viewer and click **Tooltips**. The tool tips only appear if this option is active.

To save an image of the Stackup Viewer, right-click Stackup Viewer and click **Copy Image**. The image is copied to your computer’s clipboard.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Color, Visibility, and Patterns

The following topics describe the tools and operations available for configuring color, visibility, and patterns in the **Edit Layers** window.

Setting a Layer Color

When you specify the color of a layer in the stackup, the color is assigned to every object drawn on the layer.

To set the color of objects on a layer:

1. From the Edit Layers window, click the layer.
2. Use the color button in the **Attributes** pane to assign a color to the selected layer.
3. Click **OK**.The color you selected is assigned to every object drawn on the layer.

Setting a Layer Pattern

When you specify the pattern of a layer in the stackup, the pattern is assigned to every object drawn on the layer.

To set the pattern of objects on a layer:

1. From the Edit Layers window, the **Pattern** column is not visible by default; use the shortcut menu in the grid control to make the column visible.
2. From the **Pattern** column, double-click the pattern of the layer you want to change.
3. Select a pattern on the **Select Pattern** window.
4. Click **OK**.The pattern you selected is assigned to every object drawn on the layer.

Setting Layer Visibility

A layer must be visible to be drawn upon. But in each layer, set visibility by individual object types. Perform one of these steps to control layer visibility.

- From the Edit Layers window, use the icons available to select the layers you want to be visible.
- Use the shortcut menu of the **Layout Editor**:
  - **Set Active**: Makes the current layer the active layer
  - **Show This Layer Only**: Makes the current layer the only visible layer
  - **Show All Dielectrics**: Makes all Dielectric layers visible
  - **Hide All Dielectrics**: Makes all Dielectric layers invisible
  - **Show All Signals**: Makes all Signal layers visible
  - **Hide All Signals**: Makes all Signal layers invisible

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- click the **Layout Editor** to alter the following controls for setting visibility by layout-object type.

The following controls are available:

Controls the visibility of shapes

Controls the visibility of lines (paths)

Controls the visibility of pads

Controls the visibility of holes

Controls the visibility of components

Layout Technology

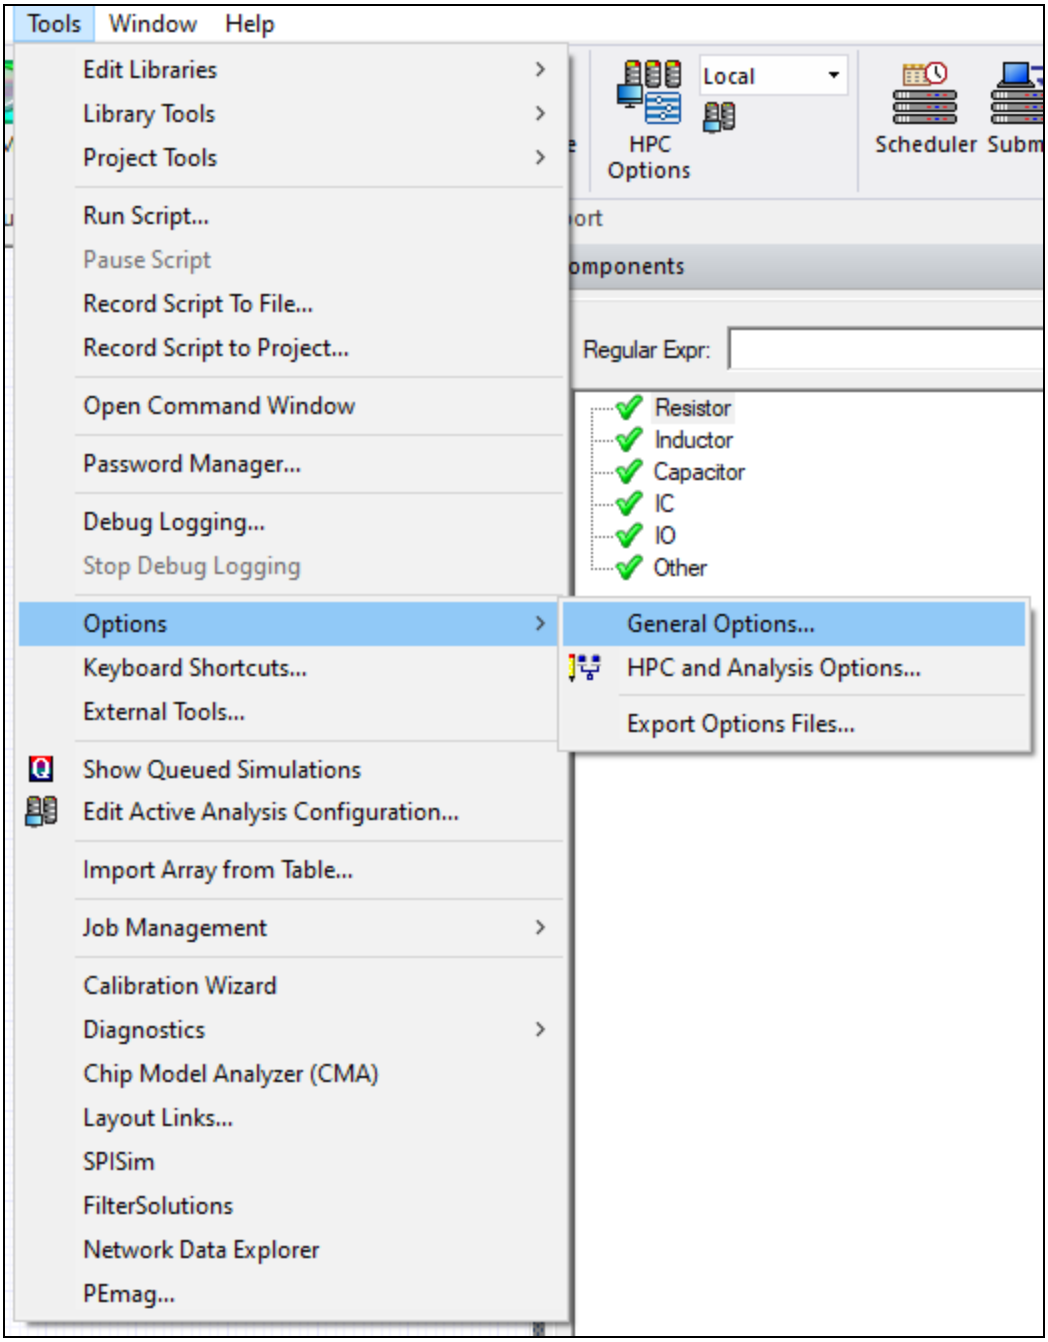
The following topics describe the tools and operations available for configuring layout technology in the **Edit Layers** window.

Choosing a Layout Technology

The Ansys Electronics Desktop (AEDT)^{TM} electronics systems design platform can associate a predefined stackup, (also called the substrate or technology), with each design. A technology includes stackup layers' material properties, units, thickness, elevation, and roughness data, and associated substrate definitions for Nexxim Circuit simulation. The current technology or substrate is applied to components defined for a design or copied in from other designs. Follow these steps to enable the **Choose Technology** window and then select a technology.

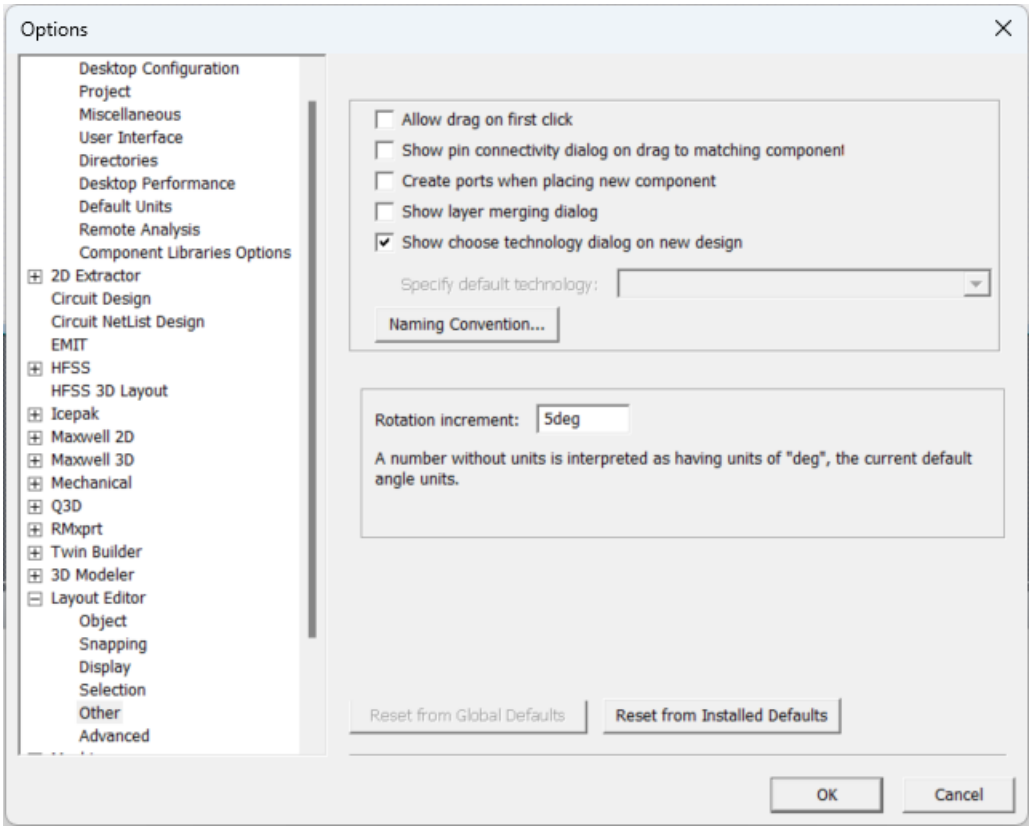
1. From the **Tools** menu, select **Options** > **General Options** to open the **Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



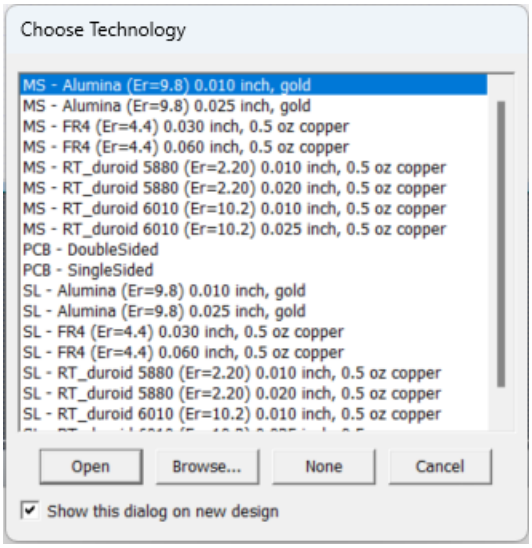
2. Expand **Layout Editor** and select **Other**. Then check the **Show choose technology dialog on new design** box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Click **OK** to close the **Options** window.
4. Insert a new design **HFSS 3D Layout** design in a project to open the **Choose Technology** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. Select the stackup technology on which the design are based. Select a technology, then proceed to design editing without selecting a technology, or abort adding a design to the project.
6. From the **Choose Technology** window, do one of the following:

- To use one of Desktop's predefined technologies, select its entry in the list, then click **Open**.
- To use an existing technology not shown in the list, click **Browse**. Through the explorer window, browse to and select the Ansys Technology *.asty* file, then click **Open**.
- To add a design without choosing a technology, click **None**.
- To select not to add a new design to the project, click **Cancel**.

7. When you specify a technology or click **None**, a blank design of the type you selected opens for editing

   All components that can use a substrate technology automatically assigns the technology you select for the design. This includes components added on the **Components** window and components pasted in from other designs. If no technology has been selected, no substrate is assigned to components.

   As a result, when a schematic from a project that has a substrate definition is copied into another project, the pasted schematic uses the substrate that is defined for the second project, if a substrate has been defined. If no substrate has been defined for the second project, the schematic elements are copied in with no substrate ("SUB" property is empty).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> To import a technology from a technology file, refer to Adding a Technology File to a Design (IC Mode only).

Creating a Layout Technology

You can create your own layout technology and save it for future use. After you have configured a technology in the Edit Layers window, on the **Project Manager** window, expand the **Project Tree**. Then select **[*Active Design Folder*]** and navigate to **File** menu > **Save as Technology File** to open an explorer window that allows you to save the technology in one of the Ansys Electronics Desktop (AEDT)™ electronics systems design platform library directories.

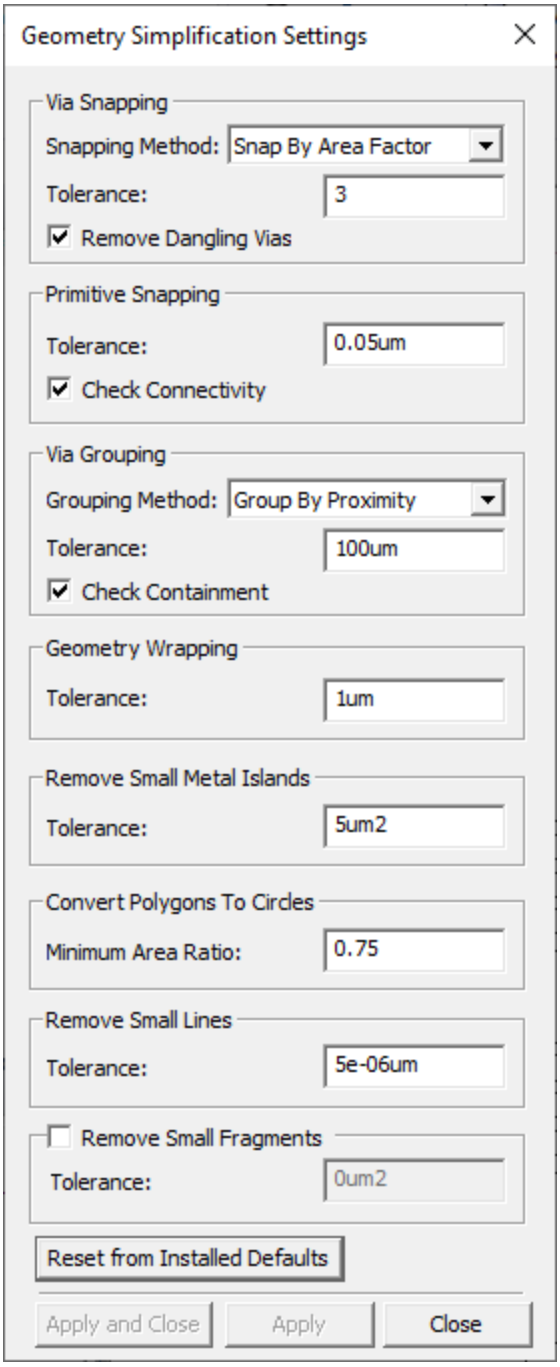
The technology file (.asty suffix) contains the definitions of substrates, layers, materials, padstacks, footprints, symbols, and scripts. The technology file also contains the settings of the Layout options (units, angle units, major and minor grid spacings, snap sources and targets, rotation increment, and hole size) that are in effect for the selected design.

The layout technology you defined is now available for future use and are listed in the **Choose a Layout Technology** window.

The Geometry Simplification Settings Window (IC Mode Only)

IC mode allows users many unique ways to simplify geometry simulations. Refer to the following instructions to open the **Geometry Simplification Settings** window and configure geometry paramaters.

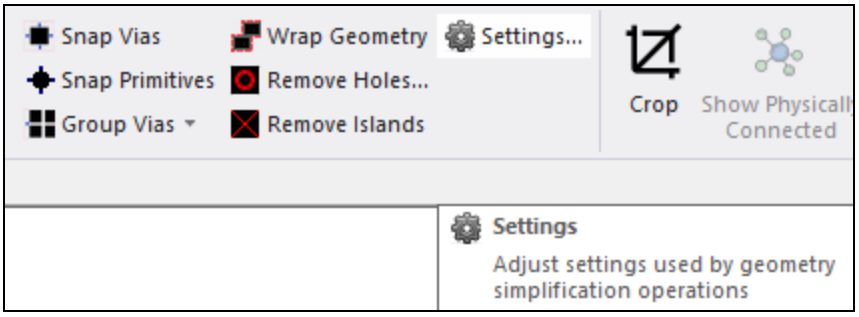
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Opening the Geometry Simplification Settings Window

To open the **Geometry Simplification Settings** window, navigate to the **Layout** tab and select **Settings**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



From the **Geometry Simplification Settings** window, users can adjust the following settings.

Via Snapping

1. Select a **Snapping Method** from the drop-down menu (**Snap By Area Factor** selected by default).
    - **Snap By Area Factor** - Via groups are snapped by a maximum area equal to the **Tolerance** times the surface area of the via group being snapped.
    - **Snap By Distance** - Via groups are snapped by a maximum distance of the **Tolerance**.
2. Enter a value in the **Tolerance** field (e.g., **3**).
3. Check the **Remove Dangling Vias** box to delete vias that have no connectivity or have connectivity only to a single layer (checked by default).

Primitive Snapping

1. Enter a value in the **Tolerance** field, including the unit of measurement (e.g., **0.05um**).
2. Check the **Check Connectivity** box to ensure snapping does not violate the connectivity of the original objects (checked by default).

Via Grouping

1. Select a **Grouping Method** from the drop-down menu (**Group By Proximity** selected by default).
    - **Group By Proximity** - Groups vias that are spaced similarly. Vias are not grouped if the distance between them exceeds the **Tolerance**.
    - **Group By Range** - Groups vias based on whether a potential member is separated by *no more* than the **Tolerance** from any other member.
2. Enter a value in the **Tolerance** field, including the unit of measurement (e.g., **100um**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Check the **Check Containment** box to detect and prevent electrical shorts (checked by default).

> **Note:**
>
> **Check Containment** analyzes the placement of via primitives. When the possibility of a short is detected, **Check Containment** splits the group to prevent a short.

Geometry Wrapping

Enter a value in the **Tolerance** field (e.g., **1um**).

Remove Small Metal Islands

Enter a value in the **Tolerance** field (e.g., **5 um^2**).

Convert Polygons To Circles

Enter a value in the **Minimum Area Ratio** field (e.g., **0.75**).

Remove Small Lines

Enter a value in the **Tolerance** field (e.g., **5e-06um**).

Remove Small Fragments

1. Check the **Remove Small Fragments** box to enable the feature.
2. Enter a value in the **Tolerance** field (e.g., **0um2**).

Snapping Vias in IC Mode

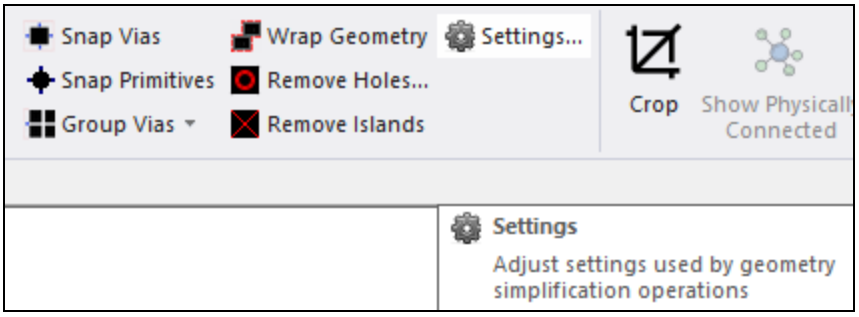
Via groups serve as an electrical connection between objects on different metal layers. Sometimes objects and via groups are misaligned by a small amount which can increase mesh complexity. Snapping via groups aligns the objects and via groups across layers.

Complete steps in the following subsections to configure **Via Snapping** settings, then snap (i.e., align) vias within a design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

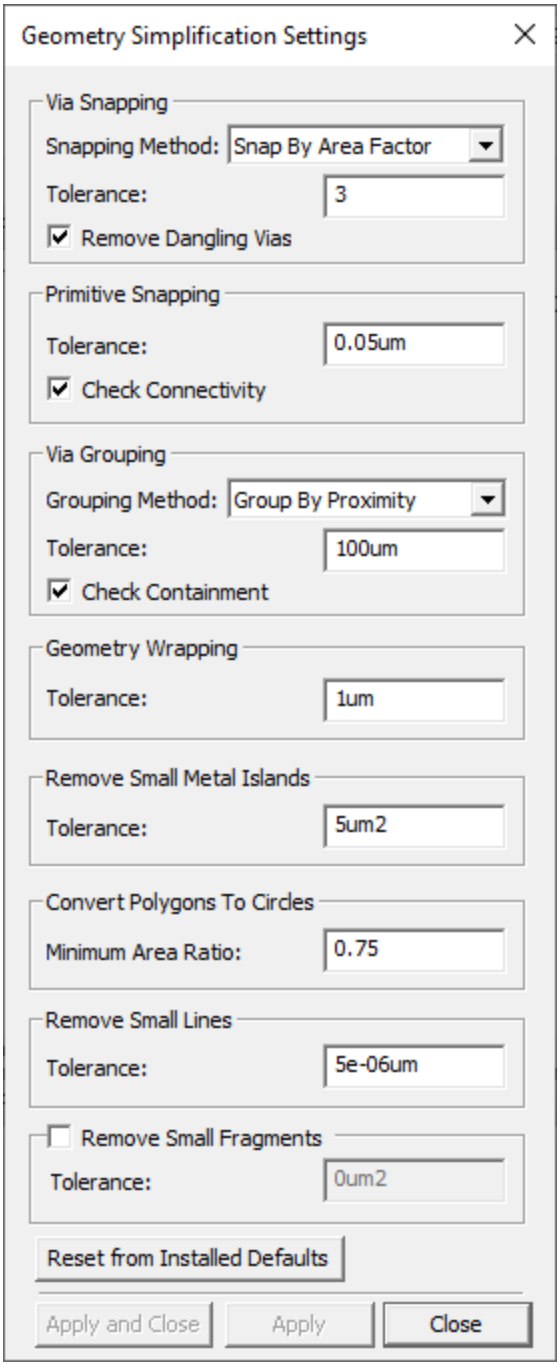
Configuring Via Snapping Settings

1. From the **Layout** ribbon, click **Settings**.



The **Geometry Simplification Settings** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Via Snapping** area, do the following:

    a. Select a **Snapping Method** from the drop-down menu (**Snap By Area Factor** selected by default).

        - **Snap By Area Factor** - Via groups are snapped by a maximum area equal to the **Tolerance** times the surface area of the via group being snapped.

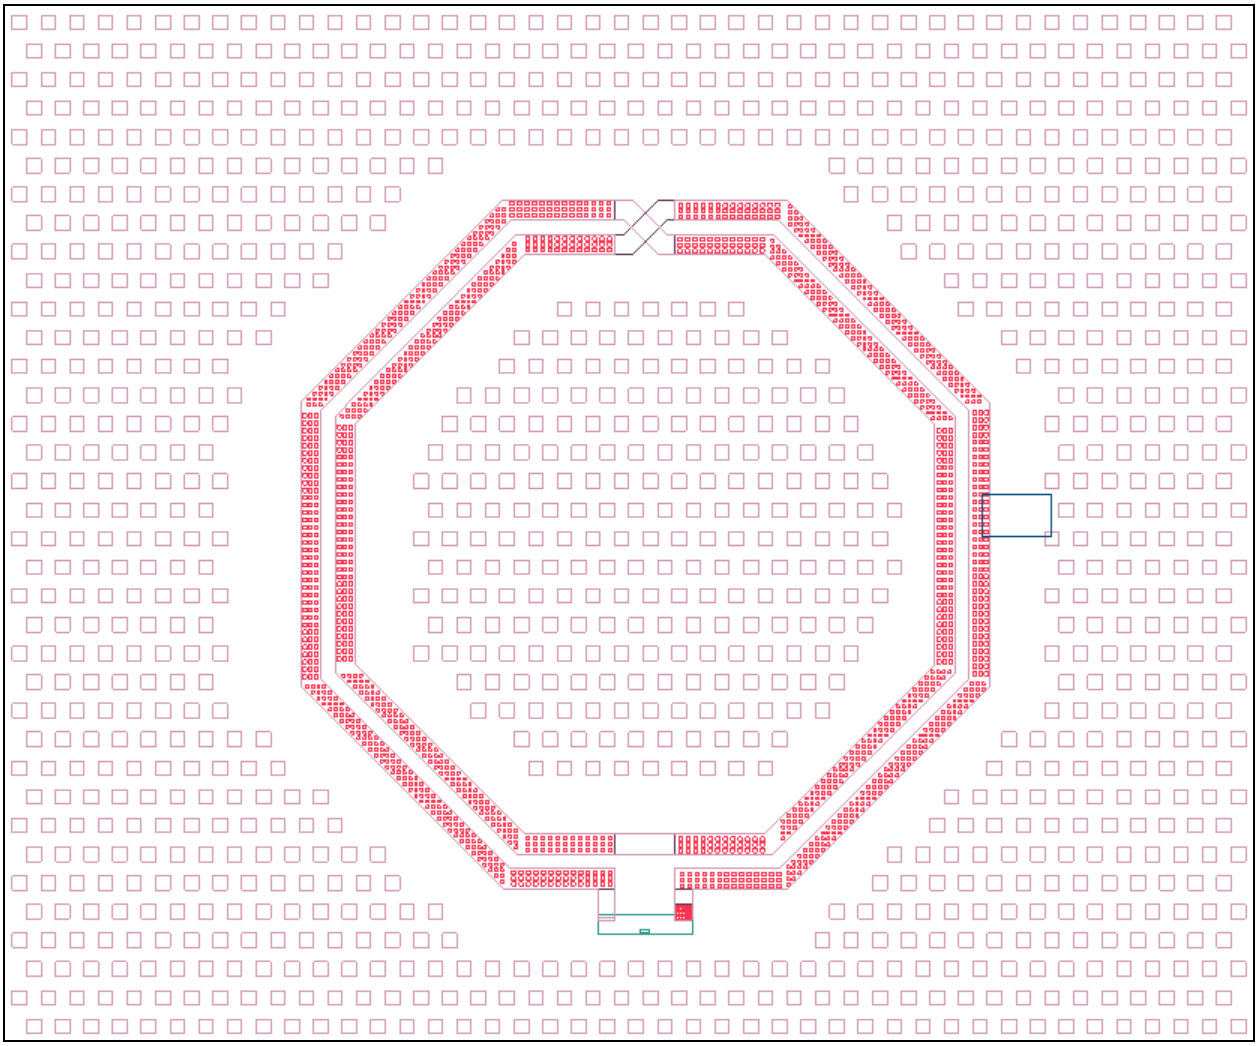
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Snap By Distance** - Via groups are snapped by a maximum distance of the **Tolerance**.

b. Enter a value in the **Tolerance** field (e.g., **3**).

c. Check the **Remove Dangling Vias** box to delete vias that have no connectivity or have connectivity only to a single layer (checked by default).

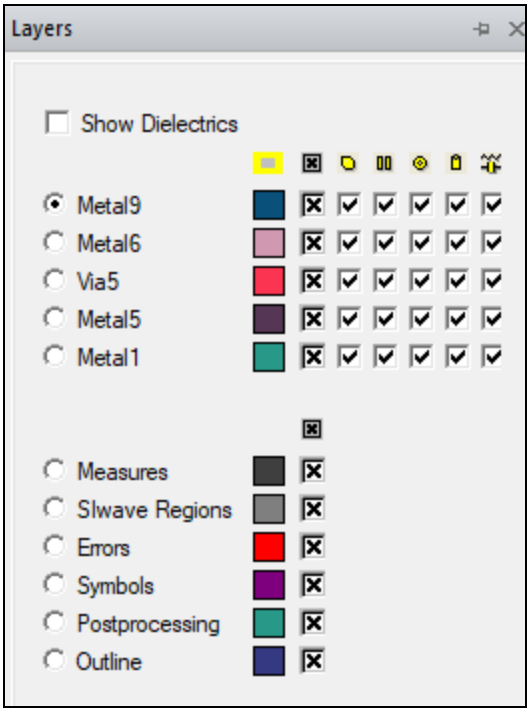
d. Click **Apply and Close**.



Snapping Vias on a Specific Layer

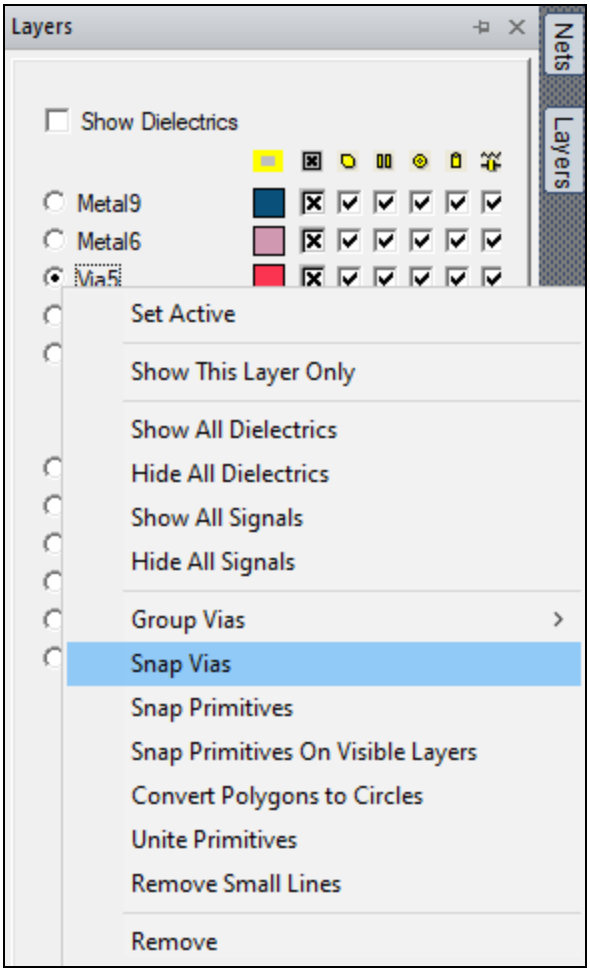
1. If the **Layers** window is not visible, navigate to the **Layers** tab. Click the **Layers** tab to open the window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



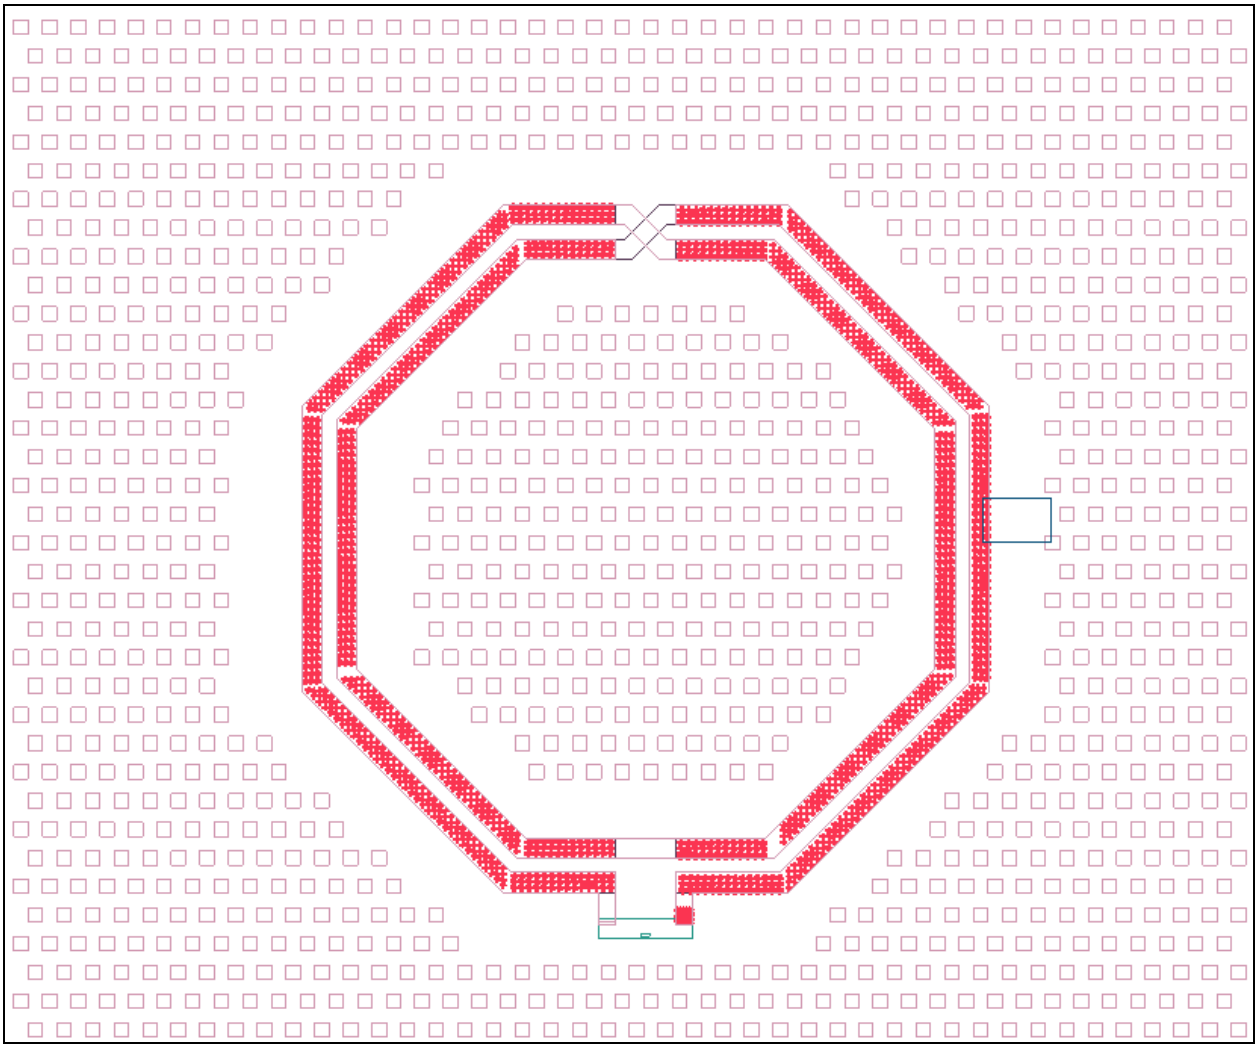
2. Right-click the selected layer (e.g., **Via5**) and select **Snap Vias**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The vias in the design are aligned.

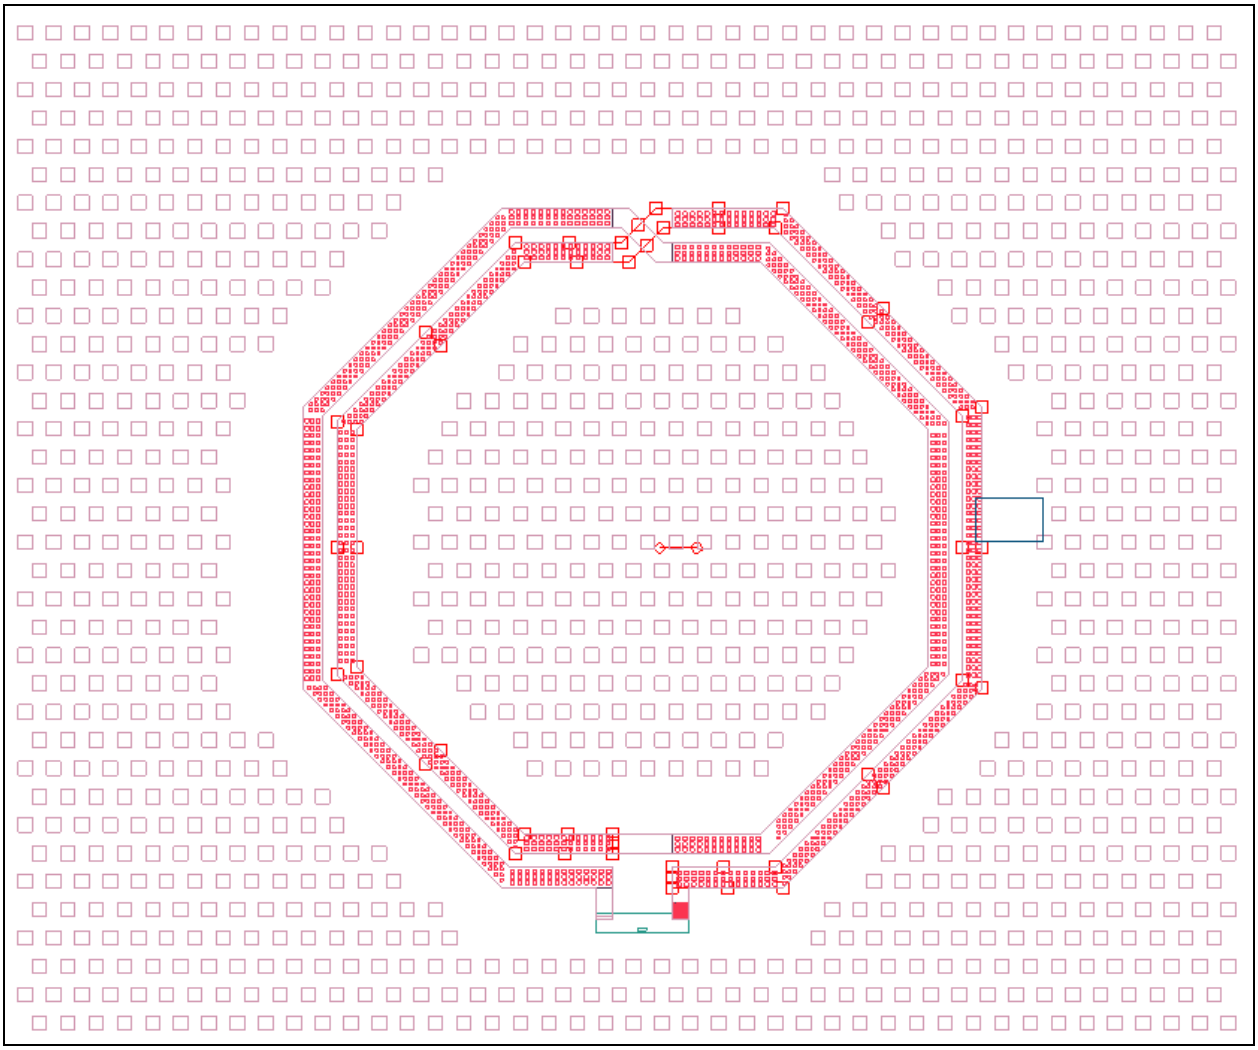
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Snapping Vias in the Layout Editor

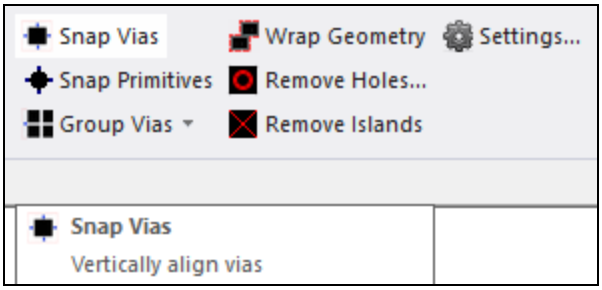
1. From the **Layout Editor**, select a group of via primitives.



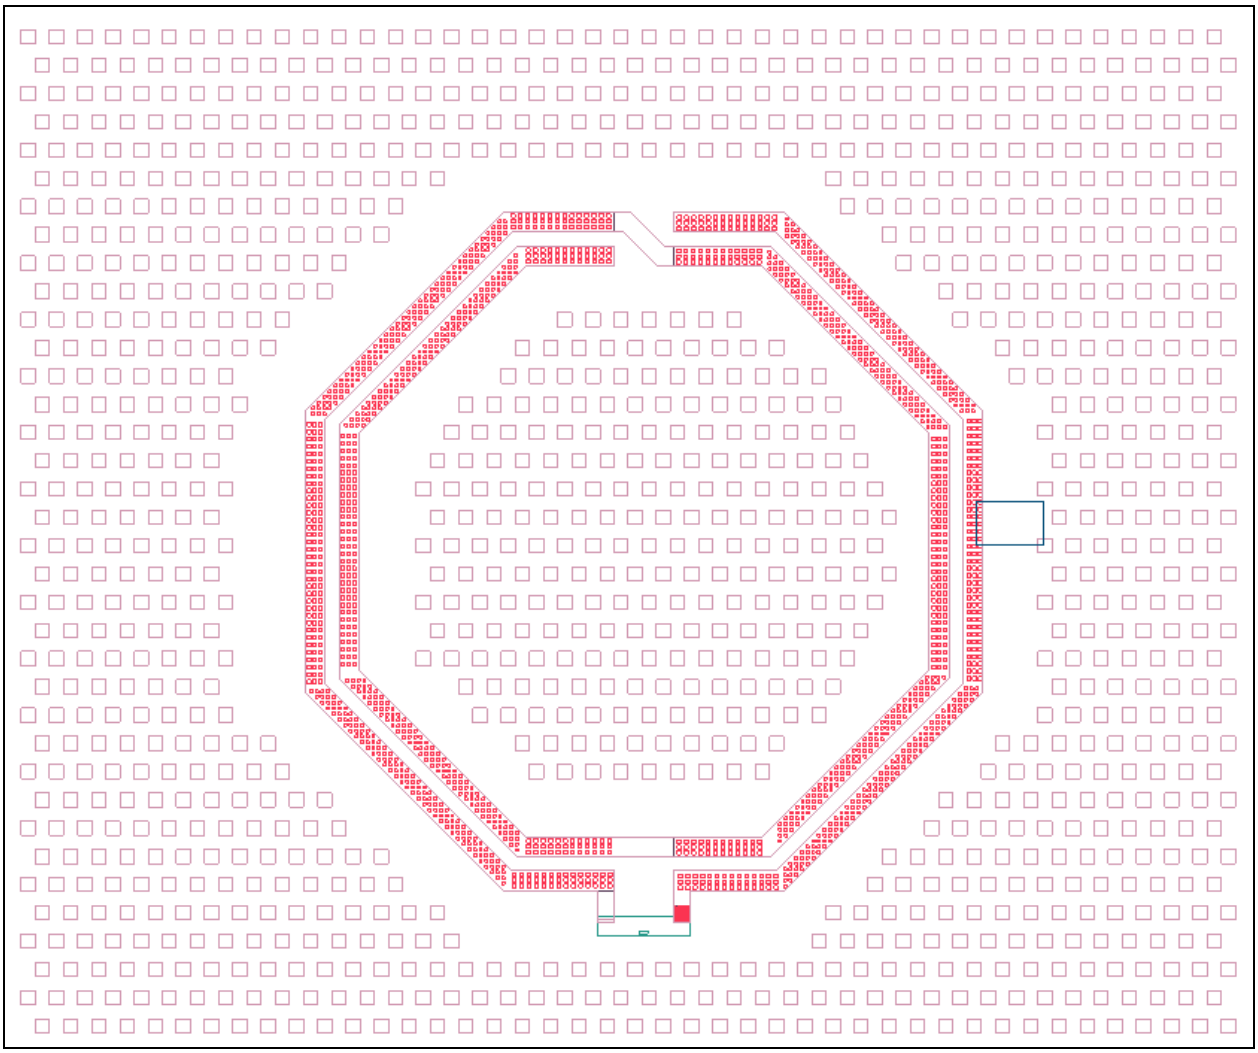
> **Note:** Via primitives can be rectangles, polygons, or lines. Only rectangular via primitives can have more than one primitive in a via group. If you want to make a via group out of polygons or lines, the group can have only one line primitive or one polygon primitive in it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **Layout** ribbon, click **Snap Vias**.



The selected vias are aligned.

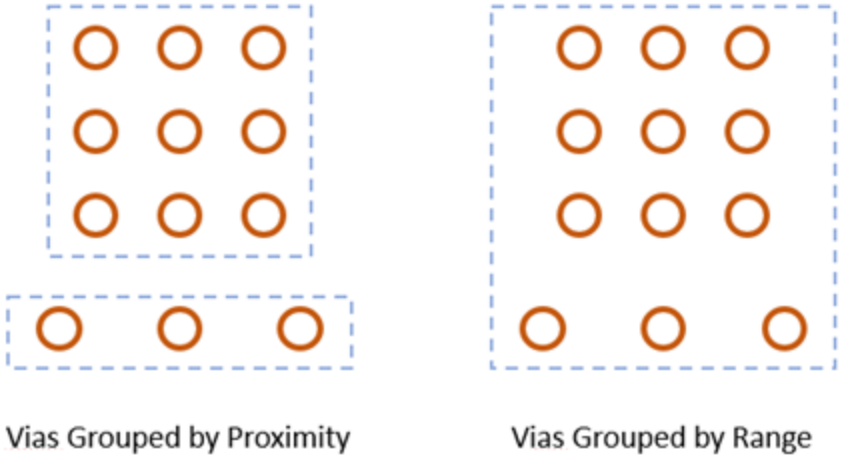


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Grouping Vias in IC Mode

Integrated chips are commonly fabricated using numerous small vias between signal layers which can result in highly complex geometries. Geometries can be simplified through grouping. Via grouping replaces via regions with an equivalent wrapping polygon that has material properties representative of the grouped primitives. The **Group Vias** tool detects clusters of primitives and creates via groups accordingly. Via groups can then be combined or dissolved depending on which option is selected.

Vias can be grouped using two methods: **Group by Range** and **Group by Proximity**. **Group by Range** expands the new group based only on whether a potential member is separated by *no more* than the **Tolerance** from an existing member. In contrast, **Group by Proximity** groups vias that are a spaced similarly. Vias are not grouped if the distance between them exceeds the **Tolerance**.



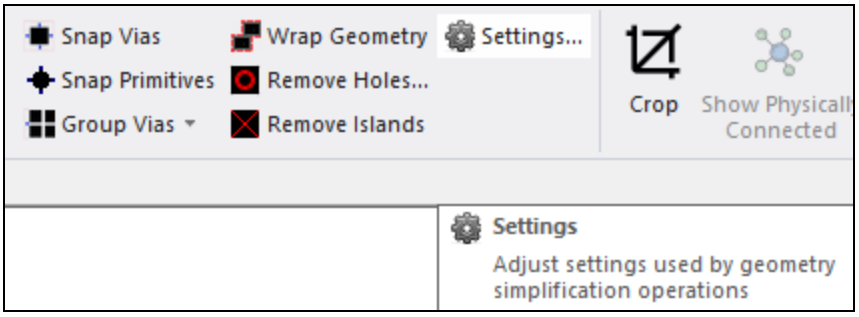
This tool also has the **Check Containment** option which checks for electrical shorts by analyzing the placement of via primitives. When a short is found, this option splits the group to prevent a short.

Complete steps in the following subsections to configure **Via Grouping** settings, then group vias within a design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

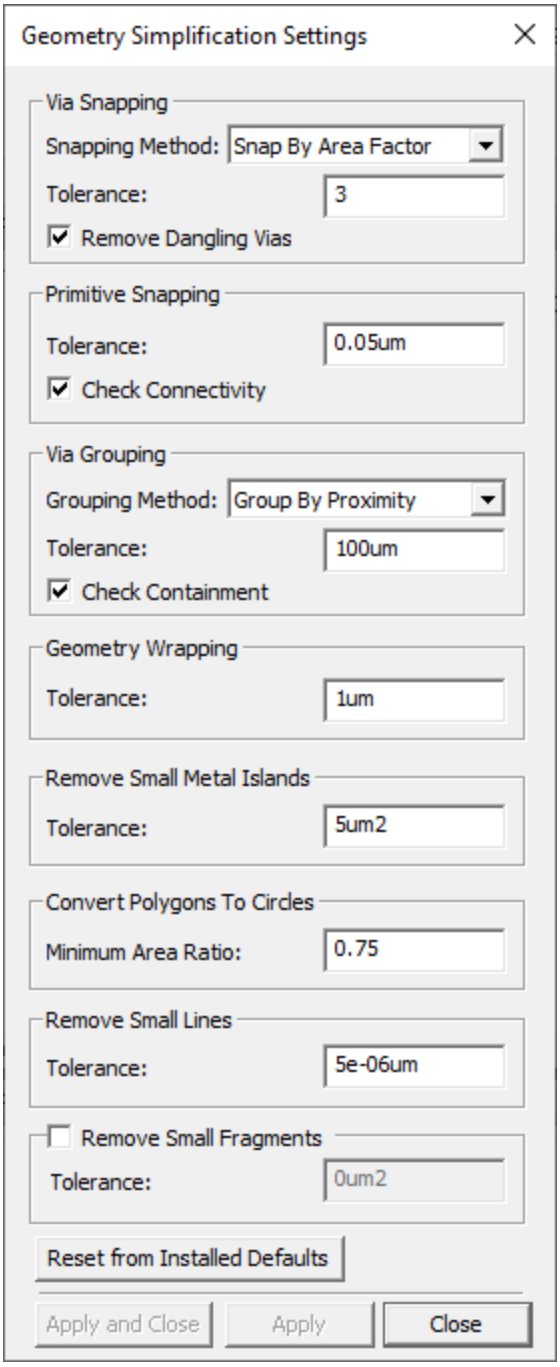
Configuring Via Grouping Settings

1. From the **Layout** ribbon, click **Settings**.



The **Geometry Simplification Settings** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Via Grouping** area, do the following:

    a. Select a **Grouping Method** from the drop-down menu (**Group By Proximity** selected by default).

        - **Group By Proximity** - Groups vias that are spaced similarly. Vias are not grouped if the distance between them exceeds the **Tolerance**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

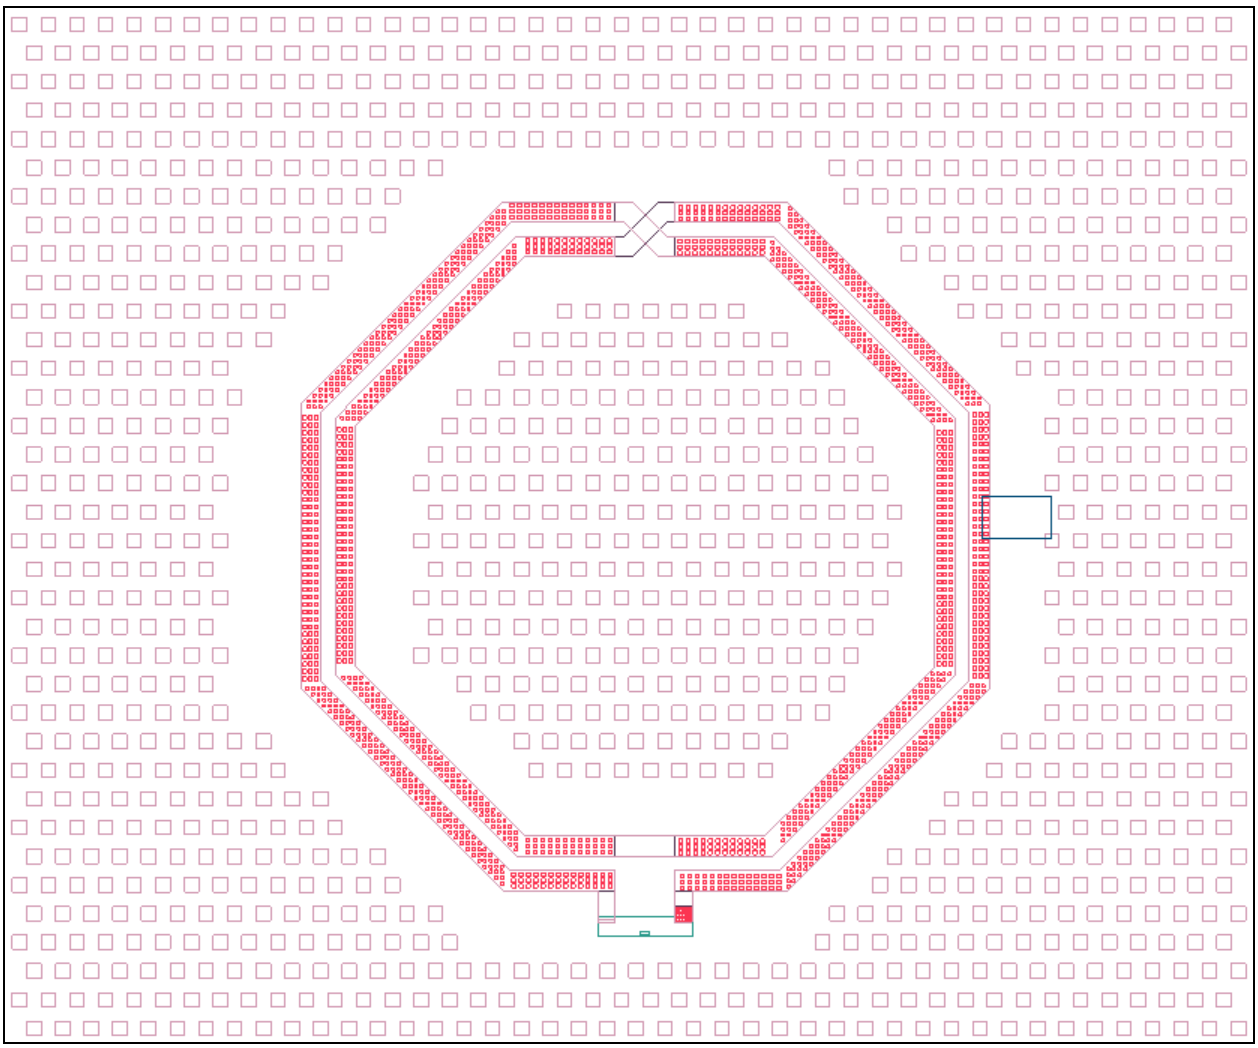
- **Group By Range** - Groups vias based on whether a potential member is separated by *no more* than the **Tolerance** from any other member.

b. Enter a value in the **Tolerance** field, including the unit of measurement (e.g., **100um**).

c. Check the **Check Containment** box to detect and prevent electrical shorts (checked by default).

> **Note: Check Containment** analyzes the placement of via primitives. When the possibility of a short is detected, **Check Containment** attempts to prevent a short.

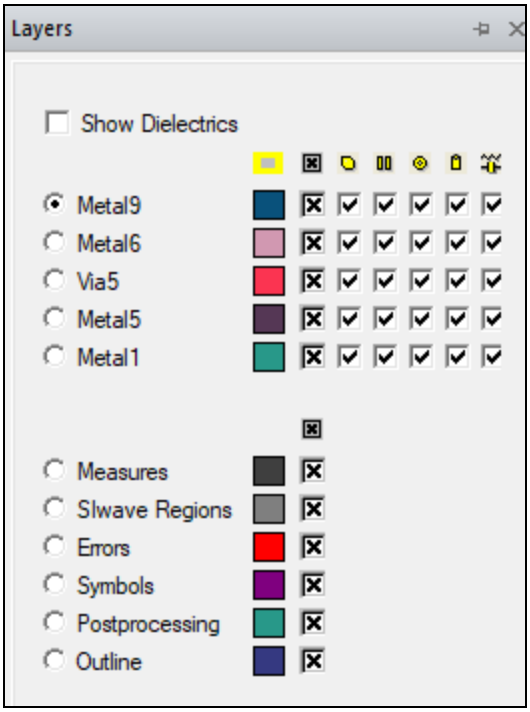
d. Click **Apply and Close**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

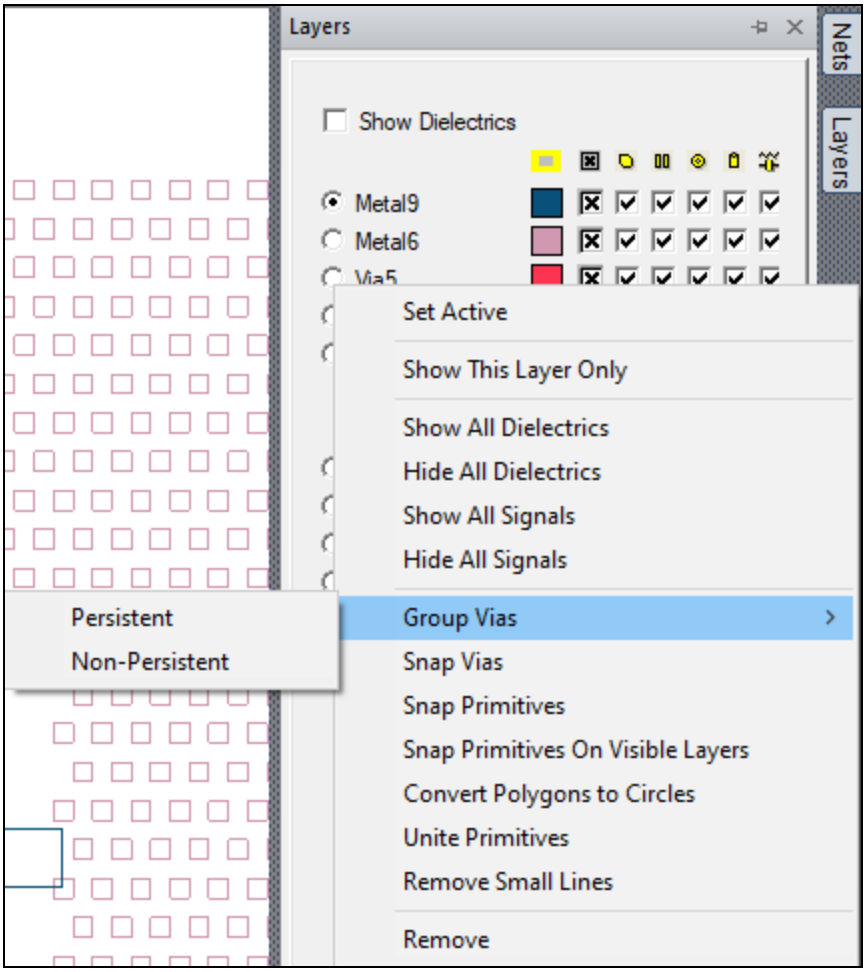
Grouping Vias on a Specific Layer

1. If the **Layers** window is not visible, navigate to the **Layers** tab. Click the **Layers** tab to open the window.



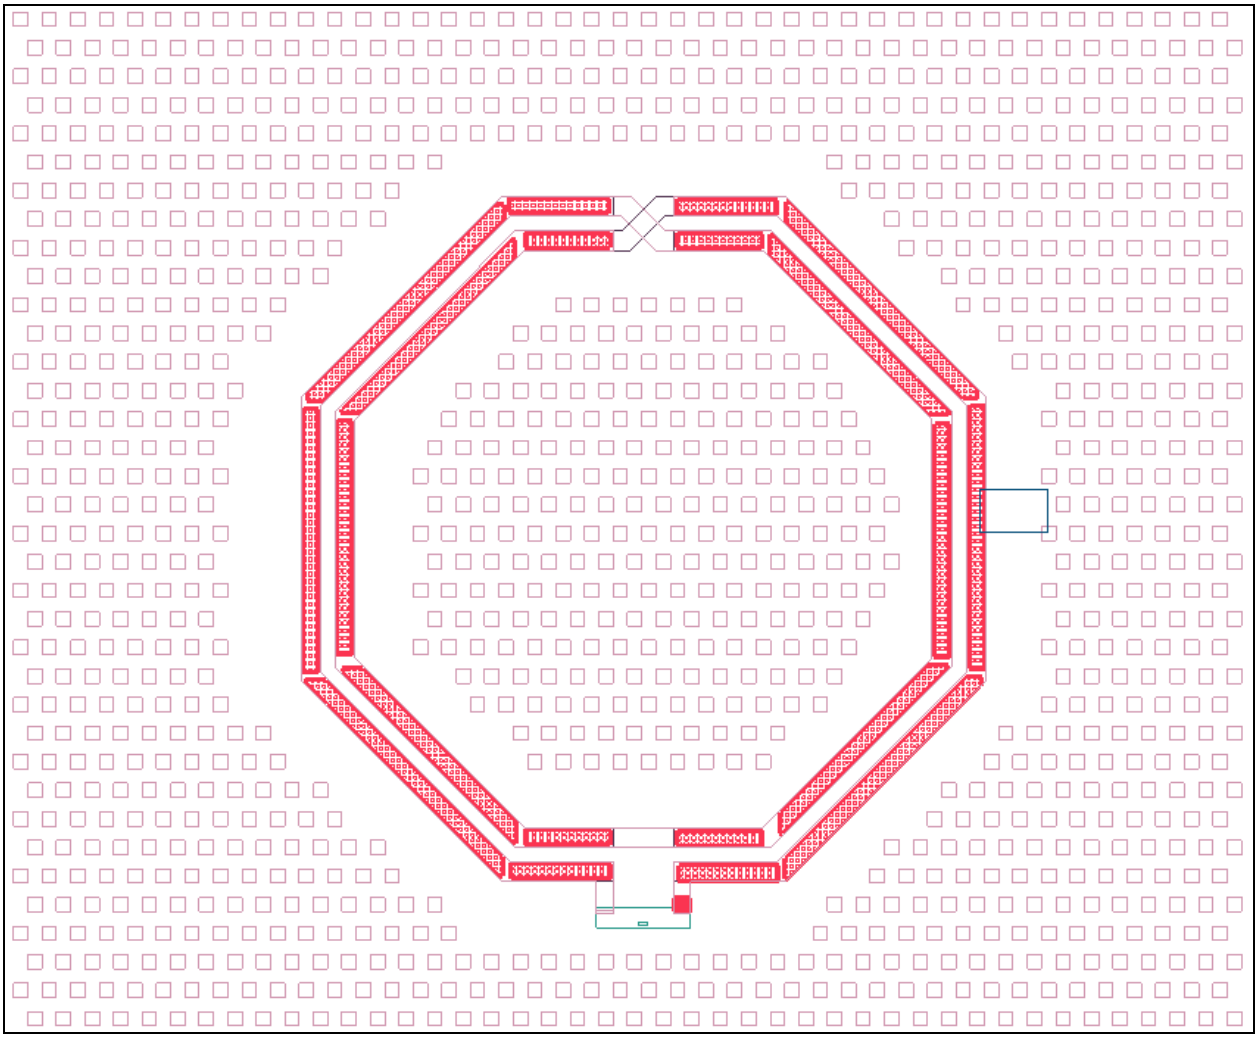
2. Right-click the selected layer (e.g., **Via5**) and select **Group Vias** > **Persistent** (or **Group Vias** > **Non-Persistent**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The vias in the design are grouped.

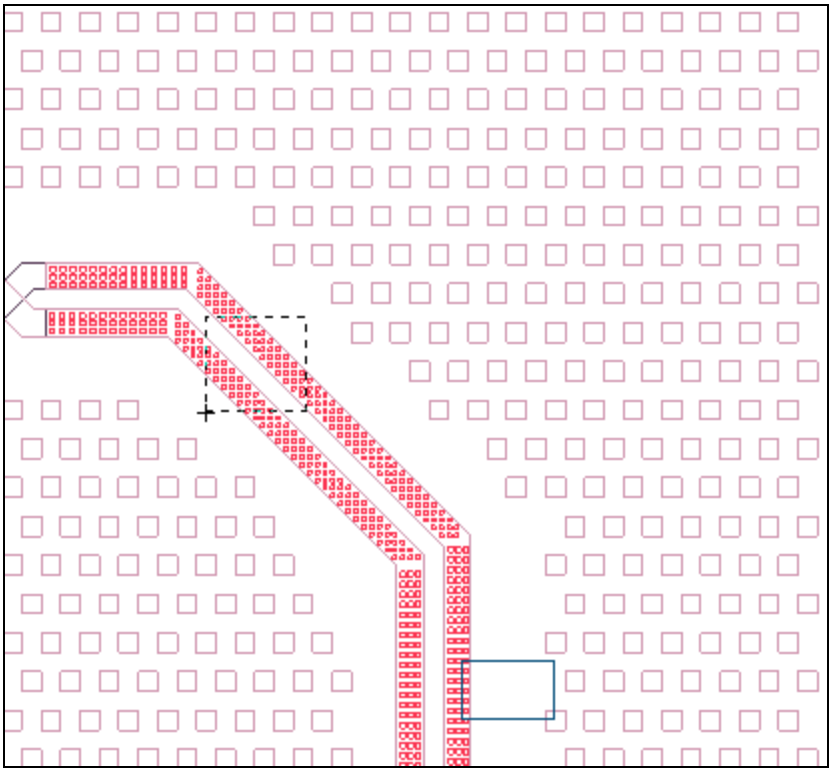
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Manually Grouping Vias in the Layout Editor

1. Select a group of via primitives.

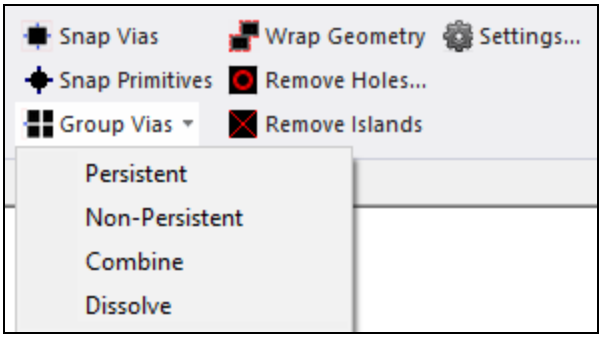


Note:

Via primitives can be rectangles, polygons, or lines. Only rectangular via primitives can have more than one primitive in a via group. To make a via group out of polygons or lines, the group can have only one line primitive or one polygon primitive in it.

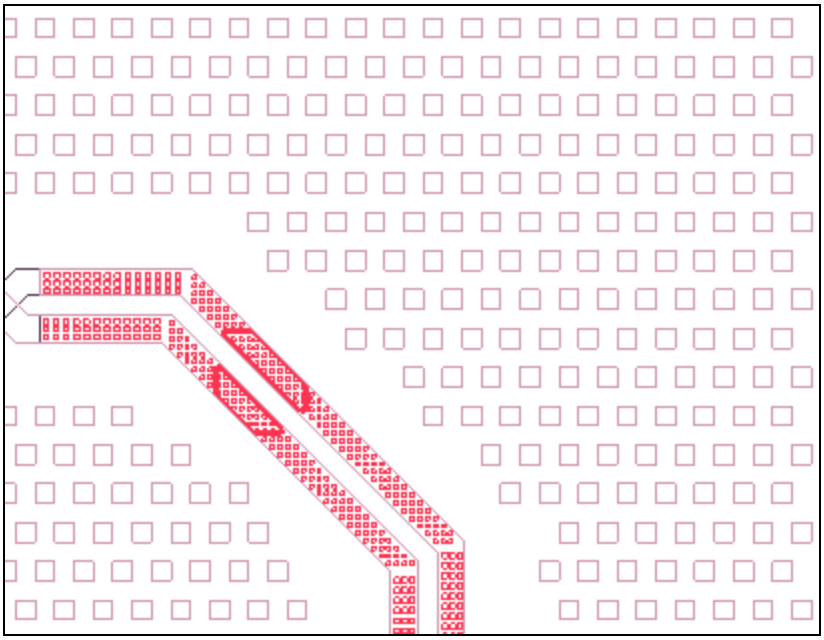
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **Layout** ribbon, select **Group Vias** > **[*Option*]**.



Options

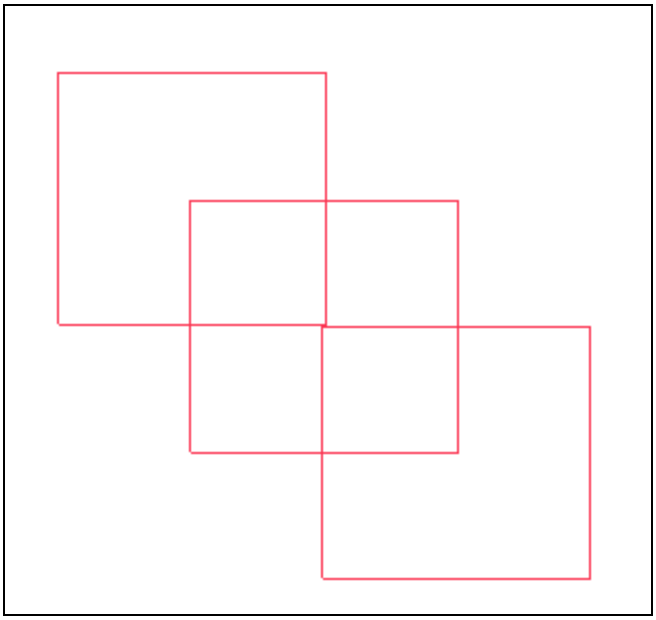
- **Persistent** - create a via group and keep the original primitives in the design
- **Non-Persistent** - create a via group and delete the original grouped primitives
- **Combine** - merge selected via group and/or via primitives into a new via group
- **Dissolve** - restore the selected via group into the primitives that comprise it



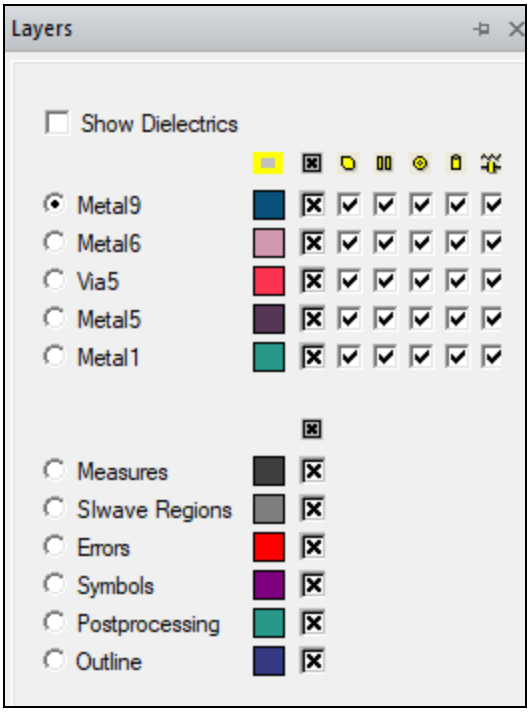
Uniting Primitives in IC Mode

Follow these steps to unite two or more primitives that overlap on the same layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

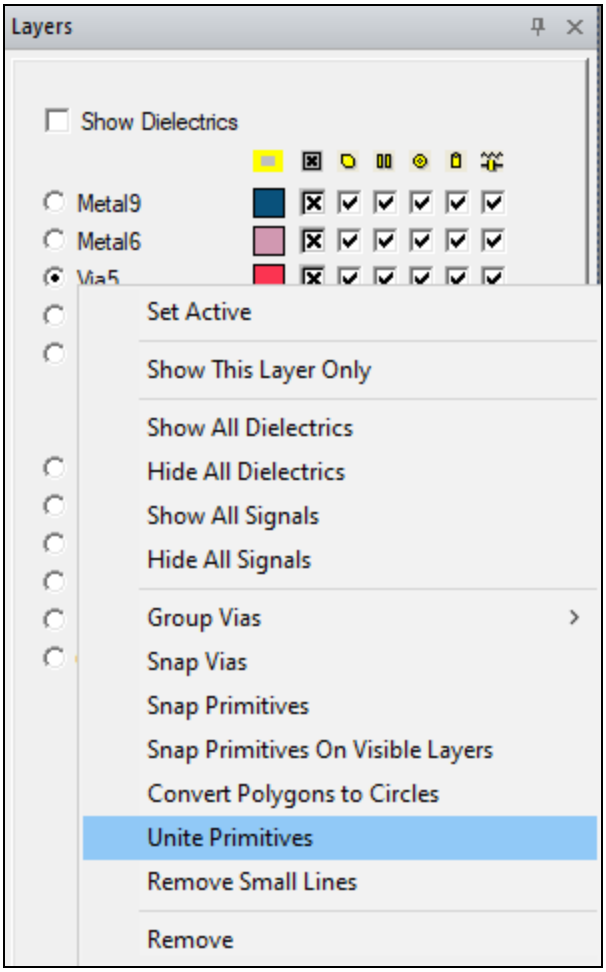


1. If the **Layers** window is not visible, navigate to the **Layers** tab. Click the **Layers** tab to open the window.



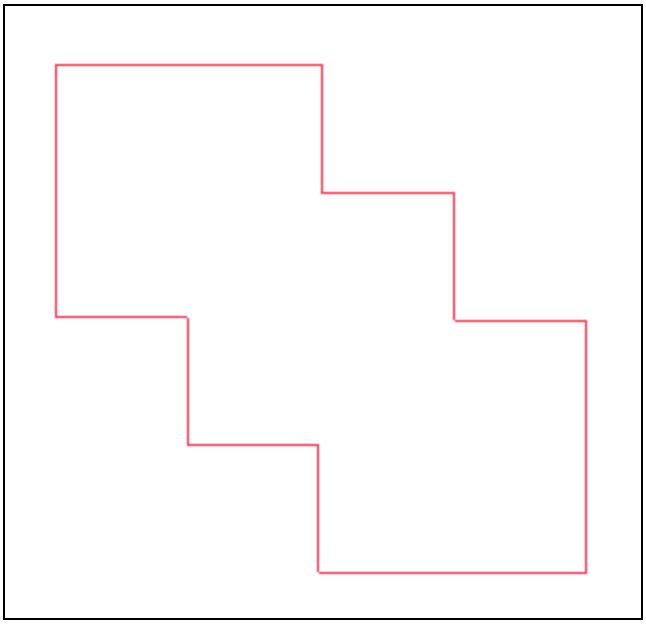
2. Right-click the selected layer (e.g., **Via5**) and select **Unite Primitives**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Any overlapping primitives merge and their internal boundaries (i.e., the overlapping aspects of the primitives) are removed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

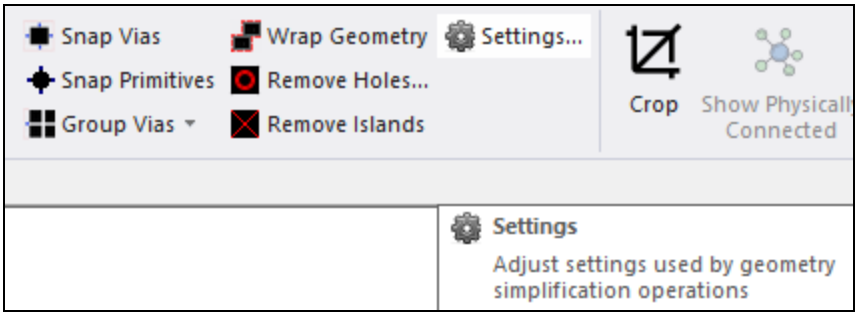


Converting Polygons to Circles in IC Mode

Complete steps in the following subsections to configure **Convert Polygons to Circles**, then convert polygons to circles in **Layout Editor**.

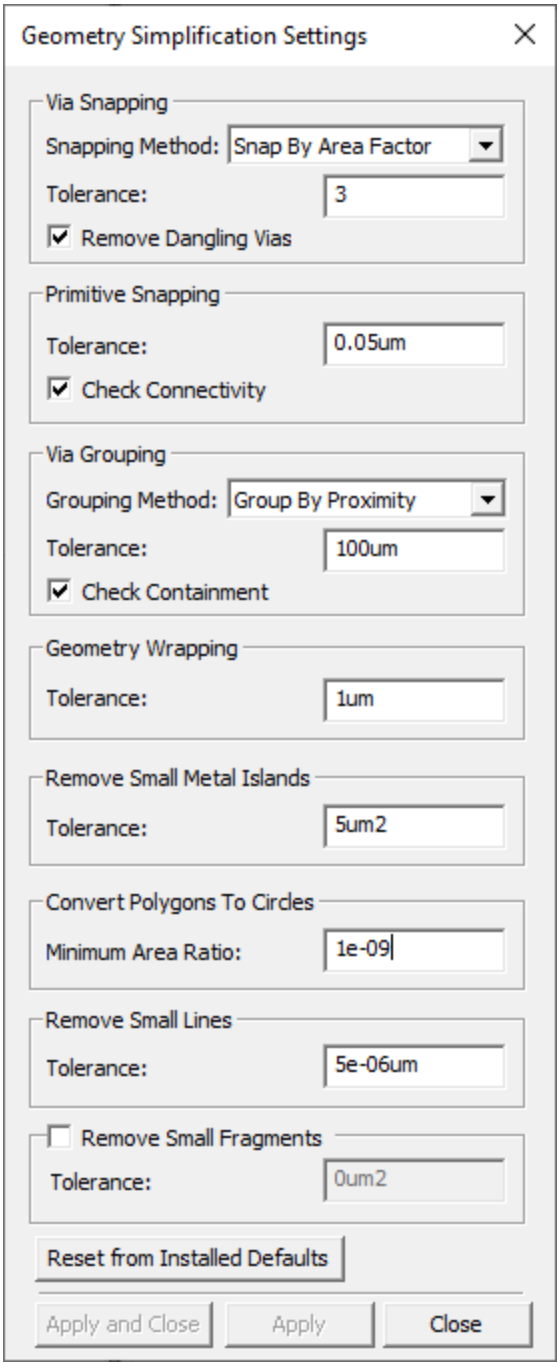
Configuring Convert Polygons to Circles Settings

1. From the **Layout** tab, click **Settings**.



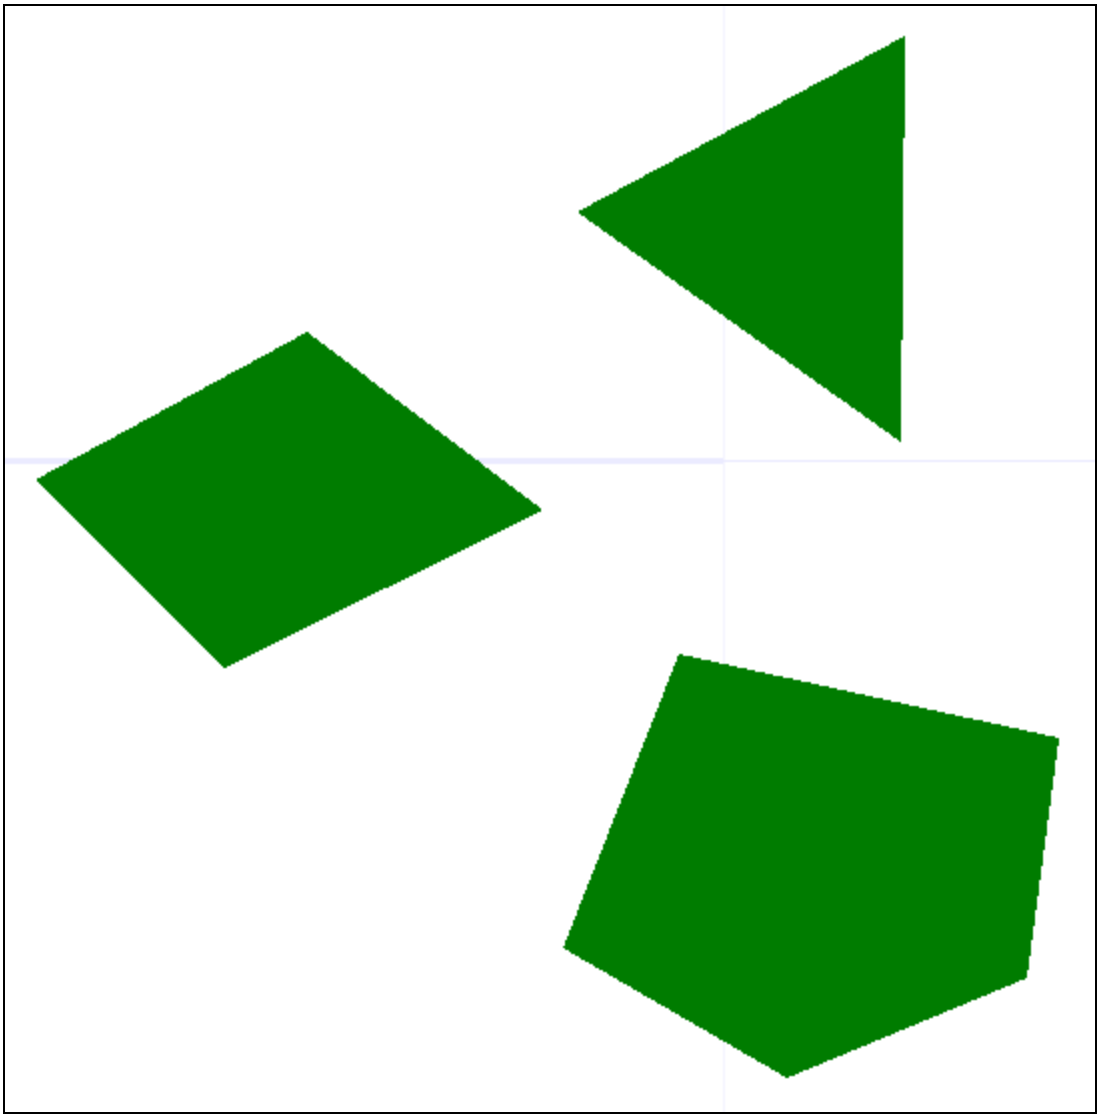
The **Geometry Simplification Settings** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Convert Polygons To Circles** area, enter a value in the **Minimum Area Ratio** field (e.g., **1e-09**, although the default value is **0.75**).
3. Click **Apply and Close**.

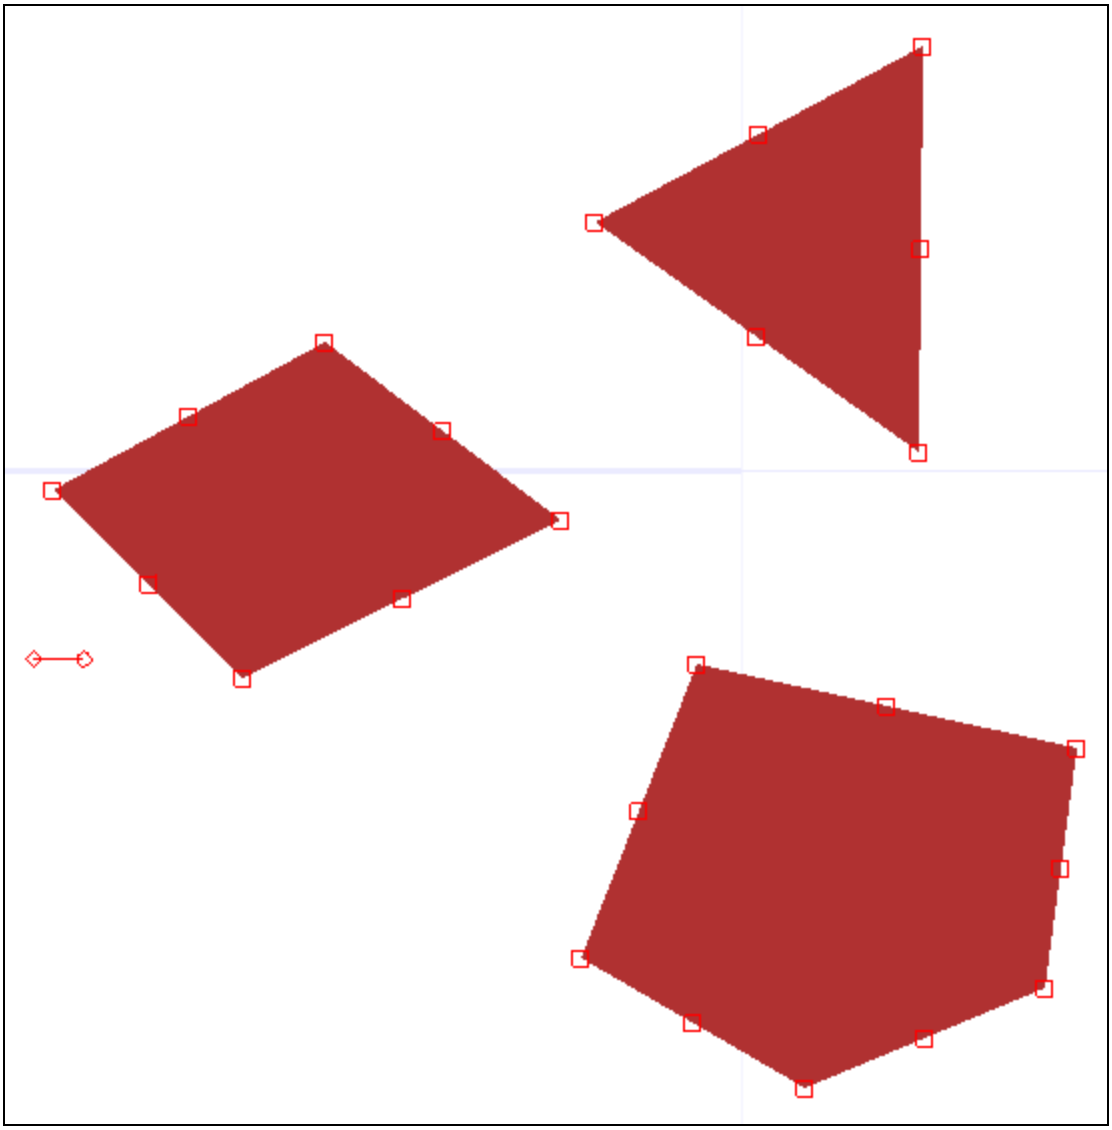
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Converting Polygons to Circles in the IC Layout Editor

1. From the IC mode, **click**+**drag** to select the selected polygons. Alternatively, press **Ctrl**+**A** to select all the available polygons.

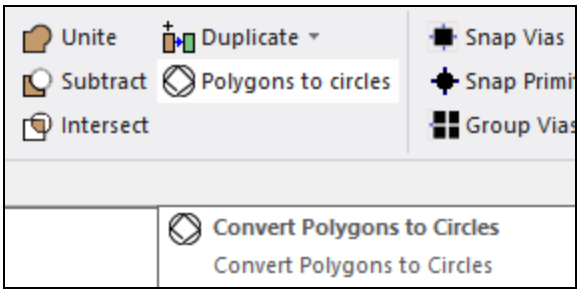
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



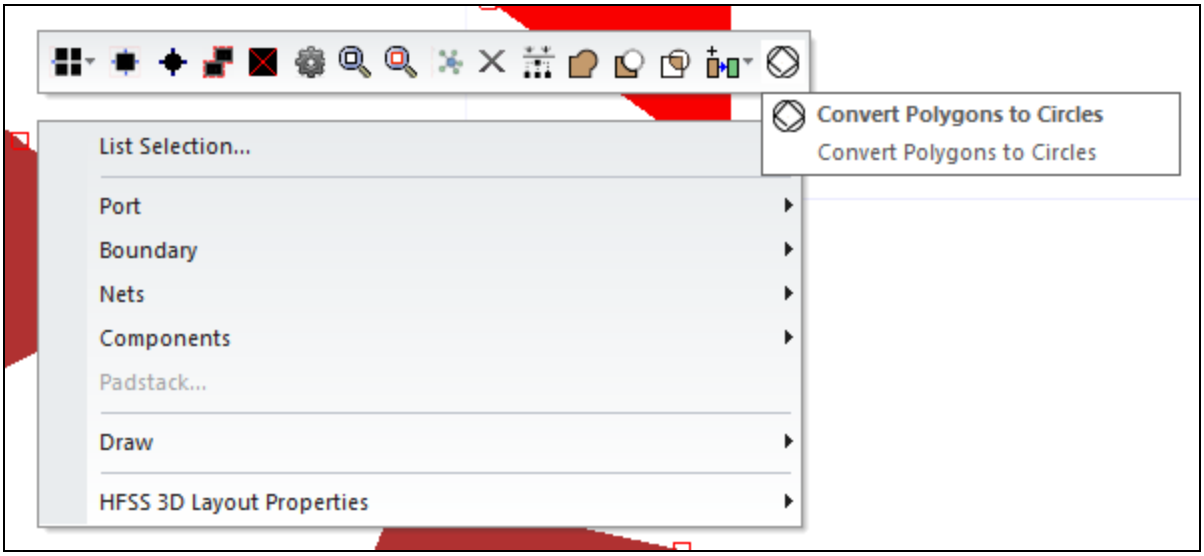
2. Do one of the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Layout** tab, click **Polygons to circles**.

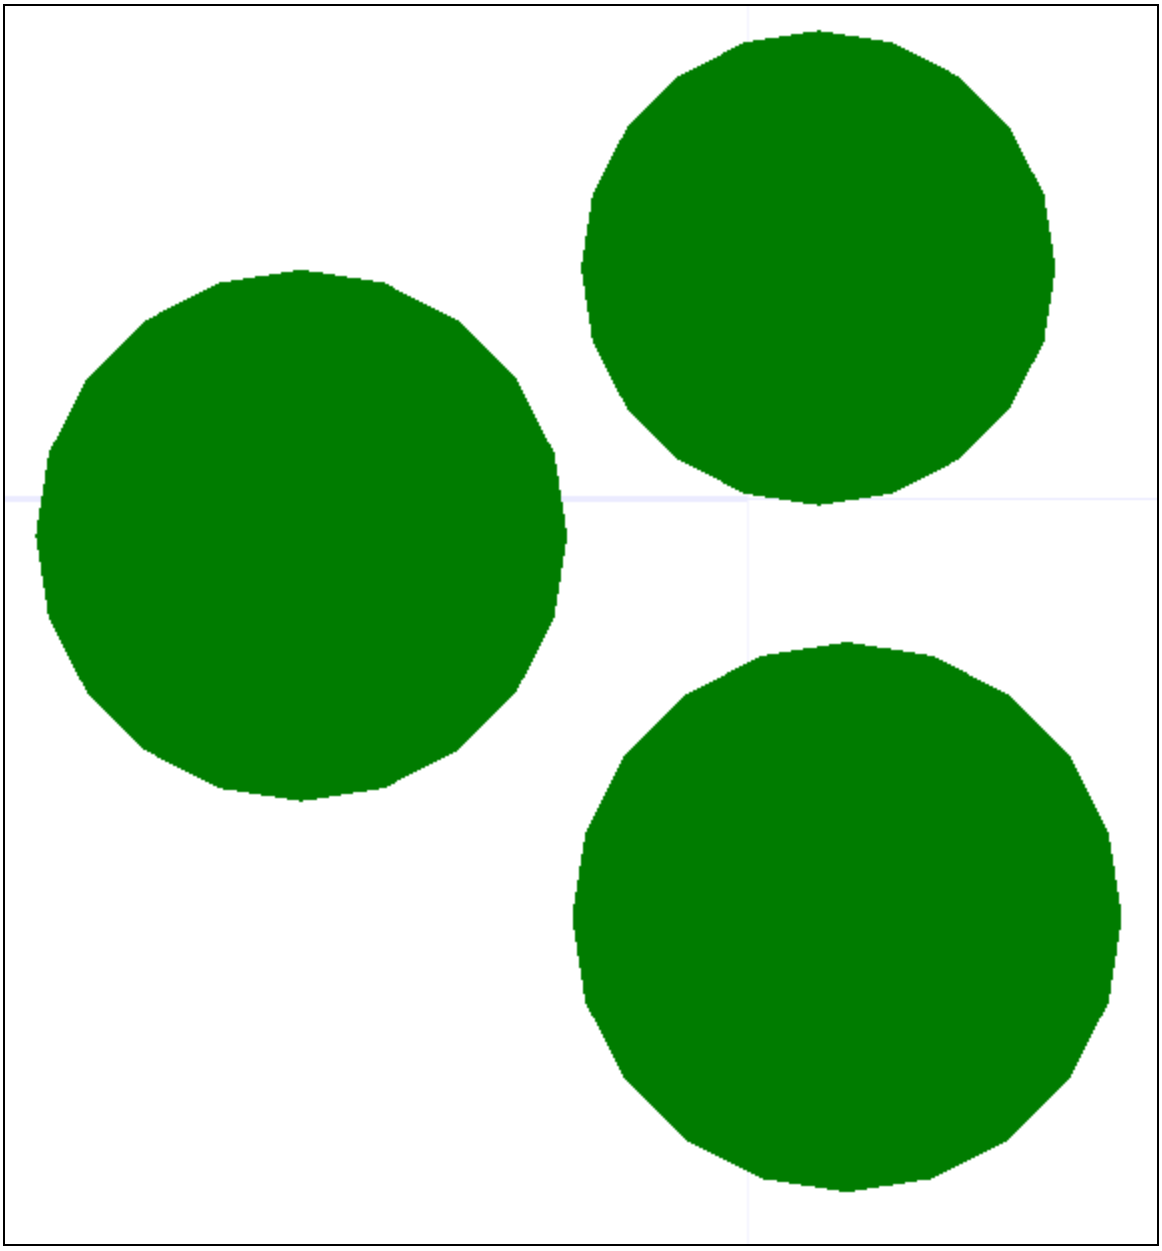


- Right-click within the **Layout Editor** and select **Convert Polygons to Circles**.



The selected polygons are compared to the value in the **Minimum Area Ratio** field. Every polygon that meets or falls within the value is formed into a circle.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For other instructions on the usage of the **Layout Editor**, keyboard commands, and simple tasks like converting polygons to circles, refer to Getting Started with Ansys Electronics Desktop.

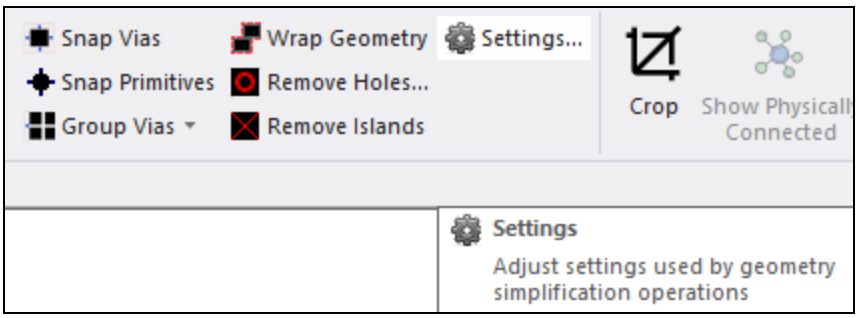
Wrapping Geometry in IC Mode

The **Wrap Geometry** feature greatly reduces mesh complexity by replacing groups of primitives with an equivalent wrapping polygon.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

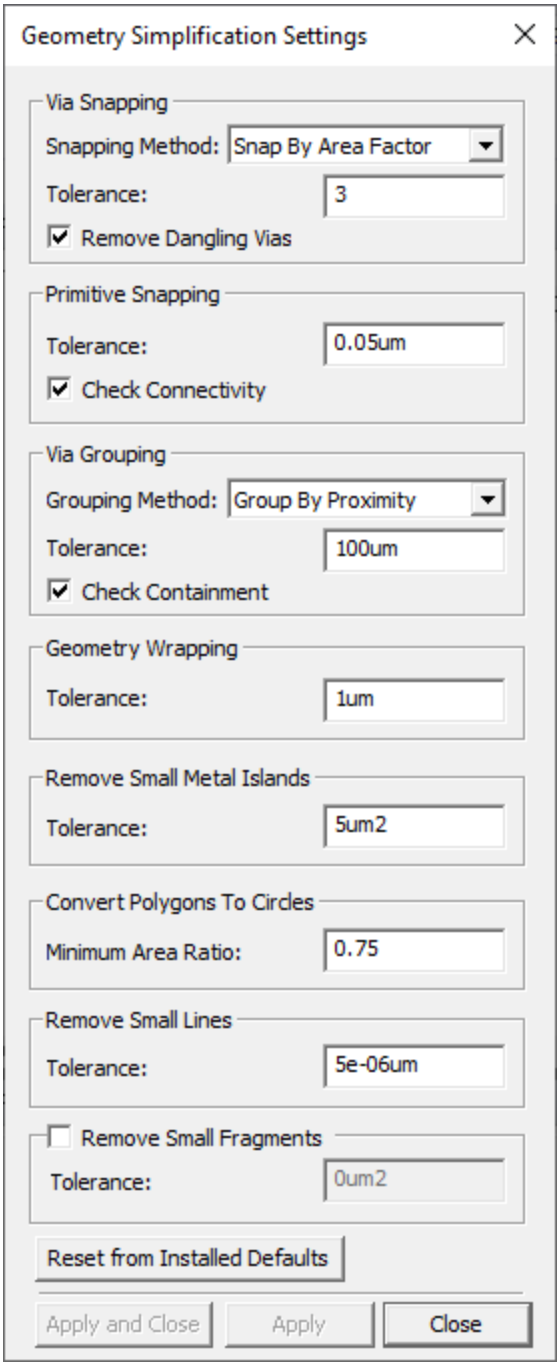
Selected primitives of or within the user-specified **Tolerance** distance can be wrapped by completing these steps.

1. From the **Layout** ribbon, click **Settings**.



The **Geometry Simplification Settings** window opens.

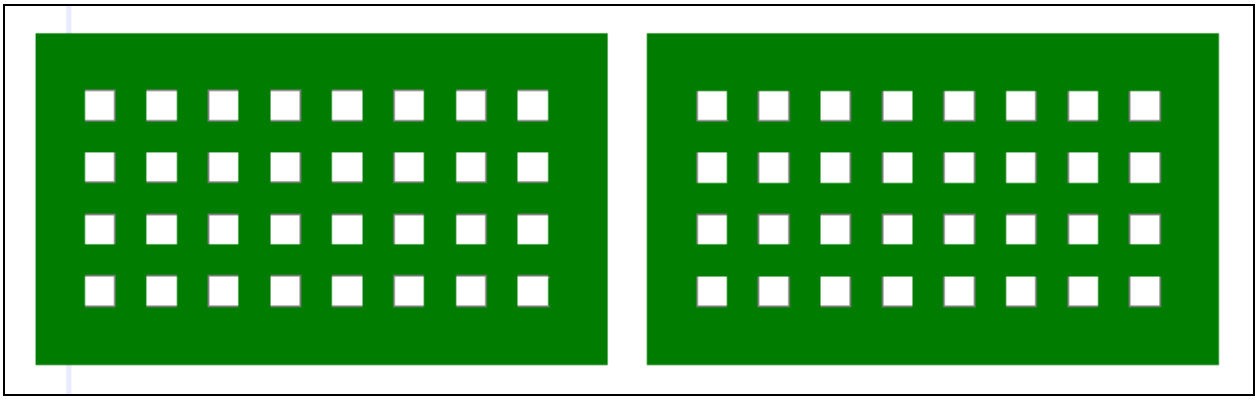
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



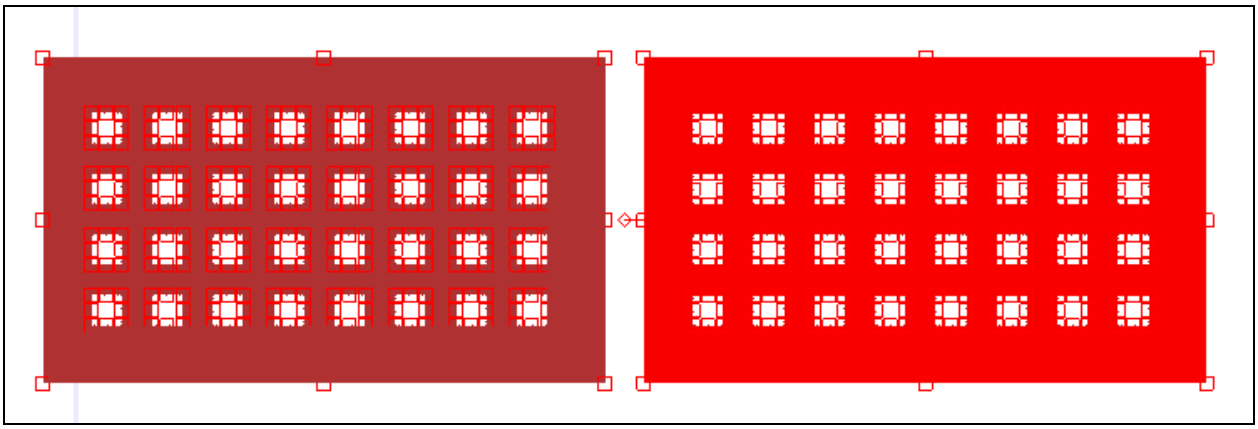
2. From the **Geometry Wrapping** area, enter a value in the **Tolerance** field (e.g., **1um**).
3. Click **Apply and Close**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

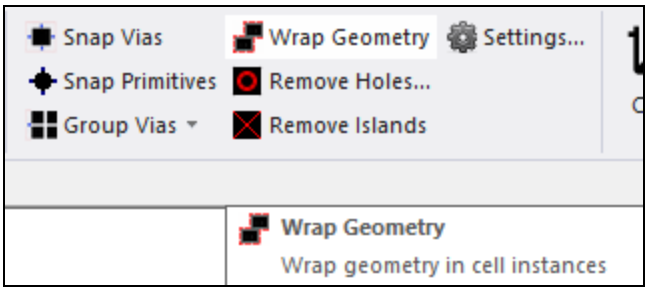
4. If applicable, navigate to the **Layout Editor** tab and the selected design geometry.



5. From the **Layout Editor**, select the selected geometry.

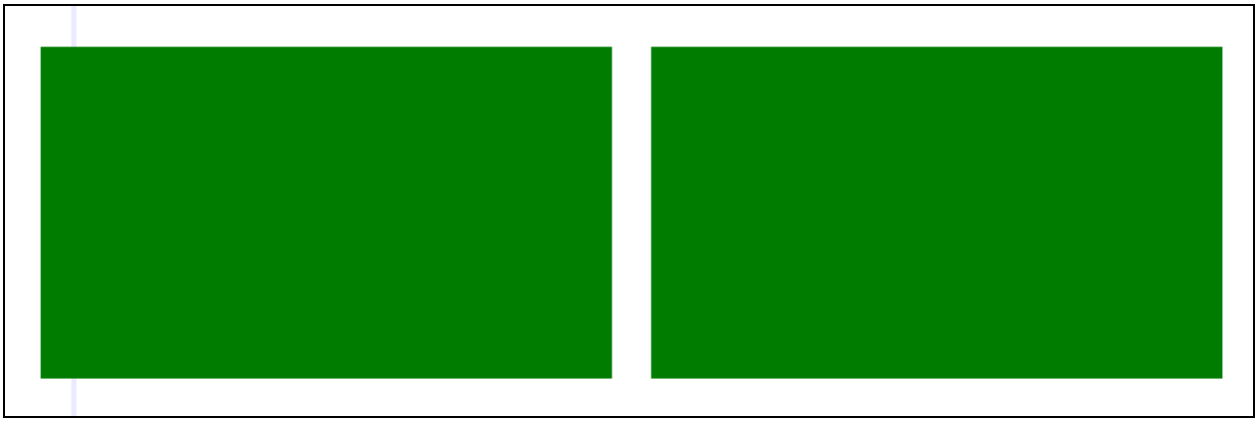


6. From the **Layout** ribbon, click **Wrap Geometry**.



The selected geometry is compared to the value in the **Tolerance** field. Every element that meets or falls within the value is wrapped

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



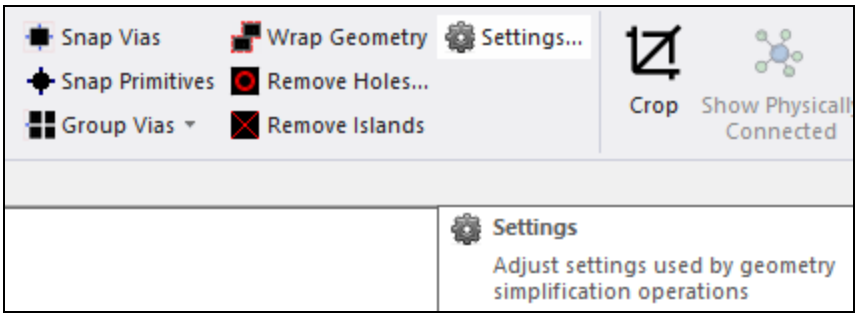
Snapping Primitives in IC Mode

Sometimes primitives exist directly above or below each other on adjacent layers, or they are misaligned by a small amount which can increase mesh complexity. Snapping primitives aligns these objects.

Complete steps in the following subsections to configure **Primitive Snapping**, then snap primitives in several ways.

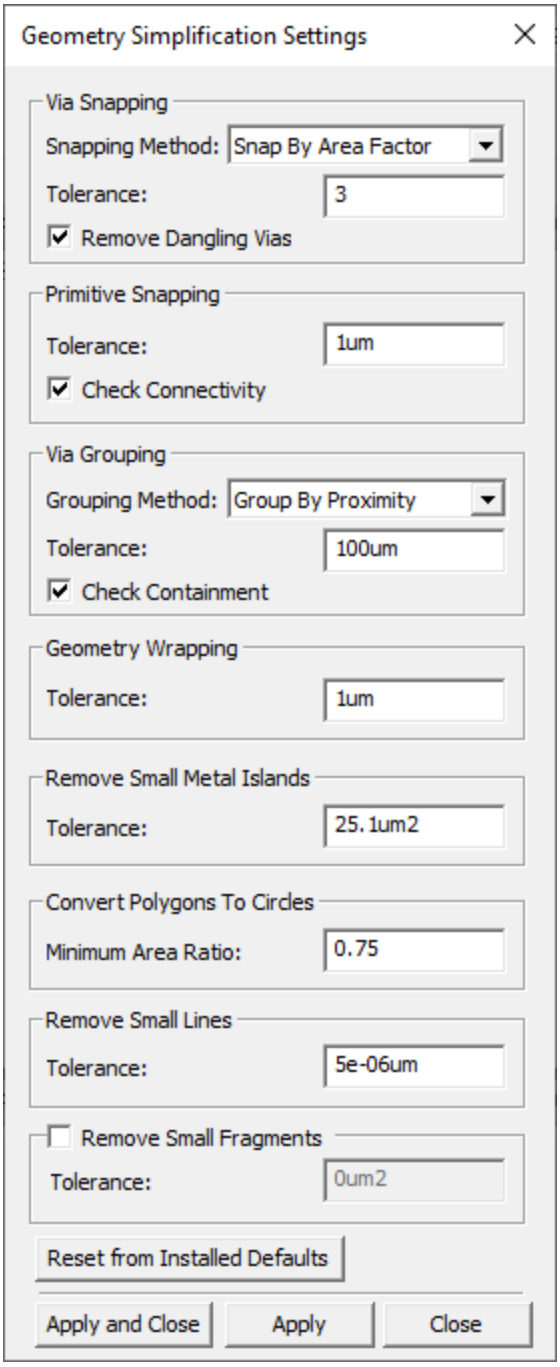
Configuring Primitive Snapping Settings

1. From the **Layout** ribbon, click **Settings**.



The **Geometry Simplification Settings** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Primitive Snapping** area, do the following:

    a. Enter a value in the **Tolerance** field, including the unit of measurement (e.g., **1um**, although the default value is **0.05um**).

    b. Check the **Check Connectivity** box to ensure snapping does not violate the

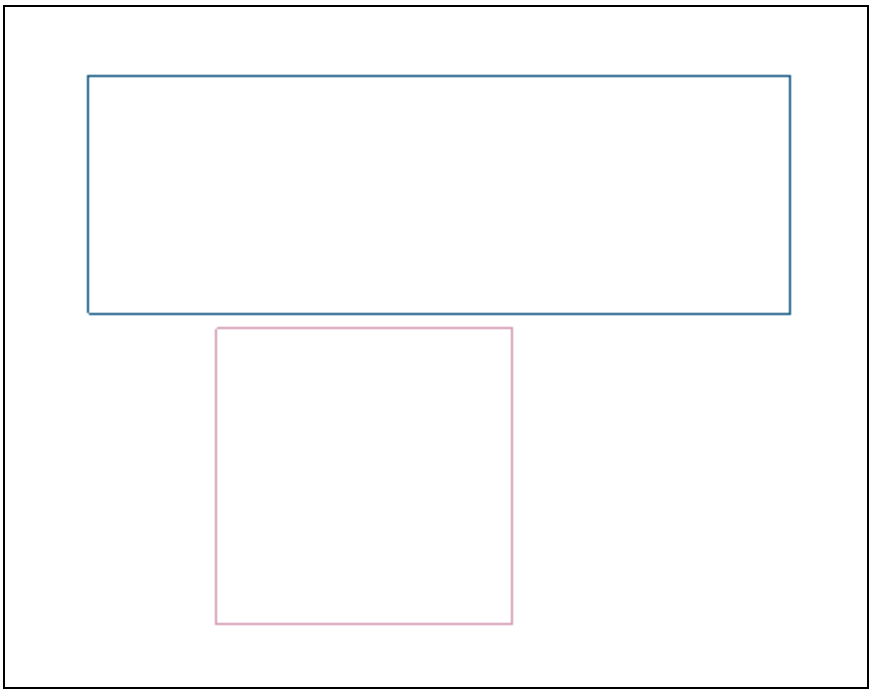
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

connectivity of the original objects (checked by default).

c. Click **Apply and Close**.

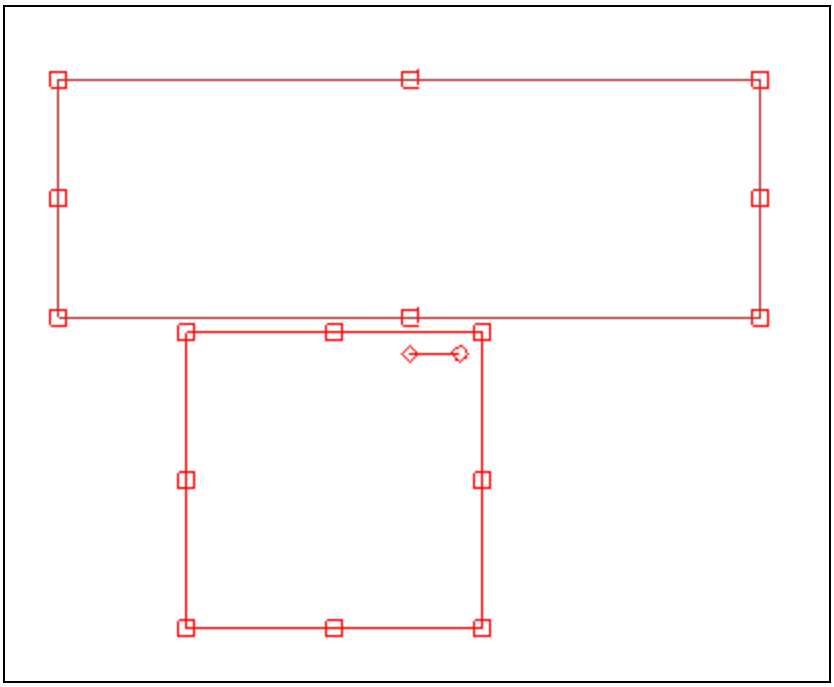
Snapping Primitives in the Layout Editor

1. If applicable, navigate to the **Layout Editor** tab and the selected components.

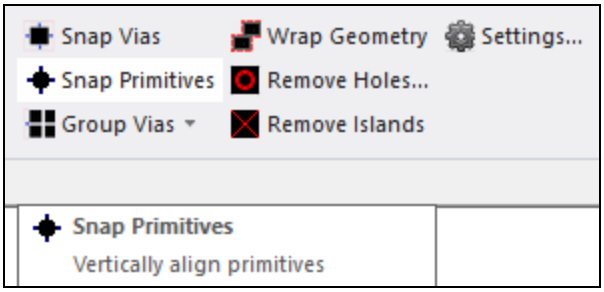


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Select the selected primitives.

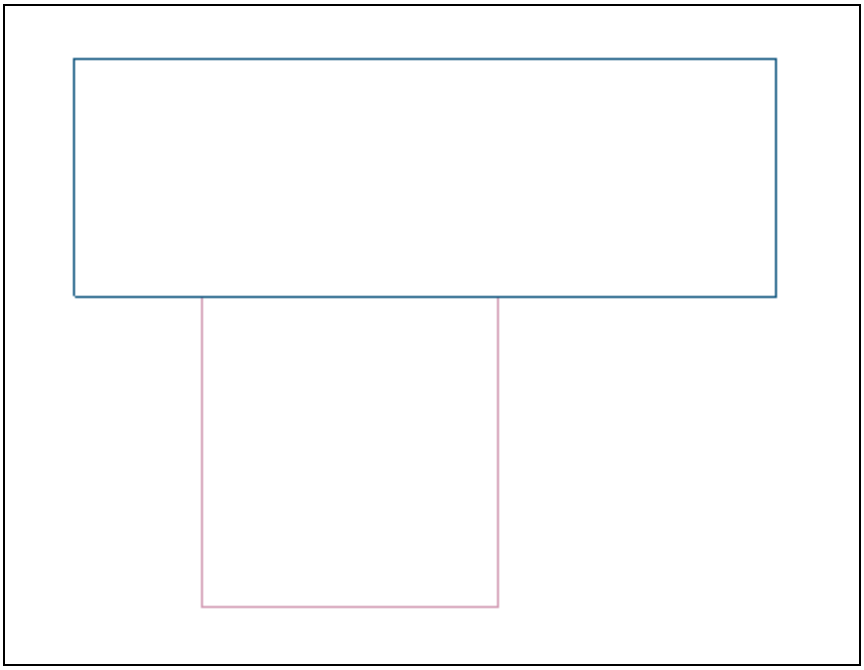


3. From the **Layout** ribbon, click **Snap Primitives**.



The selected primitives are compared to the value in the **Tolerance** field. Any primitives at or within the selected **Tolerance** are snapped (i.e., aligned).

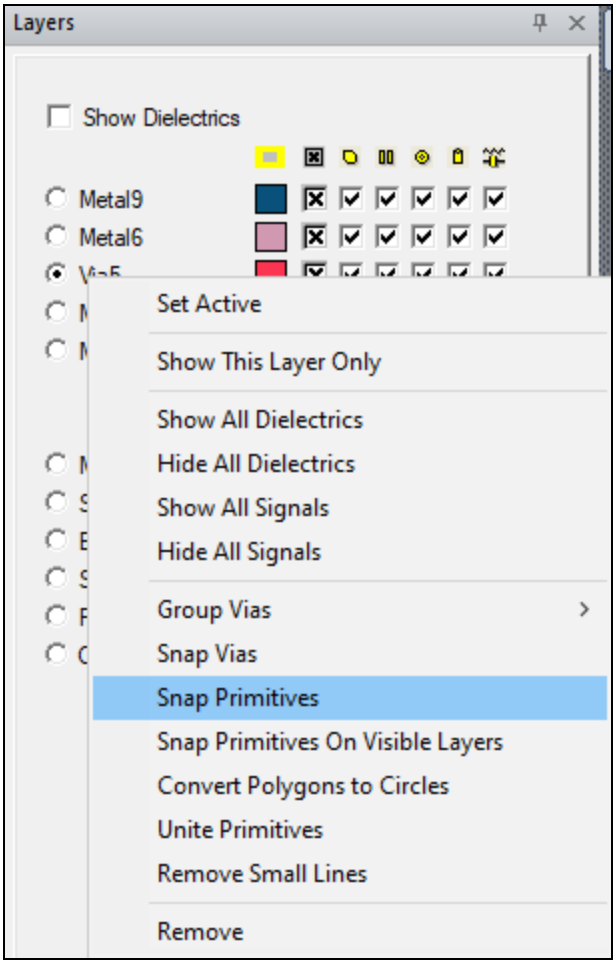
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Snapping Primitives on a Specific Layer

From the **Layers** window, right-click on a layer in the list (e.g., **Via5**) and select **Snap Primitives**.

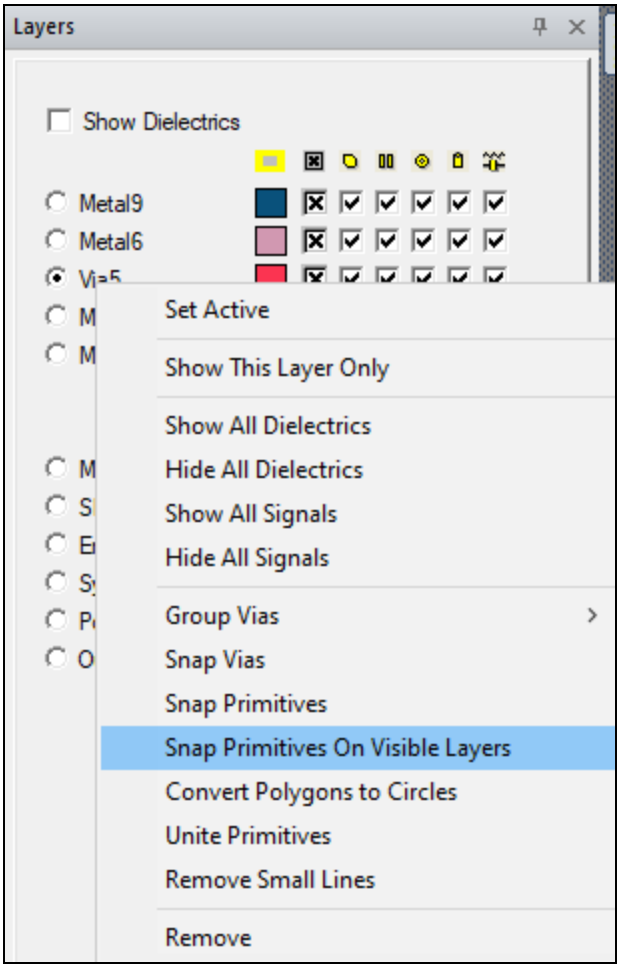
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Snapping Primitives On Visible Layers

From the **Layers** window, right-click on a layer in the list (e.g., **Via5**) and select **Snap Primitives On Visible Layers**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Removing Objects and Layers in IC Mode

IC mode offers several ways to remove unwanted objects in a design (e.g., removing islands):

- Removing Small Islands in IC Mode
- Removing Small Lines in IC Mode
- Removing Small Holes in IC Mode
- Cropping and Removing Small Fragments in IC Mode

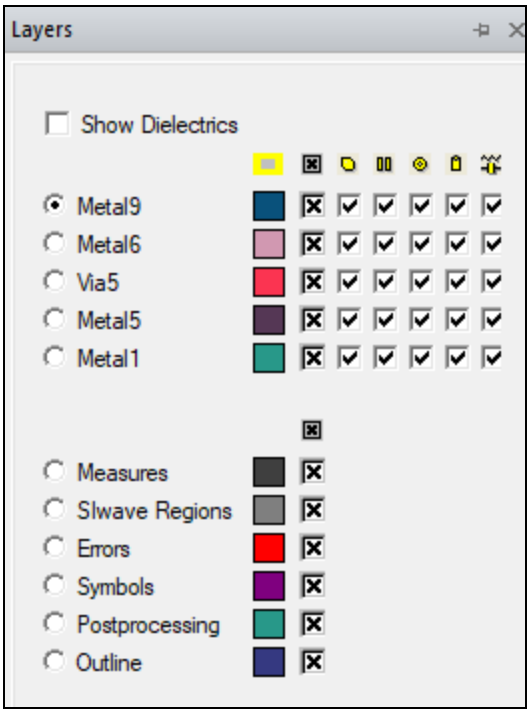
Follow these steps to remove objects from a layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

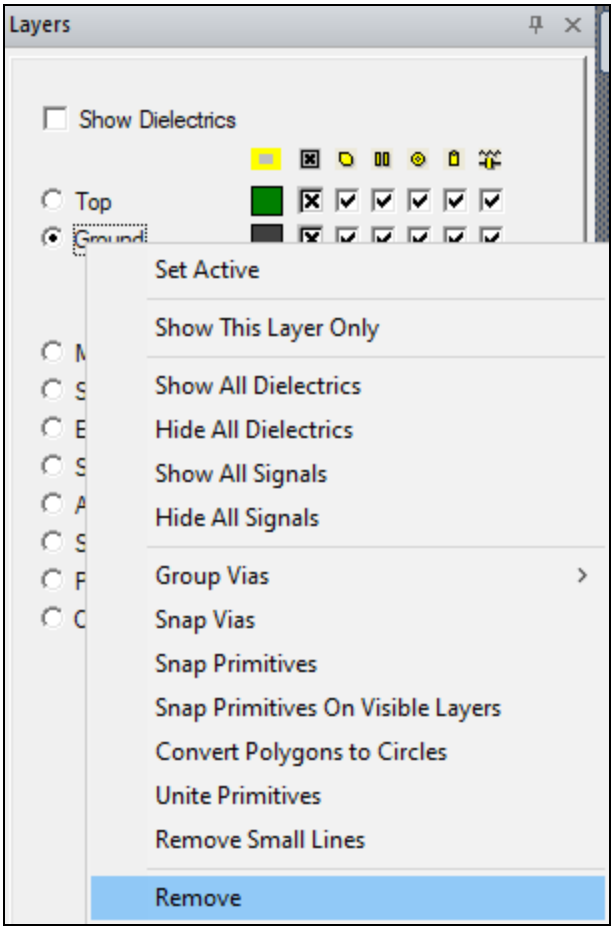
To remove layers from an encrypted design, refer to Trimming Layers from an Encrypted Design.

1. If the **Layers** window is not visible, navigate to the **Layers** tab. Click the tab to open the window.

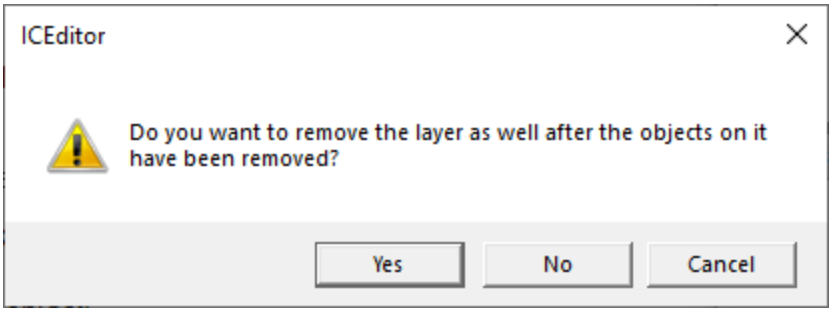


2. Right-click the appropriate layer (e.g., **Ground**) and select **Remove** to remove all the objects from it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Click **Yes** or **No**, as appropriate.



Trimming Layers from an Encrypted Design

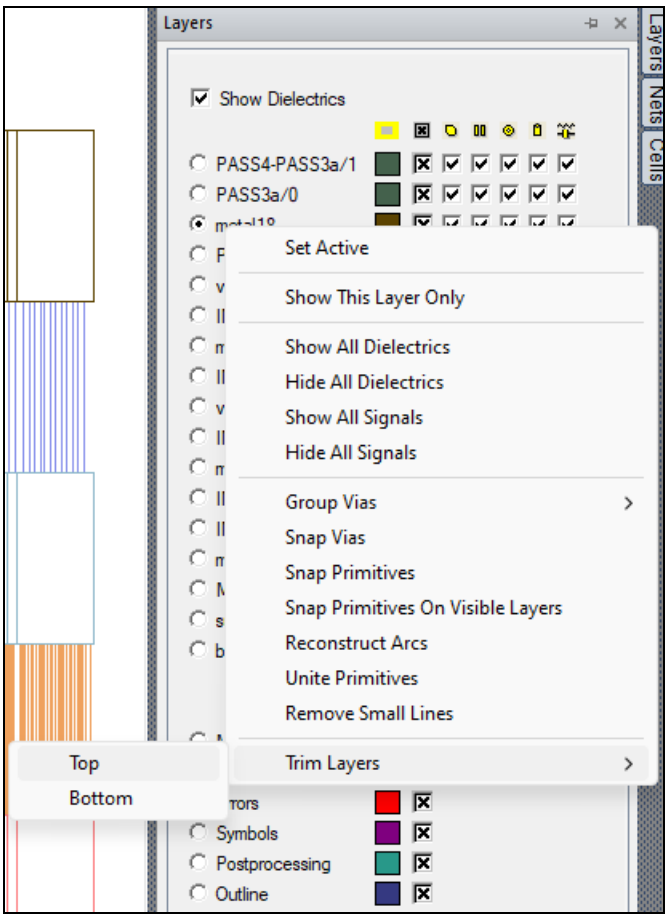
To enable interfacing with encrypted technology in hierarchical designs, users can remove the top and/or bottom layers to access the internal components. Follow these steps to remove the top/bottom layer from the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

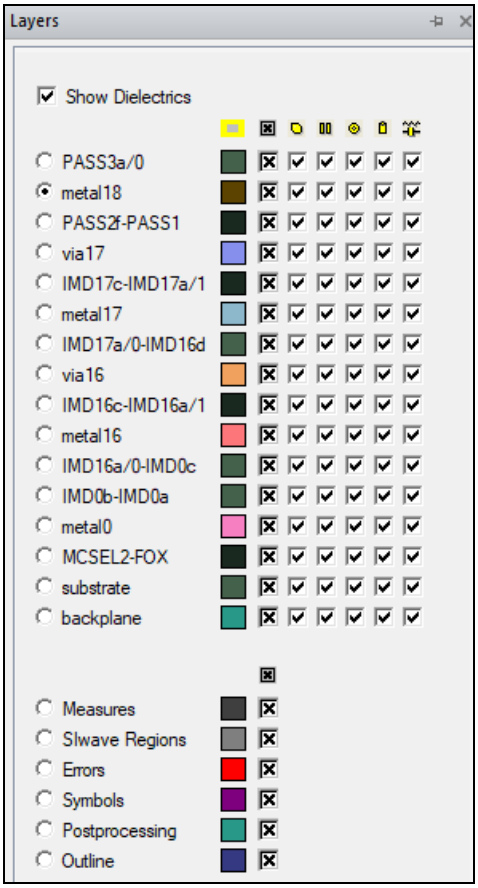
Trimming the top/bottom layers from a design disassociates the encrypted technology and invalidates all solutions and Green's Function Data.

1. Right-click in the **Layers** tab and select **Trim Layers** > **Top** or **Bottom**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. The top or bottom layer is removed from the design.



Removing Small Islands in IC Mode

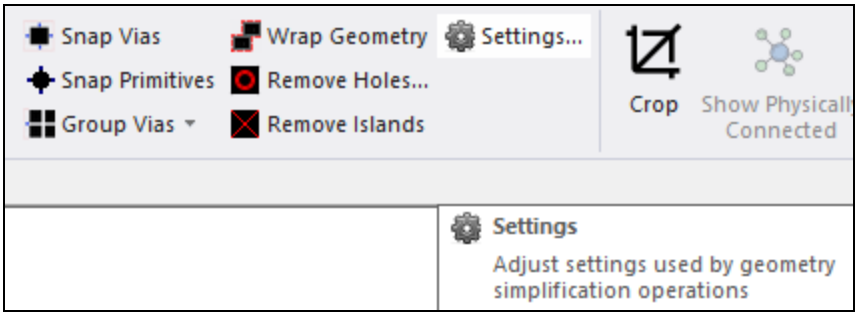
Designs may contain small detached pieces of metal (i.e., islands) that are unimportant to the simulation. An island is made up of one or more primitives and vias. Users can clean up a design by using the **Remove Islands** feature. Islands are removed if the total area covered by all of its primitives and vias is smaller than the user-specified **Tolerance**.

Complete steps in the following subsections to configure **Remove Small Metal Islands**, then remove islands within a design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

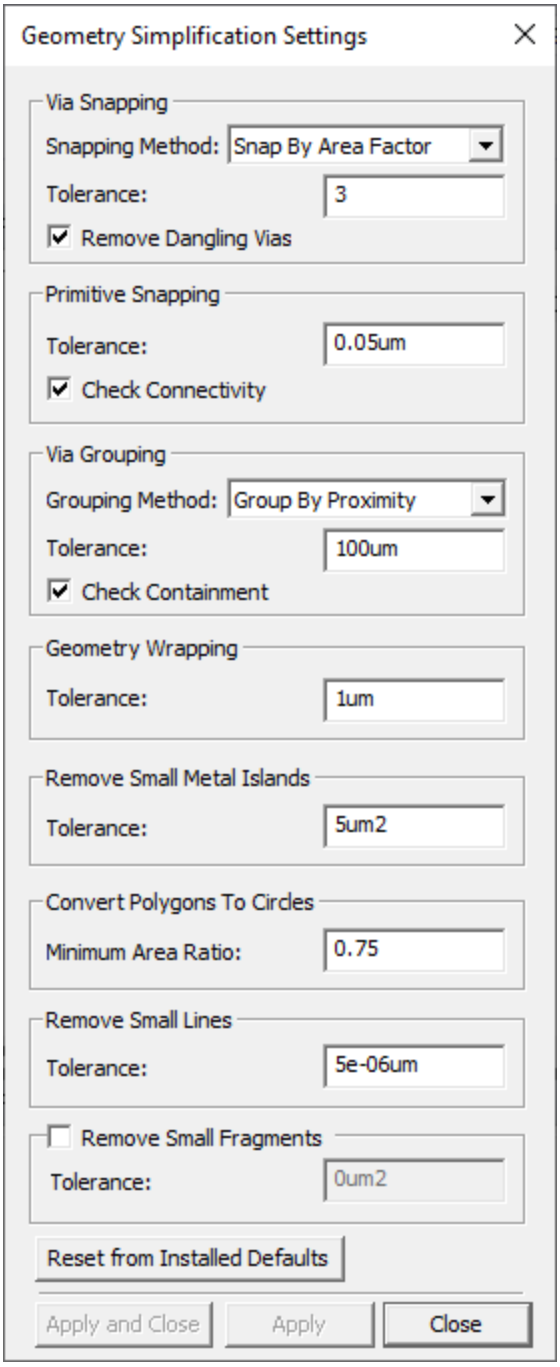
Configuring Remove Small Islands Settings

1. From the **Layout** ribbon, click **Settings**.



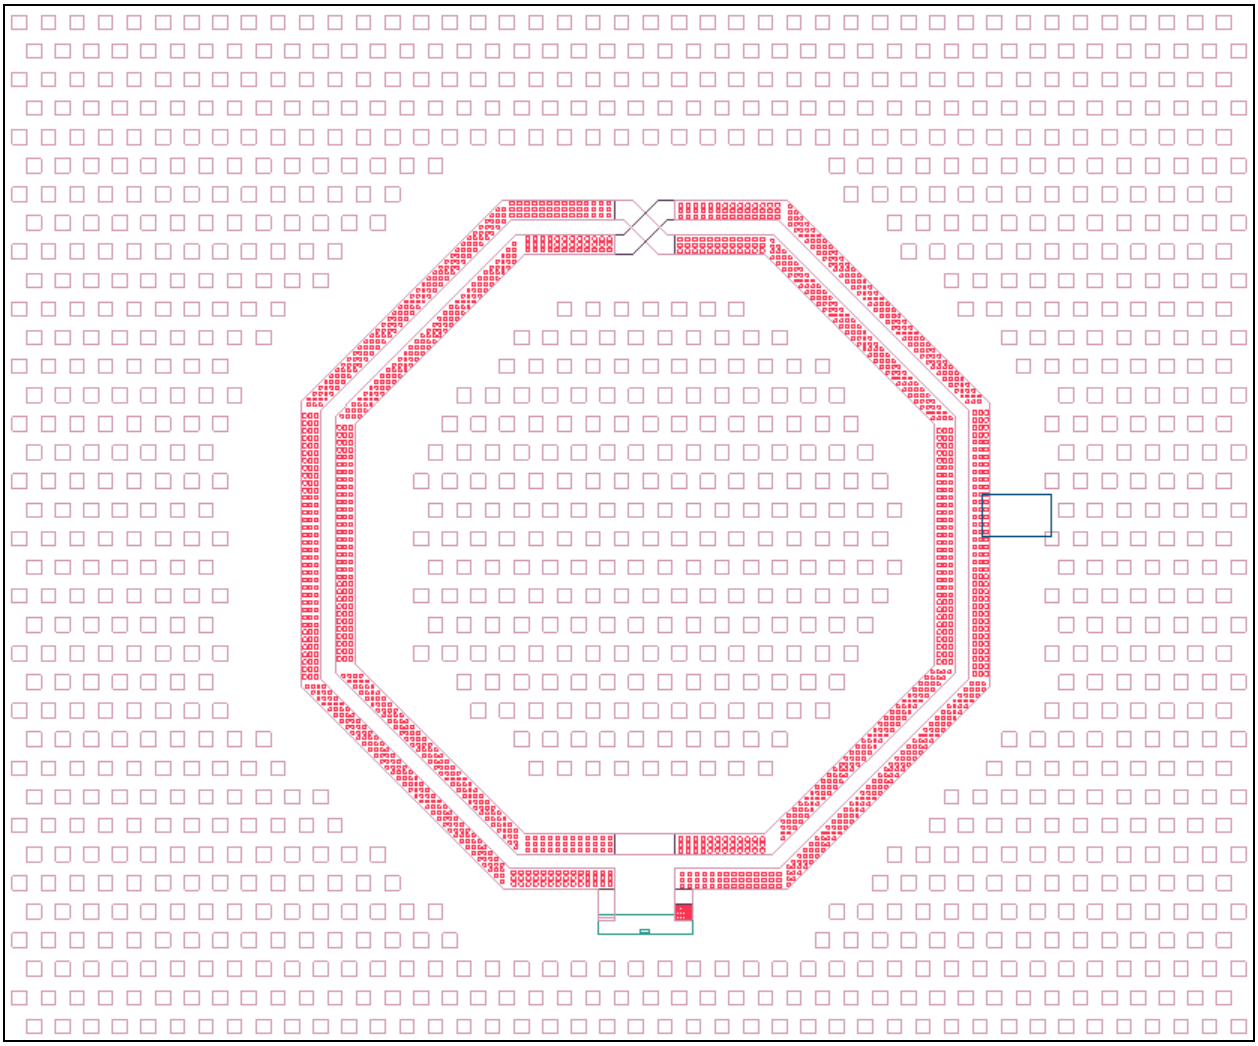
The **Geometry Simplification Settings** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Remove Small Metal Islands** area, enter a value in the **Tolerance** field (e.g., **5um2**).
3. Click **Apply and Close**.

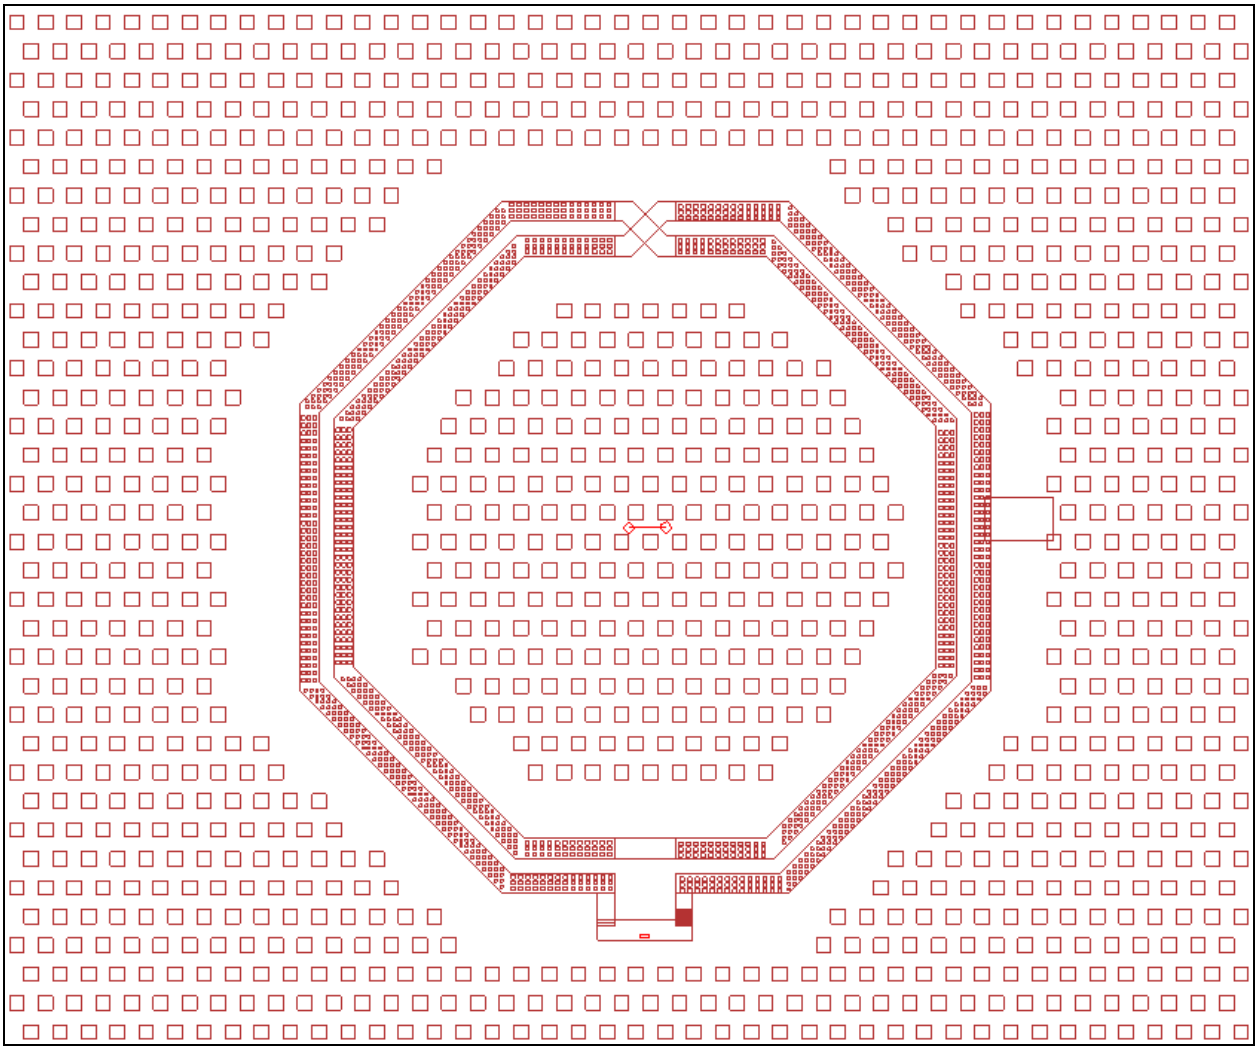
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

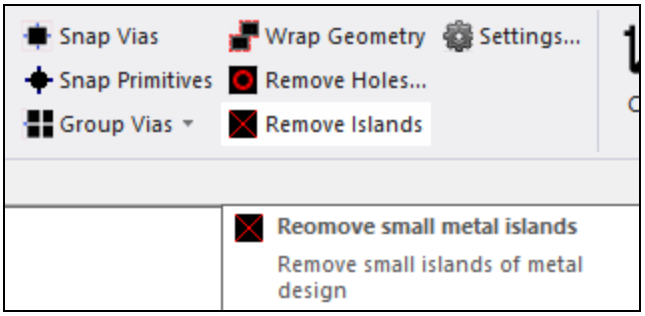
Removing Small Islands in the Layout Editor

1. Select the selected elements of the design.



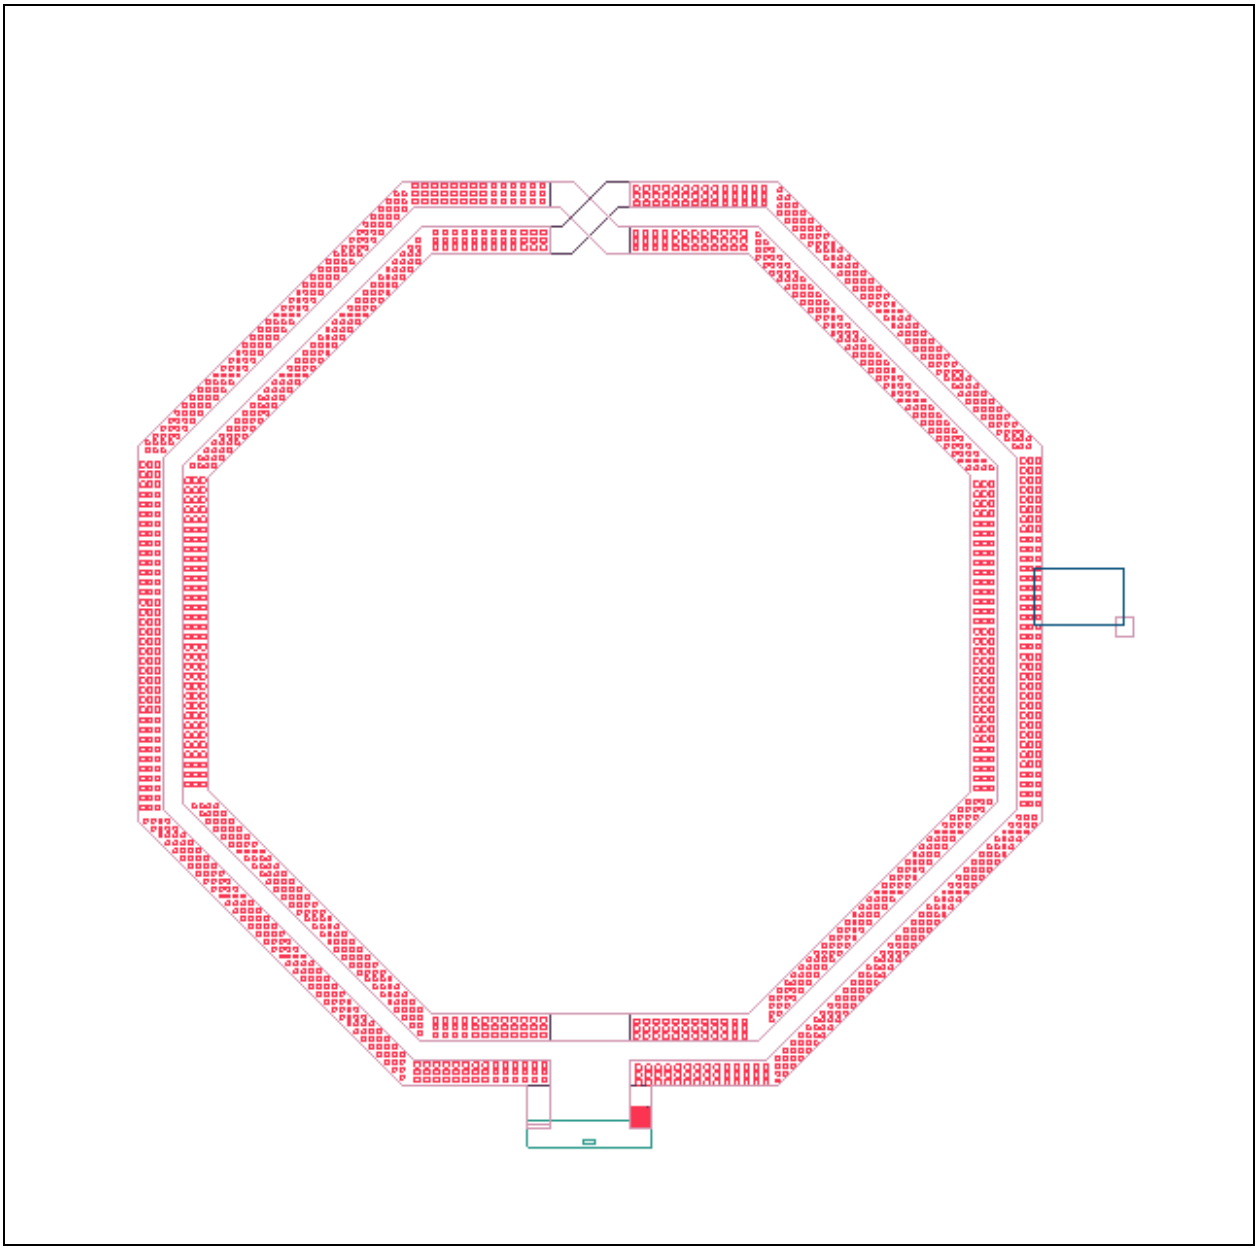
2. From the **Layout** ribbon, click **Remove Islands**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The selected elements are compared to the value in the **Tolerance** field. Any piece of metal the same size or smaller than the set **Tolerance** is removed from the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Removing Small Lines in IC Mode

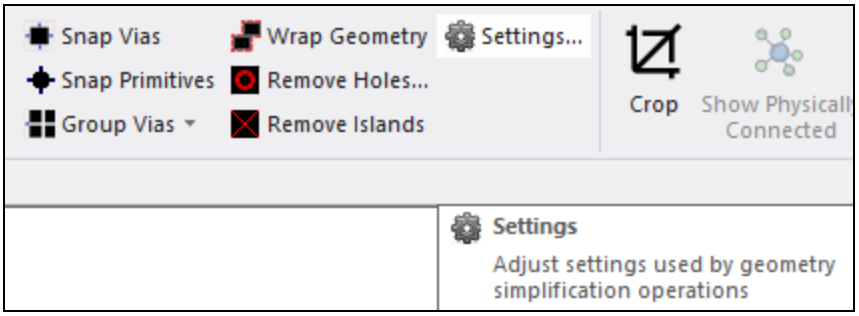
Designs contain small lines (i.e., traces) that are unimportant to the simulation. Users can clean up a design by using the **Remove Small Lines** feature. Lines are removed if their total area is smaller than the user-specified **Tolerance**. Follow these steps to configure and run the **Remove Small Lines** feature.

Complete steps in the following subsections to configure **Remove Small Lines**, then remove lines within a design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

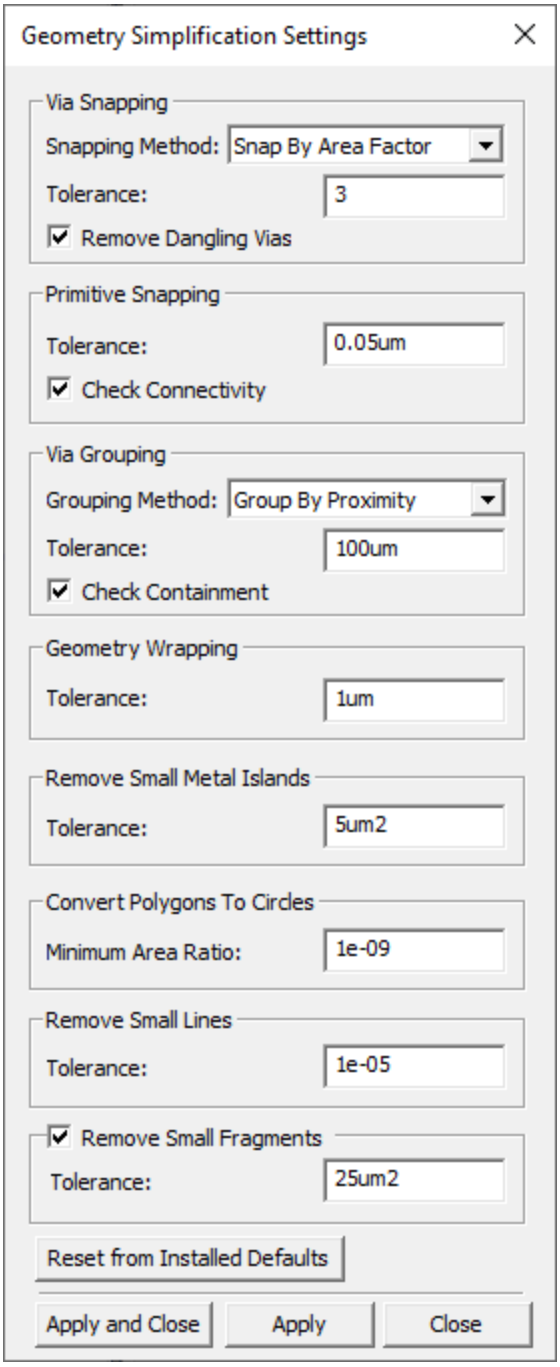
Configuring Remove Small Lines Settings

1. From the **Layout** tab, click **Settings**.



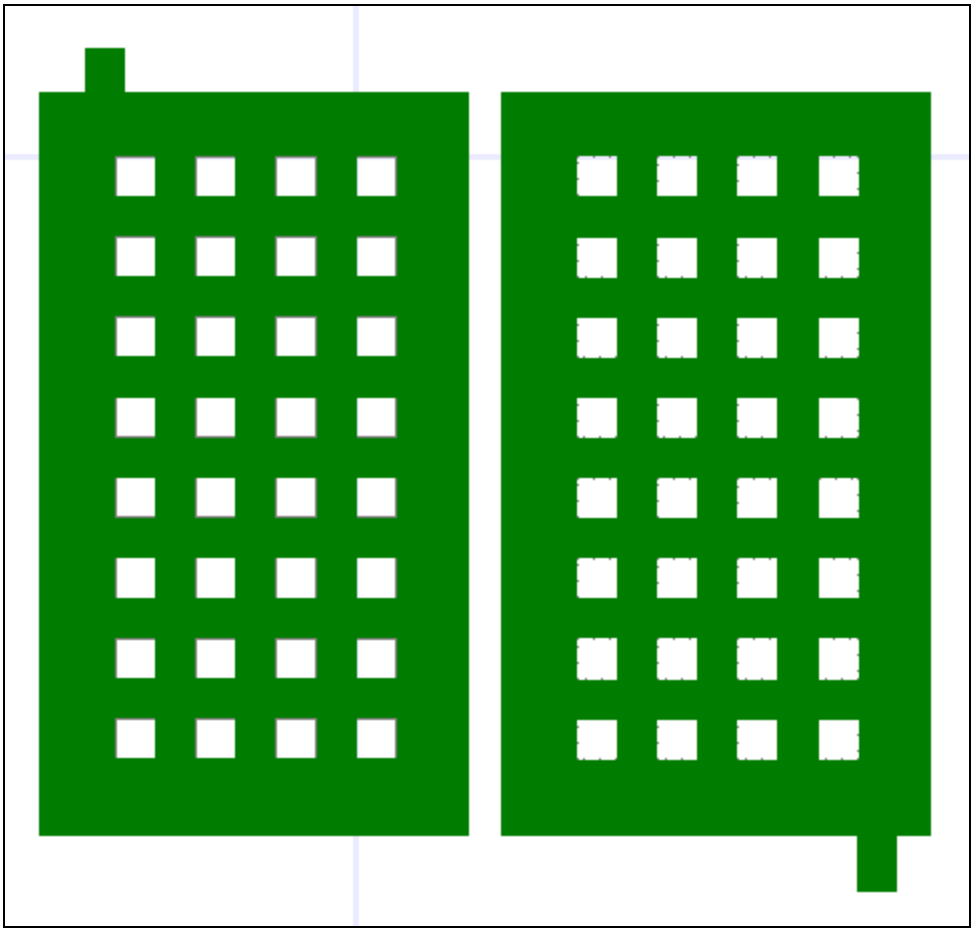
The **Geometry Simplification Settings** window opens.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Remove Small Lines** area, enter a value in the **Tolerance** field (e.g., **1e-05**, although the default value is **5e-06um**).
3. Click **Apply and Close**.

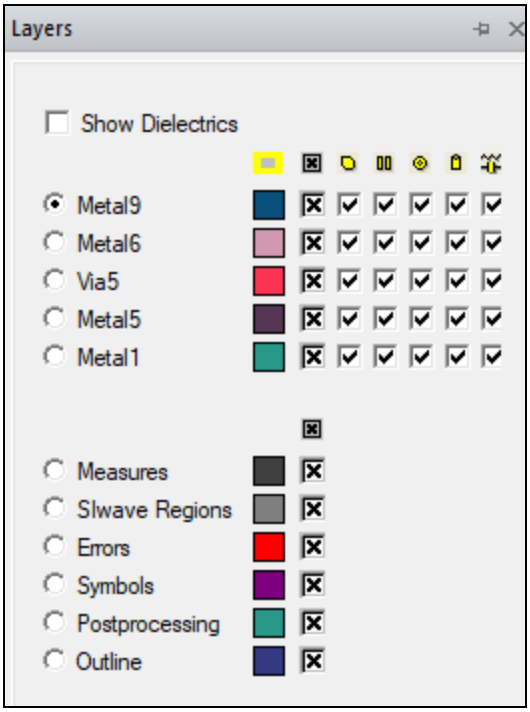
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Removing Small Lines in the Layout Editor

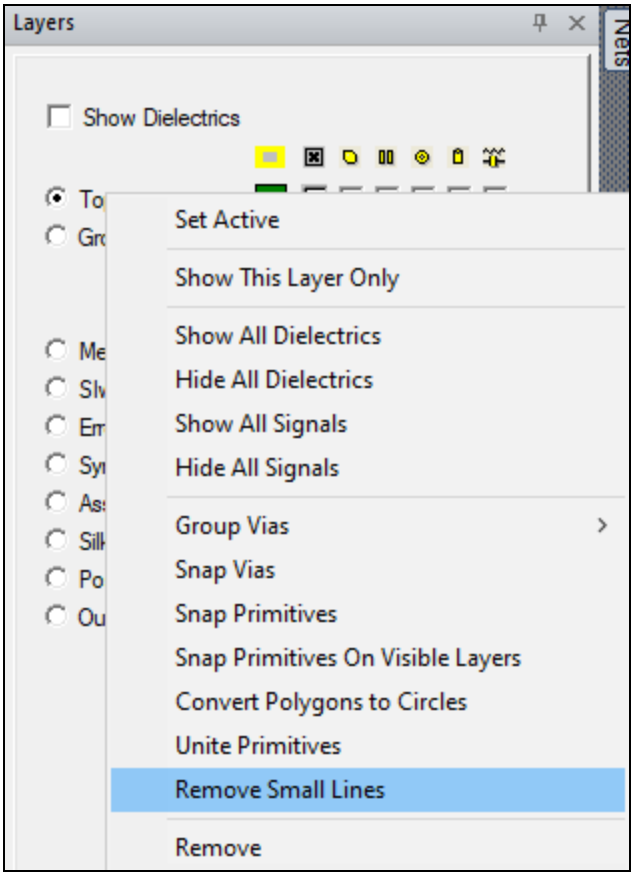
1. If the **Layers** window is not visible, navigate to the **Layers** tab. Click the **Layers** tab to open the window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



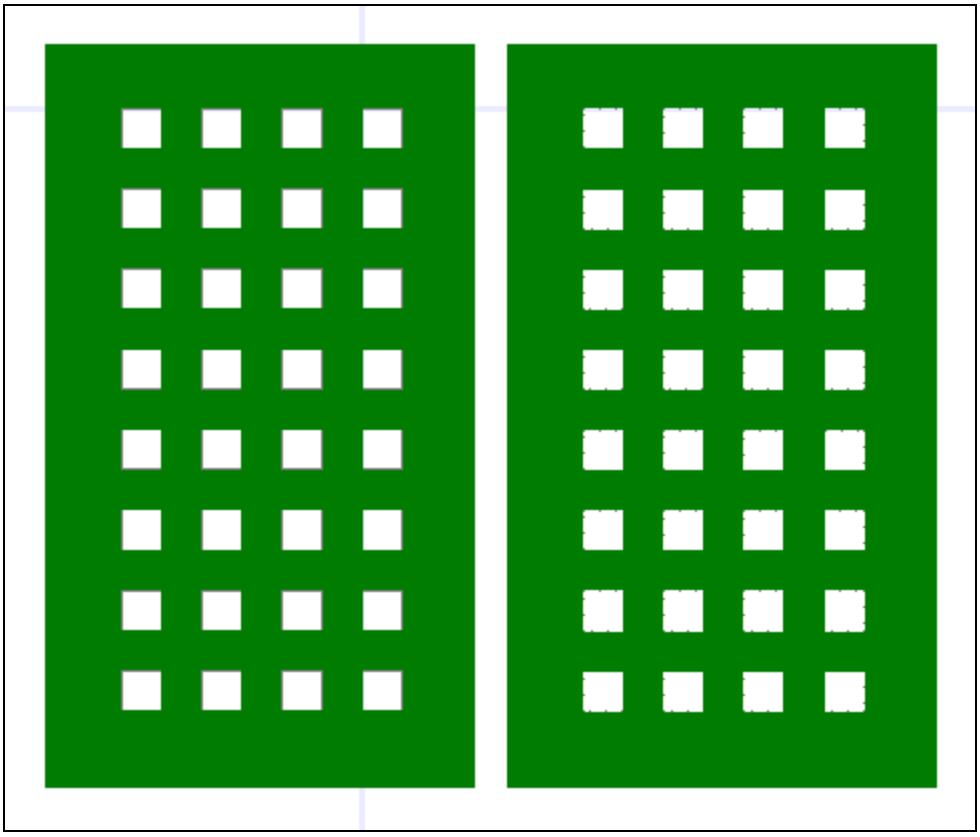
2. Right-click the selected layer (e.g., **Top**) and select **Remove Small Lines**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Lines in the designated layer are compared to the value in the **Tolerance** field. Any line with the same total area or smaller than the set **Tolerance** is removed from the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

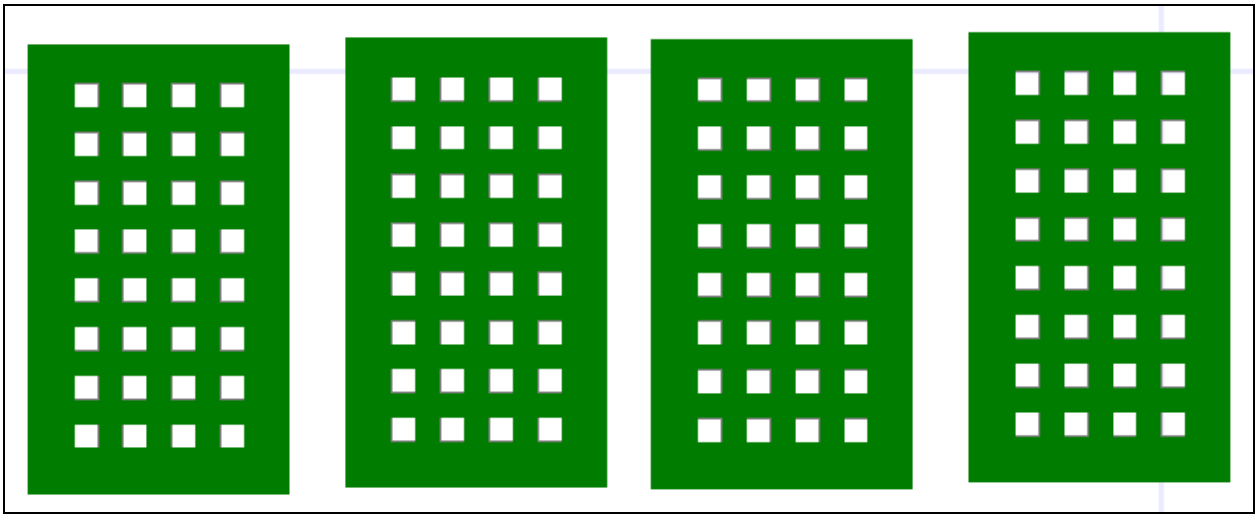


Removing Small Holes in IC Mode

Designs can contain inappropriate holes that users may want to remove. Users can clean up a design by using the **Remove Holes** feature. Holes are removed if their total area is smaller than the threshold set by the user, unless otherwise excluded using the parameters in the **Remove Small Holes** window.

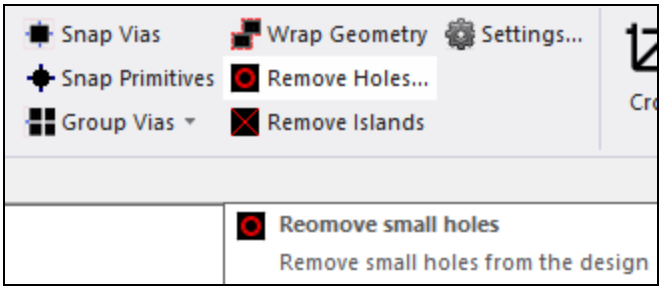
Complete the instructions in the following subsections to adjust the **Remove Small Holes** settings, then remove small holes from a design in several ways.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



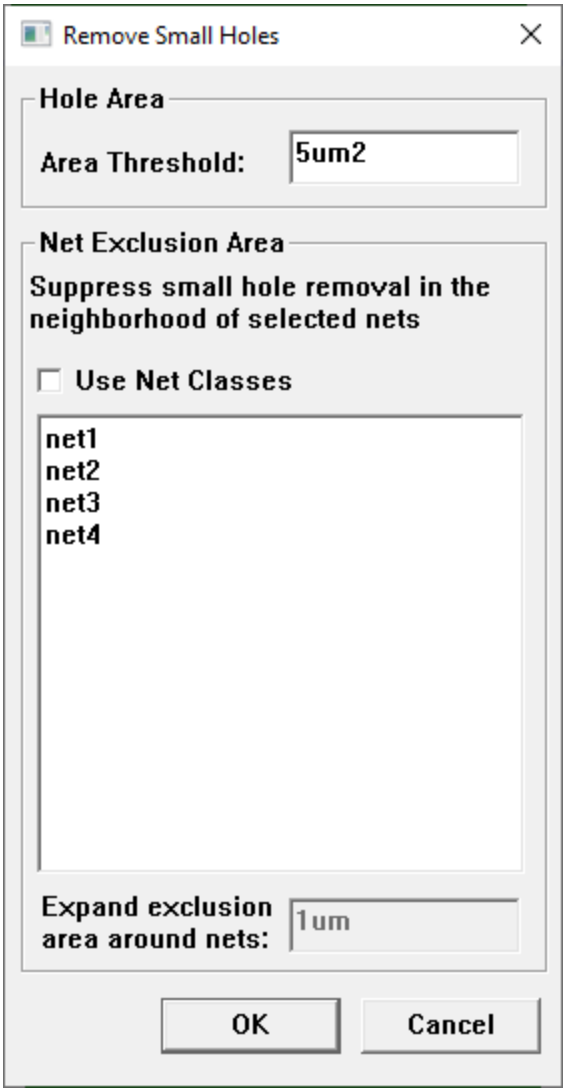
Accessing the Remove Small Holes Window

From the **Layout** ribbon, click **Remove Holes**.



The **Remove Small Holes** window opens.

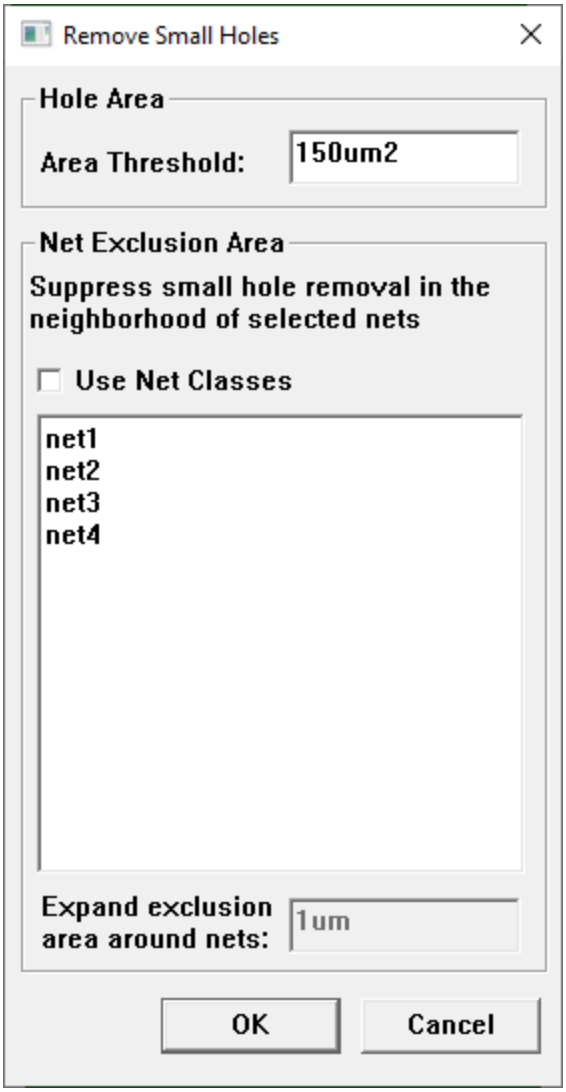
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Removing Small Holes Using Area Threshold

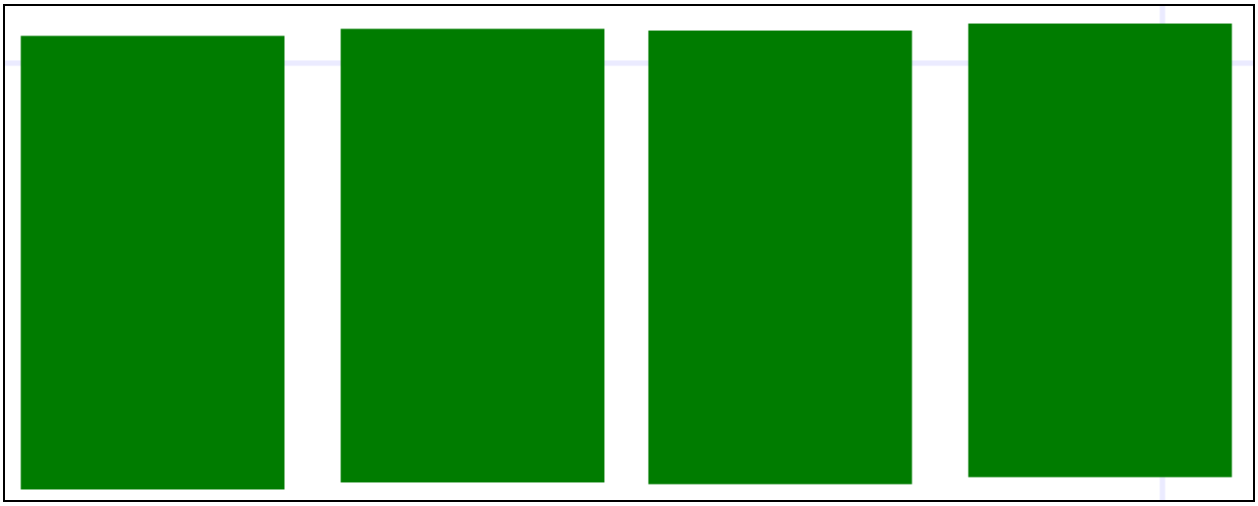
1. From the **Hole Area** area, enter a value in the **Area Threshold** field (e.g., **150um2**, although the default value is **5 um^2**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



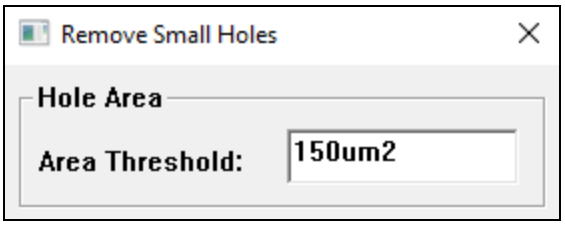
2. Click **OK** to close the **Remove Small Holes** window. All of the holes are compared to the value in the **Area Threshold** field. Any hole the same size or smaller than the entered value is removed from the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Removing Small Holes Using Net Exclusion

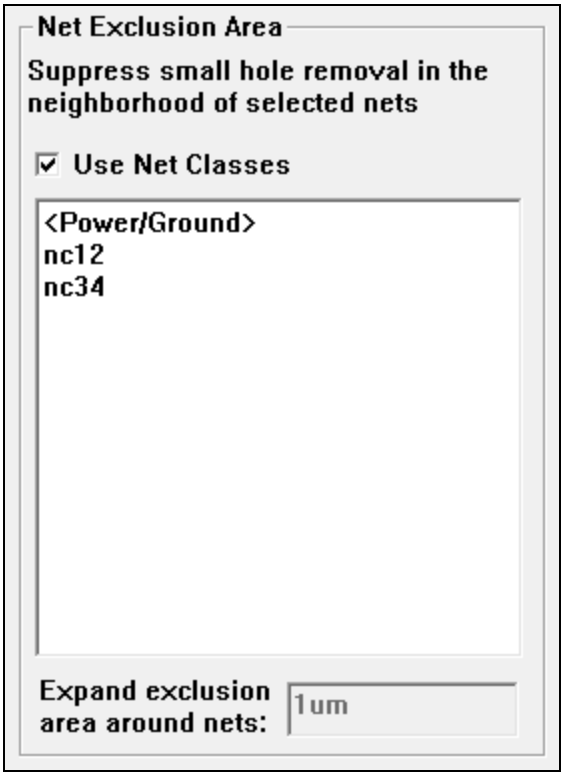
a. From the **Hole Area** area, enter a value in the **Area Threshold** field (e.g., **150um2**).



b. From the **Net Exclusion Area** area, do the following:

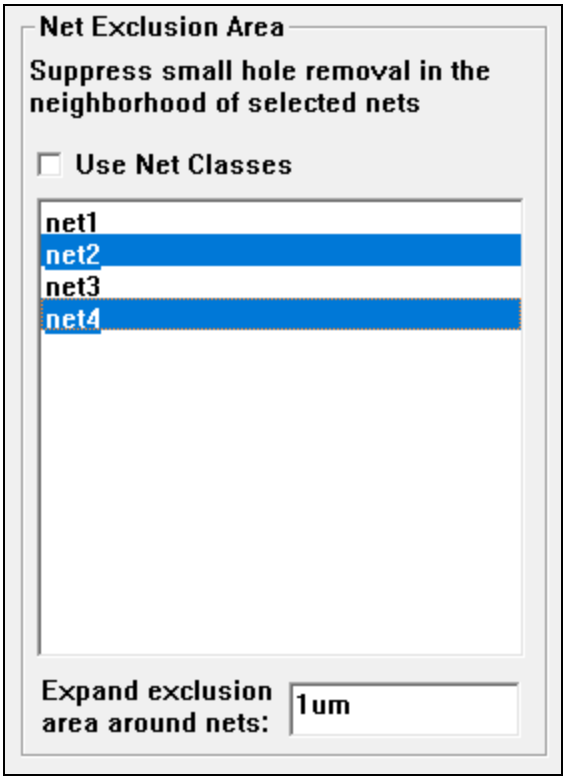
- If required, check the **Use Net Classes** box to select from a list of net classes rather than individual nets.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

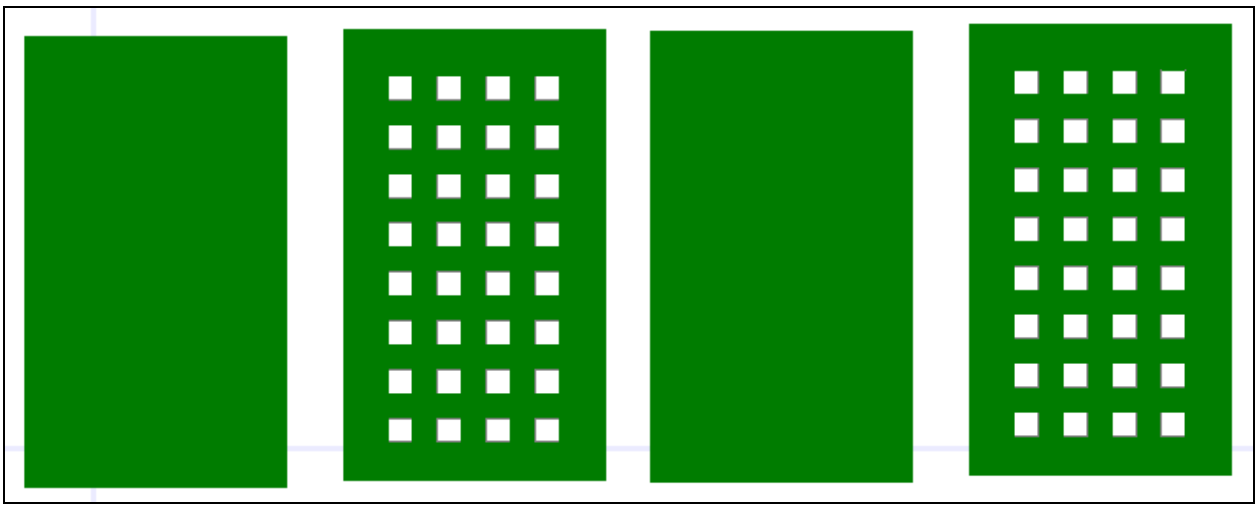


- Click a net/net class to exclude from hole removal. **Ctrl+click** to select more than one net/net class (e.g., **net2** and **net4**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



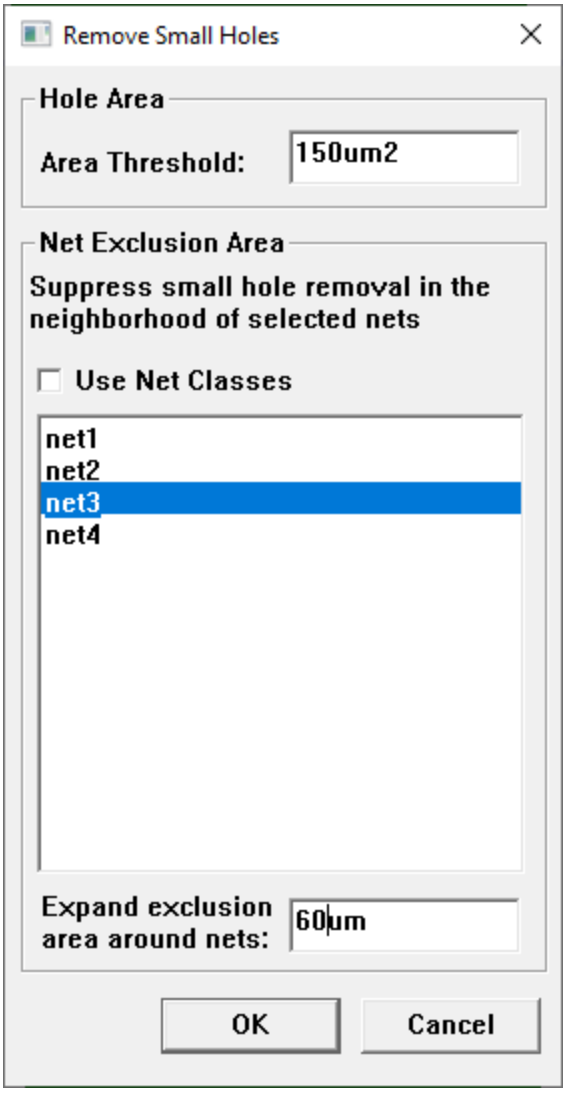
c. Click **OK** to close the **Remove Small Holes** window. All of the holes that are **not** in exclusion zones are compared to the value in the **Area Threshold** field. Any hole the same size or smaller than the entered value is removed from the design.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

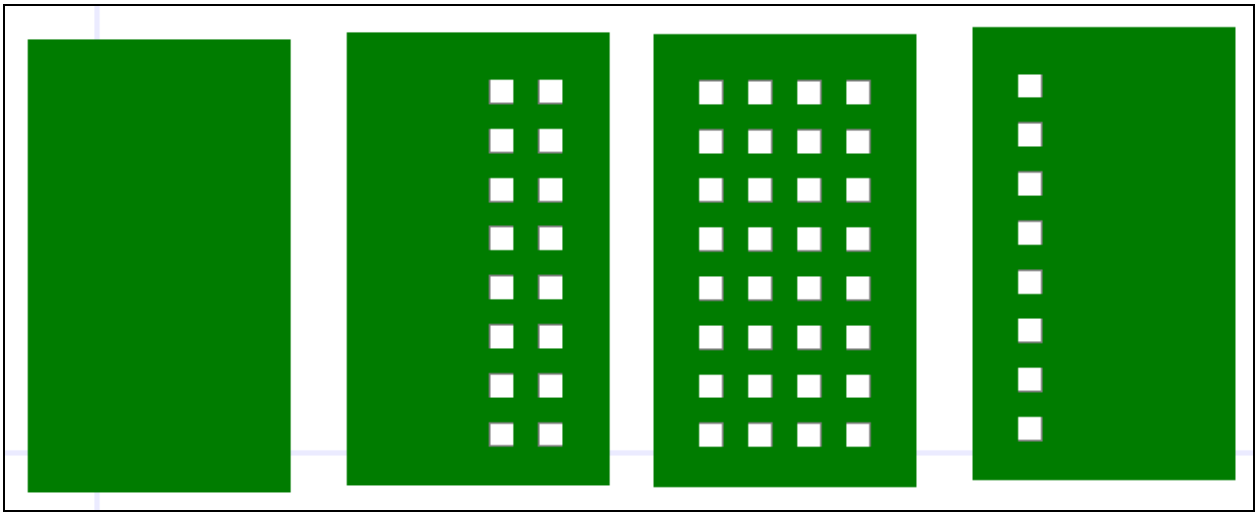
Expanding the Exclusion Area

After selecting nets or net classes to exclude from hole removal (e.g., **net3**), the **Expand exclusion area around nets** field is enabled. Enter a value in the **Expand exclusion area around nets** field (e.g., **60um**) to widen the exclusion area around the selected net(s)/net class (es).



Click **OK** to close the **Remove Small Holes** window. All of the holes that are **not** in exclusion zones, as defined by user-selection in the **Net Exclusion Area** area list and the **Expand exclusion area around nets** field are compared to the value in the **Area Threshold** field. Any hole the same size or smaller than the entered value is removed from the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Cropping and Removing Small Fragments in IC Mode

Crop a design to filter nets and/or clip a design by a polygon. If cropping a design leaves behind inappropriate fragments, remove them by adjusting the selected parameter in the **Geometry Simplification Settings** window. Before cropping, consider the following:

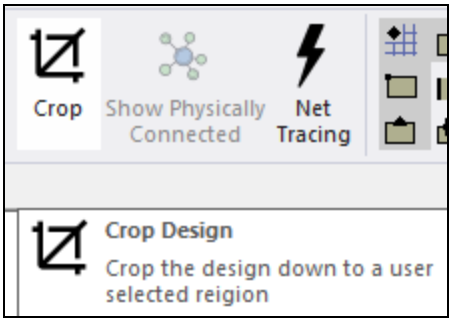
- If a polygon is selected before the operation is performed, it becomes the default extent polygon.
- If the selection is made entirely by net, then no geometry should be selected before invoking the operation. If multiple polygons are selected, the union of these polygons forms the extent.
- If no data is selected, a new design is created with a stackup identical to the source design, but no geometry is transferred.
- **Crop** works on hierarchy and footprints, however, everything is **flattened** into the sub-design that is created.

Cropping a Design

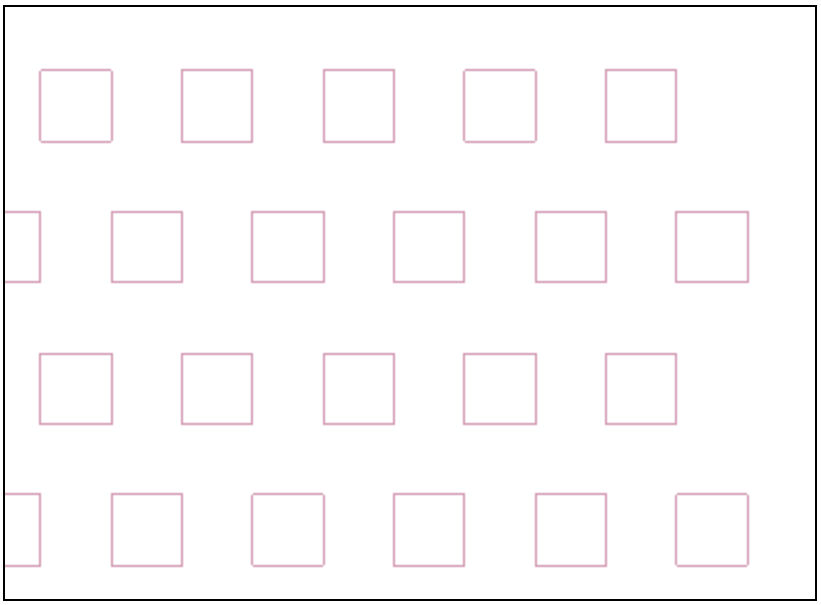
Follow these steps to crop a design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From the **Layout** ribbon, click **Crop**.

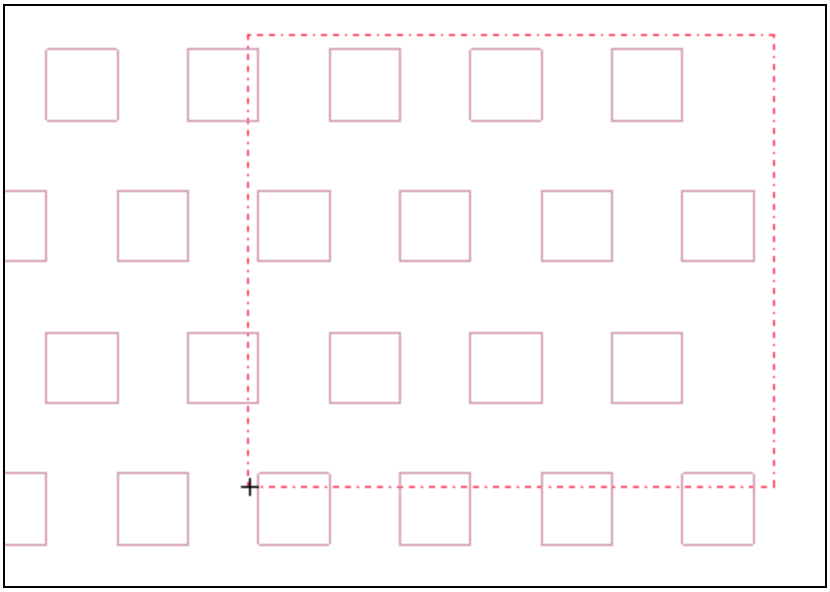


2. If applicable, navigate to the **Layout Editor** tab and the selected components.

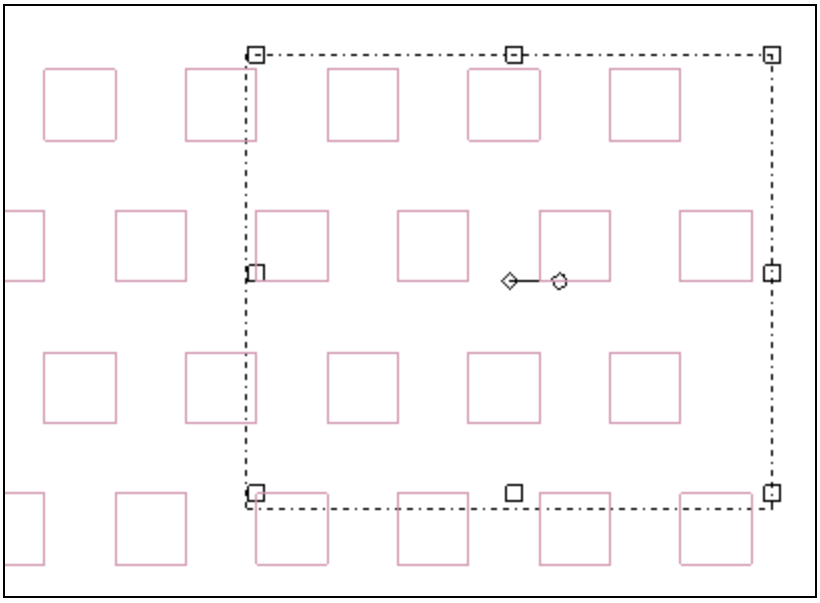


3. **Click** within **Layout Editor** to begin selecting a region of the design to preserve. Move the cursor to surround the entire region.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

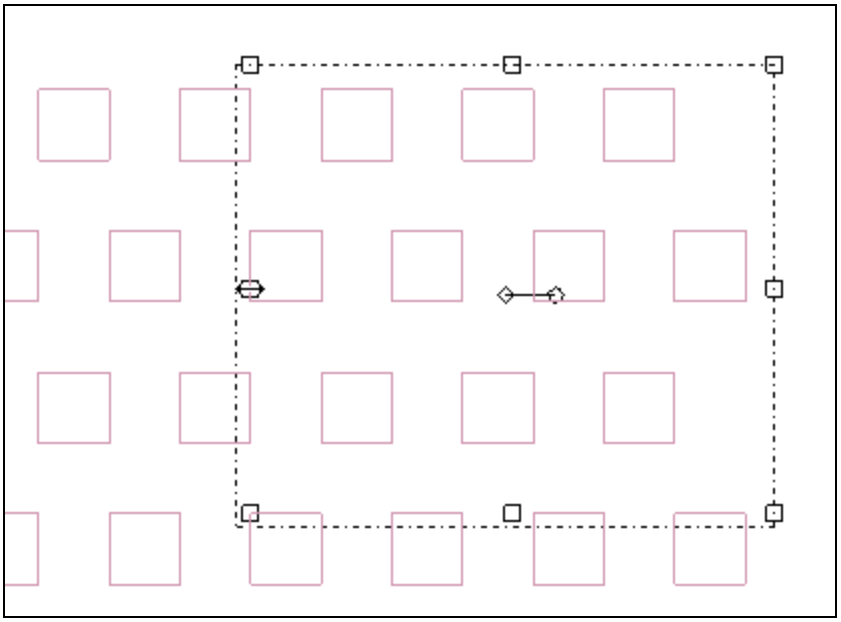


4. **Click** to define the region within the bounding box.

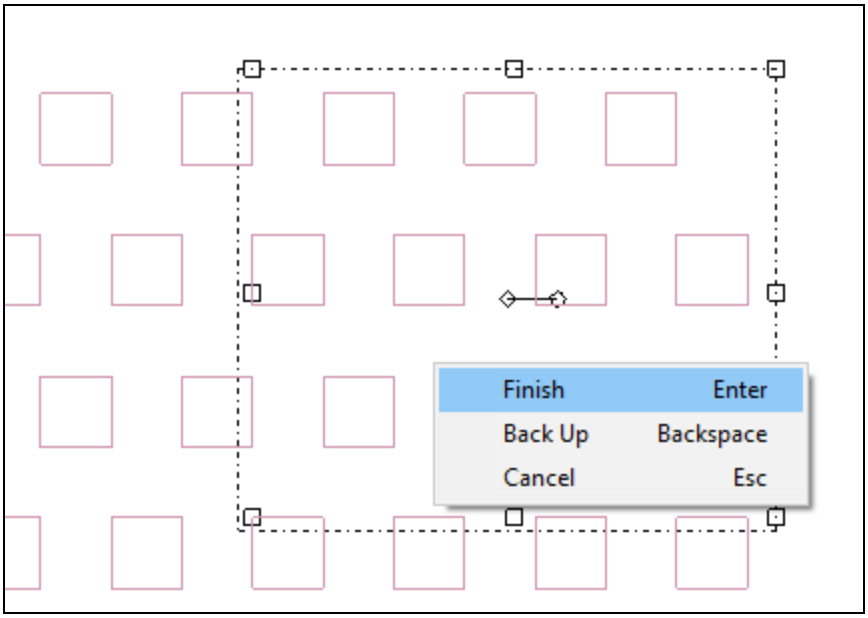


5. If applicable, expand or contract the bounding box. Hover over any of the square handles and the cursor will change into a double-headed arrow. Then **click+hold** the handle and drag to change the size of the selected region.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

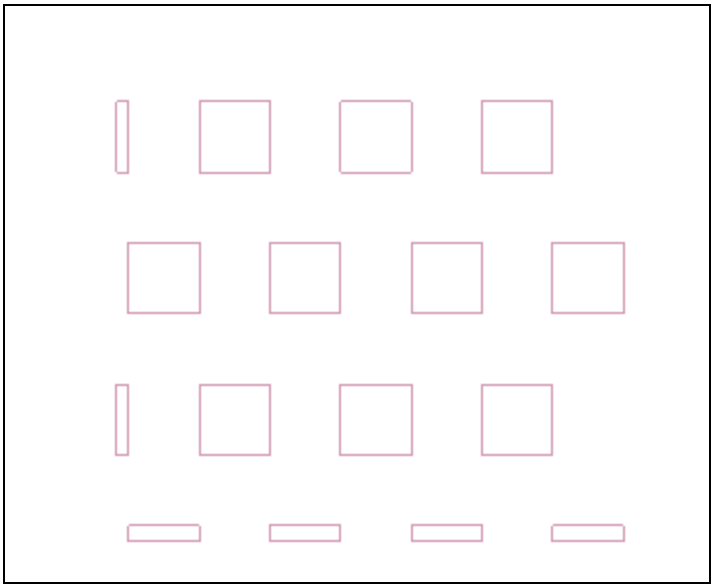


6. Right-click anywhere in the **Layout Editor** and select **Finish**.



Every element outside of the selected region is removed from the design. From the following screenshot there are fragments left behind by the **Crop**.

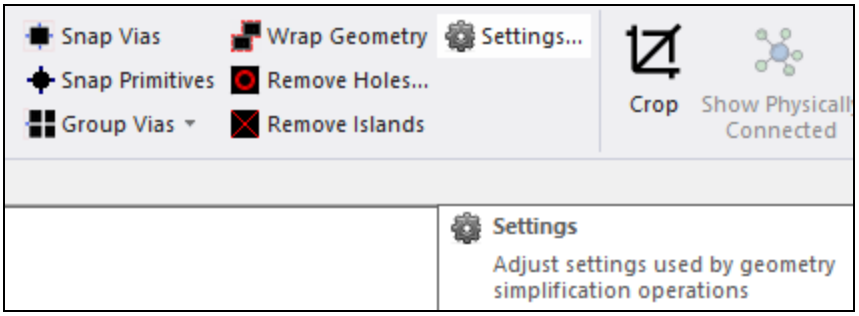
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Removing Small Fragments From a Design

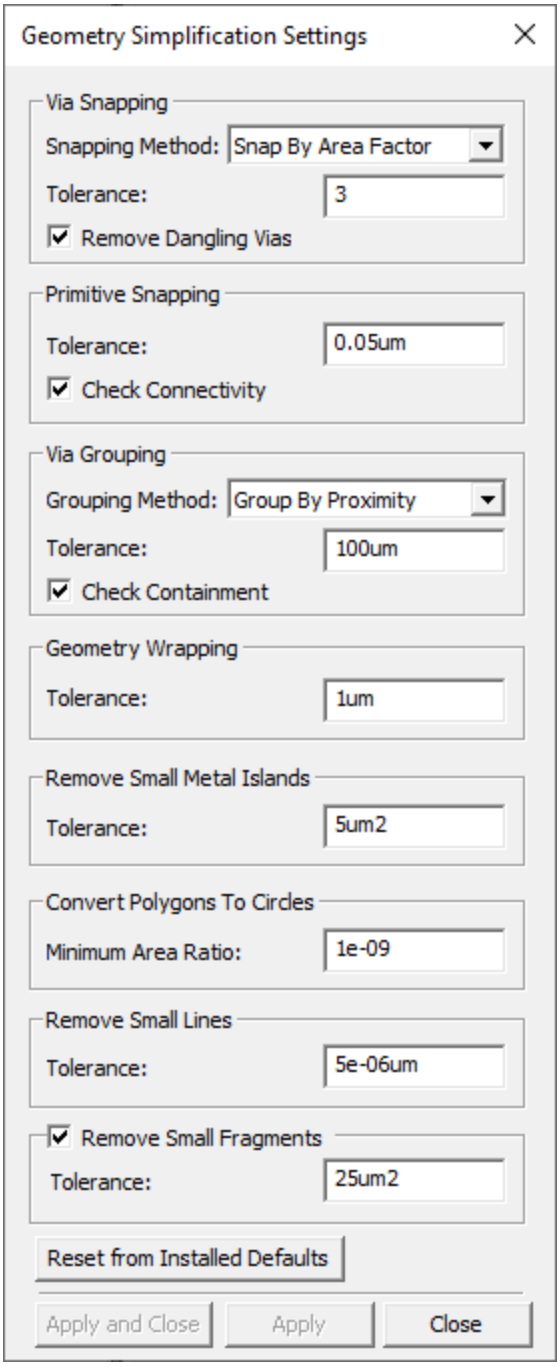
Follow these steps to configure **Remove Small Metal Fragments**, then remove fragments within a design.

1. From the **Layout** ribbon, click **Settings**.



The **Geometry Simplification Settings** window opens.

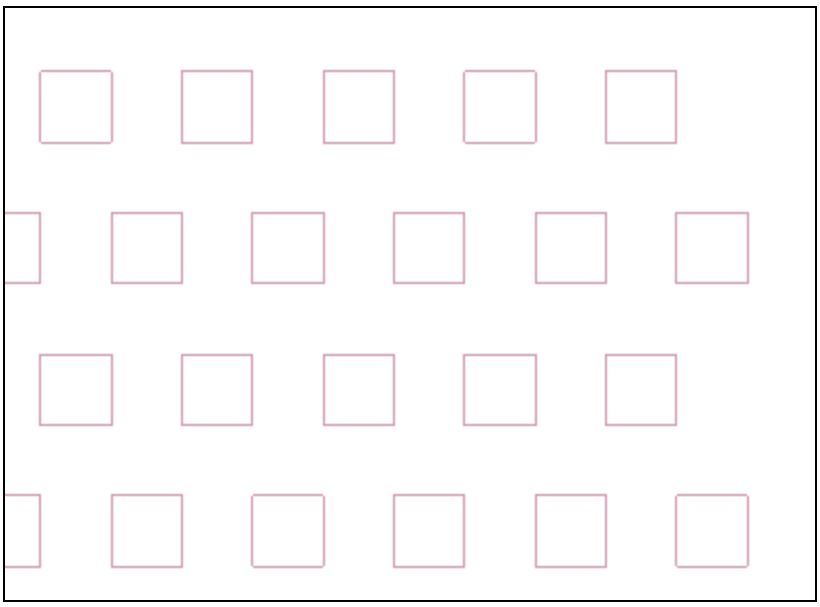
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



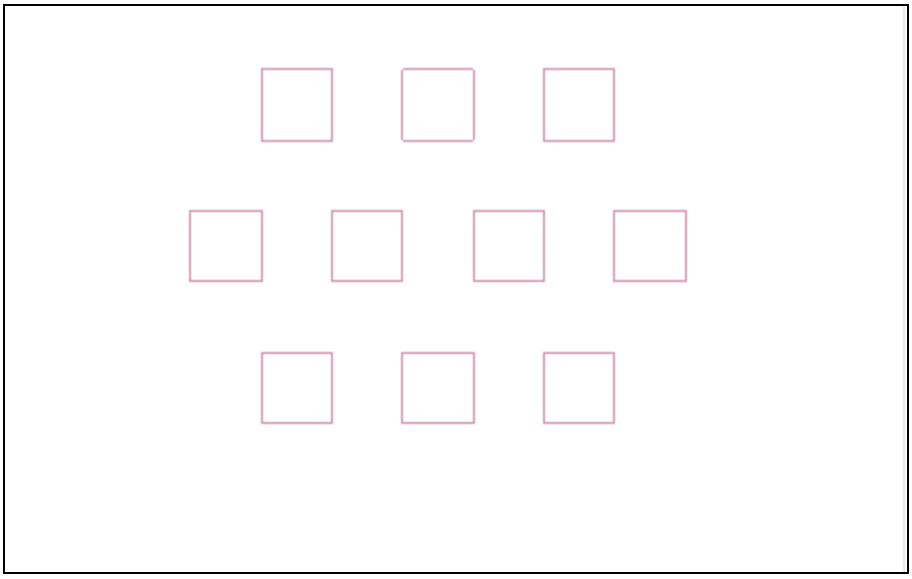
2. From the **Remove Small Fragments** area, do the following:
    a. Check the **Remove Small Fragments** box to activate the feature.
    b. Enter a value in the **Tolerance** field (e.g., **25um**, although the default is **5um**).
3. Click **Apply and Close**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click **Ctrl**+**Z** to reset the last changes made in the **Layout Editor** (e.g., undo the crop performed in Cropping a Design).



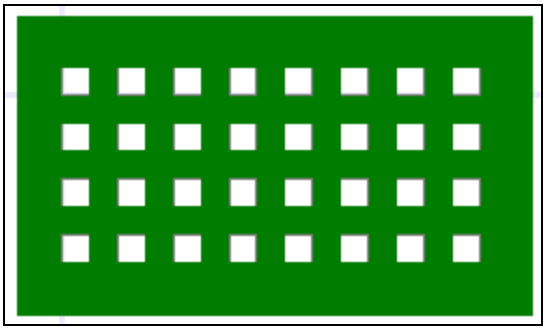
5. Repeat steps **3-6** in Cropping a Design. The fragments left behind by the **Crop**were at or below the **Tolerance** value, so they are also removed.



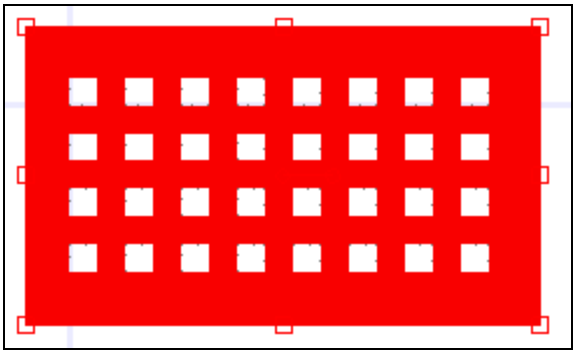
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Copying and Pasting in IC Mode

Design elements can be copied and pasted in IC mode, just like in General mode. Follow these steps to copy and paste in IC mode.

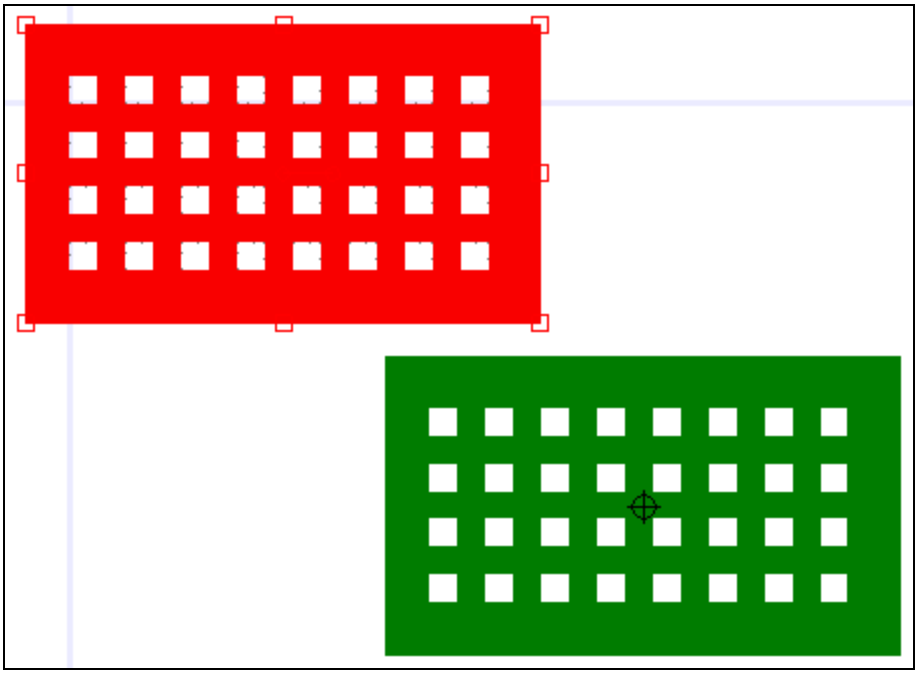


1. From the **Layout Editor**, select the selected element(s) and press **Ctrl**+**C**.

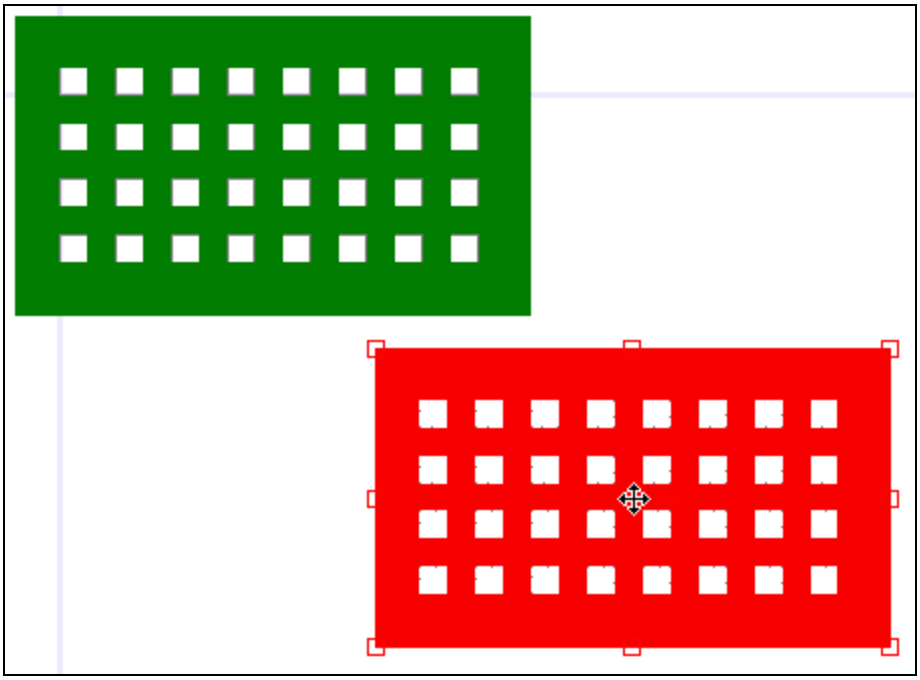


2. Press **Ctrl**+**V** to create a copy of the element. The copy is temporarily locked to the cursor.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

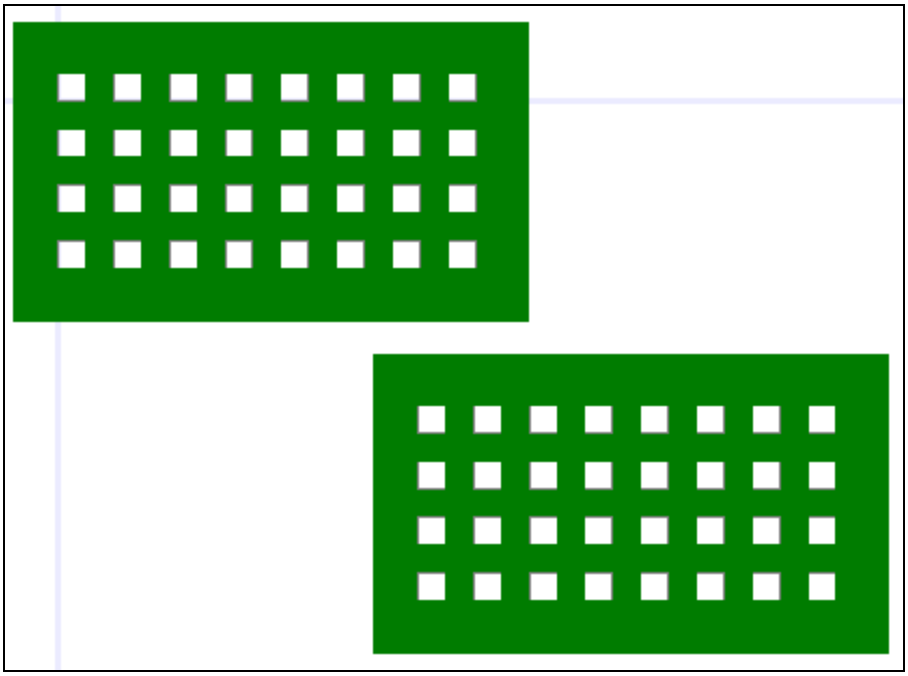


3. Choose an area in the **Layout Editor** to place the copy. **Click** to set the copy down.



4. Click anywhere else in the **Layout Editor** to deselect the copy.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



For other instructions on the usage of the **Layout Editor**, keyboard commands, and simple tasks like copying and pasting, refer to Getting Started with Ansys Electronics Desktop.

Working with Objects

The following topics describe various tools and methods for working with objects in the Layout Editor.

Selection Modes in the Layout Editor

Three selection modes exist: **General**, **Handle**, and **Edge**.

- General Selection Mode — Used primarily to select objects. **General Mode** is the default section mode. You can activate the General selection mode by selecting **Edit > Select** or by clicking the Select Elements icon .
- Handle Selection Mode — Used to select object handles. You can activate the Handle selection mode by selecting **Edit > SelectHandles** or by clicking the Select Handles icon .
- Edge Selection Mode — Used to select object edges. You can activate the Edge selection mode by selecting **Edit > SelectEdges** or by clicking the Select Edges icon .

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In General selection mode, the cursor becomes a small cross hair when it is not positioned over a selectable object:

When the cursor is positioned over a selectable object, or the handle of a selectable object, the cursor changes to one of the following to indicate what object/handle can be moved: 
To give a visual clue as to the current selection mode, the cursor changes in the following manner:

	Not over selectable Edge/Handle	Over selectable Edge/Handle
General Selection Mode		
Edge Selection Mode		
Handle Selection Mode		

Using Handles

Handles are graphical attachments to objects that allow you to manipulate objects in the Layout editor. Two general types of handles exist: **Implicit** and **Explicit**. Implicit handles are created automatically, while Explicit handles are created by the user.

Implicit Handles

- In Layout, every primitive object (void, line, polygon) and compound object (via, footprint, sub-circuit) contains **Implicit** handles — identified by small red squares — which can be used to resize the object. There are two kinds of Implicit handles: **Edge** handles and **Point**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

handles. Edge handles pertain to lines and polygons, and can be used to drag an edge. Point handles pertain mainly to points, and can be dragged/deleted separately (but Point handles can also be inserted into the edges of lines and polygons). Edge and Point handles can be selected by clicking upon them, or by using the Handle Select Tool.

- Every Layout object contains an implicit **Center** handle — identified by two small red circles connected by a line — which can be used to rotate or drag the object.
- Selections containing multiple objects have one Implicit handle which is placed at the geometric center of the data.

Explicit Handles

- Footprints may contain **Explicit** handles — identified by small black squares — that are created by users and can be used to drag or resize the footprint.

Selecting Handles

The **Select Handles** command on the **Draw** menu allows you to select just the handles of selected items in the **Layout Editor**.

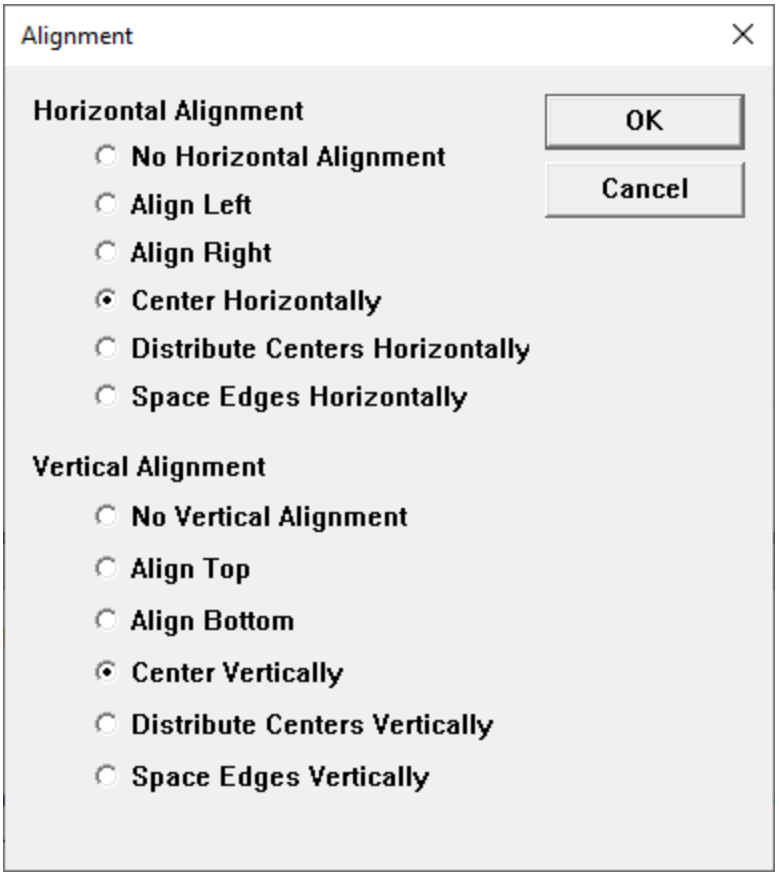
1. From the **Draw** menu, select **Select**. Then click the object you want to manipulate.
2. From the **Draw** menu, select **Select Handles**. The handles on the selected items appear as squares.
3. From the **Layout Editor**, move over the handle you want to select. A square appears at the cursor, indicating that you are over the handle.
4. Click the handle to select it.

The selected handle is highlighted.

Aligning Objects in the Layout Editor

To align objects in the **Layout Editor**, first select more than one object. From the **Draw** menu, select **Align** to open the **Alignment** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The following *Horizontal Alignment* controls are available:

- **No Horizontal Alignment**
- **Align Left**
- **Align Right**
- **Center Horizontally**
- **Distribute Centers Horizontally** places multiple polygons so the horizontal spaces between their centers are equal
- **Space Edges Horizontally** places multiple polygons so the horizontal spaces between their edges are equal

The following *Vertical Alignment* controls are available:

- **No Vertical Alignment**
- **Align Top**
- **Align Bottom**
- **Center Vertically**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Distribute Centers Vertically** places multiple polygons so the vertical spaces between their centers are equal
- **Space Edges Vertically** places multiple polygons so the vertical spaces between their edges are equal

Auto-Aligning Objects

Auto-alignment of components is available by selecting one or more objects and clicking **Ctrl**+**M**. But auto-alignment only rotates/positions components to match connections, and does not flip or unflip them. Therefore, auto-aligning components which are flipped or have twisted connections will align the components improperly.

Selecting Overlapping Objects in the Layout Editor

When two or more objects in the **Layout Editor** overlap (i.e., are selectable on the same location) click the location and type "**b**" to cycle through the selectable objects. (Alternatively, click **Cycle Selection** on the **Edit** drop-down menu.) This highlights each object as it is selectable and allows you to select from objects that overlap.

Selecting Edges in the Layout Editor

The **Select Edges** command on the **Edit** menu enables you to select just the edges of items in the **Layout Editor** and measure the length of the edges selected.

1. Do one of the following:
    - From the menu bar, click **Edit** > **Select Edges**.
    - From the Layout ribbon, open the **Select Elements** drop-down menu and click **Select Edges**.
    - Right-click in the **Layout Editor** and click **Select Edges**.
2. From the **Layout Editor**, move over the edge you want to select. A line appears at the cursor, indicating that you are over that edge.
3. Click the edge to select it.

The selected edge is highlighted. The **Distance** field on the Status bar displays the length of the edge. If you select multiple edges, the **Distance** field shows the sum of the edges' lengths.

Grouping Objects in the Layout Editor

You can group objects in the **Layout Editor** by using the Coordinate System (CS) commands listed beneath the Draw menu. To group selected objects together, select **Draw** > **Group into CS**. To ungroup objects, select **Draw** > **Ungroup CS or 3D Structure**. For more information see Coordinate Systems.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

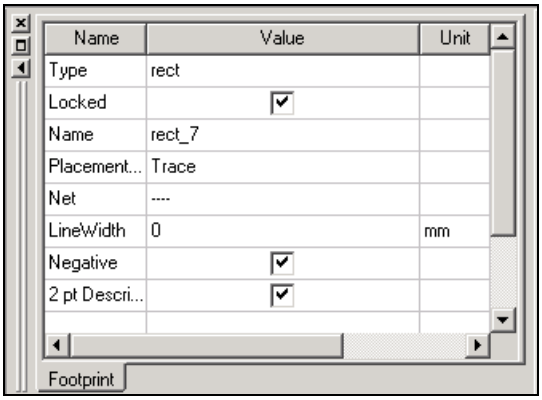
Negative Objects in the Layout Editor

Objects may be designated as a negative. The negative attribute is accessed through the **Properties** window or an object's **Propertywindow**. The following are defined as negative objects:

- Remove material from all items they overlap.
- Export to Gerber, GDSII and DXF.
- Can be copied to the clipboard.

A negative object on a ground layer does not remove material on the layer itself, but rather, interacts with other primitives in the same way as on other layers. Negative objects may contain voids. But a negative always removes material and never adds it. Consequently, a void in a negative is merely an area where material is not removed.

To designate an object as a negative in the **Layout Editor**, in the **Properties** window or the object's **Properties** window (double-click the object) check the **Negative** selection box.



Position Locking

Primitives, components, vias, and pins can all be locked into place in the **Layout Editor**. The locking attribute is accessed through the **Properties** window or an object's **Properties** window.

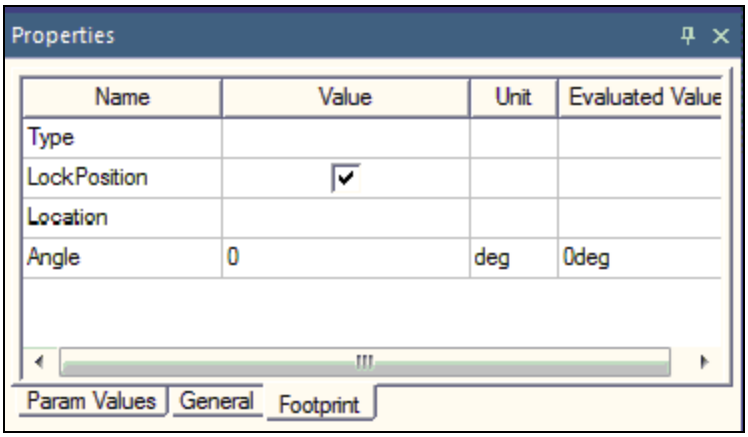
Locked objects do not move during an **Align** or **Microwave-port Align** operation. If multiple objects are locked, the first pinned object encountered in the selection (based on the selection order) is used as an "anchor" during an align (if there are none, the first object is used). If there is only one object locked, that object becomes the origin of the alignment.

- Once locked, an object cannot be dragged or rotated.
- When locked, no object properties that change position or shape are editable.
- When a locked object is selected, the object handles are not shown.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Locking a primitive locks the voids it owns.
- Locking a void prevents it from moving when the owner is moved.

To lock an object in the **Layout Editor**, in the **Properties Window** or the object's **Propertieswindow** (double-click the object) check the **LockPosition** selection box.



Modifying Objects in the Layout Editor

You can quickly modify the position, dimensions, and other characteristics of objects created in the **Layout** window.

Deleting Objects in the Layout Editor

Follow these steps to delete objects in the **Layout Editor**.

1. Select objects to delete.
2. From **Edit**, select **Delete**, or press **Delete**.

Flipping Objects in the Layout Editor

- **Draw** > **Flip about Y axis** to flip the object horizontally.
- **Draw** > **Flip about X axis** to flip the object vertically.

Rotating Objects in the Layout Editor

You can rotate one or more objects by dragging the red rotation handle at the center of the object.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select the object you want to rotate.
2. Drag the circular part of the rotation handle in the direction you want to rotate the object.

> **Note:**
>
> To drag more than one object, select the objects and the rotation handle appears at the center point between the objects.

> **Note:**
>
> To rotate without re-wiring (“rubberbanding”), hold down the <Shift> key as you rotate the object(s).

Uniting Objects in the Layout Editor

To join two or more objects into one object, use the **Layout > Merge Polygons > Union** command. The new object has the name, color, boundary, and material assignment of the first object selected. The objects are united at the point of intersection.

1. Select the objects you want to join.
2. From the **Layout** menu, select **Merge Polygons** > **Union**.

The objects are united.

Union and **Intersection** operations support using selected objects on multiple layers, and each layer object is operated on separately. However, **Subtraction** is only allowed if the selected objects are on the same layer. Selected objects may be negative objects.

- If only negative objects are selected, the merge operation is performed the same as with positive objects, but the resulting objects remain negative objects.
- If both negative objects and positive objects are selected:

  — Complete the union/intersection/subtraction operation on the positive objects

  — Always union the negative objects

  — Subtract the negative object result from the positive object result

> **Note:**
>
> By default, the objects being joined to the first object selected are *not* preserved for later use. If you want to keep a copy of the objects being joined to the first object selected, do the following:
>
> - Copy the objects, then paste them back into the design after uniting them.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Subtracting Objects in the Layout Editor

1. Select the object from which you want to subtract other objects.
2. Select the objects you want to subtract.
3. From the **Layout** menu, select **Merge Polygons** > **Subtract**.

The new object retains the name, color, and material of the first object selected.

Union and **Intersection** operations support using selected objects on multiple layers, and each layer object is operated on separately. However, **Subtraction** is only allowed if the selected objects are on the same layer. Selected objects may be negative objects.

- If only negative objects are selected, the merge operation is performed the same as with positive objects, but the resulting objects remain negative objects.
- If both negative objects and positive objects are selected:
    - Complete the union/intersection/subtraction operation on the positive objects
    - Always union the negative objects
    - Subtract the negative object result from the positive object result

> **Note:**
>
> By default, the objects being subtracted on the first object selected are *not* preserved for later use. If you want to keep a copy of the objects being subtracted on the first object selected, do the following:
>
> - Copy the objects, then paste them back into the design after subtracting them.

Creating Objects from Intersections in the Layout Editor

To create a new object on the intersection of two or more objects, click the **Layout > Merge Polygons > Intersection** command.

1. Select the objects from which you want to take the intersection.

> **Warning:**
>
> If the objects you selected do not overlap, the result is a null object and both objects vanish.

2. From the **Layout** menu, select **Merge Polygons** > **Intersection**.

The original objects vanish, leaving only the new object that was formed on their intersection.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Union and **Intersection** operations support using selected objects on multiple layers, and each layer object is operated on separately. However, **Subtraction** is only allowed if the selected objects are on the same layer. Selected objects may be negative objects.

- If only negative objects are selected, the merge operation is performed the same as with positive objects, but the resulting objects remain negative objects.
- If both negative objects and positive objects are selected:

  — Complete the union/intersection/subtraction operation on the positive objects

  — Always union the negative objects

  — Subtract the negative object result from the positive object result

> **Note:**
>
> By default, the original intersecting objects are *not* preserved for later use. If you want to keep a copy of the objects that intersect the first object selected, do the following:
>
> - Copy the objects, then paste them back into the design after creating the new object on the intersection.

Duplicating Objects in the Layout Editor

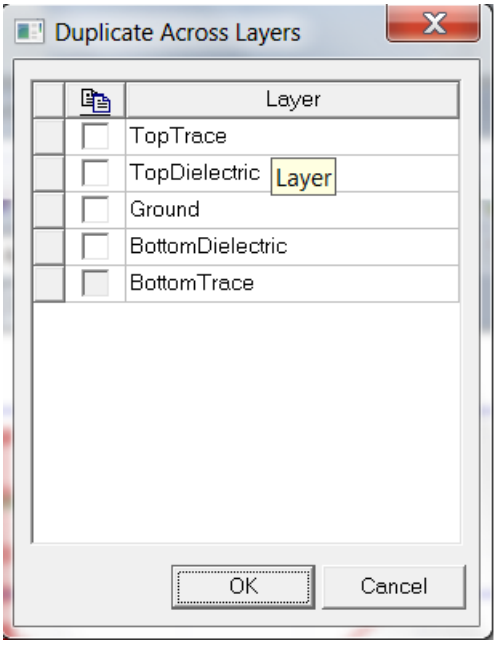
Duplicate Across Layers

The **Duplicate Across Layers** command supports duplicating layout objects to other layers at the same location. It works for both layout editing and footprint editing. The same command is available in the shortcut menu. The following layout objects are eligible for duplication:

- **Primitives**: Arc, Circle, Line, Rectangle, Polygon. A void cannot be duplicated alone; instead, a void is duplicated along with the selected object to which it belongs.
- **Edge port**: If an edge port is selected and all its edges are attached to primitives on the same layer and all those primitives are also selected, the edge port are duplicated.

When you have layout objects selected and click **Draw** > **Duplicate** > **Across Layers,** a window opens for target layer selection. (If no suitable items are selected for duplication, a warning message is displayed instead.)

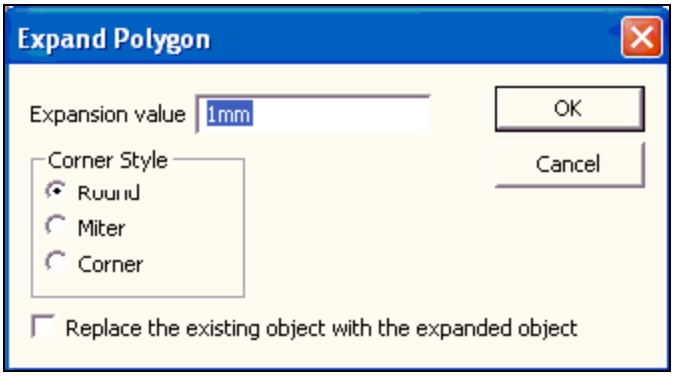
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- Only stackup layers are listed as valid target layers. Locked layers are not eligible as target layers and are unavailable. If all items are on the same layer, that layer is also unavailable.
- Right-click the layer selection grid to select from all signal, ground, or dielectric layers.
- After you select target layers and click **OK**, the eligible items are duplicated to the layer(s) you select. All duplicated items remain selected if they are on layers that are selectable and visible. Selected items that are not eligible for duplication is listed in the **Message Manager** window.

Expanding Objects in the Layout Editor

You can “expand” objects in Layout using the **Draw > Expand** command. Click **Draw > Expand** to open the **Expand Polygon** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Expansion value** can be positive or negative (e.g., “2mm”, “-2mm”). The object is expanded or shrunk by the distance specified.
- The **Corner Style** (where expanded sides meet) can be specified as **Round**, **Miter**, or **Corner**. When **Corner** is selected, if the corner extension results in a projection greater than 8 times the expansion value (which corresponds to angles approximately 15 degrees or less), the two meeting sides are truncated to reduce the corner projection.
- You may either **Replace the existing object with the expanded object** or, by default, create a new object.

Paste Objects In Place in the Layout Editor

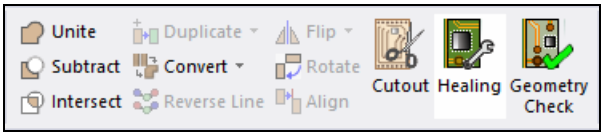
Sometimes it is convenient to copy an object and paste it without an X,Y offset or displacement. For instance, when creating copies of parameterized objects, or when copying an object to the same location but in a different layer.

1. Select the object(s) to be duplicated.
2. Choose **Copy** on the right-click menu or on the **Edit** drop-down menu.
3. Select the layer you want to draw upon on the **ActiveLayer** drop-down menu on the **Layout** toolbar.
4. Choose **Paste in Place** on the shortcut menu or on the **Edit** drop-down menu and the object is pasted onto the active layer using the same X,Y coordinates from which it was copied.

Geometry Healing in the Layout Editor

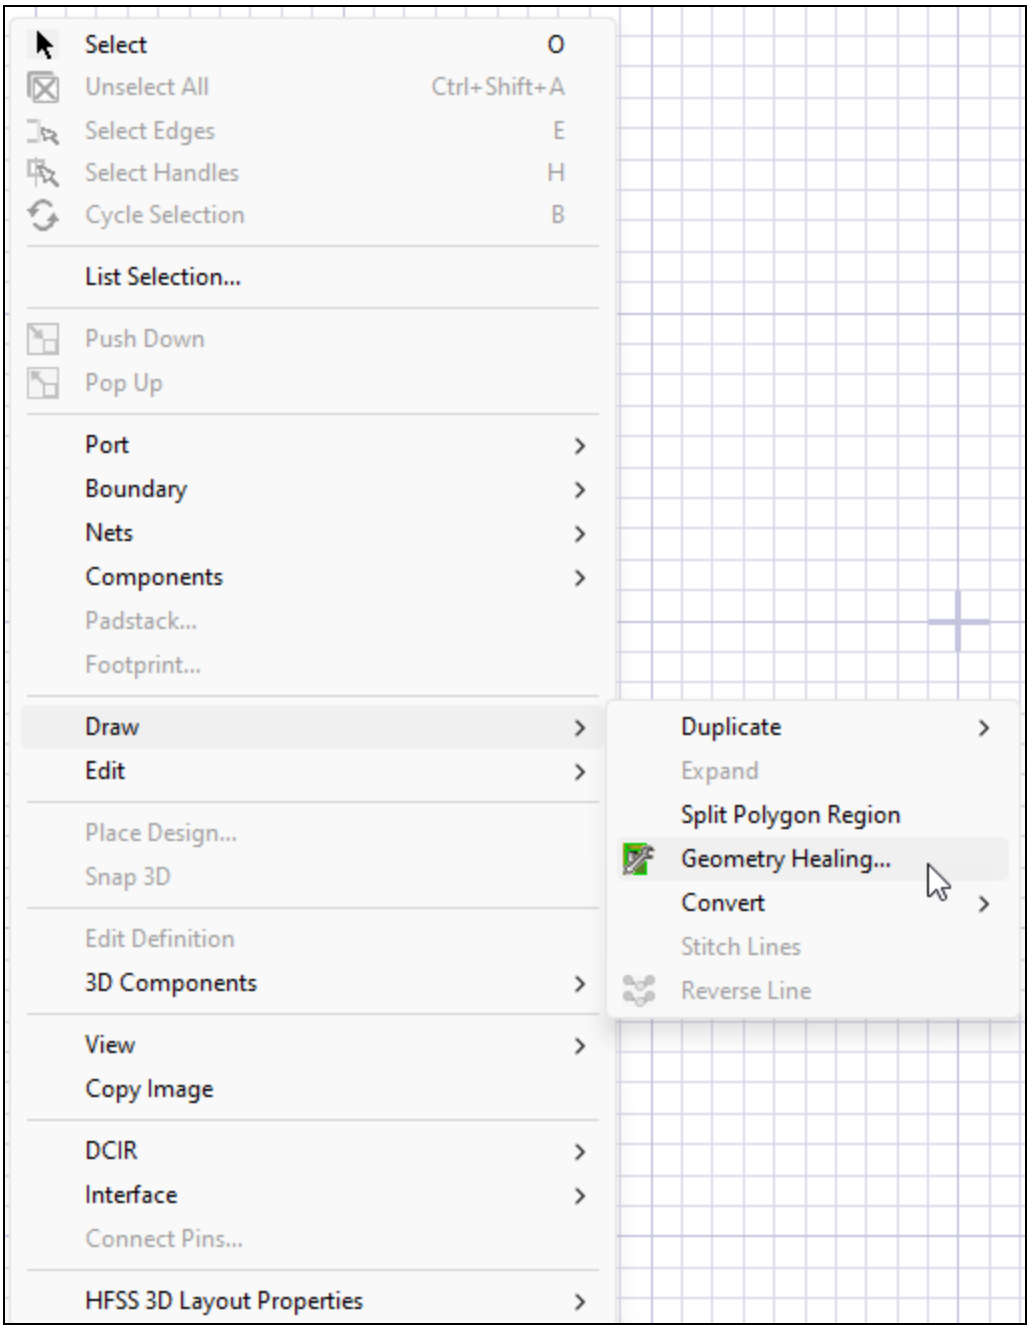
To access the **Geometry Healing** window, do either of the following:

- Navigate to the **Layout** ribbon and click **Healing**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

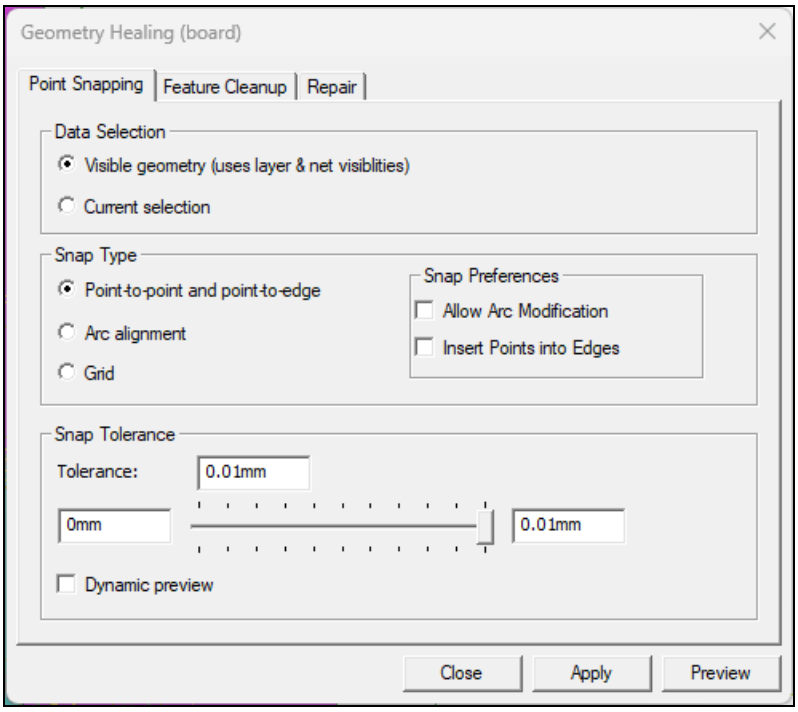
- Right-click in the **Layout Editor** and select **Draw** > **Geometry Healing**.



The **Geometry Healing** window opens at the **Point Snapping** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Point Snapping



From the **Point Snapping** tab, do the following:

- **Data Selection** – select either of the following options to determine what geometry to heal:
  - **Visible geometry (uses layer & net visibilities** – analyzes all visible geometry, based on current layer and net visibility settings.
  - **Current selection** – analyzes only the currently selected geometries.
- **Snap Type** – select one of the following snap types:
  - **Point-to-Point and point-to-edge** – attempts to snap points to points and points to edges. Keep in mind:
    - only points in the tolerance are moved.
    - points are snapped across nets (i.e., nets are not shorted).
    - a snap is rejected if the angle around the point changes by more than 1 degree.
    - locked objects can be snap targets but are not themselves altered.
    - points may snap to the edge of a trace but traces themselves are not moved.

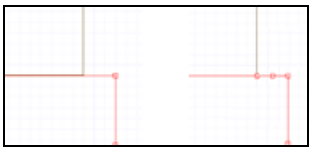
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- vias act as snap targets but are not changed.
- rectangles may become polygons.

- **Arc Alignment** – aligns arcs that share a similar center or a similar radius. Keep in mind:
  - only arcs with centers or radii in the tolerance are adjusted.
  - healing aligns the start/end points of traces and bondwires with circles and vias.
  - vias are treated as fixed objects (i.e., they do not move, but other arcs may align to them).
  - healing attempts to align arcs but does not guarantee alignment, especially when multiple arcs are connected in a polygon.
- **Grid** – snaps all geometry points to a grid defined by the user-specified tolerance. All points (i.e., coordinates) are rounded to the tolerance value supplied. Keep in mind:
  - healing snaps all primitives.
  - healing snaps the center location of vias.
  - healing snaps the start/end locations of bondwires.

- **Snap Preferences** – check either/both of the following options, as appropriate:
  - **Allow Arc Modification** – arcs drawn in close proximity to another primitive's edge will snap to the primitive if they are both healed.

  - **Insert Points into Edges** – if adjacent primitives with edges in close proximity are both healed, new points will appear at midpoints between their existing edges and at the new edges created where they snap together.

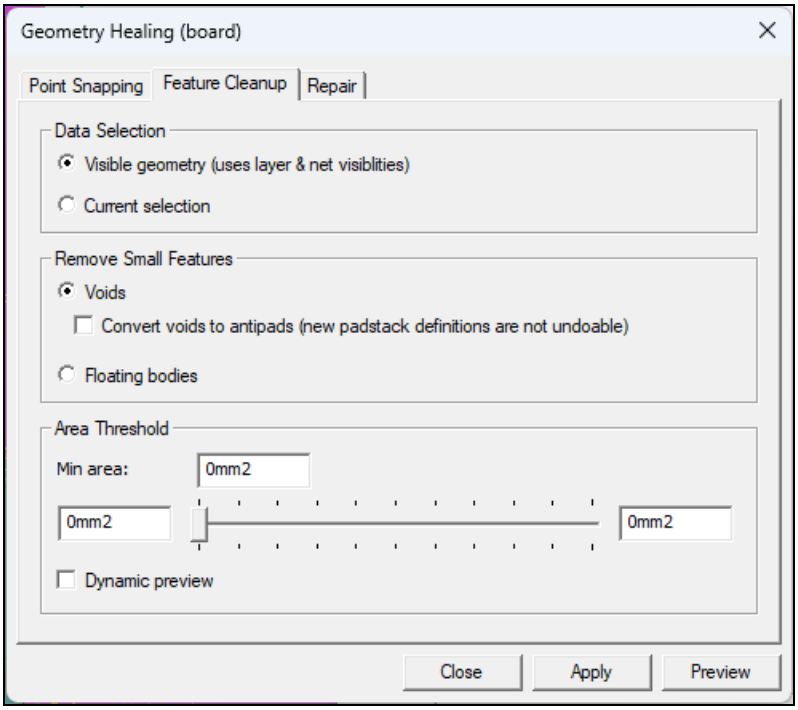


- **Snap Tolerance** – Enter a value in the first field to set a minimum area, or move the slider to an appropriate value. All points at a distance less than the specified distance are

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

snapped. Check **Dynamic preview** to see a live update as the threshold is adjusted.

Feature Cleanup



From the **Feature Cleanup** tab, do the following:

- **Data Selection** – select either of the following options to determine what geometry to heal:
  - **Visible geometry (uses layer & net visibilities** – analyzes all visible geometry, based on current layer and net visibility settings.
  - **Current selection** – analyzes only the currently selected geometries.

    > **Note:**
    >
    > For **Voids** and **Floating bodies** cleanup, all the geometry is inspected to determine if the criteria for cleanup is met.

- **Remove Small Features** – select one of the following small feature types to remove:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

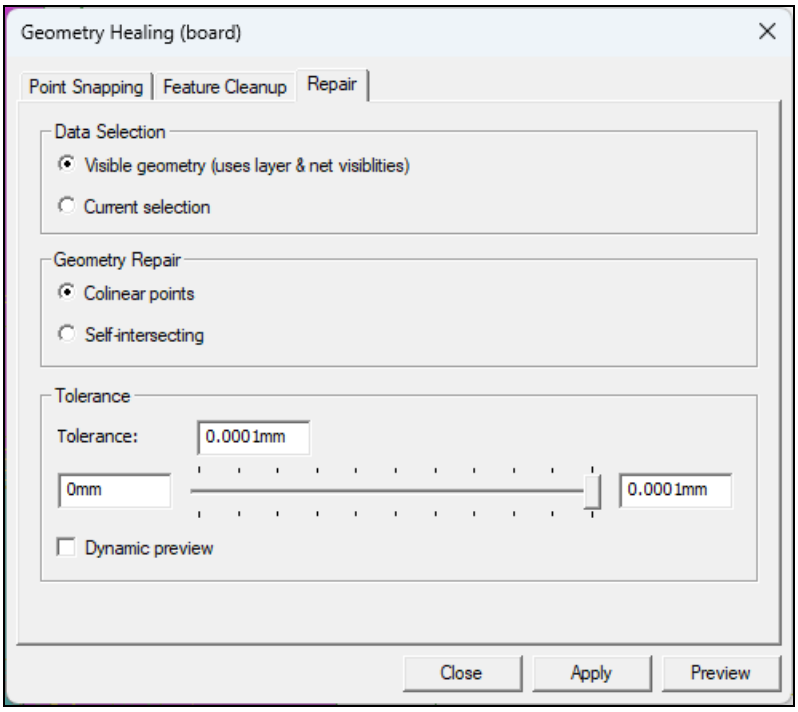
- **Voids** – removes voids with an area less than the user-specified **Area Threshold**. Keep in mind:
    - healing does not remove voids with vias passing through them.
        - If applicable, check **Convert voids to antipads (new padstack definitions are not undoable)**. Voids can only be converted if they meet the following criteria:
            - Voids can only be converted if they are circular or rectangular and the via passes through their centers.
            - The vias must be in a different net from the void owner (e.g., the via is in a TX net and the void owner is in GND).

            > **Note:**
            >
            > This creates new padstack definitions, which are not removed by **Undo**.

            If these conditions are met, the explicit void is replaced with an implicit void generated using an antipad.
- **Floating Bodies** – removes small islands of metal with an area less than the user-specified **Area Threshold**. Keep in mind:
    - if floating bodies are attached to other bodies, the total connected area is considered (takes into account vias).
    - during analysis, all geometry (selected and visible) is included.
    - healing does not remove bodies with ports attached.
- **Area Threshold** – enter a value in the first field to set a minimum area, or move the slider to an appropriate value. All features smaller than the specified area are removed. Check **Dynamic preview** to see a live update as the threshold is adjusted.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Repair



From the **Repair** tab, do the following:

- **Data Selection** – select either of the following options to determine what geometry to heal:
  - **Visible geometry (uses layer & net visibilities** – analyzes all visible geometry, based on current layer and net visibility settings.
  - **Current selection** – analyzes only the currently selected geometries.
- **Geometry Repair** – select either of the following geometry repair operations:
  - **Colinear points** – removes collinear points from polygons and trace center-lines. Keep in mind:
    - points are considered collinear if they deviate from the chord connecting the adjacent points by less than the user-specified **Tolerance**.
    - the analysis also removes very narrow intrusions and spikes from a polygon.
  - **Self-intersecting** – removes self-intersections from polygon data. Keep in mind:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

  - the negative region of the self-intersection is excised.
  - voids are correctly preserved – this may require duplicating a void if it overlaps two positive lobes of a self-intersecting shape.

- **Tolerance** – Enter a value in the first field to set a minimum area, or move the slider to an appropriate value. All points at a distance less than the specified distance are snapped. Check **Dynamic preview** to see a live update as the threshold is adjusted.

Once selections are made, select from the following:

Preview – shows a preview of the operation without changing the database. Various statistics appear after a preview or application. The worst case estimate is typically shown – click magnifying glass to jump to that location.

Apply – save changes.

Close.

Editing Arcs in the Layout Editor

You can edit an arc by changing its properties in the **Property Control** window or using the mouse as follows.

Move an arc in one of these ways:

- Drag the arc to the selected point.
- From the **Draw** menu, select **Select**. Select the arc, then type the center point's new coordinates in the **X** and **Y** fields.

Change an arc's end points in one of these ways:

- From the **Draw** menu, select **Select Handles**. Then select the start or end point handle, and drag it to the selected point.
- From the **Draw** menu, select **Select Handles**. Then select the start or endpoint and type the point's new coordinates in the **X** and **Y** fields.

Change an arc's height in one of these ways:

- Press **Ctrl** and drag the midpoint handle to the selected point.
- From the **Draw** menu, select **Select Handles**. Then select the midpoint handle and type the point's coordinates in the **X** and **Y** fields.

Adding Vertices to Edges in the Layout Editor

Add a new vertex to a line segment or polygon using the **Alt** key.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select the object and the object handles become visible as squares on the object edges.
2. From the **Edit** menu, select **Select Handles** and the cursor becomes a square.
3. Hold down the **Alt** key. While holding down the **Alt** key, the cursor will take one of two shapes:

- While hovering over a polygon edge, the cursor becomes a diagonal line with a hollow circle to indicate the cursor **is** in a valid location to insert a vertex.
- While hovering anywhere else, the cursor becomes a diagonal line segment to indicate the cursor is **not** in a valid location to insert a vertex.

4. Click an appropriate point for the new vertex.
5. Repeat step 4 to insert additional vertices, as appropriate.
6. Release the **Alt** key and it becomes the square "Select Handles" cursor once again.
7. From the **Edit** menu, select **Select Handle** again to return the cursor to its original shape..

Working with Layers

The **Layout Editor** uses layers to organize and isolate sets of geometry and other visual indicators. Physical layers such as signal, via, dielectric, and negative signal layers compose the circuit board's stackup. Non-physical, conceptual layers display component layout, connectivity, etc. Physical layers must be created and added to the project, while most non-physical layers are created by default.

Layers are displayed and configured through the stackup editor. The stackup editor provides access to additional properties of the physical layers, such as material, thickness, and elevation. Geometrical information on these layers is used to generate masks for manufacturing. Stackups can be of three types:

- Laminate: Alternating signal and dielectric layers
- Multizone: Similar to laminate, but allows zones (areas) that contain a subset of all layers in the stackup
- Overlapping: Contains signal layers that can overlap vertically with other layers. Dielectric layers must be contiguous.

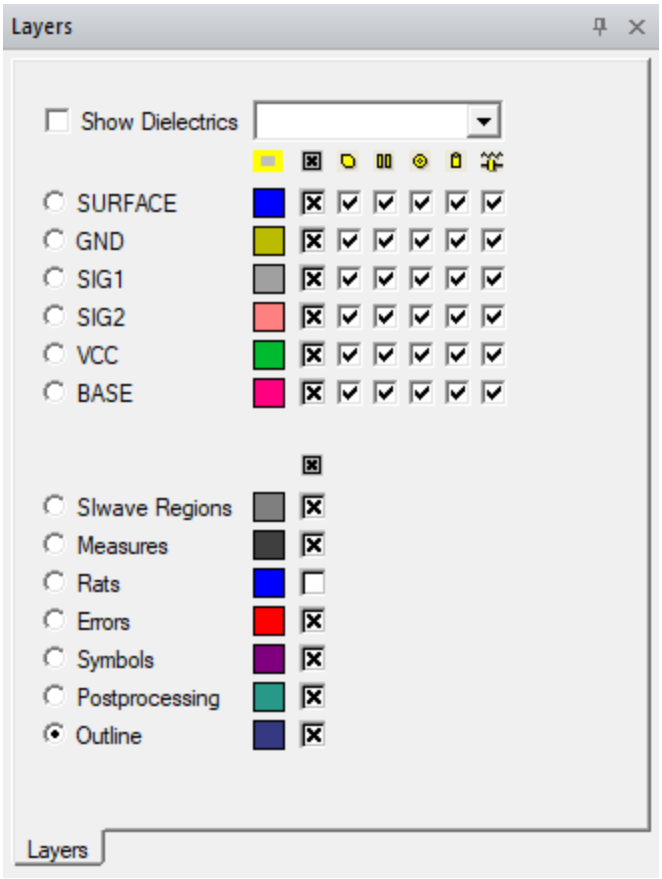
3D Layout offers several ways to create and configure layers:

- The Edit Layers window is the most comprehensive control.
- The Layers window has controls for layer visibility and select the active layer for a project in the **Layout Editor**.
- Controls on the **Layout** tab open the **Edit Layers** window and select the active layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Working with the Layers Window

In the **Layers** window, you can select the working layer and the visibility of layout objects on specific layers, objects such as shapes, pads, components, nets, and the layers themselves. The **Layers** window is divided into three sections: stackup layers, non-stackup layers, and a pre-process mesh section. This dockable window can be resized and relocated.



- To show or hide the **Layers** window on the desktop, click **View** > **Layers**. A check box appears next to this command if the **Layers** window is visible.
- To select a working layer, click the radio button of the layer you want to work on.
- To view specific items on different layers, use **Show Dielectrics**, **Zone Filter**, the layers check boxes, and View Name drop-down menu.

If the stackup is a multizone stackup, select a zone from the **Zone Filter** to see the available layers.

The **Show Dielectrics** check box controls whether dielectric stackup layers are shown. If unchecked, dielectric layers are hidden and holes (vias and pins) are rendered continuously visible from the top-most visible signal layer to the bottom most visible layer. If checked,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

dielectric layers appear and hole visibility can be finely controlled by each layer (but not necessarily continuously visible).

The View Name drop-down menu lists user-defined views and their controls. You can configure how layers and nets are displayed and then save this visibility as a view. Later, select that view from the drop-down menu to reset the **Layout** window to it. The view controls and default options are:

- **<Surface>** shows the top and bottom conducting layers of the layer stackup and hides all other layers. This is the default view.
- **Save Current View** opens a dialog that allows you to save the current setting of layers and nets to a new layout view.
- **Delete View** opens a dialog that allows you to delete saved layout views.

Check boxes control what is displayed in a layer. Icons at the top of a column control the entire column. Individual check boxes control the item visibility for the layer corresponding to the check box's row. Hover over an icon to see what the column controls:

Name	Icon	Controls the visibility of	Appears
Fill/Unfill All		Color in the object	Always
Show/Hide All		All objects	Always
Shapes		Shapes	Always
Lines		Lines and paths	Always
Pads		Pads	Always
Holes		Holes	Always
Components		Components	Always
Mesh		Mesh of signal layers	When a pre-process mesh is displayed
Background Dielectric Mesh		Mesh of dielectric layers	When a pre-process mesh is displayed with a laminate stackup

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A pre-process mesh section may appear below the non-stackup layer section. It controls design-wide visibility of:

- Airbox non-mesh and mesh
- Hole, solderball, and bondwire mesh

The visibility of these objects is not restricted to their layers. Also, layer visibility check boxes cannot control these mesh visibilities. Non-mesh visibilities are controlled by the layer check boxes.

Activating Layers

To draw on a layer, it must first be activated. This can be done on the **Layers** workspace, the **Edit Layers** window, or the **Layout** tab. Follow the steps below to activate a layer from each location.

Layers Workspace

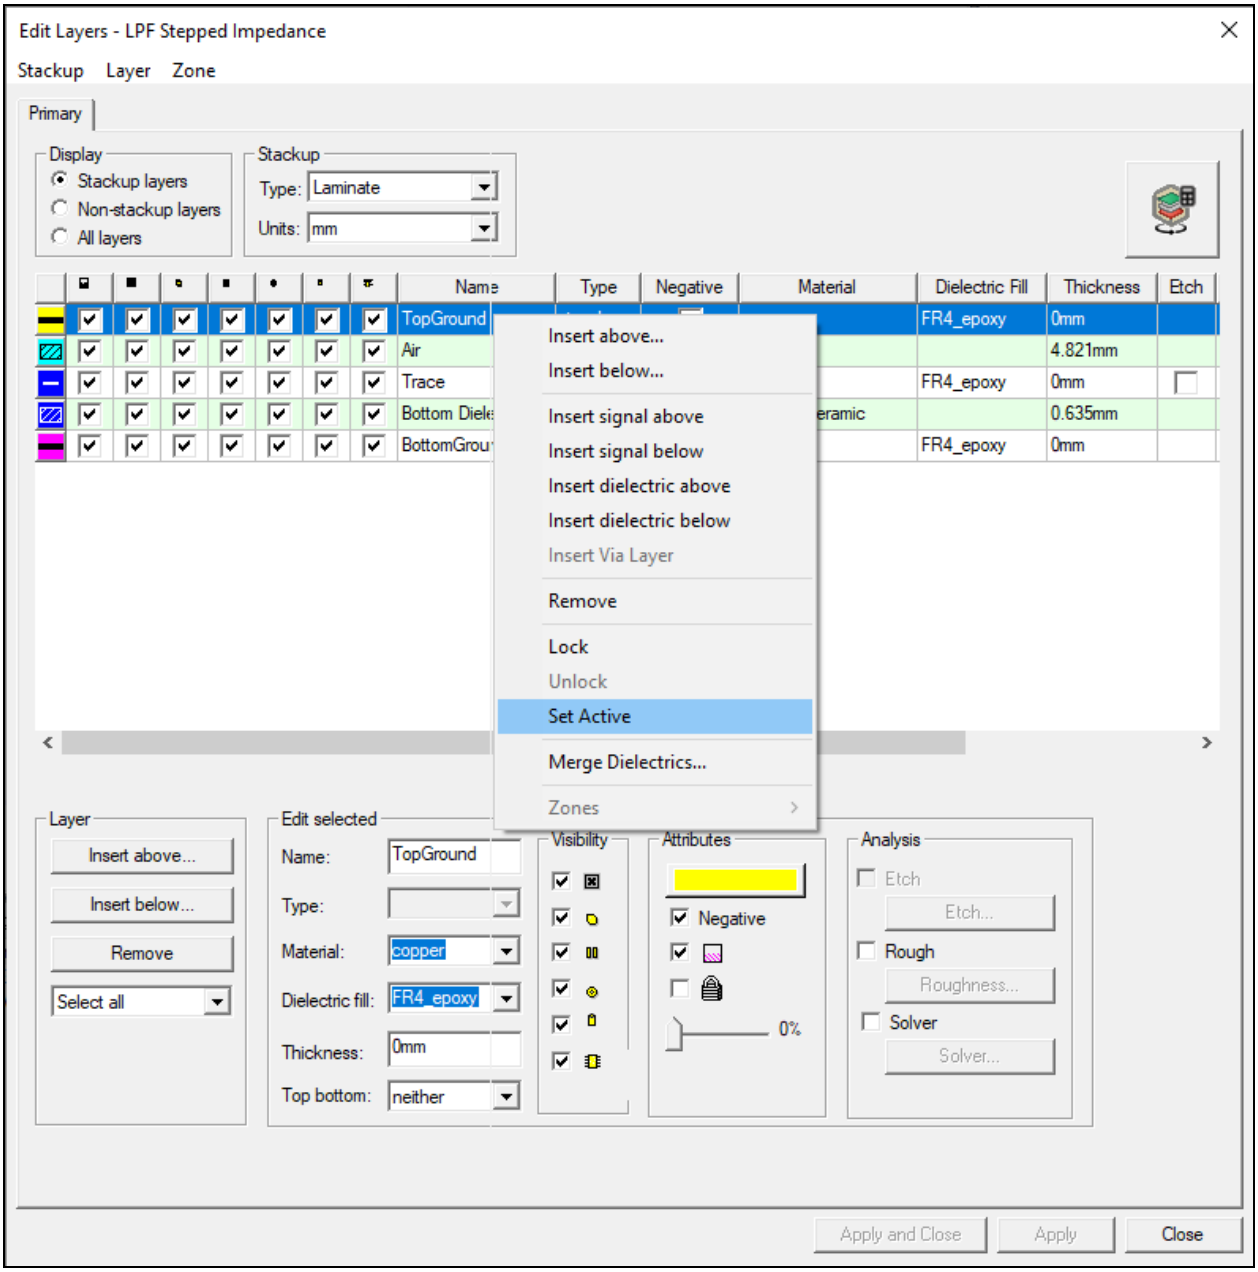
To open the **Layers** workspace, navigate to **View** > **Layers**, or click the **Layers** tab on the right-hand side of the **Layout Editor**.

From the **Layers Workspace**, select a layer to activate it.

Edit Layers Window

1. From the **Layout Editor**, perform one of these steps to open the **Edit Layers** window.
    a. From the **Layout** tab, select the **Layers dialog** icon.
    b. Navigate to the **Layout** > **Layers** .
2. From the **Edit Layers** window, right-click an inactive layer and select **Set Active**.
3. Click **Apply and Close** to close the **Edit Layers** window.

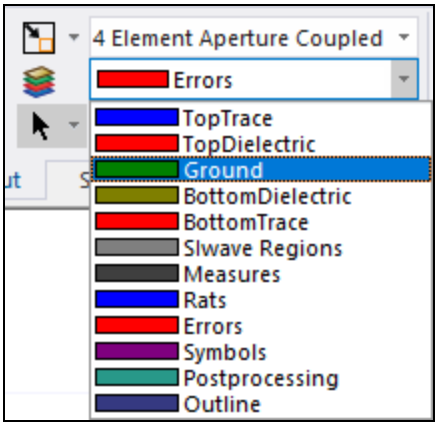
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Layout Editor Ribbon

From the **Layout Editor**, select an inactive layer on the **Layers dialog** drop-down menu to activate the inactive layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The procedure is complete.

Adding and Removing Layers

Layers can be added three ways: though the **Layer** menu, by right-clicking in the **Stackup** page, and in the **Layer** pane. With each method, select whether to insert the new layer above or below a layer selected in the **Grid Control** pane. Right-click **Grid Control** to access quick options to insert a new signal or dielectric layer.

Via layers are only available in overlapping stackups and are added in a unique process.

Adding a Layer

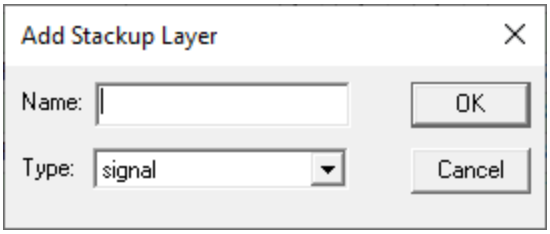
1. From the **Grid Control** pane of the Edit Layers window, click a layer that are above or below the new layer.
2. Do one of the following:
    - From the **Grid Control** pane, right-click selected layer and click an **Insert** command.

      > **Note:**
      >
      > Clicking **Insert signal** or **Insert dielectric** command adds the corresponding layer with no further steps.

    - Open the **Layer** menu and click an **Insert** command.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Layer** pane, click **Insert** to open the **Add Stackup Layer** window.



3. Enter a name for the new layer in the **Name** field.
4. Select a type of layer on the **Type** drop-down menu. Different types are available for physical (stackup) layers and non-physical (non-stackup) layers.

Type	Physical Layer	Purpose
signal	Y	For drawing traces.
dielectric	Y	Acts as a substrate upon which signal layers border. Infinite in the XY plane.
assembly	N	For assembly geometry and text. Only one assembly type layer can be defined.
silkscreen	N	For silkscreen geometry and text. Only one silkscreen type layer can be defined.
soldermask	N	For soldermask geometry. Only one soldermask type layer can be defined.
solderpaste	N	For solderpaste geometry. Only one solderpaste type layer can be defined.
glue	N	For glue geometry. Only one glue type layer can be defined.
user	N	For user-defined geometry and text. Any number of user type layers can be defined.
post-processing	N	Provides placement for a 3D Line primitive that can then be used for post-processing calculations.

5. Click **OK**. The layer is added above or below the selected layer, depending on what was picked.

Removing a Layer

1. From the **Edit Layers** window, click layer(s) to remove them from the stackup.
2. Do one of the following:
   - From the **Grid Control** pane, right-click unwanted layer and click **Remove**.
   - Open the **Layer** menu and click **Remove** command.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Layer** pane, click **Remove**.

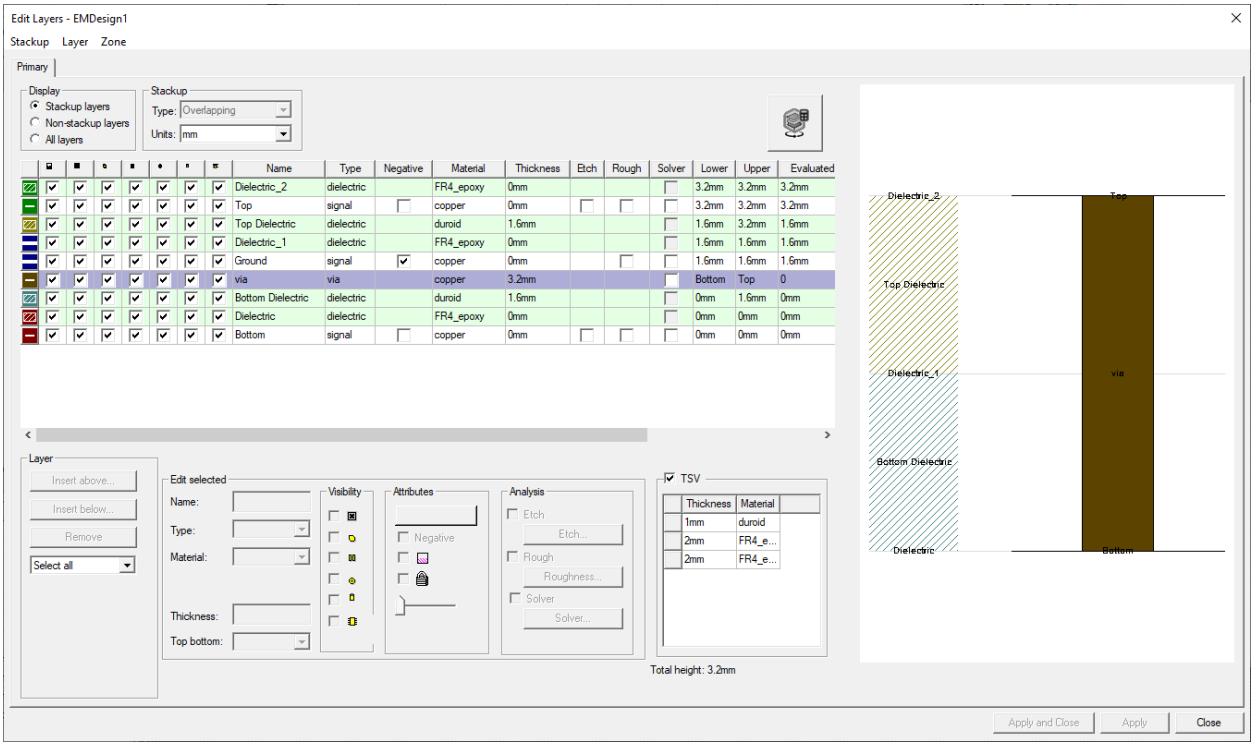
3. Confirm the action. The selected layers are removed on the stackup.

Working With TSV Layers

TSV (Through Silicon Via) layers are vias that can pass through semi-conductor layers, such as silicon. TSV layers require oxide layers along the via barrel to prevent any electrical contact between the barrel and the semi-conductor layers through which they pass.

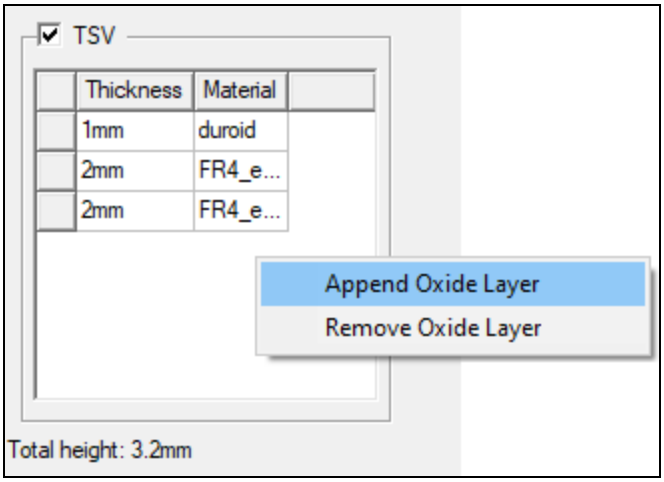
Once a via layer is created (refer to **Via Layers**), add, remove, or configure oxide layers by following these steps.

1. Open the **Edit Layers** window, by performing one of these steps on the **Layout Editor**:
   a. From the **Layout** tab, select the "Layers" icon.
   b. From the **Layout/Footprint** menu, select **Layers** .
   c. Right-click in the **Layout Editor** and select **Edit Layers**.
2. From the **Edit Layers** window, make the **TSV** area under the **Grid Control Table** by selecting a via layer.

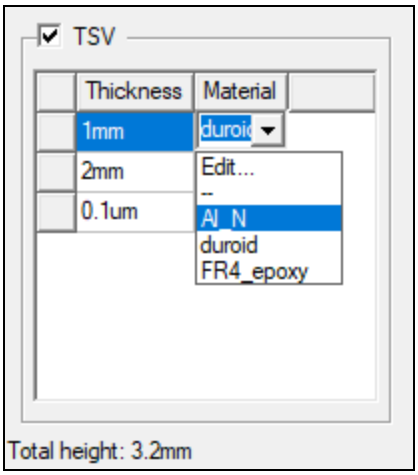


3. Right-click in the **TSV** area and select **Append Oxide Layer** (to add an oxide layer) or right-click the box adjacent to a layer and select **Remove Oxide Layer**, as appropriate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Click in a **Thickness** field to adjust the width of an oxide layer, or select a different material makeup for the oxide layer on the adjacent drop-down menus, as appropriate.

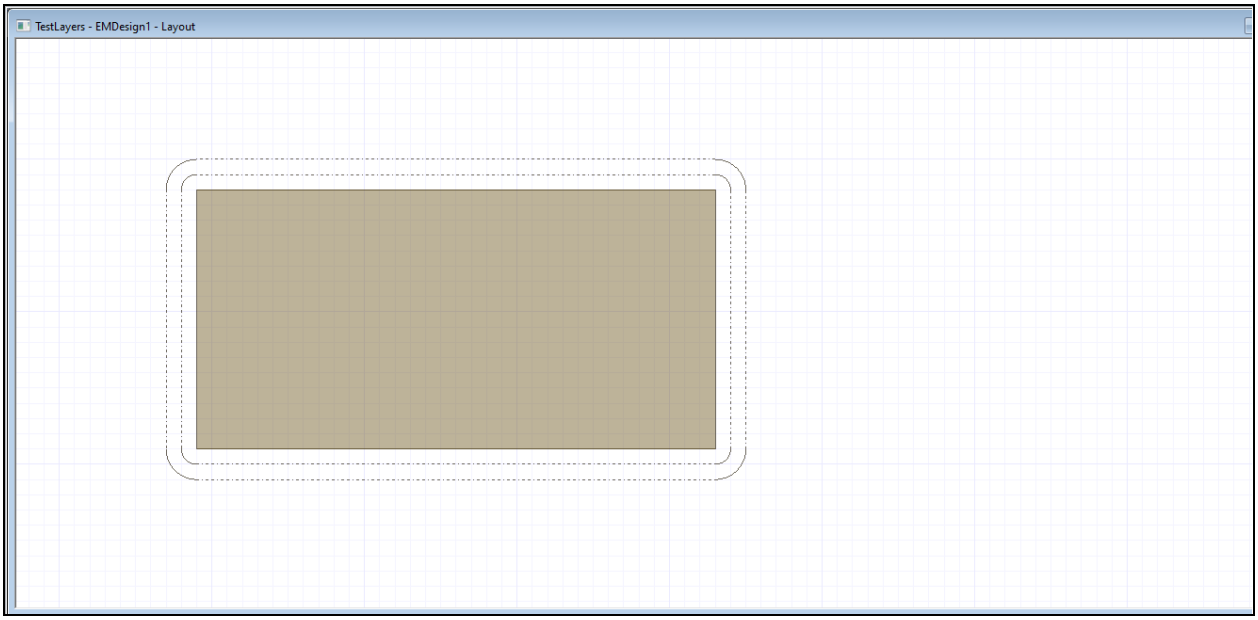


> **Note:**
>
> Make further modifications to the oxide layer materials by selecting **Edit** from the drop-down menu, to open the **Select Definition** window. Refer to **Assigning Materials**.

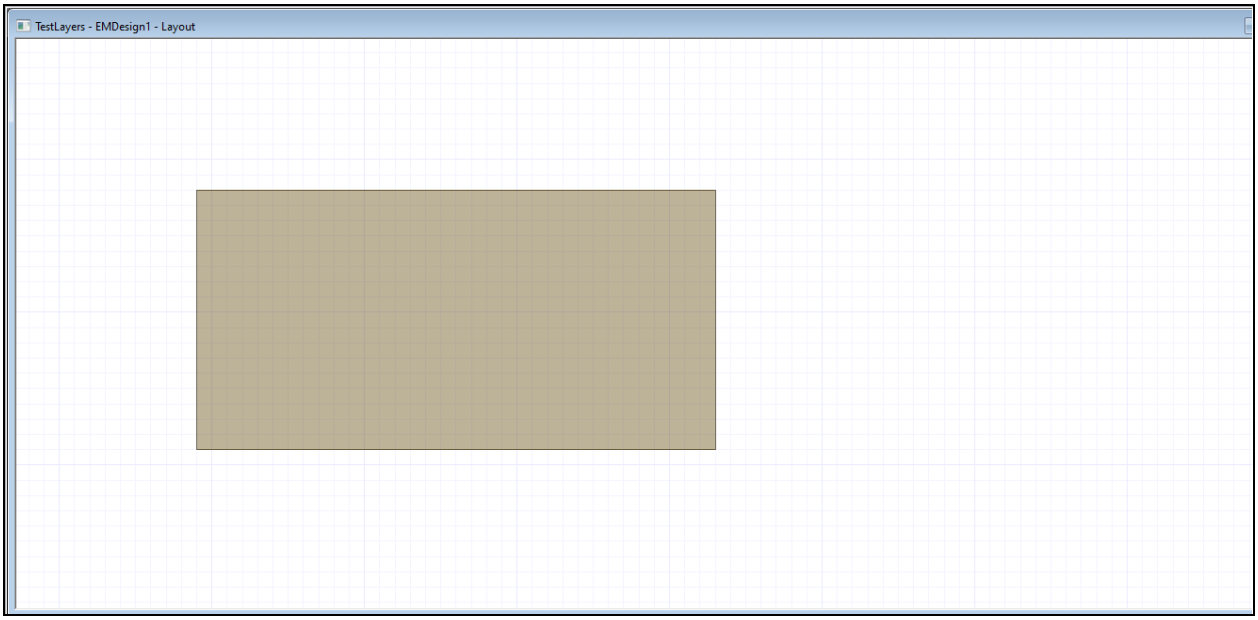
The procedure is complete. Refer to the following screenshots to see how oxide layers are depicted in the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Active Design With Oxide Layers



Active Design Without Oxide Layers



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Assigning Materials to Layers

From the Edit Layers window, click the material of a layer in a drop-down menu on the **Primary** tab, and on the **Materials** tab of the **Select Definition** window. Materials can also be parameterized with project variable text array references.

Follow these steps to assign a material to a layer.

1. From the **Edit Layers** window, click rows to select the layers that you want to modify.
2. From the **Material** drop-down menu of the **Edit selected** pane, select a material or select **Edit** to open the **Select Definition** window.
3. If you chose **Edit**, select the material you want and click **OK** to close the **Select Definition** window.
4. Click **Apply** and the selected material is assigned to the selected layer.

Default Layers

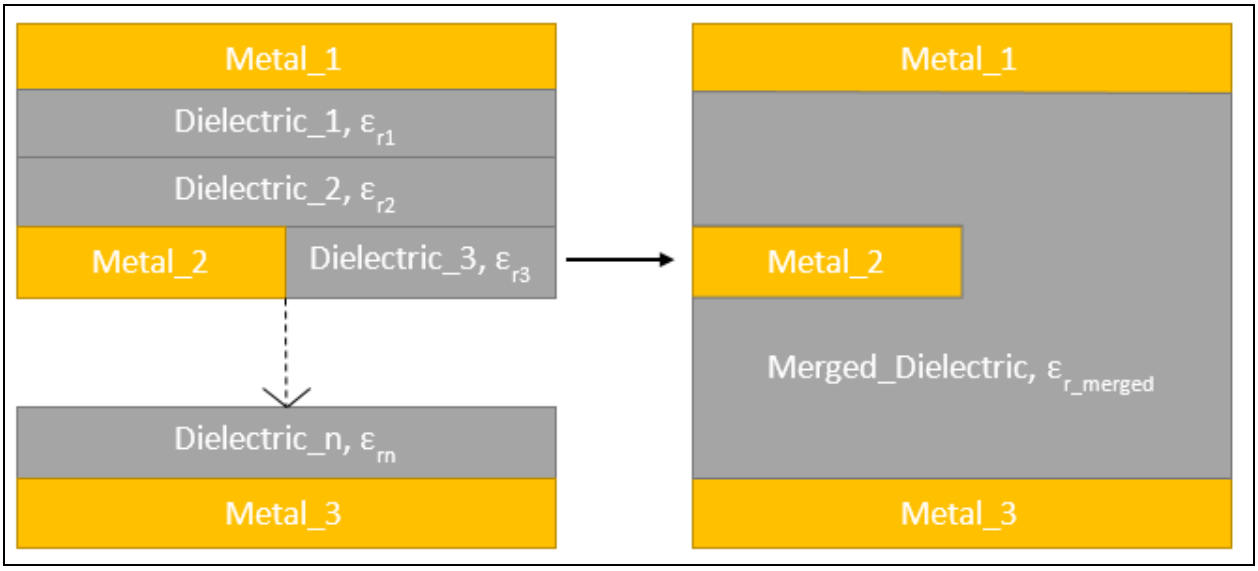
The following default layers are provided by HFSS.

Errors	Contains error messages generated during project setup.
Measures	Contains all measurements made using the ruler.
Outline	Contains the outlines of the board, its zones, and primitives.
Post-processing	Provides placement for a 3D line primitive that can then be used for post-processing calculations.
Rats	Contains logical connections between different components/circuit elements.
SI Regions	Created with an HFSS solution setup of the SIwave SYZ Solver.
Symbols	Contains the circuit element symbols.

Dielectric Simplification (Merging)

Dielectric simplification allows you to select one or more groups of continuous dielectric layers, then merge each group into one dielectric layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



During this process, a relative permittivity for the new merged layer is calculated using one of the three methods in the following table. Select the selected method viathe **Merge Dielectrics** window.

Method	Equation
Weighted Capacitance	$\varepsilon_{\text{r_merged}} = \frac{\sum_{i=1}^{n} h_i}{\sum_{i=1}^{n} \frac{h_i}{\varepsilon_i}}$
Kraszewski Method	$\varepsilon_{\text{r_merged}} = \left(\frac{\sum_{i=1}^{n} h_i \sqrt{\varepsilon_i}}{\sum_{i=1}^{n} h_i} \right)^2$.
Weighted Average	$\varepsilon_{\text{r_merged}} = \frac{\sum_{i=1}^{n} h_i \varepsilon_i}{\sum_{i=1}^{n} h_i}$

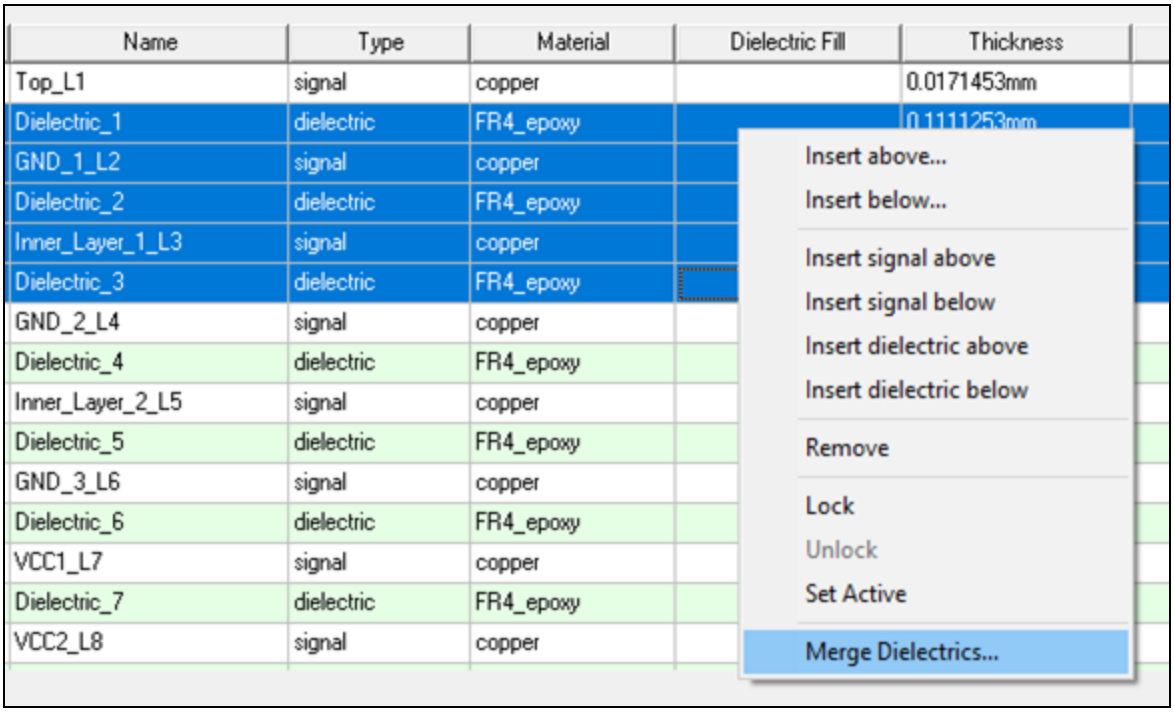
By combining numerous thin dielectric layers into one layer, the number of meshing elements is reduced with minimal decrease in computation accuracy. Thus, a comparable analysis can be performed in less time. Dielectric merging can be performed through either the user interface or the EDB API.

To perform dielectric merging:

1. Open the **Edit Layers** window.
2. Select one or more groups of layers.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

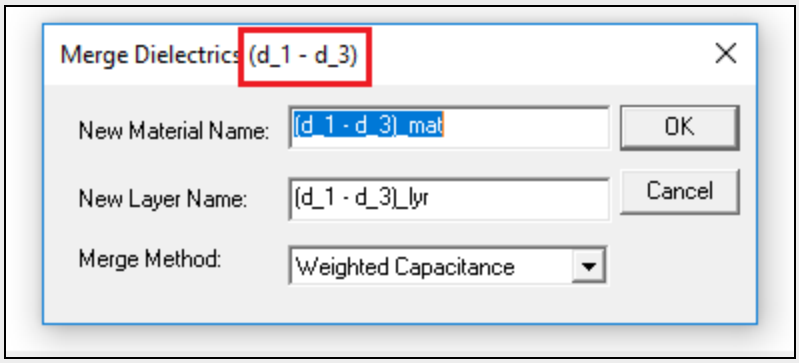
3. Right-click on a group of layers, then select **Merge Dielectrics**.



4. Enter the selected parameters in the **Merge Dielectrics** window.

Note:

When multiple dielectric ranges are selected, multiple **Merge Dielectrics** windows appear. The window titles include the range of layers affected that window's merge operation.



5. Click **OK** to merge the dielectrics.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Drawing on a Layer

You can draw on one layer at a time in the **Layout Editor**. Select the layer you want to draw upon on the **Active Layer** drop-down menu on the **Layout** toolbar and begin drawing. Any objects drawn are on your selected layer.

Setting Layer Associations

To match two similar, but not identical designs, specify layer associations. The outcome of the matched layers depends upon which layer of a structure (top or bottom) you add the design.

The **Top Bottom Association** column indicates layer associations. From the Edit Layers window, the **Top Bottom Association** column is not visible by default. Right-click the grid control column headers and select **Top Bottom Association** to make the column visible. Alternately, select a row and choose an association on the **Top bottom** field in the **Edit Selected** pane. Then choose one of the following from the drop-down menu:

Item	Description
Top	The layer is associated with the top surface. For example, if a subcircuit is added to the top layer of a stackup, the subcircuit's **top** -associated layers are mapped to the stackup's **top** -associated layers. The subcircuit's **neither** -associated layers are subsequently mapped to layers of the same type (e.g., signal to signal) beginning at the top and moving downward. If a subcircuit is added to the bottom layer of a stackup, this mapping is reversed; **top** -associated layers are mapped to **bottom** -associated layers and **neither** -associated layers are mapped to like layers, beginning at the bottom and moving upward.
Bottom	The layer is associated with the bottom surface. For example, if a subcircuit is added to the top layer of a stackup, the subcircuit's **bottom** -associated layers are mapped to the stackup's **bottom** -associated layers. The subcircuit's **neither** -associated layers are subsequently mapped to layers of the same type (e.g., signal to signal) beginning at the top and moving downward. If a subcircuit is added to the bottom layer of a stackup, this mapping is reversed; **bottom** -associated layers are mapped to **top** -associated layers. The subcircuit's **neither** -associated layers are subsequently mapped to layers of the same type, beginning at the bottom and moving upward.
Neither	The layer is not associated with a top or bottom surface. **Neither** -associated layers are mapped to layers of the same type. For example, if a subcircuit is added to the top layer of a stackup, the subcircuit's **neither** -associated layers are mapped to layers of the same type (e.g., signal to signal) beginning at the top and moving downward. If a subcircuit is added to the bottom layer of a stackup, this mapping is reversed; **neither** -associated layers are mapped to like layers, beginning at the bottom and moving upward.

Setting Layer Order and Elevations

Layer order is the sequence of physical layers in a stackup along the Z-axis. The order of the layers and their physical thickness determine the elevation of each layer.

Elevation in a stackup is the distance from zero (0) on the Z-axis to a point in a specified layer in a design's global coordinate system. A layer's lower elevation is the lowest point of the layer, while its upper elevation is the highest point of the layer. Depending on the type of stackup, change a layer's elevation without changing the layer's position in the stackup.

Elevation in Laminate and Multizone Stackups

In laminate and multizone stackups, each layer lays on the layer underneath it. Signal layers cannot be embedded in dielectric layers. The thickness of each layer can be changed but not its lower elevation. Because of this, the only ways to change a layer's lower elevation in a laminate or multizone stackup is to:

- Add or remove a layer
- Change the order of the layer
- Change the thickness of a layer underneath it.

Elevation in Overlapping Stackups

In overlapping stackups, dielectric layers must be continuous (i.e., stack on top of one another). They cannot overlap and there can be no gaps between them. To create an air gap between two dielectric layers, you must explicitly add a dielectric layer between them and define its material as "air".

In contrast, signal layers can reside at arbitrary elevations and be embedded in a dielectric layer or at the interface of layers. Signal layers and negative signal layers can overlap one another. They can also have non-zero thicknesses.

Via layers must connect two signal layers.

To help you understand where each layer in an overlapping stackup is located, four elevation columns appear by default for overlapping stackups. The **Lower** and **Upper** columns refer to the layer's elevations and can contain variables or expressions. The **Evaluated Lower** and **Evaluated Upper** columns provide calculated values for their elevations.

To change the order of layers in an overlapping stackup, choose on the following instructions.

Method A

1. From the Edit Layers ' control grid, change the **Lower** value of the bottom most dielectric layer. This is the only layer whose **Lower** value can change.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Change the **Thickness** and **Material** of the other dielectric layers as selected.
3. Add and remove dielectric layers as appropriate.
4. Change the **Lower** value for each signal layer that should move.

Method B

1. Change the stackup's **Type** to a **Laminate**.
2. **Click**+**drag** the dielectric layers into the correct order.
3. Change the stackup's **Type** back to **Overlapping**.
4. Changing the **Lower** value for each signal layer.

Setting the Layer Lower Elevation

The lower elevation of a layer is the lowest point of the layer (e.g., if you create a layer with a lower elevation of 2 microns, the layer begins at 2 and extends upwards until it reaches the **Upper Elevation** value). A signal layer's Lower Elevation value indicates its elevation above zero. Lower elevation can only be changed on signal layers in non laminate stackups.

To set a layer's lower elevation:

1. From the Edit Layers window, in the **Lower Elevation** column, double-click a layer's **Lower Elevation** field.
2. Type a value and its units in the field. The value can be specified using a number (e.g., 0.5um), a variable (e.g., $H), or an expression (e.g., $H-0.5um+$W).
3. Press **Enter**. The layer is assigned the lower elevation you entered.

Setting the Layer Upper Elevation

The upper elevation of a layer is the highest point of the layer. The upper elevation of a layer adjusts itself based on the lower elevation and the thickness of the layer. The Upper Elevation is not directly editable, but it can be seen in the Edit Layers window, in the **Upper Elevation** column.

Setting Layer Thickness

The thickness of each layer is listed in the **Thickness** column of the **Grid Control** pane in the **Edit Layers** window. A layer's thickness is measured on the point of elevation (e.g., if the elevation of a signal layer is 2 microns and the thickness is 4 microns, the layer begins at 2 microns and extends upwards for 4 microns to a height of 6). The units for the thickness is in the **Units** field of the **Stackup** pane.

Follow these steps to set a layer's thickness.

1. From the **Thickness** column of the **Edit Layers** window, double-click a layer's **Thickness** field.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

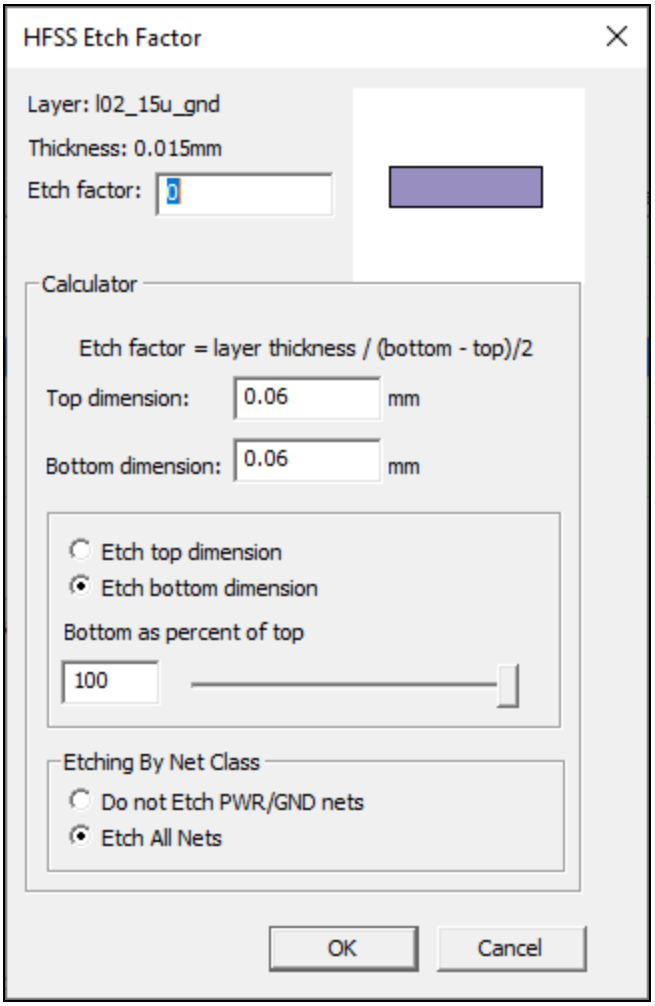
2. Type a value and its units in the field. The value can be specified using a number (e.g., 0.5um), a variable (e.g., $H), or an expression (e.g., $H-0.5um+$W).
3. Press **Enter**.The layer is assigned its new thickness.

> **Warning:**
>
> Assigning thickness to signal layers significantly increases the solution time. The number of unknowns that HFSS software must compute doubles when you increase the thickness from zero (infinitely thin) to a finite number. Therefore, if possible, model signal layers as infinitely thin objects.

Setting the Etch Factor

Substrate manufacturing does not create exact geometry. The actual geometry of substrate manufacturing often results in different thicknesses in the dimensions of each geometry within a layer — and that difference is represented by an “etch” or “etch factor”. HFSS geometry allows the presence of an etch factor in the design and modeling of different substrate layers. The specific etch factor that applies to a particular layer is usually available from the manufacturer, but is generally calculated by taking the ratio of etch depth to the undercut, where the undercut is defined as being the part of the wafer that is etched away under the photoresist. The etch factor is configurable on the **HFSS Etch Factor** window.

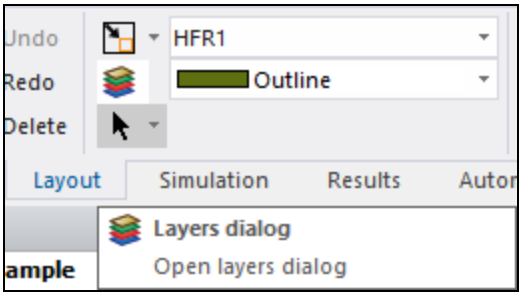
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Accessing the HFSS Etch Factor Window

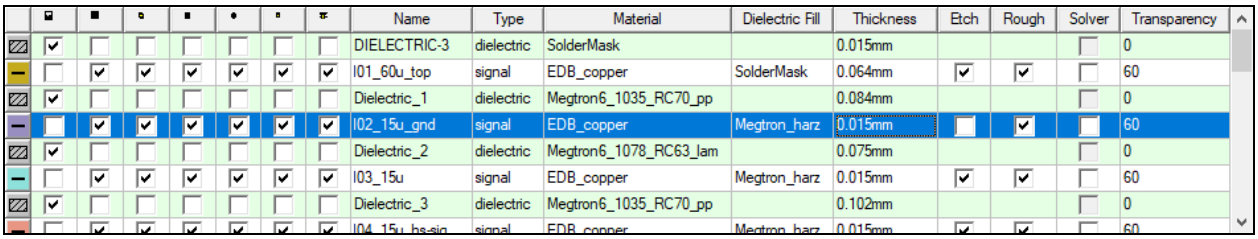
Follow these steps to access the **HFSS Etch Factor** window.

1. From the **Layout** tab, click the **Layers dialog** button to open the **Edit Layers** window.



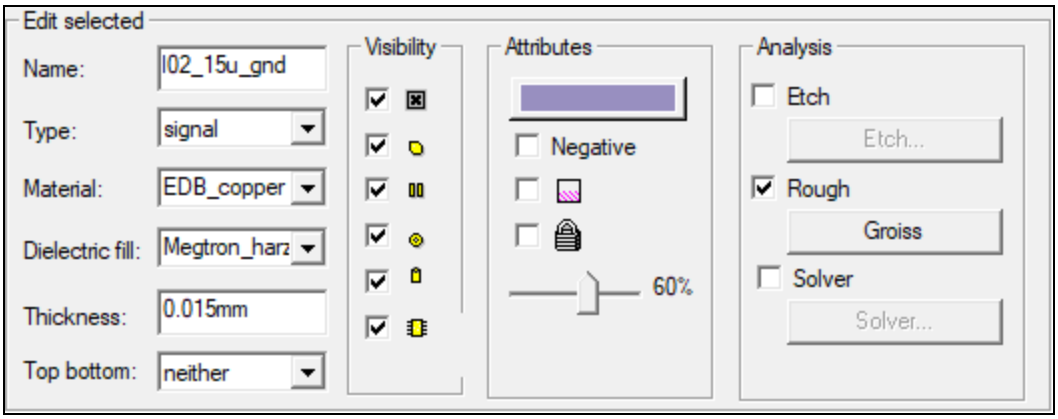
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Select a row in the layer table that has a check box in the **Etch** column.

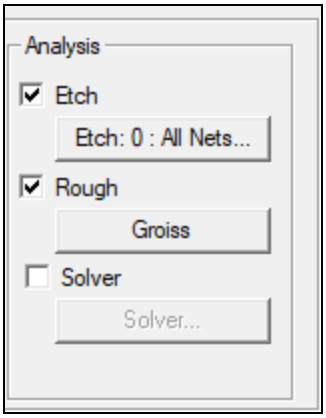


Name	Type	Material	Dielectric Fill	Thickness	Etch	Rough	Solver	Transparency
DIELECTRIC-3	dielectric	SolderMask		0.015mm				0
l01_60u_top	signal	EDB_copper	SolderMask	0.064mm	☑	☑		60
Dielectric_1	dielectric	Megtron6_1035_RC70_pp		0.084mm				0
l02_15u_gnd	signal	EDB_copper	Megtron_harz	0.015mm		☑		60
Dielectric_2	dielectric	Megtron6_1078_RC63_lam		0.075mm				0
l03_15u	signal	EDB_copper	Megtron_harz	0.015mm	☑	☑		60
Dielectric_3	dielectric	Megtron6_1035_RC70_pp		0.102mm				0
l04_15u_hs-sig	signal	EDB_copper	Megtron_harz	0.015mm	☑	☑		60

3. Navigate to the **Edit selected** area > **Analysis** area.

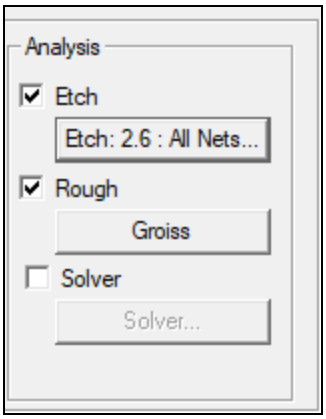


Ensure the **Etch** box is checked to activate the button beneath it.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click the button to open the **HFSS Etch Factor** window.

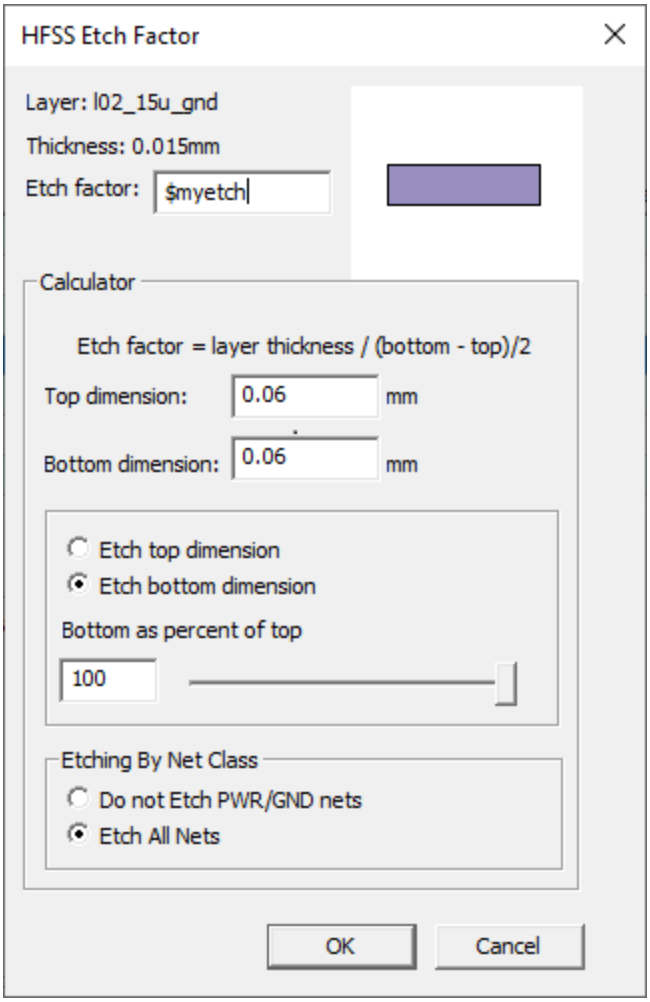


5. Make any adjustments as selected. Then click **OK** to close the window and apply the etch factor parameters to the selected layer.

Entering a New Etch Factor

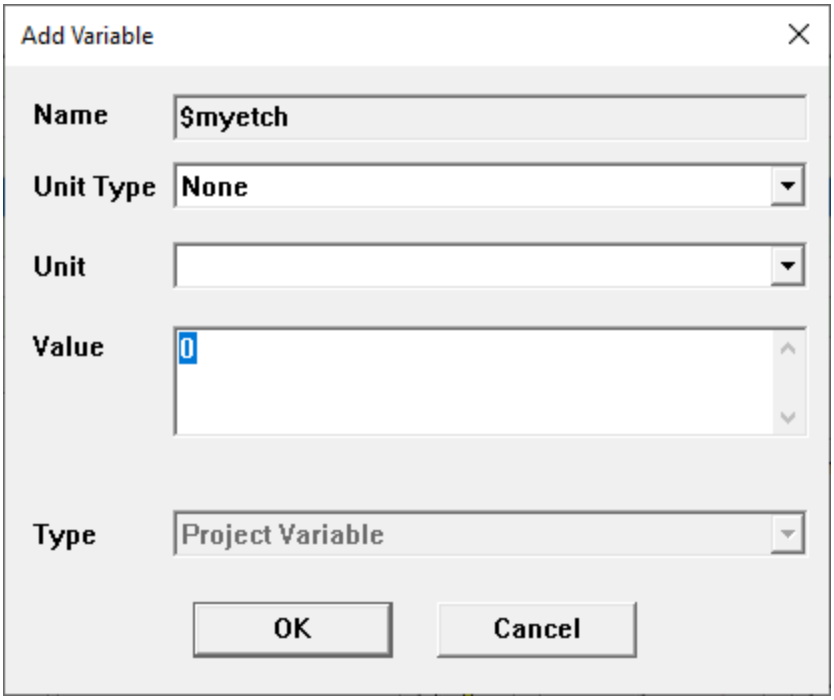
The **Etch factor** value may be entered as a number or may be parameterized as a project variable.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



If the variable has not yet been created, an **Add Variable** window will appear when users navigate away on the **Etch factor** field. Refer to **"Working with Variables" on page 3-101**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



If the input to that control is a number, the calculator controls are available; otherwise, the calculator controls are deactivated.

The Calculator Area

The purpose of the etch factor calculator is to give you a way to calculate an etch factor based on layer thickness. By default, the **Top** and **Bottom** dimension fields are populated with values that correspond to the value in the **Etch factor** field. However, the values are representational and do not correspond to a particular geometry in the layout.

To alter the etch factor, either enter new values in the **Top** and **Bottom** dimension fields, or enter a percentage into the **Top/Bottom as percent of top** field directly or by adjusting the slider to set the value of one dimension to a percentage of the other. As the **Top** and **Bottom** dimensions change, the etch factor and subsequently the layer drawing are modified to reflect the change.

The Etching By Net Class Area

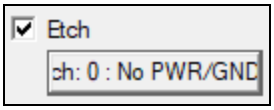
By default, **Etch All Nets** is selected. Select **Do not Etch PWR/GND nets**, and any power/ground nets in the selected layer will **not** be etched.

Change the **Etch All Nets**/**Do not Etch PWR/GND nets** option for multiple layers simultaneously by using **Ctrl**+**click** to highlight multiple rows in the layer table.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

	Name	Type	Material	Dielectric Fill	Thickness	Etch	Rough	Solver	Transparency
	DIELECTRIC-3	dielectric	SolderMask		0.015mm				0
	l01_60u_top	signal	EDB_copper	SolderMask	0.064mm	☑	☑		60
	Dielectric_1	dielectric	Megtron6_1035_RC70_pp		0.084mm				0
	l02_15u_gnd	signal	EDB_copper	Megtron_harz	0.015mm		☑		60
	Dielectric_2	dielectric	Megtron6_1078_RC63_lam		0.075mm				0
	l03_15u	signal	EDB_copper	Megtron_harz	0.015mm	☑	☑		60
	Dielectric_3	dielectric	Megtron6_1035_RC70_pp		0.102mm				0
	l04_15u_hs-sig	signal	EDB_copper	Megtron_harz	0.015mm	☑	☑		60

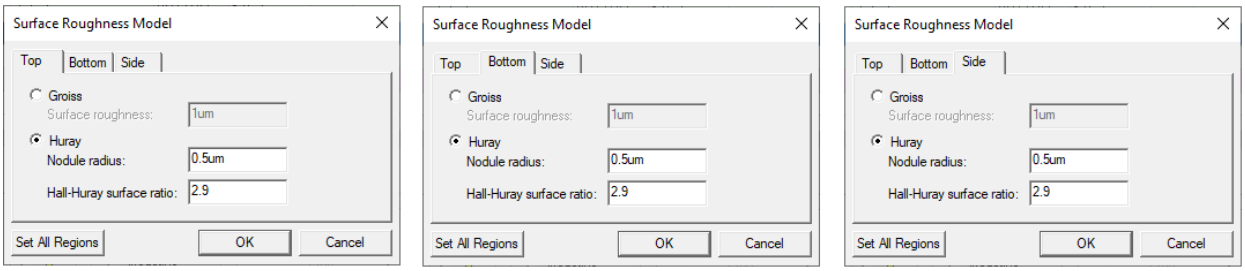
The choice is also reflected on the **Edit Layers** window > **Etch** button.



Setting the Layer Surface Roughness

The surface roughness model is used to compute conduction losses for surfaces. Surface roughness increases conduction losses, such as the interface between the conductor and the substrate for a microstrip line. The **Surface Roughness Model** window is accessed through the Edit Layers window. To access the Surface Roughness window:

1. Check the **Rough** area for a selected layer in the **Edit Layers** window.
2. Click **Roughness** to open the **Surface Roughness Model** window.



The surface roughness of top and bottom layers is set independently. Also set one roughness for the sides. There is a separate tab in the window for each.

3. Select either the **Top**, **Bottom**, or **Side** tab.
4. Select either **Groiss** or **Huray:**
   a. For the Groiss model, specify a **Surface roughness** parameter as a value/variable, then specify the corresponding units. The Groiss model is a traditional-case model. It is not causal and is only suitable for frequency-domain computations. It is also limited to a maximum impedance multiplying factor of 2, which corresponds to highly polished conductor surfaces. Legacy projects use the Groiss model by

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

default.

b. For the Huray model, also specify the **Nodule radius** value, which is the radius of copper spheres used to model the surface roughness. Next, specify the **Hall-Huray surface ratio**, which is a unitless quantity. The Huray model is causal.

5. The surface roughness of each surface is set independently. To copy the settings from one surface to the other two:
   a. Set the selected model for one of the surfaces.
   b. Click **Set All Regions**.
6. Click **OK**.

Groiss Surface Roughness Model

The Groiss surface roughness model is a simple function of the surface roughness and skin depth of the conductor.

The smooth surface impedance (Z_{smooth}) is increased by a factor ($fact_R$), given by the equation (1):

$$fact_R = 1 + e^{-\left(\frac{\delta}{2s}\right)^{1.6}}$$

where:

- s is the surface roughness (in length units)
- δ is the skin depth, which is defined as (2):

  $$\delta = \frac{1}{\sqrt{\pi f \mu_r \mu_0 \sigma}}$$

  in which:

- f is the frequency in Hz
- μ_r is the relative permeability of the conductor
- μ_0 is the permeability of free space

  $$\mu_0 = 4\pi \cdot 10^{-7}\ \mathrm{H/m}$$

- σ is the electrical conductivity in Siemens/m

Once the Groiss surface roughness factor is determined, the rough surface impedance (Z_{rough}) is determined as (3):

$$Z_{rough} = fact_R \cdot Z_{smooth}$$

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Limitations of the Groiss Model:

The Groiss surface roughness model is non-causal and is therefore limited to the frequency-domain (not suitable for time-domain computations). The Groiss roughness factor is bound by the following limits:

$0 < fact_R \leq 2$

Therefore, it is suitable for relatively highly polished conductors and not suitable for the much rougher copper conducting traces that are typical of manufactured PCBs.

For roughness factors greater than 2 and for time-domain computations, use the Huray Surface Roughness Model.

References:

1. S. Groiss, I. Bardi, O.Biro, K. Preis and K.R. Richter, Graz University of Technology, Kopemikusgasse 24, A-8010 Graz, Austria, "Parameters of Lossy Cavity Resonators Calculated by the Finite Element Method", IEEE TRANSACTIONS ON MAGNETICS, VOL 32. NO 3, MAY 1996

Huray Surface Roughness Model

Surface roughness can increase conductor power losses by more than two times the loss associated with smooth conductors. In Ansys Electronics Desktop, a modification of the standard real-valued Huray surface roughness model is implemented to accurately account for these losses in both the frequency and time domains.

This modification fixes a causality problem with the original Huray model by adding some frequency-dependent reactance to the roughness-enhanced surface impedance. The purpose is to provide a complex-valued causal analytic model that exactly matches the loss results of the original model but is also suitable for time domain computations.

The original Huray model was limited to calculations in the frequency domain and did not account for the effects of roughness on the phase of the transmitted signal. These limitations have been eliminated. The enhanced causal model not only provides accurate broadband modeling of the losses in very rough copper foils (typically used in PCB manufacturing) but also accurately predicts increased phase delay due to the surface roughness.

Essentially, the smooth surface impedance (Z_{smooth}) is increased by a complex “Huray” factor (H_c), a function of frequency, given by the following equation (1):

$$H_c(j\omega) = 1 + \frac{K}{1 + \left(\frac{j2\omega}{\omega_0}\right)^{-1/2}}$$

where:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- ω is the frequency in radians/second
- ω_0 is a corner frequency represented by the equation (2):

$$\omega_0 = \frac{2}{a^2 \mu_r \mu_0 \sigma}$$

- K is a derived constant used to simplify the equation (3):

$$K = \frac{3}{2} \cdot SR = \frac{6\pi a^2 N}{A_f}$$

in which:

- *SR* is the Hall-Huray surface ratio:

$$\frac{4\pi a^2 N}{A_f}$$

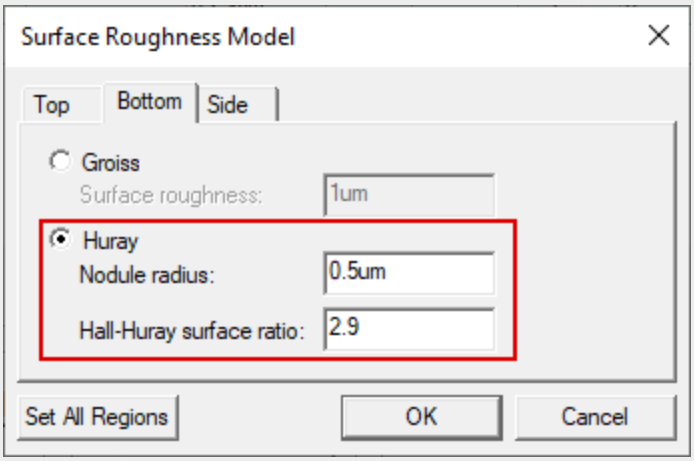
- *a* is the radius of a spherical nodule
- μ_r is the relative permeability of the conductor
- μ_0 is the permeability of free space

$$\mu_0 = 4\pi \cdot 10^{-7}\ \mathrm{H/m}$$

- σ is the electrical conductivity in Siemens/m
- *N* is the number of nodules
- A_f is a unit cell area

Note:

a and *SR* are the two parameters you must enter in the **Surface Roughness Model** dialog box when you select the Huray option:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For more information about this complex causal Huray model (its necessity, background, derivation, proof of accuracy, and consistency with the original real-valued model), see Reference 6 below.

Once the Huray surface roughness factor is determined, the rough surface impedance (Z_{rough}) is determined by the equation (4):

$$Z_{rough} = H_c \cdot Z_{smooth}$$

Working with Dielectric and Negative Signal Layers

If you have multiple dielectric layers in the model, they must touch other dielectric layers or negative signal layers. This prevents “pockets” of air from developing. If you have a signal layer between two dielectric layers, the dielectric layers must touch. The signal layer may overlap the two dielectric layers; however, a signal layer may not touch a negative signal layer. You may create an air gap by defining a dielectric layer as air.

Via Layers

Via layers are used to create a connecting metal layer between two existing signal layers. They are abstract constructs that exist between and in reference to their signal layers. For instance, a via layer’s Evaluated Lower and Evaluated Upper values are defined by the Evaluated Lower and Evaluated Upper values of their signal layers. The thickness of a via layer is the distance between its reference signal layers. Via layers are rendered as purple in the Edit Layers window's Control Grid.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To create a via layer:

1. From the **Edit Layers** window, make the stackup an overlapping stackup.
2. Use the mouse and **Ctrl** key to select two signal layers between which the via layer exists.
3. Right-click on one of the selected layers and click **Insert Via Layer**. The new layer appears in the Stackup Viewer and Control Grid.

Existing layers in an overlapping stackup can be changed to via layers by selecting a layer and changing the **Type** drop-down menu in the **Edit selected** pane.

Drawing a Model in the Layout Editor

All geometric models that you create are a collection of objects. These objects are drawn at the **Layout Editor**. The Ansys Electronics Desktop (AEDT)™ electronics systems design platform allows you to draw on all three primitive layer types (i.e., dielectric, signal, and negative signal).

The Drawing Region

The drawing region is the rectangular area, displayed as a grid, in which you create the model. You can control the following aspects of the drawing region:

Setting the Drawing Region Size

Defining the size of the region in which you are interested helps to conserve computing resources. HFSS does not attempt to compute a solution outside the drawing region.

Drawing region settings can be changed for the local layout design, or for all layout designs. See The Display Tab under Layout Options for details on changing the drawing region settings

Fitting View Areas in the Drawing Region

If the drawing region is too large to fit in the viewing area of a **Layout Editor**, scroll bars automatically appear on the bottom and left side of the window. Use them to scroll across the drawing region. Alternatively, click **View > Fit Drawing** to rescale the viewing area of the window to display the entire drawing region.

Choosing Grid Settings

The grid displayed in the **Layout** window is a drawing aid that helps to visualize the location of objects. By default a cartesian (rectangular) grid is displayed in the active **Layout Editor**. The grid is centered at the origin of the local coordinate system (x = 0, y = 0). Grid spacing is set according to the current project's drawing units.

Grid settings can be changed for the local layout design, or for all layout designs. See The Display Tab under Layout Options for details on changing the grid settings

Choosing Snap Settings

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

By default, the selection point and graphical objects are set to “snap to” a point on the grid when the cursor hovers over it. The coordinates of the selection point are used, rather than the exact location of the mouse.

Snap settings can be changed for the local layout design, or for all layout designs. See The Snapping Tab under Layout Options for details on changing the snap settings

Choosing Shadow Settings

When a sub-circuit is selected, it is drawn shadowed. The shadowing can be controlled through a property on the sub-circuit. Shadow Percent: a low number means less shadowing, a high number means more. A low number also means the sub-circuit are drawn with colors closer to the original intensity.

General Drawing Guidelines for the Layout Editor

There is no strict procedure to follow when creating a geometric model; these steps serve as general guidelines.

1. Select the layer you want to draw on.
2. Activate the **Layout** view window by clicking its window frame.
3. Click the **Draw** menu commands to create one- and two-dimensional objects. Treat each conductor or material in the structure as a separate object.
4. If applicable, select commands from **Draw** and **Layout** to modify the geometry that you created.
5. Periodically save the geometry.

Drawing Apertures on Negative Signal Planes

You can create apertures or holes in an infinite negative signal plane layer. Draw an object on the negative signal layer in the shape of the aperture. The Ansys Electronics Desktop (AEDT)™ electronics systems design platform assumes any object drawn on a negative signal layer is an aperture and automatically assigns it the properties of air (if the stackup is non laminate) or properties of a dielectric fill material (if the stackup is laminate).

Zooming and Panning the Layout View

Complete the steps in the following subsections to magnify (zoom in) or shrink (zoom out) the contents in the view window, or on a rectangular area in the view window, and pan (scroll) the view in any direction.

> **Note:**
>
> While zooming and panning, the absolute size of the active design does not change.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Zoom In on Window Contents

1. To magnify (zoom in on) the contents in the view window, do one of the following:
    a. From the **View** menu, select **Zoom In**.
    b. Right-click in the **Layout Editor**/**Schematic Editor** and select **Zoom In**.
    c. Press **Ctrl** + **+**.
2. Repeat until the selected magnification is achieved.

Zoom Out on Window Contents

1. To shrink (zoom out on) the contents in the view window, do one of the following.
    a. From the **View** menu, select **Zoom Out**.
    b. Right-click in the **Layout Editor**/**Schematic Editor** and select **Zoom Out**.
    c. Press **Ctrl** + **-**.
3. Repeat the operation until the selected magnification is achieved.

Zoom In on a Rectangular Area

1. To magnify a specific rectangular area in the view window, do one of the following:
    a. From the **View** menu, select **Zoom Area**.
    b. Right-click in the **Layout Editor**/**Schematic Editor** and select **Zoom Area**.
2. The cursor changes to a magnifying glass. **Click**+**drag** to draw a rectangle (or square) by selecting two diagonally opposite corners. This is the area where magnification is increased.
3. Release the mouse button to magnify the area. The cursor returns to normal.

Zoom In/Out Using the Mouse Wheel

a. Press **Shift** and spin the mouse wheel to zoom in/out at the current cursor position.

b. Press **Shift** + **Alt** and spin the mouse wheel to zoom in/out more precisely.

Restoring a Previous Zoom View

After executing a zoom in or zoom out operation, you can return to the previous magnification by selecting **Zoom Previous** on the **View** drop-down menu or on the shortcut menu in the layout window.

Panning the View

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To pan (scroll) the view in any direction, hold down **Shift** while clicking the mouse. The view is attached to the cursor. While holding down the Shift key and left mouse button, move the cursor to pan the view in any direction. Release the mouse button to end the panning operation.

Cross-Probing Selected Elements

When both the **Layout Editor** and the Schematic editor are displaying the same design, select one or more component instances and interface ports in both editors. Select schematic elements or layout elements to cross-probe. Then use one of the following methods to effect the cross-selection:

- In either editor, press **Ctrl**+**K**
- From the **Schematic Editor**, select **Schematic** > **Cross-Probe Layout**
- From the Layout editor, select **Layout** > **Cross-Probe Layout**

The corresponding elements in the related editor are selected and that editor window are brought to the front. If you select only component instances or only interface ports, then cross-probing makes the primary selection in the first editor the primary selection in the related editor. Note that all previous selections in the related editor are cleared and only the cross-probed elements are selected when the command is invoked.

> **Note:**
>
> Changes to a design should be made on the editor that was used to create the design. For example, if a design was created using the **Schematic Editor**, it should not be modified on the layout editor. In some cases, attempts to change a schematic design on the **Layout Editor** results in a warning such as:
>
> ```
> [warning] Port Port2, ID %2, was disconnected from net 98, but
> it was not possible to unwire it. This must be done manually.
> ```
>
> Similarly, a **Layout Editor** design can be viewed as a schematic using the cross-probing feature, but the schematic view should not be used to make changes to the design. Although an operation such as deleting a port in the schematic may successfully delete the cross-probed layout port, the operation cannot be undone in the **Layout Editor** after the schematic window has been closed (the undo attempt may cause an error).

Voids in Layout

For both copy/paste and copy to an EM design, if a void's owner is selected, all of its voids are copied and pasted as voids. Any voids that are not wanted can then be deleted after the paste.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If a void is selected but its owner is not, the void is copied as a primitive. If selected, the boolean subtract functionality can be used to notch or add a void, based on the overlap between the primitive and another selected primitive.

Directional Drawing in the Layout Editor

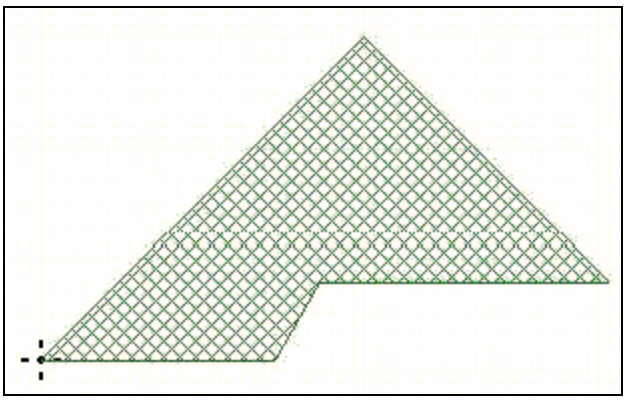
Directional drawing allows you to constrain snapping to a particular direction when moving, placing, and duplicating objects or primitives in the **Layout Editor**. Directional drawing/snapping can be set to snap to the orthogonal (x or y) or to 45 degrees. Directional drawing/snapping is set in the same manner as other layout snap options, by using the **Snapping** options tab of the **Layout Options** window. For more information see The Snapping Tab.

Rather than configuring a universal directional drawing constraint using the **Snapping** options tab of the **Layout Options** window, alternately you may temporarily modify the current constraint using a simple keystroke. The following keys modifies the current directional drawing/snapping constraint as you manipulate objects and primitives in the **Layout Editor**:

- Pressing 'd' applies a 45 degree directional drawing/snapping constraint
- Pressing 'r' applies an orthogonal directional drawing/snapping constraint
- Pressing 'n' removes any directional constraint that has been configured

Both the move and duplicate operations uses the currently configured directional constraint. The default for directional drawing is none. From the **Layout Editor**, the directional drawing mode is indicated by a dotted-cross cursor.

The reference point for directional drawing — the (0,0) point for the current movement — is marked with a dotted cross:



The following directional drawing rules apply when creating primitives, voids, and measurements:

- The first hover after initiating directional drawing sets the reference point for the current movement.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- The cursor moves freely, but when a snapped-on-hover event occurs, the directional constraint is applied.
- Each click resets the reference point for the next movement.

Drawing Geometric Objects in the Layout Editor

You can draw one- or two-dimensional objects using **Draw** commands. You can alter objects individually or together to create the geometry of your structure.

- *One-dimensional (1D,)* or *open objects* are zero-width arcs, lines, or any combination thereof that have not yet been closed to form the boundary of an object. Generally, open objects are used as temporary objects from which to create complex closed objects.
- *Two-dimensional (2D)* or *closedobjects*are objects with boundaries that enclose a region. All closed objects are automatically saved as part of the geometric model when you click **File** > **Save**.
- *Simple* closed objects include thick lines and arcs, circles, and rectangles. A *complex* closed object is one created by joining open objects to enclose an area. For example, to turn an open object into a closed object, draw a line that connects the end points of the open object.

Drawing a Circle in the Layout Editor

Draw a circle by selecting a center point and a radius. Circles are drawn as true surfaces.

1. From the **Draw** menu, select **Primitive** > **Circle**.
2. Select the center of the circle in one of the following ways:
   - Click the mouse on the point.
   - Enter the point's coordinates in the **X** and **Y** fields using the keyboard.
3. Specify the circle's radius in one of the following ways:
   - Select a point on the circle's circumference using the mouse or the keyboard.
   - Type a value for the radius in the **Distance** field and press **Enter**.

The circle is added to the active layer.

Drawing a Rectangle in the Layout Editor

Draw a rectangle by selecting either two diagonally opposite corners.

1. From the **Draw** menu, select **Primitive** > **Rectangle**.
2. Select the first diagonal corner in one of the following ways:
   - Click the mouse on the point.
   - Type the point's coordinates in the **X** and **Y** fields.

To delete the selected point and start over, press **Esc** or right-click and select **Cancel**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

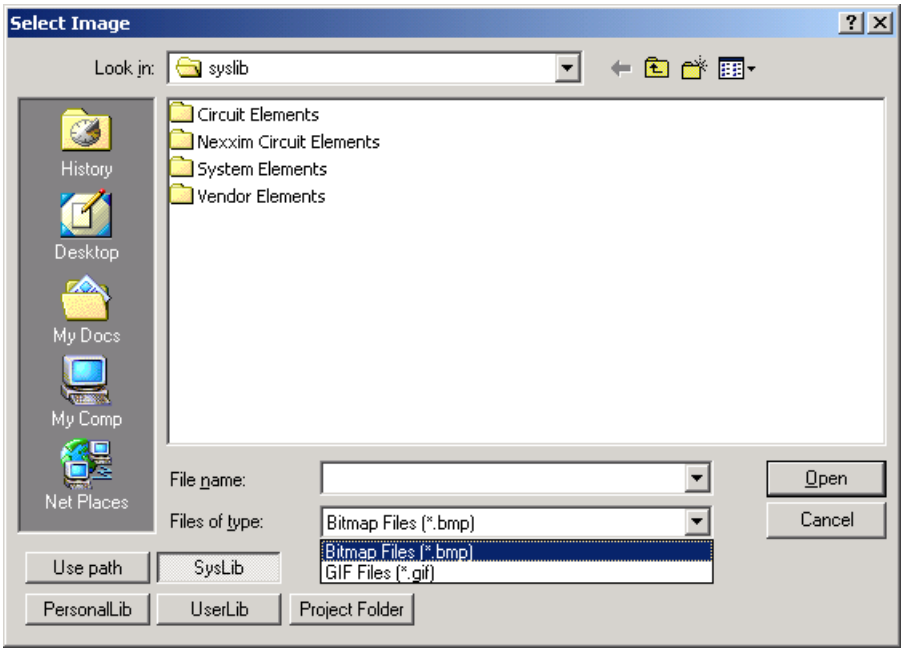
3. Select the second diagonal using the mouse or the keyboard.

The rectangle is added to the active layer.

Drawing an Image in the Layout Editor

Draw an image by using the **Draw** > **Primitive** > **Image** command.

1. From the **Draw** menu, select **Primitive** > **Image** to open the **Select Image** window.



2. Select an appropriate path, Lib, or Folder to access by clicking one of the following buttons: **Use path**, **SysLib**, **PersonalLib**, **UserLib**, **Project Folder**.

- Within the **PersonalLib**, **UserLib**, or **SysLib** folder, select the file from those listed, or type the name of the file in the **File Name** area. Note that **SysLib** is reserved for libraries supplied with HFSS.
- If you select **Use path**, type the name of the file in the **File Name** area, or click the **Look in** field to navigate to the file and record its name. Note that objects imported with **Use Path** may not be portable if the design is moved to a different machine.
- When **In project folder** is selected, references to the file in the design are relative to the directory where the project resides. In this case, the path is saved in the project **.adsn** file as a variable such as:

```
.lib '$PROJECTDIR/x_113854.lib'
```

The variable $PROJECTDIR are expanded to the current location of the project when the design is converted to a netlist and run by an analysis tool. Otherwise, an absolute path is

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

saved. If you move a project and its library files together to a new directory, you can preserve the file references by selecting the **Project Folder** option.

3. Select the file type from one of the following:
- Bitmap Files (*.bmp)
- GIF Files (*.gif)
4. Select a file on the display, or type the name of the file in the **File Name** field.
5. Click **Open** and a ghost image appears that drag over the schematic display and click to place. The image is added to the active layer.

> **Note:**
>
> - The **PersonalLib** folder is located at **<Project Directory>/PersonalLib**
> - The **userlib** folder is located at **<Installation Directory>/userlib**
> - The **syslib** folder is located at **<Installation Directory>/syslib**
>
> **<Project Directory>** is the location you specified for the projects,and **<Installation Directory>** is where HFSS was installed during setup.

Drawing an Arc in the Layout Editor

Draw an arc by selecting a center point, start point, and endpoint. Arcs are drawn counter-clockwise and as true surfaces.

1. From the **Draw** menu, select **Primitive** > **Arc**.
2. Select the center point of the arc in one of the following ways:
- Click the mouse on the point.
- Type the point's coordinates in the **X** and **Y** fields.
3. Select the arc's start point using the mouse or the keyboard.
4. Select the arc's endpoint using the mouse or the keyboard.

The arc is added to the active layer.

> **Note:**
>
> Arcs are drawn as true circles in the Layout Editor, but they are segmented for mesh generation.

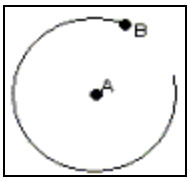
Additional Notes for Drawing an Arc

1. After clicking the arc toolbar icon or the arc menu item, the cursor changes to indicate arc creation. The first mouse-click location in the editor specifies the center point for the arc.

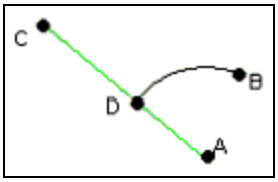
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Alternatively, rather than clicking in the editor, you can always enter an equivalent value in the coordinate bar to indicate a location.

2. Cursor movements draw an arc showing the radius and starting angle based on cursor position. Both the radius and starting angle may change as the cursor is moved.
3. The next mouse-click in the editor specifies both the radius and the starting angle for the arc. From the following figure, point A is the location of the first click. Point B is the location of the second click.



4. Cursor movements change the ending angle only; the radius is fixed. During a mouse hover, the cursor is moved to the radius. The end angle indicated by the cursor position remains unchanged. Grid snapping is relative to the moved position and the snap is constrained to remain at the defined radius. Only end angles at 0, 90, 180, and 270 degrees on the start angle grid snaps; other end angles do not intersect a grid intersection. From the following figure, the cursor hovers at C. The line from A to C indicates the end angle position. D is the location to which the cursor is moved.



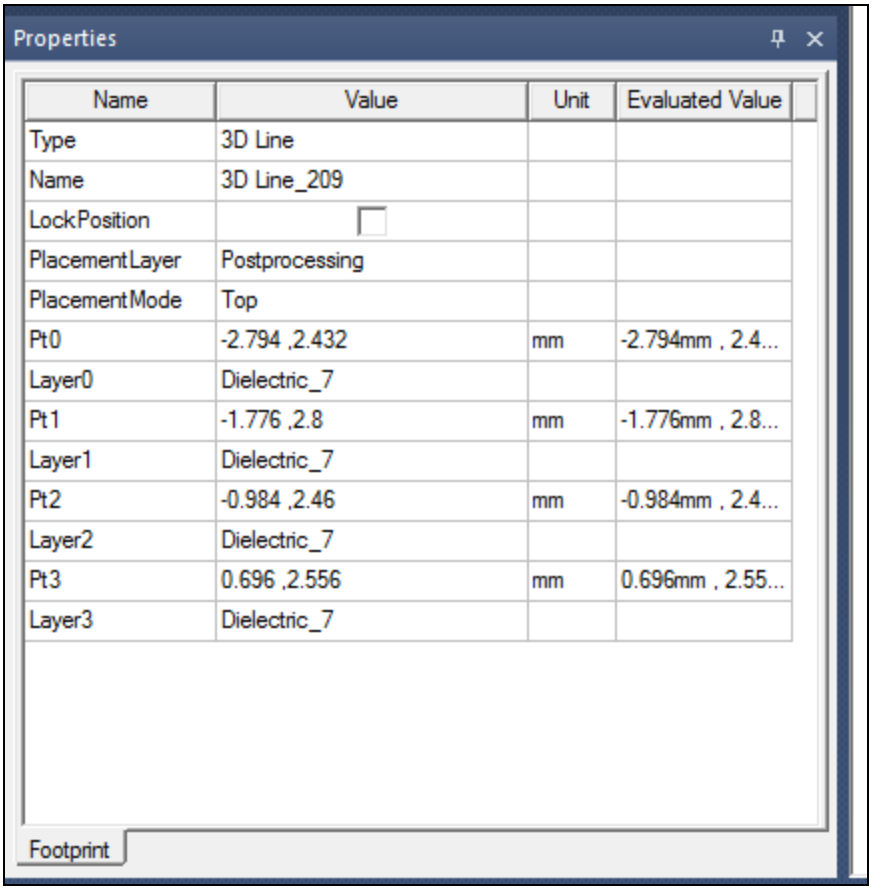
5. The next click specifies the end angle for the arc. Note that this location may NOT be the end point of the arc. The end point of the arc is the position along the ending angle at the defined radius. If the cursor is clicked at C, the arc is created with D as the end point. If the cursor is clicked at D, the arc is created with D as the end point.

Drawing a 3D Line Segment

The following describes how to draw an object with one or more straight segments.

1. **Create the 3D Line**: To draw the line, on the **Draw** menu, select **Primitive** > **3D Line**. Once you have completed the line, its associated property window should appear similar to the following example.

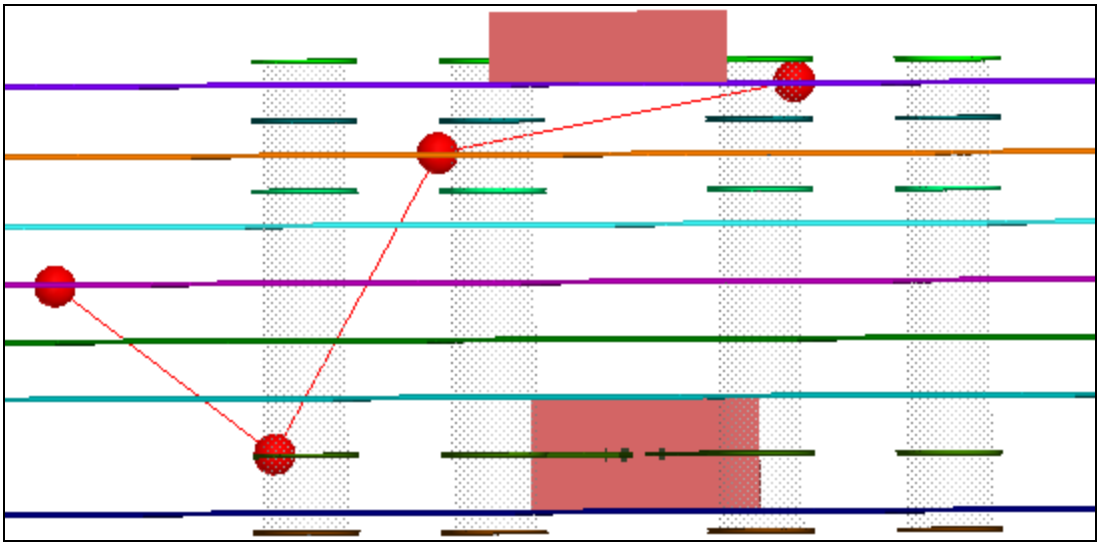
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The property window for the line has following features: — **Placement Layer**: The layer on which this primitive exists. It is always set to ‘Post-processing’ and cannot be changed. — Each point has its 2D coordinates and a layer on which it is placed currently. — The layer for each point is initially set to the active Layer in the ‘Active Layer’ drop-down menu. — **PlacementMode**: Can be set to Top, Bottom, Middle, or 3D. It is initially set to Top.

2. **Select the Layers for Each Point**: The field named layer contains a list of all the stackup layers present in the design. The point can be placed on any of those lines. Each layer has a different elevation and changing the layer for each point has the effect shown in the following image.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

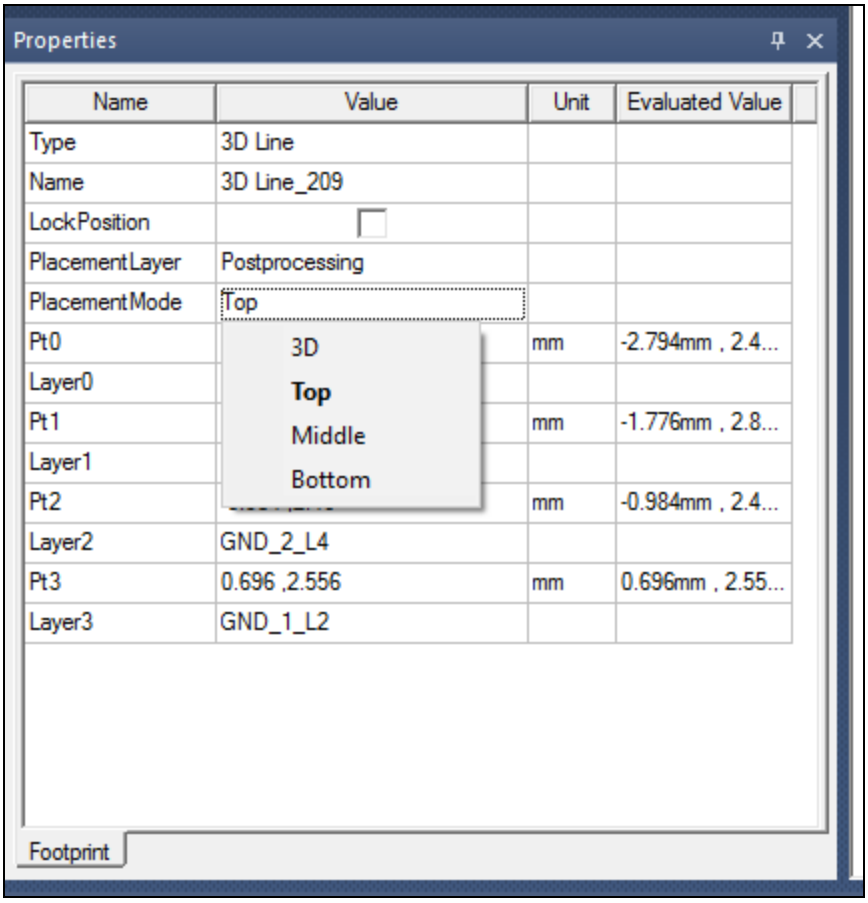


3. **Toggle between placement modes:**

- **Top**: Places the point on the ‘Upper elevation’ of the current layer.
- **Bottom**: Places the point on the ‘Lower elevation’ of the current layer.
- **Middle**: Places the point on the middle elevation (lower elevation + thickness/2) of the current layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

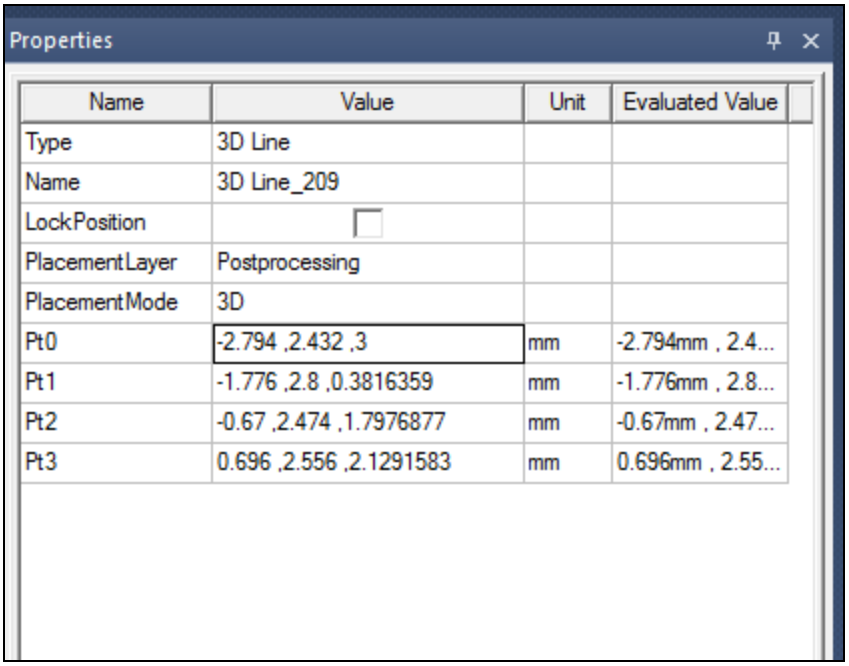
- **3D**: The point has true 3D coordinates which can be changed as selected.



- **Changing from Top to 3D:** The property window shows the layer names have been removed and the 'Pt' field contains the true 3D coordinates of the point. The 3D coordinates of the point are currently set to the upper elevation of the layer, since you have toggled from Top to 3D.
- You can change the coordinates of the point using the property window, as shown in the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

following image. Note the difference in the Z-coordinate for Pt0.



- In 3D mode, while toggling back to top/bottom/middle, the layer for each point is set to the layer whose elevation is closest to the point. The point is then moved to that layer.
- Toggling from 3D to Middle/Bottom or the reverse yields similar results and assigns layers to the points based on the Middle/Lower elevation.

4. **Script Recording and Replay**:

- 3D Line script record/replay works just like any other script record/replay. Before drawing the line, click on **Tools > Record Script to Project**. Once you have finished drawing the line, click on **Tools > Stop Recording**.
- From the project manager window, go to **Definition >Scripts**. Right-click the script to see the available operations.
- The recorded script looks like the following diagram. Running the script returns the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

geometry of the line captured in the script.

```

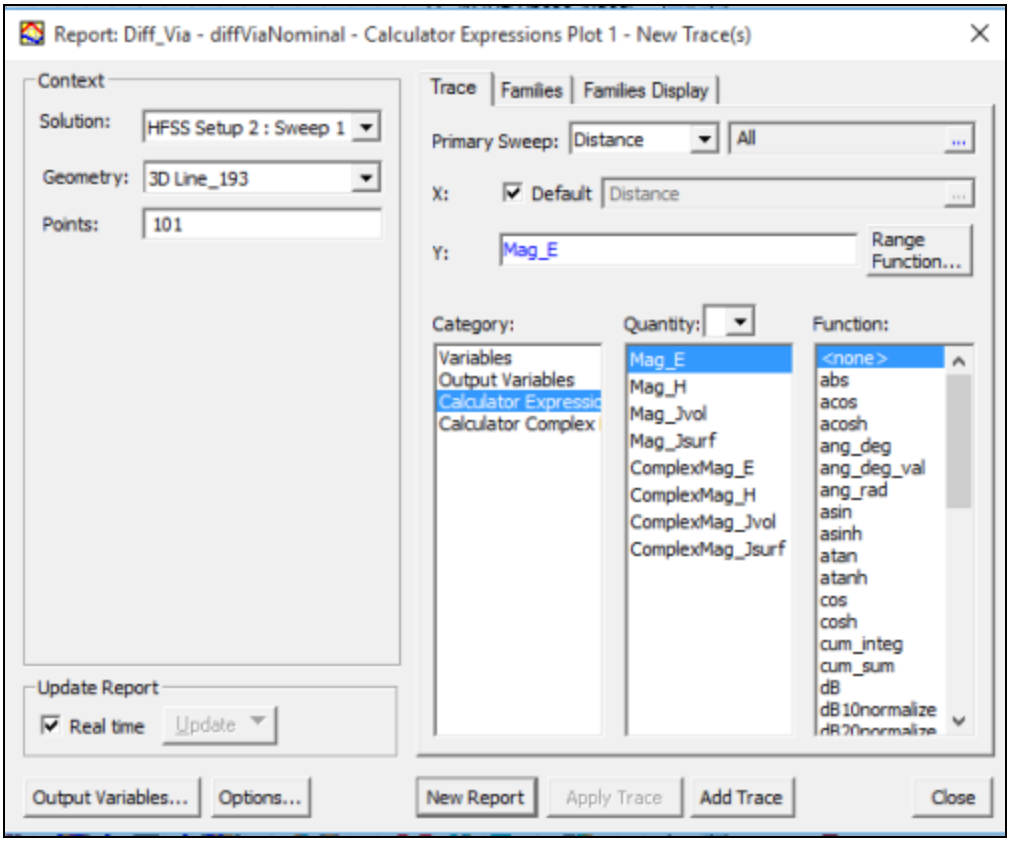
```

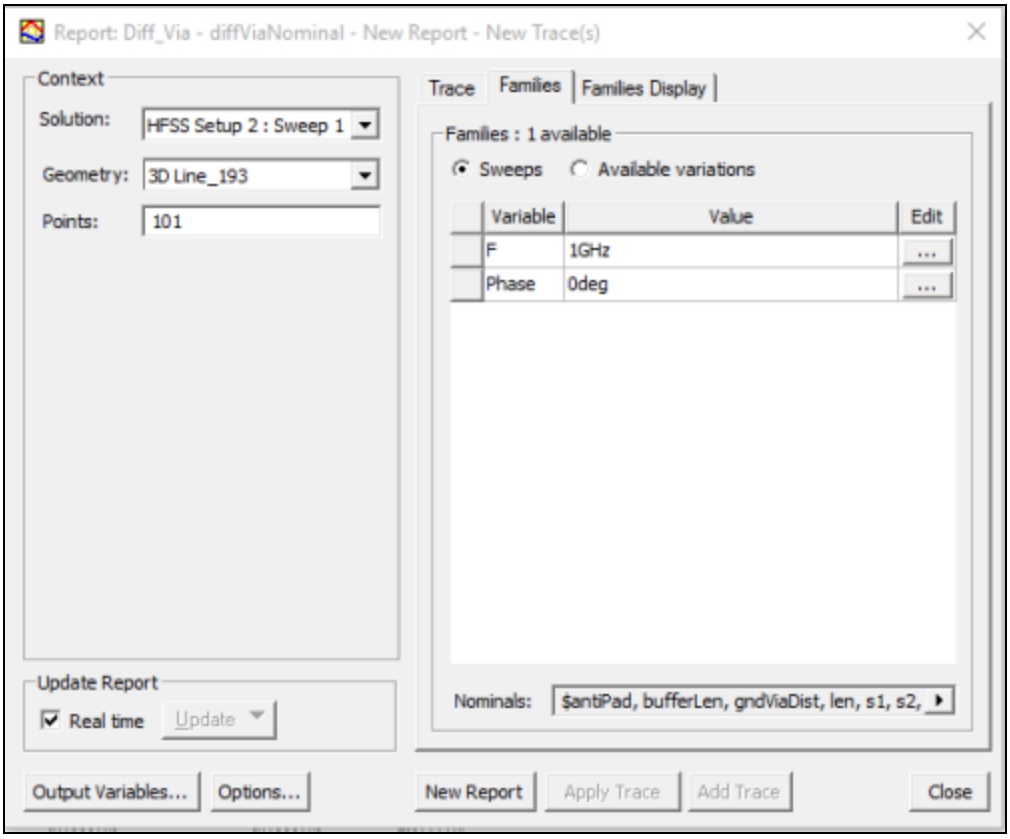
5. **Analyzing the Results and Plots**:

- Create an HFSS Setup, then analyze.
- Draw a 3D line by clicking on the icon in the ribbon.
- From the property window, change the placement mode to 3D. From the toolbar, change the moving axis to Z. Then change the coordinates of some points in the line.
- Select **Results** > **Create Fields Report** > **Rectangular plot** and ensure all the settings are the same as in the following diagram that shows the settings in the **Trace** and **Families** tabs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

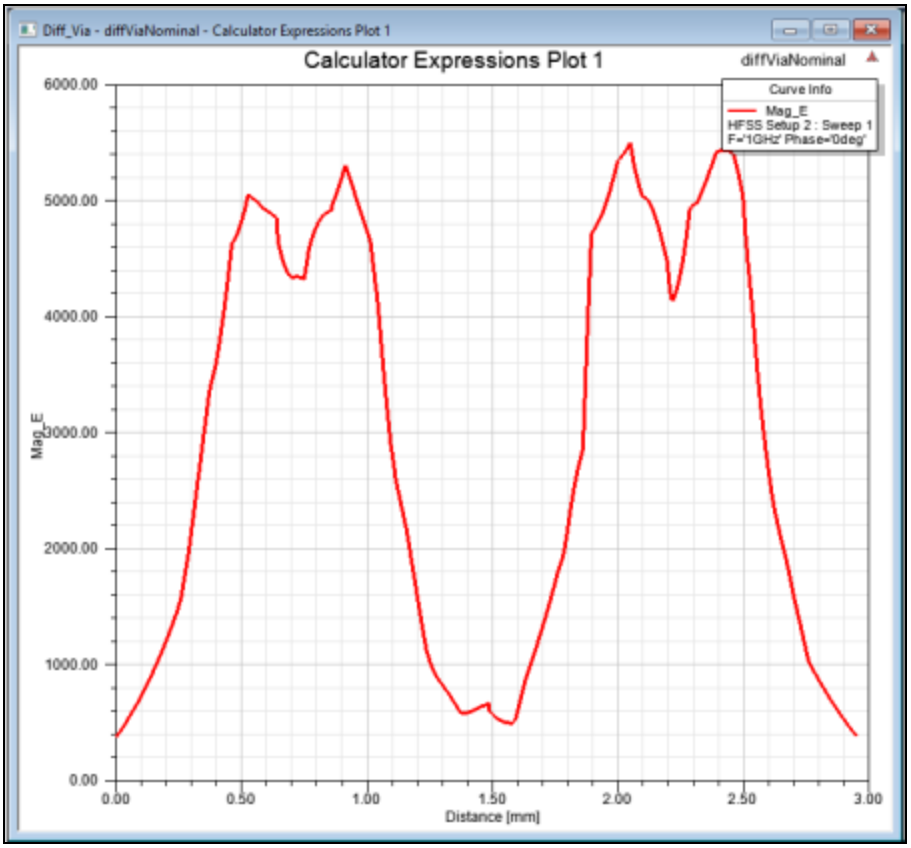


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The resulting plot is shown in the following image.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Now return to the **Layout Editor** and move the line to a new position. Observe the plot should change accordingly.

In a similar manner to these examples shown, other types of plots can be obtained by right-clicking on **Results** in the **Project Manager** window and choosing on the **Create Standard Report** drop-down menu.

For more information, refer to the plotting and report information listed in Post Processing and Generating Reports and Post Processing and Generating Reports for 2D and Circuit.

Drawing a Line in the Layout Editor

Draw an object with one or more straight segments using the **Draw** > **Primitive** > **Line** command.

1. From the **Draw** menu, select **Primitive** > **Line**.
2. Select the first point of the line in one of the following ways:
   - Click the mouse on the point.
   - Type the point's coordinates in the **X** and **Y** fields.
3. Select the next point of the line using the mouse or the keyboard. Notice that HFSS draws a line between the two points.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- To delete the last point that was entered, press **Backspace** or right-click and select **Back Up**.
- To delete all selected points and start over, press **Esc** or right-click and select **Cancel**.

4. Repeat step 3 to enter each point.
5. Complete the line in one of the following ways:
   - Double-click the final point of the line.
   - Press **Enter** or right-click and select **Finish**.

The line is added to the active layer.

You can edit the line's properties in the **Property Control** window to change the line's width, bend type, and end type in the **Line Styles** window.

> **Note:**
>
> HFSS no longer displays the "Linewidth" property for primtives in the Properties Window. In order to make modifications to the linewidth, you must use the "Expand" function. Note that a zero-width line is ignored by the Meshmaker.

Stitch Lines

Click the **Layout** > **Stitch Lines** command to stitch together connected/crossing lines into polygons and lines. Selected lines with zero width are united to form polygons when the segments close. Selected zero-width lines are first split at all points of intersection. Then lines are stitched together into polygons. Stitching is done in such a way as to avoid forming lines that cross.

Specifying Line Width in the Layout Editor

HFSS no longer displays the **Linewidth** property for all primitive types in the **Properties** window. For trace primitives, the line width can still be adjusted directly through **Properties**, but for other primitive types, such as polygons, use the **Expand** tool to modify the width instead.

> **Note:**
>
> A zero-width line is ignored by the Meshmaker.

Legacy adsn Files

The following apply to opening legacy adsn files or importing files of other formats that contain polygons, circles, and rectangles with linewith specifications:

- Polygons with linewidth are converted to non-linewidth polygons of the same shape.
- Rectangles with linewidth are converted to non-linewidth polygons of the same shape.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Circles with linewidth are converted to non-linewdith circles. Circle diameters are equal to the diameters of the legacy circles plus the linewidth.

Legacy Script Commands

The following apply to executing legacy script commands that operate on polygons, circles, and rectangles with linewidths:

- All linewidth properties of rectangles is ignored and warnings are posted in the Message Manager window.
- All polygons and circles are converted to corresponding non-linewidth polygons and circles, but the same shapes are generated.

Reverse Line Command in the Layout Editor

The Reverse Line command reverses the direction of selected Bond Wires, Lines and Arcs. The command is accessible on the Draw menu, the Toolbar, and the right-click Draw drop-down menu when an object is selected. Invalid objects is ignored.

Drawing a Polygon in the Layout Editor

A polygon is an arbitrarily shaped, closed object with three or more sides.

1. From the **Draw** menu, select **Primitive** > **Polygon**.
2. Select the first point of the polygon in one of the following ways:
   - Click the mouse on the point.
   - Type the point's coordinates in the **X** and **Y** fields.
3. Select the next point of the polygon using the mouse or the keyboard. Notice that HFSS draws a line between the two points.
   - To delete the last point that was entered, press **Backspace** or right-click and select **Back Up**.
   - To delete all selected points and start over, press **Esc** or right-click and select **Cancel**.
4. Repeat step 3 for each point. HFSS will draw a line between the first point and last point entered to close the object.
5. Complete the polygon in one of the following ways:
   - Double-click the final point of the line.
   - Press **Enter** or right-click and select **Finish**.

The polygon is added to the active layer.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

HFSS no longer displays the "Linewidth" property for primtives in the Properties Window. In order to make modifications to the linewidth, you must use the "Expand" function. Note that a zero-width line is ignored by the Meshmaker.

Curving Polygon Edges in the Layout Editor

1. Follow steps **1-5** in Drawing a Polygon in the Layout Editor.
2. Hold **Ctrl** and drag the center handle of an appropriate edge to curve it.

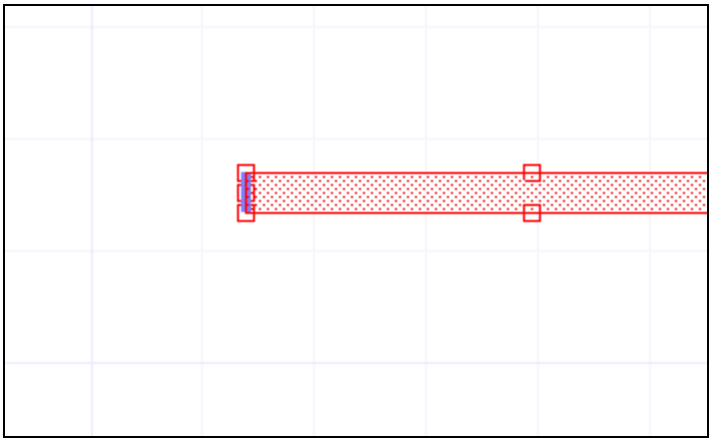
Drawing a Void in the Layout Editor

Follow these steps to create a void, or remove material from an object in the shape of a circle, rectangle, polygon, or line.

Note:

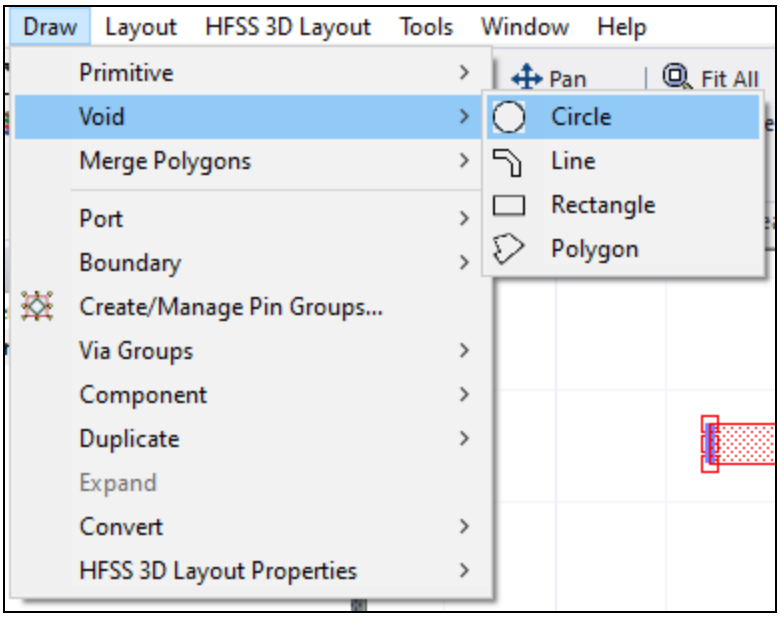
One object can have multiple voids but each void can only be associated with one parent object (e.g., to create two concentric rings, draw the outer circle, then add a circular void within it).

1. Select a parent object.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

a. Navigate to **Draw**, then select **Void** and one of the following:

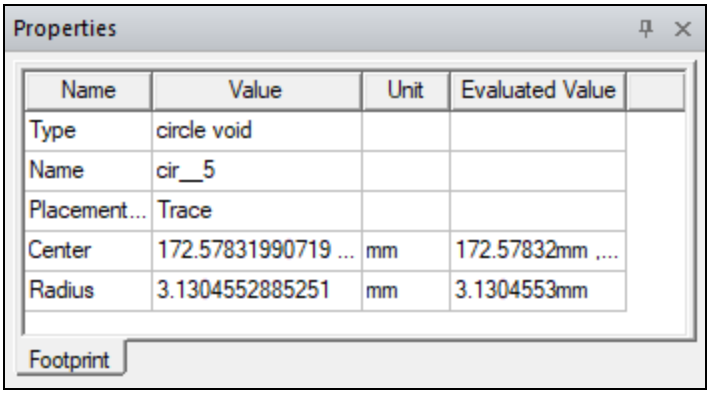


- **Circle**. Then follow the procedure for drawing a circle.
- **Rectangle**. Then follow the procedure for drawing a rectangle.
- **Polygon**. Then follow the procedure for drawing a polygon.

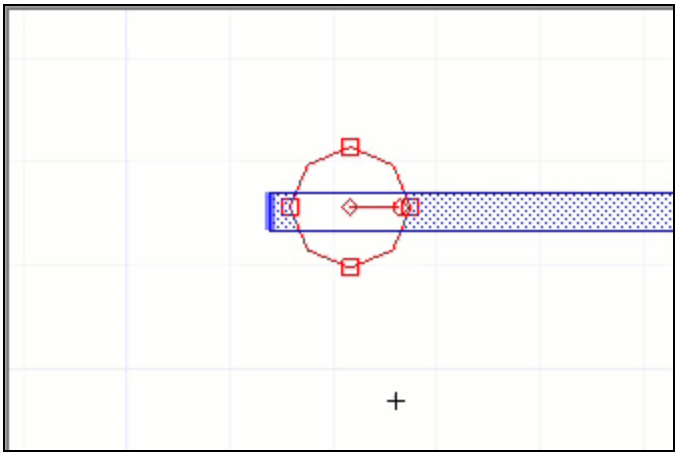
> **Note:**
>
> To **Remove a Line**, navigate to **Draw** menu, then select **Void** > **Line**. Follow the procedure for drawing a polygon. A void cannot be created in the shape of a line on an existing line object. Material is removed from the object in the shape and dimensions of the void.

2. Repeat steps **1-2** to create additional voids in an object.
3. View or edit a void's properties in the **Property Control** window or use the mouse to drag the void's handles.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. **Click+drag** the void's handles to change its shape.



> **Note:**
>
> 3D vias may contain voids. Voids in 3D vias can be placed entirely or partially in the outer contour. No attempt is made to geometrically align voids in the upper polygons with those in the lower. The order in which voids on different layers are created is used to control their alignment.

Drawing a Via in the Layout Editor

A via is an object that extends in the z direction and connects two signal layers, allowing a signal to travel from one layer to another. Unlike cross-layer plates, vias have volume, can be electrically large, and vary in shape. For these reasons, vias also use greater computational resources than cross-layer plates.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Vias are created from two 2D objects. Each 2D object is located on a trace layer. The via is extruded between the 2D objects when a mesh is generated, thereby connecting the layers.

> **Note:**
>
> Vias can also be 2.5D, 3D, or created from primitives drawn on a padstack layer (i.e., circles, polygons, arc, or lines).

2.5D Vias

2.5D vias must have a circular cross-section and be strictly vertical. A 2.5D via has a finite radius and the current is assumed to be flowing along the surface of the via. The current flow is assumed strictly vertical; the Ansys Electronics Desktop (AEDT)™ electronics systems design platform treats the via as a 1D wire connecting the two layers. All 2.5D vias have a default complex load impedance of zero.

3D Vias

3D vias can be any shape, but the 2D objects they connect must have the same number of edges. The current is assumed flowing on the surface of the via in all directions.

> **Note:**
>
> 3D vias may contain voids. Voids in 3D vias can be placed entirely or partially in the outer contour. No attempt is made to geometrically align voids in upper polygons with those in lower polygons. Instead, the order in which voids on different layers are created is used to control their alignment.

Drawing a Cross-Layer Plate in the Layout Editor

After selecting two or more objects on different layers, navigate to **Draw** and select **Create 3D Structure** to connect the objects and create a single 2D or 3D object. The selected objects must possess the same number of points. If the selected objects contain open lines, the created structure will include a two-dimensional face (i.e., cross-layer plate) that spans the different layers. If the selected objects contain closed lines, the structure will include a three-dimensional solid (i.e., 3D Via) that spans the different layers. These 3D surfaces are included in the model. 3D structures also possess material attributes.

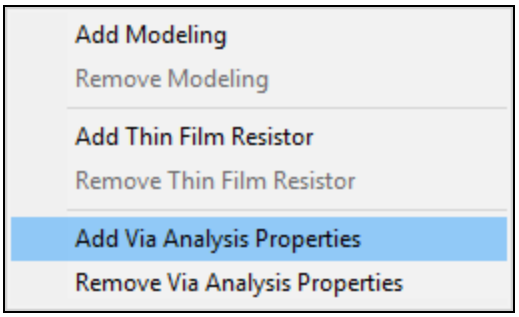
Drawing a Hole in the Layout Editor

A hole is a placeholder created while drawing a via. To create a void, or remove material from an object, refer to Drawing a Void in the Layout Editor.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Drawing a 2.5D Via in the Layout Editor

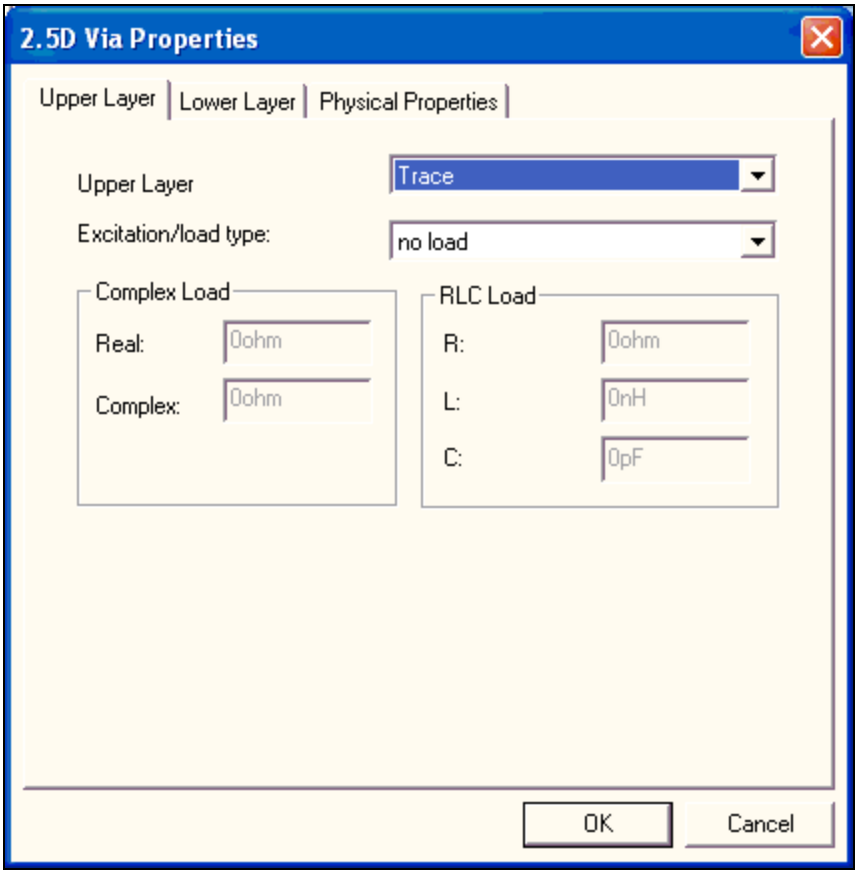
1. Select a signal or ground layer to draw upon.
2. From the **Draw** menu, select **Via**.
3. Select the center point of the via using the mouse or the keyboard.
4. With a via selected, click **Draw** > **HFSS 3D Layout Properties**, or right-click the via and select **HFSS 3D Layout Properties**, which brings up the following drop-down menu:



5. Select **Add Via Analysis Properties** to open the **EM Design** tab of the **Properties**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

window.



Upper Layer Properties

6. Click the **Upper Layer** tab and do the following:
    a. Specify the top layer — a signal or ground layer — at which the via terminates.
    b. If the top layer contains the load, select a load type on the **Excitation/Load Type** area. You may only define a load at one end of the via. The load on the other end is then set to zero.
    c. If you selected **complex**, type the real part of the complex load in ohms in the **Real** field. Then type the imaginary part of the complex load in ohms in the **Complex** field.
    d. If you selected any RLC combination, do the following:
        - Type the resistance value in ohms in the **R** field. It must be a positive or zero value.
        - Type the inductance value in nanohenries in the **L** field. It must be a positive or zero value.
        - Type the capacitance in picofarads in the **C** field. It must be a positive value.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Lower Layer Properties

7. Click the **Lower Layer** tab and do the following:

   a. Specify the bottom layer — a signal or ground layer — at which the via terminates
   b. If the bottom layer contains the load, select a load type on the **Excitation/Load**
   c. If you selected **complex**, type the real part of the complex load in ohms in the **Real** field. Then type the imaginary part of the complex load in ohms in the **Complex** field.
   d. If you selected any RLC combination, do the following:
      - Type the resistance value in ohms in the **R** field. It must be a positive or zero value.
      - Type the inductance value in nanohenries in the **L** field. It must be a positive or zero value.
      - Type the capacitance in picofarads in the **C** field. It must be a positive value.

Physical Layer Properties

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

8. Click the **Physical Properties** tab and do the following:

   a. Optionally, select **Model using a wirebond**
   b. Optionally, select **Mesh as a 3D Via**, then select the **number of sides**
   c. Optionally, select **Via field**
   d. Click **Via material** to open the material browser window. Follow the procedure for assigning a material.
9. Click **OK**. The via is set at the specified position.

> **Note:**
>
> When working with a Via, select **Draw** > **Toggle Between Via and Pin** to convert the Via to a Pin and then reconfigure the Pin settings using the options described in Creating a Probe Port.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Selecting Load Types for 2.5D Vias

When defining the properties of a 2.5D via, specify the type of load being applied to the signal or negative signal layer. This is done in the **Via Properties** window, under the **Upper Layer** or **Lower Layer** tab, depending on which layer contains the load. Only the load at one end of the via can be defined. The load on the other end is then set to zero.

Select one of the following load types on the **Excitation/Load Type** area:

complex	A complex number with a real and imaginary part.
RLC series	The resistor, inductor, and capacitor are in series.
RL series, C parallel	The resistor and inductor are in series, and they are in parallel with the capacitor.
RC series, L parallel	The resistor and capacitor are in series, and they are in parallel with the inductor.
LC parallel, R series	The inductor and capacitor are in parallel, and they are in series with the resistor.
LC series, R parallel	The inductor and capacitor are in series, and they are in parallel with the resistor.
RC parallel, L series	The resistor and capacitor are in parallel, and they are in series with the inductor.
RL parallel, C series	The resistor and inductor are in parallel, and they are in series with the capacitor.
RLC parallel	The resistor, inductor, and capacitor are in parallel.
coaxial excitation	The via is an external coaxial probe source that excites the structure as a port. A probe source represents a coaxial-type connector with its center pin extending from the negative signal plane to any signal layer.

If **complex** is selected, specify the real and imaginary portions of the load in ohms.

If any RLC combination is selected, specify the resistance value in ohms, the inductance value in nanohenries, and the capacitance in picofarads.

If **coaxial excitation** is selected, specify the selected current in amps, the phase in degrees, and the coaxial source impedance in ohms.

Creating Vias, Pins, and Padstack Definitions from Primitives

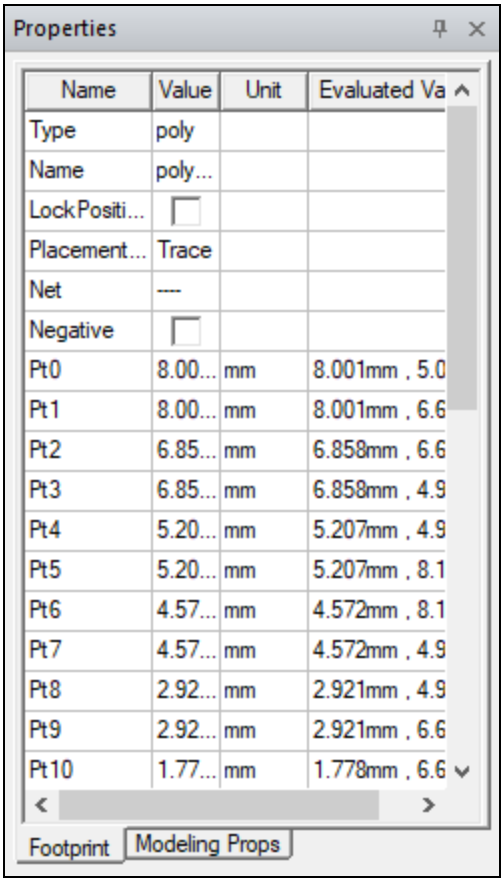
HFSS 3D Layout can create a via or pin from a primitive. When it does, HFSS 3D Layout creates a new padstack definition based on the geometry of the primitive. HFSS 3D Layout then replaces the primitive with a via that is assigned this new padstack definition. To make a primitive into a pin, convert the primitive to a via, the via into a pin.

Multiple primitives can be converted into vias at once. When identical primitives are converted at the same time, only one padstack definition is created. That definition is then applied to all the identical vias. These vias has the same dimensions. If the primitives are not identical, then one padstack definition is created for each unique geometry.

To create vias from primitives, or pins from vias, perform the steps in the following subsections.

To Create Vias from Primitives:

1. Draw one or more primitives. From the **Properties** window, the primitive's **Type** is whatever type of primitive that it is (e.g., "**poly**").

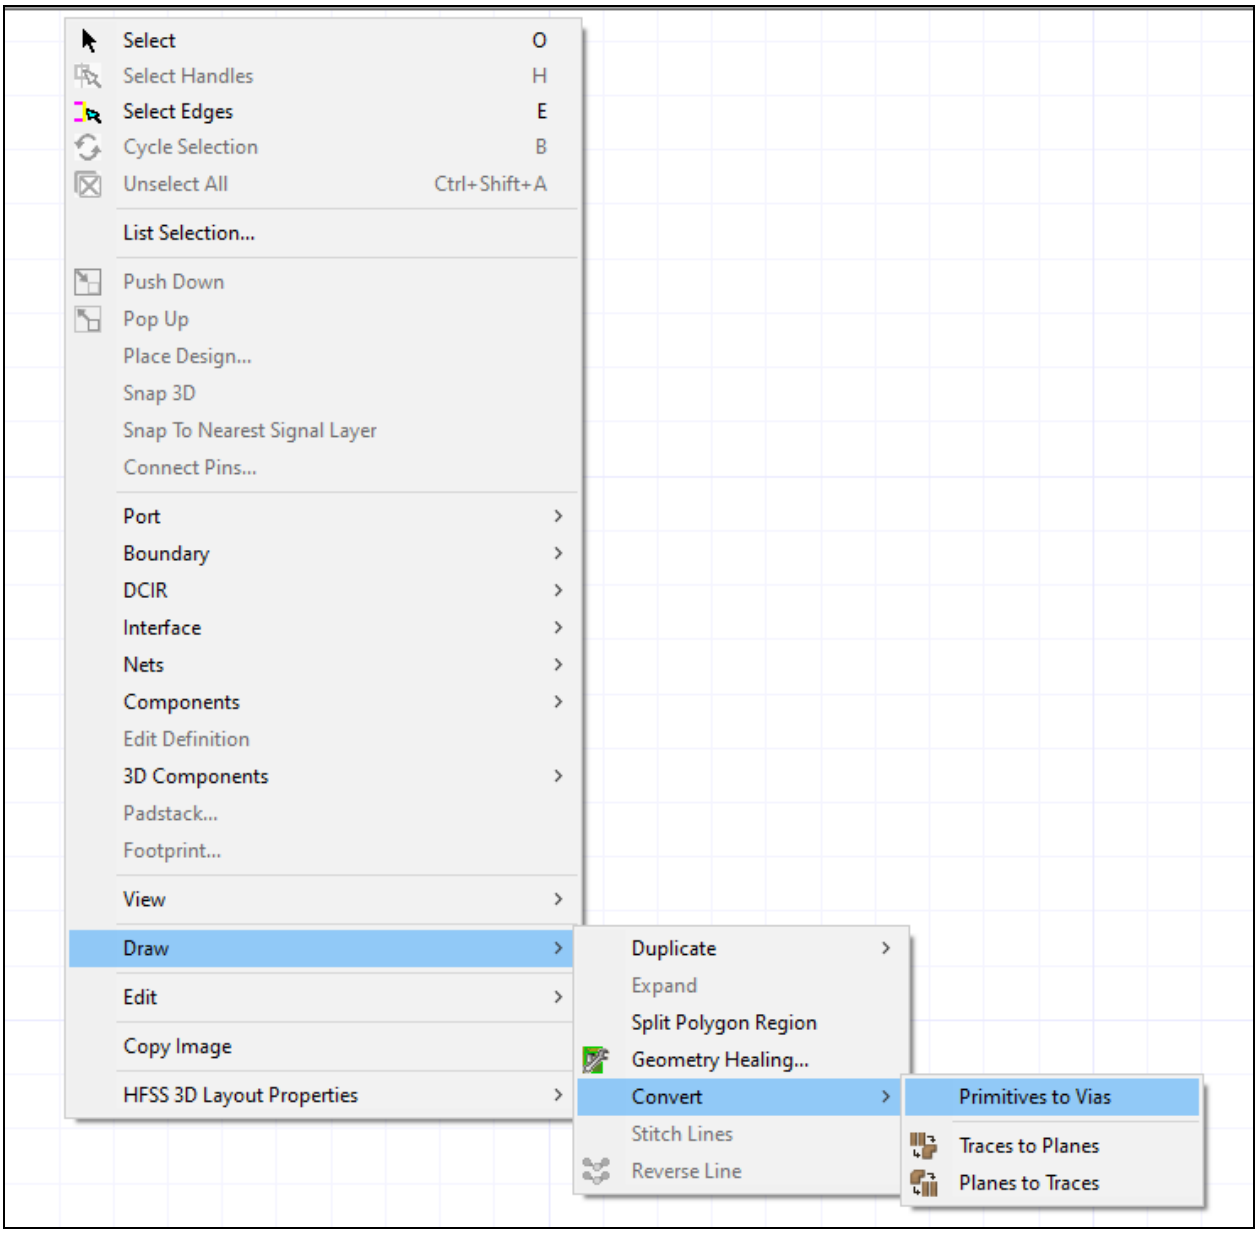


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Highlight the primitives.

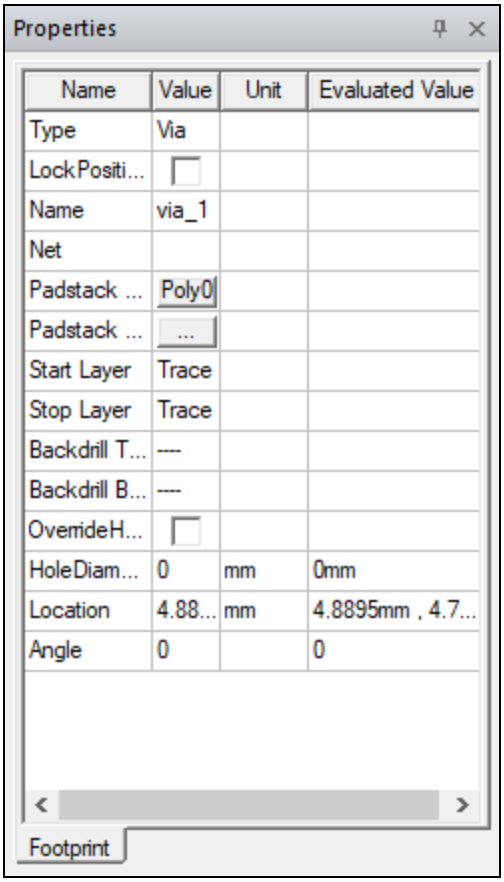
> **Note:**
>
> The vias remain selected until purposefully deselected.

3. From either the menu bar or by right-clicking in the **Layout Editor**, select **Draw** > **Convert** > **Primitives to Vias**.



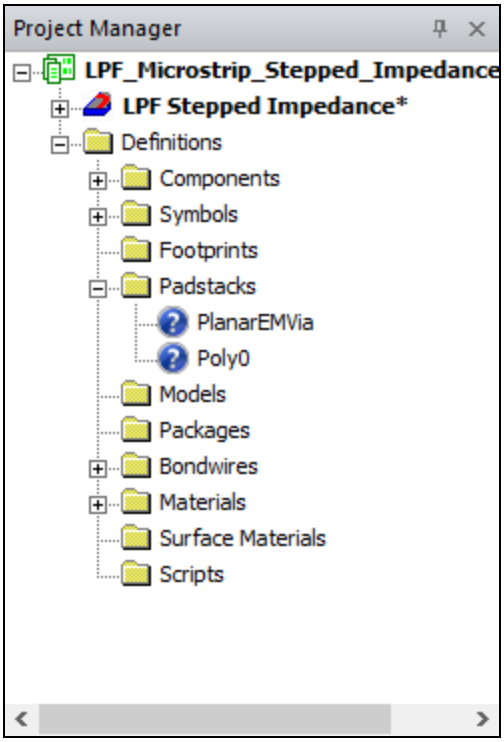
From the **Properties** window, the primitive's **Type** is now **Via**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



New padstack definitions appear in the **Project Tree** (**Definitions** > **Padstacks**) .

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



To Create Pins from Vias:

To convert the new vias to pins, change the **Type** to **Pin** in the **Properties** window.

To See the Geometry of a New Via:

1. From the **Properties** window, click **Padstack Definition** to open the **Select Definition** window. The via's padstack definition is highlighted.The padstack definition is named after the type of primitive.
2. Highlight the new via.
3. Click **Edit Padstack**. The geometry of the via is listed in the **Layers** section.

> **Note:**
>
> If this procedure is attempted on anything that is not a primitive, then it is ignored.

Compressing Primitives in the Layout Editor (IC Mode Only)

Compressing primitives into collections reduces redundancy, optimizes memory, and improves performance by minimizing the number of unique entities that must be stored and

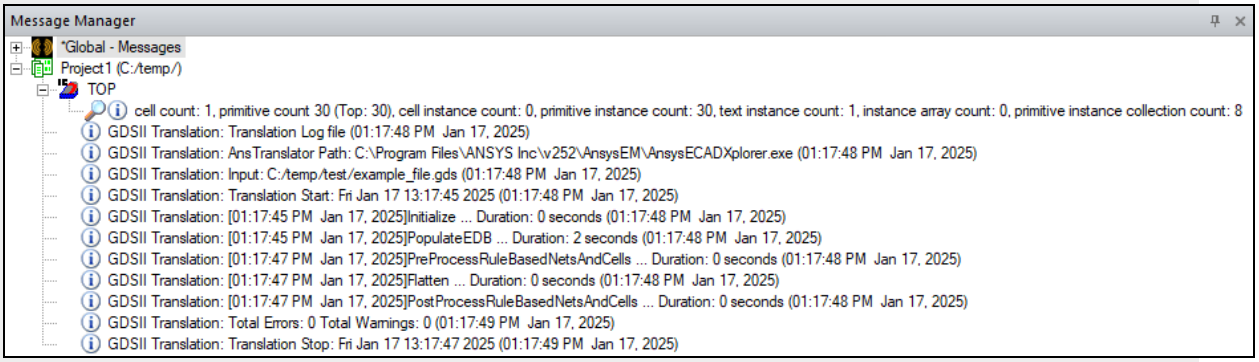
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

processed. Primitives must be geometrically identical rectangles, circles, or convex polygons on the same net, and cannot contain any of the following features:

- Holes or other complex features
- Modeling properties or specific parameters
- Pins or electrical connections
- Membership in any via groups

Note:

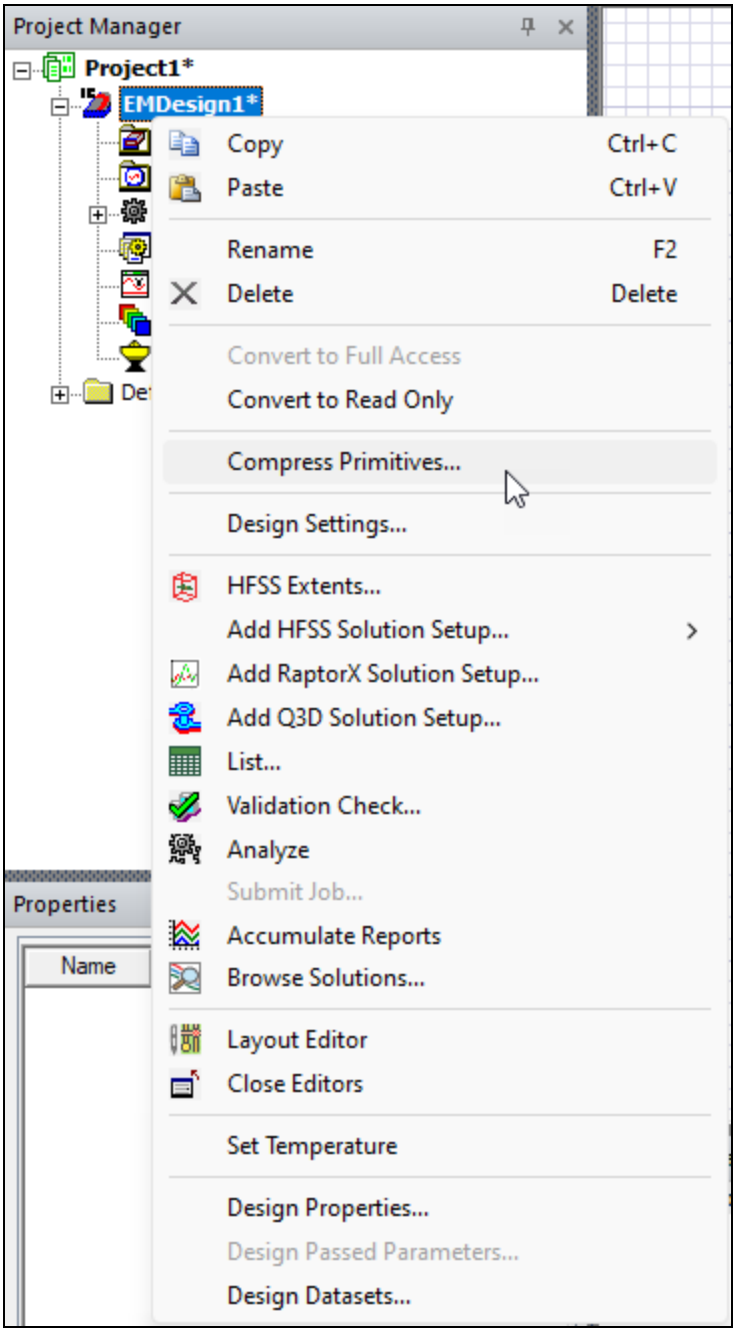
Primitives created by GDSII import are automatically compressed, as evidenced in the **Message Manager** window.



Follow these steps to compress primitives.

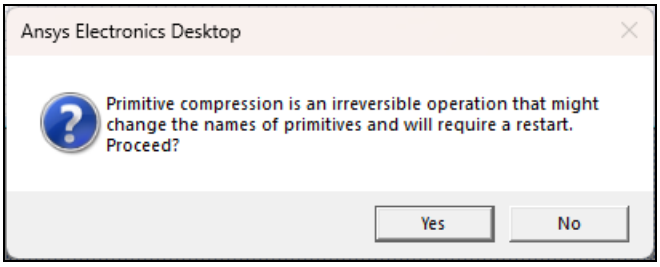
1. From the **Project Manager** window, expand the **Project Tree** (e.g., **Project1**) and right-click the HFSS 3D Layout design (e.g., **EMDesign1**). Then click **Compress Primitives**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

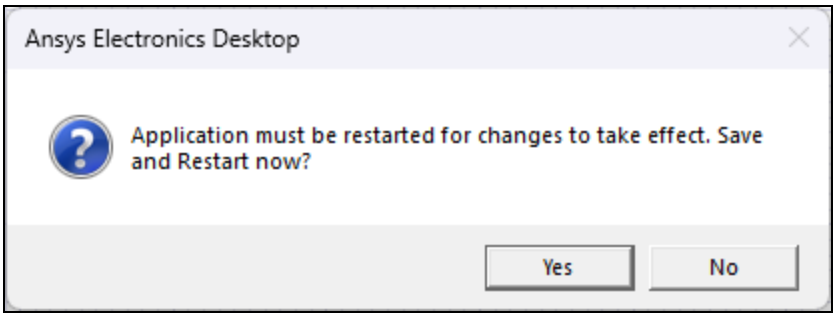


2. Two consecutive prompts will appear. The first warns users that primitive compression is an irreversible operation that may change the names of primitives, and that a restart is required to see an immediate performance improvement. Click **Yes** to compress primitives and continue to the next prompt.

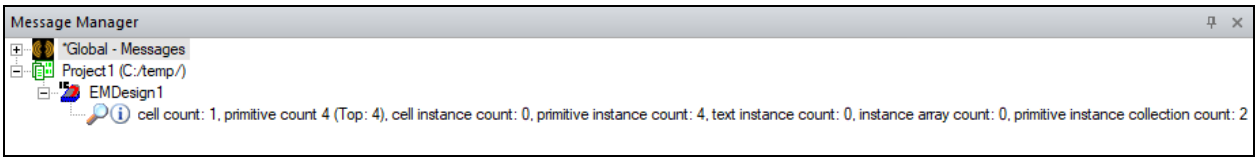
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Click **Yes** to automatically save changes and restart immediately.



4. After the software restarts, reopen the project file. The **Message Manager** window will display evidence of the compression, including a count of affected elements, including the number of primitive instance collections (e.g., **2**).



Via Clustering (Via Groups)

On-chip inductors are commonly fabricated using thousands of small vias between signal layers. In **Layout Editor**, vias are represented as square primitives. While this is important for the purpose of fabrication, this level of complexity often introduces inappropriate mesh density for simulation. Vias are grouped and represented by a single primitive if the via grouping option is selected. This greatly reduces mesh complexity with a minimal decrease in accuracy. The accuracy is preserved by calculating an equivalent material based on the original geometry.

Given a group of square primitives, the via grouping tool automatically detects clusters of rectangular primitives and creates via groups accordingly. Via groups can then be combined or dissolved as needed.

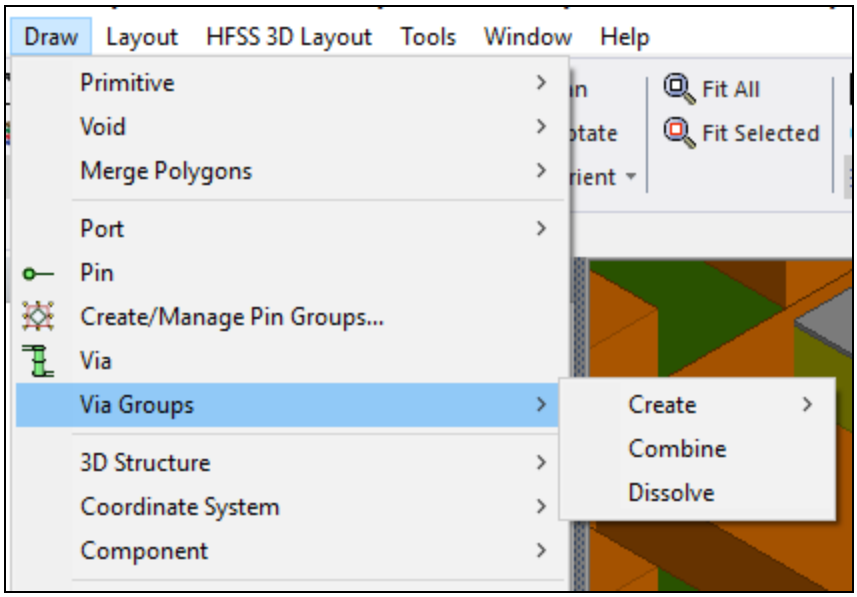
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Both persistent and non-persistent via groups can be created.
- Persistent via groups keep the original primitives of a via group in the layout.
- Non-persistent via group creation deletes the primitive inputs.

Via grouping is accessible through both the user interface and EDB API.

To perform a via grouping:

1. Select the selected square primitives.
2. Navigate to **Draw** > **Via Groups** as in the following figure.
3. One of several options can then be selected:
    a. **Create**: Make either persistent or non-persistent via groups on the selected primitives.
    b. **Combine**: Merge selected via groups and/or via primitives into a new via group.
    c. **Dissolve**: Restore the selected via group into the primitives that comprise it.

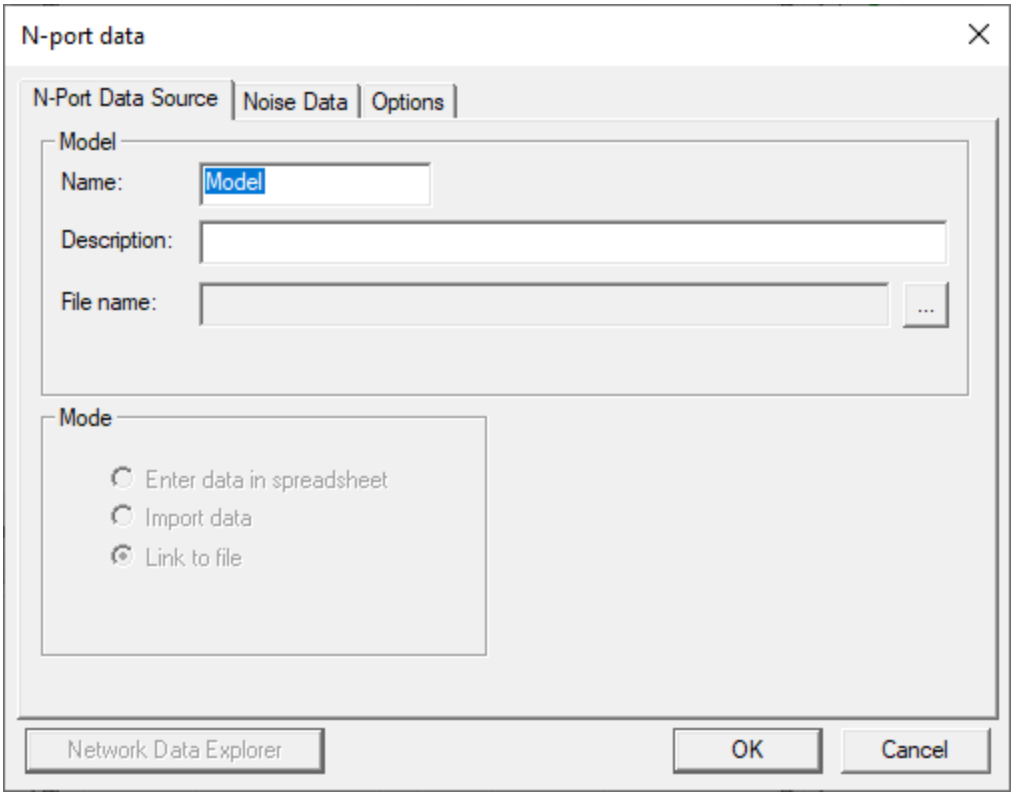


Inserting N-Port Data

To insert N-port data into the active project, follow this general procedure:

1. From the **Project** menu, select **Add Model** > **Add NPort Model** to open the **N-port data** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

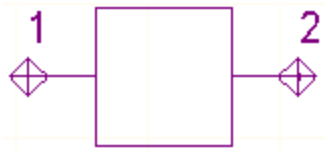


2. Under the **N-Port Data Source** tab, type a name for the N-port in the **Name** field.
3. Select an interpolation method - **Linear** interpolation, interpolation using a **Cubic spline**, or interpolation using a **Rational polynomial** - from the list. Your selection determines how S-parameters between frequency points in your N-port file, if needed, are calculated.
4. Specify the data source:

- Select **Enter data in spreadsheet** if you want to manually enter the S-, Y-, or Z-matrix data for the N-port. Then see Manually Entering N-Port Data.
- Select **Import data** if you want to import the N-port data file into the active project. Then see Importing or Linking to N-Port Data.
- Select **Link to file** if you want to refer to an N-port data file during the solution process. This is useful when you want to avoid importing an N-port data file into the project every time it is updated. Then see Importing or Linking to N-Port Data.

5. Click the **Port Impedance** tab. If selected, change the reference impedance for the S-parameter data.
6. If selected, specify a phase rotation for the S-parameter data.
7. Click **OK** to return to the **Layout Editor**. The N-port is represented by the following symbol, which varies depending upon the number of ports.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



8. Click an arbitrary point in the **Layout** window to place the N-port data in the project.

The N-port is listed under N-Ports in the project tree.

After inserting the N-port into the project, you must draw the connection on the model to the N-port.

Guidelines for Inserting N-Ports

Before inserting an N-port in a project, review the following information:

- The S-parameter file for the N-port must be in one of the following formats:

.szg	Ansys HFSS version 6 and later and Maxwell Strata from version 1.1.
.s *n* p, .tou, .y*p, .z*p	Touchstone .s*n*p, .tou, .y*p, and .z*p format files. For .s*n*p files, the number of ports in the S-parameter file is indicated by *n* (e.g., a Touchstone file with one port has the extension *.s1p). If the S-parameter file has more than 10 ports, the *.tou extension is used.
.flp	HFSS version 2014.
.cit	CITIfile version 1

- N-ports are assumed to be non-radiative. The coupling between the N-ports and the rest of the circuitry is also ignored. Therefore, if you generate an output far-field or near-field file for a structure containing N-ports, the results are contain the radiation on the N-ports.
- Be aware the order in which you connect the model ports to the N-port ports affects the solution. When you select the ports to connect to the N-Port in the **Layout** window, the order in which you select them determines the order of port connection. It is very important to connect the right ports since most active device S-parameters are not symmetrical.
- If your N-port is an active or nonlinear device and you are inserting the device along a section of microstrip line, it is very important the dimensions of the microstrip are as precise (as close to the actual, physical model) as possible. This precision increases the solution's accuracy when connecting the complex S-parameters of the N-port to the overall circuit.
- The simulation frequency must be in the range of frequency specified in the N-port S-parameter file. If the simulation frequency is out of range, an error message appears and the simulation is terminated. You need to either change the simulation frequency or update the N-port S-parameter file to include new frequency data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

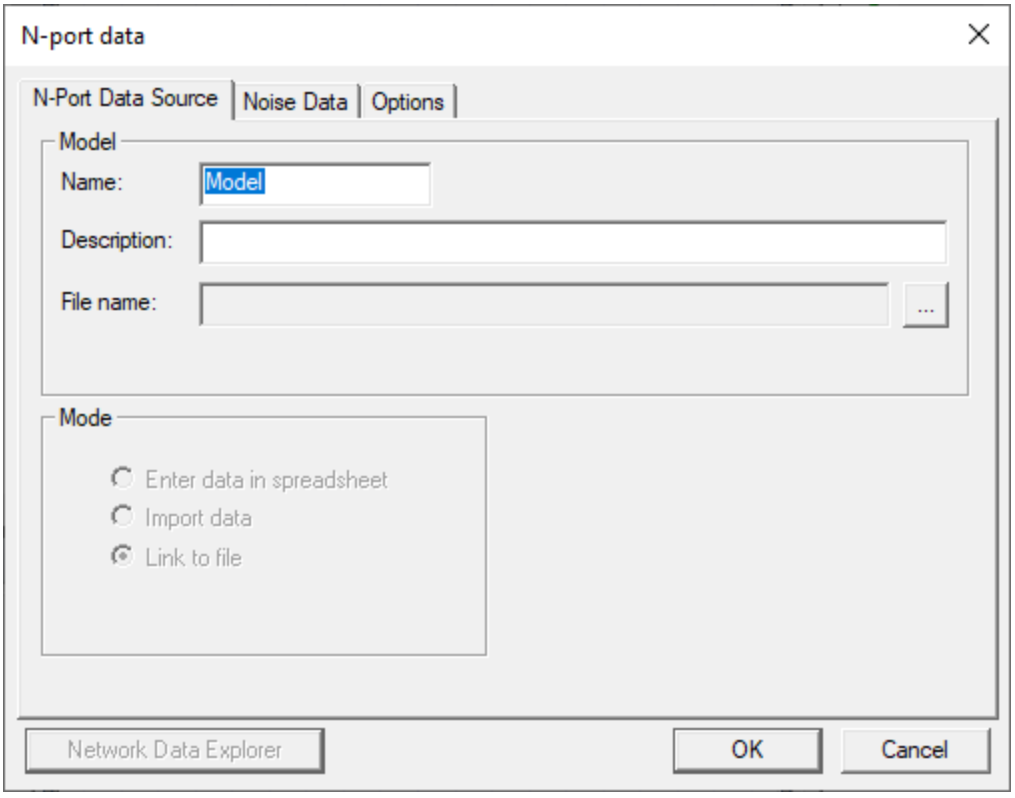
If the simulation frequency does not coincide with any of the N-port frequencies, HFSS approximates the N-port S-parameters at the simulating frequency by interpolating them. The accuracy of the interpolation may deteriorate if the S-parameters contain sharp nulls or peaks. So for N-ports that resonate, ensure there are enough data points in the N-port S-parameters near the resonance.

- N-ports cannot be connected to coupled mode, slotline, or CPW ports.
- If you modify the S-parameter file of an N-port, you must update the N-port in the structure by re-importing the file to use the updated data.

Importing or Linking N-Port Data

If you want to refer to an N-port data file during the solution process, you can import an N-port data file into the active project or link to an N-port data file. The latter method is useful when you want to avoid importing an N-port data file into the project every time it is updated.

1. From the **Project** menu, select **Add Model** > **Add NPort Model** to open the **N-port data** window.



2. Under the **N-Port Data Source** tab, select one of the following data sources:
   - **Import data**
   - **Link to file**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Select one of the following options in the **File** area:
    - **Use Path** if you want to specify the exact location of the N-port data file.
    - **In PersonalLib folder** if the file is located in the program's *PersonalLib* folder.
    - **In userlib folder** if the file is located in the program's *userlib* folder.
    - **In syslib folder** if the file is located in the program's *syslib* folder.
4. Click the **[...]** button and use the explorer window to select the selected N-port data file.
5. Click **OK** to return to the **N-Port Data Source** tab of the **N-port data** window
6. Follow the general procedure for inserting N-Port data.

Manually Entering N-Port Data

You have the option to manually enter S-, Y-, or Z-matrix data in the **N-Port Data** window, rather than importing or linking to an existing N-port data file.

1. From the **Project** menu, select **Add Model** > **Add NPort Model** to open the **N-port data** window.
2. Under the **N-Port Data Source** tab, select **Enter data in spreadsheet**.
3. Click the **Network Data** tab and select whether the information being entered is in the **Time** or **Frequency** domain on the **Domain** list.
4. Select the units for the information being entered on the **Units** list.

- Select **S-matrix**, **Y-matrix**, or **Z-matrix**, depending upon the type of data you want to enter.

> **Note:**
>
> If the N-port data file contains complex propagation constant or characteristic impedance values, select **Gamma** or $\mathbf{Z_o}$, respectively, to view the data, but the information is not appropriate to run a simulation.

5. Enter the number of ports to which the N-port is connected in the **Ports** box.
6. Select the format in which you want to enter the data - (magnitude, phase), (real, imaginary), or (dB/, phase) - from the list. Then enter the data for each frequency point in the spreadsheet.
    - Click **Add Frequency** to add information for an additional frequency point.
    - Click **Clone** to create a copy of the selected set of frequency data and place the copy at the end of the spreadsheet. Cloning can save data entry time.
    - Click **Delete** to delete the selected set of frequency data.
7. Follow the general procedure for inserting N-Port data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Changing the Reference Impedance for N-Port Data

If applicable, change the reference impedance for the S-parameter data in an N-port data file. This is done under the **Port Impedance** tab in the **N-port data** window. If applicable, apply the same impedance to all ports or a different impedance to each port.

1. Click the **Port Impedance** tab in the **N-Port Data** window.
2. To apply the same reference impedance to all ports, do the following:
   a. Select **Simple Port Impedance**.
   b. Type the impedance value in ohms.
   c. Select **Admittance** if you want to calculate the admittance matrix, the inverse of the impedance matrix, based on the value entered.
   d. Click **Update**.
3. To apply a different reference impedance to each port, do the following:
   a. Select **Set impedance for each port**.
   b. Select a port from the list.
   c. Select **Impedance** or **Admittance**, then type the real and imaginary parts of the impedance value in the **Real** and **Imaginary** fields.
   d. Click **Update**.

Repeat these steps for each port.

Rotating the Phase of N-Port Data

You can rotate the phase of an N-port's S-parameter data. This is done under the **Network Data** tab in the N-Port Data window.

1. Click the **Network Data** tab in the **N-Port Data** window.
2. Click **Phase Rotation**.
3. If you select **Specify Distance and Effective Dielectric Constant**, enter a distance in the **Length** field and a dielectric constant value in the **Keff** text box.
4. If you select **Time Delay**, enter the delay time in the **Time** field and select a unit in seconds from the list.
5. Click **Update**.
6. Click **OK**.

Phase rotation is calculated for the N-port data and you return to the **Network Data** tab.

Drawing a Connection in the Layout Editor

After inserting an N-port into the project, you must connect it to the model. A new port is created upon connection and is automatically defined as a pad port. The order in which you select the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ports determines the order of port connection and the solution. So is important to connect the ports in the right order, since most active device S-parameters are not symmetrical.

To draw a connection from an N-port to the model:

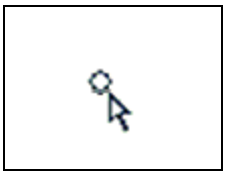
1. Select the edge of the model to which you want to connect the N-port.
2. Select the port on the N-port that you want to connect to the edge.
3. From the **Draw** menu, select **Connection**.

- The edge you selected is connected to the N-port and creates a new internal port upon connection. The N-port data is used during the solution process.
- Ensure to connect all the ports of an N-port to the model.

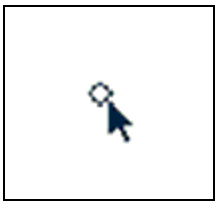
> **Note:**
>
> To remove a connection so that objects can be easily removed and/or reinserted elsewhere, select one or more objects and click **Disconnect from Net** on the **Draw** menu.

Multiple Connections

Additionally, the **Connection** command is an interactive mode that can be used to make multiple connections, one after another. When nothing is selected, and **Draw** > **Connection** is selected, the layout changes to connect mode and the cursor changes to the following:



Then, when the cursor is close enough to select an object that can be connected, the object is graphically highlighted and the cursor changes to the following:

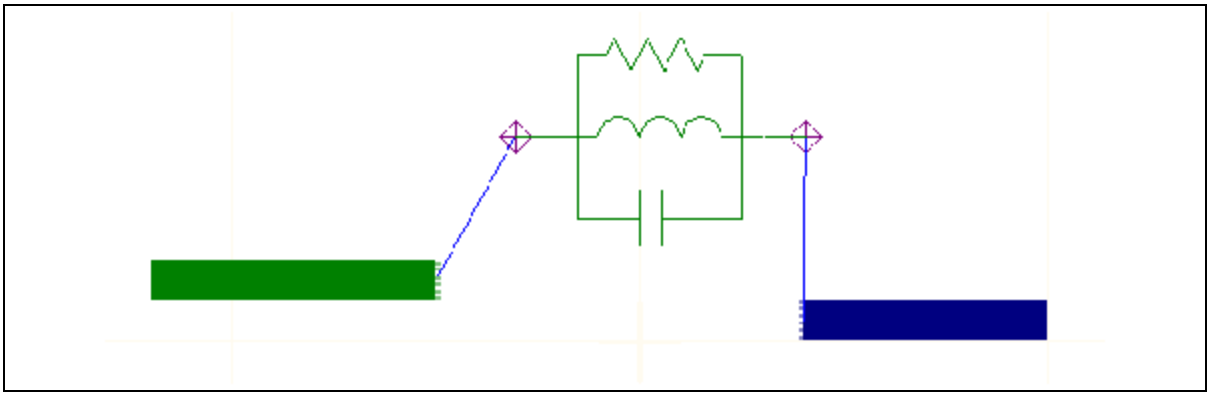


Click on an object to connect. Moving the cursor now extends a feedback segment on the connected object. Click on a second object and the two are connected in the same net.

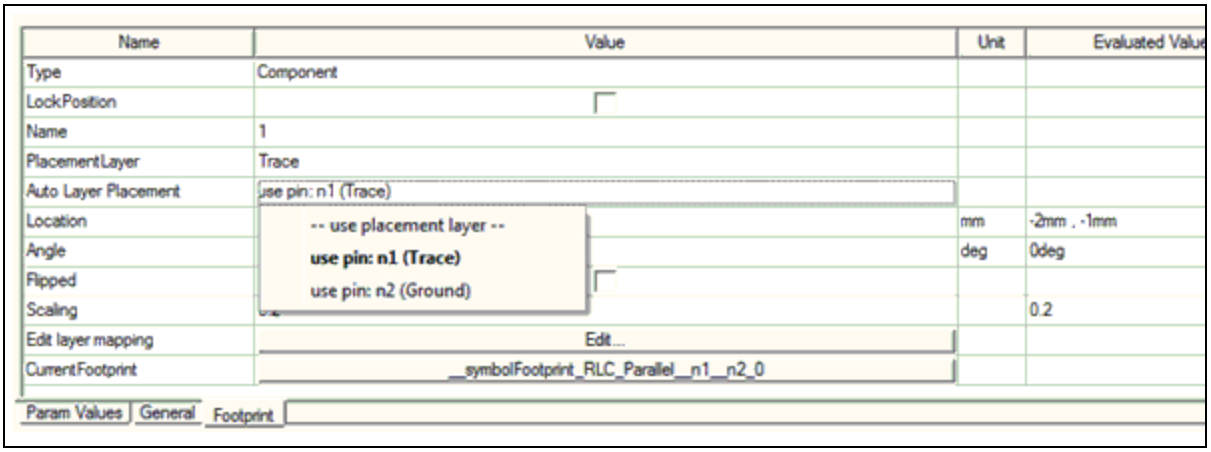
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Components with a Symbol Footprint

Components that do not have footprint geometry are initially rendered on the Symbol layer. When the component is first wired to an object on a physical layer, it renders on that physical layer.



If the component has any pins wired to an object on a physical layer, a new property called **Auto Layer Placement** appears. It is populated with all the pins that are connected to physical layers, plus an additional override option: **use placement layer**.



When the **Auto Layer Placement** is set to **use placement layer**, the **PlacementLayer** property is editable and users may override the layer placement for the component rendering.

Assigning Reference Ports in the Layout Editor

Assign reference ports using the **Draw** > **Port** > **Assign Reference** command. Both selected edges and vias are changed to ports:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Selected edges become edge ports
- Selected vias become pins

Assign reference ports using any of the following scenarios.

Padstack/Padstack

1. Select two padstack instances.

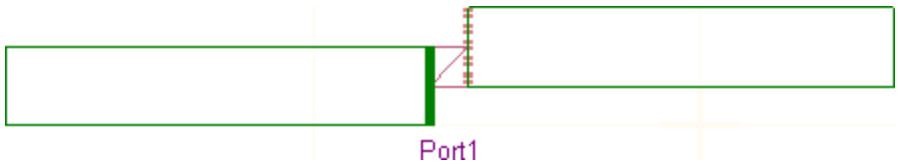
2. Navigate to **Draw** and select **Port** > **Create**

The first padstack selected becomes the port, and the second becomes the reference.

Edge/Edge

1. Select two non-linear edge groups on the same layer.

2. Navigate to **Draw** and select **Port** > **Create**.



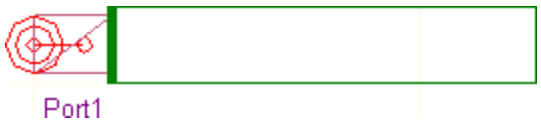
The first edge selected becomes the port, and the second becomes the reference.

Edge/Padstack

1. Select an edge and a padstack.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

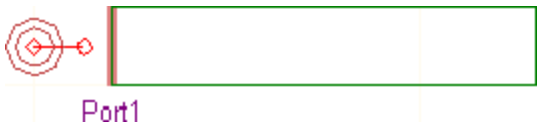
2. Navigate to **Draw** and select **Port** > **Create**.



The first edge becomes the port, and the second becomes the reference.

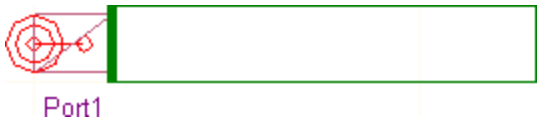
Port/Padstack

1. Select an existing port and a padstack.



OR

2. Navigate to **Draw** and select **Port** > **Assign Reference**



OR

The padstack becomes the reference for the port.

Circuit Ports in Layout

Circuit ports may be created using the following commands:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Draw** menu, select **Port** > **Create Circuit Ports**.
- Right-click in the active area of the **Layout Editor** and select **Port** > **Create Circuit Ports**.

Modes of Operation

- With no active selection, the command activates the circuit port drawing tool.

1. Click at the start point.
2. Click at the end point.
3. Choose the start/end layers.

A circuit port is created between the two points and the tool remains active until it is canceled or until a new tool is selected.

- With an active selection, the command creates a circuit port between the selected edges or pins, or in the case of a single edge, on the edge to the ground.

General Rules

- The start/end points of a circuit port must lie on metal (a negative ground layer is acceptable).
- The HFSS port type can be toggled between gap and circuit if the port geometry represents a valid gap port.

Dielectric Modeling

HFSS and HFSS 3D Layout support finite dielectrics. Dielectric layers are always truncated according to the HFSS Model Extents. Using the extents settings, define how the polygon dielectric and negative signal layers are generated relative to the base polygon. By default, the HFSS Model Extents setting for “Honor primitives on dielectric layers” is selected, but when the check box is unselected, dielectric layers use the extents settings regardless of whether drawn polygons on them. For more information, see HFSS 3D Model Extents.

In contrast, Signal layers can be made of either dielectric or conducting materials and can have internal, user-drawn shapes to create what are sometimes called "dielectric bricks" or "dielectric inclusions”. While sometimes called "bricks", there are no limitations on the dielectric shapes. Signal layers assigned a dielectric material creates objects corresponding to whatever shapes exist on the layer. Signal layers may overlap other Signal layers in elevation, and this provides a great deal of flexibility for representing dielectric object.

From the event that dielectrics on different Signal layers overlap, the Precedence Value on the EM Modeling Properties can be used to resolve ambiguities with lower values having priority. If EM Modeling Properties have not been added or cannot be used to resolve overlaps, precedence is assigned according to material properties.

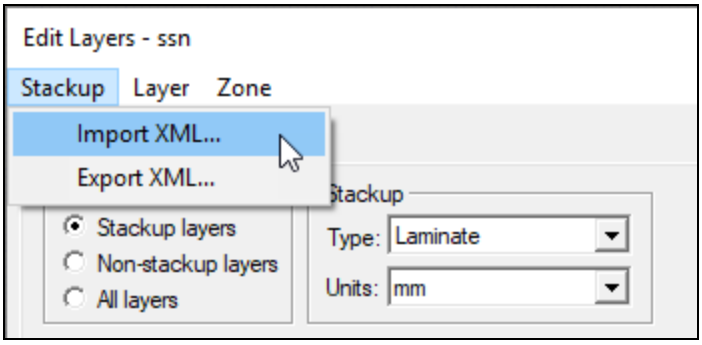
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Importing a Stackup

In certain instances it may be easier to define your dielectric and signal layer stackup by importing an XML based “control file" using the **Edit Layers** window (e.g., if you have a standard technology process, and you want to assure that all the designs you create use this process, you can import a control file to guarantee that all the stackups are identical).

The XML control file can be created using a third party text editor or a script. In some cases, extremely complex stackups can be more easily created outside of HFSS , then imported, rather than creating the stackups using the HFSS interface. For more information on the format of the XML layer control file, see Layout and ODB++ Control File.

The Edit Layers window has two drop-down menus: **Stackup** and **Layer**.



The **Stackup** menu allows users to import a stackup from an XML file and export the stackup in the window to an XML file.

To import a stackup, open the **EditLayers** window by clicking its toolbar icon or by selecting **Layout > Layers**. Next, click on **Stackup** > **Import XML**. A series of window opens that allow you to browse to the XML control file and import the stackup. The exact series of steps depends on whether the design has existing layers and whether the layers contain geometry. In certain instances the import mechanism adds additional dielectric/signal layers to create the pancake stackup.

The Design Does Not Have Existing Layers

The Layout/ODB++ Control file can be imported directly. A **FileOpen** window appears that allows you to browse to the XML layer control file.

The Design Has Existing Layers

After clicking **ImportStackup**, a warning may display that indicates at least one of the existing layers contains geometry. A window then offers the option of replacing or updating the existing layers. After choosing to update or replace existing layers, a **FileOpen** window appears that allows you to browse to the XML layer control file.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Replace existing layers** – All existing layers in the design are discarded and layers on the Layout/ODB++ Control File are inserted into the design. Geometry on any of the existing layers may be moved to different layers. After importing a stackup into a design with existing geometry, it is important to recheck your design.
- **Update existing layers** – The import mechanism attempts to merge the existing design layers with those in the Layout/ODB++ Control File. In some cases the import mechanism cannot merge the layers and you are not able to import the Layout/ODB++ Control file. The following examples illustrate the results when a one-to-one match does not exist between existing and imported layers. The XML file and existing stackup contain layers of type signal ("S") and dielectric ("D"). The name "S1" signifies a signal layer, but the layer names you select can be arbitrary.

Example 1: One to one mapping. This is the simplest case where existing layers are updated with new material properties and thicknesses. The matching of layer names is case insensitive.

XML File	Existing	Resulting Stackup
S1	S1	S1
D0	D0	D0
S0	S0	S0

Example 2: Merge not possible. In this case the layers in the XML file are very different on the layers in the existing stackup and the import mechanism cannot create a merged stackup.

XML File	Existing	Resulting Stackup
S1	S3	Not possible to merge
D0	D1	
S0	S2	

XML File	Existing	Resulting Stackup
S1	S1	Not possible to merge
D0	D1	
S0	S0	

Example 3: Additional layers. In this case the XML file has one or more additional layers. The import mechanism updates existing material properties and thicknesses and add the additional layers.

XML	Existing	Resulting

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

File		Stackup
D1		D1
S1	S1	S1
D0	D0	D0
S0	S0	S0

Example 4: Automatic layer addition. The import mechanism adds dielectric or signal layers to create a strict pancake stackup.

XML File	Existing	Resulting Stackup
D1		D1
S2		S2
D0		D0
S1	S1	S1
S0	S0	S0_DIEL
		S0

Layer "S0_DIEL" is a dielectric layer added by the import mechanism with defaults for the material and thickness.

Components

A component (i.e., a component instance) is a group of objects (e.g., pins, vias, primitives, et cetera.) on a layer that constitute a chip or RLC. When a component is created, a definition for it is created in the **Project Tree** > **Definitions** > **Components** folder.

From the **Layout Editor**, the borders of the component appear as a box that encloses all the component's members. **Click+drag** the bounding box to move the component. Individual members of the component cannot be moved individually. Once a component is created, the positions of its members are frozen in relation to one another.

You can add or remove entities from components. When you do, the component's border shifts accordingly. The component's definition can change because component models are partially defined by the number of pins they contain. If the number of pins changes, then a new definition is created.

To highlight a component, either select the reference designation of a component in the **Components** window or **click+drag** the cursor over the components.

When a component's bounding box is highlighted, all members of the component are also highlighted. If an entity in the component is not highlighted, then that entity is not a member of the component.

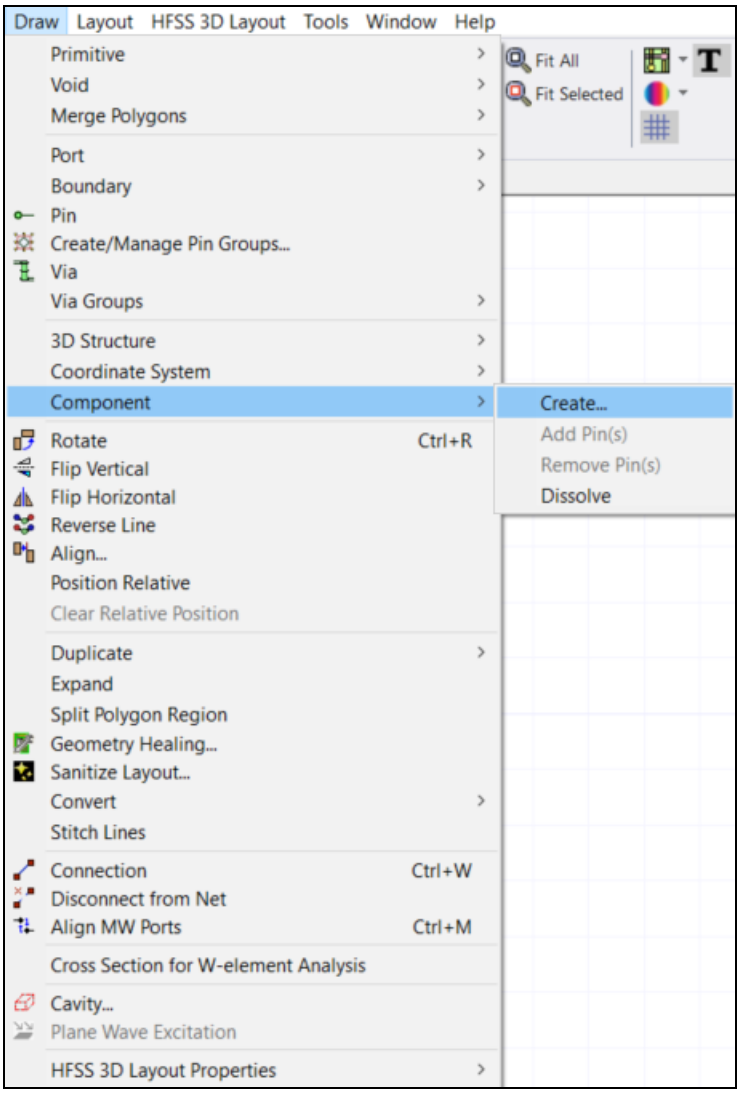
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

An active component can be moved within a hierarchical design to a higher or lower position within the global Coordinate System (CS). Refer to Component Placement in HFSS 3D Layout.

Creating a Component

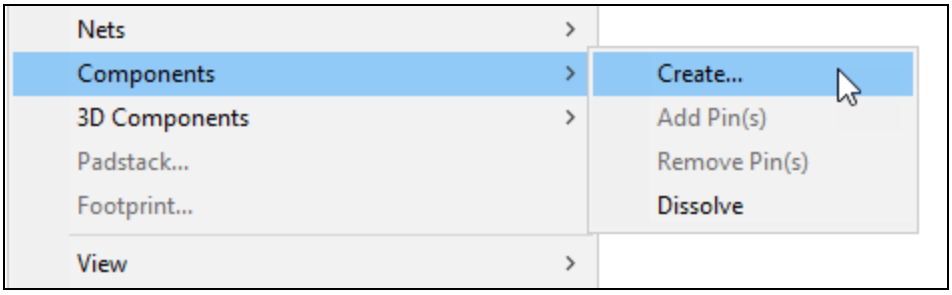
You can create a component from pins, vias, and primitives. A bounding box shows the border of the component unless another component is a member of the new component. Follow these steps to join components.

1. From the **Layout Editor**, select the components.
2. Perform either of these steps to open the **Create Component** window.
    a. From the **Draw** menu, select **Component** > **Create**.

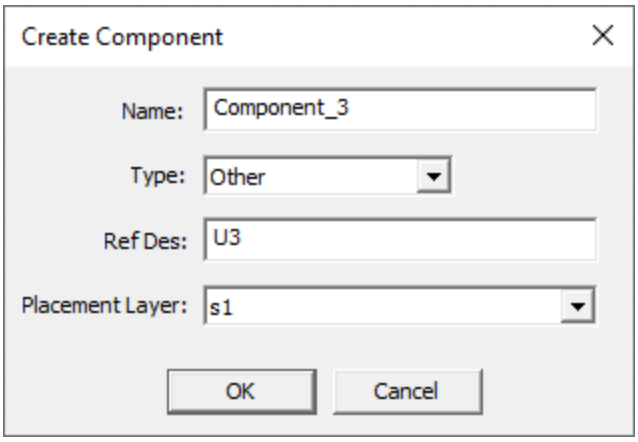


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. From the **Layout Editor**, right-click and select **Components** > **Create** .



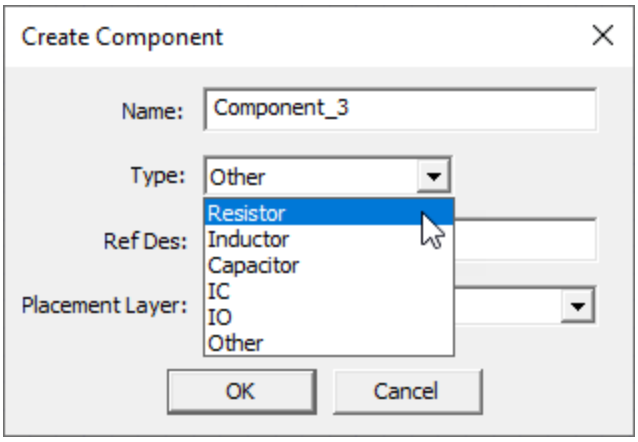
The **Create Component** window opens.



3. Once the **Create Component** window opens, enter the following information into the fields and drop-down menus.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Name: — enter a name for the new component
- Type: — choose**Resistor**, **Inductor**, **Capacitor**, **IO**, **IC**, or **Other**.



> **Note:**
>
> The type you choose determines the component's model type.

- Ref Des: — enter an alternative reference destination to identify this component in the active design

> **Note:**
>
> This is optional. A reference destination is automatically supplied.

- Placement Layer: — select which stackup layer the component should be on

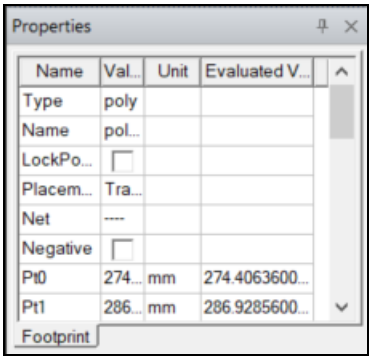
4. Click **OK**. The new component is listed in the dockable **Components** window.

The process is complete.

Creating or Editing Package Definitions for Components

ODB++ and IPC2581 imports may include properties in their IDF files that describe the component outline or height properties of a component, while IDF imports may bring in thermal properties of a component. These properties describe the component's materials, thermal, power, outline, and heatsink characteristics. These properties can also be added to new components and are accessible through the **Footprint** tab of the **Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



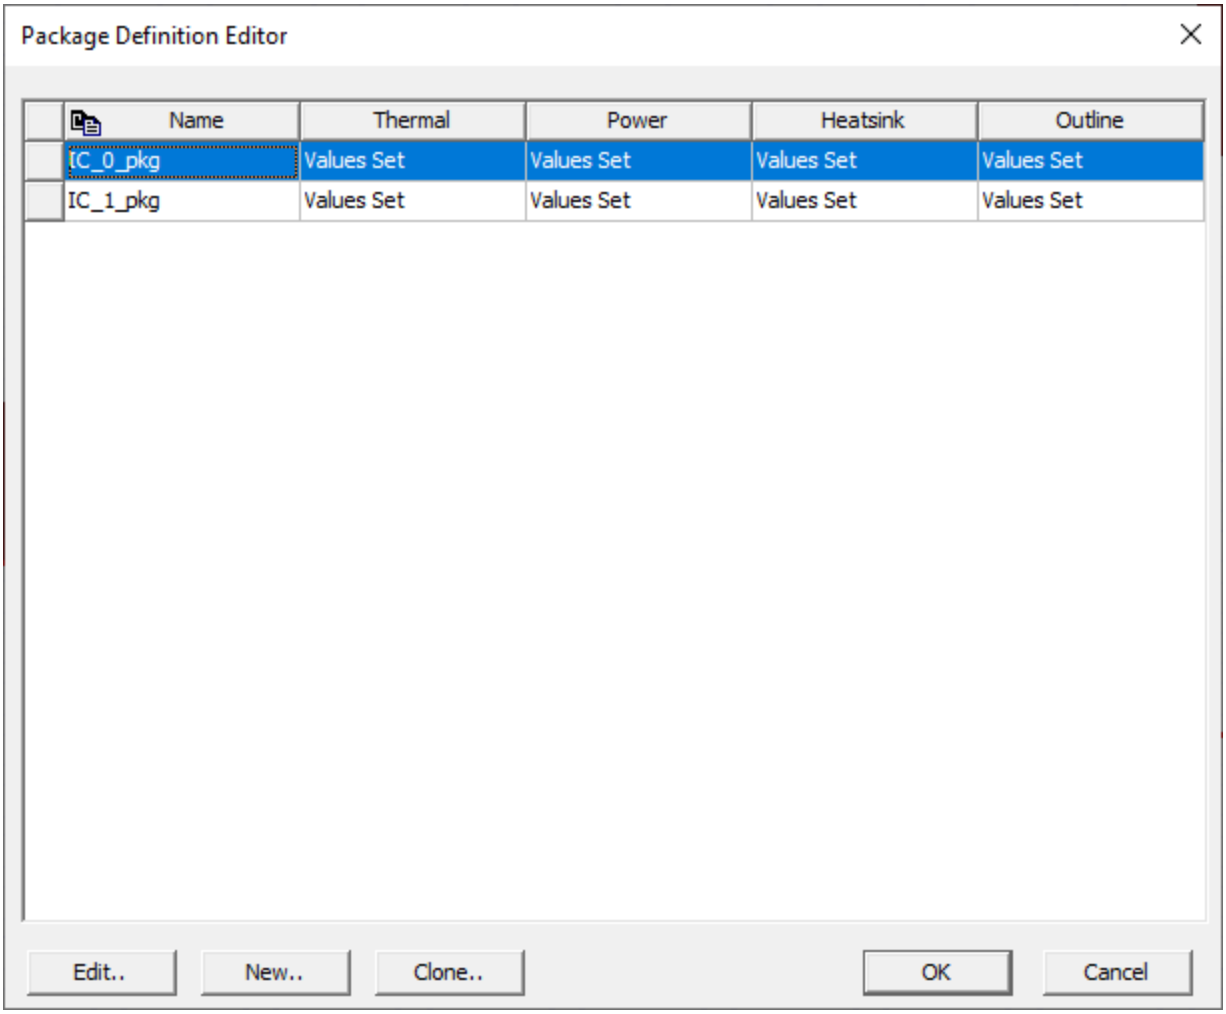
Note:

Package definitions are only used for Icepak thermal analysis with linked PCB components, and when Mechanical projects import an Electronics Database (EDB) directly. It is not used by the electromagnetic solvers.

Follow these steps to add, create, or edit a new or existing package to a component.

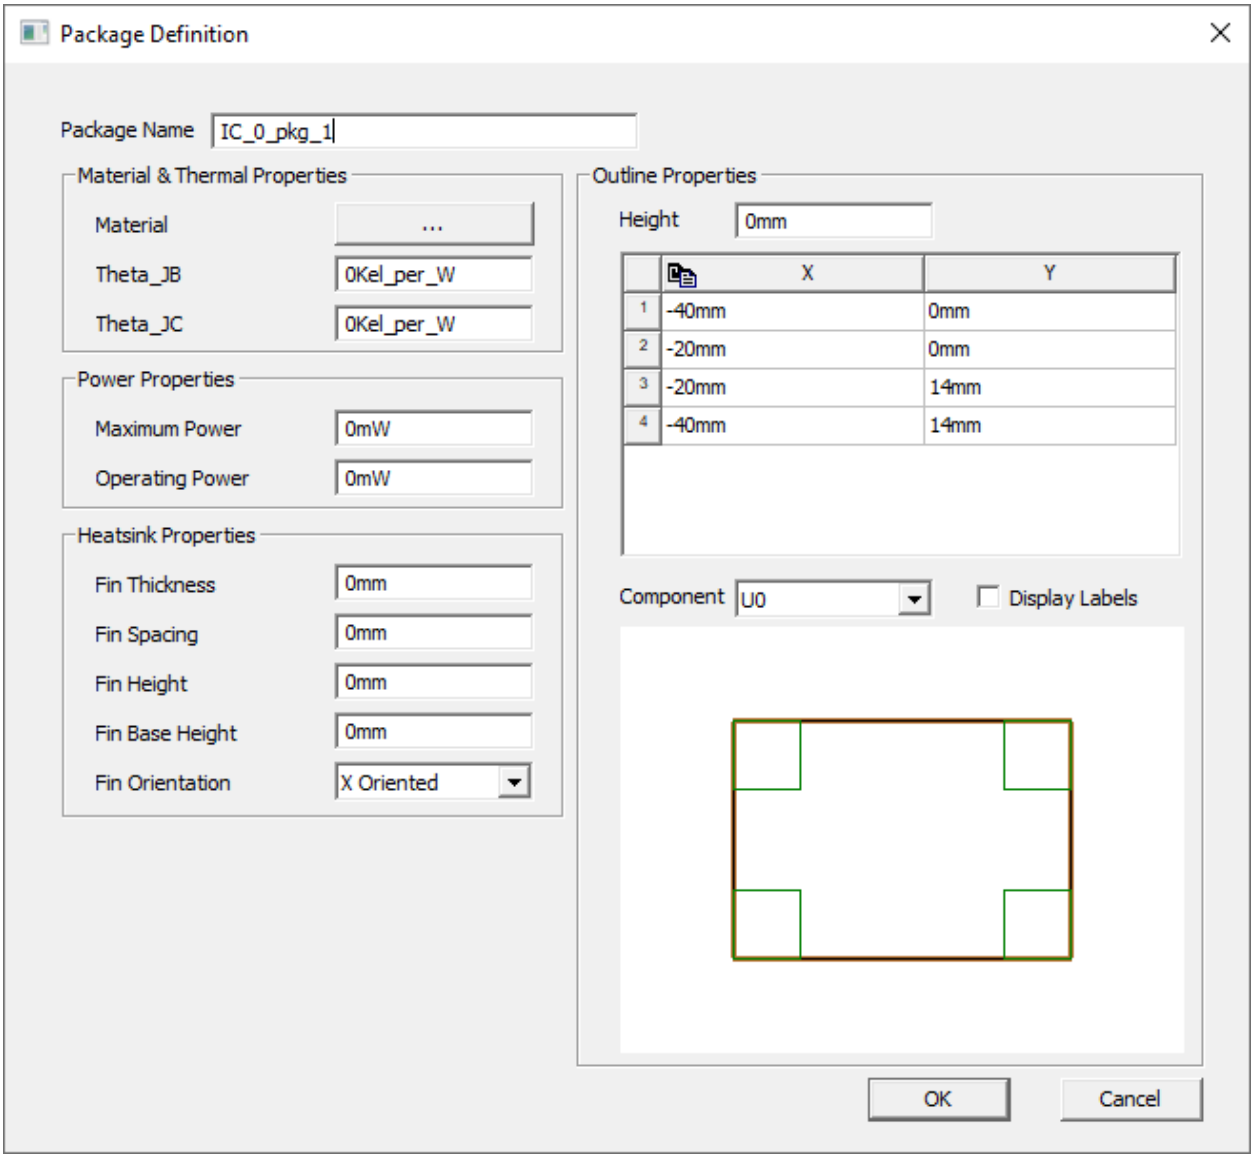
1. From the **Components** window, click a component.
2. From the **Footprint** tab of the **Properties** window, click in the **Value** cell of the **Package Definition** row and select **Edit** to open the **Package Definition Editor**. It lists all packages available in the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. To add an existing package, select the package from the list and click **OK**.
4. To create a new package, click **New**.
5. To edit an existing package, select the package from the list and click **Edit** to open the **Package Definition** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



6. Adjust the properties as selected.
7. Click **OK**.
8. In the **Package Definition Editor**, select a package from the list and click **OK**.
9. To view the package outline, enable **Display package graphics** in the Layout Options.

Packages contain four types of properties: materials and thermal, power, heatsink, and outline. The **Materials & Thermal Properties** are the materials the heatsink is made of and measured properties that describe the rate of its heat transfer from a junction to another location. Specifically they are:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Materials**: Allows you to select materials.
- **Theta_JB**: thermal resistance from junction to board. Include the unit Kel_per_W (Kelvin per Watt.)
- **Theta_JC**: thermal resistance between the junction and a point on the outside surface of the package (i.e., the case). (See the IDF specification 3.0 for details.) Include the unit Kel_per_W (Kelvin per Watt.)

The **Power Properties** are:

- **Maximum Power**: the greatest amount of power the package can handle.
- **Operating Power:** the average amount of power experienced during a typical load.

The **Heatsink Properties** simulate a three-dimensional modeling component that can exchange radiation with other objects in the model. The package defines an extruded heatsink which consists of a base and fins that run parallel to each other across the base.

HFSS 3D Layout produces as many fins as fit given the settings of these properties:

- **Fin Thickness**: how wide each fin is.
- **Fin Spacing**: how far apart each fin should be from its nearest neighbor.
- **Fin Height**: how tall each fin is.
- **Fin Base Height**: how tall the base on which the fins sit is.
- **Fin Orientation**: whether the fins are oriented along the X or Y axis.

The **Outline Properties** are a 3D representation of the component. The table lists the X and Y coordinates for the corners of the component and the **Height** is the elevation of the component box along the Z axis. Specify which component is represented in the **Component** drop down list. Click **Display Labels** to label the pins and vias on the diagram.

Intersection Checks for 3D Components

Intersecting 3D components (e.g., 3D structures that partially or completely overlap) can cause a validation check to fail. If the validation check fails, an error message will appear in the **Message Manager** window. The error message may provide detailed feedback about which objects are intersecting. The error message varies, depending on whether the components are unencrypted, encrypted but visible, or encrypted and hidden. If applicable, users can deactivate the intersection check conducted during validation (continue to "Deactivating the Intersection Check" on page 7-276).

Follow these steps to attempt validation with intersecting components, then view the error message and details (if any).

1. If users have not already done so, they can add a setup to the design and analyze the setup (refer to HFSS 3D Layout Getting Started Guides).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. To open the **Validation Check** window, do one of the following:

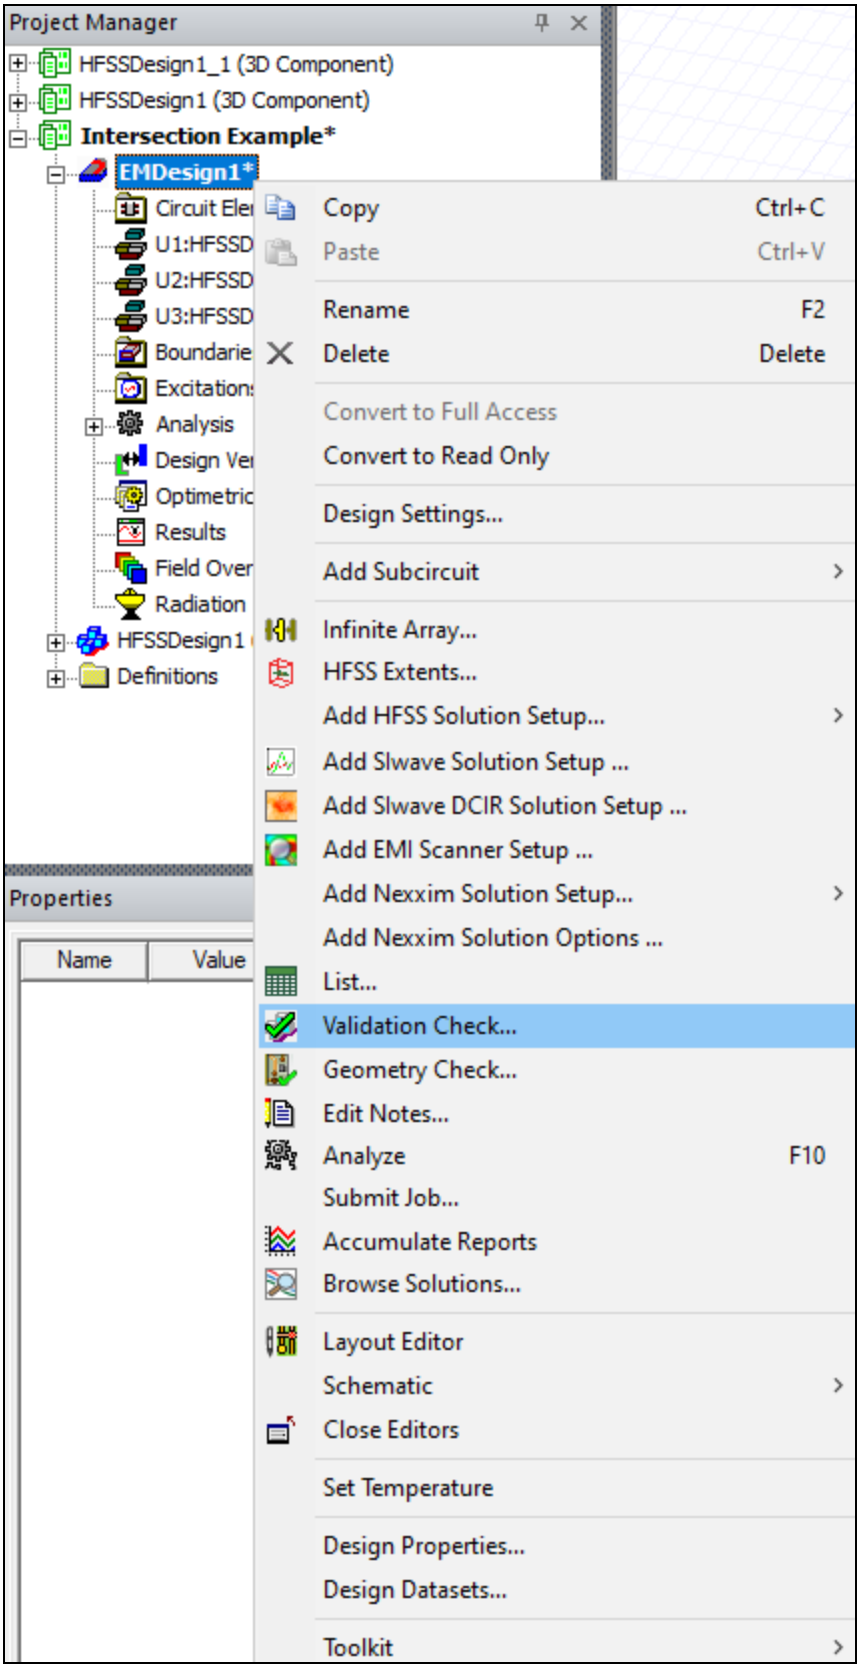
   - Navigate to the **Simulation** tab and select **Validate** from the **Simulation** ribbon.

   - From the **Project Manager** window, expand the **Project Tree** > **[*active design folder*]**. Then right-click the active design (e.g., **EMDesign1**) and select **Validation**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

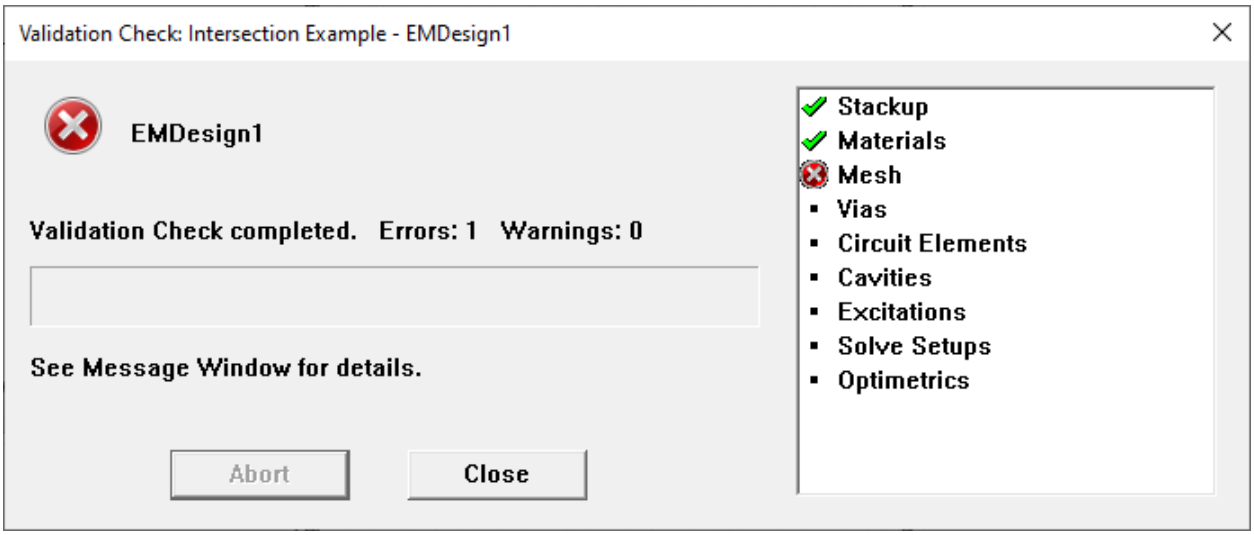
Check.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

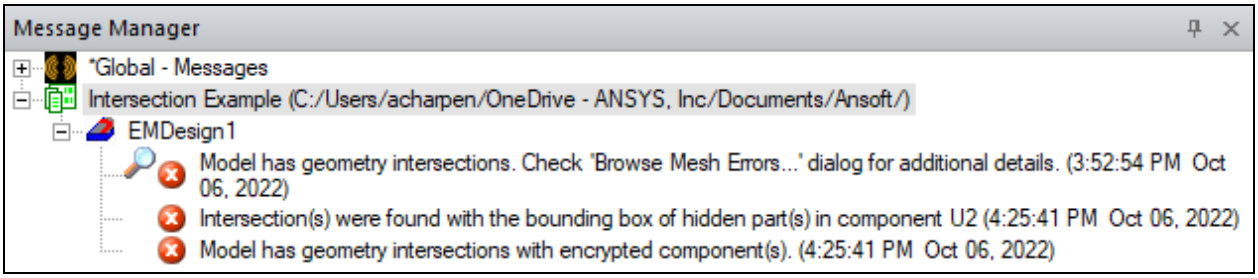


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. The **Validation Check** window will display errors/warnings as they occur. If the design includes intersecting objects, the window will display a mesh error. Click **OK** to close the **Validation Check** window.

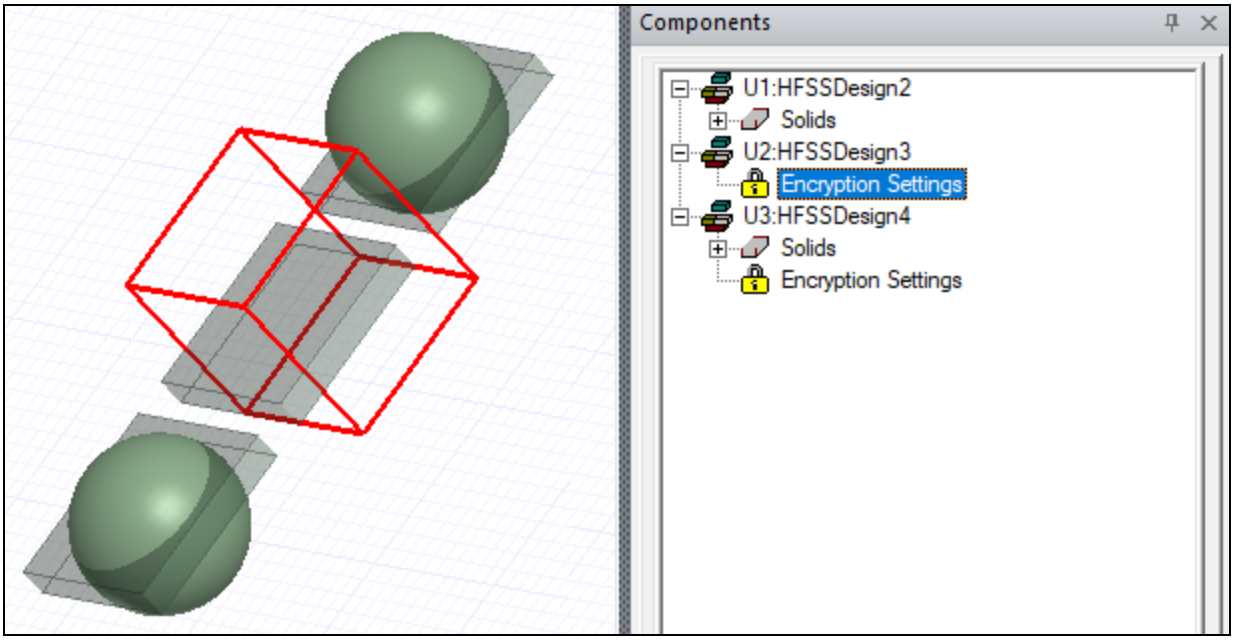


4. Navigate to the **Message Manager** window and identify the mesh error message. Depending on the level of encryption (e.g., unencrypted, encrypted but visible, and/or encrypted and hidden), the specific mesh error(s) will vary.

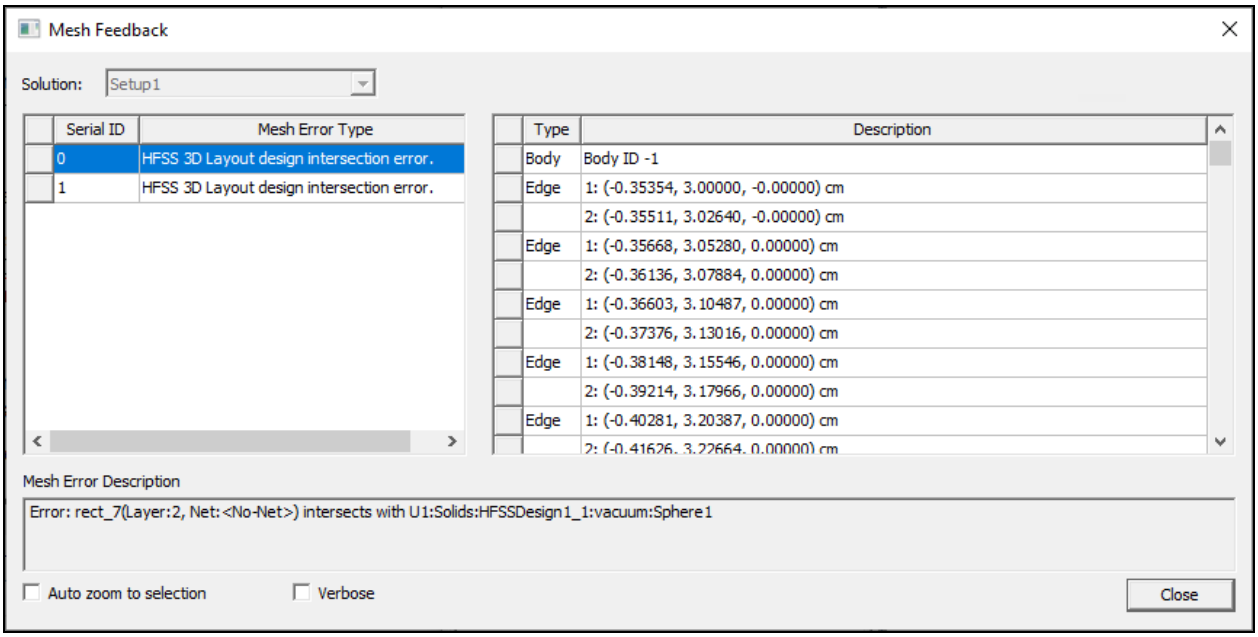


Encrypted, unencrypted, and hidden encrypted components can potentially exist within the same design. Refer to Importing and Exporting Components for more information.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. Click the mesh error(s) for unencrypted or encrypted but visible components to view a detailed list of the intersection points, click the error message to open the **Mesh Feedback** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Creating a Mesh Region to Validate Encrypted Designs

If Electronic Desktop identifies an intersection with an encrypted and hidden component, it is impossible to ascertain the exact coordinates of the intersection or whether the intersection invalidates the design since the exact parameters of the hidden component are unknown (i.e., only its bounding box is calculated).

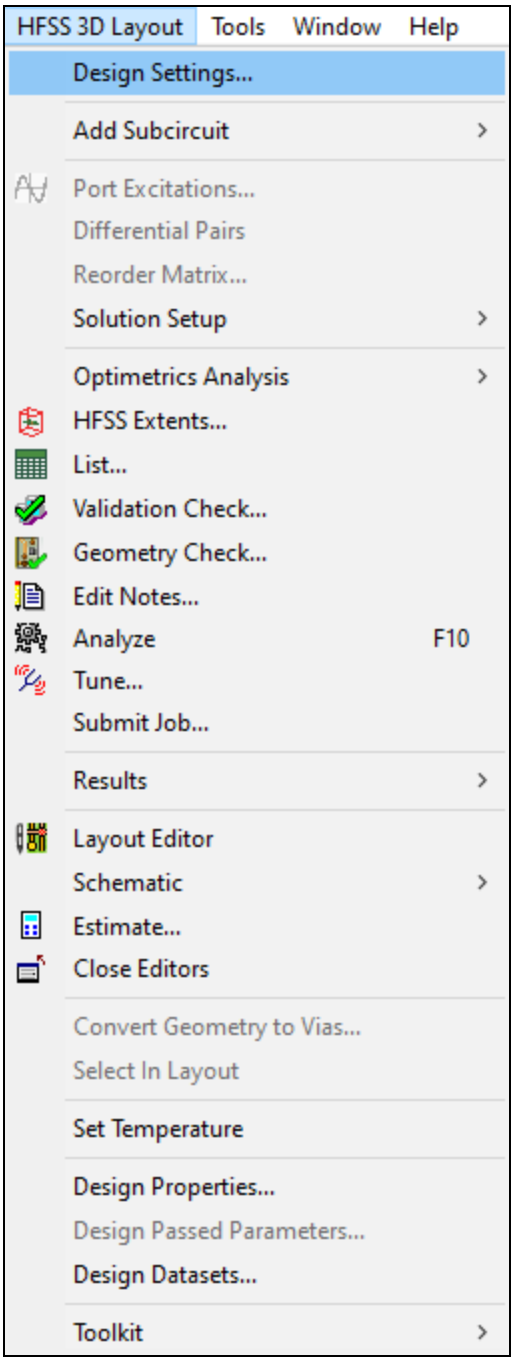
Ansys suggests creating a mesh region around the component. Mesh generation will automatically cease if the generator encounters an intersection. If mesh generation is successful, then the intersection is valid. Refer to "Meshing In HFSS 3D Layout " on page 17-1 for more information.

Deactivating the Intersection Check

If the components in the design are all unencrypted, users can deactivate the intersection check altogether. Deactivating the check has no impact when validating a design that includes an encrypted component. Follow these steps to deactivate the intersection check.

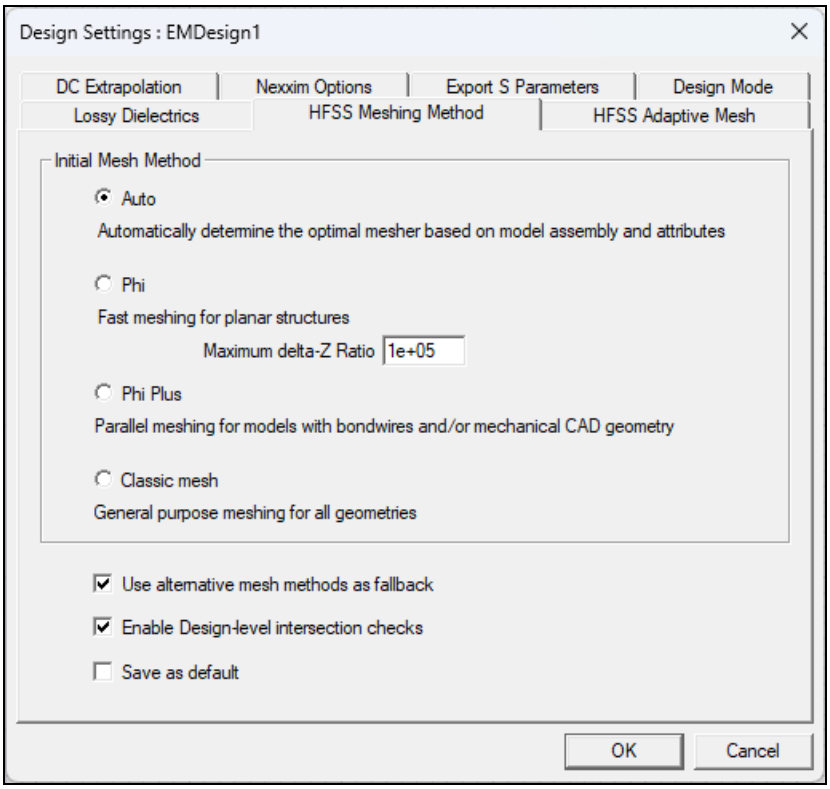
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From **HFSS 3D Layout**, select **Design Settings** to open the **Design Settings** window.



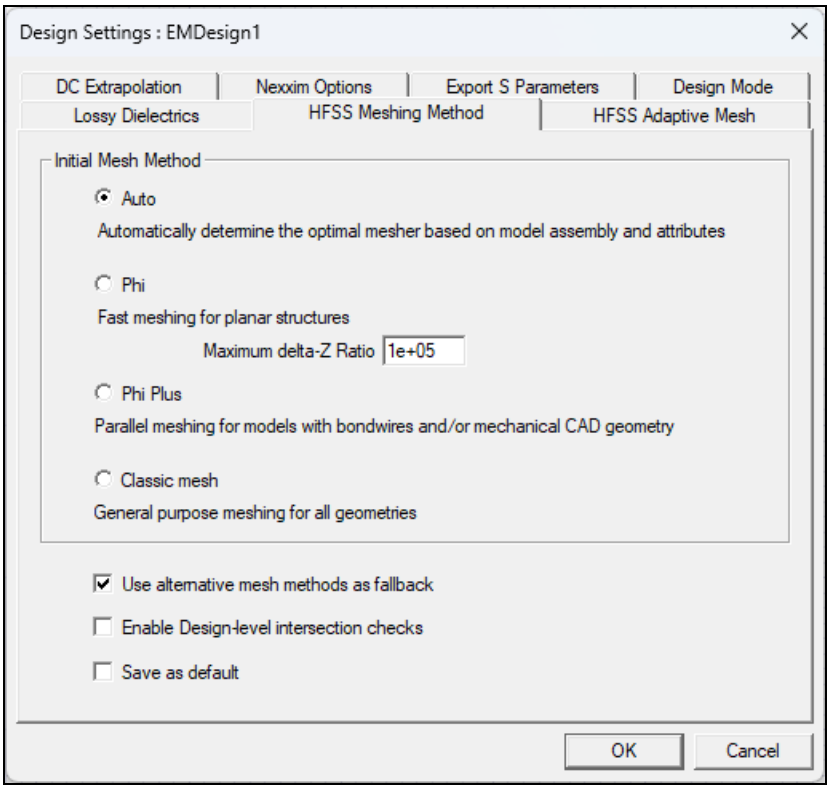
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Navigate to the **HFSS Meshing Method** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Remove the check from the **Enable Design-level intersection checks** box.



4. Click **OK** to close the **Design Settings** window.

Next Steps

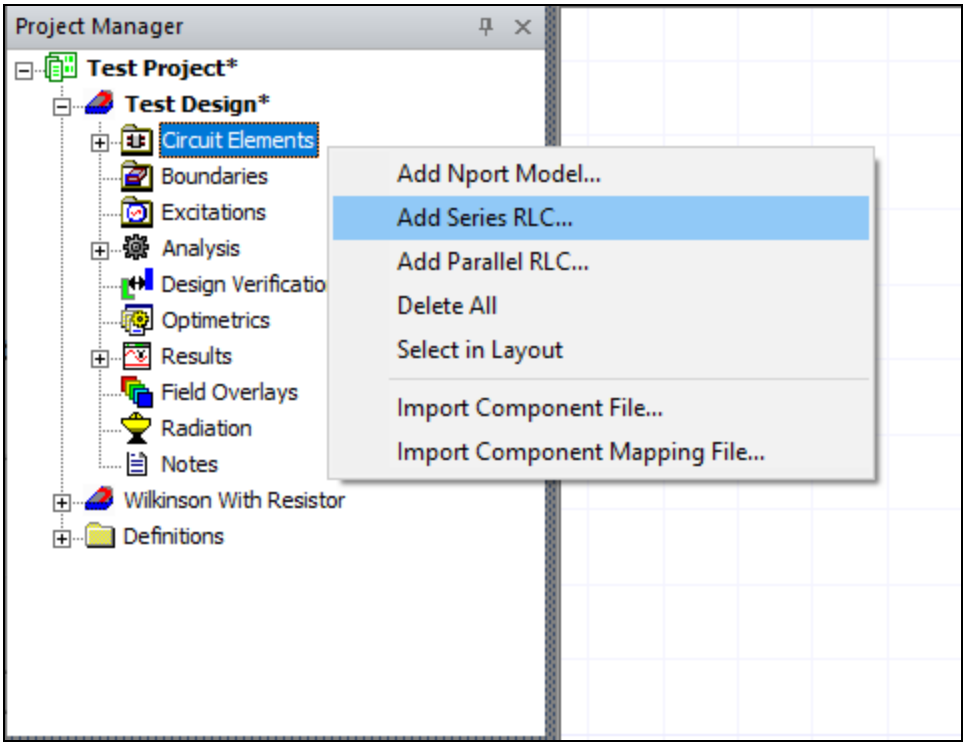
Typically, the intersection should be corrected before proceeding. Users can change the shape of objects, or remove a component to reach this goal.

Creating a Circuit Element

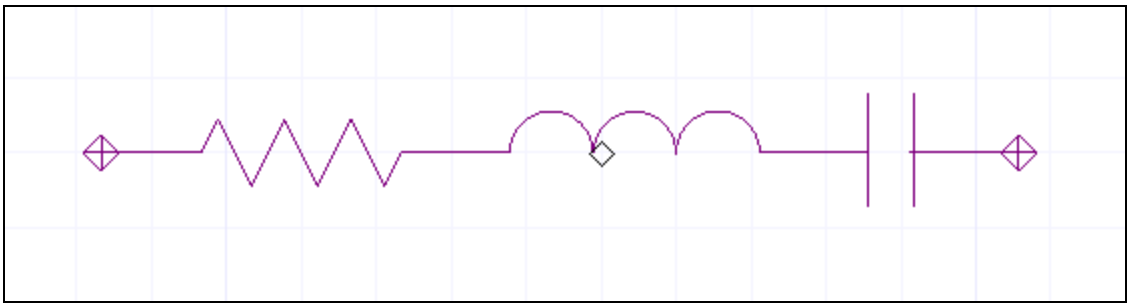
Follow these steps to add an RLC circuit element to a design.

1. From the **Project Manager** window, expand the **Project Tree** > **[Active Design Folder]**. Then right-click **Circuit Elements** and select **Add Series RLC** or **Add Parallel RLC**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

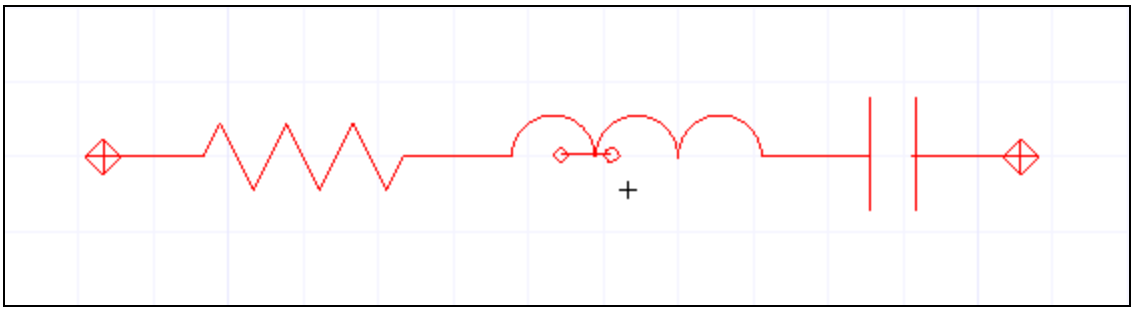


The selected element appears in the **Layout Editor** fixed to the cursor.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

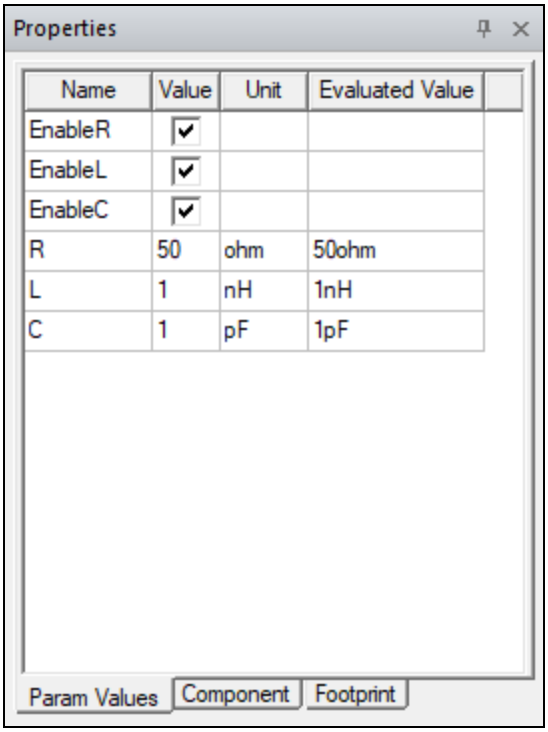
2. Click in a selected place in the design to place the element.



Modifying a Circuit Element's Properties

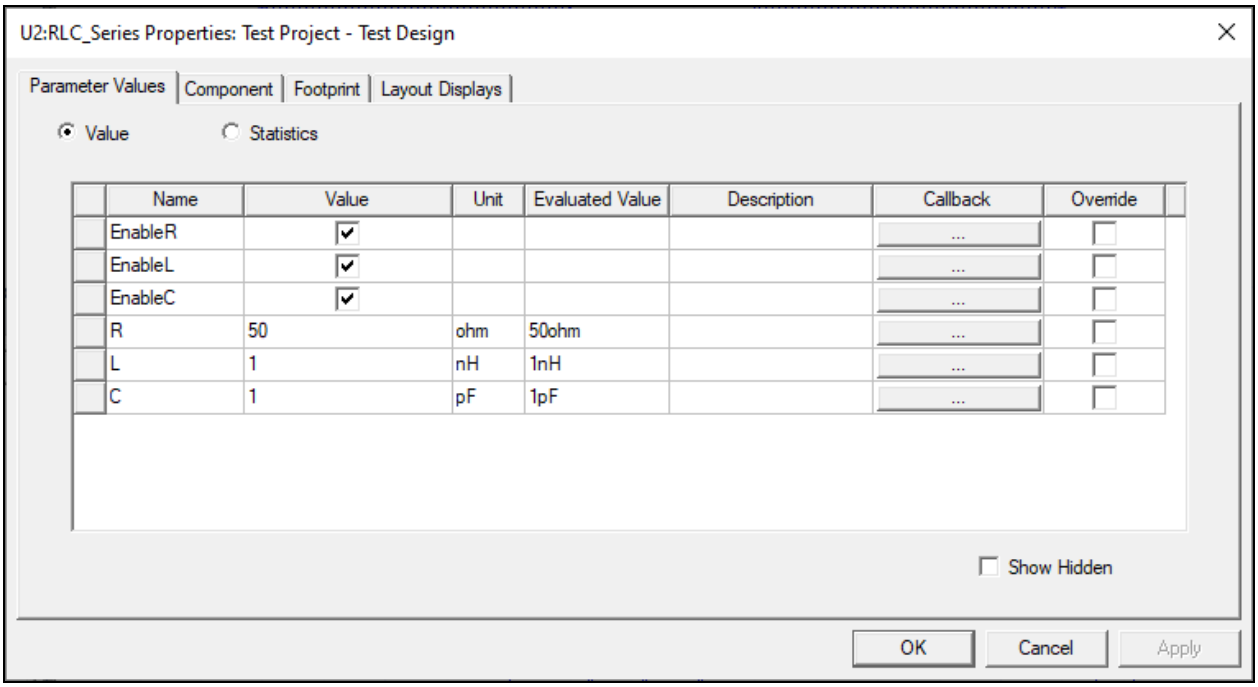
Modify a circuit element's properties by doing either of the following from the **Layout Editor**:

- Select the circuit element and change the selected values in the **Properties** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

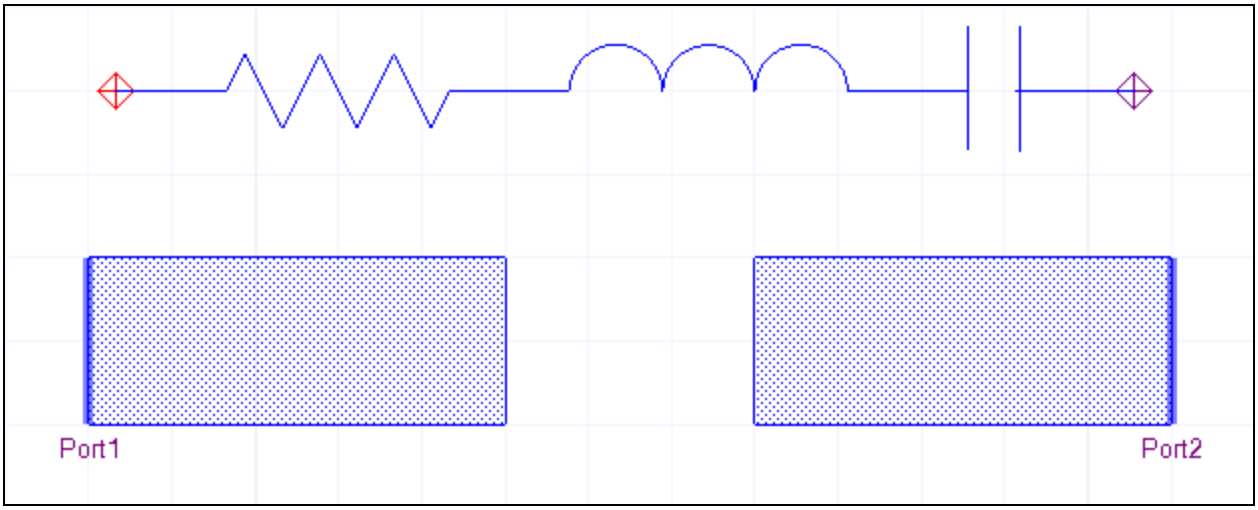
- Double-click the element to open the **Properties** window.



Connecting a Circuit Element

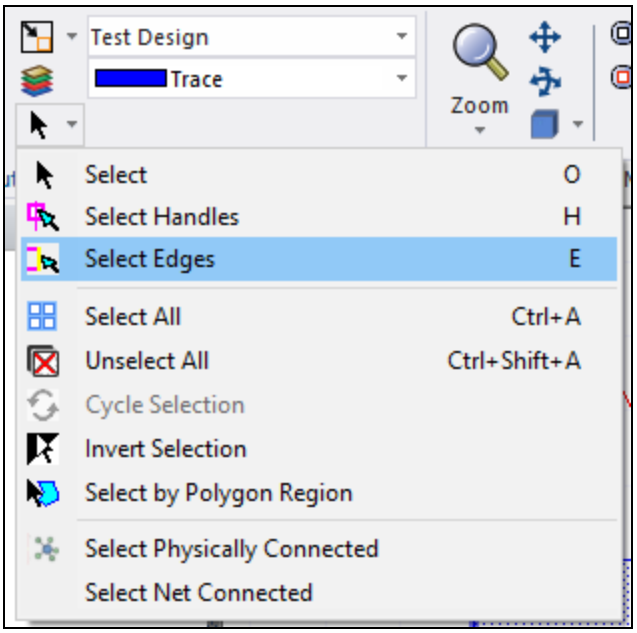
Follow these steps to connect a circuit element to an existing design element.

1. Select the outside edge of one of the circuit element's terminal ports. If the entire circuit element is selected, press B to switch between the selectable regions of the circuit element (i.e., the entire circuit element or only the terminal port).

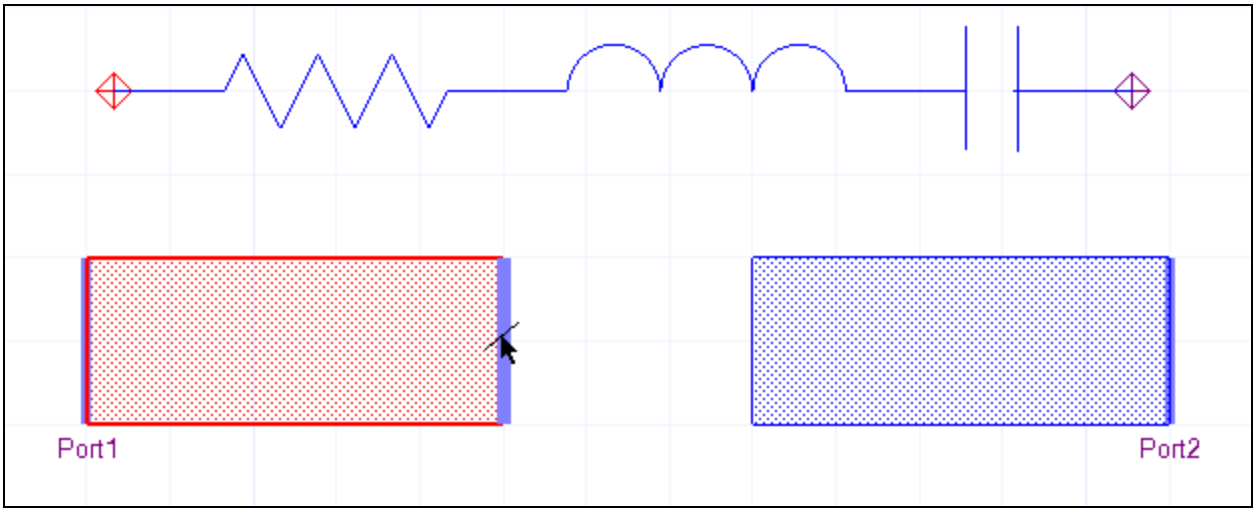


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. To enter **Select Edges** mode, either type **E** or navigate to the **Select elements** drop-down menu and click **Select Edges**.



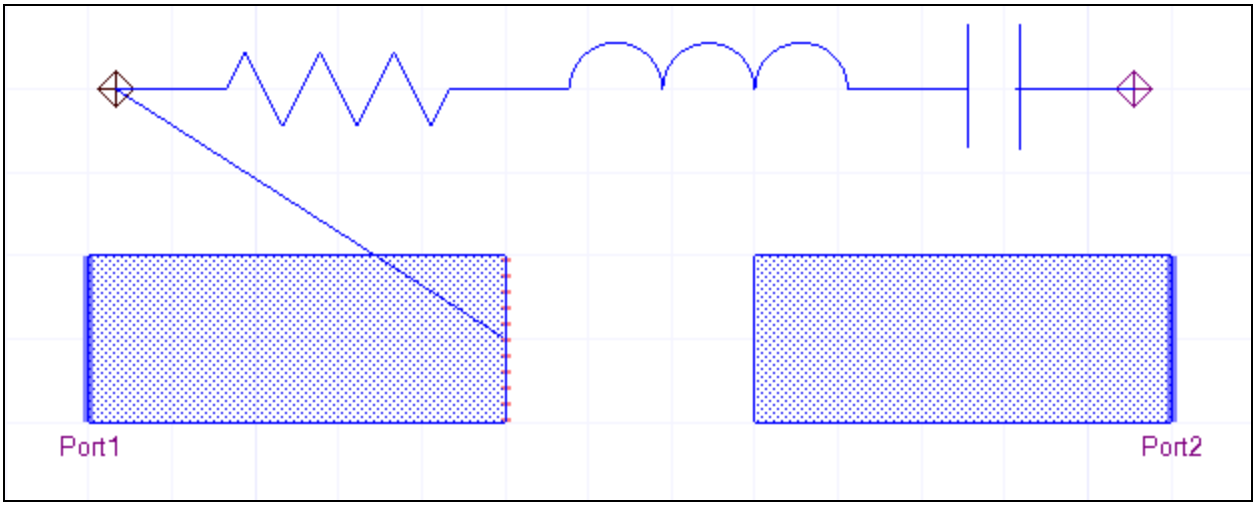
3. Click an unused edge of the design to ready it for port entry.



4. From the **Layout** ribbon, select **Connection**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The circuit element is immediately connected to the existing design element.



Note:

If the connection is not visible, ensure visibility is selected for **Rats** in the **Layout Editor**. Repeat the same procedure to define a connection for the second terminal.

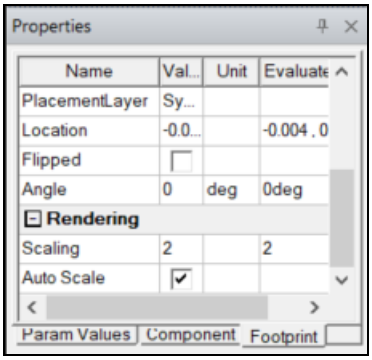
5. Repeat steps 1-4 to connect the circuit element's second terminal port to the existing design element.

n

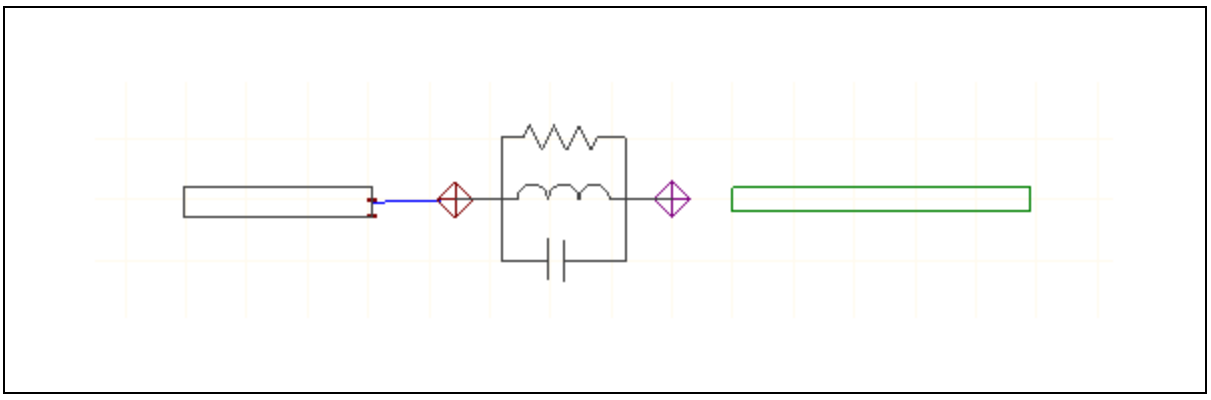
Auto Scale of Circuit Elements

When Auto Scale is enabled for a circuit element and two or more of the circuit element's pins are connected, the circuit element is automatically scaled to fit the smaller of the dimensions of the bounding box of the connections.

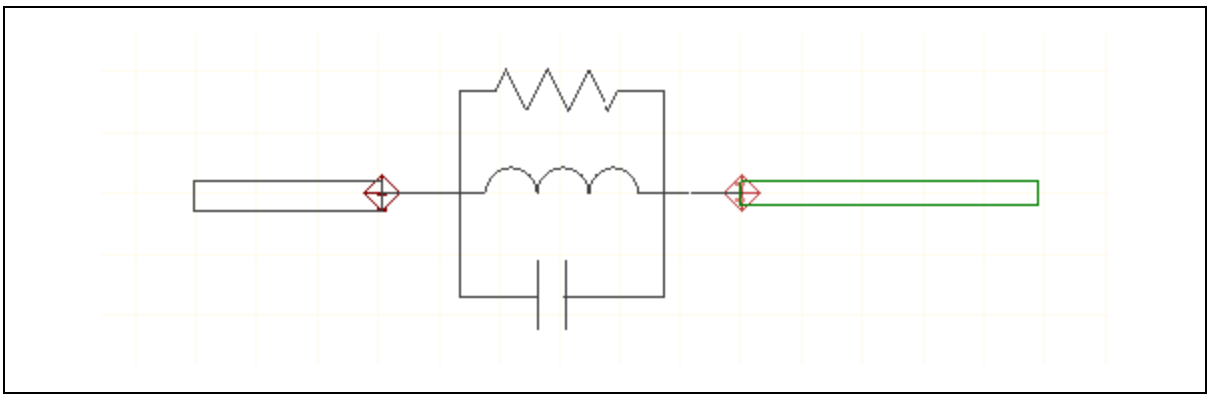
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The following figure is a circuit element with one connection.



Auto Scale is enabled (checked), so when the second connection is made, the circuit element is scales to fit, as shown in the following figure.

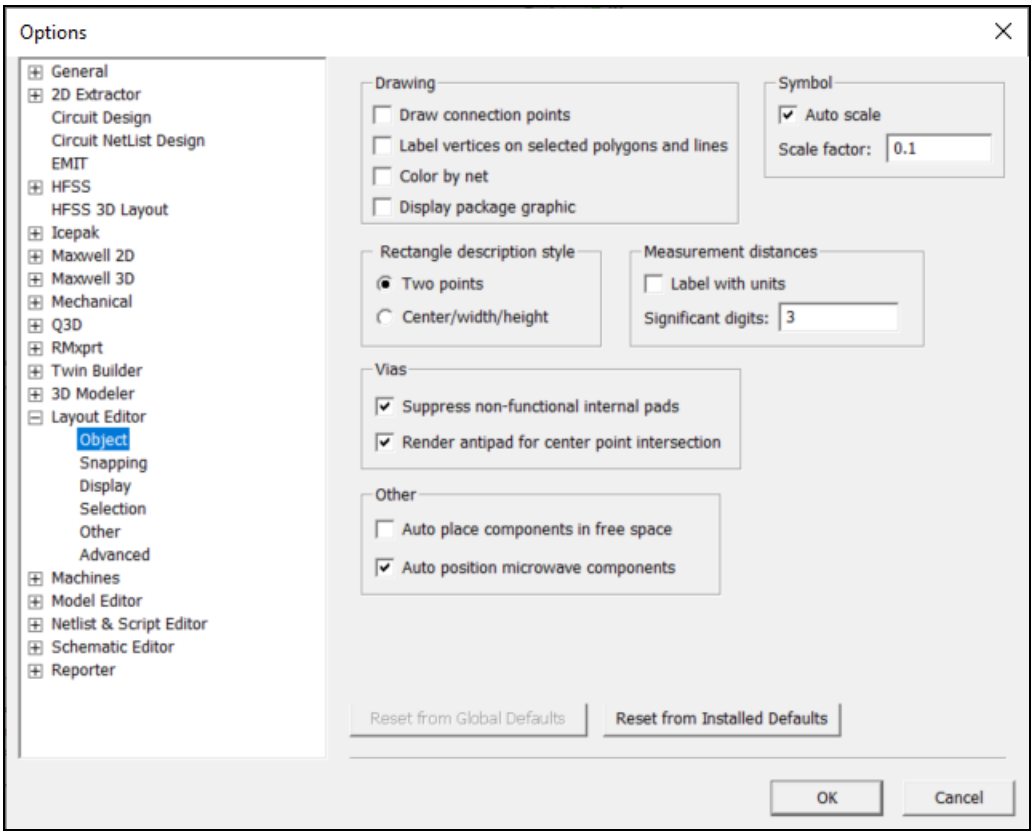


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turn Off Auto Scale

The circuit element does not move, so manually adjust the components as appropriate to match the pins to the connected location.

1. Auto scale is enabled by default. Follow these steps to deactivate Auto scale or adjust the scale factor (Scale factor is 0.1 by default).
2. Navigate to **Tools** > **Options** and select **General Options...** to open the **Options** window.
3. Expand **Layout Editor** and select **Object** to see the associated options in the **Symbol** area.
4. Click the **Auto scale** check box to remove the check mark and deactivate Auto scale. If applicable, type a new number in the **Scale factor** field to change the scale factor.

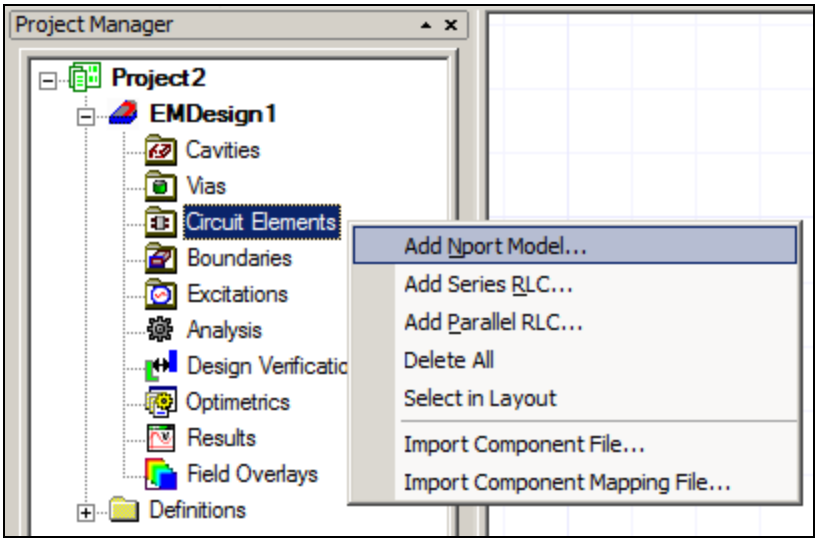


The process is complete.

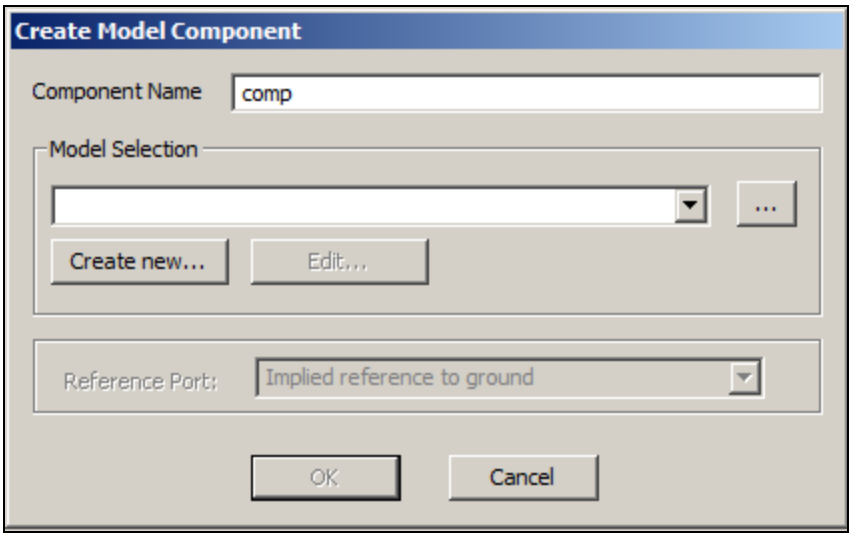
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Nport Circuit Elements

To add an Nport model to a design, right-click **Circuit Elements** in the **Project Manager** window and select **Add Nport Model**.

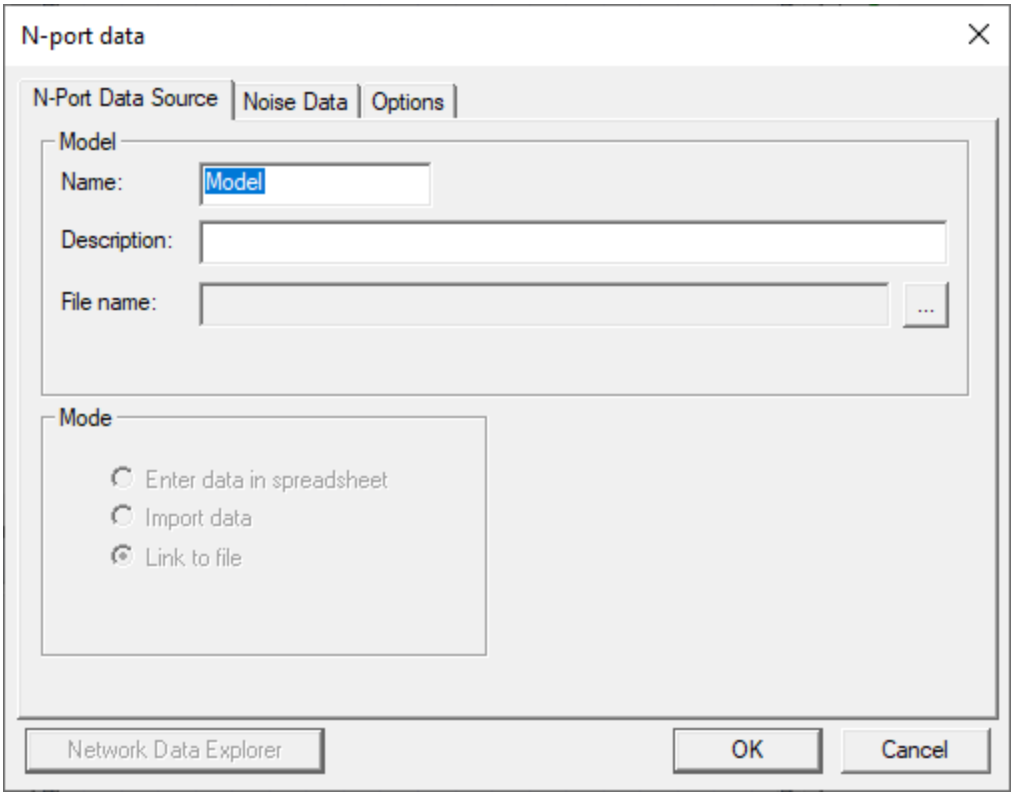


The **Create Model Component** window opens in which the component Model can be created or edited, and an additional option controls the reference used to determine port voltages.



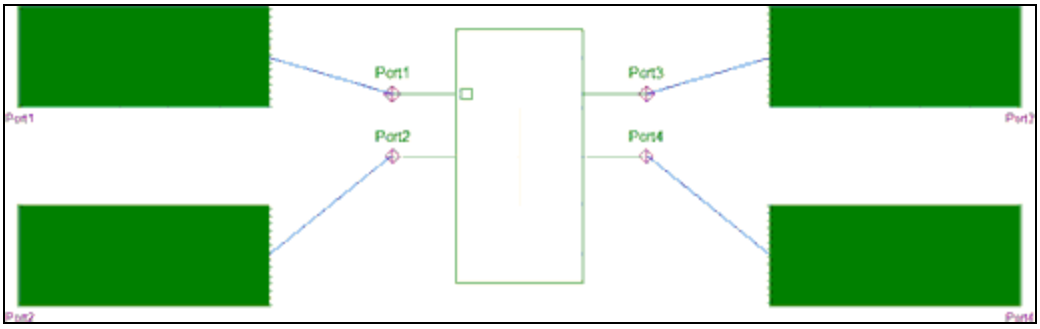
To create a new model, click **Create new** to open the **N-port data** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



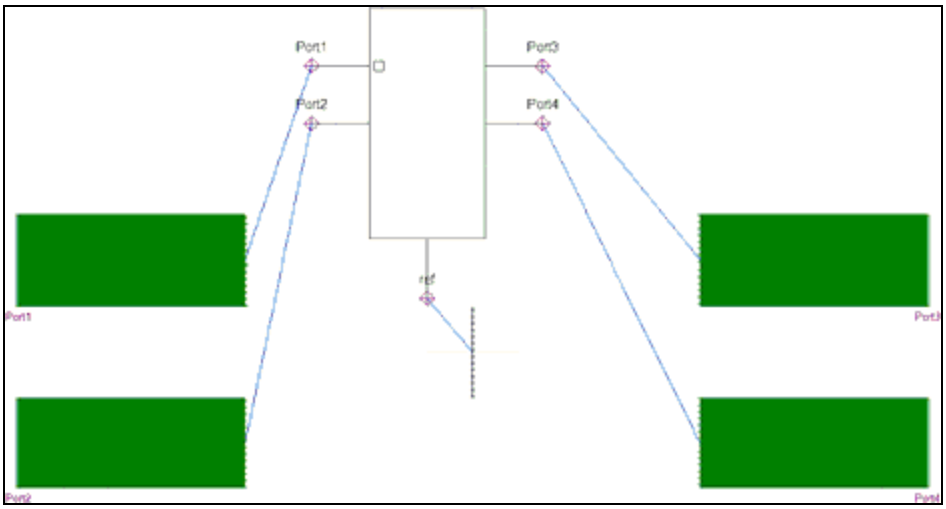
From this window, the component can either be defined by importing or linking to an existing definition in a touchstone file, or by manually entering the S, Y, or Z Matrix entries into a spreadsheet.

Once the model has been created the component can be placed into a design and the ports connected to edges of conductors as was the case for series and parallel RLC elements. There are three cases to consider, based on the type of Reference Port selected in the **Create Model Component** window. For **Implied reference to ground**, each of N port connections must be defined.

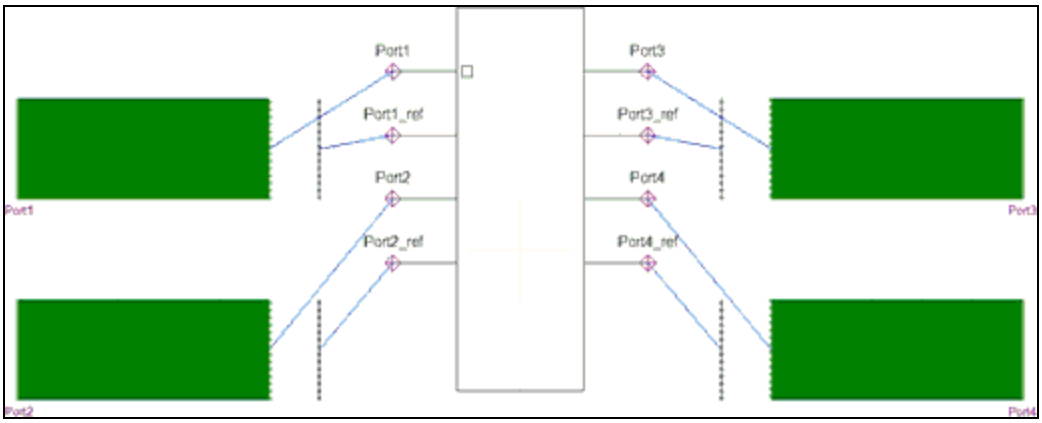


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For **Show common reference port**, an additional connection must be defined representing a common reference for the definition of port voltages.



In this case the common reference is an edge in the ground plane. For **Add individual reference pin per port**, an additional N connections must be defined allowing for a different reference for each port.



In this case, each port is referenced to a nearby edge in the ground plane.

Creating a Circuit Element Between Any Two Layers

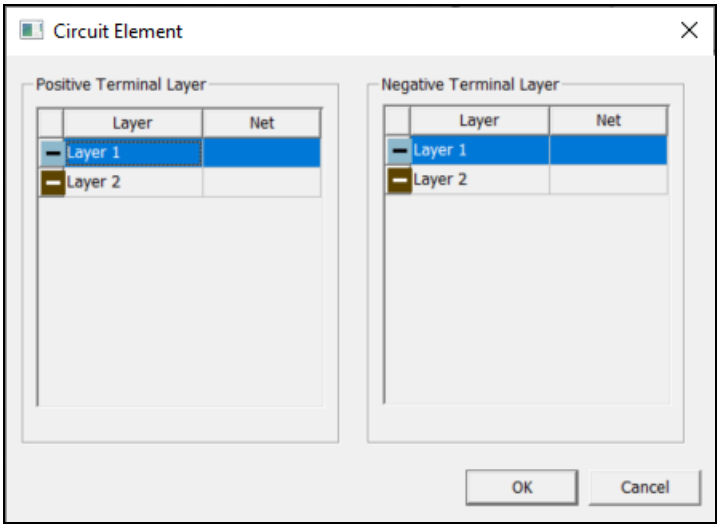
When most components are created, they are formed on a single layer from existing pins. Combinations of resistors, inductors, and capacitors can be created without pins and with terminals that are attached to different layers.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When a circuit element is created, a generic graphic appears. As the RLC properties are deactivated or deactivated, the graphic updates to reflect the state of the element. The element's model type determines if the graphic displays elements in series or in parallel. A circuit element which has an S-parameter model assigned to it is represented by a generic graphic with an X in it.

Follow these steps to create a circuit element between two layers. These steps assume that there are already multiple layers in the project.

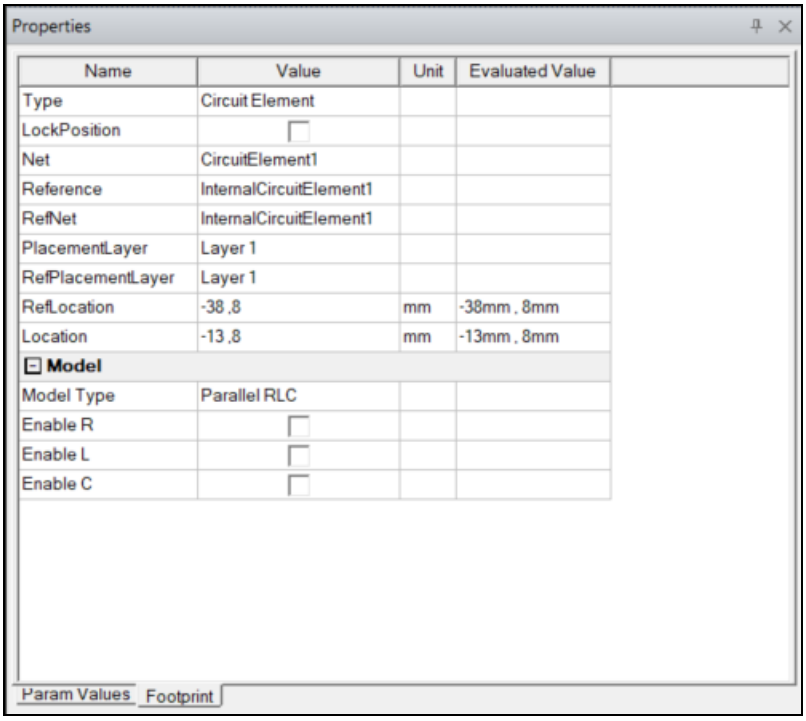
1. From the **Layout Editor**, right-click and select **Boundary** > **Create Circuit Element**.
2. **Click+drag** to draw the component into position in the **Layout Editor** to open the **Circuit Element** window.



3. Choose which layer each terminal of the component connects to and click **OK**.
4. Select the component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

5. From the **Properties** window, click the **Footprint** tab.



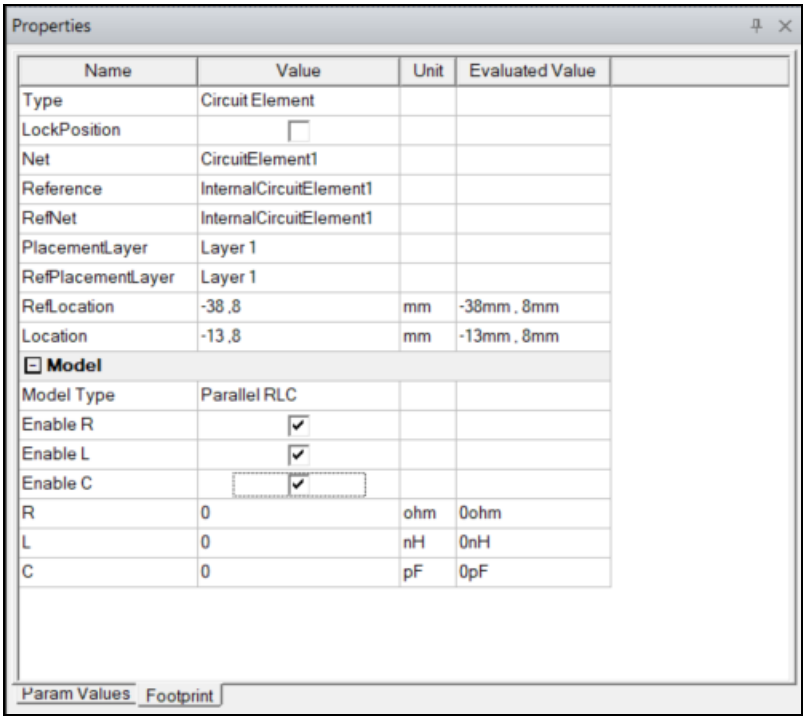
6. Choose one of the following model types on the **Model Type Value Field** drop-down menu:
    - **Parallel RLC** – the components are parallel to one another
    - **Series RLC** – the components are in series to one another
    - **S-parameter** – a frequency-dependent, imported model

Parallel RLC or **Series RLC** components only.

1. Add a resistance:
    a. Click the **Enable R** check box to add an **R** row to the **Footprint** tab.
    b. Click the **RValue Field** to enter the resistance into the field.
2. Add inductance:
    a. Click the **Enabled L** check box to add an **L** row to the **Footprint** tab.
    b. Enter the inductance into **L**.
    c. Click the **L Value Field** to enter the inductance into the field.

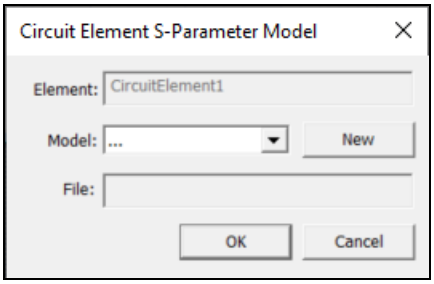
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Add capacitance:
    a. Click the **Enable C** check box to add a **C** row to the **Footprint** tab.
    b. Click the **C Value Field** to enter the capacitance into the field.



S-parameter components only.

1. Click the **S-parameter mo del [...]** button in the **Value** field to open the **Circuit Element S-Parameter Model** window.



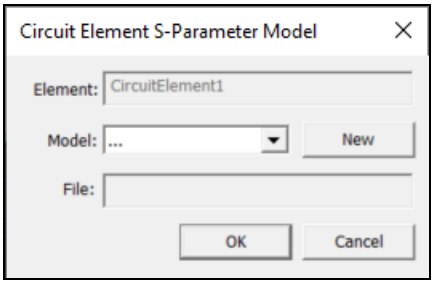
2. To import an existing model, click the **Model** drop-down menu and select an existing model. By default, no model is selected. Then click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To Import a new model, click **New** to open an explorer window. Then navigate to the model, select it, and click **Open**.

> **Note:**
>
> By default, the model is assigned the same name as the file. To give the model a new name, enter it in the **Comp Name** field.

Click **Open**. The new model is imported into HFSS 3D Layout and set in the S-parameter model row.



3. The new model is imported into HFSS 3D Layout and set in the **S-parameter model** row.

Physical Definition for EM Models

To verify that a component possesses a physical definition, access the Edit Component window. This can be accomplished one of two ways, depending upon whether the component is user-defined or is part of the HFSS library.

User-Defined Components

If the component is contained in a loaded project:

1. From the **Project Tree**, expand the **Definitions** folder and the **Components** subfolder for the project that contains the component you want to examine.
2. Double-click the component entry, or right-click the component entry and select **Edit Component** to open the **Edit Component** window.

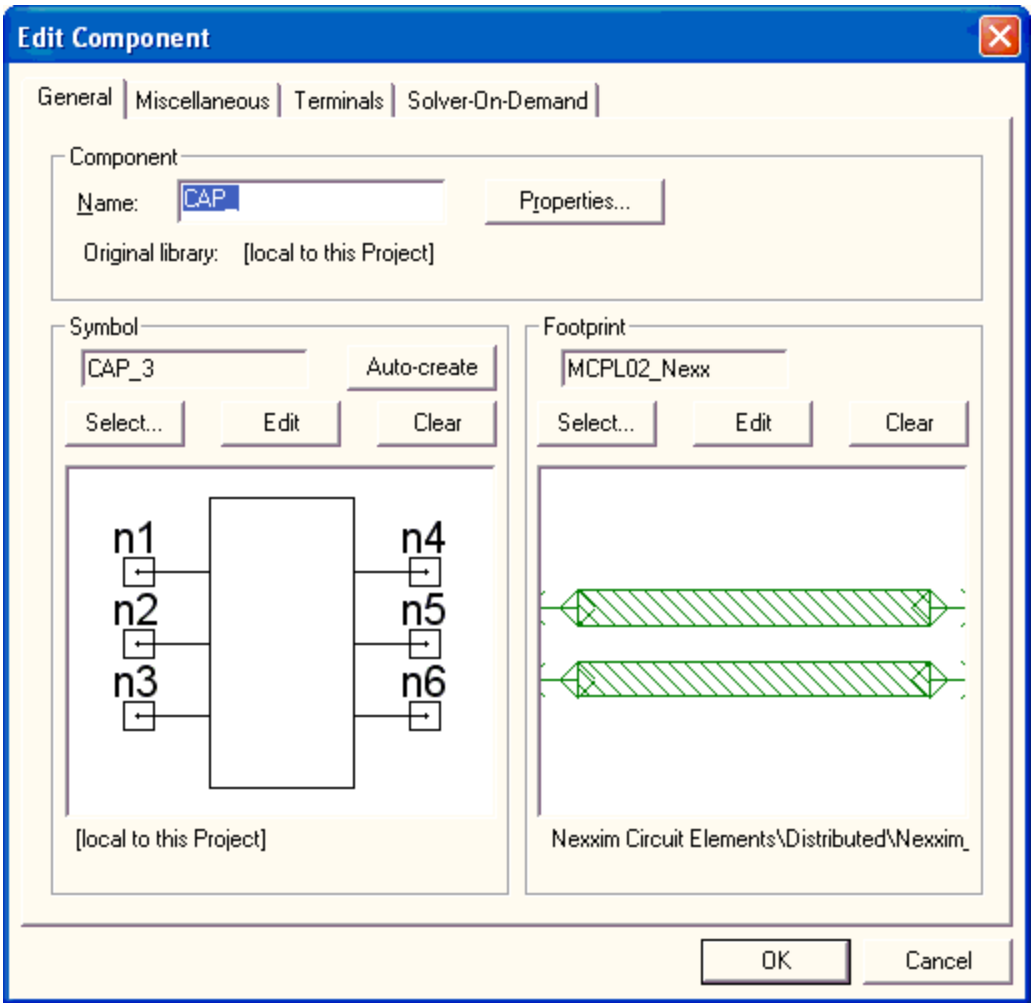
Library Components

If the component is contained in a library known to HFSS:

1. Select **Tools** > **Edit Libraries** > **Components** to open the Edit Libraries window, then select the component you want to edit.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Click **Edit Component**, or double-click the selected entry, to open the **Edit Component** window.



The physical definition of a component can be verified using the information displayed by the window. In particular, information related to the footprint of a component is displayed.

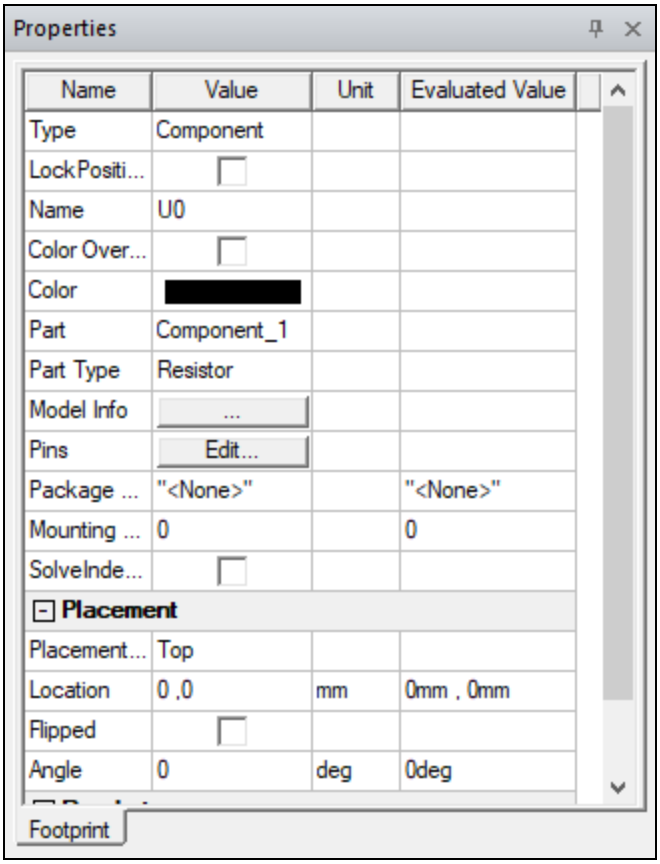
Components Model Window

A component is a collection of entities grouped together with a common set of configurations. Use components to configure HFSS 3D Layout objects. Follow these steps to create and edit these configurations in the **Component Model** window.

1. To open the **Component Model** window, do one of the following:

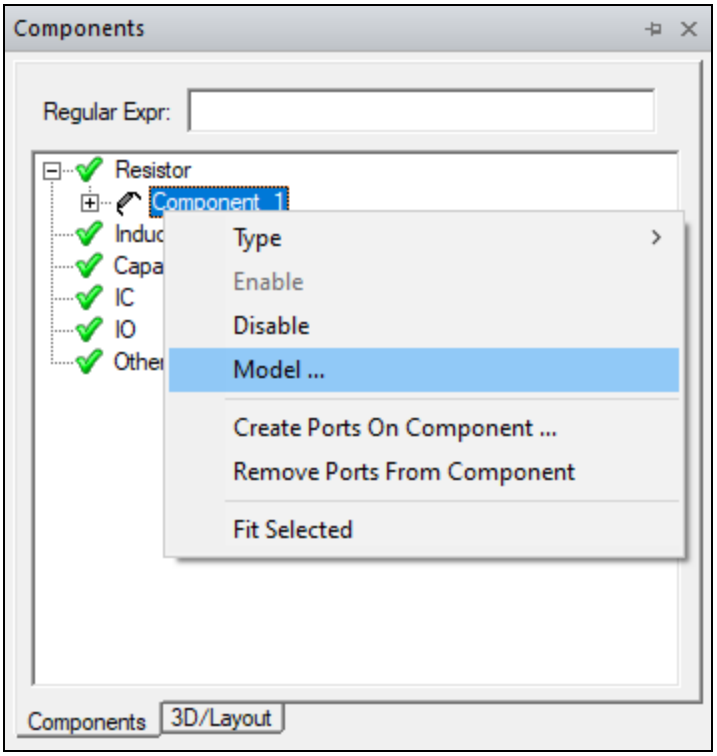
- From the **Layout Editor**, select a component to populate the **Properties** window. Then click the **Model Info [...]** button.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



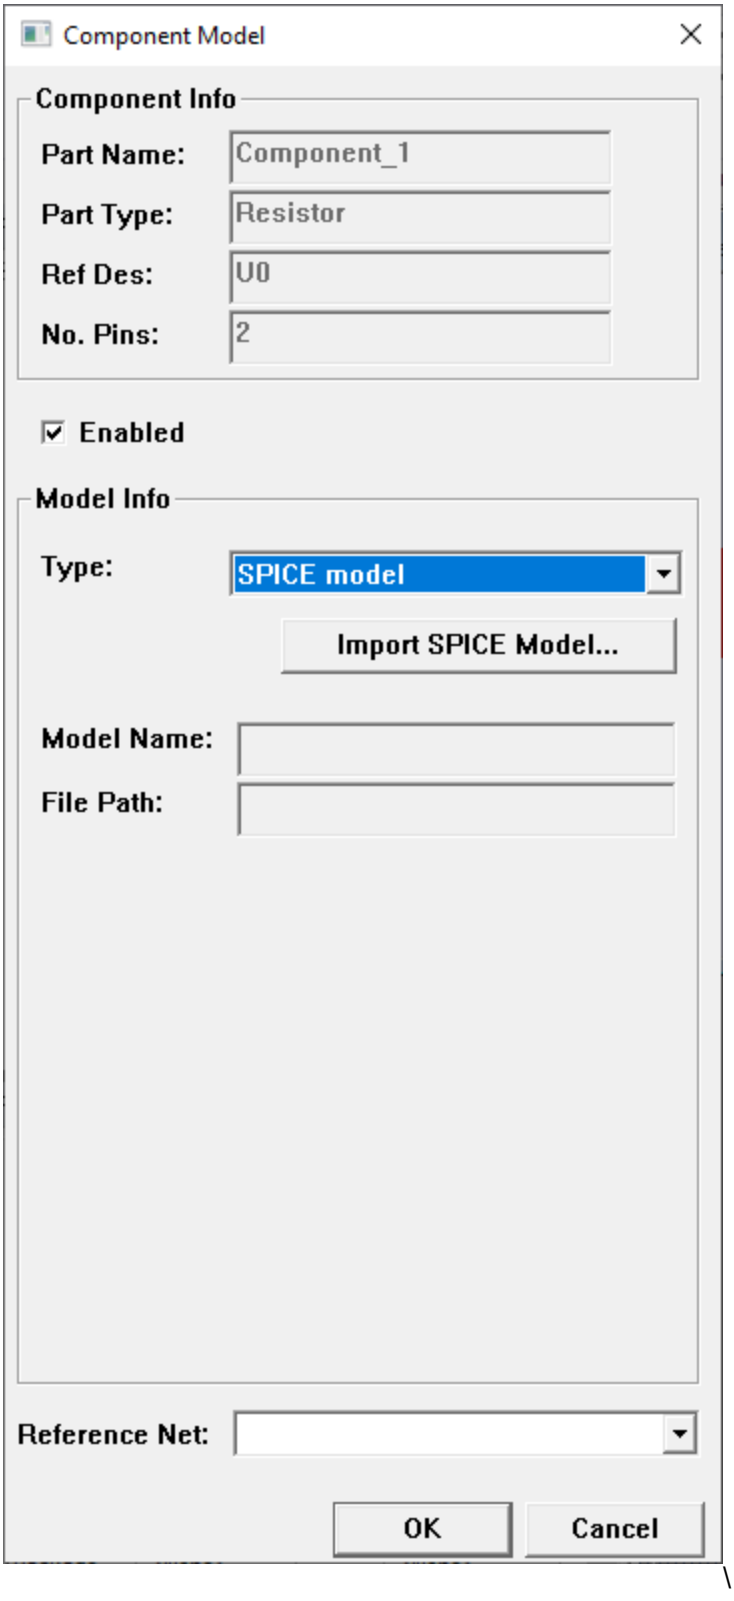
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Components** window, right-click a component and select **Model**.



2. From the **Component Model** window, configure all the pins of a component or components of the same class. The exact configurations depend on the model type (e.g., an assigned electrical model can characterize how a passive device behaves).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Part Type** determines what model type a component can have

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Part Type	Model Type
Resistor Inductor Capacitor	• RLC network: assign a simple parallel or series RLC network. • S-Parameter model: create a model from a touchstone file. • Circuit model: create a model in the **Schematic Editor**. This is also the model type for legacy netlist models. • Library: select a model on the installed vendor libraries. • SPICE model: click **Import SPICE Model** to attach a SPICE model.
IC (integrated circuit) IO (input output) Other	• Manual: Create a custom configuration. • SPICE model: click **Import SPICE Model** to attach a SPICE model.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

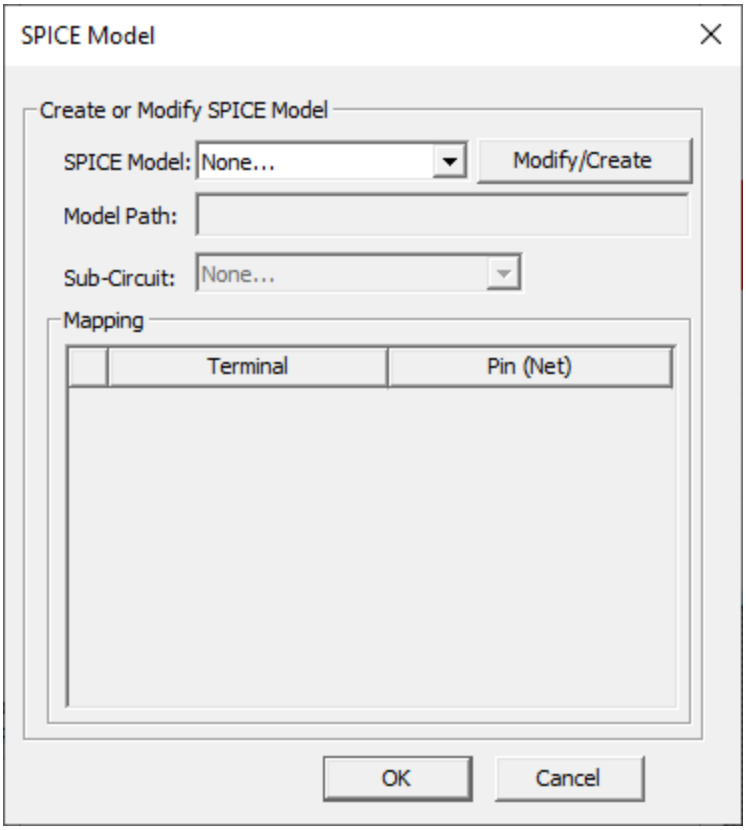
For S-Parameter and Library models, users can specify a reference net (e.g., a ground/power net), to use as reference for the terminals of the components. Whether to provide a reference net is entirely at user discretion. If no reference net is provided, one will be automatically determined.

Circuit models supersede netlist models. Continue to edit any netlist model that exists in a legacy project or create a new circuit model with the **Schematic Editor**. Netlists cannot be edited in or converted to a format that can be edited in the **Schematic Editor**.

SPICE Model Window

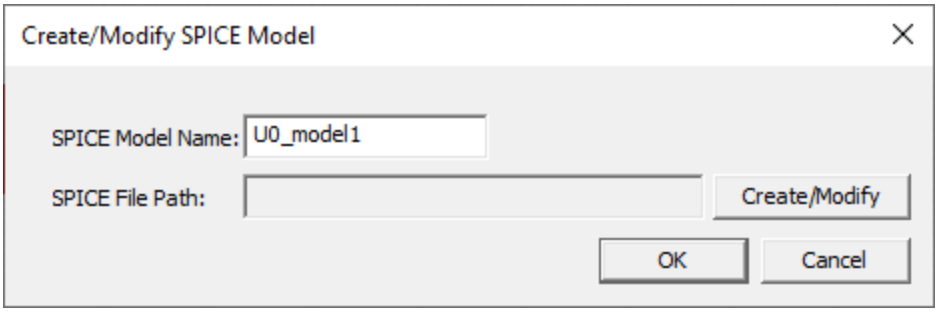
Attach a SPICE model to a specific component in the layout or to a component type. Follow these steps to attach a SPICE model to a specific component.

1. If a SPICE Model has been prepared, select it from the drop-down menu. Otherwise, click **Modify/Create** to open the **Create/Modify SPICE Model** window.

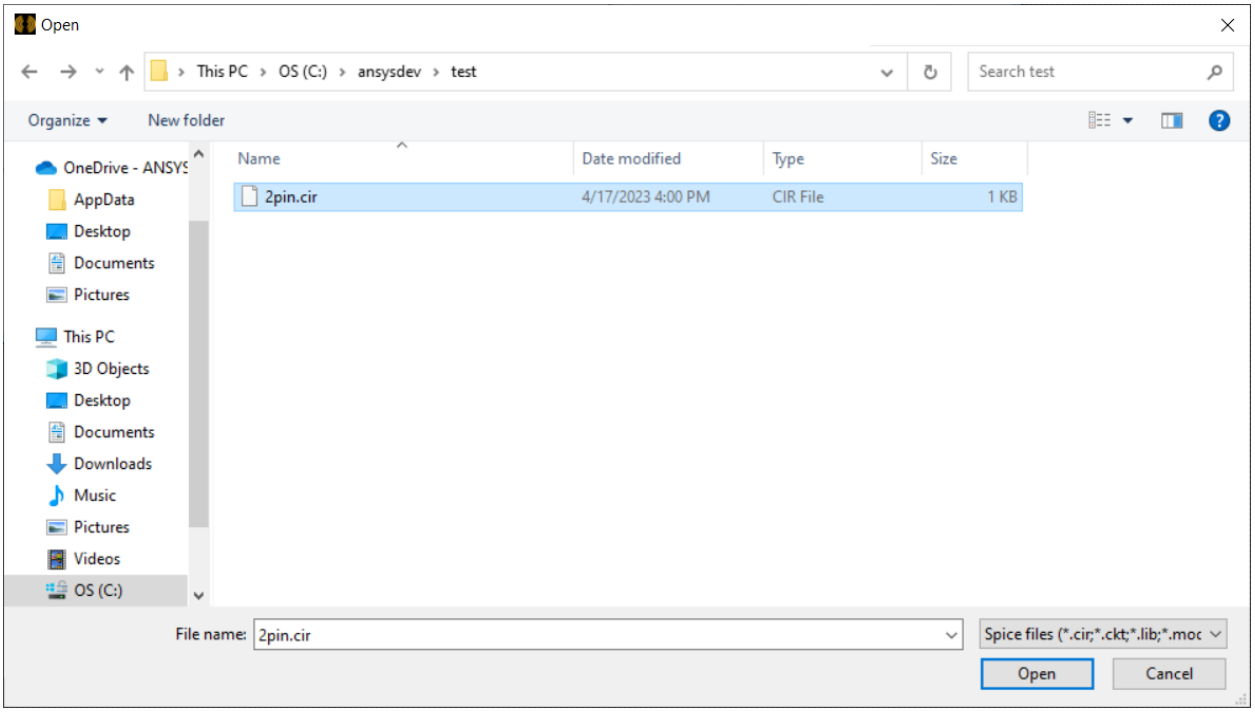


2. Enter a **SPICE Model Name** or accept the default (e.g., **U0_model1**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

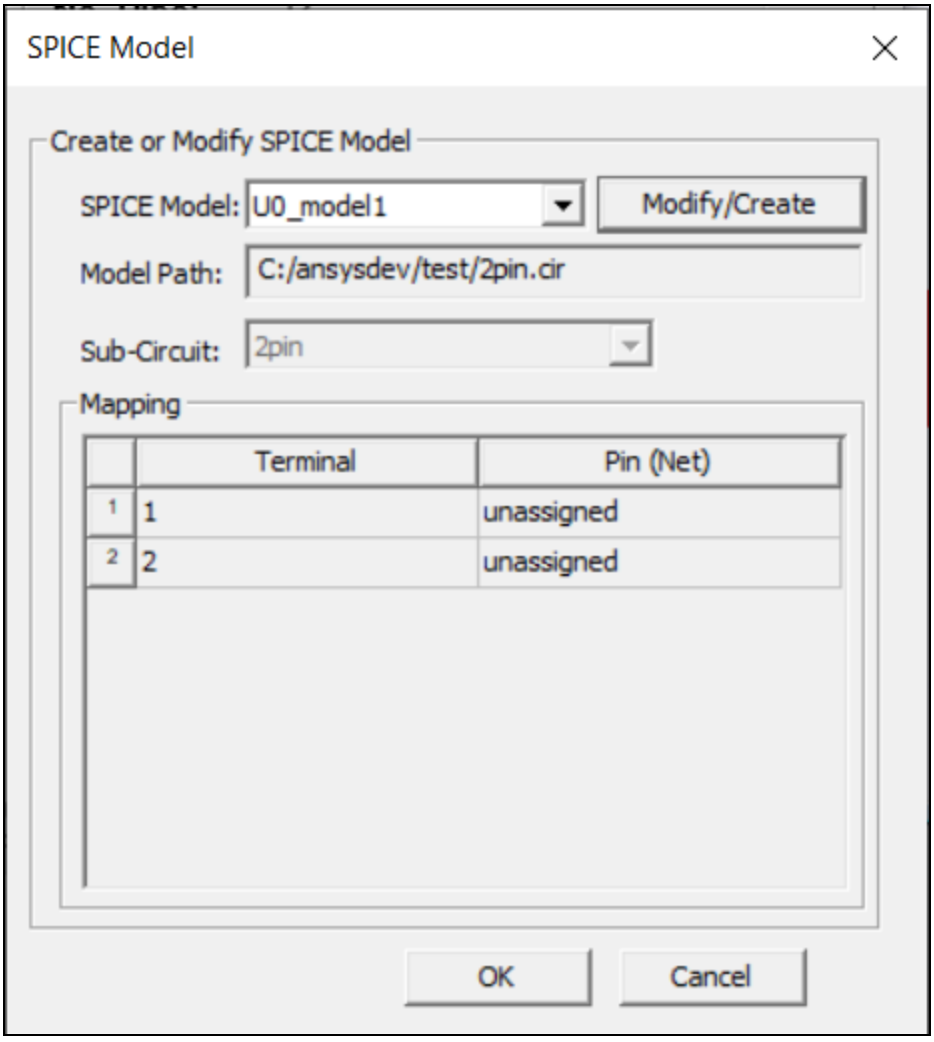


3. Select **Create/Modify** to open an explorer window.



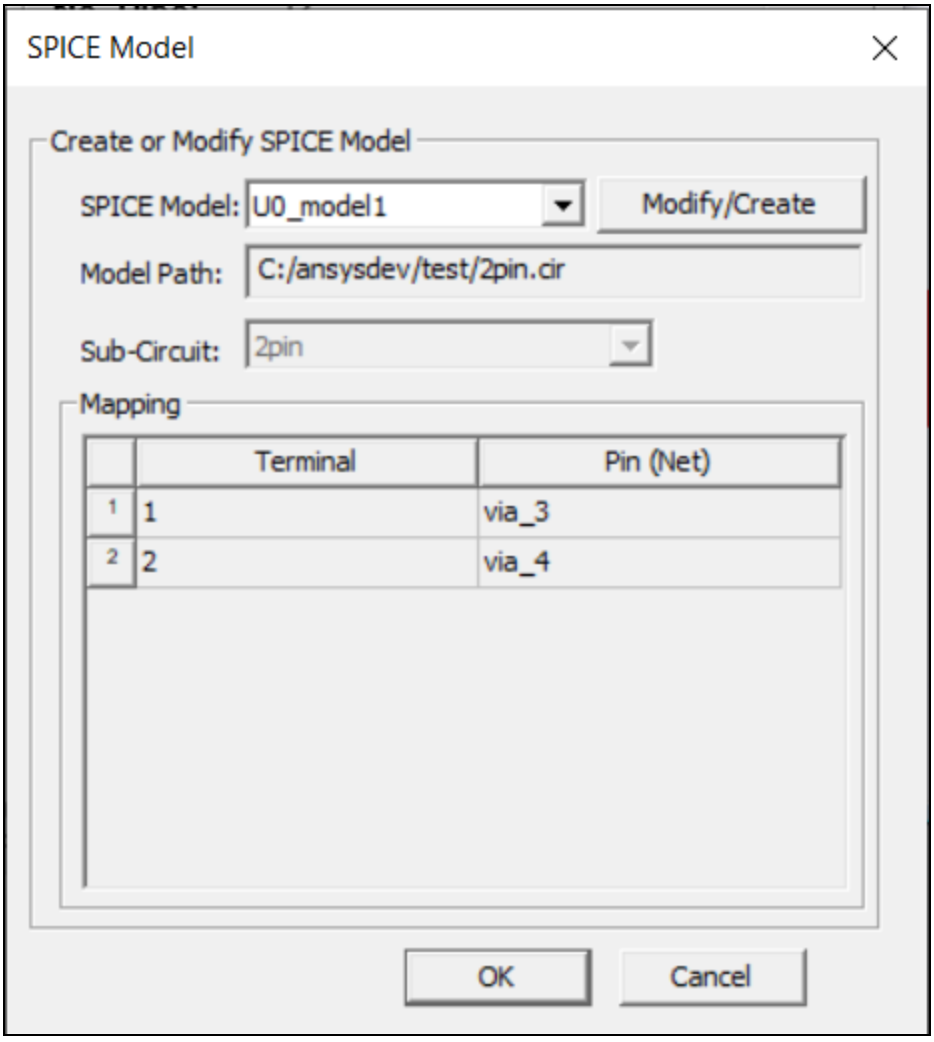
4. Navigate to and select a **Spice file** (e.g., **2pin.cir**). Then click **Open** to close to the explorer window and return to the **Create/Modify SPICE Model** window.
5. Click **OK** to close the**Create/Modify SPICE Model** window and return to the **SPICE Model** window, which is now populated with the Spice file's parameters. This includes **Model Path**, active **Sub-Circuit** (if any), and the current **Terminal/Pin Mapping**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



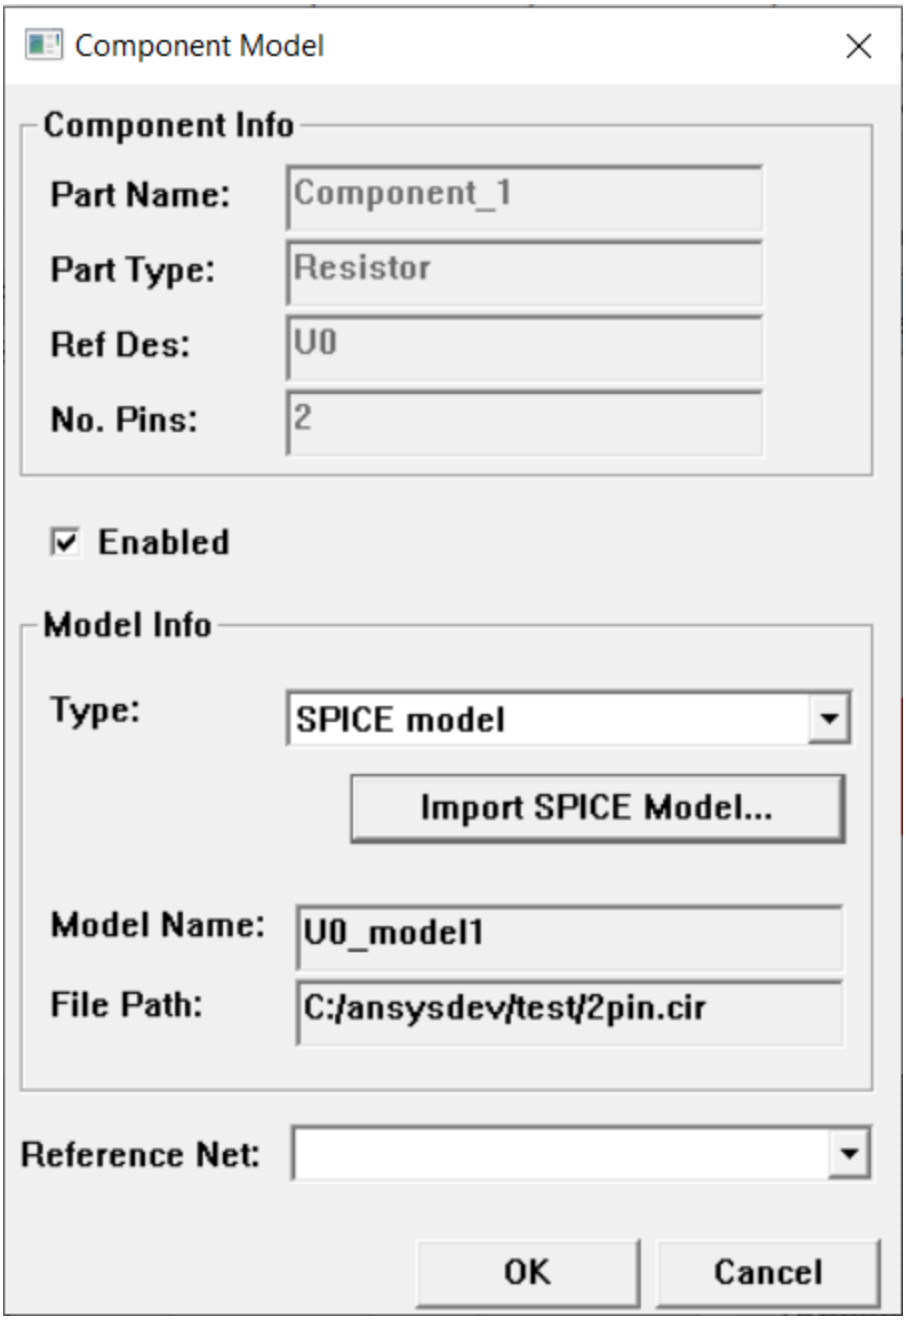
6. If available, select a **Sub-Circuit** from the drop-down menu.
7. Make adjustments to **Terminal**/**Pin Mapping** by clicking in the **Pin** column cells and selecting a pin from the drop-down menu. Repeat, as appropriate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



8. Click **OK** to close the **SPICE Model** window and return to the **Component Model** window. The Component Model window is now populated with the SPICE model's parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



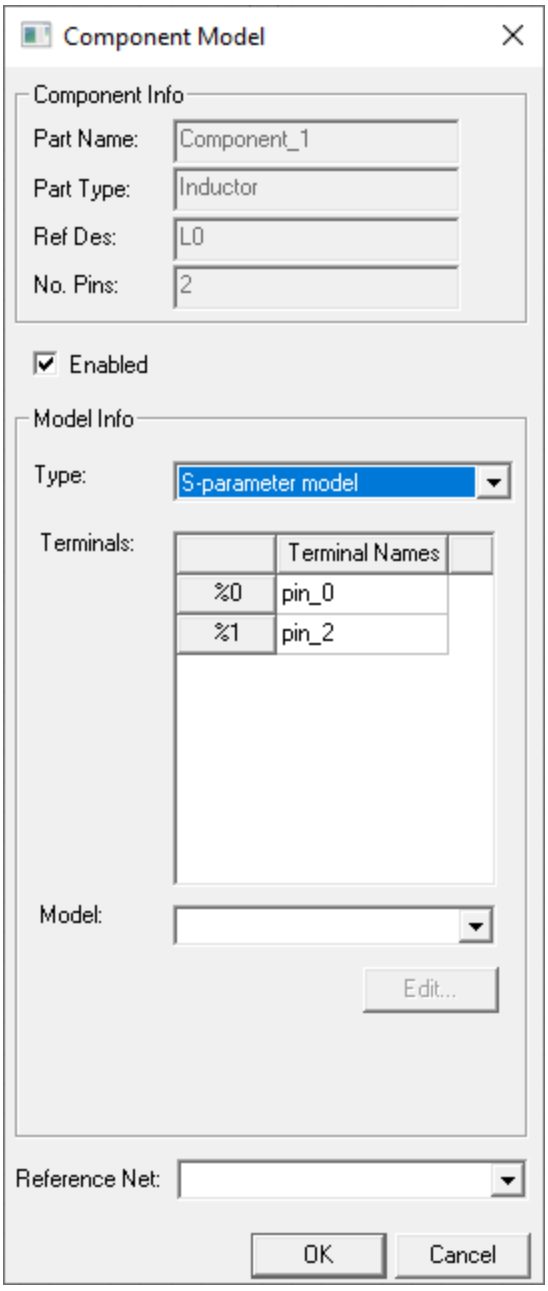
Manual Model

A **Manual** model type contains die, solder ball, and port properties. These properties apply across the component. So, if you configure the **Solder Ball Properties**, every pin on the component is configured with the same type solder ball, positioned uniformly above or below, and generates a common reference for HFSS simulation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Solder Ball and **Port Properties** are common for IC, IO, and other components. **Die Properties** are only available for IC components.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Die Properties

IC components's die properties determine the z-orientation and connections to the component's pins on its stackup layer. There are three types of die properties: **None**, **Flip chip**, and **Wire bond**.

If the type is **None**, there is nothing connecting to the pins and no configurations to set.

With **Flip chip**, configure the component's pins to the top or bottom side of its layer. **Chip up** places the pins on the bottom side of the layer, while **Chip down** places them on the top side. The pins' default depends on where in the stackup the component is.

When the **Flip chip** controls are available, the component's pins connect via solder balls. So the **Solder Ball Properties** become available.

Wire bond type components have all pins in the same orientation, either on the top (**Chip up**) or bottom (**Chip down**) side of the layer. Set the **Height** of the wires as measured on the layer.

Solder Ball Properties

When available, solder balls are identical across a component. They have the same diameters, height, and material. Solder balls can be spheroids or cylinders. Cylinders have a uniform diameter along their height.

Spheroid solder balls are spheres with the top and bottom truncated. Their **Diameter** is the diameter of the interface at the pin and whatever it is connecting to. The **Mid Diameter** is the diameter of the ball at its midpoint.

If **Shape** is set to **None**, the component does not have solder balls.

> **Note:**
>
> When **Die Properties** are available, solder balls can only be configured for **Flip Chip**.

Port Properties

Solder balls and wire bonds are drawn using a reference plain that is controlled by the **Port Properties**. By default, this plain is as large as the component and sits at the top of the solder balls and wire bonds.

The solder balls can have a **Reference offset** which moves the reference plane a configurable distance on the top of the solder balls.

The reference plane can be resized for solder balls and wire bonds. If **Auto** is enabled, the plane is the size of the component. If unavailable, set the dimension of the plane on the x- and y-axis. The plane can be as large or as small as selected.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

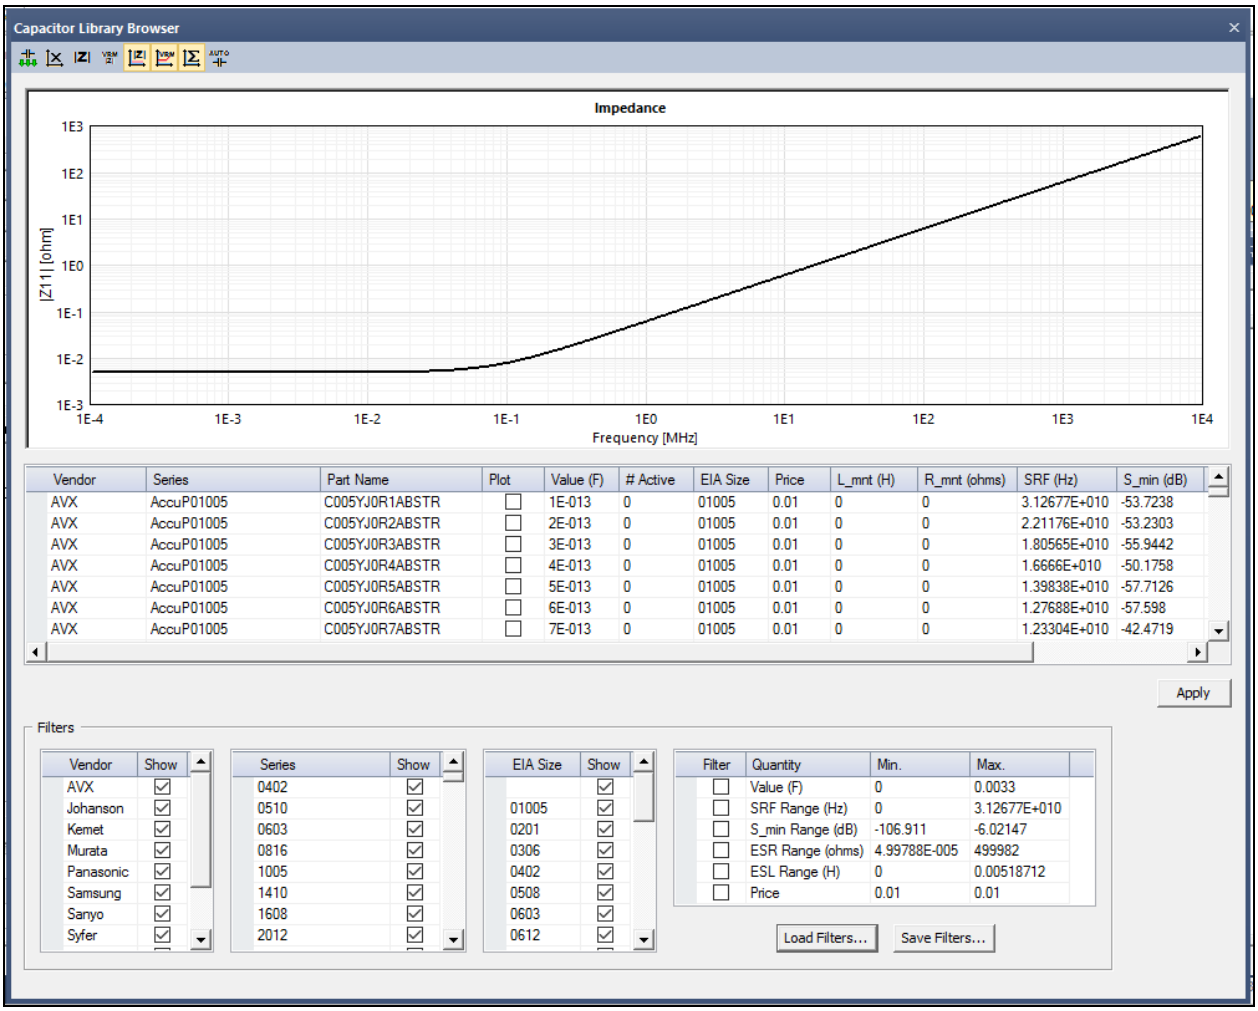
Working With The Capacitor/Inductor Library Browser

Ansys SIwave™ allows you to define VRM parameters and impedance requirements, then automatically select capacitors that meet those requirements. Also plot the impedance of various vendor or imported capacitor components versus frequency.

To view the Capacitor/Inductor Library:

1. Select a capacitor in the **Components** window, click **Model Info** for the capacitor in the **Properties** window, then in the **Component Model** window that appears, click the **Library Browser** to open the **Capacitor/Inductor Library Browser** window.

   You can sort the values in each column by clicking the column title.



2. To automatically select the capacitors that match the defined impedance profile, click the icon.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. To manually select the capacitors, click the **Plot** check box. To plot all the capacitors, click the **Plot** column title.
4. Specify filters for the options that you want to show. You can save these options to a **.cff** (capacitor filter criteria) file. Also load an existing filter.
5. To update the value for multiple capacitors, make a selection on the value drop-down menu. Then enter a value for all the selected capacitors in the field, then click **Update**.
6. To import a capacitor model from a Touchstone file: click the icon to open the **Import S-parameter Component** window. Specify the component details, and click **OK**.
7. To remove all capacitor impedance curves that have been selected, click the icon.
8. To define the impedance requirements, click the icon to open the **Define Impedance Mask** window. You can create and save the existing profile, or load a saved profile.
9. To define VRM parameters, click the icon to open the **Define VRM Parameters** window. Specify the ESL and ESR parameters, along with the plot color, and click **OK**.
10. To change the display options, click the corresponding  icons to display impedance mask, VRM output impedance curve, or aggregate output impedance curve.
11. To update the value for multiple capacitors, make a selection on the value drop-down menu. Then enter a value for all the selected capacitors in the field, then click **Update**.

Add a New Member to a Component

When entities are added to an existing component, the component's border shifts accordingly and its definition changes if new pins are added. From the **Layout Editor**, right-click the component and entity that you want to add to it and select **Components** > **Add Pin(s)**.

> **Note:**
>
> If a pin is added to a component with an RLC network model type, the pin pairs cannot be updated.

Remove a Member from a Component

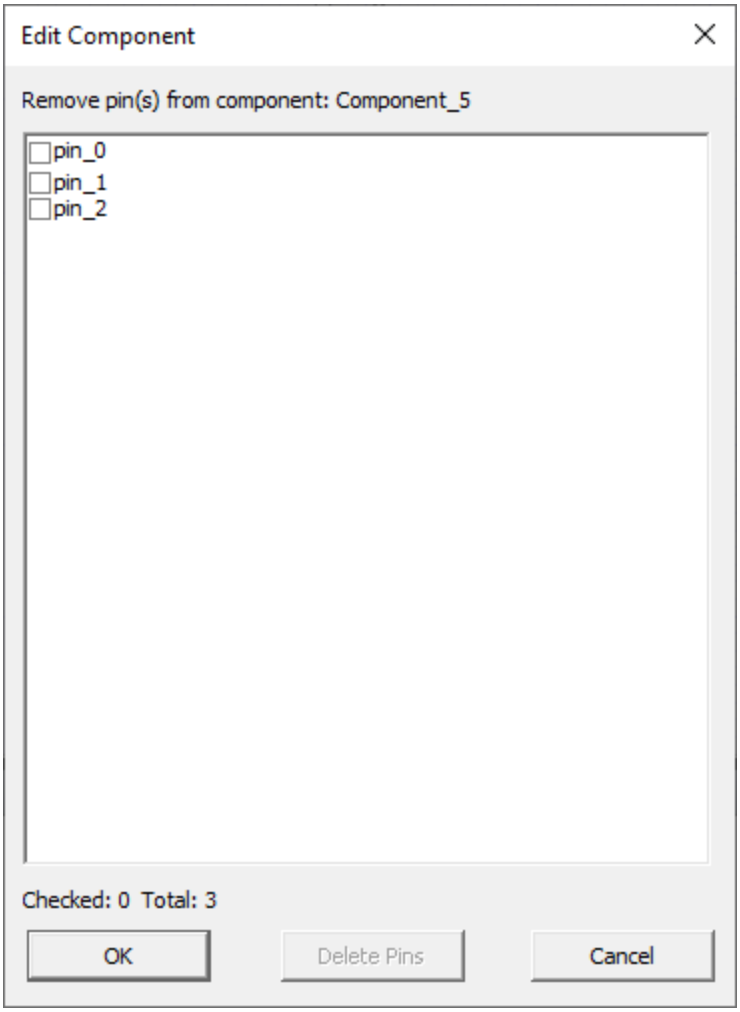
You can remove entities from components. When you do, the component's border shifts accordingly and its definition changes if pins are removed. Depending on the component's model type, you may need to make other changes when removing a member of the component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To remove a single member: in the **Layout Editor**, right-click the unwanted member in the component and in the shortcut menu, select **Components** > **Remove Pin(s)**.

To remove multiple members:

1. Highlight the component.
2. From the **Properties** window, select **Edit** in the **Pins** row to open the **Edit Component** window.



3. From the **Edit Component** window:
   a. Select the unwanted pin(s).
   b. Click **Delete Pins**.
   c. Click **OK**.
4. Check the component's model type for whether any updates

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the component is redefined and has a SPICE model that requires more pins, the redefined component has, then update the model, reassign the pins, or give the pins another location.

When a pin is removed from a component with an RLC network models, its pin pair is removed on the **Model Info** pane in the Component Model window.

When a pin is removed from a component with a S-parameter model, the exact model is removed on the component. A new S-parameter model must be assigned to the component.

Dissolve a Component

Delete a component by dissolving it in one of two ways.

- From the **Layout Editor**, right-click the unwanted component and select **Components** > **Dissolve**.
- Highlight the component and in the menu bar, click **Draw** > **Components** > **Dissolve**.

The component's bounding box is removed on the **Layout Editor** and the component is removed on the **Component** window.

Importing and Exporting Layout Components

All entities that make up an active design can be packaged, exported, imported, edited, and shared as a single layout component, either encrypted or unencrypted. This includes entire layout components as well as individual parts (e.g., such as pins, vias, or primitives) on a layer that forms a chip or RLC. Once a layout component is created, it can be exported and shared with one of two encryption levels. If multiple layout components are selected for export as part of a layout component group, users can choose to expose specific layout components from the group while maintaining full encryption for the overall design. These exposed layout components will remain visible upon import, enhancing usability and interoperability while preserving encryption capabilities.

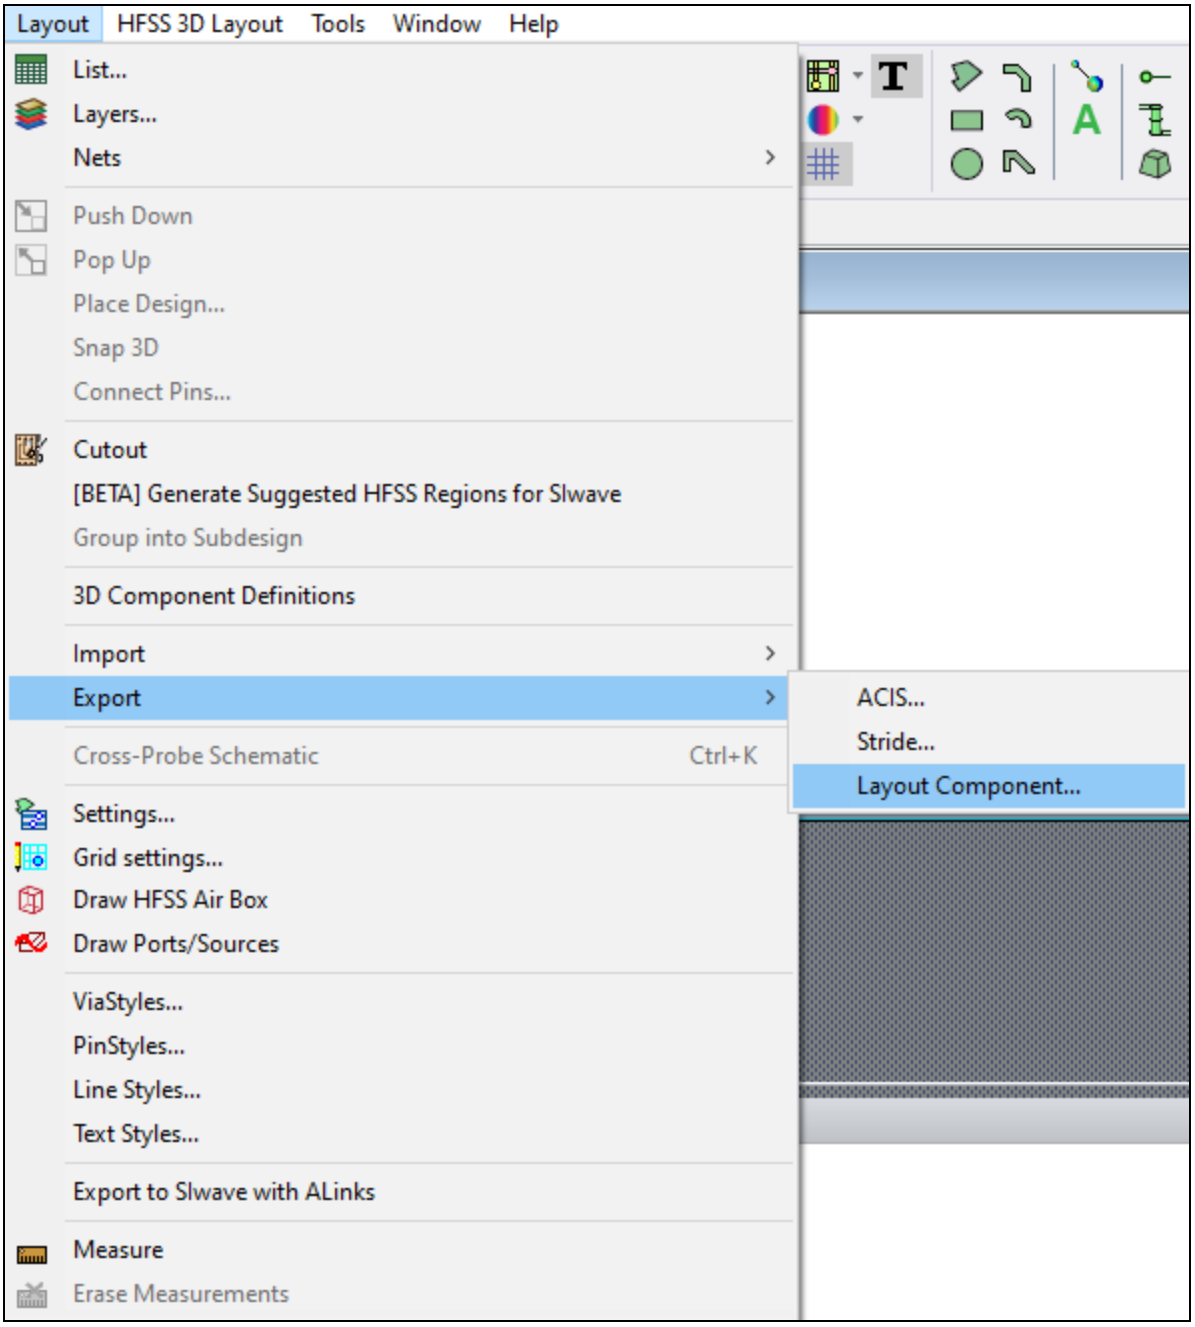
> **Note:**
>
> Field overlays are not supported and toggling layer visibility is unavailable for layers within exposed layout component groups.

Export and, if applicable, encrypt a layout component by completing these steps.

1. From the **Layout Editor**, select the layout component.
2. From the **Layout** menu, select **Export** > **Layout Component** to open an explorer

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

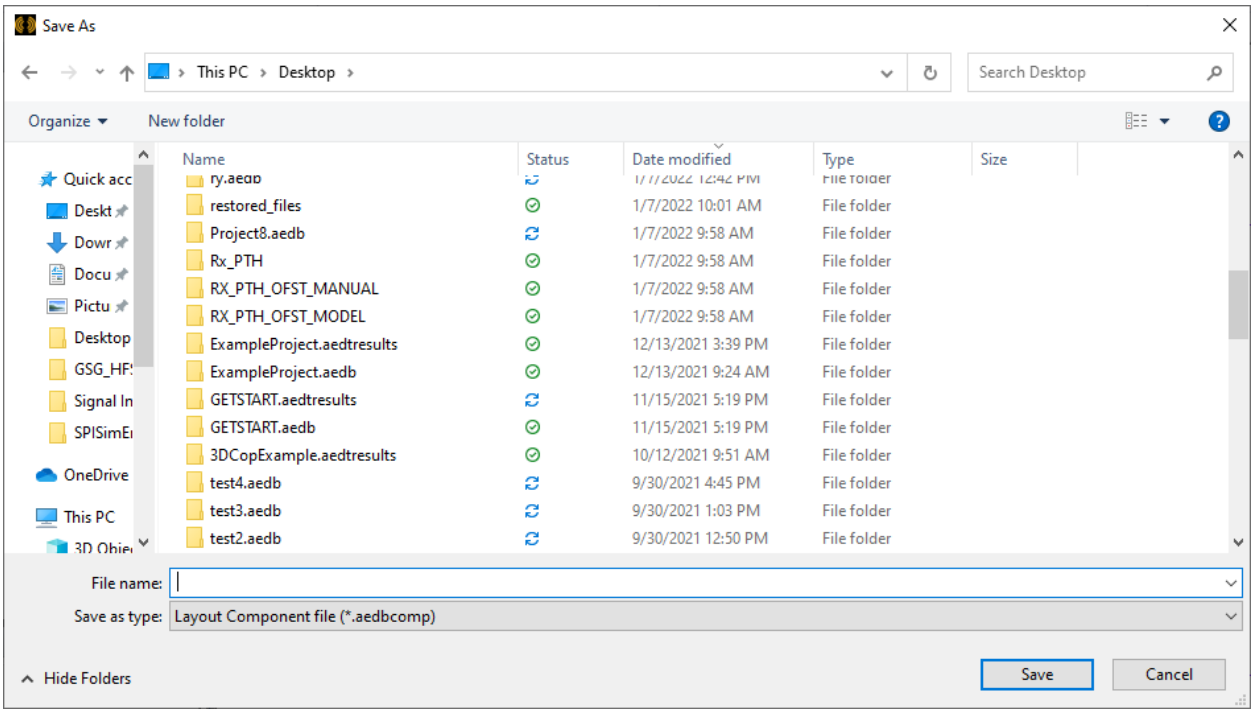
window.



3. Navigate to a selected directory. Then enter a **File name** for the layout component and, if applicable, choose **Layout Component file (*.*aedbcomp*)** from the **Save as type** drop-

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

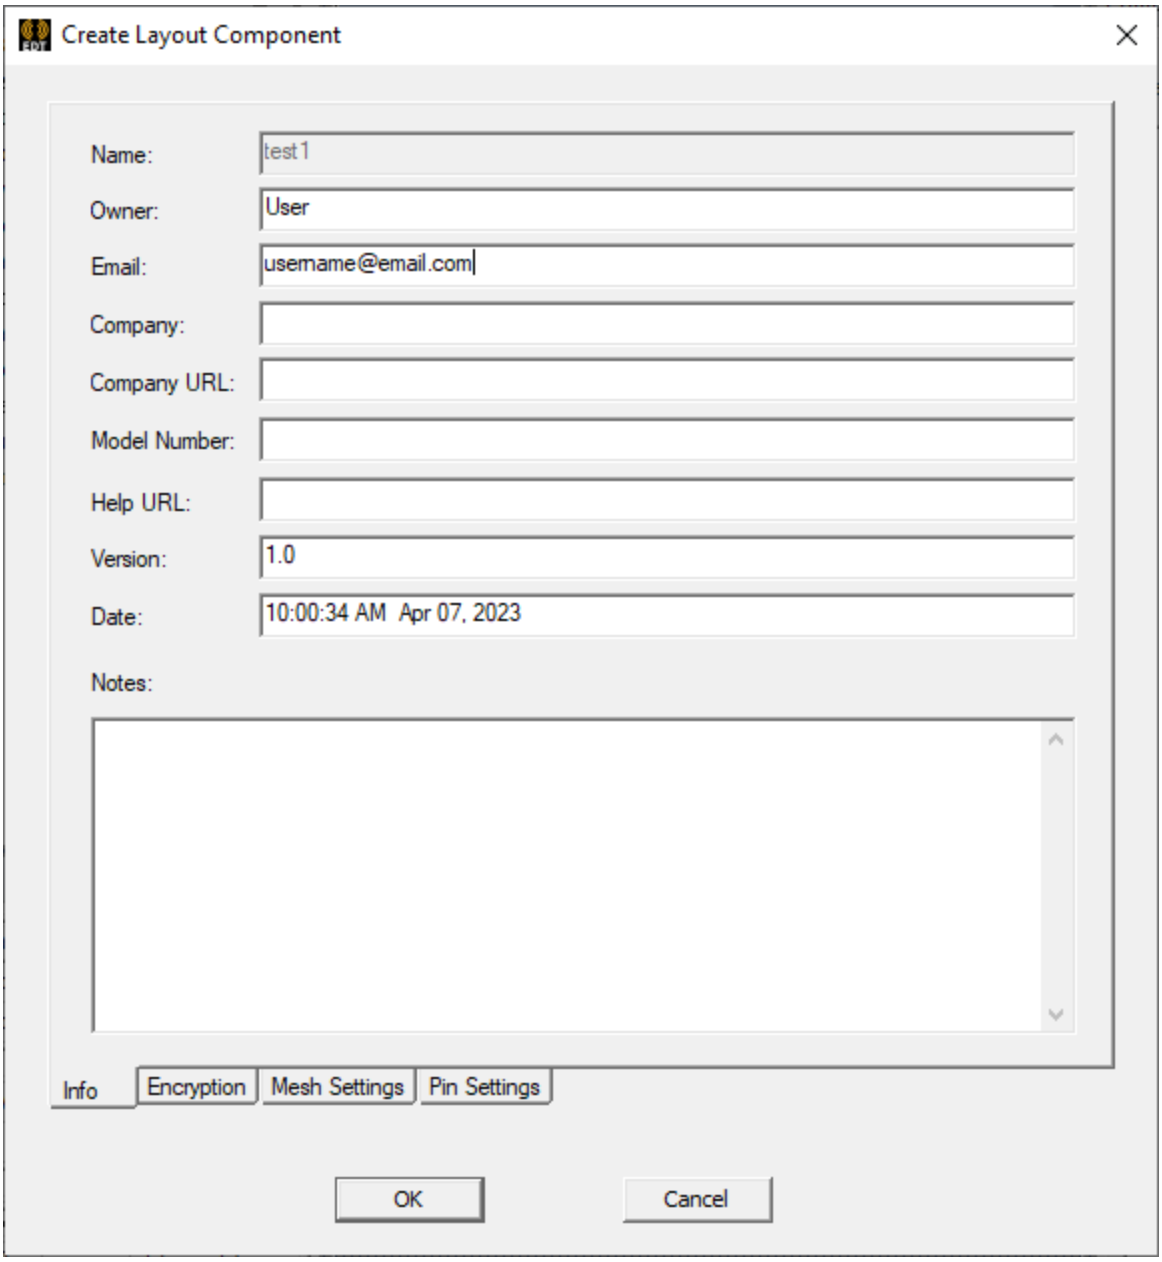
down menu (selected by default).



4. Click **Save** and the layout component will be saved in the selected directory in a folder named **<filename>*.aedbcomp***.
5. The explorer window closes and the **Create Layout Component** window opens. From the **Info** tab, enter metadata into the appropriate fields. The layout component's file name

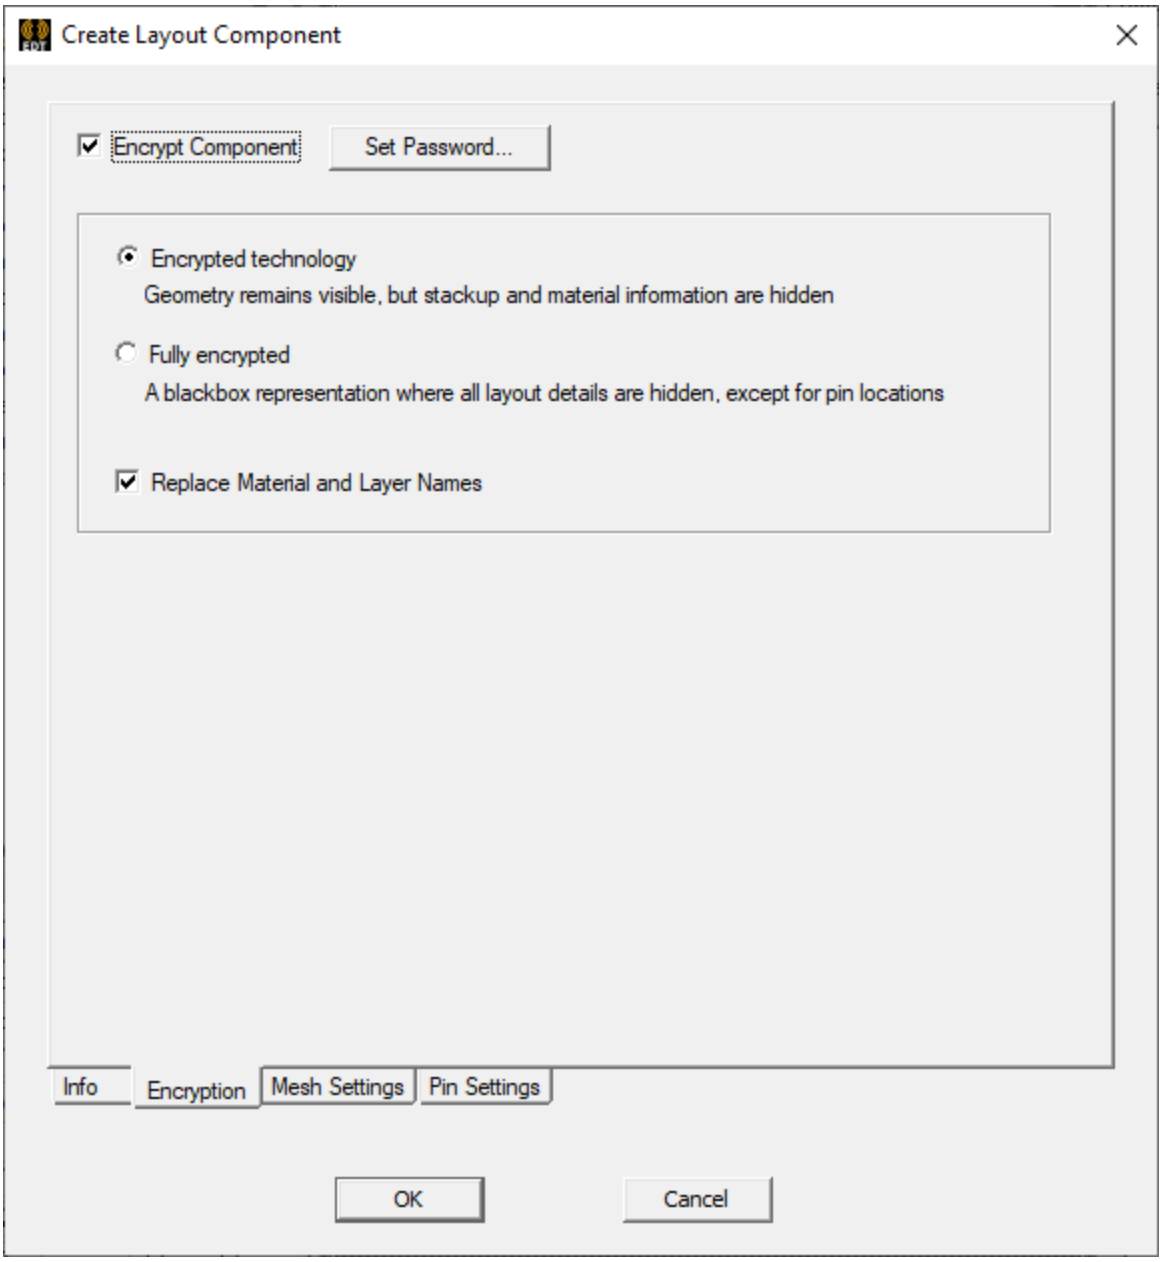
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

is shown in the **Name** field.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Click the **Encryption** tab.



7. If no encryption is necessary, remove the check from the **Encrypt Component** box and skip to **step 13**. Otherwise, choose from the following:

   - **Encrypted technology** — geometry will remain visible, but stackup and material information is encrypted. The layout component may be editable. Click **Set Password** to open the **Set Passwords** window, and proceed to **step 8**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Fully encrypted** — all data, except port locations, is hidden under a blackbox stencil. The layout component will remain uneditable. Click **Set Password** to open the **Set Passwords** window, and proceed to **step 8**.
- Check the **Replace Material and Layer Names** box and all material and layer names will be obfuscated (e.g., **Dialetric_1** will be renamed **Layer1** and the material column will be hidden from view).

> **Note:**
>
> If there is a check in the **Encrypt Component** box, the **Set Passwords** window will open if users attempt to leave the **Encryption** tab. Attempting to bypass the window will produce a **Warning: Please input password.** dialog box. This is true even if no encryption is selected. To leave the **Encryption** tab, uncheck the **Encrypt Component** box.
>
> >

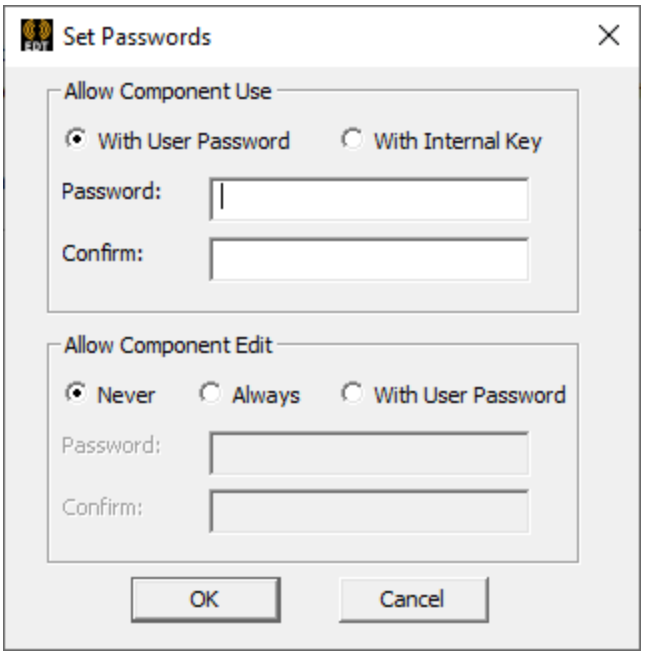
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

8. Click **OK** to open the **Set Passwords** window.



9. From the **Allow Component Use** area, choose from the following:

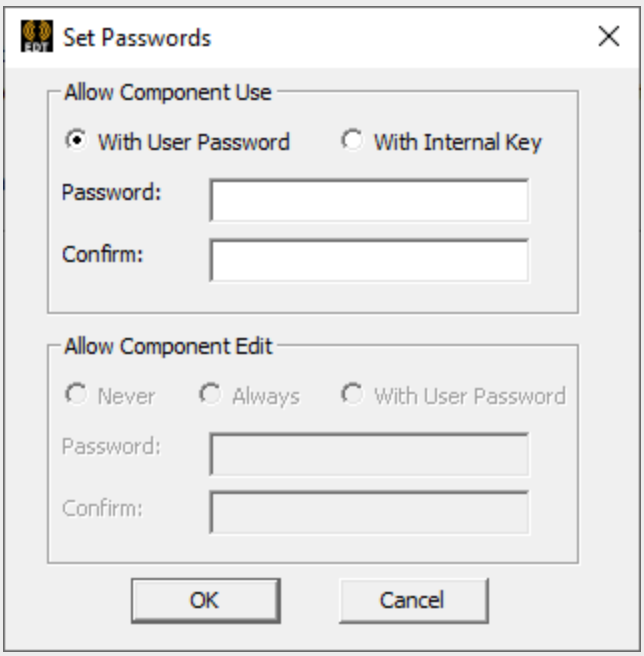
- **With User Password** — the layout component can be exported as an *.aedbcomp* file and reopened in the Ansys Electronics Desktop (AEDT)™ electronics systems design platform or other compatible software with the correct password.
- **With Internal Key** — the layout component can be exported as an *.aedbcomp* file and reopened in (and only in) the Ansys Electronics Desktop (AEDT)™ electronics systems design platform without a password.

10. Enter and re-enter a password in the selected fields in the **Allow Component Use** area.
11. If future layout component editing is required, choose from the following in the **Allow Component Edit** area:
    - **Never** — once the **Set Passwords** window is closed, the layout component will no longer be editable.
    - **Always** — if future layout component editing is selected, and no further security is appropriate.
    - **With User Password** — if future layout component editing is selected, but some further security is appropriate. Enter and re-enter a password in the selected fields.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Choosing **Fully encrypted** deactivates the **Allow Component Edit** area. This level of encryption is a permanent state and the layout component will not be editable after the **Create Layout Component** window is finally closed.



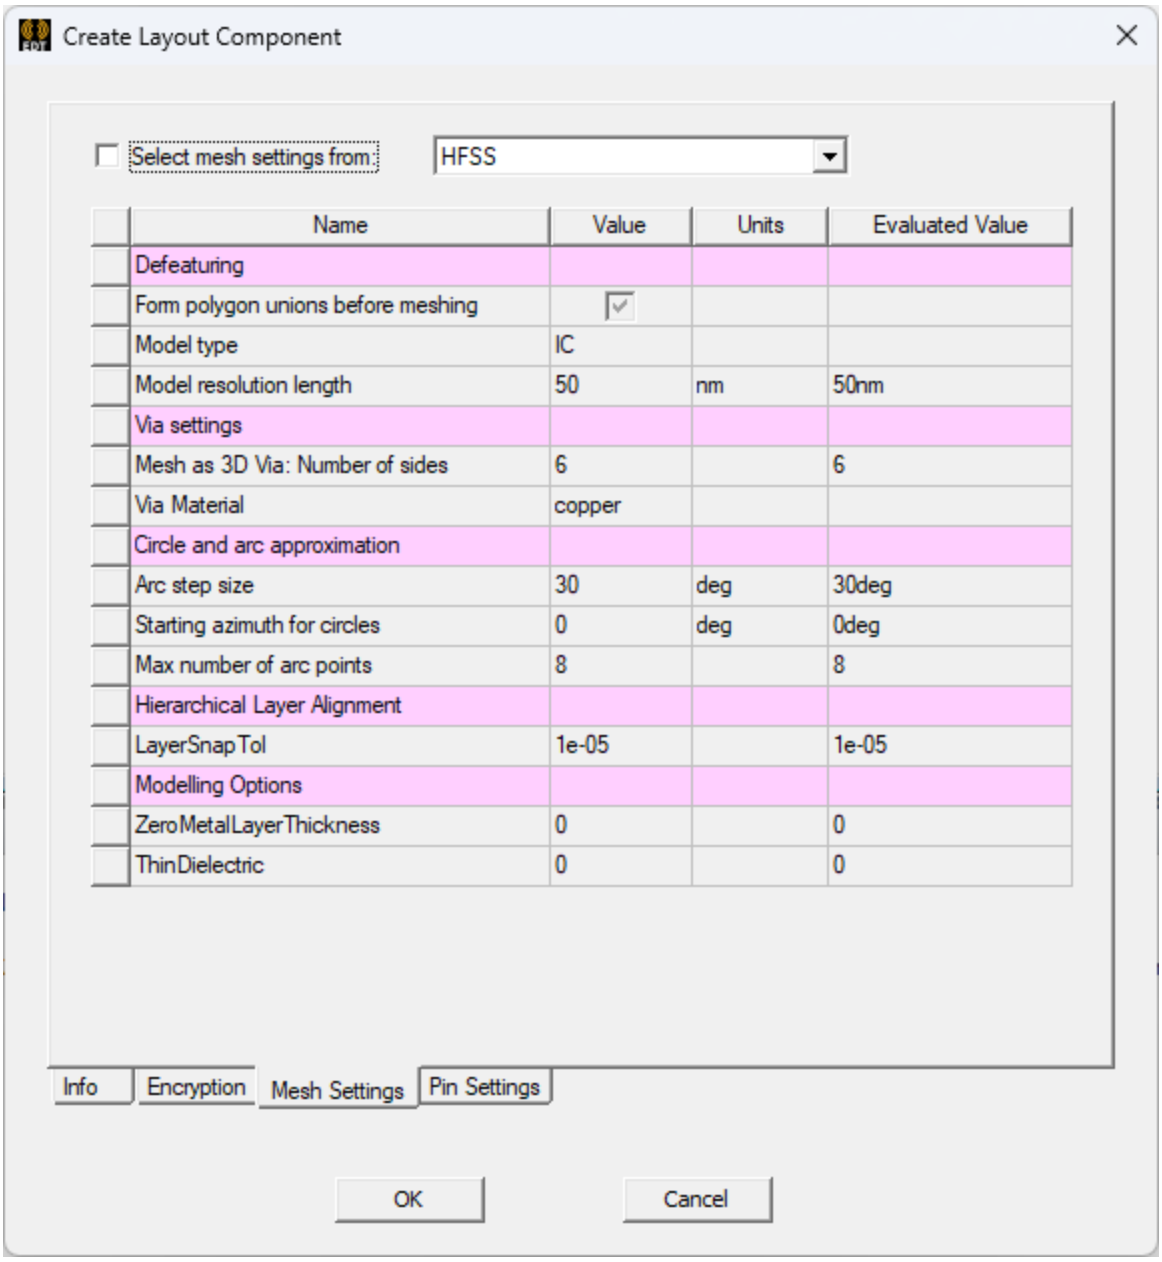
12. Click **OK** to save, close the **Set Passwords** window, and return to the **Create Layout Component** window.

Note:

Once a layout component is encrypted and users click **OK**, encryption cannot be removed from the layout component. However, encryption strength can be increased (i.e., if the user chooses not to encrypt the layout component, the exported layout component can be re-imported and exported again as an **Encrypted technology** layout component. If the user exports the **Encrypted technology** layout component, the exported layout component can be re-imported and exported again as a **Fully encrypted** layout component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

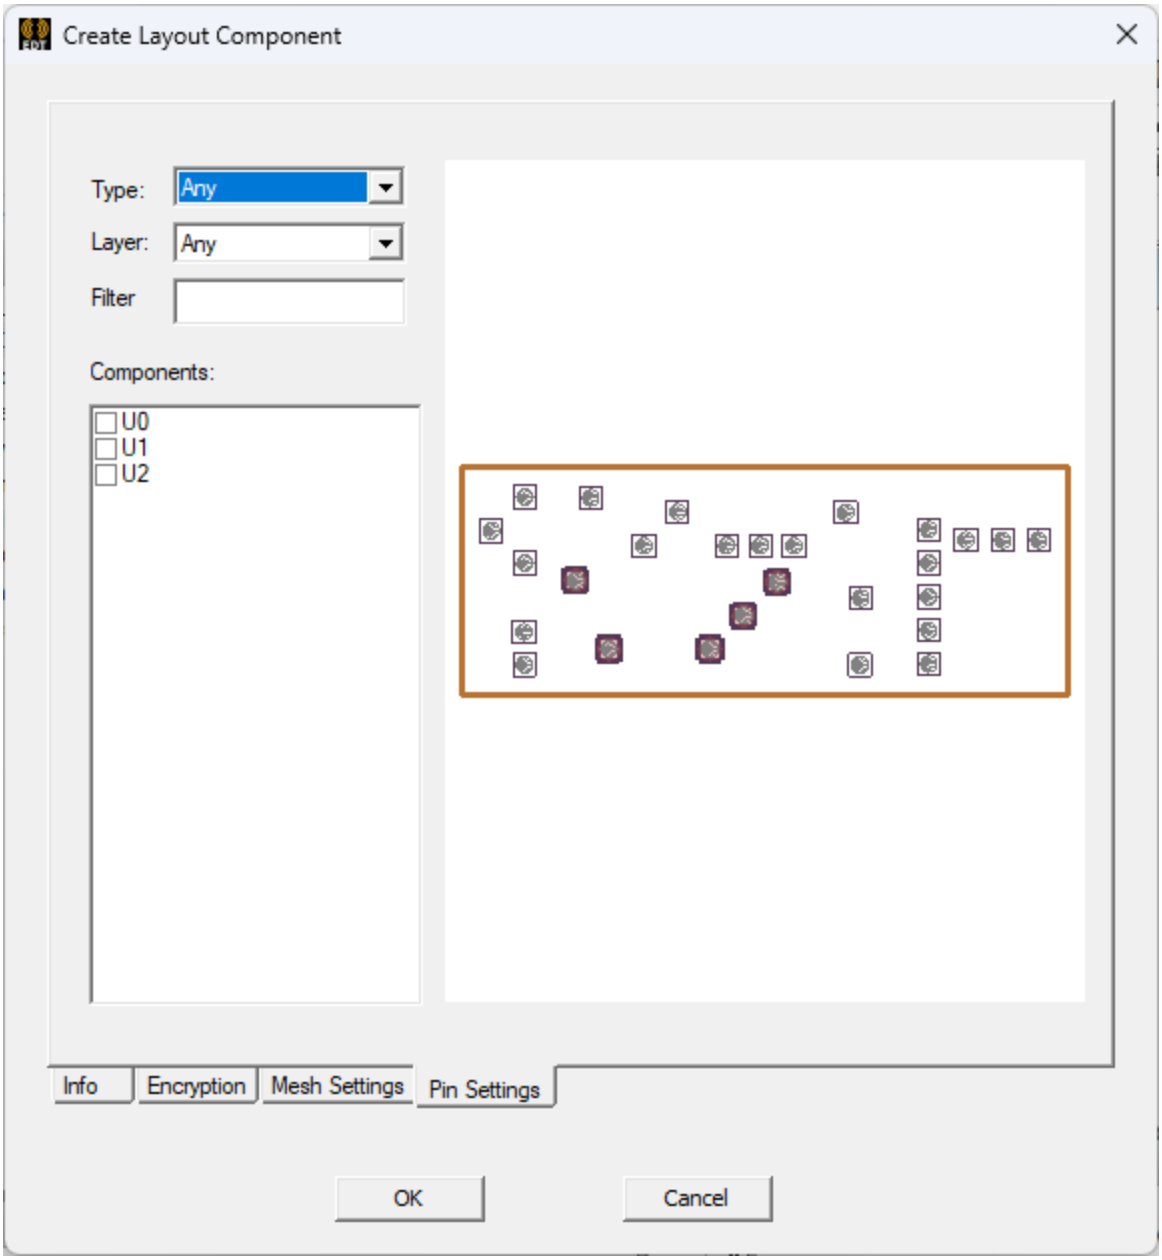
13. Click the **Mesh Settings** tab.



14. To save existing mesh settings with the exported layout component, check the **Select mesh settings from** box and make a selection from the drop-down menu.

15. If **Fully encrypted** is selected on the **Encryption** tab, click the **Pin Settings** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



16. From the **Pin Settings** tab, choose from the following:

    - Use the **Type** and **Layer** drop-down menus, as well as manually entering **Filter** variables to filter the list of available **Layout Components** selected on the **Layout Editor**.
    - **Components** — check boxes adjacent to each layout component part to leave the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

layout component(s) exposed, despite full encryption. The exposed layout components are shown in preview window.

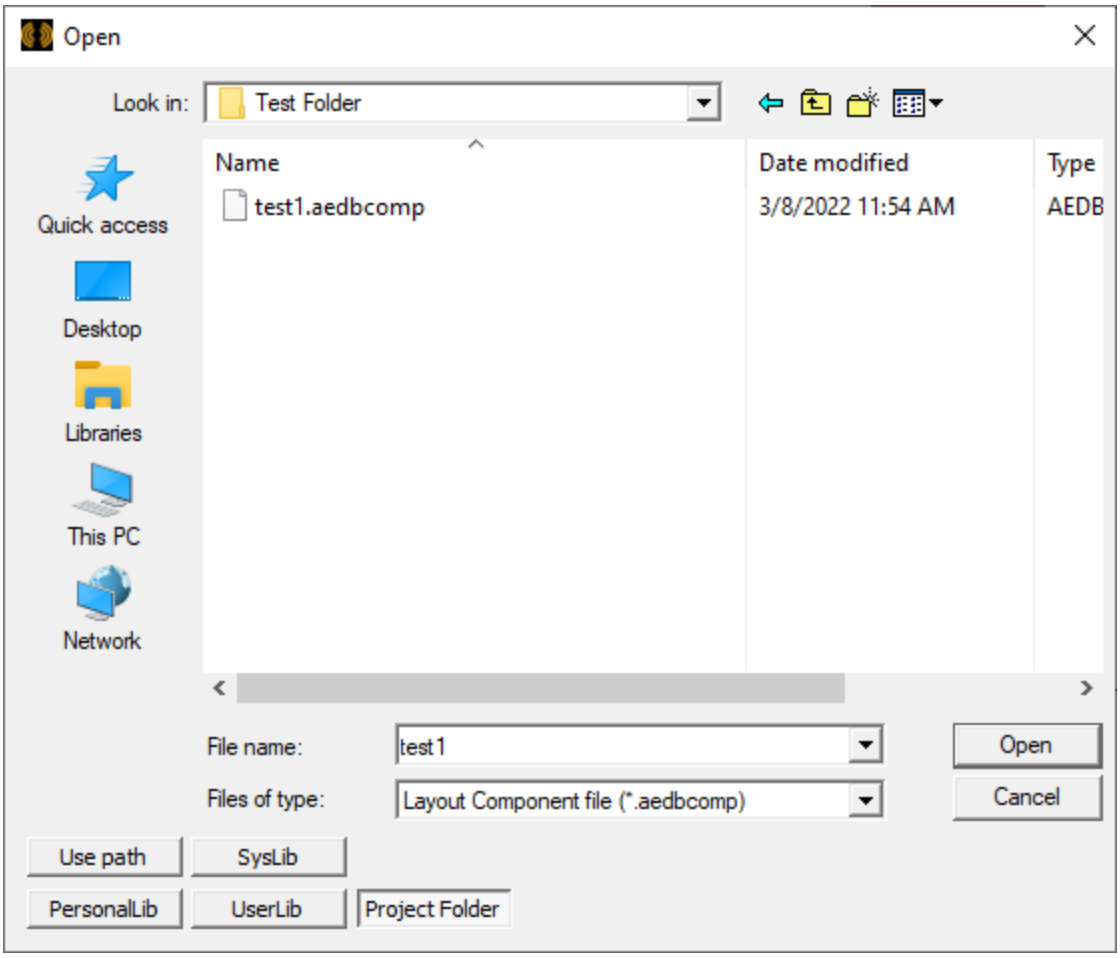
17. Click **OK** to export the layout component.

The procedure is complete.

Importing a Layout Component (General Mode Only)

Follow these steps to import a layout component into the active design.

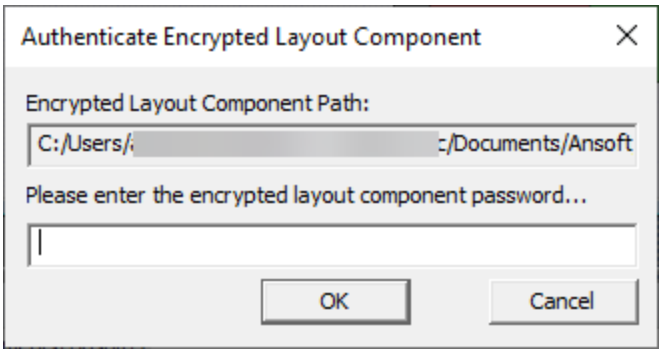
1. From the **Draw** menu, select **Import** > **Layout Component** to open an explorer window.
2. Navigate to a folder that contains the appropriate **Layout Component file (*.aedbcomp file)**. Then click **Open** to close the explorer window and return to the **Layout Editor**.



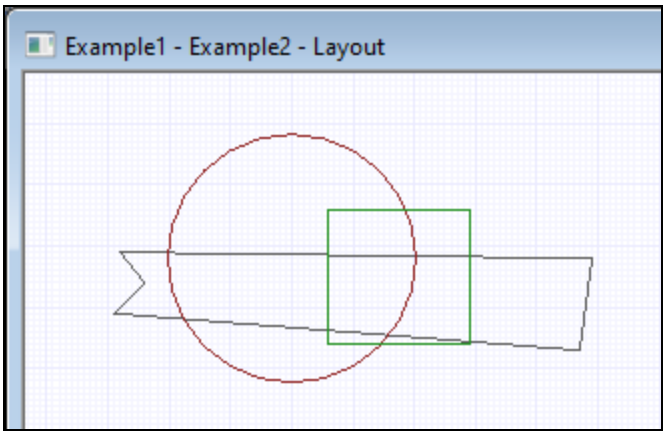
3. If the layout component is encrypted, an **Authenticate Encrypted Layout Component** window appears. Enter the layout component's encryption password, then click **OK** to

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

proceed.

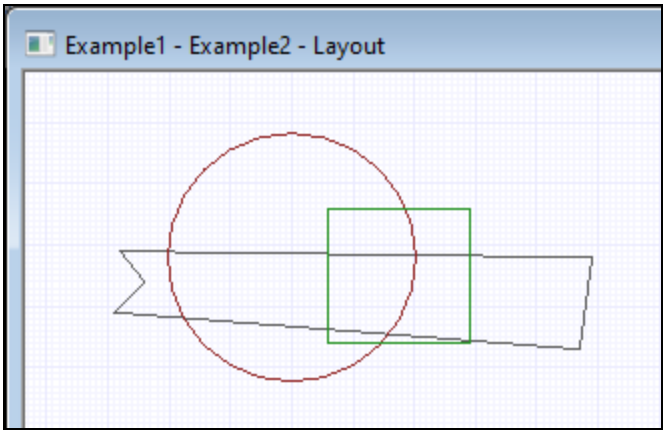


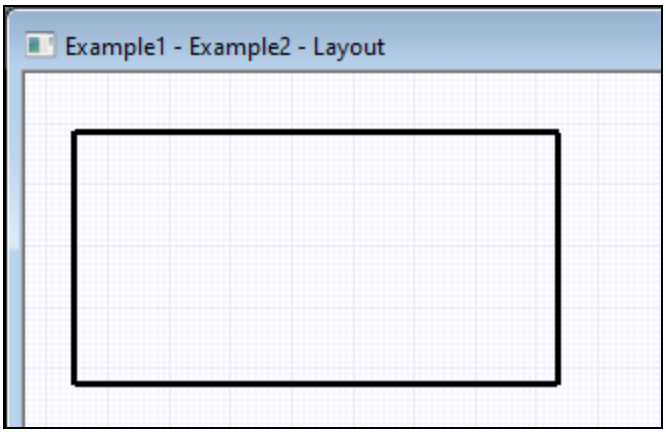
4. The imported layout component is attached to the mouse cursor as a stencil. **Click+drag** the stencil to move the layout component. Individual members of the layout component cannot be moved individually. Once a layout component is created, the positions of its members are frozen in relation to one another. If the layout component is unencrypted or partially encrypted, the stencil is an accurate representation of the layout component's geometry.



If the layout component is fully encrypted, the outline is a rectangle with no visible perimeters. Drag the stencil into position in the **Layout Editor** and left-click to place.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.





The imported layout component is now part of the active design. A definition for it is created in the **Project Manager** window > **Project Tree** > **Definitions** > **Components** folder.

Visible Restrictions of an Encrypted Layout Component

An encrypted layout component has other obvious restrictions that users will notice at a glance, such as in the following examples.

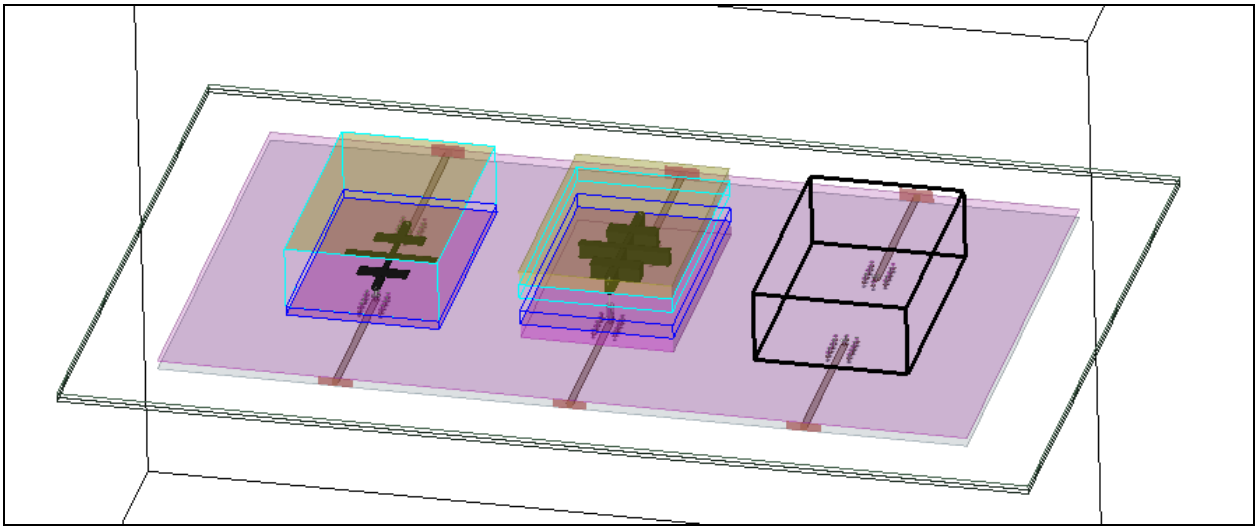
Layout Editor

Navigate to the **Layout Editor**. Layout Component stencils in the **Layout Editor** will differ greatly, depending on their level of encryption. Referring to the following example:

- **Unencrypted Layout Component** — (left-most) represents the design accurately, displaying every member of the layout component according to its material type, position, and dimensions.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Encrypted Technology Layout Component** — (middle) normalizes the dimensions of the layers and member parts of the layout component, making the visual representation noticeably more symmetrical and less accurate.
- **Fully Encrypted Layout Component** — (right-most) appears as a black box outline.



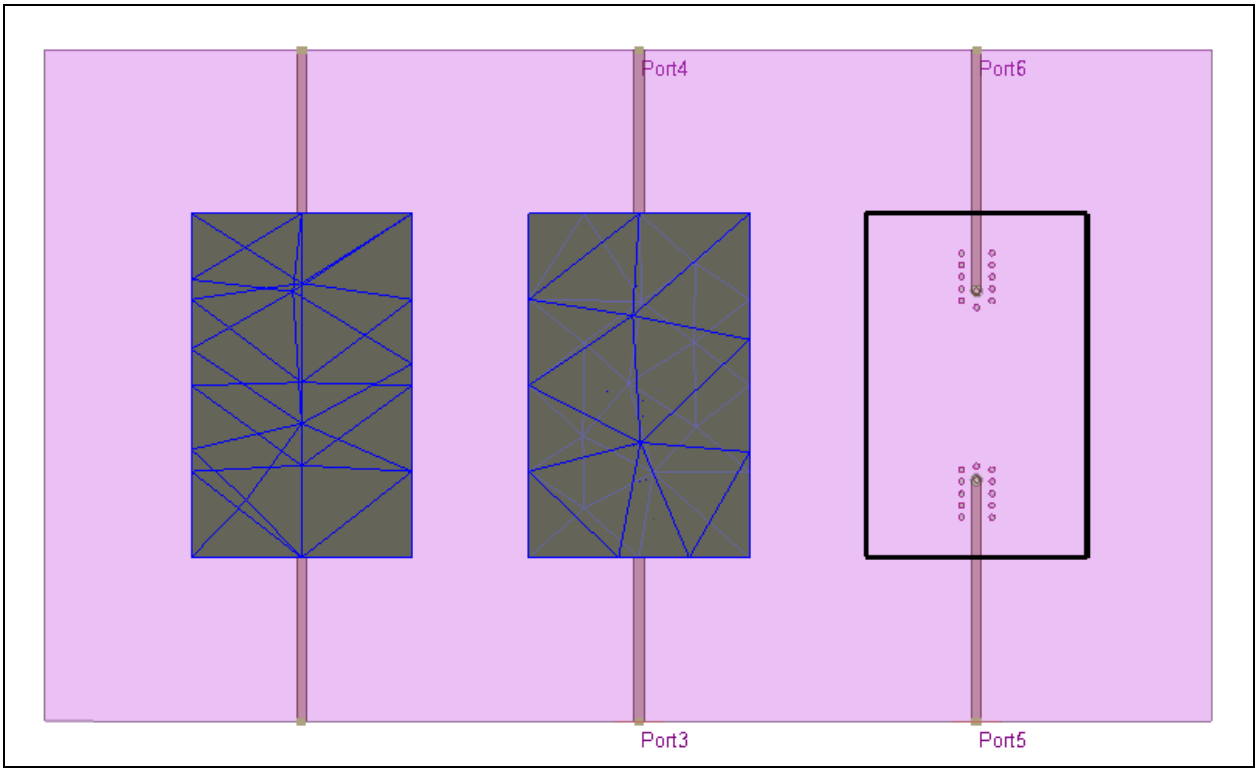
Layout Editor - Mesh View

Layout Component plotted meshes will differ greatly depending on their level of encryption. Referring to the following example:

- **Unencrypted Layout Component** — (left-most) represents the design accurately with a mesh as dense and complicated as the layout component requires depending on its materials, position, and dimensions
- **Encrypted Technology Layout Component** — (middle) normalizes the dimensions of the layout component and its member parts. Subsequently, the mesh is noticeably more symmetrical and less accurate
- **Fully Encrypted Layout Component** — (right-most) can not be assigned a mesh and will remain a black outline, or stencil. The only guidance the visual representation of a fully encrypted mesh gives users the accurate location of its ports.

Note: Layout Component members with different levels of encryption cannot be plotted together. Attempting to do so will result in an error message.

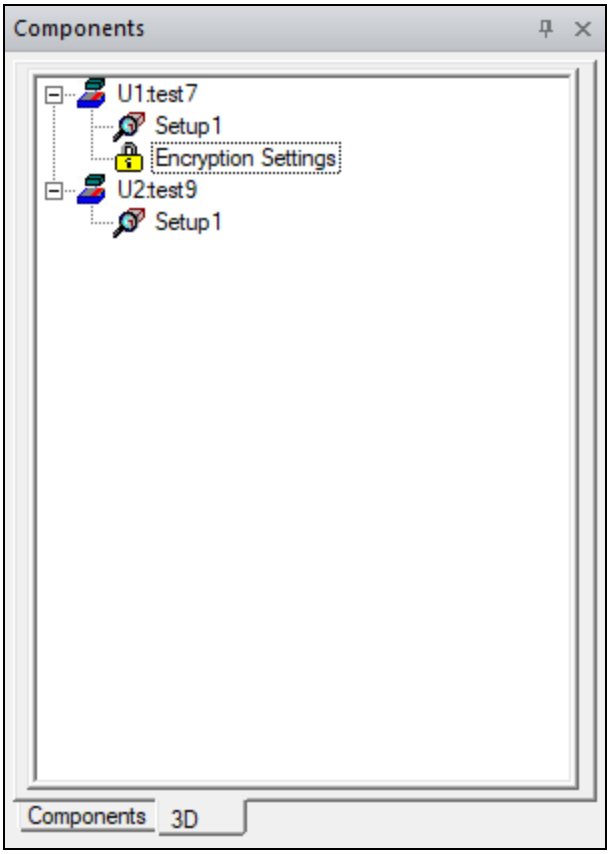
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Components Window

Refer to the **Components** window. A layout component that is ***not*** encrypted will list **Setup** mesh settings in an expandable dropdown menu. An encrypted layout component will have mesh settings and an **Encryption Settings** yellow lock icon.

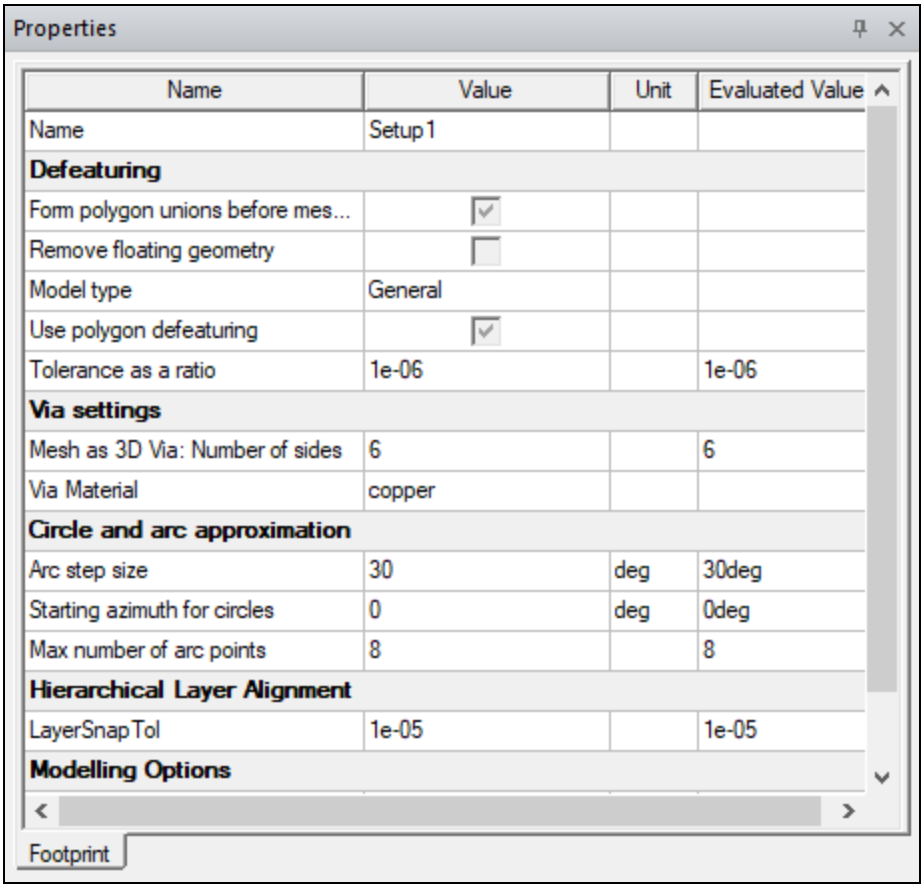
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



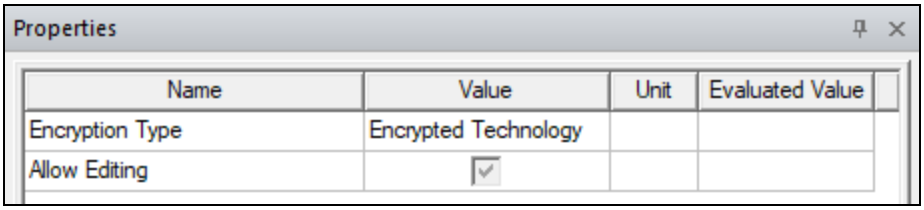
Properties Window

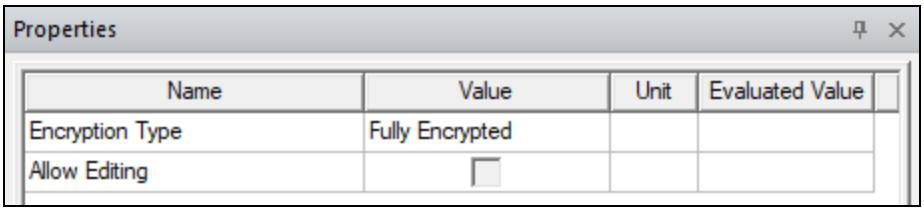
Select a **Setup** to view the layout component's accompanying mesh settings in the **Properties** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Select the yellow lock icon to view the layout component's encryption settings in the **Properties** window.

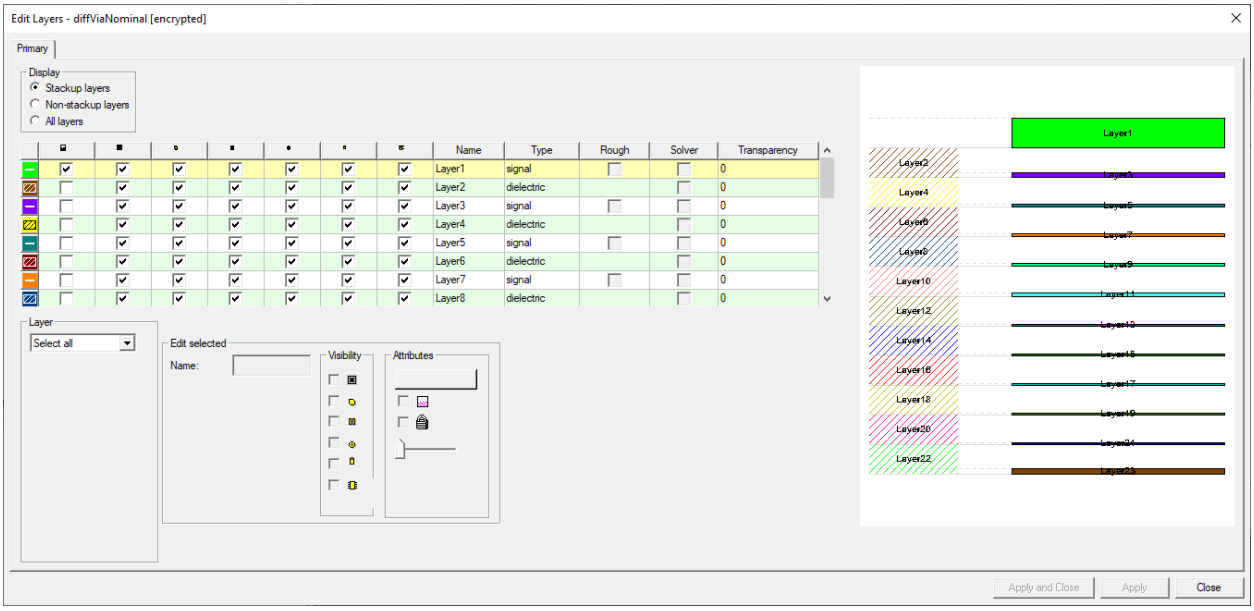




Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

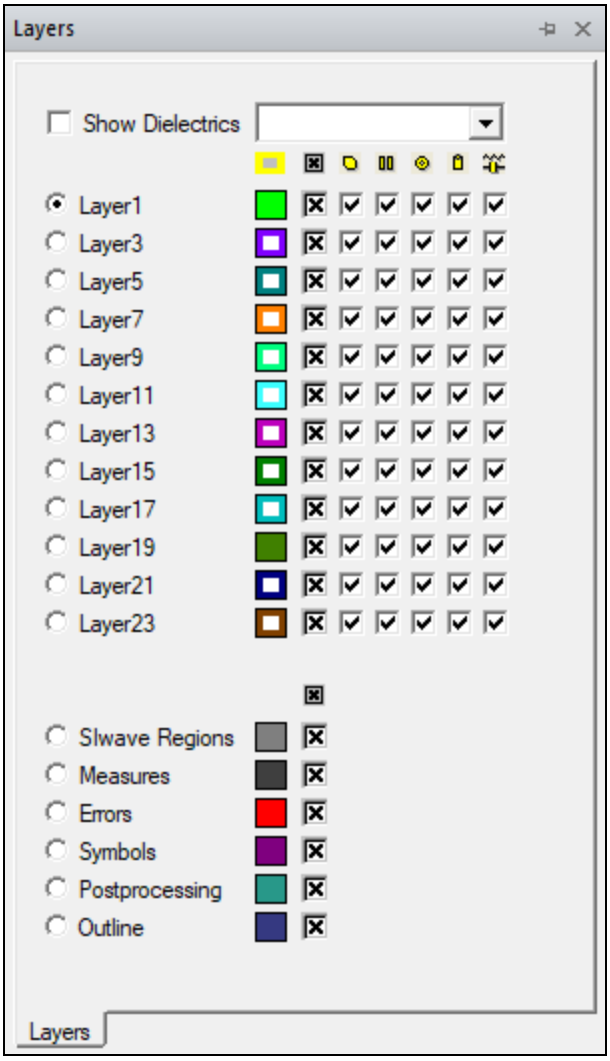
Edit Layers Window and Layers Pane

Navigate to the **Edit Layers** window. The layer **Names** have been obfuscated, and the physical parameters of the layers (e.g., material, dimensions, et cetera) have either been hidden or normalized.



The names of the layers have also been obfuscated on the **Layers** pane.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



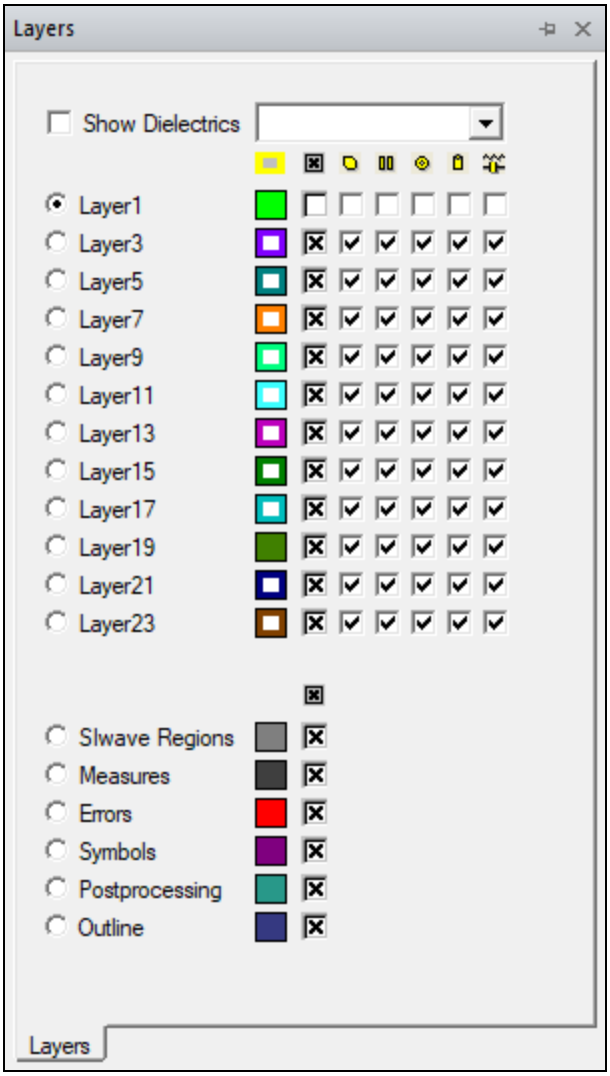
Hiding Layers and Nets

Encryption may make it difficult to view complex layout components in the **Layout Editor**, but nets and layers can be temporarily hidden to make it easier for users to view layout component members.

To Hide a Layer

From the **Layers** pane, remove the check on the box in the selected layer.

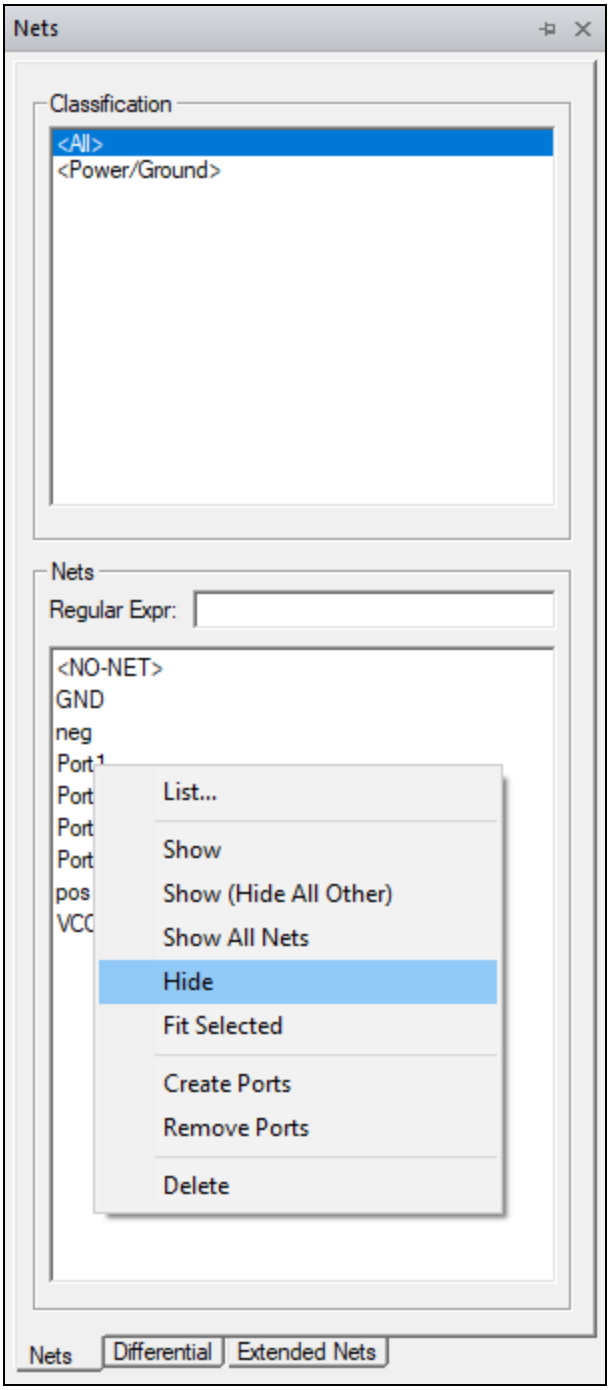
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



To Hide a Net

From the **Nets** pane, right-click a net and select **Hide**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

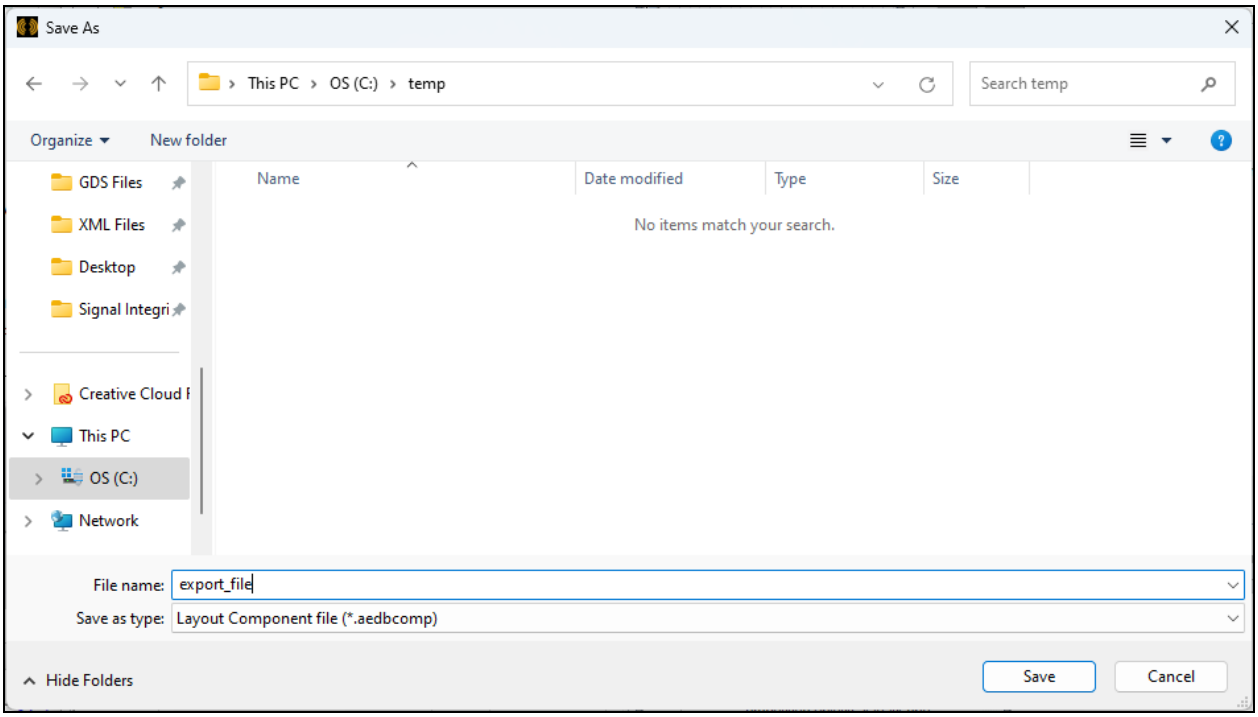


Exporting a Layout Component

Follow these steps to export a layout component from the Layout Editor.

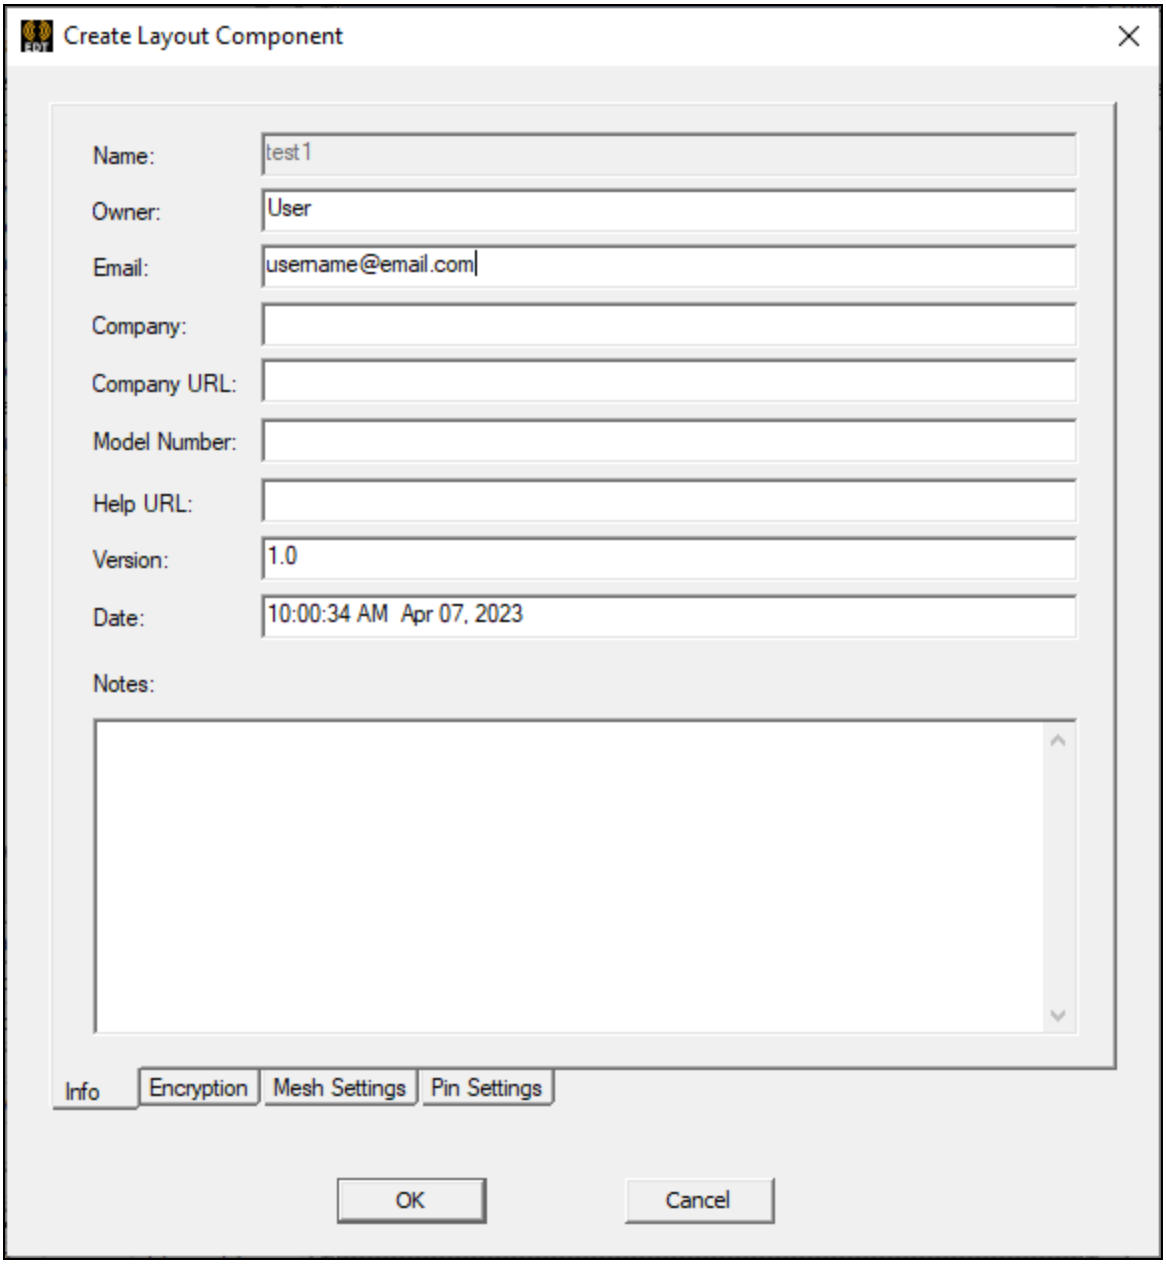
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. From the **Layout Editor**, select a layout component.
2. Depending on whether the Ansys Electronics Desktop (AEDT)™ electronics systems design platform is running in General mode or IC mode, navigate to one of the following selections to open an explorer window:
   - In General mode, navigate to **Layout** > **Import** > **Layout Component**.
   - In IC mode, navigate to **Layout** > **Export Layout Component**.
3. Navigate to an appropriate directory to save the exported layout component. Then enter a **File name** for the layout component and, if necessary, choose **Layout Component file (*.aedbcomp)** on the **Save as type** drop-down menu (selected by default).



4. Click **Save** to close the explorer window and open the **Create Layout Component** window. The **Create Layout Component** window allows users to add meta data, encryption, and mesh settings to an HFSS 3D Layout design layout component before exporting it.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. From the **Info** tab, enter metadata into the appropriate fields. The layout component's file name is shown in the **Name** field.
6. Click the **Encryption** tab. Use the **Encryption** tab to protect the layout component with two levels of security. Encryption is a common technique for encoding information in a manner that is very difficult for unauthorized users to decode. When these options are enabled for layout components, the contents of the layout component file are encrypted to

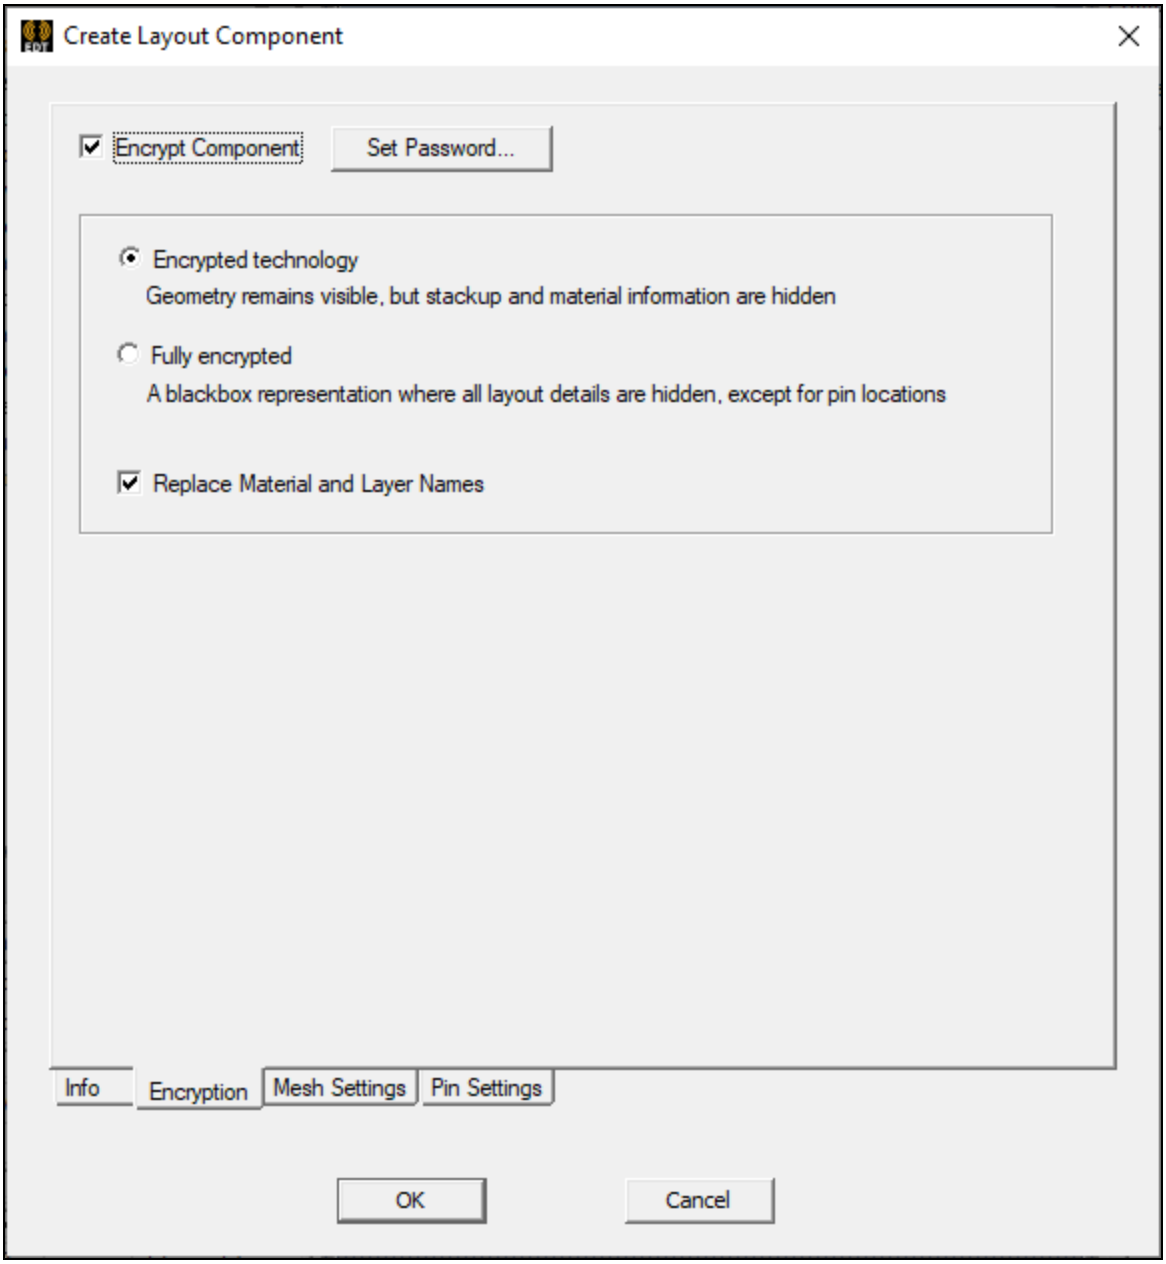
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

protect them from external viewing or editing. Layout Components use the Advanced Encryption Standard (AES) with a 256-bit key and password-based key derivation.

Note:

Once a layout component is encrypted and users click **OK**, encryption cannot be removed on the layout component. However, encryption strength can be increased (i.e., if the user chooses not to encrypt the layout component, the exported layout component can be re-imported and exported again as an **Encrypted technology** layout component. If the user exports the **Encrypted technology** layout component, the exported layout component can be re-imported and exported again as a **Fully encrypted** layout component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



7. From the **Encryption** tab, choose from the following options:
   - No encryption – remove the check on the **Encrypt Component** box.
   - **Encrypted technology** – geometry will remain visible, but stackup and material information is encrypted. The layout component may be editable. Click **Set Password** to open the **Set Passwords** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Fully encrypted** – all data, except port locations, is hidden under a blackbox stencil. The layout component will remain uneditable. Click **Set Password** to open the **Set Passwords** window.
- **Replace Material and Layer Names** – check the box to obfuscate all material and unique layer names (e.g., **Dialetric_1** will be renamed **Layer1** and the material column will be hidden from view).

  It is not possible to edit a **Fully encrypted** layout component unless you choose **Always** or **With User Password** in the **Allow Component Edit** area, when you define the layout component.

> **Note:**
>
> If there is a check in the **Encrypt Component** box, the **Set Passwords** window will open if users attempt to leave the **Encryption** tab. Attempting to bypass the window will produce a **Warning: Please input password.** dialog box. This is true even if no encryption is selected. To leave the **Encryption** tab, uncheck the **Encrypt Component** box.
>
> >

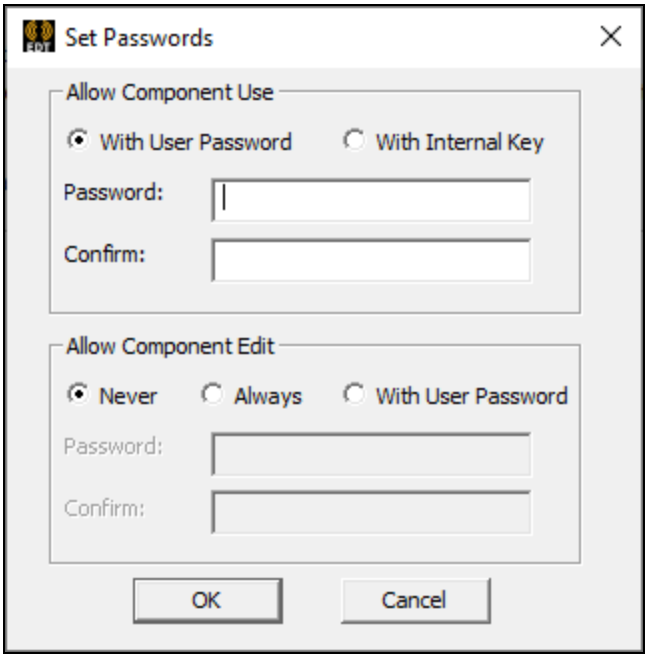
8. Click **OK** to open the **Set Password** window, enter and re-enter a password in the selected fields in the **Allow Component Use** area and decide whether future layout component editing is selected.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

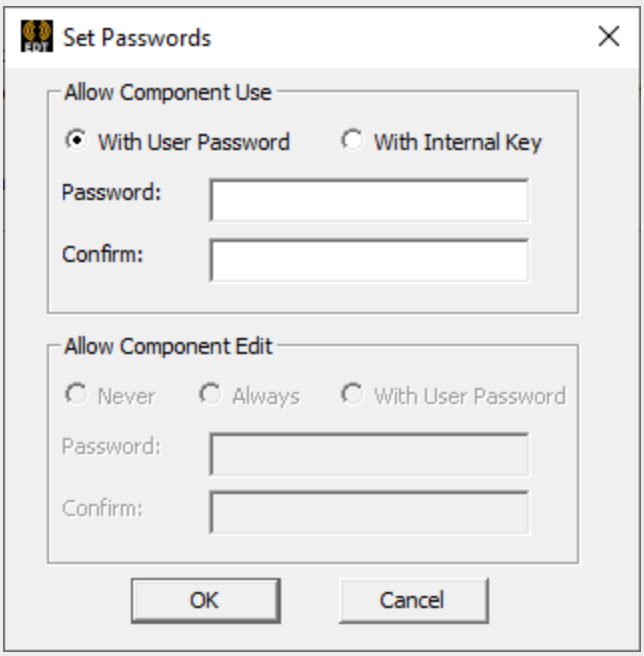


9. From the **Allow Component Use** area, choose from the following:
    - **With User Password** – the layout component can be exported as an *.aedbcomp* file and reopened in AEDT or other compatible software with the correct password.
    - **With Internal Key** – the layout component can be exported as an *.aedbcomp* file and reopened in (and only in) AEDT without a password.
10. If future layout component editing is required, from the **Allow Component Edit** area, choose from the following:
    - **Never** – once the **Set Passwords** window is closed, the layout component will no longer be editable.
    - **Always** – if future layout component editing is selected, and no further security is appropriate.
    - **With User Password** – if future layout component editing is selected, but some further security is appropriate. Enter and re-enter a password in the selected fields.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

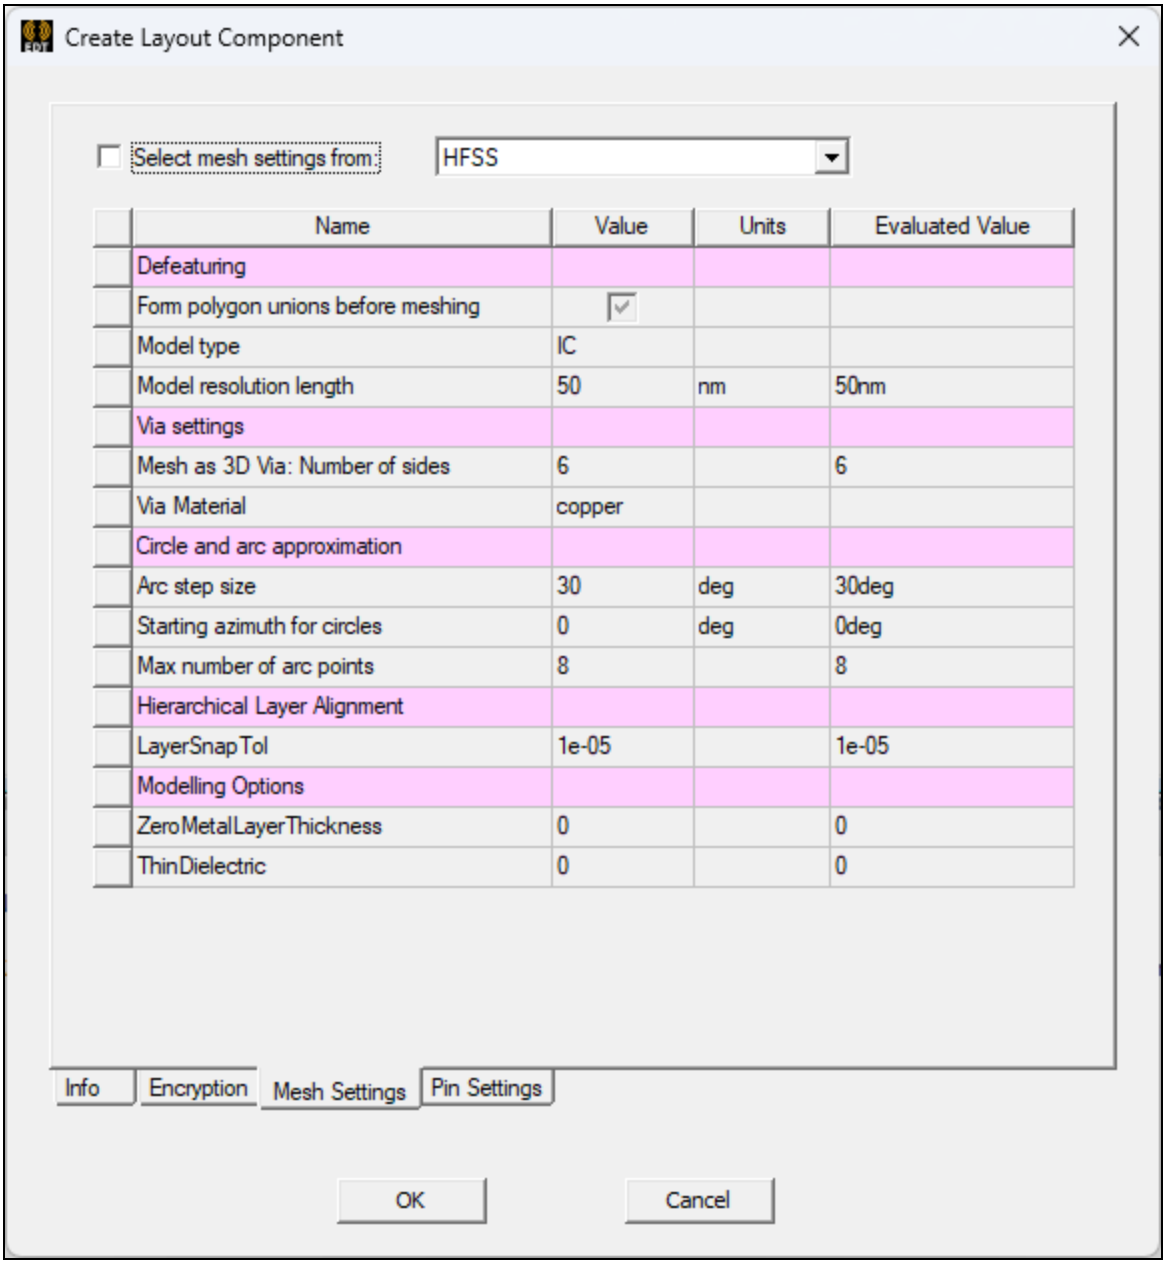
Note:

Choosing **Fully encrypted**deactivates the **Allow Component Edit** area. This level of encryption is a permanent state and the layout component will not be editable after the **Create Layout Component** window is finally closed.



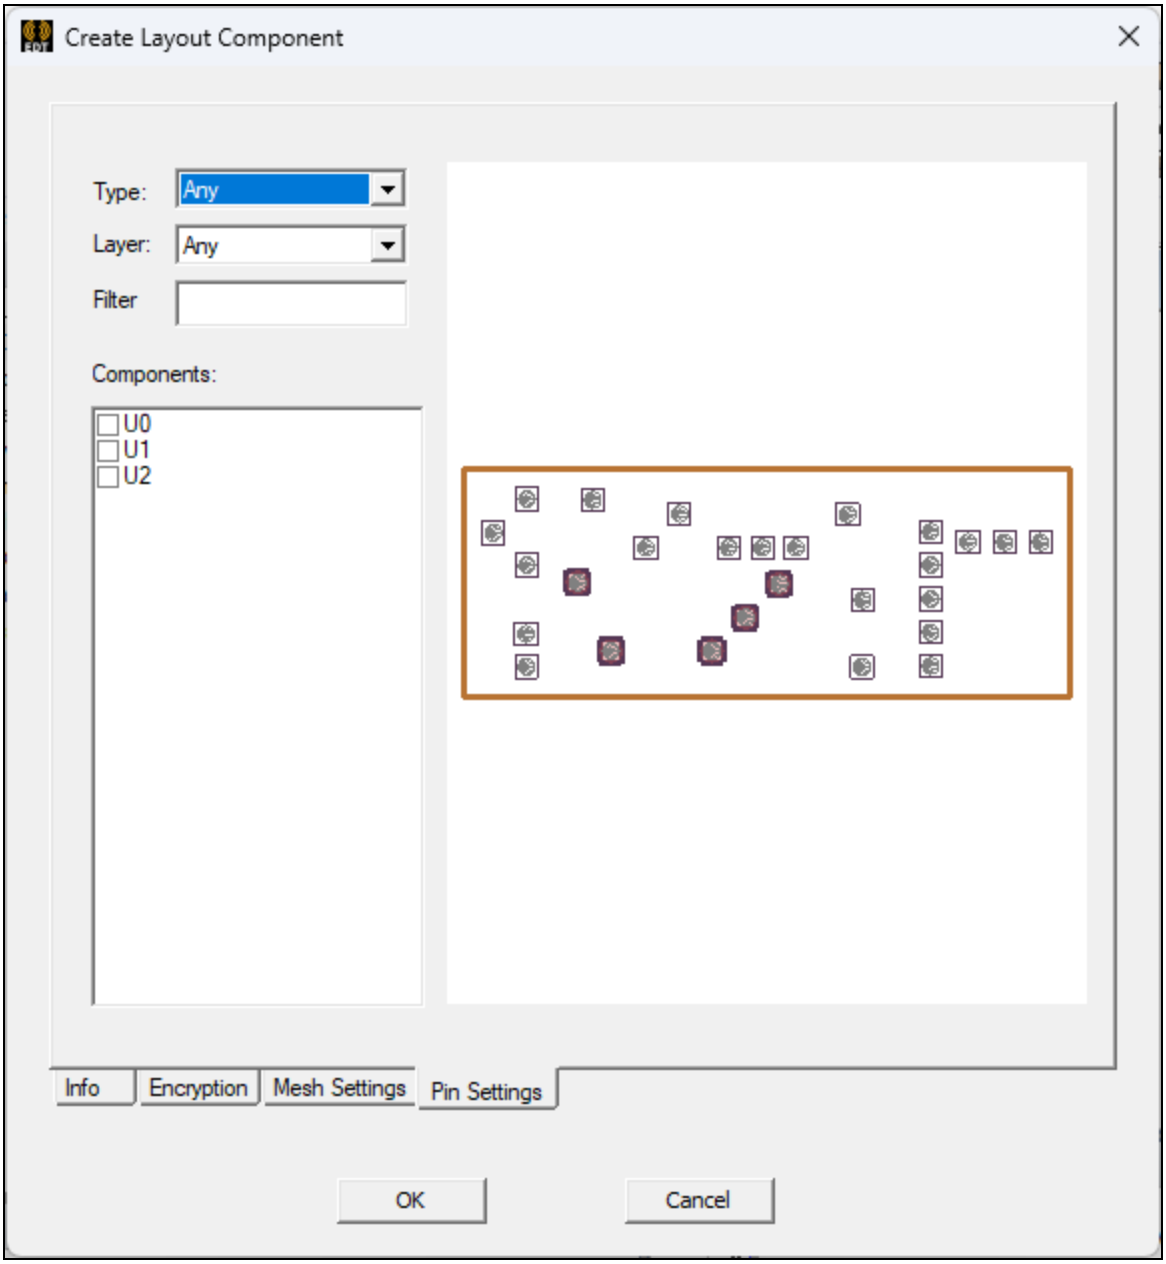
11. Click **OK** to save, close the **Set Passwords** window, and return to the **Create Component** window.
12. Click the **Mesh Settings** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



13. To save existing mesh settings with the exported layout component, check the **Select mesh settings from** box and make a selection from the drop-down menu.
14. If **Fully encrypted** is selected on the **Encryption** tab, click the **Pin Settings** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



15. From the **Pin Settings** tab, choose from the following:

    - Use the **Type** and **Layer** drop-down menus, as well as manually entering **Filter** variables to filter the Layout Component list of available parts selected on the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Components** — check boxes adjacent to each layout component part to leave the layout component(s) exposed, despite full encryption. The exposed layout components are shown in preview window.

16. Click **OK** to export the layout component.
17. After the layout component is configured, click **OK** to add it to the active design.

Editing a Layout Component Definition

The **Edit Definition** feature allows users to create a new layout component definition using an existing layout component file. This speeds up the task of creating new versions of layout components without having to start on the beginning.

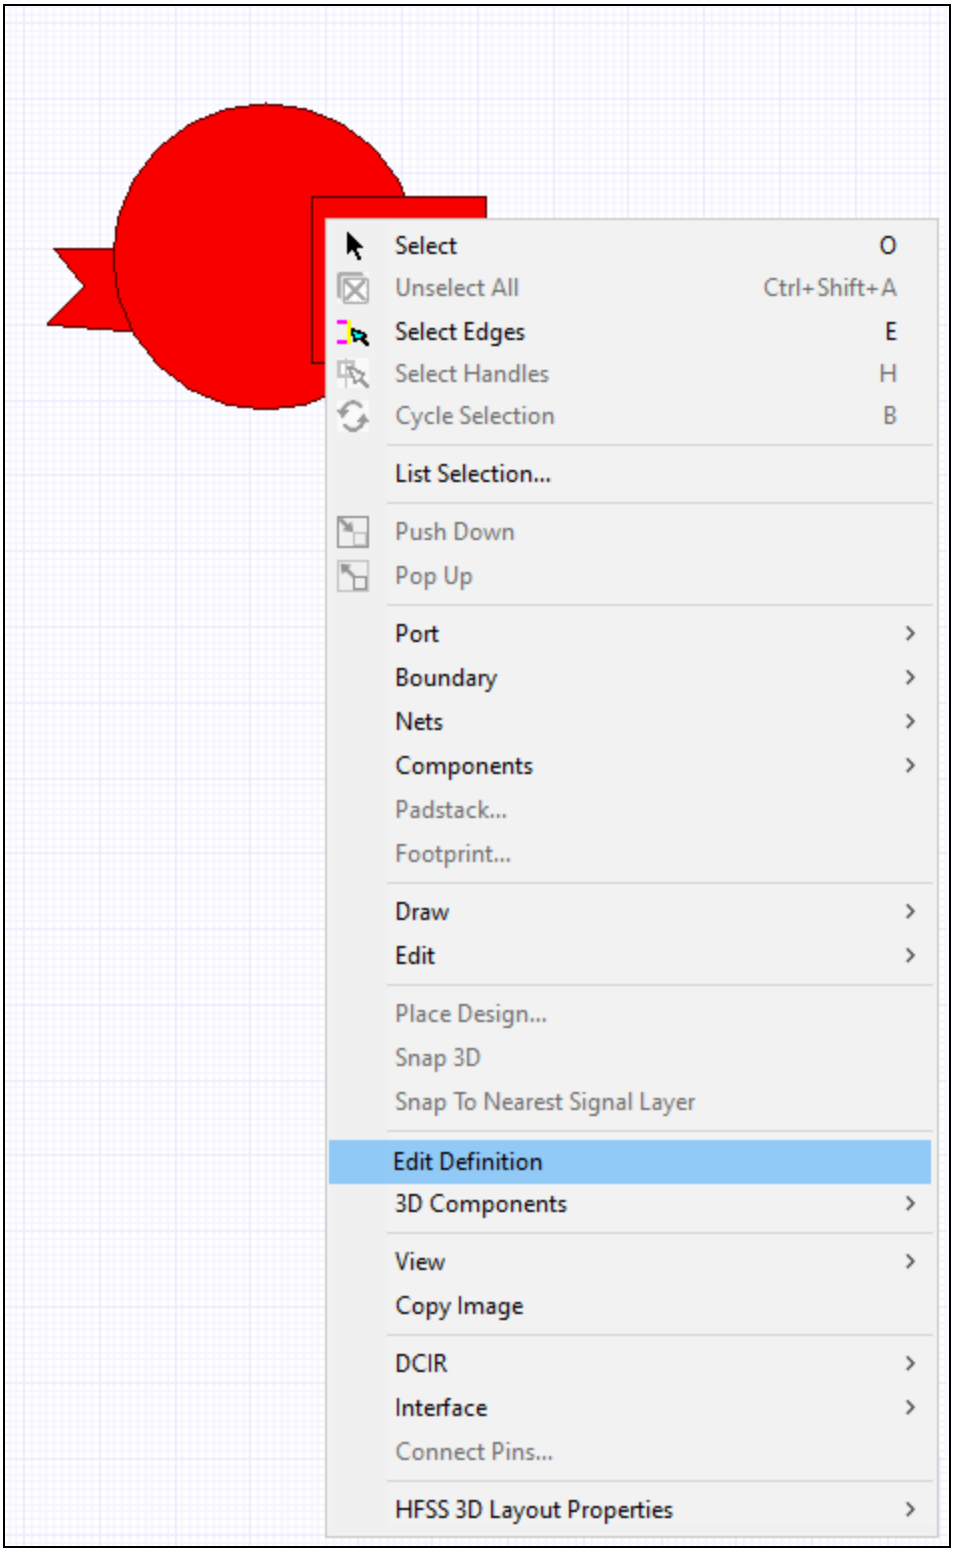
> **Important:**
>
> Fully encrypted layout components can not be edited as described in this section.

Follow these steps to edit a layout component definition.

1. Navigate to the **Edit Definition** window via one of the following paths:

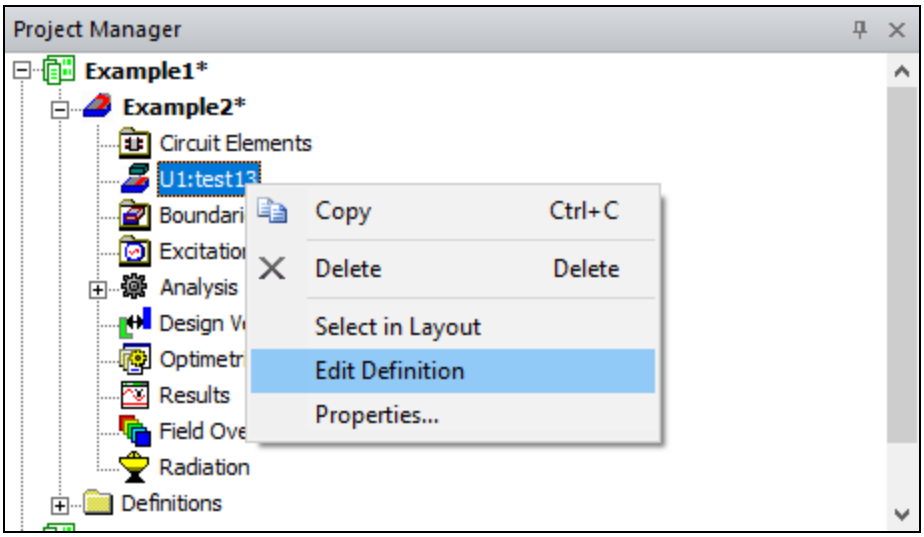
- From the **Layout Editor**, right-click the applicable, layout component and select **Edit Definition**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

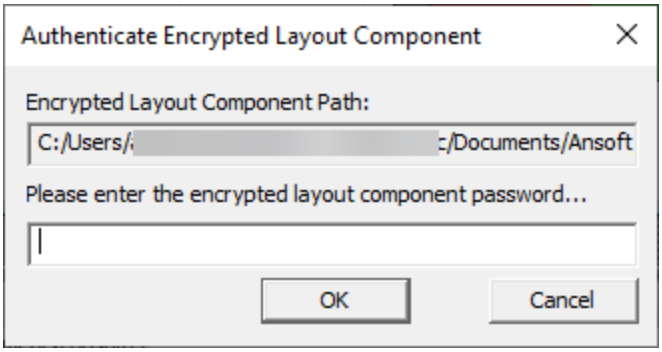


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Project Manager** window, expand the **Project Tree** and **[*Active Design Folder*]**. Then right-click the applicable, layout component and select **Edit Definition**.



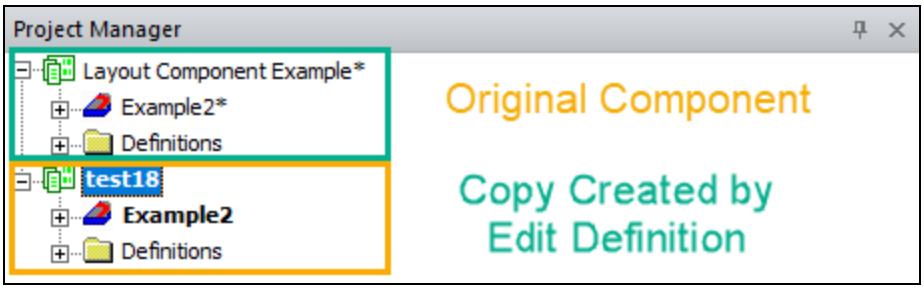
2. If the layout component is encrypted, an **Authenticate Encrypted Layout Component** window appears. Enter the layout component's encryption password, then click **OK**.



3. A duplicate project is created. Copies of the original layout component's materials are added at the project level; variables are added at the project and design level; a detailed history is created for all objects in the layout component; design data is added to the applicable, folders in the **Project Manager**. A copy of the layout component opens in the **Layout Editor**, and a new project folder appears in the **Project Manager** window,

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

containing a copy of the original design.

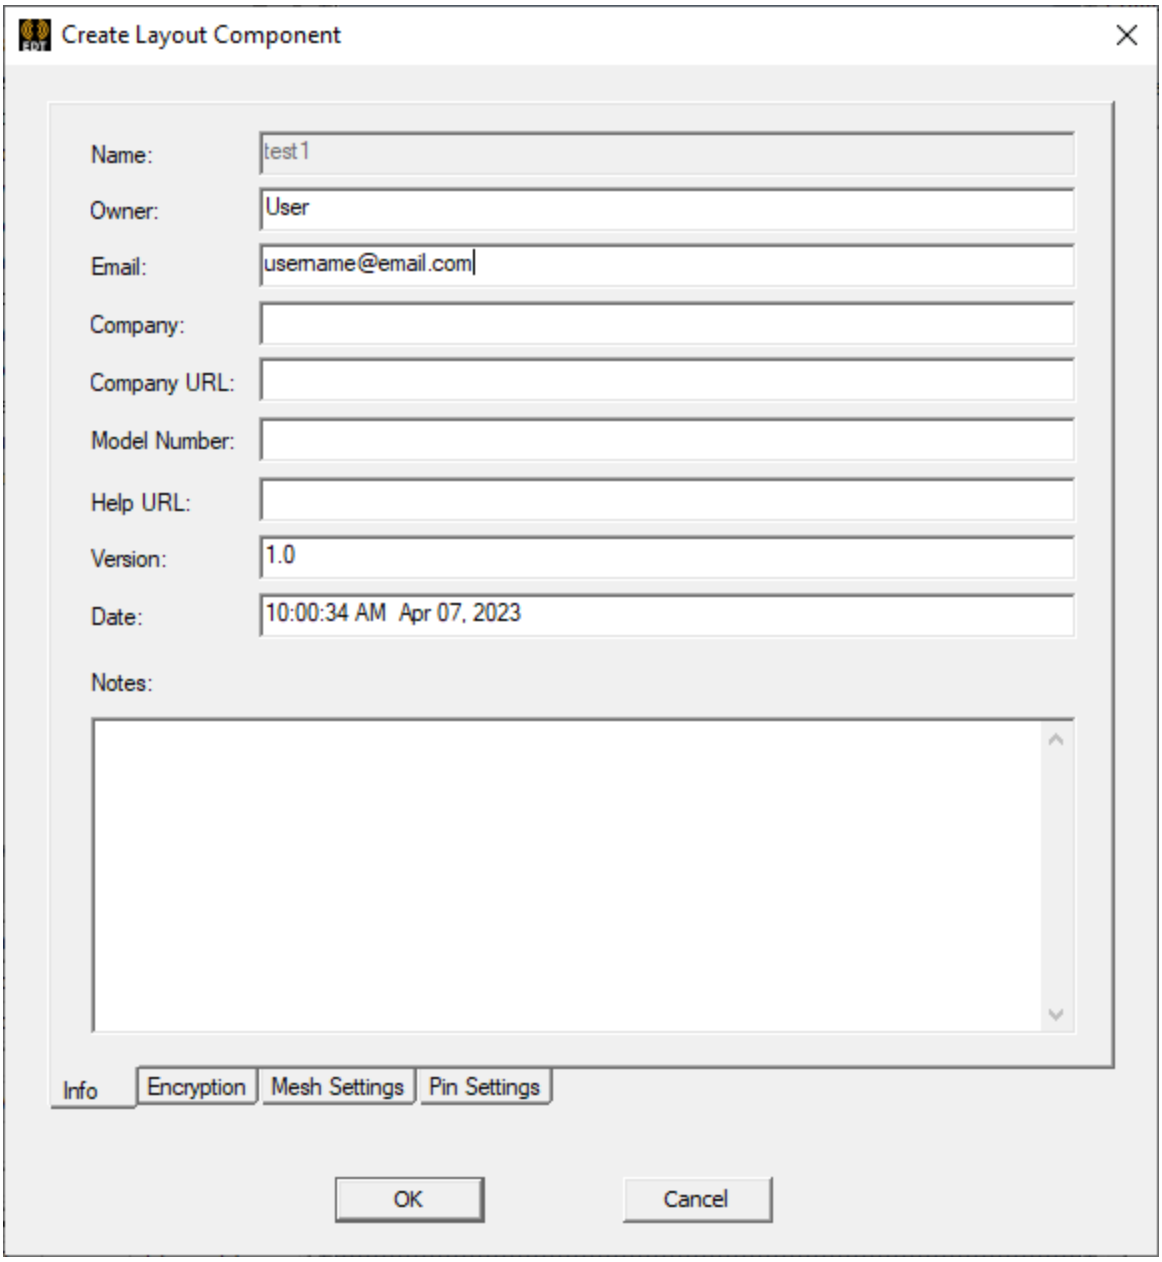


4. Edit the layout component, as preferred (refer to Components).
5. To save the edited layout component, do one of the following:

- To save the edited layout component as its own layout component file (*.*aedbcomp*), click **File** > **Save As** to open an explorer window. Navigate to the applicable, directory, enter a **File name:** for the layout component, and click **Save** to close the explorer window. The procedure is complete. The layout component will be saved with the original layout component's settings and encryption.
- To save the edited layout component in the current project, click **Save** to open the **Create**

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Layout Component window. Then proceed to **step 6**.



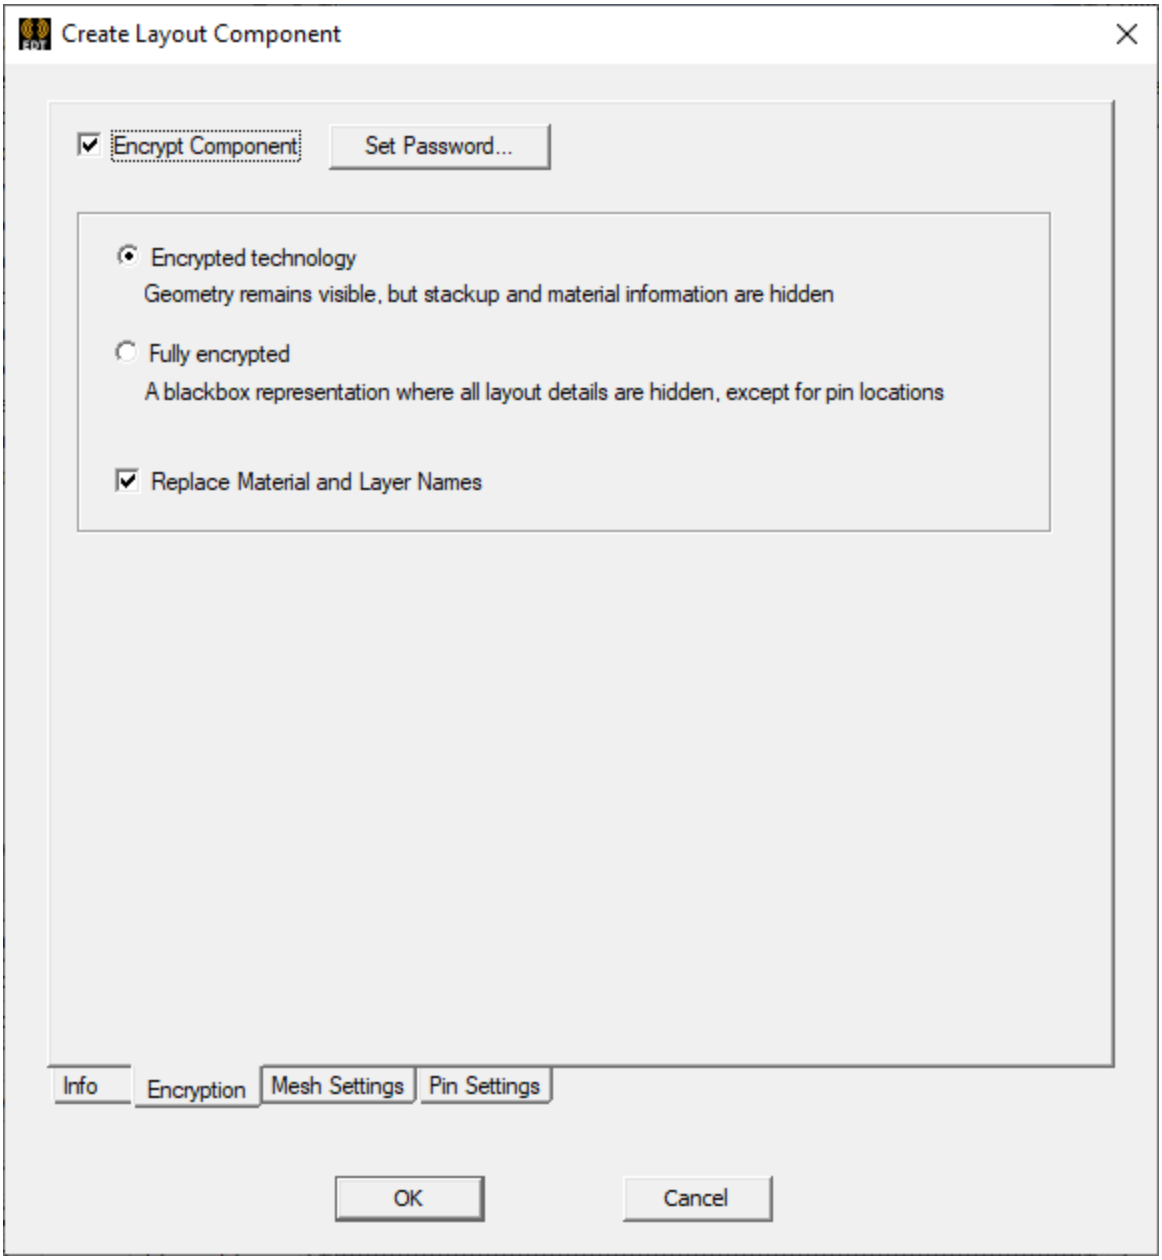
6. From the **Info** tab, enter metadata into the appropriate fields. The layout component's file name is shown in the **Name** field.
7. Click the **Encryption** tab. Use the **Encryption** tab to protect the layout component with two levels of security. Encryption is a common technique for encoding information in a manner that is very difficult for unauthorized users to decode. When these options are

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

enabled for layout components, the contents of the layout component file are encrypted to protect them from external viewing or editing. Layout Components use the Advanced Encryption Standard (AES) with a 256-bit key and password-based key derivation.

> **Note:**
>
> Once a layout component is encrypted and users click **OK**, encryption cannot be removed on the layout component. However, encryption strength can be increased (i.e., if the user chooses not to encrypt the layout component, the exported layout component can be re-imported and exported again as an **Encrypted technology** layout component. If the user exports the **Encrypted technology** layout component, the exported layout component can be re-imported and exported again as a **Fully encrypted** layout component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



8. From the **Encryption** tab, choose from the following options:
    - No encryption – remove the check on the **Encrypt Component** box.
    - **Encrypted technology** – geometry will remain visible, but stackup and material information is encrypted. The layout component may be editable. Click **Set Password** to open the **Set Passwords** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Fully encrypted** – all data, except port locations, is hidden under a blackbox stencil. The layout component will remain uneditable. Click **Set Password** to open the **Set Passwords** window.
- **Replace Material and Layer Names** – check the box to obfuscate all material and unique layer names (e.g., **Dialetric_1** will be renamed **Layer1** and the material column will be hidden from view).

  It is not possible to edit a **Fully encrypted** layout component unless you choose **Always** or **With User Password** in the **Allow Component Edit** area, when you define the layout component.

> **Note:**
>
> If there is a check in the **Encrypt Component** box, the **Set Passwords** window will open if users attempt to leave the **Encryption** tab. Attempting to bypass the window will produce a **Warning: Please input password.** dialog box. This is true even if no encryption is applicable,. To leave the **Encryption** tab, uncheck the **Encrypt Component** box.
>
> >

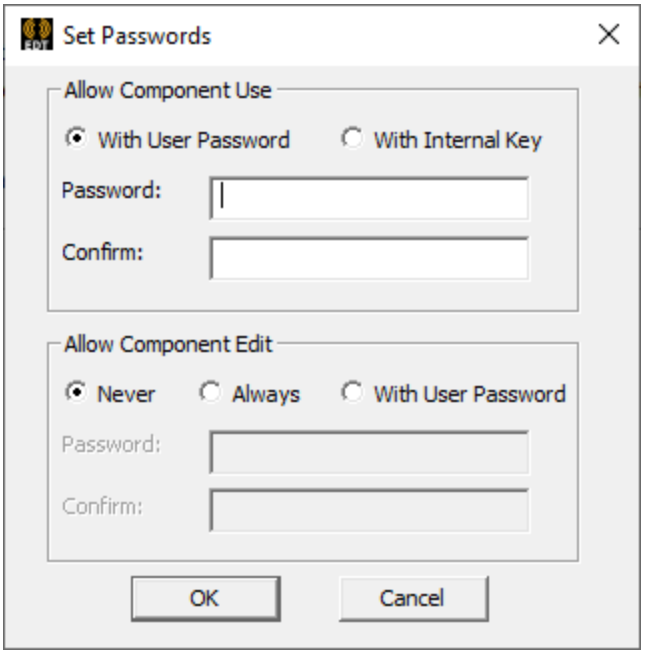
9. Click **OK** to open the **Set Password** window, enter and re-enter a password in the applicable, fields in the **Allow Component Use** area and decide whether future layout component editing is applicable,.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

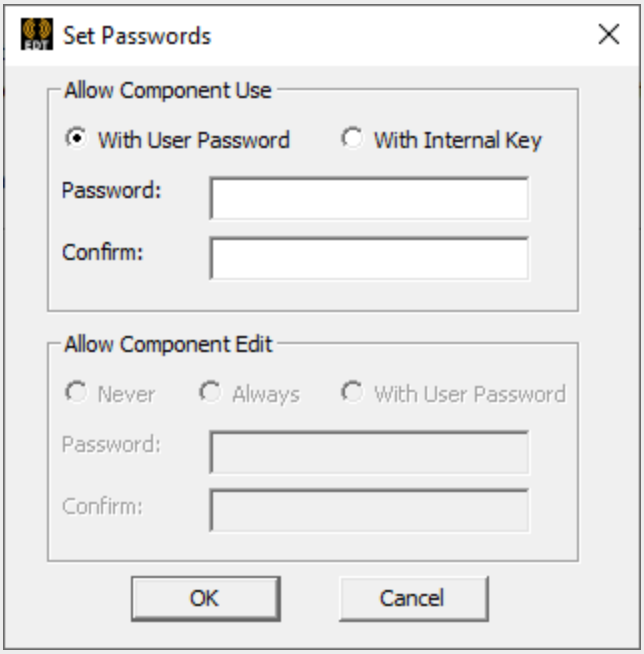


10. From the **Allow Component Use** area, choose from the following:
    - **With User Password** – the layout component can be exported as an *.aedbcomp* file and reopened in AEDT or other compatible software with the correct password.
    - **With Internal Key** – the layout component can be exported as an *.aedbcomp* file and reopened in (and only in) AEDT without a password.
11. If future layout component editing is required, from the **Allow Component Edit** area, choose from the following:
    - **Never** – once the **Set Passwords** window is closed, the layout component will no longer be editable.
    - **Always** – if future layout component editing is applicable,, and no further security is appropriate.
    - **With User Password** – if future layout component editing is applicable,, but some further security is appropriate. Enter and re-enter a password in the applicable, fields.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Choosing **Fully encrypted**deactivates the **Allow Component Edit** area. This level of encryption is a permanent state and the layout component will not be editable after the **Create Component** window is finally closed.



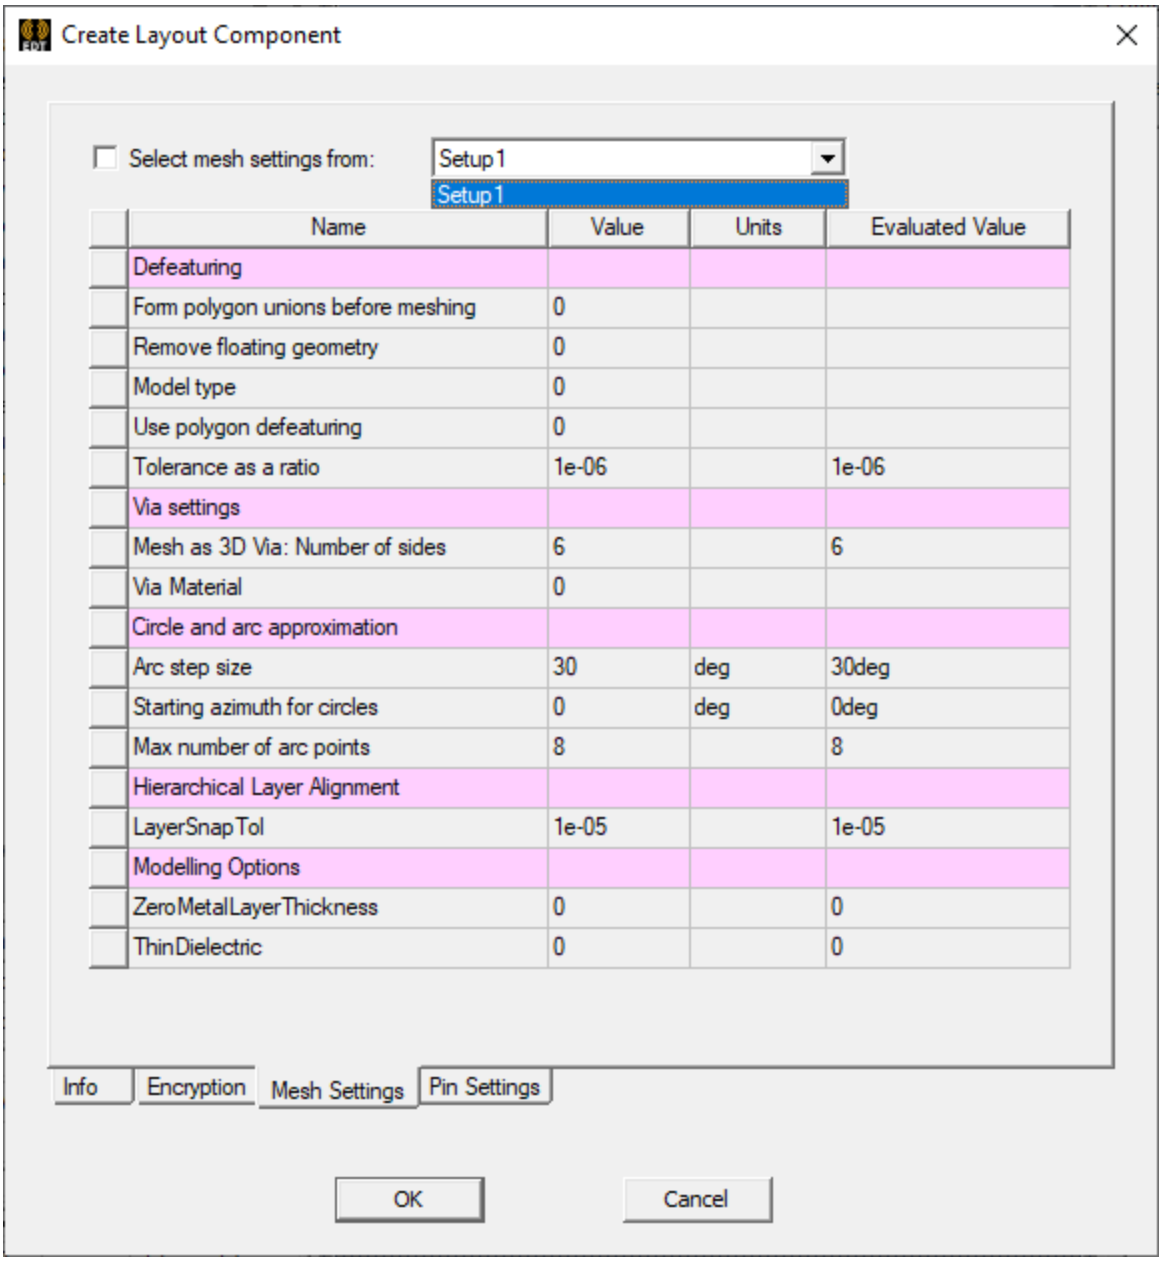
12. Click **OK** to save, close the **Set Passwords** window, and return to the **Create Component** window.

Note:

Once a layout component is encrypted and users click **OK**, encryption cannot be removed on the layout component. However, encryption strength can be increased (i.e., if the user chooses not to encrypt the layout component, the exported layout component can be re-imported and exported again as an **Encrypted technology** layout component. If the user exports the **Encrypted technology** layout component, the exported layout component can be re-imported and exported again as a **Fully encrypted** layout component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

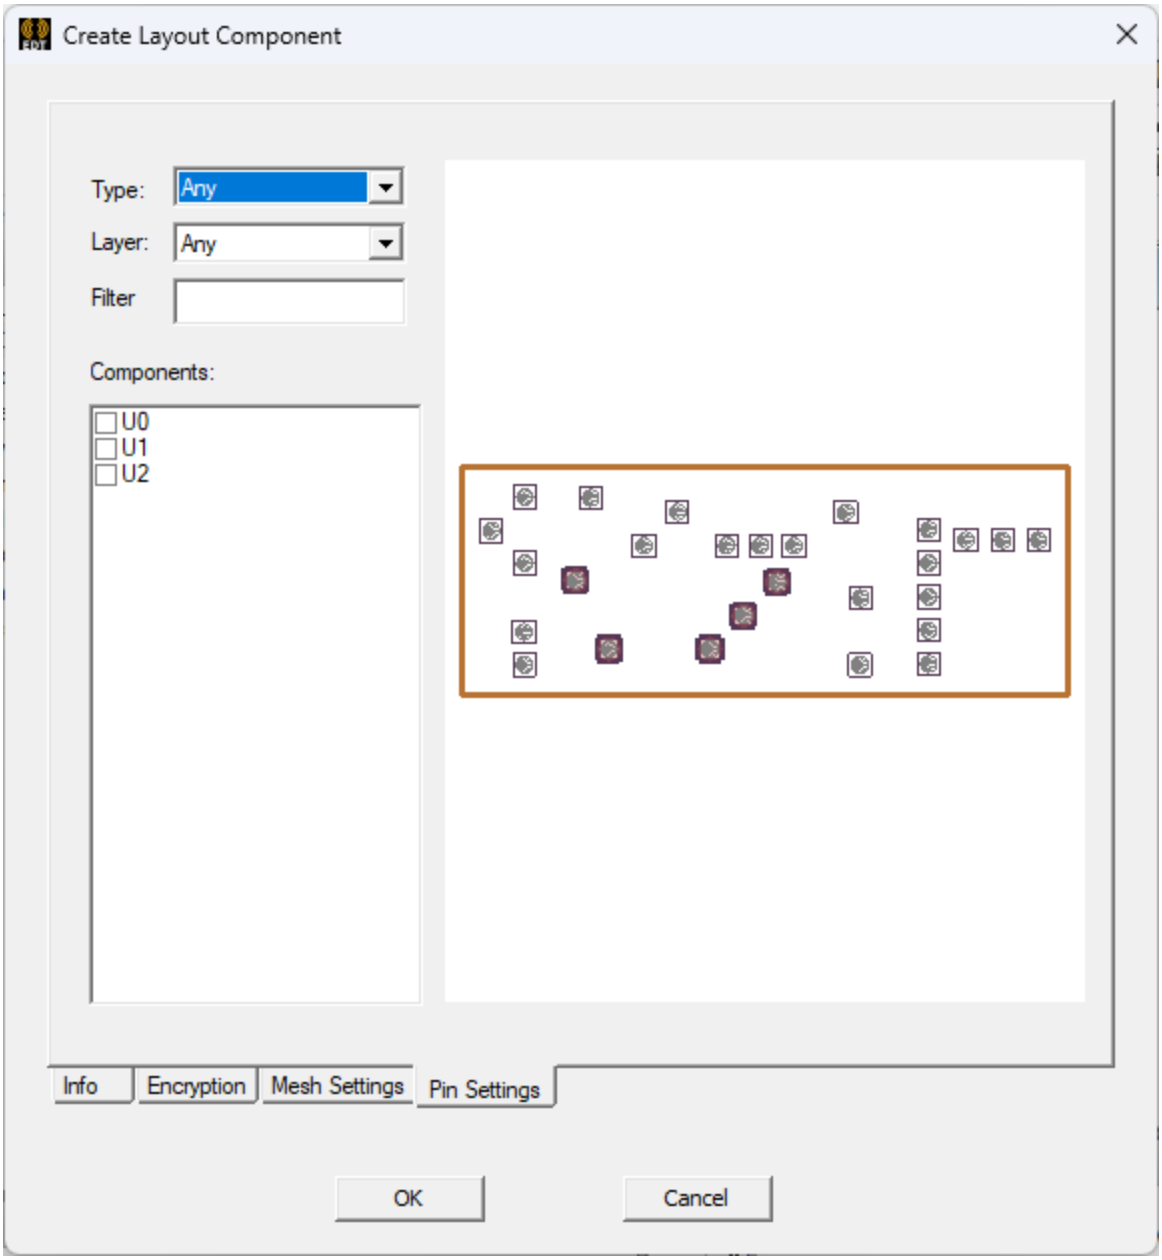
13. Click the **Mesh Settings** tab.



14. To save existing mesh settings with the exported layout component, check the **Select mesh settings from** box and make a selection from the drop-down menu.

15. If **Fully encrypted** is applicable, on the **Encryption** tab, click the **Pin Settings** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



16. From the **Pin Settings** tab, choose from the following:

    - Use the **Type** and **Layer** drop-down menus, as well as manually entering **Filter** variables to filter the Layout Component list of available parts applicable, on the **Layout Editor**.
    - **Components** — check boxes adjacent to each layout component part to leave the

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

layout component(s) exposed, despite full encryption. The exposed layout components are shown in preview window.

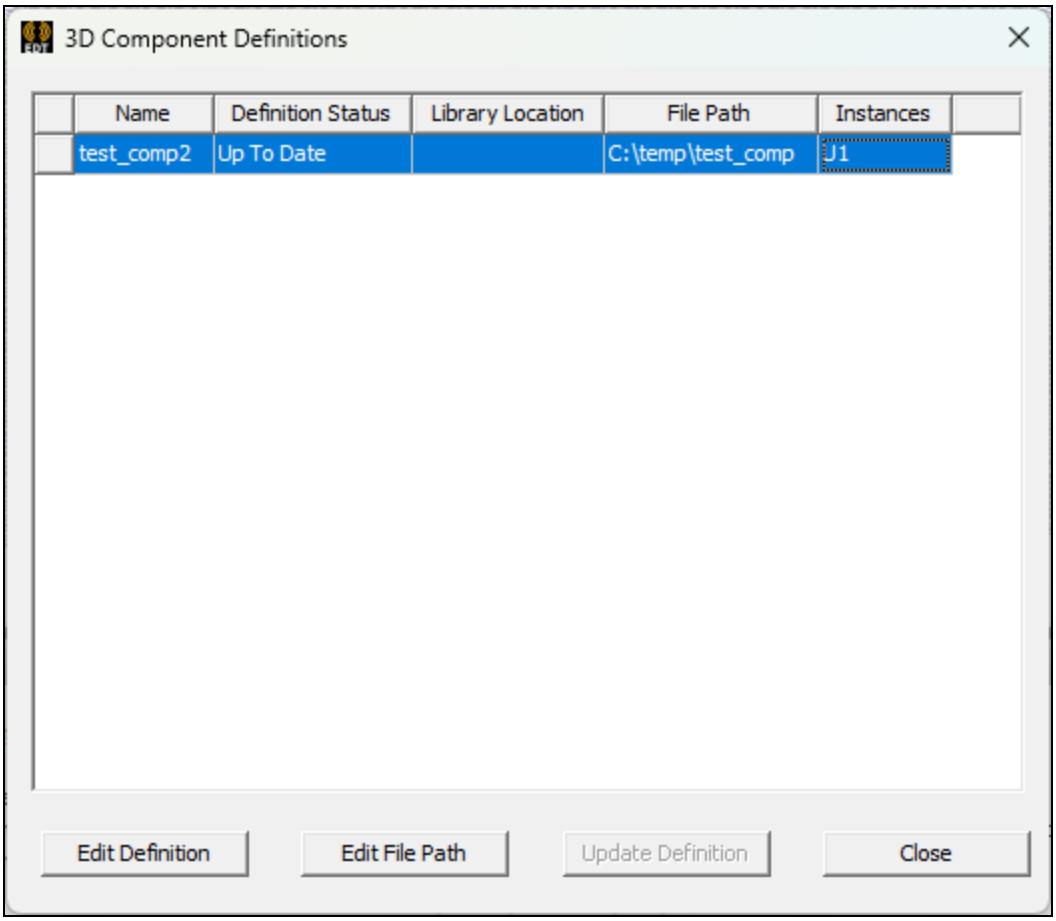
17. Click **OK** to export the layout component.
18. After the layout component is configured, click **OK** to add it to the active design.

The procedure is complete.

Replacing Layout Components

Layout components (and/or 3D components) can be replaced everywhere they have been placed in a design simultaneously from the **3D Component Definitions** window. Follow these steps to make a replacement.

1. Navigate to **Layout** > **3D Component Definitions** to open the **3D Component Definitions** window.
2. Highlight a component and click **Edit File Path** to open an explorer window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Navigate to the new component and either select it and click **Open** or double-click it to immediately replace the applicable, component. Keep in mind the following:

- All instances of the definition within the active design are replaced.
- All transformations (i.e., modifications) to the instance(s) are retained.
- All ports previously added to the instance(s) are also retained.
- Names are not retained.
- The replacement is irreversible.

Encrypted Designs (IC Mode)

Encryption obfuscates parameters, materials, and restricts access, however there are still many options available for users working with projects that include encrypted design, including:

- Adding layers to an encrypted design
- Trimming layers (i.e., deleting certain layers) from an encrypted design
- Enabling Solver Options, including surface roughness, in encrypted layers

For general guidance, refer to:

- Encrypted Layout Components
- Applying Encrypted Technology Files
- Encrypted Libraries

Adding Layers to an Encrypted Design

When a design is encrypted, users can add a signal or dielectric layer, and appropriate parameters (i.e., **Thickness** and **Material**) to the top or bottom of the encrypted stack without removing the encryption.

> **Note:**
>
> The stackup remains encrypted. After a layer is added, it will conform to the existing encryption level.

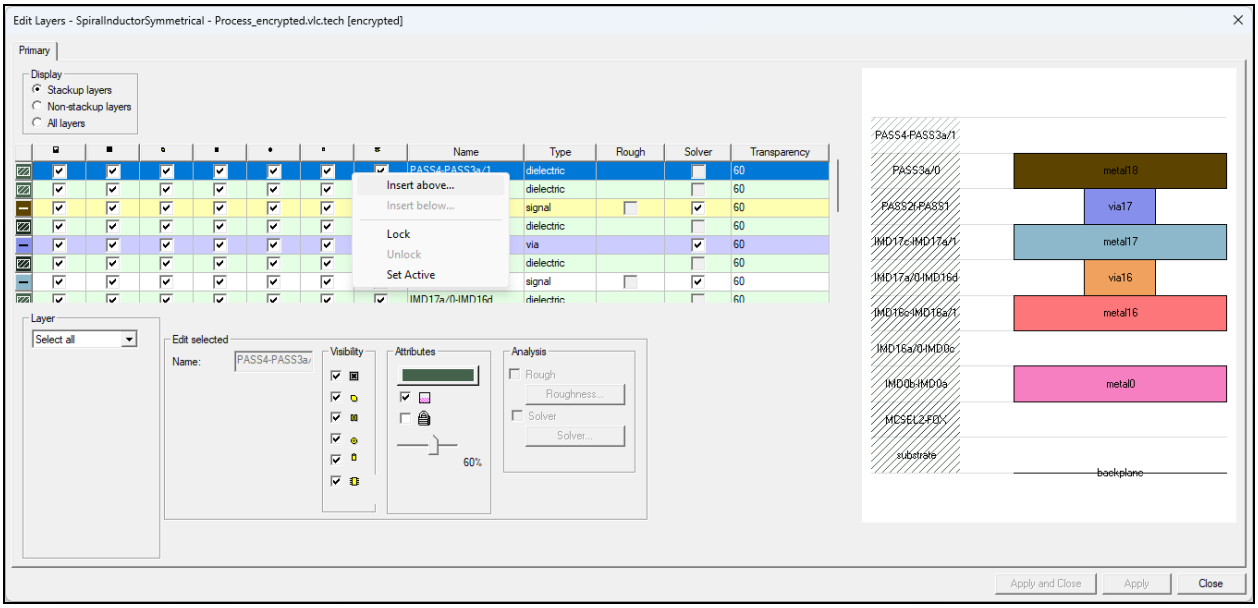
Follow these steps to add a layer to an encrypted stackup. Refer to the Edit Layers window.

1. To open the **Edit Layers** window, do one of the following from the **Layout** tab.

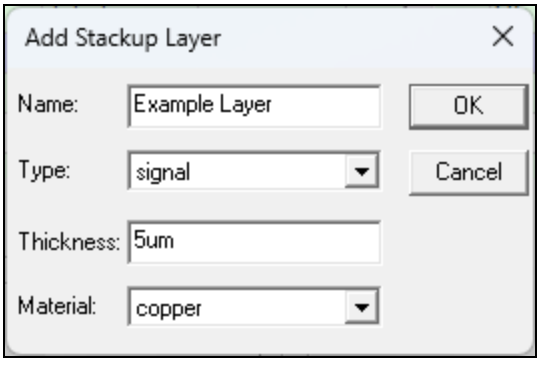
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Layout** ribbon, select **Layers dialog**.
- From **Layout** or **Footprint**, select **Layers**.
- Right-click in the **Layout Editor** and select **Edit Layers**.

2. From the **Grid Control Table**, right-click in the top or bottom row and select **Insert above/Insert below** to open the **Add Stackup Layer** window.

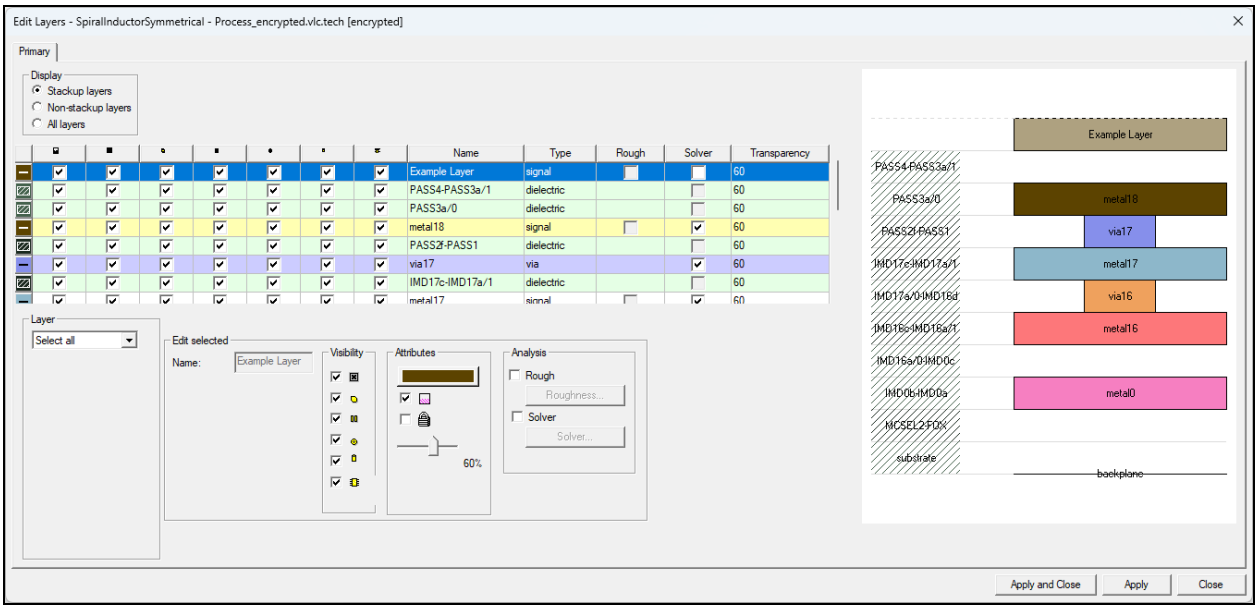


3. From the **Add Stackup Layer** window, enter an appropriate **Name**, **Type** (i.e., **signal** or **dielectric**), **Thickness** (e.g., **5um**), and **Material** from the drop-down menu (e.g., **copper**).



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click **OK** to close the **Add Stackup Layer** window and add the new layer to the **Grid Control Table**.



> **Note:**
>
> To remove layers from an encrypted design, refer to Trimming Layers from an Encrypted Design.

Enabling Solver Options in Encrypted Layers

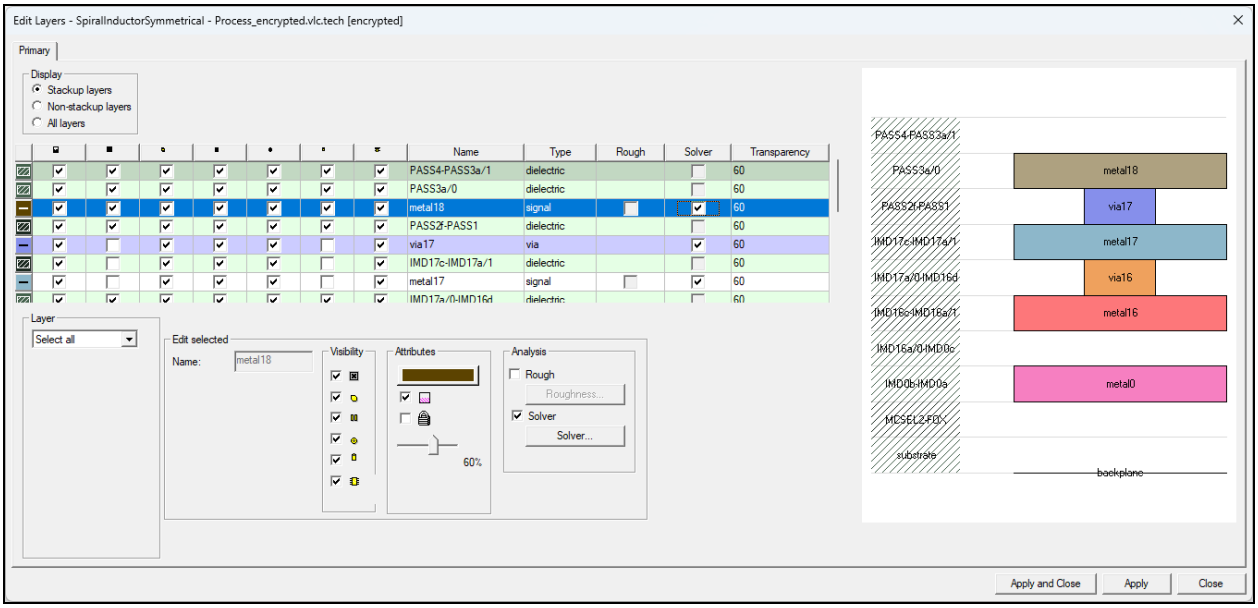
Follow these steps to enable solver options and surface roughness in an encrypted stackup.

1. To open the **Edit Layers** window, do one of the following from the **Layout** tab.

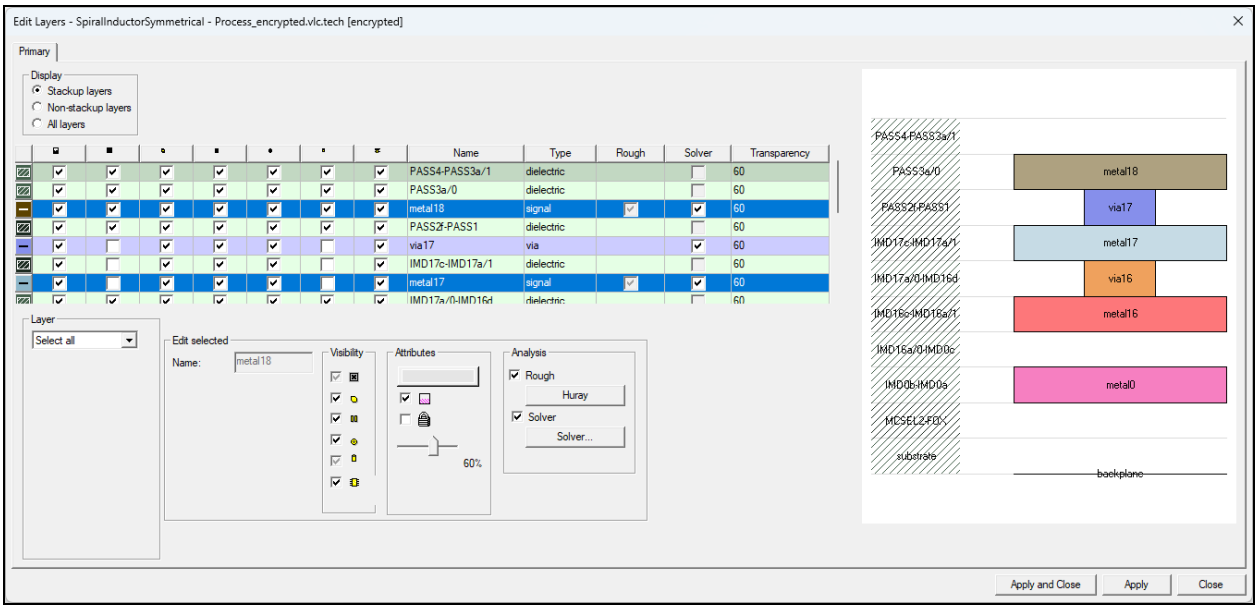
- From the **Layout** ribbon, select **Layers dialog**.
- From the **Layout** or **Footprint** menu, select **Layers** .
- Right-click in the **Layout Editor** and select **Edit Layers**.

2. From the **Grid Control Table**, check any/all of the active boxes in the **Solver** column, or select one or more layers and check the **Solver** box in the **Analysis** area.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

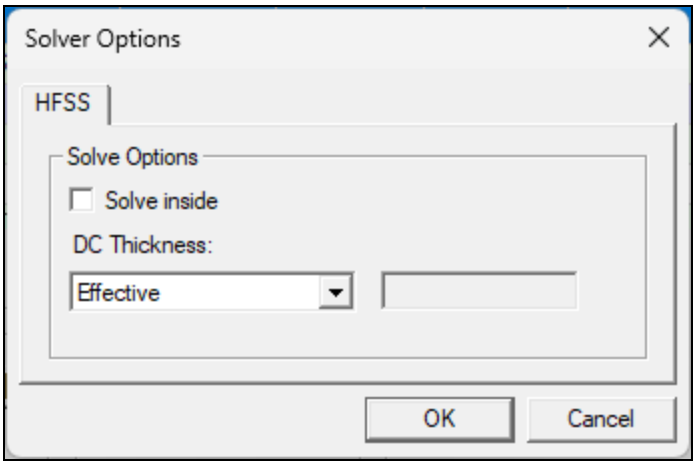


3. By default, layers do not have surface roughness. If applicable, add **Rough** status to one or more signal layers by selecting the layer(s) and checking the **Rough** box in the **Analysis** area. The roughness is added to the layer when its mesh is created. Refer to Setting the Layer Surface Roughness.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Checking either **Solver** boxes in the **Grid Control Table** or the **Solver** box in the **Analysis** area activates the **Solver** button. Click **Solver** to open the Solver Options window.



5. From the **Solver Options** window, do the following:

   - **Solve inside** check box — check to enable all objects in the layer to have the "solver inside" attribute . It is possible to perform solve inside on an object-by-object basis. Refer to HFSS 3D Layout Properties
   - **DC Thickness** drop-down menu — controls how DC thickness is calculated for the conductor lumps on the layer:
     - **Effective** — calculates thickness as twice the volume/surface area.
     - **Layer** — uses the layer's thickness.
     - **Manual** — enter a value in the field.

Creating Instance Arrays in IC Mode

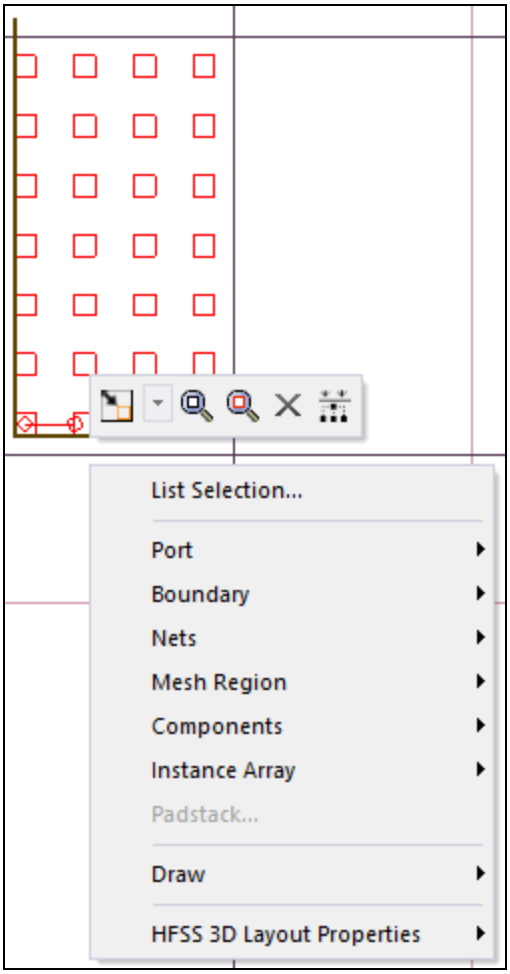
Instance arrays allow users to create arrays of cell instances to speed up the design process and reduce file size.

> **Note:**
>
> Instance arrays can only be created from a GDSII file. The Ansys Electronics Desktop (AEDT)™ electronics systems design platform does not currently support editing a GDSII file in this context, but to import a GDSII file that includes instance arrays, refer to Importing GDSII Format Files in IC Mode.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

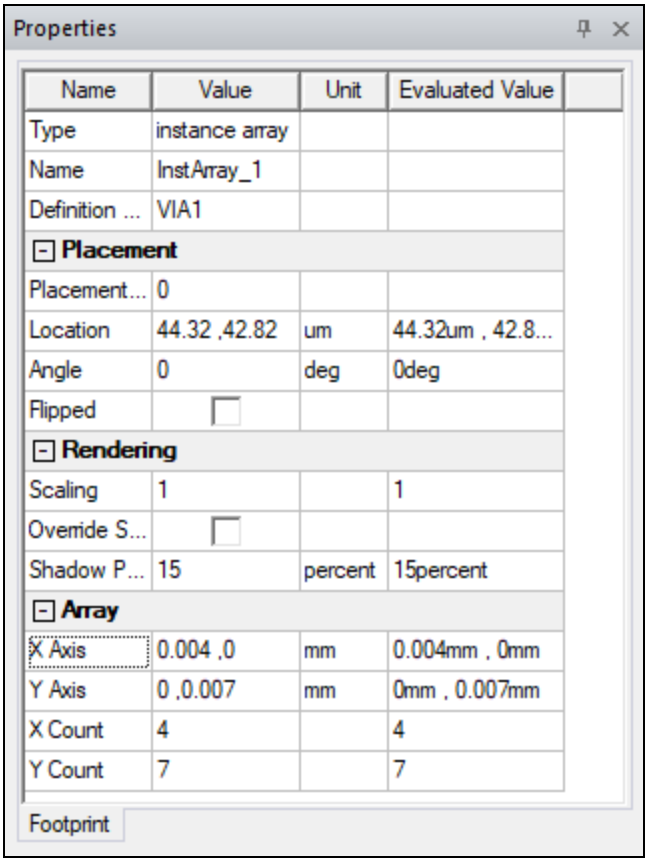
Selecting Instance Array

To select an instance array, click its axis, displayed as bold vertical and horizontal lines connecting in the bottom left-hand corner. Right-click on the array to view a contextual shortcut ribbon.

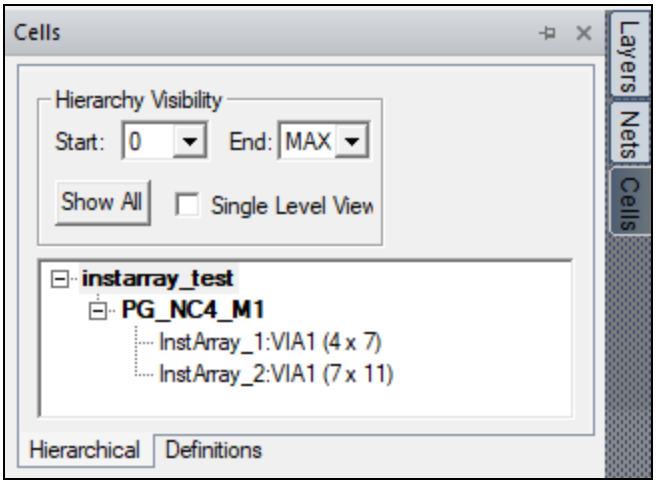


Selecting an array populates the **Properties** window. The array's editable parameters include **X Axis** and **Y Axis** (i.e., the values represent the array's offset from each axis), and **X Count** and **Y Count** (i.e., **X Count** is the number of cells present in the array in rows, while **Y Count** represents the number of cells present in the array in columns).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The array's hierarchical dimensions are visible in the **Cells** window.

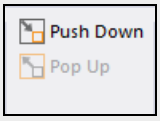


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

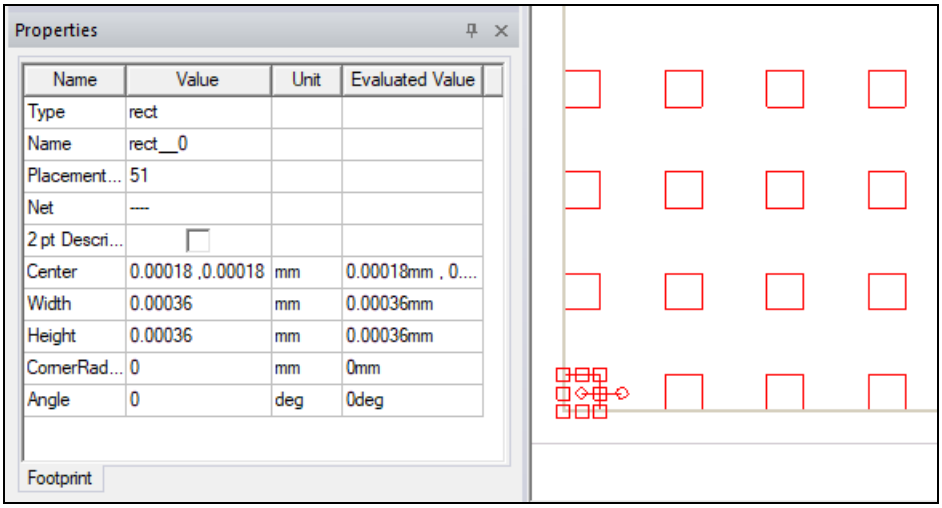
Navigating a Hierarchical Design

From the shortcut ribbon, select **Push Focus Down** and/or **Push Focus To** to navigate between components.

> **Note:**
>
> Double-clicking an instance array's axis will also focus on the cells (i.e., Push Down/Pop Up), as will clicking **Push Down**/**Pop Up** at the **View** ribbon.



Once the array's cells are highlighted, click the reference cell at the nexus of the vertical and horizontal axis lines to populate the **Properties** window with the cells' editable parameters.

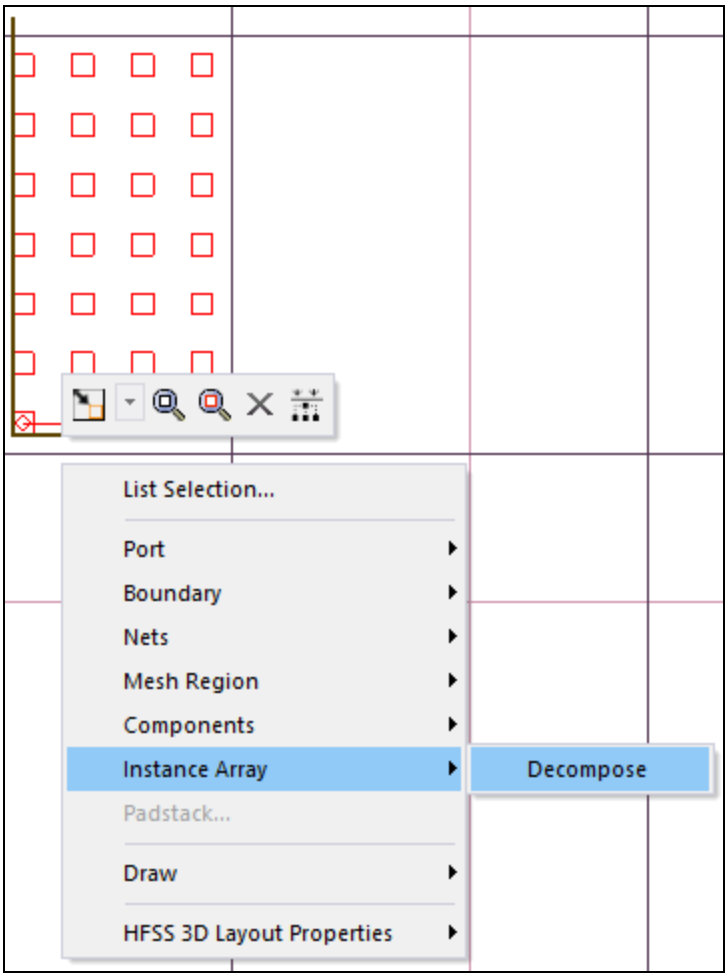


Dissolving an Instance Array

Dissolve an instance array to turn all of the array's cells into individual instances. To dissolve an array, do either of the following:

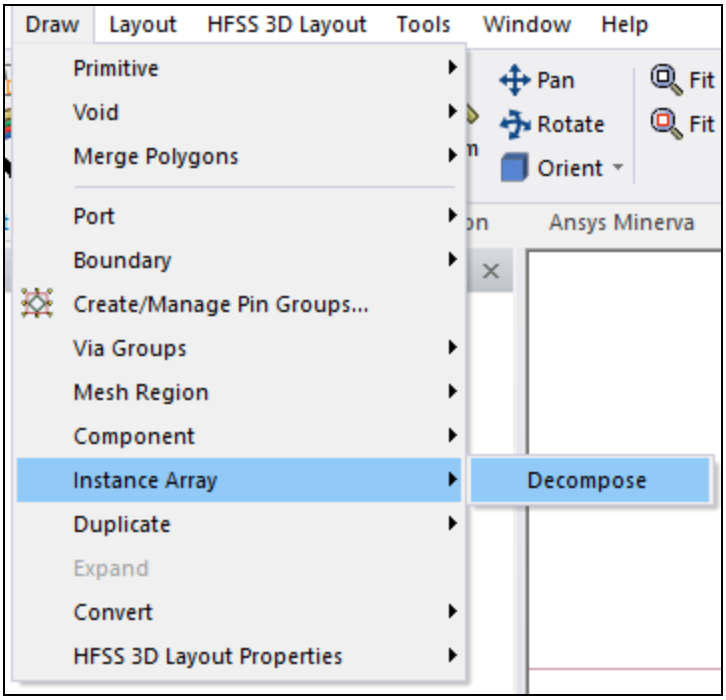
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Right-click an appropriate instance array and select **Instance Array** > **Decompose**.



- With an instance array selected, navigate to **Draw** > **Instance Array** > **Decompose**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Creating Circuit Ports in IC Mode

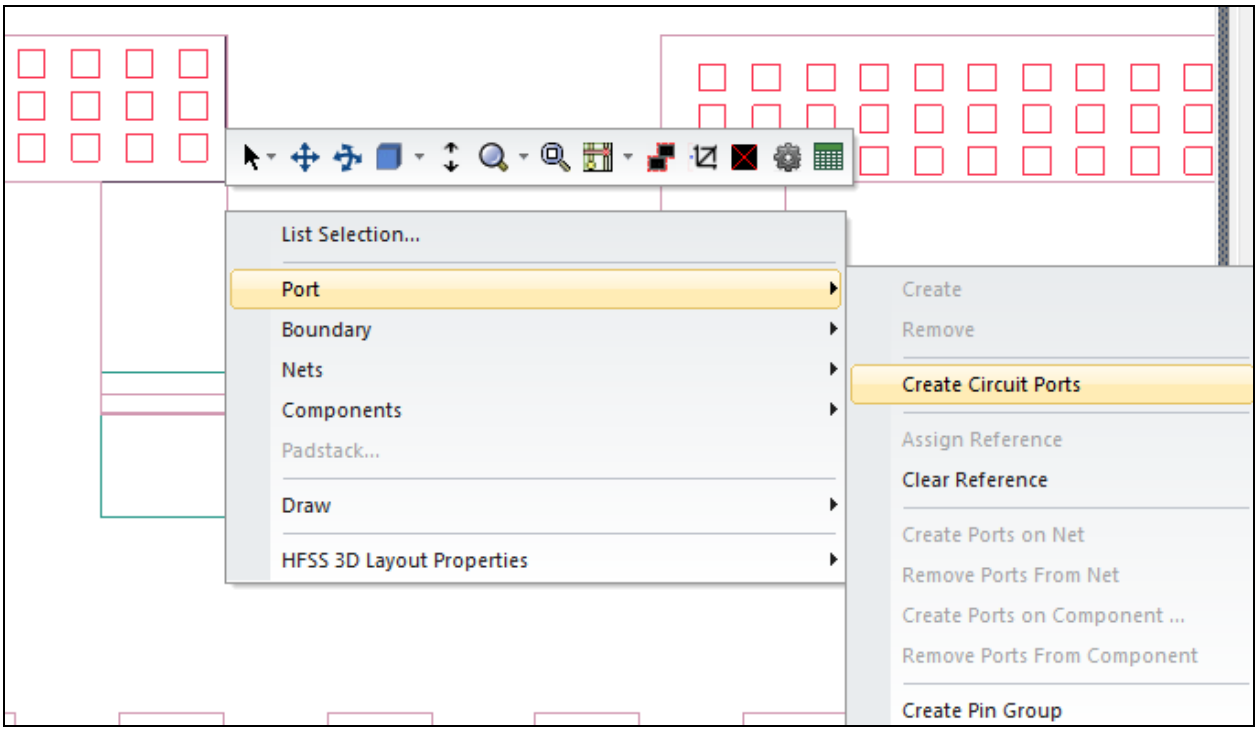
Circuit ports can be created the same way in both **General** and IC modes. Refer to the HFSS 3D Layout Creating a Circuit Port page for further information.

Creating a Point-to-Point Circuit Port

Follow these steps to create a circuit port.

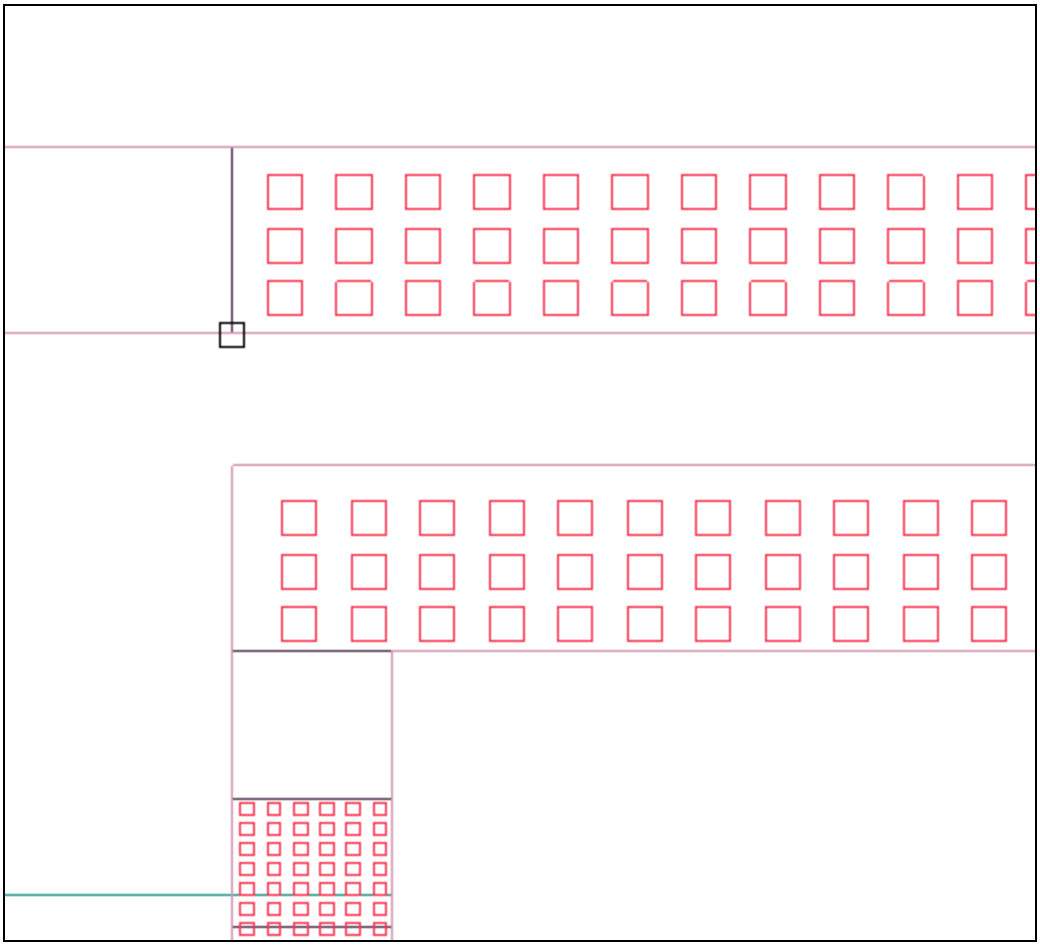
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Right-click within the **Layout Editor** and select **Port** > **Create Circuit Ports**.



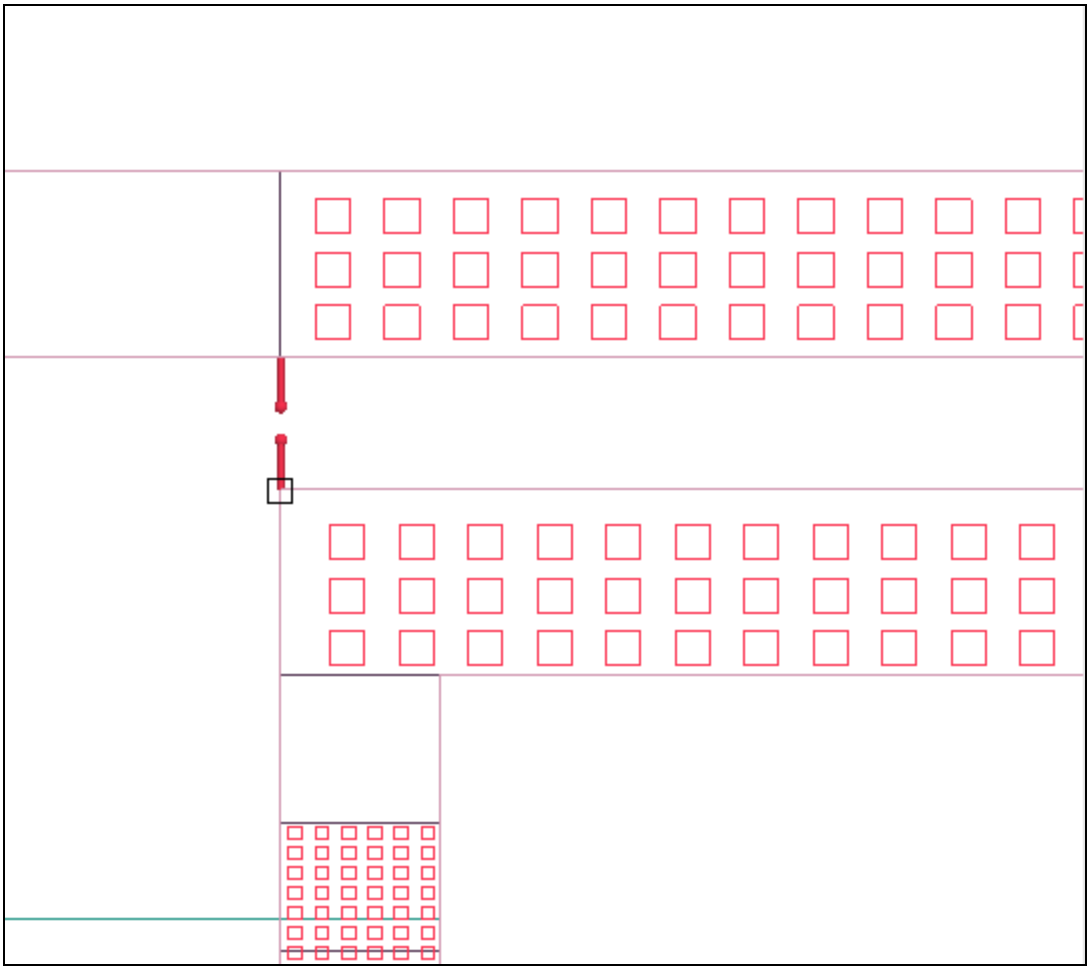
2. Hover the cursor over a conductor until the cursor changes shape (i.e., from an arrow into a square). Then left-click the conductor to select it as the positive terminal.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



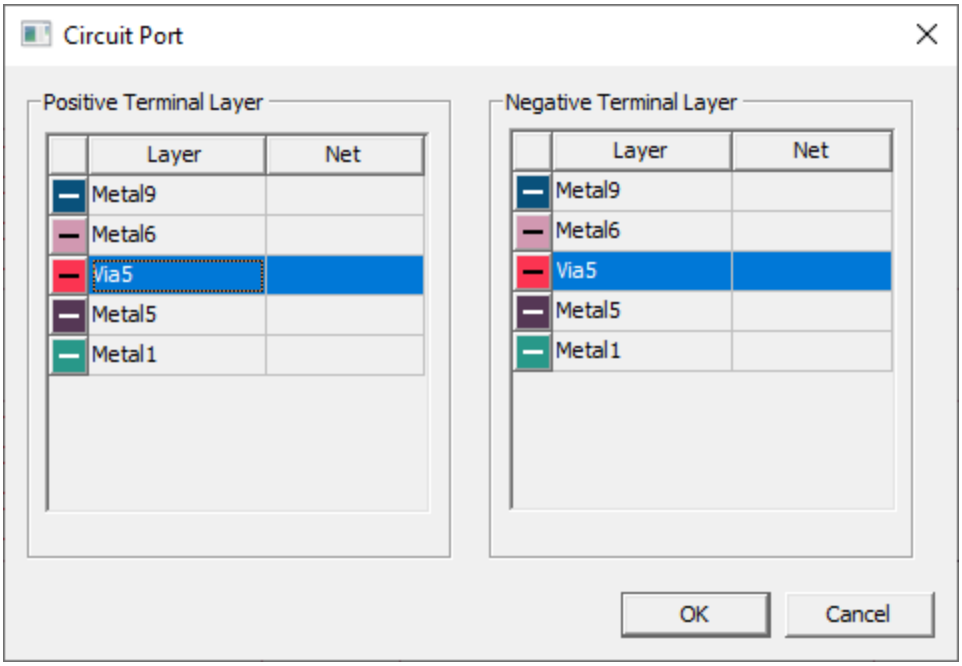
3. Repeat step 2, now dragging the port behind the cursor. Hover the cursor over a conductor until the cursor changes shape, then left-click the conductor to set it as the negative terminal.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Circuit Port** window will open.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



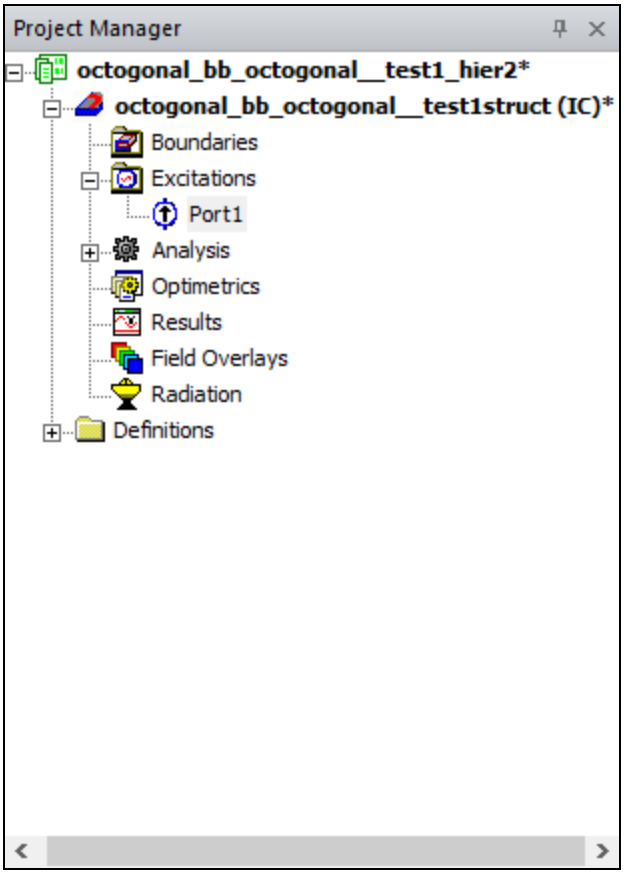
4. From the **Circuit Port** window, select a **Positive Terminal Layer** and a **Negative Terminal Layer**.
5. Click **OK** to close the **Circuit Port** window and finalize the new circuit port.

Editing Circuit Ports

Follow these steps to edit a circuit port's properties.

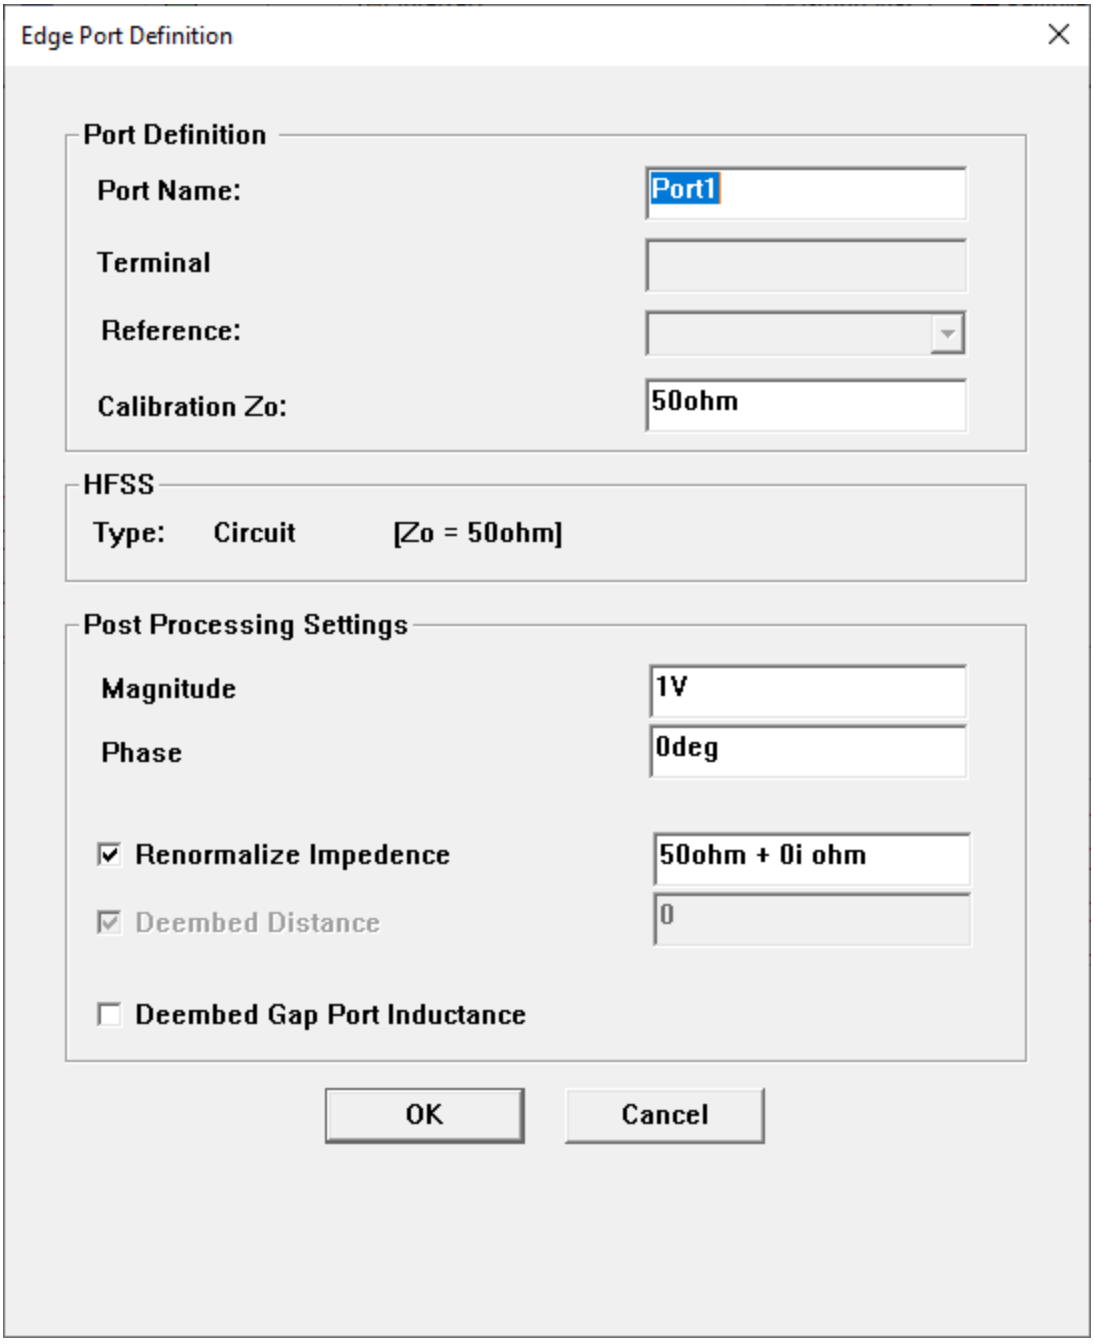
1. Navigate to the **Project Manager** window. Then expand the **Project Tree** > **[*Active Design Folder*]** > **Excitations** folder.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Double-click the selected port (e.g., **Port1**) to open the **Edge Port Definition** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. From the **Edge Port Definition** window, users can perform the following tasks:

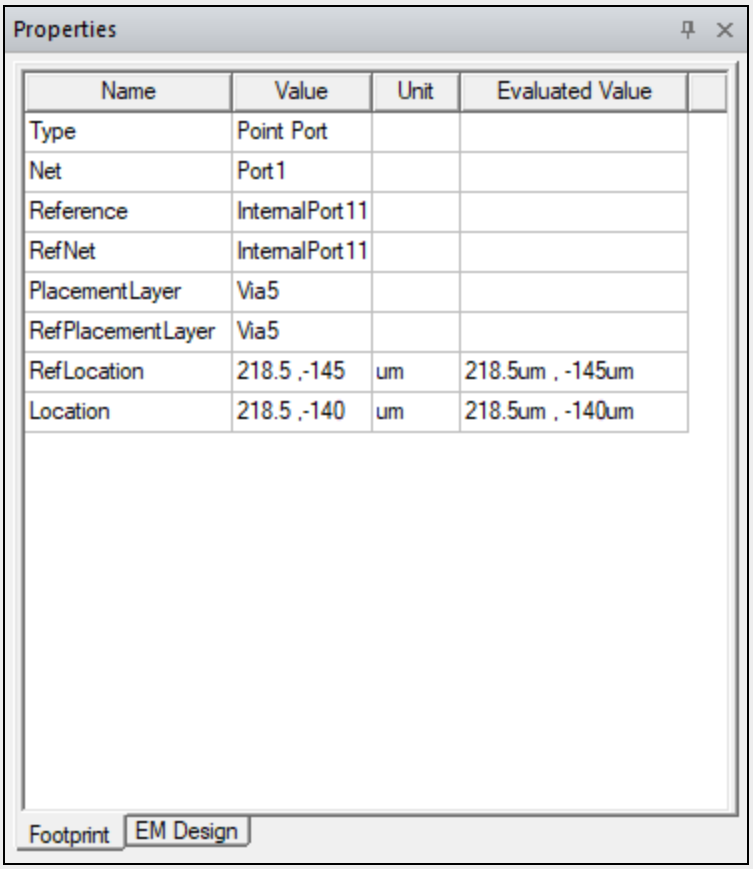
- Change the name of the pad port.
- De-embed the S-matrices.
- Vary the port excitation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Renormalize the port to a specific port impedance.
- Set up a reference to the nearest negative signal.

Note:

When a circuit port is selected, its parameters appear in the **Properties** window. Some values, such as the port's positive and negative terminal layers, can be changed directly in the **Properties** window.



3D Structures

A 3D structure is a special type of coordinate system (CS). Objects are grouped together as a 3D structure in the same way objects are grouped in a relative CS, with the following differences:

- When corresponding objects exist on two different layers of the project (e.g., a ground plane and a trace layer) and belong to the same 3D structure group, faces are automatically generated that span the various layers and connect the objects on the two

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

stackup layers resulting in 3D solid or planar geometry.

- Unlike in a CS, a 3D structure cannot be nested within another 3D structure. However, in addition to creating a 3D structure relative to the global CS, a 3D structure is created within any existing relative CS.

Activate a 3D structure to modify the objects within it (e.g., move, resize, et cetera). First, navigate to the **Layout Editor**. From **Draw**, select **3D Structure** and use the commands described in the following subsection.

Creating 3D Structures

When two or more objects on different layers are selected, the **Draw** > **3D Structure** > **Create** command connects the objects to create a single 2D or 3D object. Objects being connected must possess the same number of points.

- If the selected objects contain open lines, the created structure is a two-dimensional face (i.e., a cross-layer plate) that spans the different layers.
- If the selected objects contain closed lines, the created structure is a three-dimensional solid (i.e., a 3D Via) that spans the different layers. These 3D surfaces are included in the model. 3D structures also possess a material attribute.
- If the user selects **Create** and no objects are selected, the user must manually place the structure. The current CS is then set to the new 3D structure.

> **Note:**
>
> When **Draw** > **3D Structure** > **Create** is used to create a structure using a selection of closed polygon lines, the order in which the lines are selected is not significant. Lines are automatically ordered according to elevation before being connected by the closed surface. But when a structure is created using open lines, the selection of lines is order-significant (i.e., lines are connected in the order in which they are selected).

3D Ungroup

The following ungroup command is available when working with 3D structure objects.

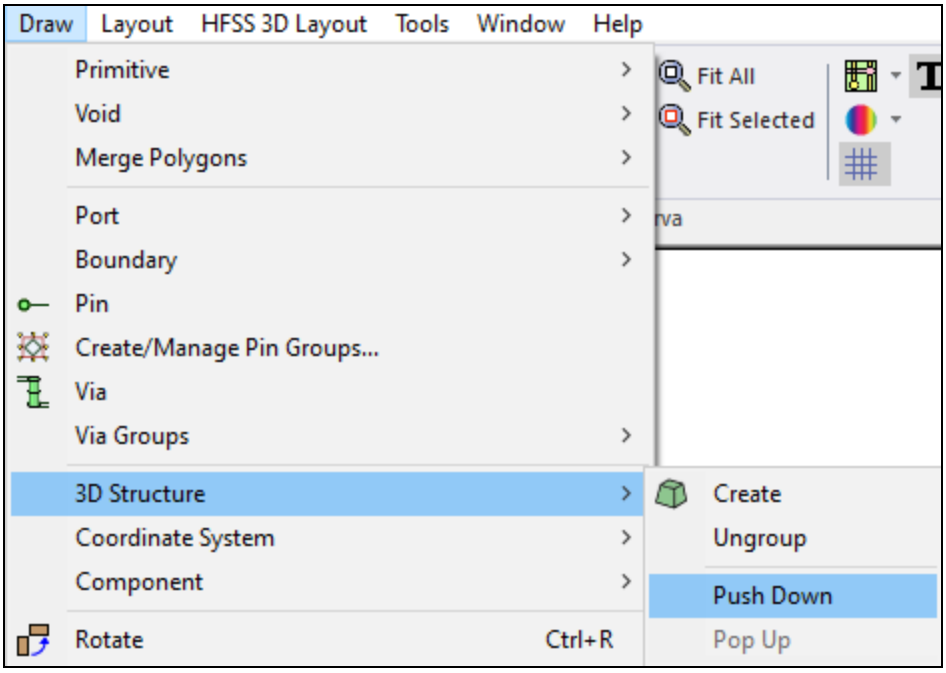
- The **Draw** > **3D Structure** > **Ungroup** command ungroups all selected objects and deletes the relative CS. Ungrouping 3D structures removes the connecting 3D surface between the objects that make up the structure without removing the objects.

3D Push Down and Pop Up

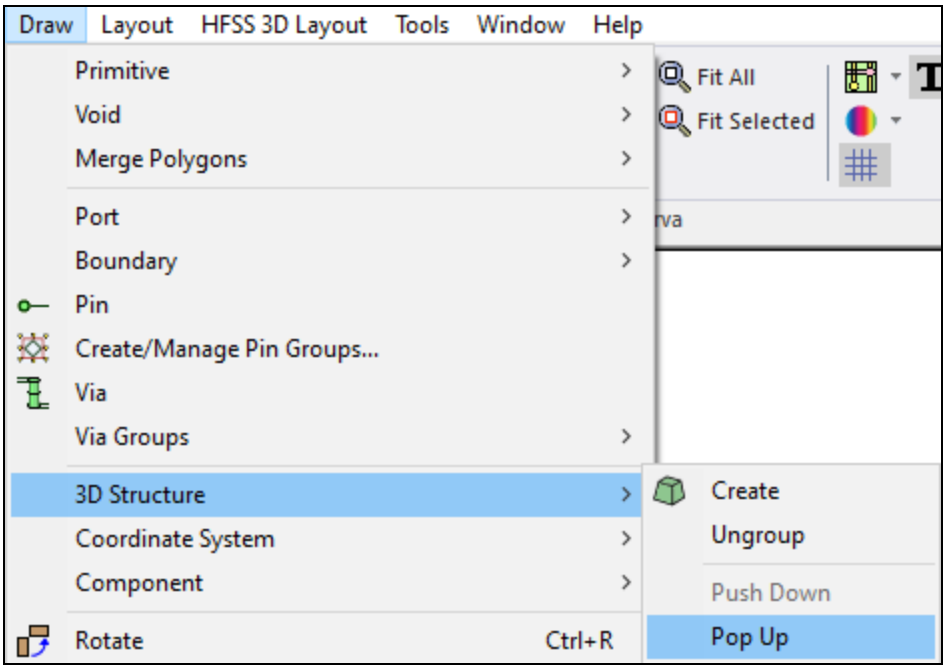
The 3D structure **Push Down** and **Pop Up** commands allow users to switch between a 3D structure and the global or relative CS on which it is based. Refer to the subsection within Coordinate Systems.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From **Draw**, select **3D Structure** > **Push Down** to activate the next lower level of the global CS. Repeat, as appropriate.



- From **Draw**, select > **3D Structure** > **Pop Up** to activate the next higher level of the global CS. Repeat, as appropriate.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Geometry Check in Layout

Running Geometry Check before running an analysis on a model can find and automatically fix common problems that may prevent a simulation from completing successfully.

To perform a geometry check on the active project:

1. Click **HFSS 3D Layout > Geometry Check** to open the **Launch Geometry Check** window. Select any checks that you want to validate:
   - Select **Self-Intersecting Polygons** to check for duplicating planes, intersecting edges, and check whether voids intersect the plane boundaries.
   - Select **Disjoint Nets** to check if there are nets that are not completely connected.
   - Select **DC-Shorted Errors** to check if any nets overlap.
   - Select **Identical/Overlapping Vias** to check if any vias are identical or overlap on the same nets.
   - Select **Misalignments** to check for all misalignments in the following cases:

◦ Flag and auto-correct areas where the centerline of a trace is not contained within a plane.

◦ Check if a trace overlaps with a plane, but the trace centerline does not intersect with a plane.

◦ Check if a trace overlaps with another trace, but the centerline of a trace does not intersect with the centerline of another trace.

◦ Check if the boundary of a pad/via intersect with the boundary of a trace, but the center of a via/pad is not located on the centerline of a trace (in other words, the pad/via is not snapped to the centerline of a trace).

◦ Check if the boundary of a plane intersect with the boundary of a pad/via, but the center of the pad/via is not contained in the boundary of the plane.

◦ Check if a trace overlaps with a plane, but the trace centerline does not intersect with a plane.

◦ Check if a trace overlaps with another trace, but the centerline of a trace does not intersect with the centerline of another trace.

◦ Check if the boundary of a pad/via intersect with the boundary of a trace, but the center of a via/pad is not located on the centerline of a trace (in other words, the pad/via is not snapped to the centerline of a trace).

◦ Check if the boundary of a plane intersect with the boundary of a pad/via, but the center of the pad/via is not contained in the boundary of the plane.

◦ Check if a trace overlaps with a plane, but the trace centerline does not intersect with a plane.

◦ Check if a trace overlaps with another trace, but the centerline of a trace does not intersect with the centerline of another trace.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Check if the boundary of a pad/via intersect with the boundary of a trace, but the center of a via/pad is not located on the centerline of a trace (in other words, the pad/via is not snapped to the centerline of a trace).
- Check if the boundary of a plane intersect with the boundary of a pad/via, but the center of the pad/via is not contained in the boundary of the plane.

The following checks are done in all cases, regardless of the selections you make:

Zero Via Plating — Flags padstack definitions with no (0%) plating.

Pin Shared By Multiple Pin Groups — Flags pins that belong to more than one pin group.

2. Click **OK** in the **Launch Geometry Check** window.

   The progress bar displays the progress. The **Geometry Check Results** window opens and lists errors and warnings. Items that can be fixed automatically contain **Auto Fix** check boxes; select a box to have a problem automatically corrected.

3. Click **OK** in the **Geometry Check Results** window.

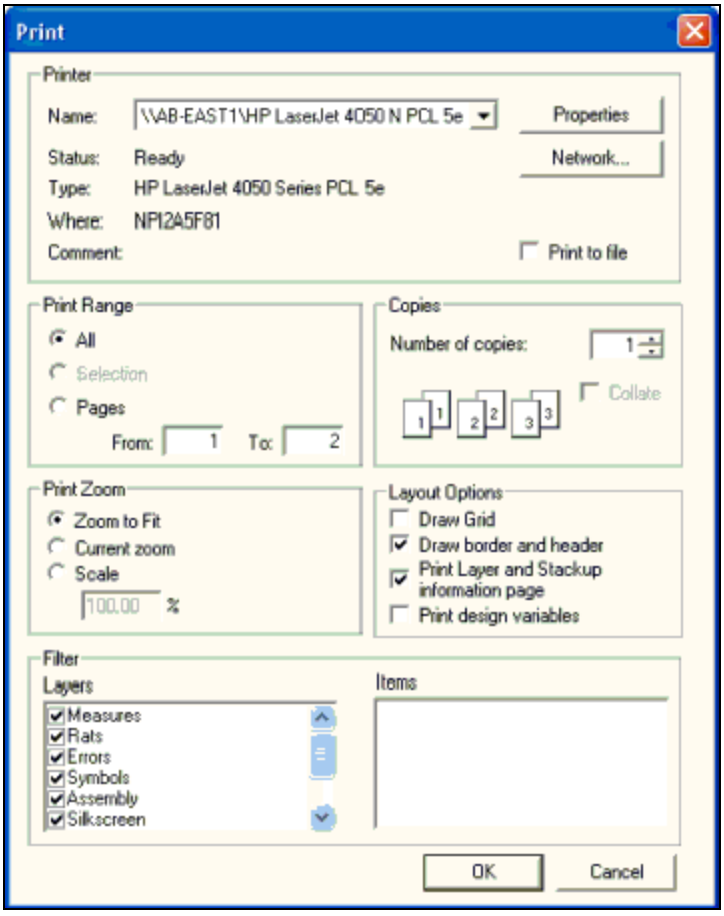
   The result details can be viewed in the **Message Manager**. Most geometry check results are displayed with a magnifying glass that can be clicked to zoom into the relevant area of the design. It may help to toggle layer and net visibilities when zooming into individual results.

Printing a Layout

To print the layout that is in the active window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select **File** > **Print** to open the Print window:



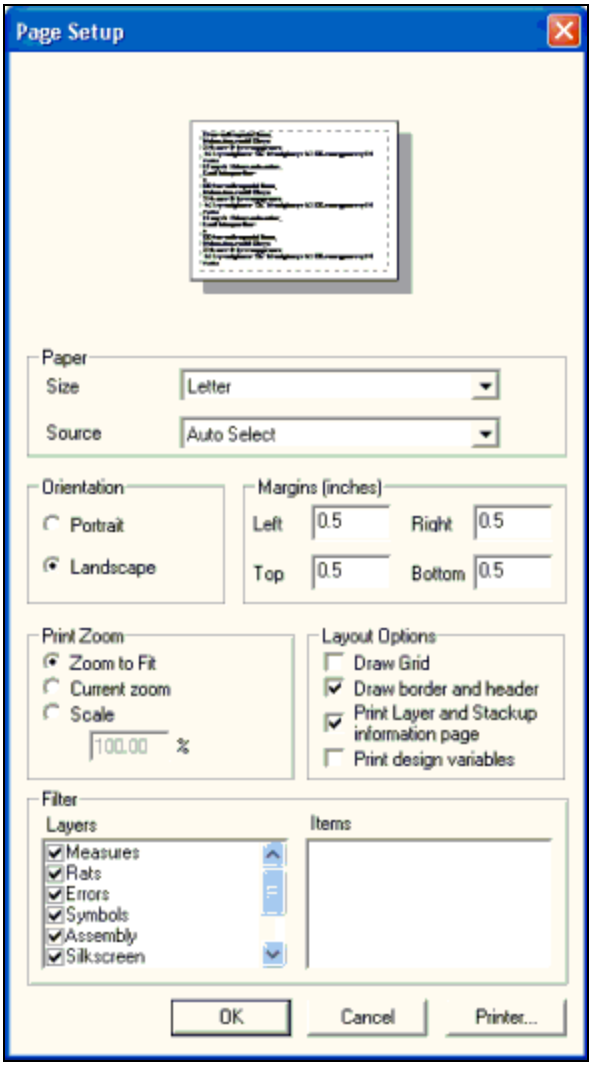
2. Use the **Print Range**, **Copies**, and **Print Zoom** controls to specify print preferences. From the **Layout Options** area, specify whether to draw the grid, border/header, the layer and stackup information, and design variables. From the **Filter** area, toggle the printing of any layer and selected items.
3. Click **OK** to print the layout and close the **Print** window.

Setting up the Page Layout

To set up the page layout before printing:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select **Page Setup** on the **File** menu to open the **Page Setup** window.



2. Use the **Paper**, **Orientation**, **Margins**, and **Print Zoom** controls to specify print preferences. From the **Layout Options** area, specify whether to draw the grid, border/header, layer and stackup information, and design variables. From the **Filter** area, toggle the printing of any layer and selected items.
3. Click **OK** to close the **Page Setup** window with your settings.
4. Select **Print Preview** on the **File** menu to see a preview of the print.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

8 - Assigning Materials

You can add, remove, and edit materials in two main ways:

- Using the **Tools** > **Edit Libraries** > **Materials** menu command.
- Under **Definitions** in the Project Manager, right-click **Materials** and select **Edit Library**.

Regardless of which of the preceding two methods you use to edit a library, any new material you create exists only in the current project. Similarly, if you edit an existing material, the edited version becomes a *Project* material and exists only within the current project. To make a new or modified material available for other projects, you must export it to a user library and choose that library (or select **Show all libraries**) within the **Select Definition** dialog box.

> **Note:**
>
> In the History Tree, by default, objects are grouped by material. You can easily change the default grouping. Using the menu bar, click **Modeler** > **History Tree Layout** and clear **Group Objects by Material** along with any other listed option you may wish to disable. You can also perform this action from the **Tree View** drop-down menu on the **View** ribbon tab or from the shortcut menu that appears when you right-click most of the items in the History Tree.

If you check **Show Material Colors** on the Material Filters tab of the **Select Definition** or **Edit Library** dialog box, the **Materials** tab will include a **Color** column showing a color swatch for each listed material.

You can edit the color and transparency values for materials in the View/Edit Material dialog box.

Solving Inside or on the Surface

When you assign a material to an object, you can specify whether to generate a field solution inside the object or on the surface of the object. If you elect to generate a solution inside the object, a mesh is created inside the object and generate a solution from the mesh. If you elect to generate a solution on the surface of the object, only a surface mesh is created for the object.

If you want a solution to be generated inside an object, select **Solve Inside** in the **Properties** window. Conversely, if you want a solution to only be generated on the surface of an object, clear the **Solve Inside** option in the **Properties** window.

Assigning DC Thickness

The **Assign DC Thickness** option allows you to more accurately compute the DC resistance of a thin conducting object for which Solve Inside is not selected. Skin impedance of the object will

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

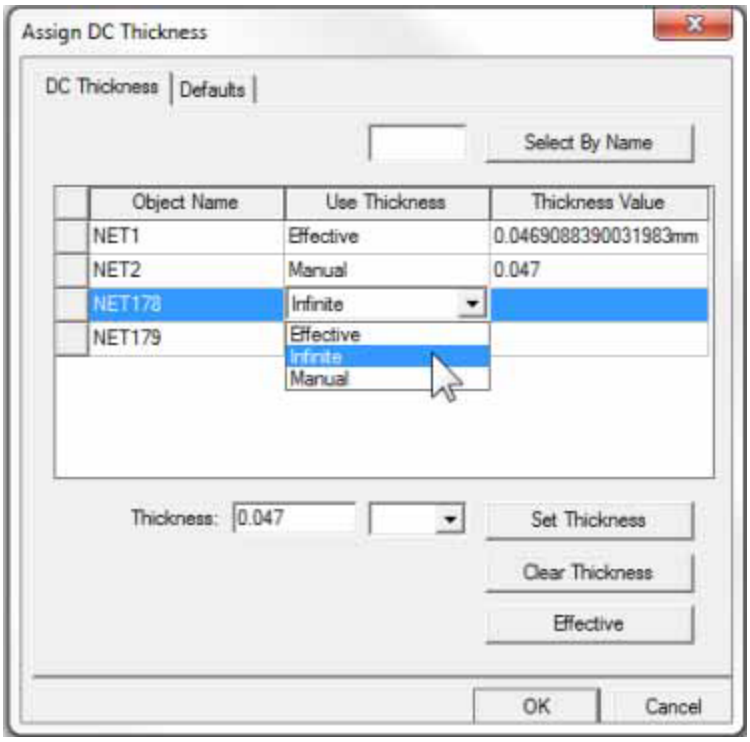
be calculated using the defined finite thickness, which can be Automatic (the default), Manually assigned per object, or Infinite per object. This option also exists for finite conductivity boundaries.

The **Assign DC Thickness** option on the **Boundaries** menu is enabled if at least one object contains a good conducting isotropic material (such as copper), and the **Solve Inside property** is not selected. If the object meets these conditions, you can assign a DC thickness, either by enabling the automatic default, or by specifying a value for a selected object.

To see the **Assign DC Thickness** dialog box:

1. Select **HFSS 3D Layout** > **Boundaries** > **Assign DC Thickness**.

   This displays the **Thickness of Objects for DC Resistance** dialog box with the DC Thickness tab selected. Objects to which the thickness can be applied are listed in the **Object Name** column.



2. Select the objects to assign a value. You can select objects either by:

- Clicking on the **Object Name** to highlight it.
- Use the **Select By Name** field to type the object name, and click **Search**.

  The first object to match the name is highlighted.

Selecting an object highlights the **Thickness** field and the **Set Thickness** button.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. In the Use Thickness column, you can specify that the value the object uses is Automatic, Infinite, or Manual.

You can disable automatic assignment on the **Defaults** tab of the **Assign DC Thickness** dialog box. The Automatic value is calculated as Thickness ~ 2* Volume / Surface Area

It should be noted that this is a calculation for an "effective" DC thickness to be used by the correction calculation. For a "thin" object this will work well. For example, a rectangular microstrip trace described by a box with dimensions 100 by 10 by 1 the volume is 1000 and the surface area is 2220 resulting in an apparent thickness of .9009, close to the geometric thickness of "1". For arbitrary shapes of "thicker" objects, this calculation will not work as well. For example, a cube with sides of 1 will have volume of 1 and surface area of 6, and a resulting apparent thickness of .3333. Another example is the case of a cylindrical wire (e.g., bond wire).

In this case, the automatic effective DC thickness will be about R_o, which gives us the best approximation of the DC resistance of a cylindrical wire.

The intention is that the auto-thickness will provide an accurate representation the majority of the time and is superior to not using any DC thickness setting. When the automatic value is not appropriate, you can override it using the manual technique.

DC thickness impedance is an approximation. It is accurate just for TE/TM waves when the widths are infinite which clearly never occurs in a "real" design. The fact that the object is finite causes an increase of the effective impedance due to current crowding/edge effects. Thus entering the exact geometrical thickness would actually underestimates the impedance. By returning a DC thickness smaller than the geometric thickness the automatic DC thickness compensates for this underestimation resulting in a slightly higher impedance as desired.

4. To manually apply a value, enter a **Thickness** value, select the units and click the **Set Thickness** button.

This applies the value to the selected object and changes the **Use Thickness** selection for that object to **Manual**.

Note:

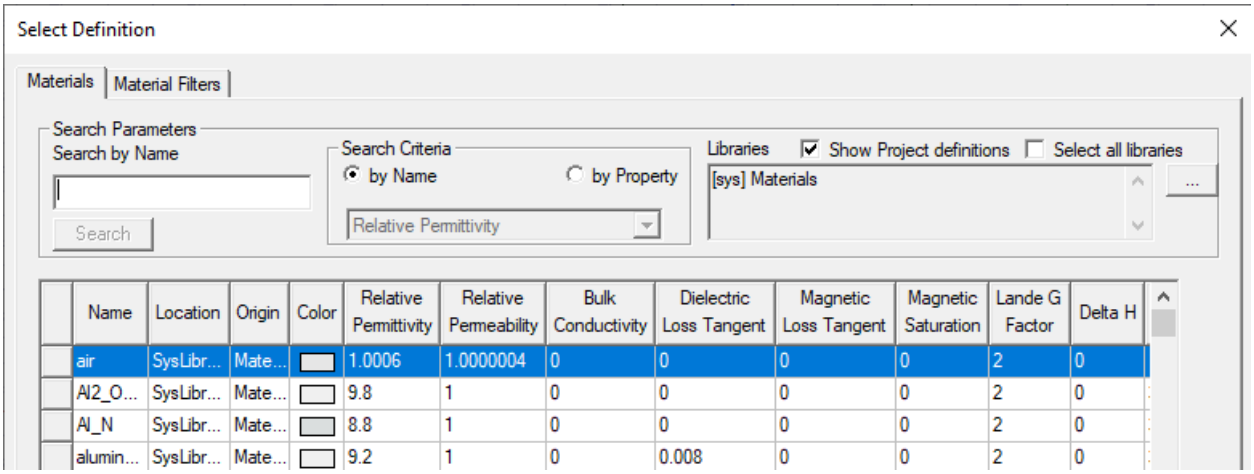
If you enter a “0” for the thickness, HFSS gives a warning that this will cause infinite impedance that causes isolation.

5. To change the value, select the **Clear Thickness** button and then enter a different value. You can also manually select or deselect the box and manually enter or delete a thickness value in the table.
6. When you have assigned the values you need, click **OK** to close the dialog box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Searching for Materials

You can search for materials in the **Select Definition** dialog box. The default Search Criteria is **by Name**, which is shown in the following example. Alternatively, you can choose to search by Property.



To search for a material **by Name**:

1. Access the **Select Definition** dialog box using one of the following methods:

   With one or more objects selected (that is, to assign a material to selected objects):

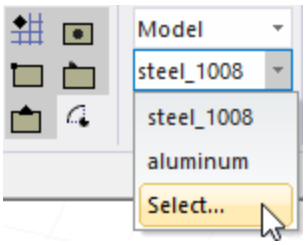
   - Click **Modeler** > **Assign Material**
   - Click the **Material** *value* in the docked **Properties** window, and select **Edit...** from the drop-down menu.

   - On the **Draw** ribbon tab, click **Assign material**.

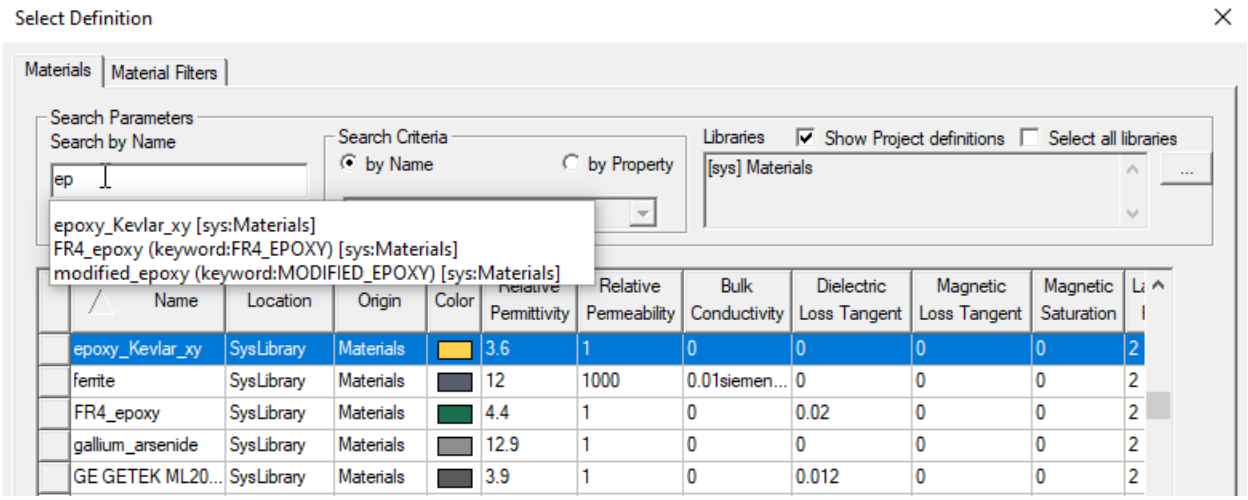
   With nothing selected (that is, to set the default material):

   - On the **Draw** ribbon tab, choose **Select** from the **Default material** drop-down menu:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. In the **Search Criteria** section, ensure that **by Name** is selected, and in Libraries, specify the Libraries that you want to search. Only loaded libraries participate in text and keyword matching.
3. In the **Search by Name** text box, type a portion of the desired material name. The search text is case-insensitive.



A drop-down menu under the Search Parameters field will show the a list of the materials from selected libraries matching any part of the current text, and, if the Granta Materials library is selected, matching keywords in the material definitions. The first row containing the material name most similar to the characters you typed will be selected.

If the selected material is not the one you are searching for, do one of the following:

- Use the keyboard's arrow keys to select the material above or below the currently selected row.
- Use the scroll bar to scroll the listed materials upward or downward and click the desired material when it is visible.
- Type different characters in the **Search by Name** text box.

When the **Select all libraries** option is selected, the window lists all of the materials in Ansys Electronics Desktop's global material libraries that are applicable to the current design type as well as those in the project's local materials library. The Granta Materials

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Data for Simulation library now includes keywords that are used in the auto-complete matching. For example, entering "glass" will generate an auto-complete list of all materials with a name containing "glass" or with a keyword that contains "glass", all case-insensitive, for materials showing in the grid. The drop down of potential matches under the search field applies to all libraries. What shows in the grid is defined by which libraries are selected, what material filters are selected, project/design-specific validation, and whether project materials are selected for display.

Searching by Material Property

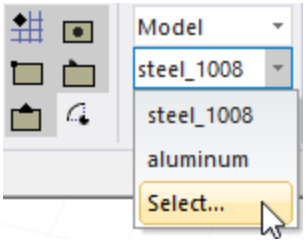
1. Access the **Select Definition** dialog box using one of the following methods:

   With one or more objects selected (that is, to assign a material to selected objects):

   - Click **Modeler** > **Assign Material**.
   - Click the **Material** *Value* in the docked *Properties* window, and select **Edit...** from the drop-down menu.
   - On the **Draw** ribbon tab, click **Assign material**.

   With nothing selected (that is, to set the default material):

   - On the **Draw** ribbon tab, choose **Select** from the **Default material** drop-down menu:



2. In the **Search Criteria** section, select **by Property**.
3. Select a material property from the drop-down menu:

> **Note:**
>
> By default, not all of the available properties are displayed in the materials table. Only the properties commonly used by the product are displayed in the table, though all properties are available in this drop-down menu. To view the complete table of properties, see Filtering Materials.

4. In the **Search Parameters** area, type a numerical value in the **Search by Property** text box and then click **Search**.

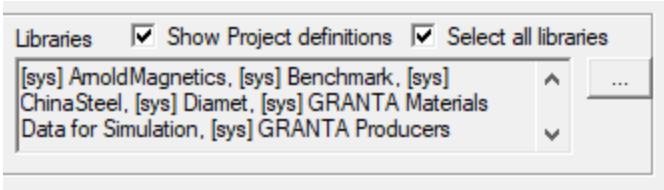
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The materials are sorted according to the property you selected. Additionally, the material with the property value closest to the one you typed, but without exceeding it, is selected.

If the selected material is not the one you are searching for, do one of the following:

- Use the keyboard's arrow keys to select the material above or below the currently selected row.
- Use the scroll bar to scroll the listed materials upward or downward and click the desired material when it is visible.
- Type a different numerical in the **Search by Property** text box and click **Search** again.

When the **Select all libraries** option is selected, the window lists all of the materials in Ansys Electronics Desktop's global material libraries that are applicable to the current design type as well as those in the project's local materials library.



Adding New Materials

You can add a new material to a project or global user-defined material library. To make the new project material available to all projects, you must export the material to a global user-defined material library.

Materials are added using the **View/Edit Material** dialog box, which can be opened from either the **Select Definition** window or the **Edit Libraries** window.

To open the **Select Definition** window:

- Click **Modeler** > **Assign Material**.

  The **Select Definition** window appears.

To open the **Edit Libraries** window:

- Click **Tools** > **Edit Libraries** > **Materials**. In the project tree, you can also right-click **Materials**, and select **Edit Library**.

  The **Edit Libraries** window appears.

To add a new material:

1. From either the **Select Definition** window or the **Edit Libraries** window, click **Add Material**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **View/Edit Material** dialog box appears.

By default, only properties commonly used by the selected product are displayed. To view the complete table of properties, see Filtering Materials.

2. Type a name for the material in the **Material Name** text box, or accept the default.
3. Use the radio buttons in the **View/Edit Material for** section to specify whether the new materials apply to Active Design, Active Project, or All Properties. When **All Properties** is selected, **Physics** classification options are enabled to show or hide properties based on simulation type (Electromagnetic, Thermal, or Structural).

> **Note:**
>
> If a material is edited in a design type for which the **Physics** type has not been set (e.g., an design but physics type was not set), the **Physics** type will be automatically set in the material.

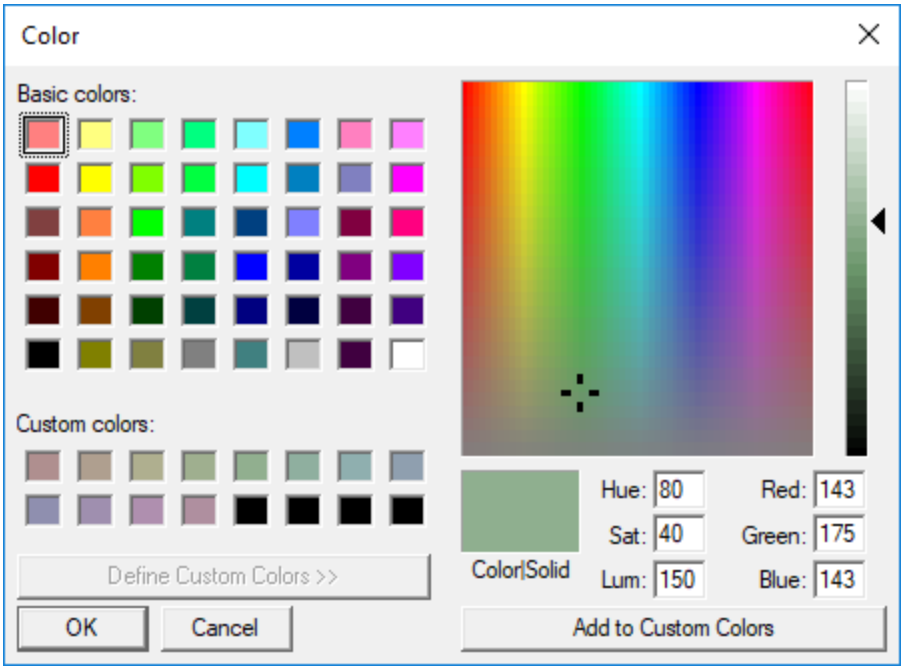
You can also enable the View/ Edit Modifier check box for Thermal Modifier. Checking this box causes the Thermal Column to display at the right side of the Properties of the Material table. Selecting **Edit** rather than None causes display of the Edit Thermal Modifier dialog.

4. Enter a **Material Name**, or accept the default.
5. For each available material property, select a **Type** from the drop-down menu. Only applicable types appear for each material property. Some properties only use the Simple type, while others offer four or more types.
6. nter a **Value** for the following material properties:

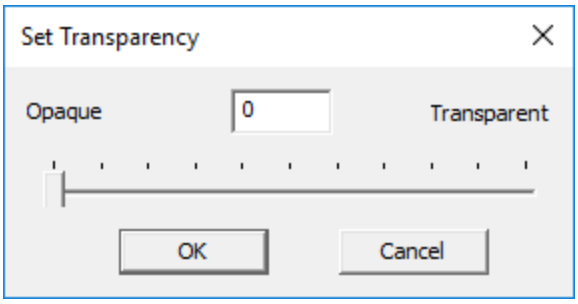
> **Note:**
>
> You may enter a variable name or mathematical expression in the **Value** box.

7. If one or more of the material properties are dependent on frequency, click **Set Frequency Dependency**, and then follow the directions for defining frequency dependent materials.
8. To modify the units for a material property, double-click the **Units** box and select a new unit system.
9. For Material Appearance, you can check the box to enable the fields for you to specify a color and transparency. Clicking the color bar opens a color selection window:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

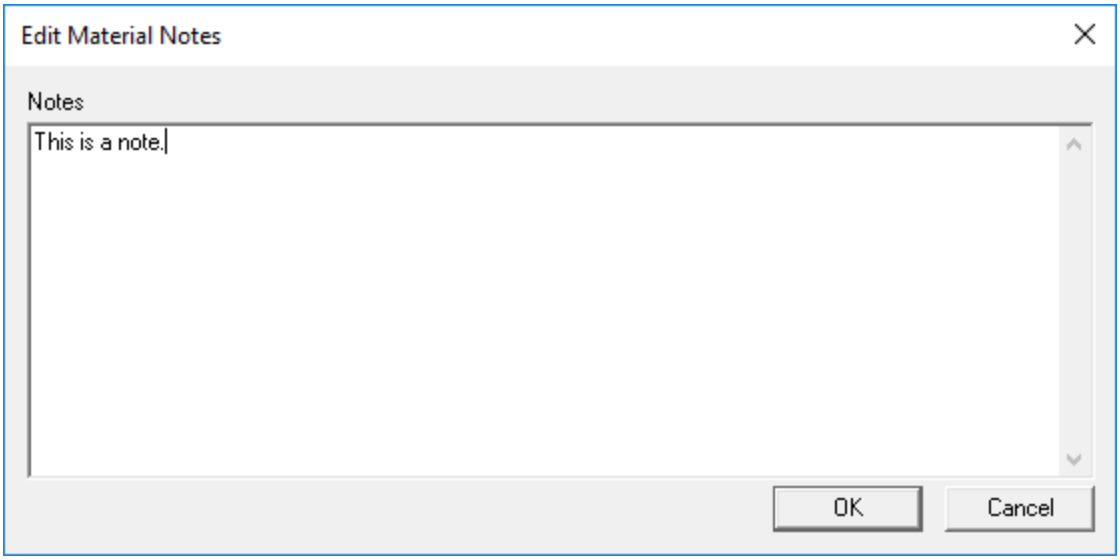


10. Clicking the Transparency box opens a Transparency dialog box with a text field and slider bar for selection.



11. Click **OK**.
12. To modify the units for a material property, double-click the **Units** box and select a new unit system.
13. Click **OK**.
14. If you want to add descriptive notes for the new material, click the ellipsis button [...] next to the **Notes** field. This opens a dialog box in which you can enter text.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



15. Click **OK** to add the Notes.
16. Click **OK** on the **View/Edit Materials** dialog to add the new material to the material library.

Assigning Material Property Types

Material properties can be assigned using the **View/Edit Material** dialog box, using one of the following material property types, based on the applicability to the material property:

Simple	The material is homogeneous and linear.
Anisotropic	The material's characteristics vary with direction. This models only the diagonal.
Tensor	A full 3x3 matrix general tensor, which may or may not be symmetrical.
Nonlinear	A BH Curve.

Select a material property type for each property from the **Type** drop-down menu. Some properties only use the Simple type

If the material property is anisotropic, its characteristics are defined by its anisotropy tensor. You must define three diagonals for anisotropic . Each diagonal represents a tensor of your model along an axis.

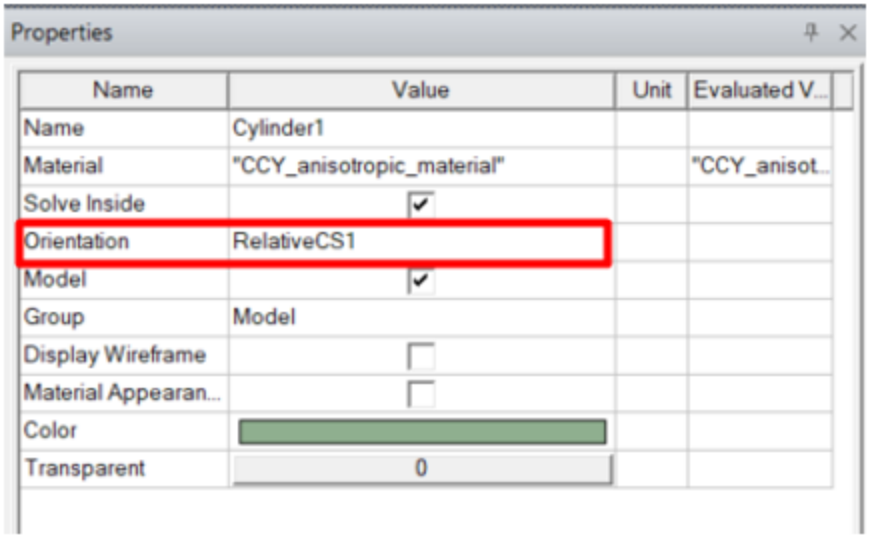
These tensors are relative to the coordinate system specified as the object's Orientation property. By specifying different orientations, several objects can share the same anisotropic material but be oriented differently.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Defining Anisotropic Tensors

If a material property is anisotropic, its characteristics are defined by its anisotropy tensor. Each diagonal represents a tensor of your model along an axis. These tensors are relative to the coordinate system specified as the object's *Orientation* property (when supported). Otherwise, the tensors conform to the global Cartesian coordinate system. By specifying different orientations, several objects can share the same anisotropic material but be oriented differently. Spherical and Cylindrical tensors must be converted to Cartesian coordinates, as described below. In such cases you must specify the coordinate system carefully.

> **Note:** Spatial-dependent material properties are calculated according to coordinates in the 'Orientation CS'.This CS should be set carefully.



> **Important:**
>
> Anisotropic materials are supported in 2D models but are not available for Q3D.

Assigning Anisotropic Tensors

To assign anisotropic tensors to :

1. From the **View/Edit Material** window, use the **Type** drop-down menu to select **Anisotropic**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. For each of the new anisotropic property rows, use the **Type** drop-down menu to select either **Simple** or **Nonlinear** (when supported). This setting determines the type of **Value** you can enter.
3. In the **Value** field, enter the . along each axis of the material's tensor.
4. Click **OK** to save the values and return to the **Select Definition** window.

Defining Variable Material Properties

When defining or modifying a material's properties, each material property value in the **View/Edit Material** dialog box can be assigned a project variable. Simply type the project variable's name in the appropriate **Value** box. Project variables are used for material properties because materials are stored at the project level.

For example, define a project variable with the name and define its value as **4**. To assign this property value to a material, type in the box for the material. Be sure to include the prefix **$** before the project variable name, which notifies the software that the variable is a project variable.

> **Note:**
>
> By default, not all of the available properties are displayed in the materials table. Only the properties commonly used by the product are displayed. To view the complete table of properties, see Filtering Materials.

Defining Frequency-Dependent Material Properties

HFSS provides several frequency-dependent material models. The Piecewise Linear and Frequency Dependent Data Points models apply to both the electric and magnetic properties of the material. However, they do not guarantee that the material satisfies causality conditions, and so they should only be used for frequency-domain applications.

The Debye and Djordjevic-Sarkar models apply only to the electrical properties of dielectric materials. These models satisfy the Kramers-Kronig conditions for causality, and so are preferred for applications (such as TDR or Full-Wave Spice) where time-domain results are needed. The Design Settings also include an automatic Djordjevic-Sarkar model to ensure causal solutions when solving frequency sweeps for simple constant material properties.

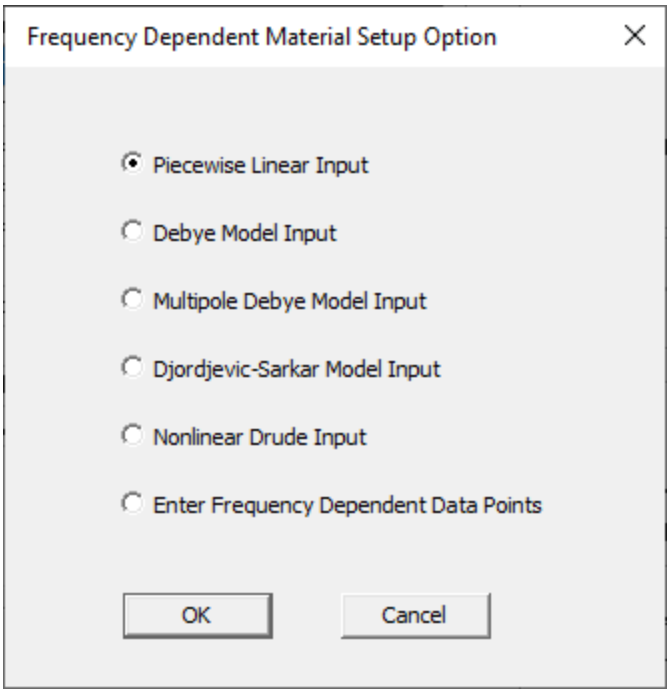
In HFSS, you can assign conductivity either directly as bulk conductivity, or as a loss tangent. This provides flexibility, but you should only provide the loss once. The solver uses the loss values just as they are entered.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Assigning Frequency-Dependent Properties

1. From the **Select Definition** window, select a material and click **View/Edit Material**.
2. Click **Set Frequency Dependency**.

   The **Frequency Dependent Material Setup Option** dialog box appears.



The options are:

- **Piecewise Linear Input** – defines the material property values as a restricted form of piecewise linear model with exactly 3 segments (flat, linear, flat). You specify the property's values at an upper and lower corner frequency. Between these corner frequencies, HFSS linearly interpolates the material properties; above and below the corner frequencies, HFSS extrapolates the property values. This dataset can be modified with additional points if desired.
- **Debye Model Input** – a single-pole model for the frequency response of a lossy dielectric material. In some materials, up to about a 10-GHz limit, ion and dipole polarization dominate and a single pole Debye model is adequate. HFSS allows you to specify an upper and lower measurement frequency, and the loss tangent and relative permittivity values at these frequencies. You may optionally enter the permittivity at optical frequency, the DC conductivity, and a constant relative permeability.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Multipole Debye Model Input** – allows you to provide the data of relative permittivity and loss tangent versus frequency. Based on this data, the software dynamically generates frequency-dependent expressions for relative permittivity and loss tangent through the Multipole Debye Model. The input dialog plots these expressions together with your input data through the linear interpolations. The generated expressions provide the new value for the material properties of relative permittivity and loss tangent. Both the expressions and data triples can be saved and reloaded.
- **Djordjevic-Sarkar Model Input** – for low-loss dielectric materials (particularly FR-4) commonly used in printed circuit boards and packages. In effect, it uses an infinite distribution of poles to model the frequency response, and in particular the nearly constant loss tangent, of these materials. This allows you to enter the relative permittivity and loss tangent at a single measurement frequency. You may optionally enter the relative permittivity and conductivity at DC.
- **Nonlinear Drude Input** – Drude materials are now supported by the transient solvers, producing plasma density data within the material domains. This means that plasma density plots can be produced.
- **Enter Frequency Dependent Data Points** – allows you to enter, import or edit frequency dependent data sets for each material property. Any number of data points may be entered. This is an arbitrary piecewise linear model.

3. Select the input type and click **OK**.

   An input type-specific dialog box appears, based on your selection.

   Piecewise Linear Frequency Dependent Material Input, Debye Model Input, and Djordjevic-Sarkar Model Input remember the values previously used and also include plots to show the property curves in real time as changes to the input are made. Input values for each are saved as material attached data for the material being edited. These data items are saved with materials when they are written into a project file or exported to a material library. Note that when a frequency-dependent setup method is used and the values are pre-populated with saved data, the dialog box title will have "(Update)" appended.

After you have entered the data for your selection, you return to the **View/Edit Material** window. New default function names appear in the material property text boxes. HFSS automatically creates a dataset for each material property. Based on a varying property's dataset, HFSS can interpolate the property's values at the desired frequencies during solution generation.

To modify the dataset with additional points, see *Editing Datasets*.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Neither the piecewise nor the loss model asks for frequency-dependent conductivity because the constant sigma represents DC loss and the frequency-dependent loss tangent represents polarization losses.

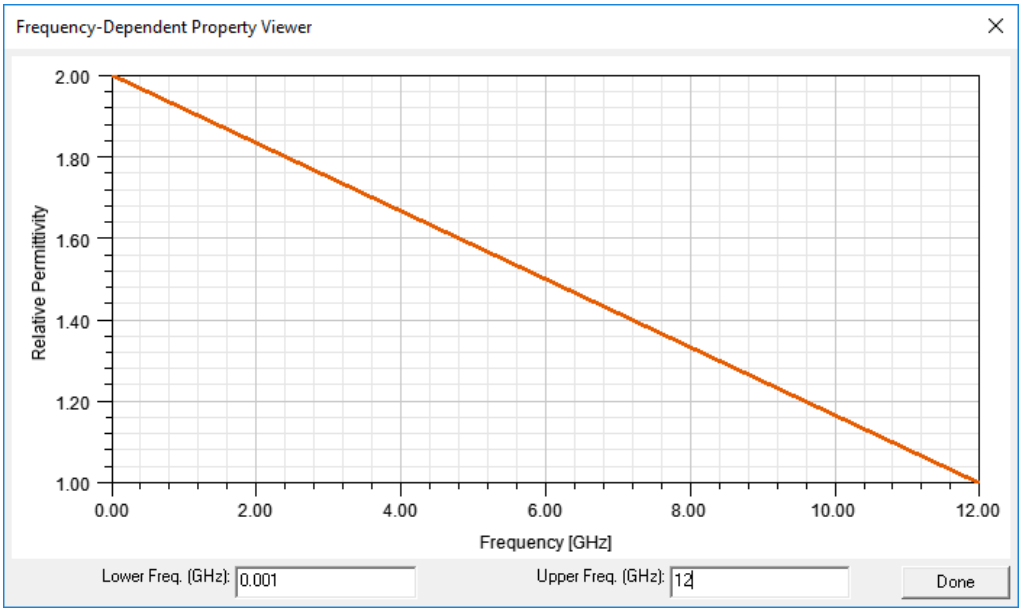
Frequency Dependence Visualization

When you view or edit material properties, it is important to have a sense of how properties may vary with frequency. Frequency-dependent properties come in a variety of forms, ultimately resulting in some value expression or dataset. Plots of properties as a function of frequency are available through the **View/Edit Materials** window.

To view the plot:

1. From the **Select Definition** window, select a material and click **View/Edit Material**.
2. Right-click a property (for example, relative permittivity or dielectric loss tangent), and select **View Property vs. Frequency**.

   The **Frequency-Dependent Property Viewer** appears, displaying the plot.



The window contains boxes where you can edit the frequency range for the plot. If the property was set by one of the nonlinear frequency setup methods, the frequency range will be derived from the data for that method, and edits to the lower/upper frequencies are not saved. Otherwise, the frequency range lower/upper frequency limit defaults are stored in the registry, and are updated if you modify the values. If values are not yet stored in the registry, the range

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

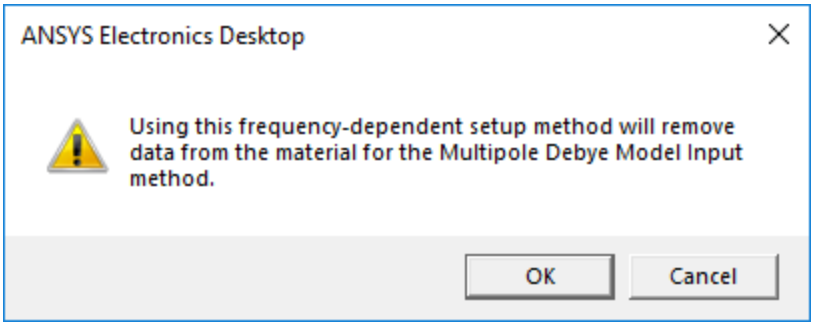
defaults to 1MHz-10GHz. Note that **the View Property vs. Frequency** menu option is not displayed for choice properties because frequency-dependence doesn't apply to those.

Saved Input Data Invalidation For Frequency-Dependent Setup

You will be prompted with a warning in two circumstances:

- Data associated with one of the frequency-dependent setup methods is attached to the material definition, and a property which would be set by this method is modified.
- Data associated with one of the frequency-dependent setup methods is attached to the material definition, and a different setup method is subsequently used.

You can choose **OK** to continue with the edit and remove the invalidated setup data, or choose **Cancel** to discard any changes.

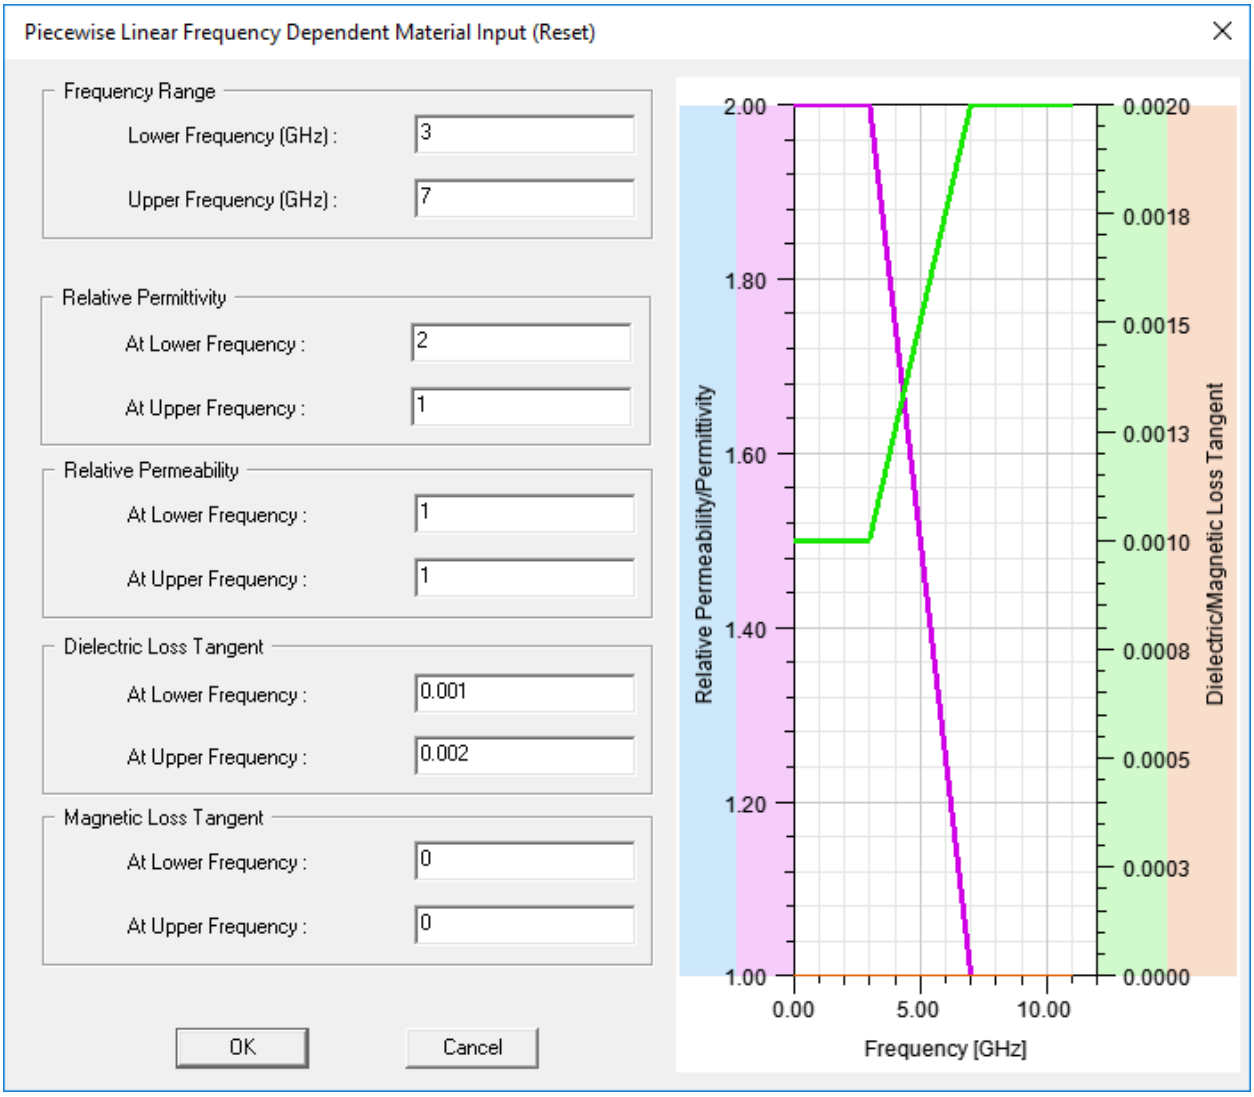


Assigning Frequency Dependent Material: Piecewise Linear Input

When you select **Piecewise Linear Input** as the model for the frequency dependent material property, the **Piecewise Linear Frequency Dependent Material Input** window appears.

From this window, you can enter material property values and view a property vs. frequency plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Use the fields to enter lower and upper frequency values for:

- **Frequency Range** – assumes that the material's property values remain constant between these frequencies.
- **Relative Permittivity** – If the permittivity of the material does not vary with frequency, enter the same value you entered for the Frequency Range Lower Frequency.
- **Relative Permeability** – If the permeability of the material does not vary with frequency, enter the same value you entered for the Frequency Range Lower Frequency.
- **Dielectric Loss Tangent** – If the dieletric loss tangent of the material does not vary with frequency, enter the same value you entered for the Frequency Range Lower Frequency.
- **Magnetic Loss Tangent** – If the magnetic loss tangent of the material does not vary with frequency, enter the same value you entered for the Frequency Range Lower Frequency.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

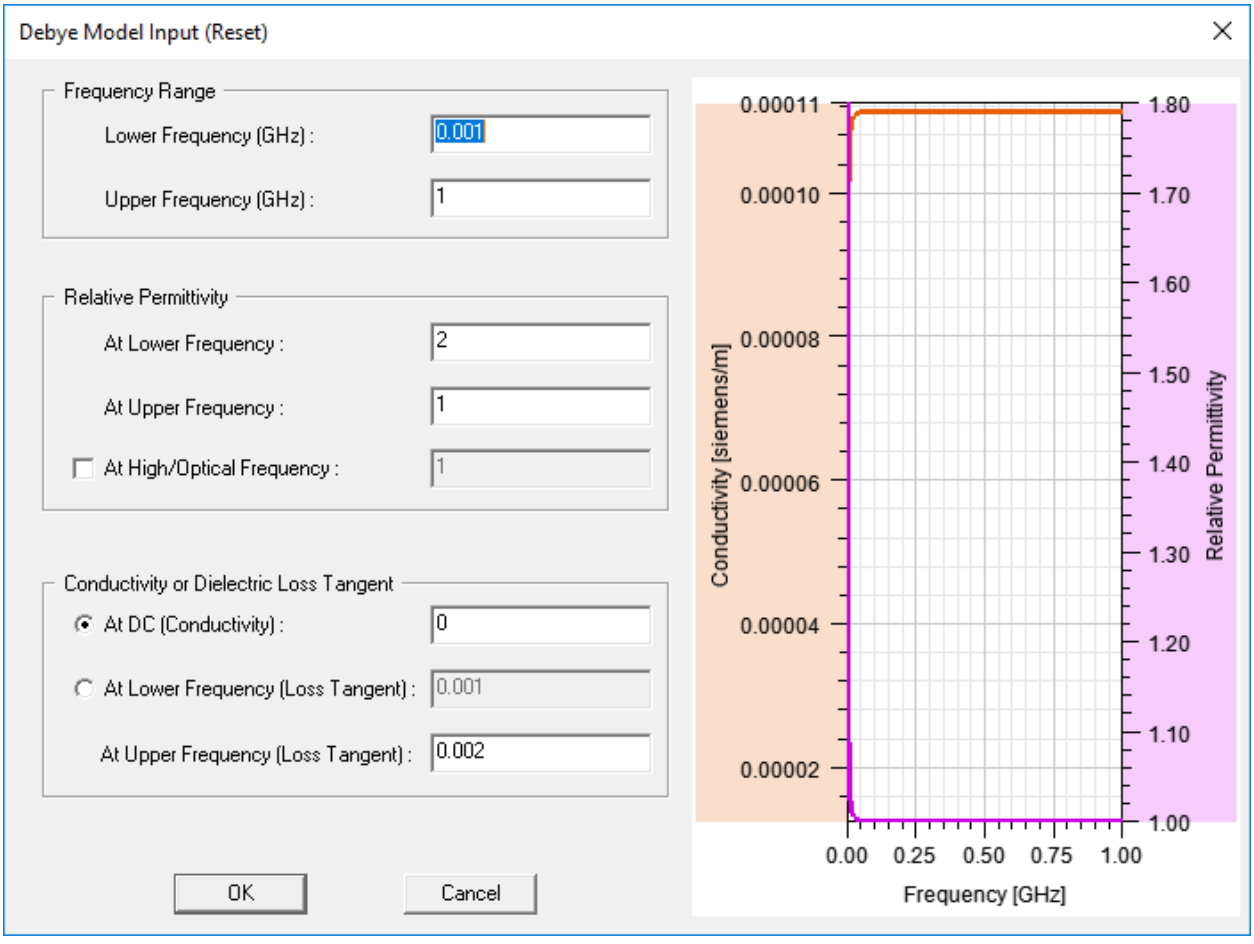
> **Note:**
>
> Neither the piecewise or the loss models ask for frequency dependent conductivity because there the constant sigma represents the DC loss and the frequency dependent loss tangent represents the polarization losses.

To modify the dataset with additional points, see Editing Datasets.

Assigning Frequency Dependent Material: Debye Model Input

When you select **Debye Model Input** as the model for the frequency dependent material property, the **Debye Model Input** window appears.

From this window, you can enter material property values and view a property vs. frequency plot.



Use the fields to enter lower and upper frequency values for:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Frequency Range** – assumes that the material's property values remain constant between these frequencies.
- **Relative Permittivity** – If the permittivity of the material does not vary with frequency, enter the same value you entered for the Frequency Range Lower Frequency. If you need to specify a value for At **High/Optical Frequency**, select the check box and enter a value.
- **Conductivity or Dielectric Loss Tangent** – Select either **At DC** to specify conductivity, or **At Lower Frequency** to specify Loss Tangent.

After you have entered the data for your selection, click **OK** to return to the **View/Edit Material** window. New default function names appear in the material property text boxes. A dataset is automatically created for each material property. Based on a varying property's dataset, can interpolate the property's values at the desired frequencies during solution generation.

To modify the dataset with additional points, see Editing Datasets.

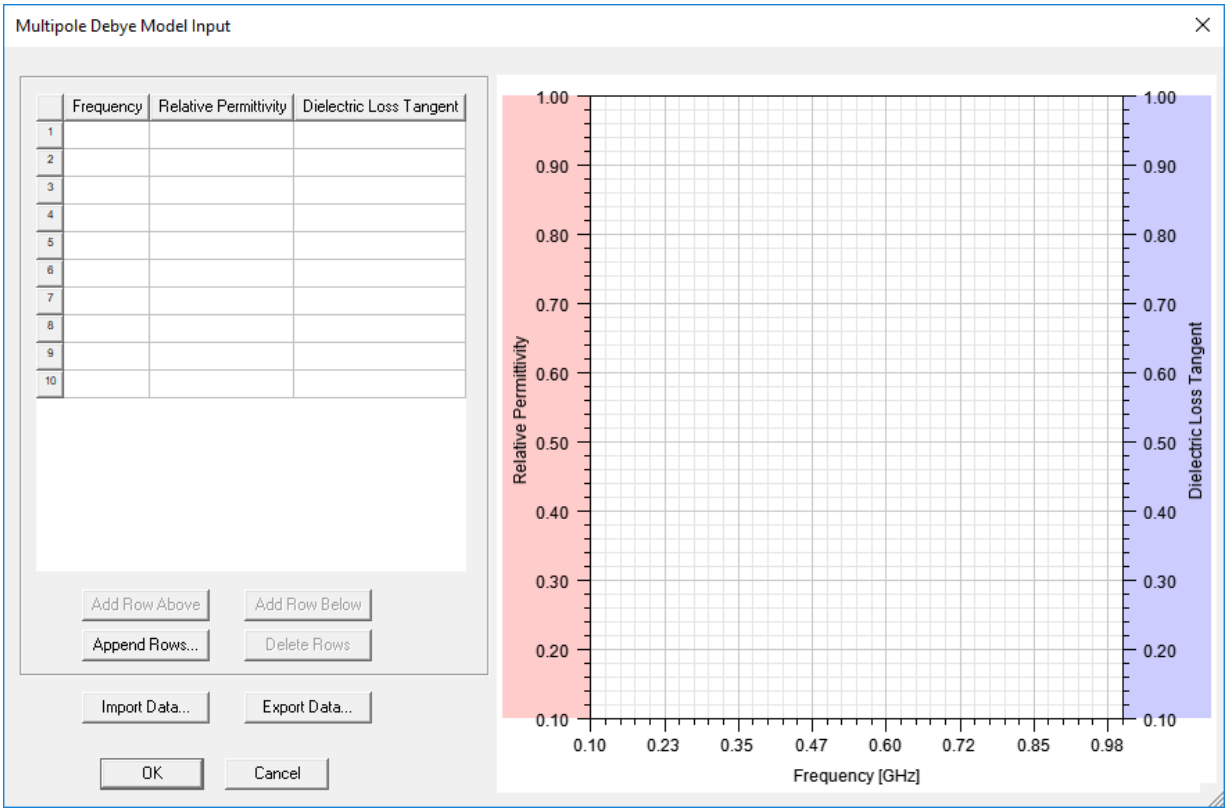
> **Note:**
>
> Neither the piecewise or the loss models ask for frequency dependent conductivity because there the constant sigma represents the DC loss and the frequency dependent loss tangent represents the polarization losses.

Assigning Frequency Dependent Material: Multipole Debye Model Input

When you select **Multipole Debye Model Input** as the model for the frequency dependent material property, the **Multipole Debye Model Input** window appears.

From this window, you can enter material property values and view a property vs. frequency plot.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The window contains a table that allows you to specify **Frequencies**, and the material's **Relative Permittivity** and **Dielectric Loss Tangent** at each frequency.

Note:

- The minimum value for Frequency is 0. There is no upper limit.
- The minimum value for Relative Permittivity is 1. There is no upper limit.
- The minimum value for Dielectric Loss Tangent is 0. There is no upper limit.
- To get good results, provide at least 5 frequency points.

Enter data values manually, or click **Import Data** to import data from a *.tab file.

Below is an example of the file format. Each row provides Frequency (assumed to be Hz), Permittivity, and Loss Tangent.

```
0.00001 3.8136 0.00128

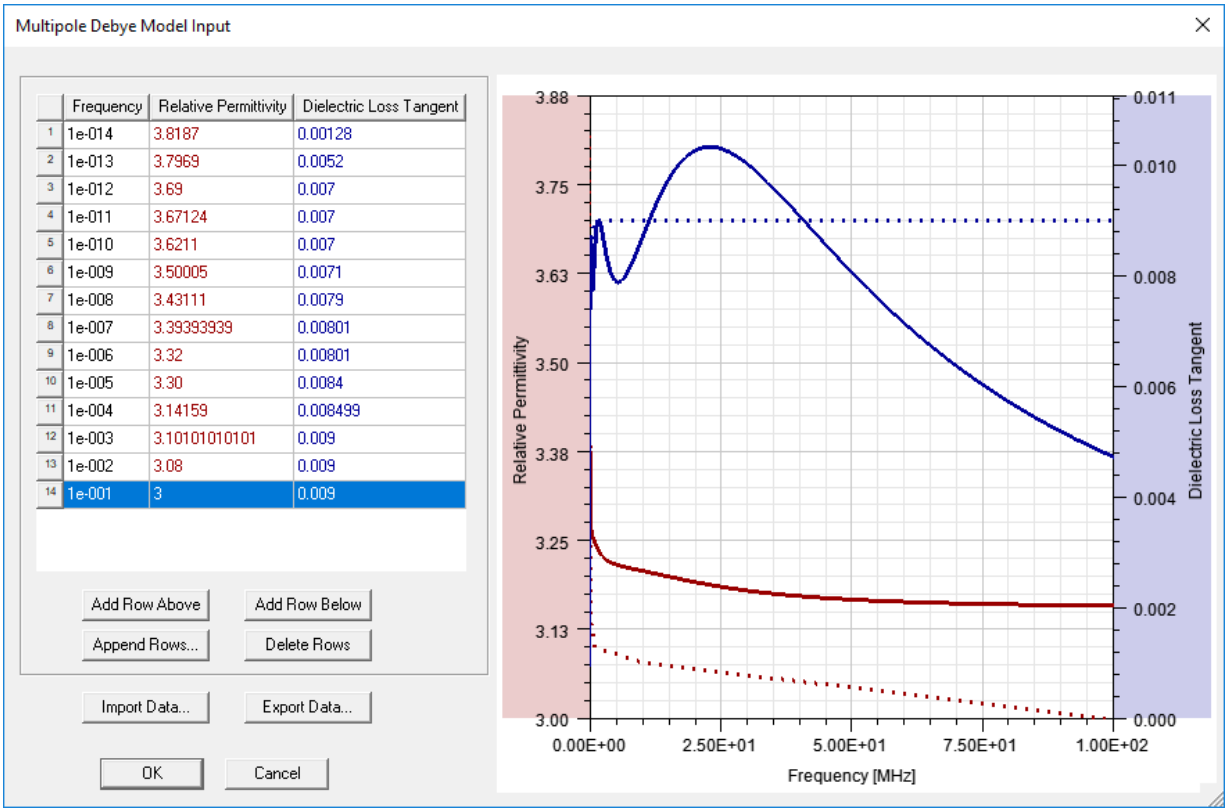
0.00010 3.7914 0.00520

0.00100 3.7500 0.00700
```

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
0.01000 3.7119 0.00700
0.10000 3.6742 0.00700
1.00000 3.6354 0.00700
2.15444 3.6346 0.00702
3.17000 3.6325 0.01073
4.64160 3.6186 0.01500
10.0000 3.5777 0.01750
21.5444 3.5458 0.01750
26.0000 3.5383 0.01750
46.4160 3.5148 0.01750
50.0000 3.5119 0.01750
```

As you enter data, the plot updates. The input data is linearly interpolated using the Multipole Debye model.



Double-click any plot element to change its properties (color, units, scaling, etc.).

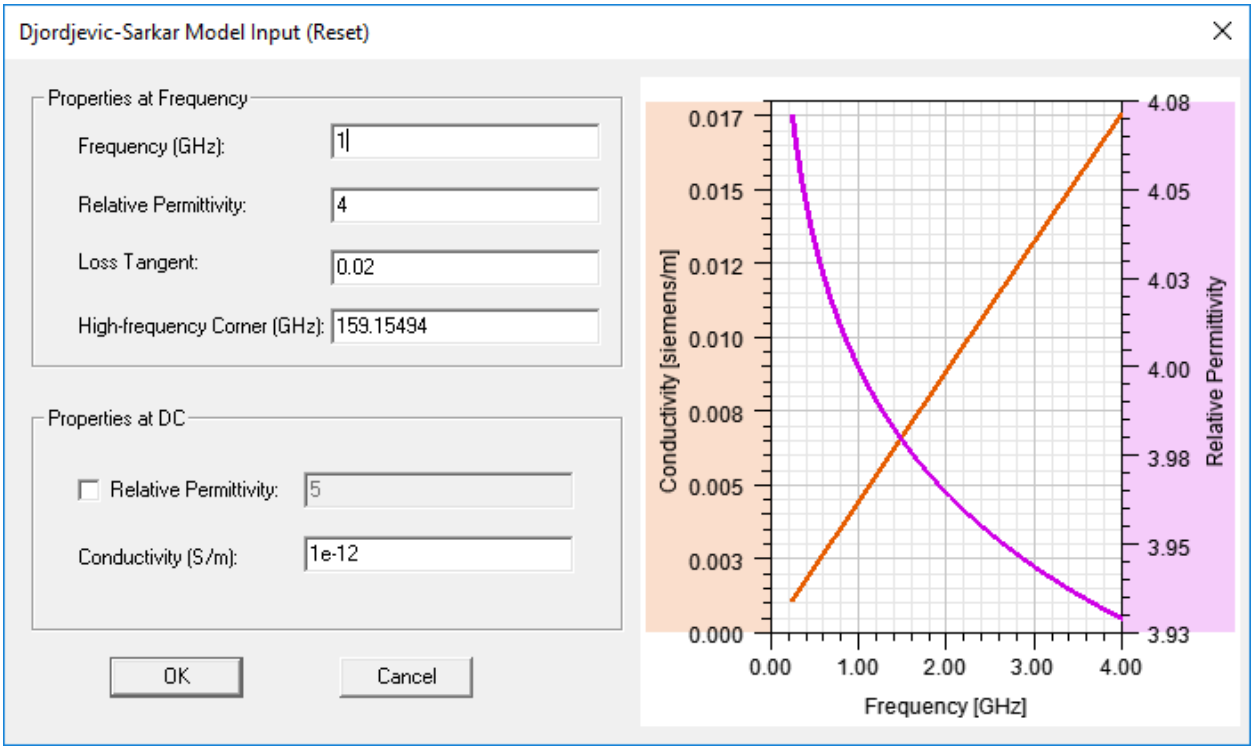
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To export the dataset in *.tab format for later use, click **Export Data**.

Assigning Frequency Dependent Material: Djordjevic-Sarkar Model Input

When you select **Djordjevic-Sarkar Model Input** as the model for the frequency dependent material property, the **Djordjevic-Sarkar Model Input** window appears.

From this window, you can enter material property values and view a property vs. frequency plot.



Use the fields to enter **Properties at Frequency** values:

- **Frequency**
- **Relative Permittivity**
- **Loss Tangent**
- **High-Frequency Corner** – the value of the High-frequency Corner should be at least 10 times higher than the Frequency. Reducing the upper corner frequency is not very attractive, because it has not been observed in experimental data. Therefore it is an upper bound on the loss tangents the Djordjevic-Sarkar model can handle. For technical details see *Technical Notes*: Djordjevic Sarkar Causal Dielectric Model.

Use the fields to enter **Properties at DC** values:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

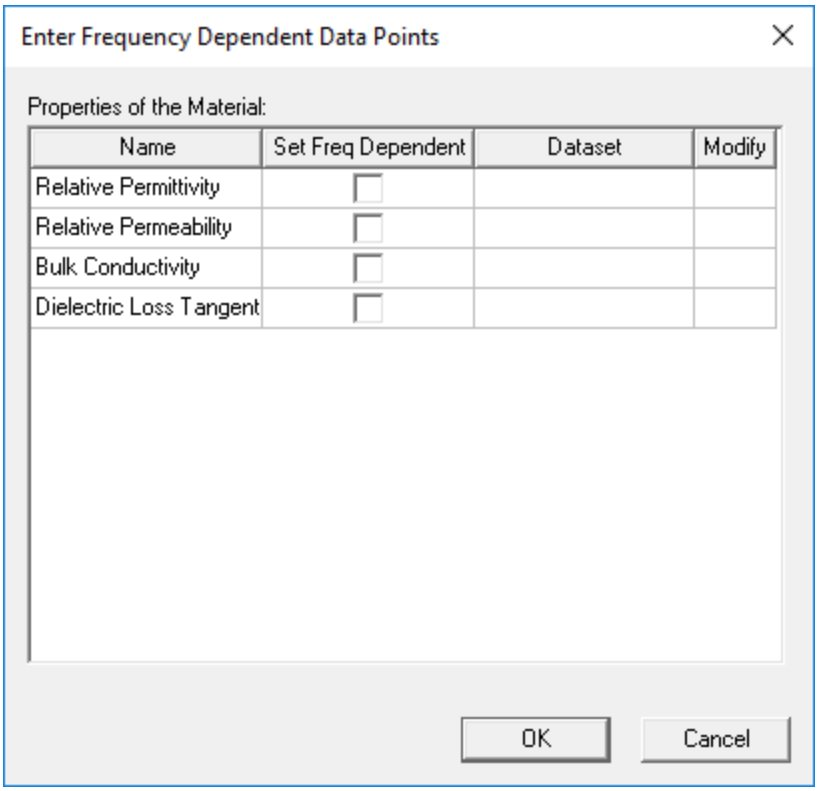
- **Relative Permittivity** – select the check box if you wish to specify relative permittivity.
- **Conductivity**

After you have entered the data for your selection, click **OK** to return to the **View/Edit Material** window. New default function names appear in the material property text boxes. A dataset is automatically created for each material property.

To modify the dataset with additional points, see Editing Datasets.

Assigning Frequency Dependent Material: Enter Frequency Dependent Data Points

When you select **Enter Frequency Dependent Data Points** as the model for the frequency dependent material property, the **Enter Frequency Dependent Data Points** window appears.

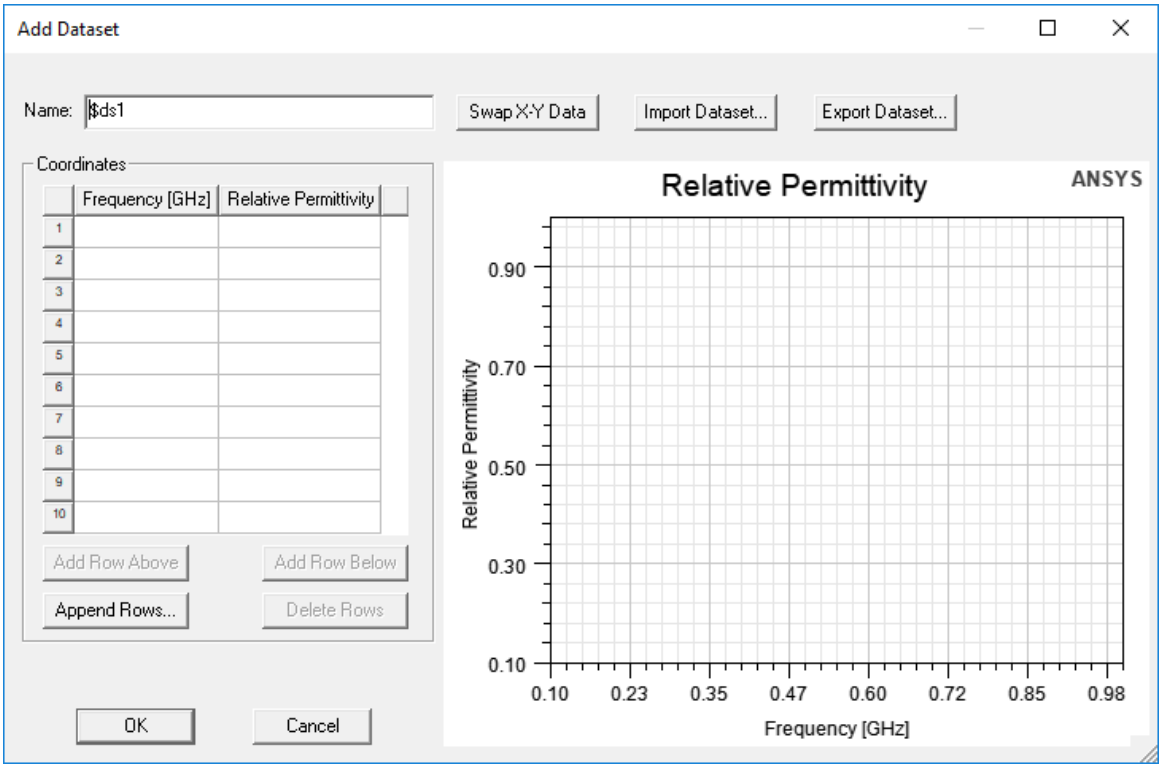


From this window, you can use datasets to set frequency-dependent material properties.

1. Select the **Set Freq Dependent** check box next to the property you wish to edit. This enables the **Dataset** field.
2. Click the property's **Dataset** field and use the drop-down menu to select **Add/Import Dataset**.

   The **Add Dataset** window appears.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



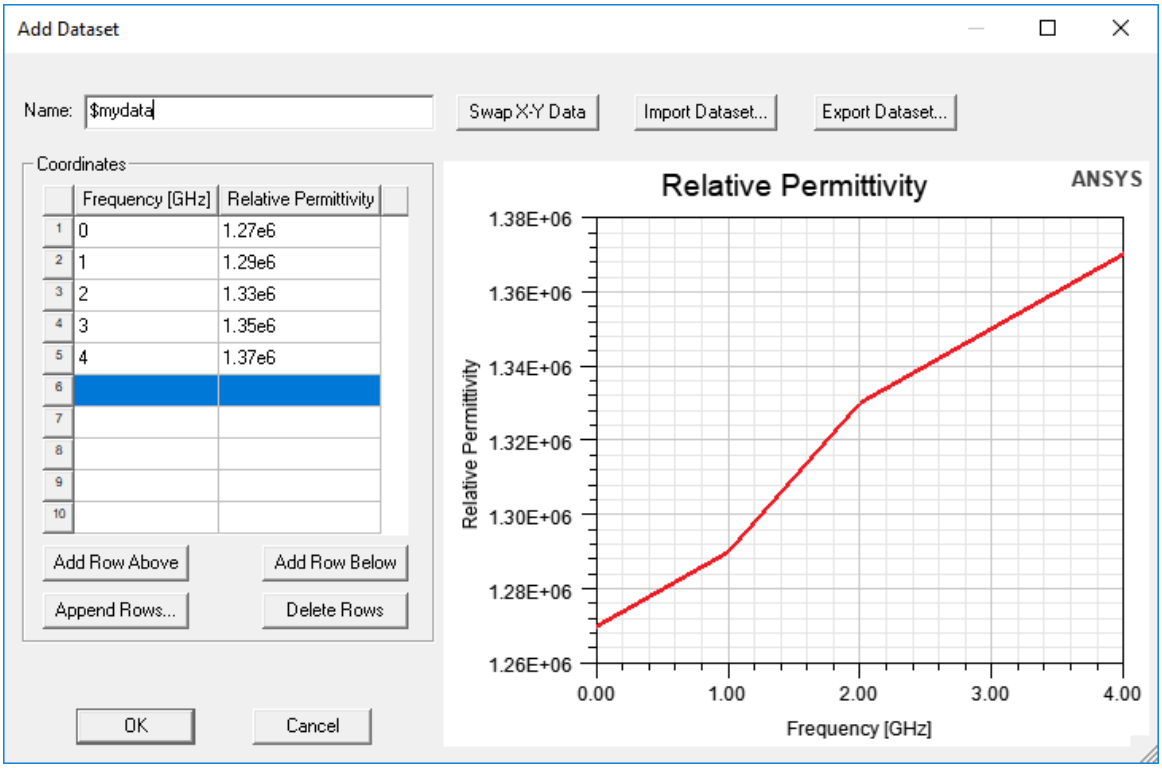
This window allows you to specify the following:

- **Name** – the default name is $ds1, but you can rename it. Note that the dollar sign ($) is automatically appended.
- **Coordinates** – contains a table that allows you to specify the Frequency (in GHz) and the specified material property's value at that frequency. Enter the data into the table manually, or click the **Import Dataset** button to populate it from a *.tab file.

You can also:

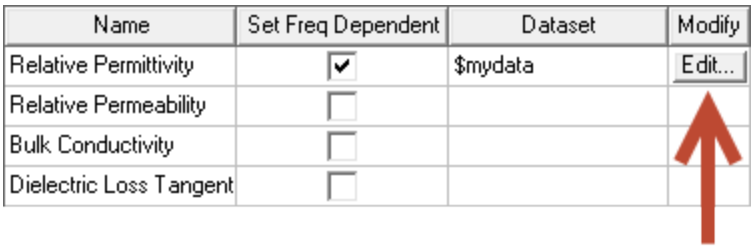
- Rearrange table items using the **Add Row Above**, **Add Row Below**, **Append Rows**, and **Delete Rows** buttons.
- **Swap X-Y Data**
- **Export Dataset** as a *.tab file for later import.
- View the table data as a plot on the right side of the window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. When you have finished adding points, click **OK**.

   You are returned to the **Enter Frequency Dependent Data Points** window, where the **Modify** field is now active. If you need to modify the dataset, click **Edit**.



4. Click **OK** again to return to the **View/Edit Material** window.

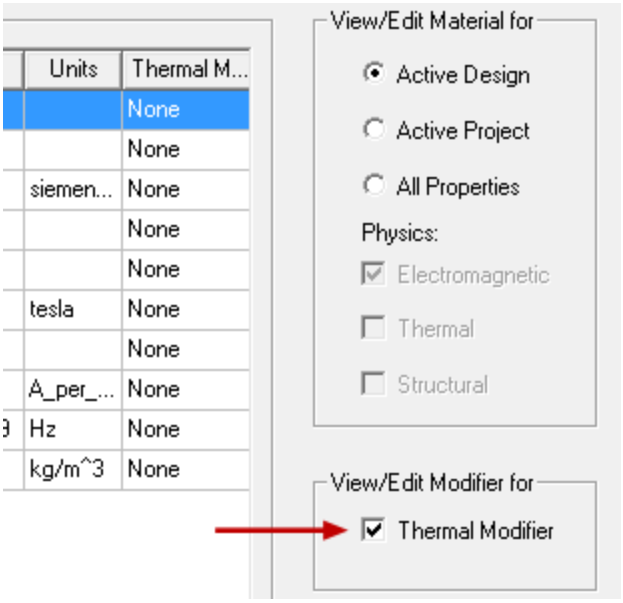
Specifying Thermal Modifiers

Thermal modifiers are multiplicative in nature and assigning them introduces spatial dependence. Because you cannot have spatial dependence and causality, Ansys Electronics Desktop ignores Auto Causal Materials options when a thermal modifier exists.

To specify thermal modifiers for a material:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

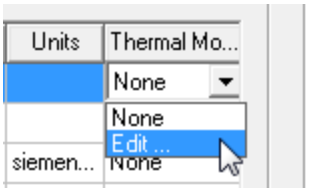
1. In the **View/Edit Material** dialog box, you must enable the **Thermal Modifier** check box:



This option causes the properties table to expand to include a Thermal Modifier column.

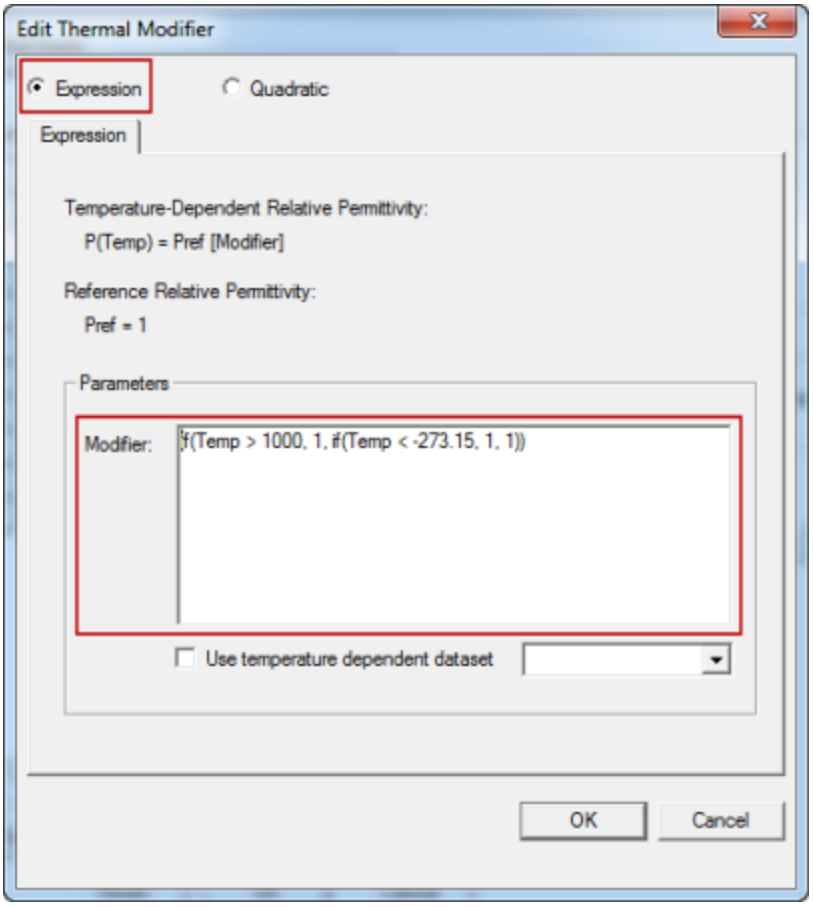
By default, the **Thermal Modifier** option is set to **None** for all material properties.

2. Click a **Thermal Modifier** cell and select **Edit...** from the drop-down menu:



The **Edit Thermal Modifier** dialog box appears with the **Expression** option selected.

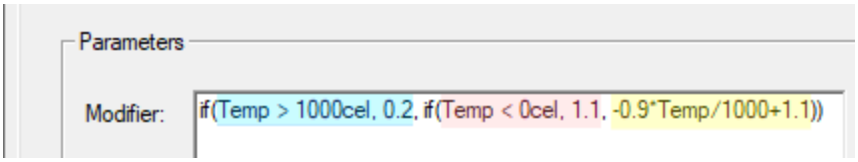
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



With this option selected, the **Modifier** text box is displayed under **Parameters**. This text box contains a conditional expression template, which you can use as a starting point for creating your own expression. The property for which the multiplier is being defined and its nominal value are indicated above the **Parameters** section.

- With **Expression** selected, you can write an equation for a thermal modifier in the **Modifier** text box.

  The following example defines a multiplier that varies linearly from 1.1 (at 0° C) to 0.2 (at 1000° C). The multiplier is constant at 1.1 for temperatures below 0° C and constant at 0.2 for temperature above 1000° C:

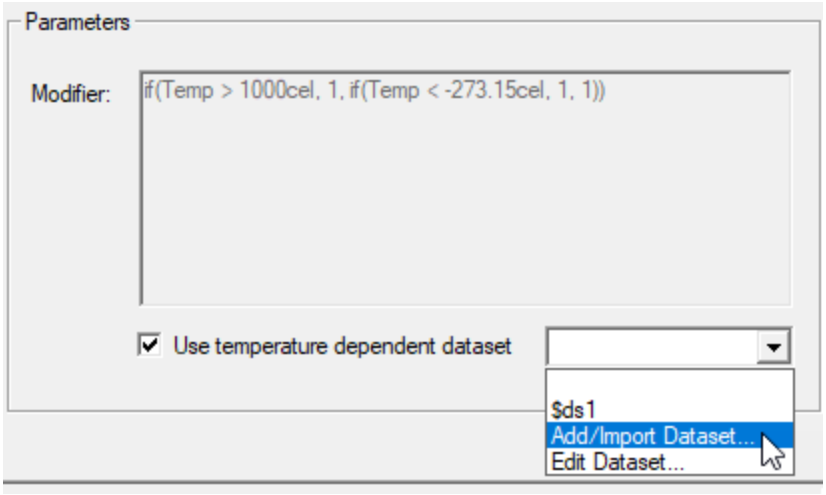


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In this example, the linear equation **-0.9 * Temp / 1000 + 1.1** (highlighted in yellow) defines the multiplier for the range 0° C ≤ Temp ≤ 1000° C.

The default unit of temperature in thermal modifier expressions is Celsius (cel). However, you can override the units by appending the appropriate abbreviation to the numbers in the expression (mkel, ckel, dkel, kel, cel, rank, fah). Model temperatures, material properties, and thermal modifiers need not have consistent units; values are converted automatically as needed.

- Check **Use temperature dependent data set** to disable the Modifier text box. You can then use the drop-down menu at the bottom-right corner of the dialog box to select an existing project dataset or to create a new one by choosing **Add/Import Dataset**.

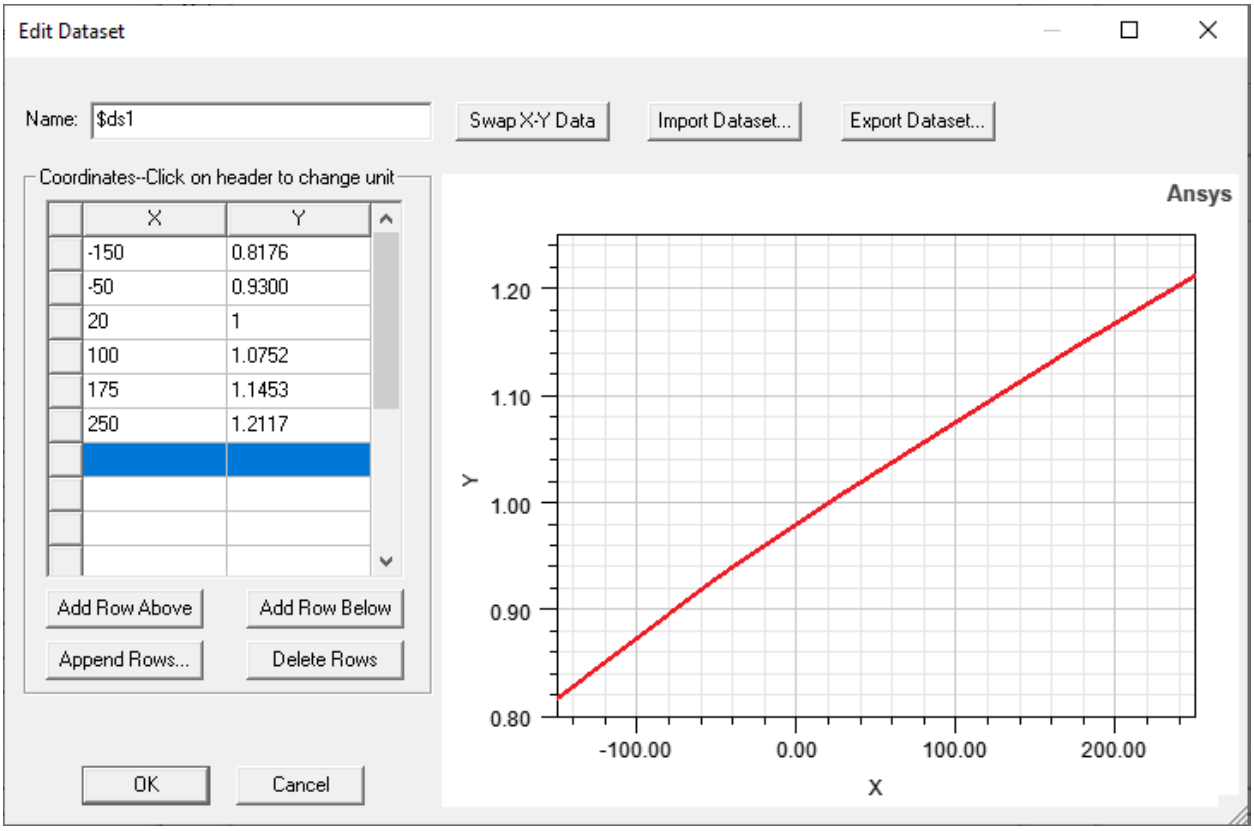


This command lets you define the thermal modifier dataset (a set of X and Y values). Alternatively, if a suitable project dataset already exists, it will be available for selection from the same drop-down menu.

When creating a new dataset, the **X** values are temperatures, and the **Y** values are the corresponding thermal modifiers. The value of the nominal material property is multiplied by this thermal modifier to determine the resultant property at a given temperature. The modifier is interpolated linearly between specified data points.

The following example is a dataset defining thermal multipliers for the thermal expansion coefficient (TEC) of an aluminum-beryllium alloy. The temperature range is -150 to 250° C, and the nominal value (corresponding to 20° C) is 1.37e-5/°C:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Based on these multipliers, the resultant TEC at -150° C is approximately 1.12e-5 (= 1.37e-5 * 0.8176), and the TEC at 250° C is 1.66e-5 (= 1.37e-5 * 1.2117).

In addition to filling the table of values manually, you can also **Import** an existing tab-delimited file to create the dataset.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

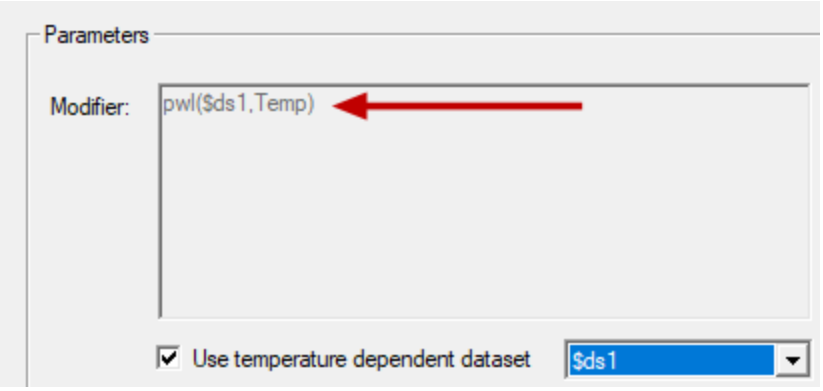
Important:

When you add a dataset from the **Edit Thermal Modifier** dialog box, you cannot specify the temperature units. The numbers in the **X** column will be interpreted as degrees Celcius and cannot be changed. Also, you cannot append a unit abbreviation (such as "fah" or "cel") to the numbers. You must enter temperature values in degrees Celcius for correct results. The values in the **Y** column are multipliers and therefore dimensionless.

Alternatively, you can create a dataset based on any desired temperature units before defining your temperature-dependent material properties. To do so, click **Project> Datasets** from the menu bar and then choose **Add**. If your project includes a design type that supports 3D datasets, a submenu appears offering a choice of a 1D or 3D dataset. If you see this choice, click **1D**. In either case, the **Add Dataset** dialog box appears.

For the dataset to be used later as a thermal modifier, you must click the **X** column header and choose **Temperature**. Then, click the **X** column header again and choose the desired temperature units. Finally, populate the table with your temperature and multiplier values and then click **OK** and **Done**. The dataset will now be available for selection from the drop-down menu in the **Edit Thermal Modifier** dialog box.

After choosing or creating a dataset, it appears in the **Modifier** field of the **Edit Thermal Modifier** dialog box, as shown in the following image:



The syntax of the dataset expression is explained as follows:

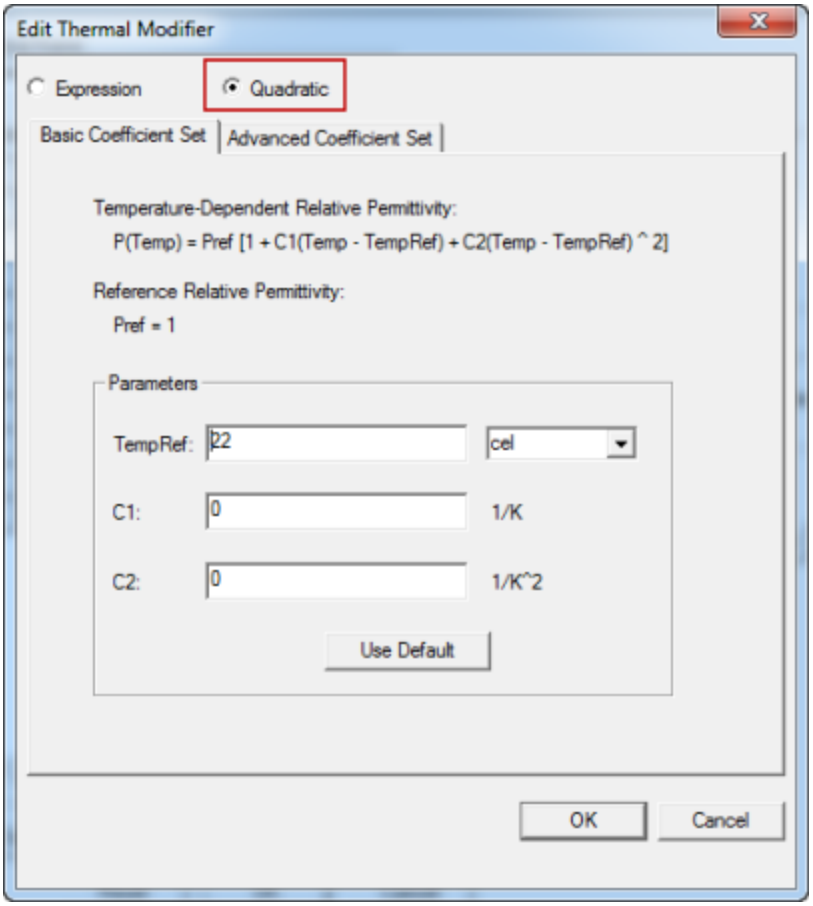
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **pwl:** Type of dataset – Piecewise linear
- **$ds1:** Name of an existing dataset – "$" indicates a *project* dataset, which is a requirement for thermal modifiers
- **Temp:** Type of X value – Temperatures

  The Y values in this case are simple multipliers and therefore unitless.

> **Note:**
>
> To edit an existing dataset, select **Edit Dataset** from the drop-down menu in the **Edit Thermal Modifier** dialog box. The **Datasets** dialog box appears. Select the dataset to modify and click **Edit**.

3. Alternatively, select the **Quadratic** option to display the tabs for **Basic Coefficient Set** and **Advanced Coefficient Set** (as shown below):

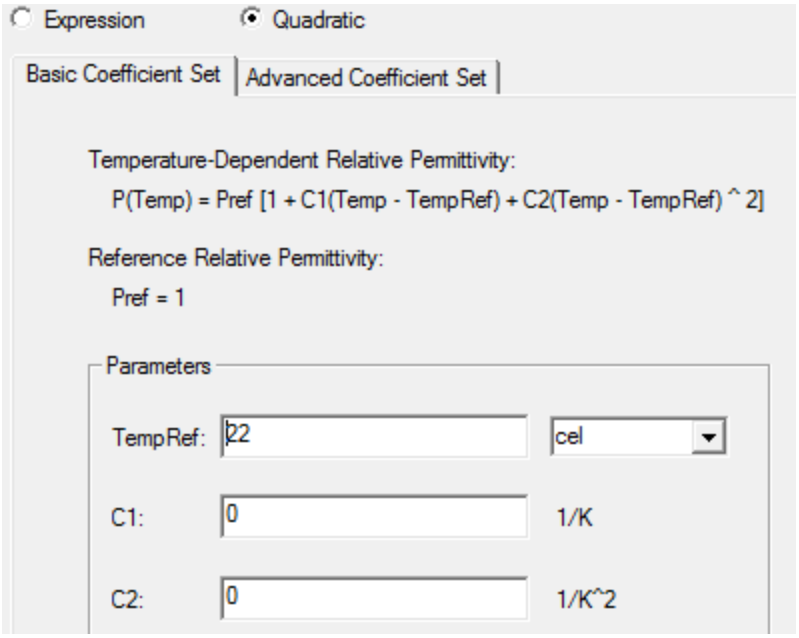


- Under the **Basic Coefficient Set** tab, you can edit fields for the TempRef and units, and fields for C1 and C2 for the following equation:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

P(Temp) = Pref[1+ C1(Temp - TempRef) + C2(Temp - TempRef)^2]

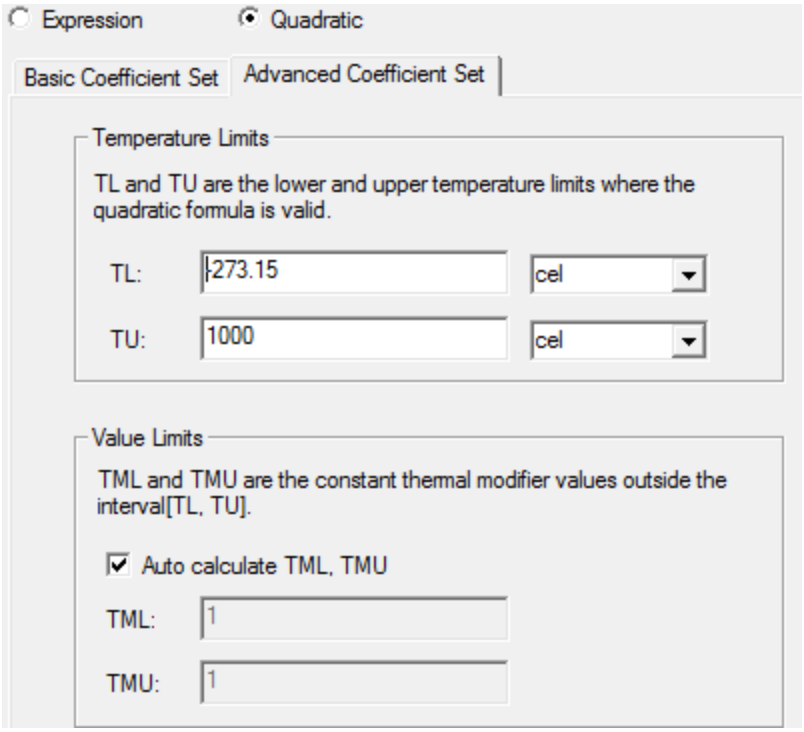
where TempRef is 22 cel by default and where the Pref is defined as the reference relative permittivity.



> **Note:**
>
> The coefficients, C1 and C2, should be negative to yield physical results.

- Under the **Advanced Coefficient Set** tab, you can edit fields for lower and upper temperature limits (TL and TU, respectively) and select their units from the drop-down menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



You can also edit the constant value limit for the thermal modifier values outside the limits. By default, these are automatically calculated. Uncheck the Auto Calculate TML and TMU to specify new values for thermal modifier lower (TML) and thermal modifier upper (TMU).

4. Click **OK** to accept your edits and return to the View/Edit materials dialog box.

Defining Material Properties as Expressions

When defining or modifying a material's properties, each material property value in the **View/Edit Material** window can be assigned a mathematical expression. Simply type the expression in the appropriate **Value** box. Expressions typically contain intrinsic functions, such as sin(x), and arithmetic operators, such as +, -, *, and /, but do not include project variables.

> **Note:**
>
> By default, not all of the available properties are displayed in the materials table. Only the properties commonly used by the product are displayed. To view the complete table of properties, see Filtering Materials.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Defining Functional Material Properties

Any material property that can be specified by entering a constant can also be specified using a mathematical function. This is useful when you are defining a material property whose value is given by a mathematical relationship — for instance, one relating it to frequency or another property's value. When defining or modifying a material's properties, simply type the name of the function in the appropriate **Value** box.

> **Note:**
>
> By default, not all of the available properties are displayed in the materials table. Only the properties commonly used by the product are displayed. To view the complete table of properties, see Filtering Materials.

Assigning Materials from the Object Properties Window

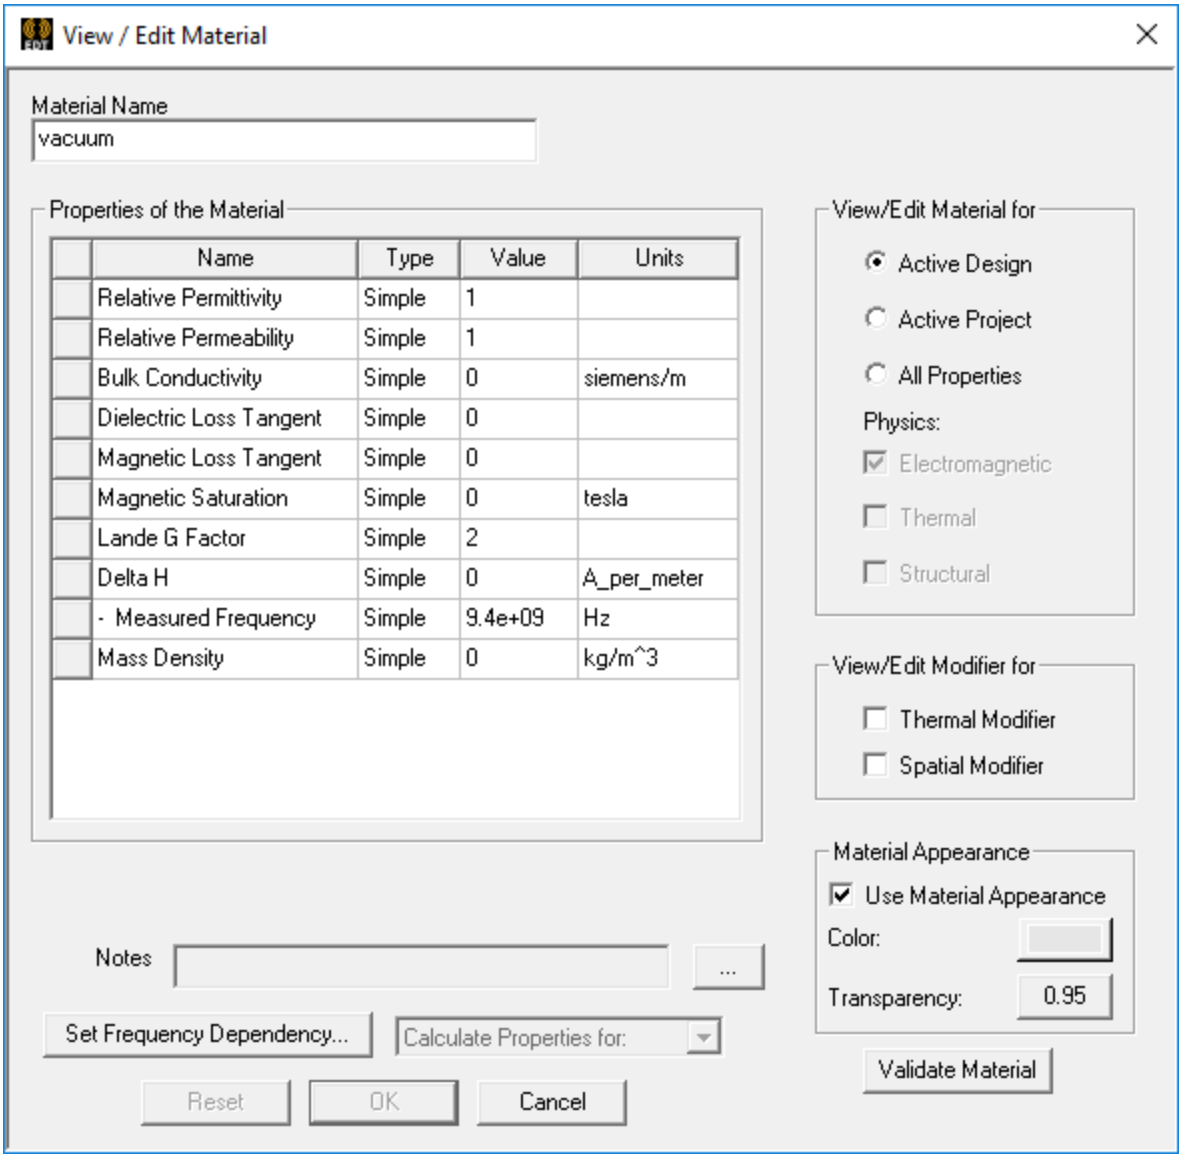
The Properties dialog for each object includes a materials property. If you click on the current material property you see a drop down list that includes an *Edit* command and a list of materials in the current project. You can select from the list of current materials to assign the selected material to that object.

Viewing and Modifying Material Attributes

1. From the **Select Definition** window, select a material to view or modify, and click **View/Edit Materials**.

   The **View/Edit Material** window appears. The material name and its property values are listed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

By default, not all of the available properties are displayed in the materials table. Only the properties commonly used by the product are displayed.

To view the complete table of properties, see Filtering Materials.

2. Under **View/Edit Material for**, select:
   - **Active Design** to display properties used in the active design.
   - **Active Project** to display properties used in the active project.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **All Properties** to display all properties available. This enlarges the table of properties to show all properties possible. You can use the scroll bars or size the dialog to see all properties. When **All Properties** is selected, the following **Physics** classification options are enabled to show or hide properties based on simulation type:
  - **Electromagnetic**
  - **Thermal**
  - **Structural**

> **Note:**
>
> If a material is edited in a design type for which the **Physics** type has not been set (e.g., an design but physics type was not set), the **Physics** type will be automatically set in the material.

3. You can modify the material as follows:
   a. Provide a new name for the material in the **Material Name** text box.
   b. Depending on material property selected, the types available may be **Simple Anisotropic** as required for that property.

      For **Simple**, you provide a value or variable.

      For **Anisotropic**, you provide tensor values.

   c. Provide new material property values in the **Value** boxes.
   d. Change the units for a material property.
   e. Enable the **Use Material Appearance** check box to specify a color and transparency.

> **Note:**
>
> Materials stored in the global material library cannot be modified.

4. If you want to add descriptive notes for the new material, click the ellipsis button [...] to the right of the **Notes** field. This opens a dialog box in which you can enter text. Pressing **Enter** or clicking **OK** saves the note. To enter multiple lines of notes, use **Ctrl+Enter** at the start of each new line.
5. Click **OK** on the **View/Edit Materials** dialog to add the new material to the material library.
6. Click **OK** to save the changes and return to the **Select Definition** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Warning:

If you modify a material that is assigned in the active project after generating a solution, the solution will be invalid.

Validating Materials

The Ansys Electronics Desktop can validate a material's property parameters for an Ansys EM software product. For example, the software will check if the range of values specified for each material property is reasonable.

If a material's property parameters are invalid, an error message will appear in the lower-right corner of the **View/Edit Material** window. If the parameters are valid, a green check mark will appear there.

To validate the material attributes listed in the **View/Edit Material** window:

- Select **Active Design**, **Active Project**, or **All Properties**, and then click **Validate Material**.

Copying Materials

1. In the **Select Definition** window, select the material you want to copy, and then click **Clone Material** or right-click the selected material and select **Clone** from the shortcut menu.
2. To modify the material's attributes, follow the directions for modifying materials.
3. Click **OK** to save the copy in the active project's material library.

Removing Materials

1. In the **Select Definition** window, select one or more materials you want to remove from the active project's material library.
2. Click the **Remove Material (s)** button or right-click the selected material and click **Remove** on the short-cut menu.

The material is deleted from the project material library.

Note:

The following materials cannot be deleted:

- Materials stored in Ansoft's global material library.
- Materials that have been assigned to objects in the active project.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In a project library, you may want to use the **Tools** > **Project Tools** > **Remove Unused Definitions** command to remove selected materials definitions that your project does not require.

Exporting Materials to a Library

1. In the **Select Definition** window, select the material you want to export.
2. Click the **Export Material to Library** button, or right-click the selected material and click **Export** from the short cut menu.

   The **Export to material library** file browser appears.
3. Click **PersonalLib** to export the material to a local project directory, accessible only to the user that created it.

   Click **UserLib** to export the material to a library that is shared by more than one user, usually in a central location.
4. Type the library's file name and then click **Save**.

Sorting Materials

You can change the order of the materials listed in the **Select Definition** window. You can sort the list of materials by name, library location, color, or material property value. To change the order of the listed materials:

- Click the column heading by which you want to order the materials.

If the arrow in the column heading points up, the material data will be listed in ascending order (1 to 9, A to Z) based on the values in the column you chose. If you want the material data to be listed in descending order (9 to 1, Z to A), click the column heading again. The arrow will point down.

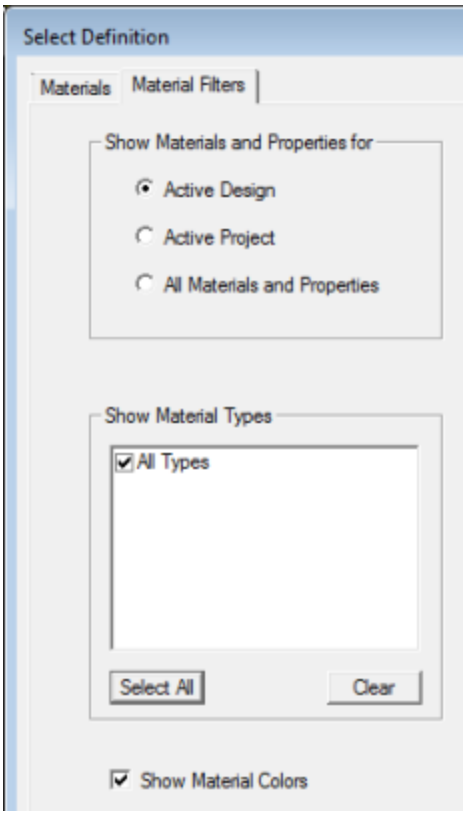
> **Note:**
>
> By default, not all of the available properties are displayed in the materials table. Only the properties commonly used by the product are displayed. To view the complete table of properties, see Filtering Materials.

Filtering Materials

If you want to remove certain materials or material properties from the list in the **Select Definition** window, use the filter options under the **Material Filters** tab. You can filter out materials based on the product or library with which they are associated. You can also filter out

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

material properties and types of material properties. And you can remove the filtering in order to see all available material properties.



To filter materials or material properties listed in the **Select Definition** window, using the choices in the **Materials** tab:

1. The text field under Libraries lists the libraries for the project. Selecting the listed library highlights it and cause the table to display the materials in that library.
2. Above the Libraries area, you can check or uncheck boxes to show or hide Project Definitions and All Libraries.

- With both unchecked, nothing appears in the materials table. With both checked, the table shows all materials and highlights those used in the project.
- With only Project Definitions checked, the materials table shows only the materials used in the project.
- With All Libraries checked, the table displays all materials, but may not show all available properties.

To filter out or show additional materials/properties in the **Materials** tab:

1. Click the **Material Filters** tab.
2. Under **Show Materials and Properties for**, select one of the radio buttons:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Active Design** to display materials/properties used in the active design.
- **Active Project** to display materials/properties used by the active project.
- **All Materials and Properties** to display all materials and properties available. Selecting this enlarges the table of materials shown under the **Materials** tab to show all materials possible. You can use the scroll bars or size the dialog to see all materials.

3. Under **Show Material Types**, select materials types to display on the **Materials** tab. Click **Select All** to select all of the types listed. Click **Clear** to clear all selections.
4. If you check Show Material colors, the Materials tab of the **Select Definition** window includes a color for material colors. See Viewing and Modifying Material Attributes.
5. Click the **Materials** tab to save your selections.

Click **Cancel** to revert back to the last saved selections.

Working with Material Libraries

There are three different materials libraries in HFSS 3D Layout: a *system library*, a *user library*, and a *personal library*.

The library files that ship with Electronics Desktop are stored under the **`syslib`** directory. These libraries are intended to be read-only and should not be modified. They are available for any material assignment in any project.

In addition to the system libraries, Electronics Desktop recognizes two user-configurable library structures, called the *User Library* and the *Personal Library*. These are used to add user (or company)-defined materials. Customarily, **`userlib`** is a network repository for proprietary or corporate definitions available to all seats in an enterprise, while **`personalLib`** contains project and design-specific libraries as needed by individual designs.

A root library directory is set up at installation. If none is specified, the default is the root Electronics Desktop directory.

Materials from all libraries are available for use in projects.

Editing Libraries

There are two different methods of editing libraries:

- Right-click **Materials** in the project window to display the **Edit Libraries** shortcut menu. Clicking displays the **Edit Libraries** window.

  Editing definitions from the project window does not modify the configured libraries for any particular design, since this is editing in general.

- Using **Tools** > **Edit Libraries** > **Materials** from the menu bar takes the current design into account and adds any new libraries to the configured list for the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9 - Port Setup in HFSS 3D Layout

When you specify an excitation for an HFSS 3D Layout structure, HFSS 3D Layout uses the principle of linear superposition to calculate the solution. The signal on each port and mode is solved for separately. HFSS 3D Layout sets the signals on all non-zero modes and generates a solution. This procedure is repeated with each port until a solution is generated for each.

HFSS 3D Layout offers a variety of ports. HFSS attributes and sizing information are all available as properties. This includes port sizes, selected return paths, and verifying port types as being selected for the particular application that is being designed and simulated.

HFSS 3D Layout automates the following processes to ensure the successful setup of ports:

- Automatic reference location (with override option)
- Automatic port-geometry generation (with sizing override option)
- Automatic terminal identification
- Numerous pre-solve validation checks, with messaging to alert you when something is wrong

The following topics describe the setup and usage of the various ports available in HFSS 3D Layout.

HFSS 3D Layout Port Types

The HFSS port types available in HFSS support configurations that are common for the excitation of most layered designs.

- Wave ports are available to excite common transmission-line cross-sections.
- Lumped ports are available to excite internal structures or transmission lines, and can be vertical, horizontal, or coaxial.
- Deembedded lumped ports in HFSS 3D Layout are not restricted to being rectangular, they can be arbitrary in shape.
- A parallel excitation exists for the HFSS 3D Layout so that two solvers are available for one design setup.

The following HFSS port types are available in HFSS.

- Ports for Transmission Lines (Edge Ports or Vertical Lumped Ports)
- Ports for Imported Package and PCB Structures
- Creating Pin-Based Ports
- Configuring Port-Instance Ports
- Gap(coax) Ports

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Wave(coax) Ports
- Horizontal Lumped Ports
- CPW and Slotline Ports
- Circuit Ports and Elements

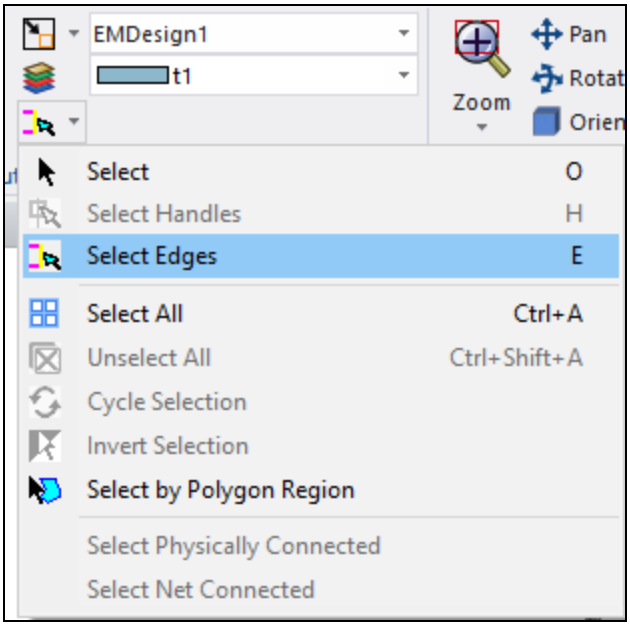
Ports for Transmission Lines

HFSS ports for transmission lines can be set up as single-line or multi-line edge ports. Edge ports (i.e., vertical lumped ports) can be added to any primitive. By default, the edge ports are port boundaries. However, you can make boundaries that are perfect electrical conductors (PEC) or RLCs, or change an existing edge port to a PEC or RLC. Edge ports are listed under **Excitations** in the **Project Manager** window. Boundaries are listed under **Boundaries**.

Creating Edge Ports

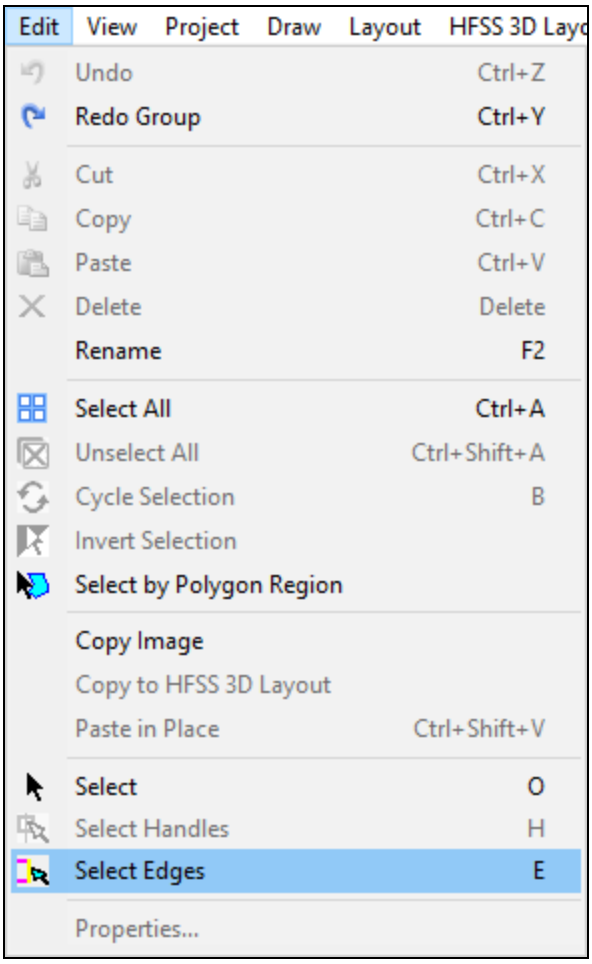
Follow these steps to create an edge port.

1. To begin, do any of the following:
   - Press **E** to enter **Select Edges** mode.
   - From the **Layout** tab, click **Select edges** > **Select Edges**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From **Edit**, click **Select Edges**.

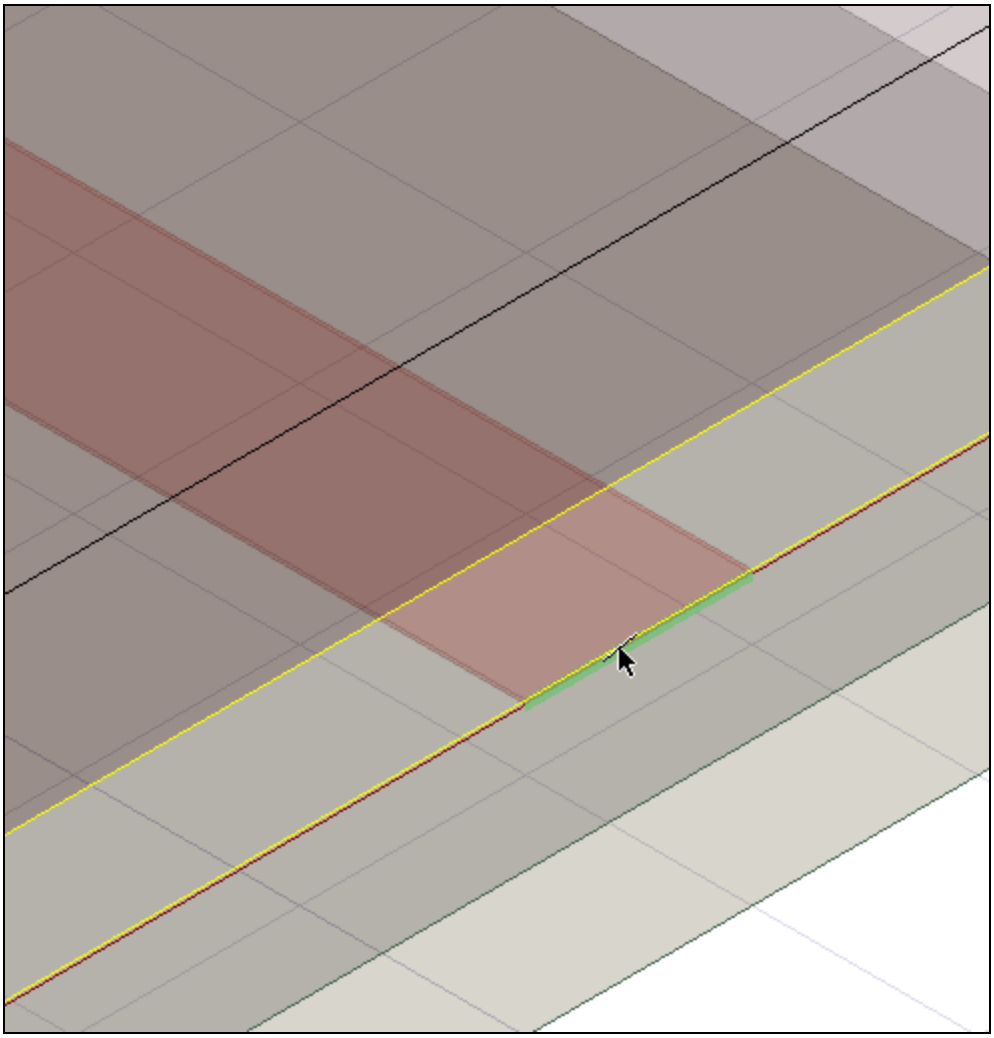


Note:

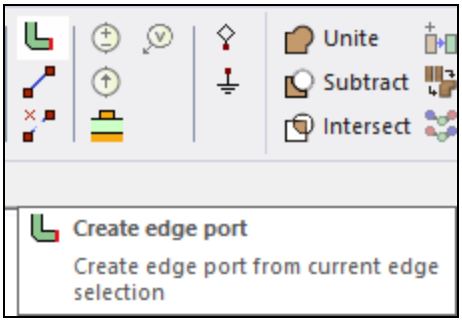
Once **Select Edges** is selected, the cursor changes: a diagonal line crosses the tip of the arrow. Refer to the following step.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Click the primitive at the appropriate location to add a port.

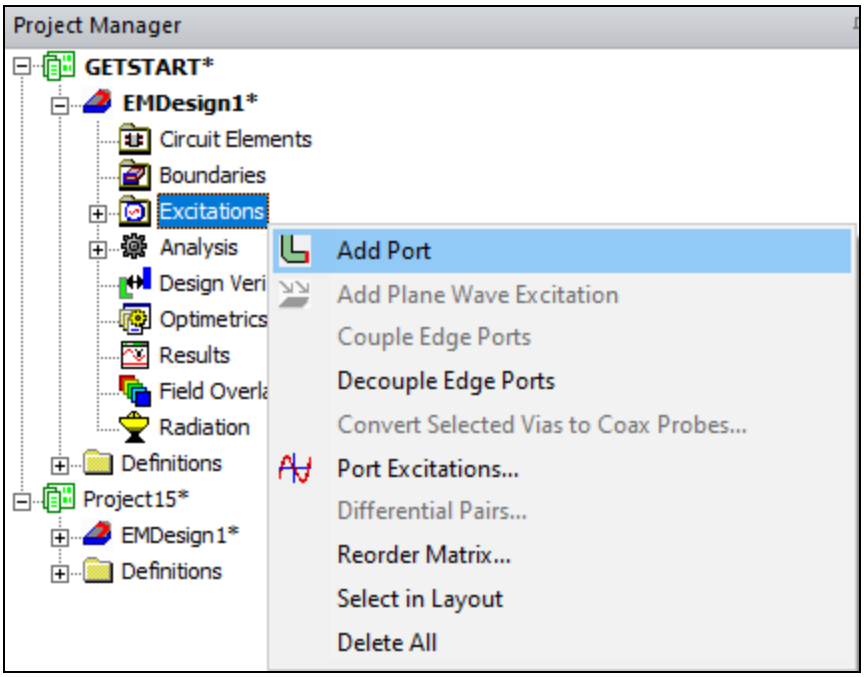


3. To create the edge port, do one of the following:
   - From the **Layout** tab, select **Create edge port**.



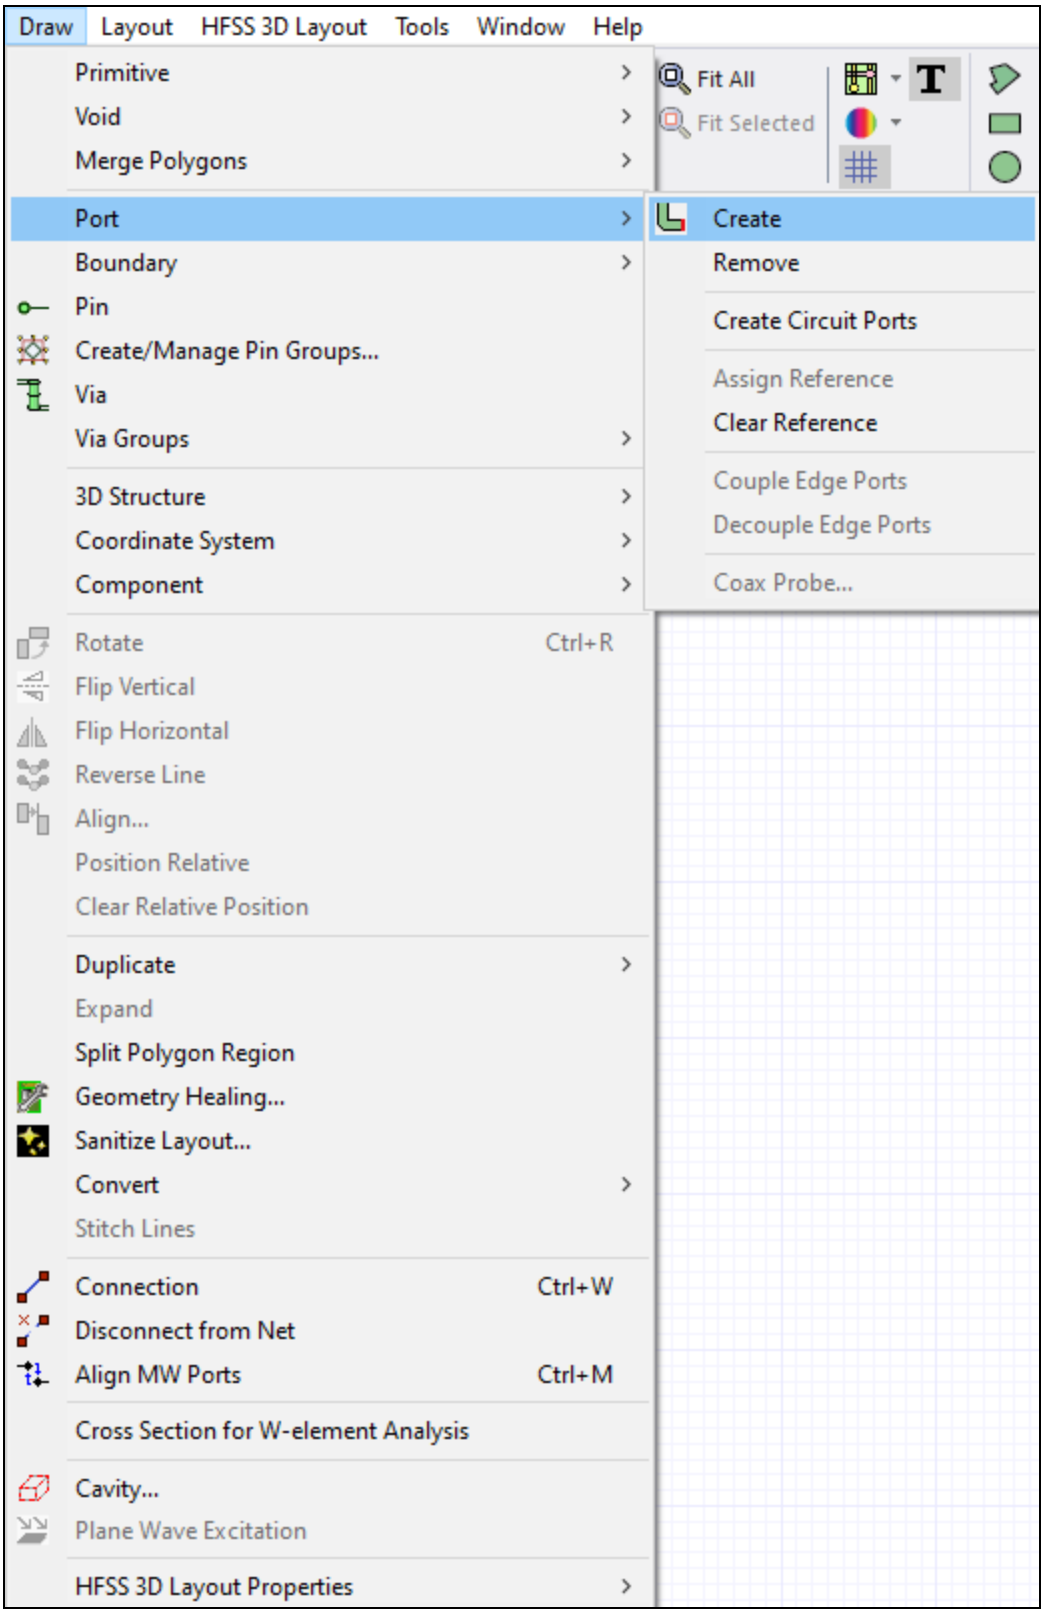
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From the **Project Manager** window, expand the **Project Tree** and ***active design folder*** **(e.g., EMDesign1**. Then right-click **Excitations** and select **Add Port**.



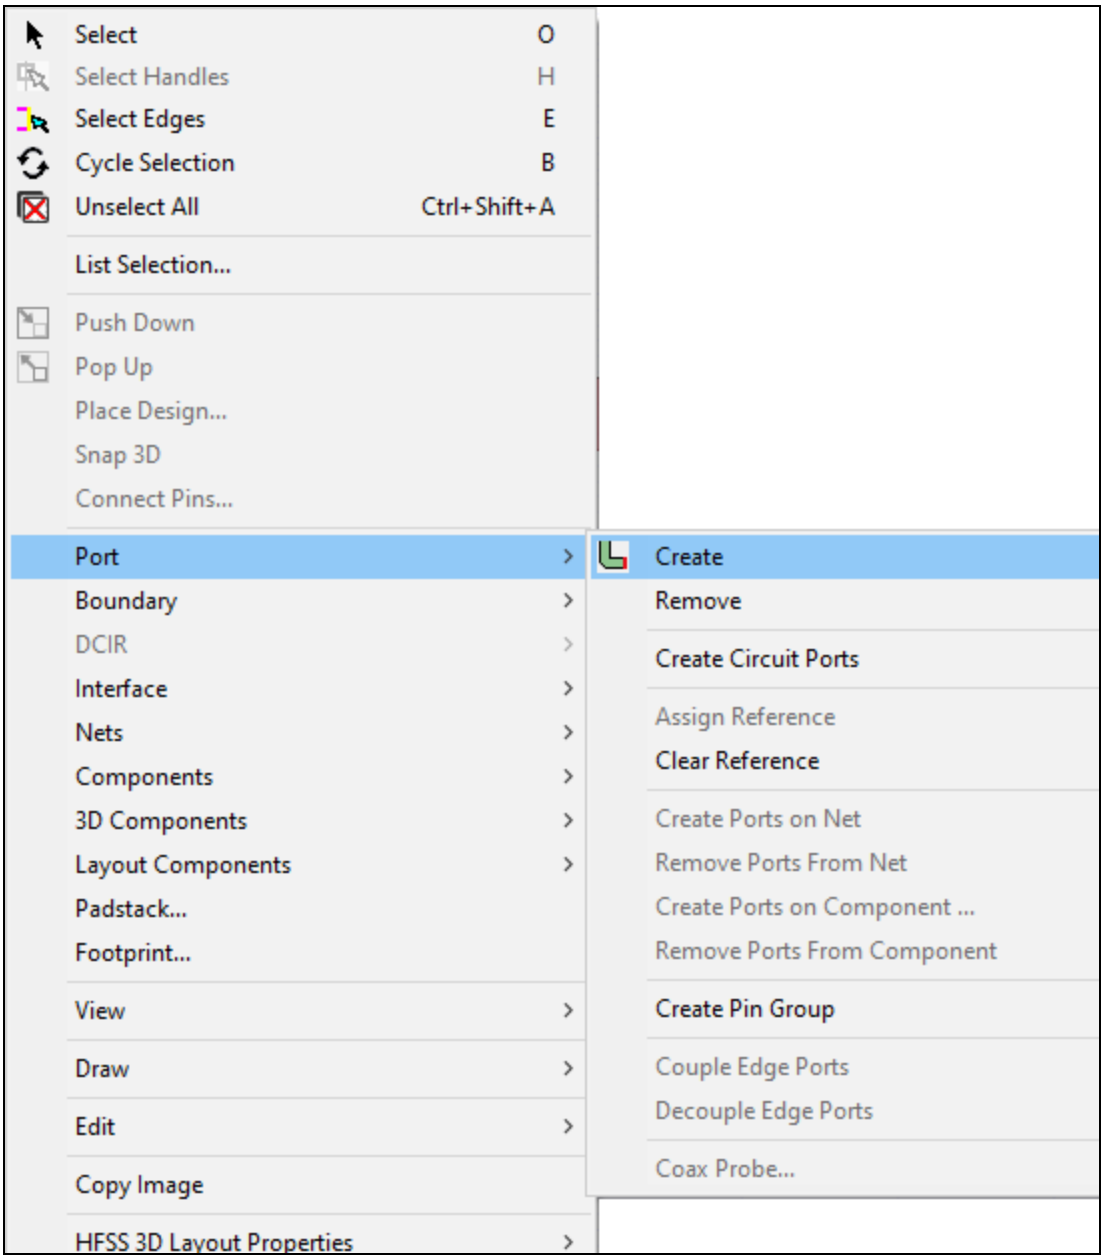
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- From **Draw**, select **Port** > **Create**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

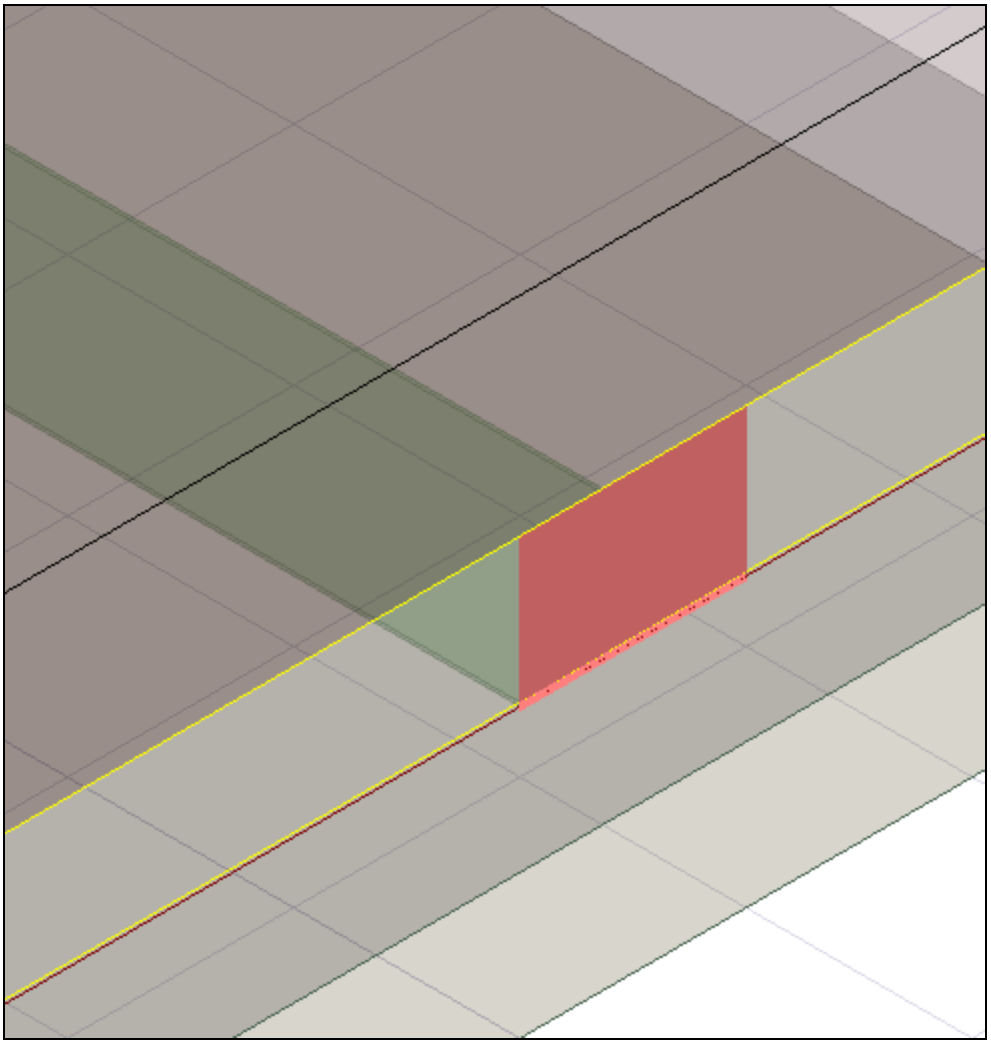
- Right-click in the **Layout Editor** and select **Port** > **Create**.



> **Note:**
>
> Once a port is created, it appears in the **Project Manager** > **Project Tree** > **[*active design folder*]** > **Excitations** folder.

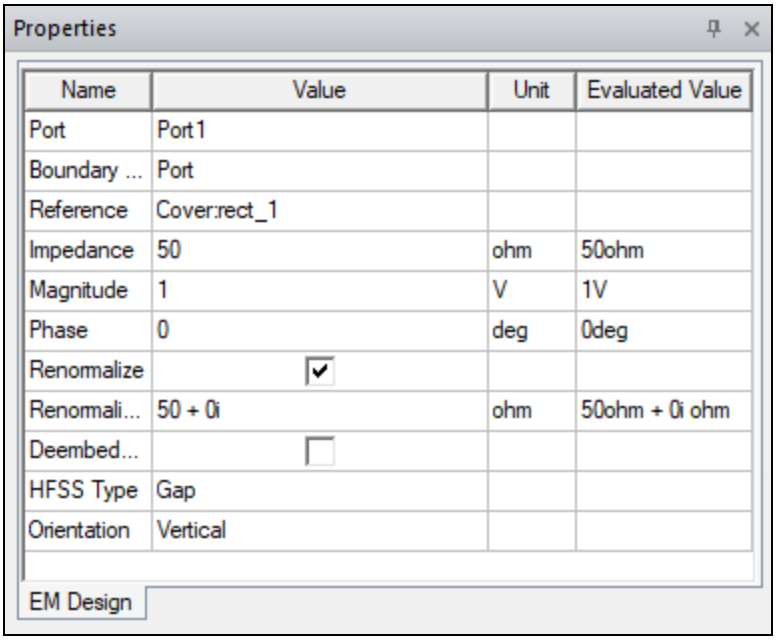
The port appears in the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



While the port is selected, the **Properties** window populates with its parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The **Reference** surface automatically defaults to the closest signal layer (with geometry) or negative layer, above or below the primary terminal. If the port abuts two possible reference surfaces (i.e., two planes), users can select either surface or both (i.e., dual reference surfaces).

Creating PEC Edge Ports

1. From the Layout Editor, select an edge of the primitive that has the edge port.
2. Either:
   - Click **Draw** > **Boundary** > **Create PEC**.
   - Right-click and select **Boundary** > **Create PEC**.

Creating RLC Edge Ports

1. From the Layout Editor, select an edge of the primitive that has the edge port.
2. Either
   - Click **Draw** > **Boundary** > **Create RLC**.
   - Right-click and select **Boundary** > **Create RLC**.
3. From the **Properties** window, open the **EM Design** tab.
4. Set the resistance, capacitance and inductance values in the **R**, **L**, and **C** rows.

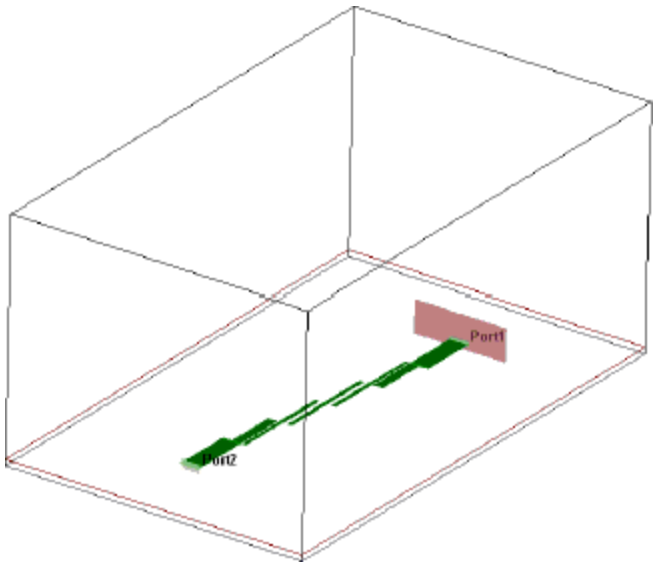
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Changing the Type of Port or Boundary

1. From the Layout Editor, select the port or boundary.
2. From the **Properties** window, open the **EM Design** tab.
3. From the **Boundary Type** row, select the new type.

Single-Line Transmission Line Ports

When configuring HFSS ports as single-line transmission ports, the edge selections must be a continuous, co-linear set of segments.



To convert between a lumped-gap and a wave port, toggle the HFSS Type Attribute in the HFSS 3D Layout Properties. The 3D view are updated automatically. Additional properties that can be set include:

General properties

- Reference -select geometry/layer for vertical constraint
- Impedance -if Z0 cannot be determined from port solution
- Post-processor –renomalization and deembedding

Gap

- Orientation (read only)

Wave

- Orientation (read only)
- Horizontal Extent Factor –if applicable, sizing parameter for vertical wave ports

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- PEC Launch Width –dimension for port-geometry thickness.

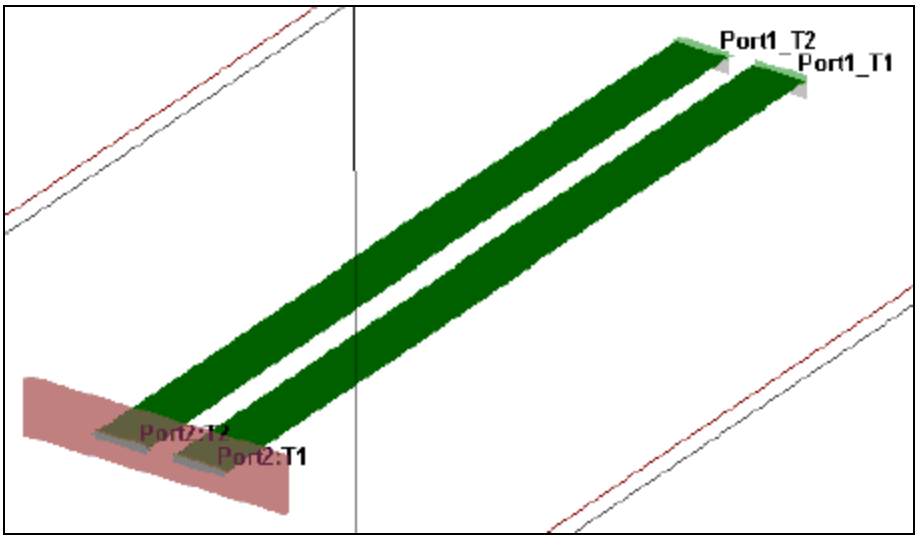
The following pre-simulation validation checks apply:

- Port geometry may not intersect other port geometry
- Port geometry may not intersect layout geometry
- Wave ports may not contain “floating” terminal geometry

Multi-Line Transmission Line Ports

When configuring HFSS ports as multi-line transmission ports, wave ports are created by default, but can be “decoupled” to create a collection of lumped-gap ports. To decouple a multi-line coupled port:

1. Select the port graphically, or click **Layout** > **List**, then select the port
2. Click **Draw** > **Decouple Edge Ports**



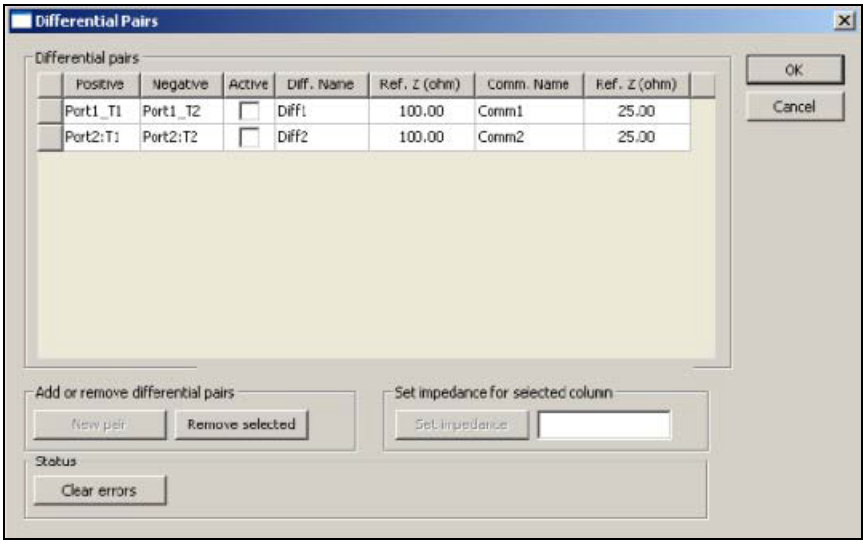
Similarly, ports can be coupled using **Draw** > **Couple Edge Ports**. Edge selection must be co-linear, but can span multiple planes.

The following pre-simulation validation checks apply:

- Geometry intersections
- Floating terminals

Solution are always terminal, but differential-pairs may be configured separately using the **Differential Pairs** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Creating Coupled Ports From Existing Edge Ports

To create coupled port from an existing edge port:

1. Create two or more edge ports using the procedure described in Ports for Transmission Lines.
2. Click the **Select elements** tool to select the edge ports that you want to include in the layout editor. (Do not click the **Select Edges** tool.) The ports must lie in the same plane, be collinear and cannot touch.
3. Right-click **Excitations** in the **Project Tree** (or open the **Draw** menu) and select **CoupleEdgePorts**. The coupled ports now share the same port name, but have different terminal names: <PortName>:<TerminalName>.

To decouple ports, click one or more of the coupled ports and right-click **Excitations** in the **Project Tree** (or open the **Draw** menu) and select **Decouple Edge Ports**. Alternately, you can also decouple by selecting a port beneath **Excitations** in the project tree and selecting **Decouple Edge Port**. Also decouple by deleting one or more of the coupled ports.

Removing an Edge Port or Boundary

1. Select the edge port or boundary.
2. Do one of the following:
   - Click **Draw** > **Boundary** > **Remove**.
   - Click **Draw** > **Port** > **Remove**.
   - Right-click and select **Boundary** > **Remove**.
   - Right-click and select **Port** > **Remove**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ports for Imported Package and PCB Structures

From a geometrical perspective, a pin is nothing more than a via. However, pins must also provide a logical interface (a port) to the design in the schematic view. This means that all pins must publish an external port and the associated geometry for HFSS analysis.

Pins are crucial in HFSS because they are a fundamental element in most layout data models, so any translated designs likely includes them. While it is possible to interactively assign ports based on edges and primitive geometry, this approach scales poorly, particularly when pins already exist. Also, in HFSS, pins can be toggled to create internal PEC or RLC boundary conditions just like HFSS-3D.

Creating Pin-Based Ports

To create a new pin:

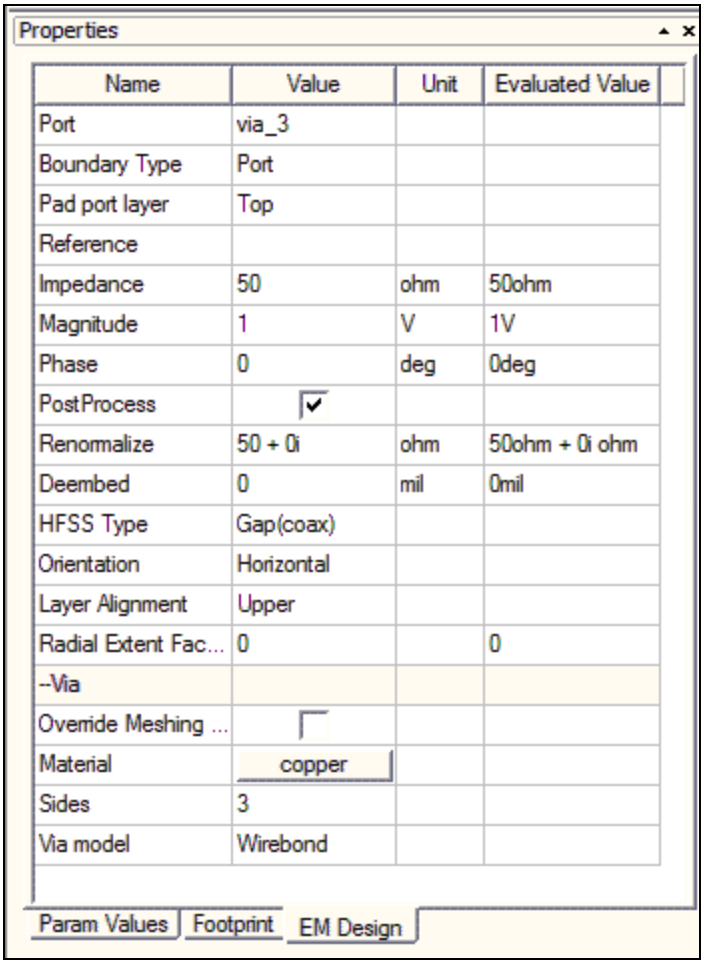
1. Click **Draw** > **Pin** and place the pin at the selected location in the Layout Editor.
2. From the **Footprint** tab of the **Properties** window, set the **Padstack Definition** or **Padstack Usage**.
    - Click **Padstack Definition** to open the Padstack definition library in the Select Definition window, where select a pre-defined padstack.
    - Click **Padstack Usage** to open the Padstack Usage and Definition editor where you can modify the padstack used by this pin.
3. Select the terminal **Location** by setting the **Pad port layer**. The **Pad port layer** selection is not displayed if the padstack has no pads. Click **Padstack Usage** to adjust the padstack if selected.

Configuring Pin-Based Ports

The following settings on the **EM Design** tab in the **Properties** window are HFSS 3D Layout properties. They apply to pin-based ports.

- **Pad port layer**: Sets the terminal location and pad-geometry used for derivation of the HFSS port.
- **Reference**: If applicable, select the geometry or layer for vertical constraint.
- **HFSS Type**: Either **Gap** or **Gap(coax)**.
- **Orientation** (read only)
- **Layer Alignment**: If applicable, select layer surface for port-geometry.
- **Radial Extent Factor**: Sizing parameter for port-geometry radius. Only appears if HFSS Type is **Gap(coax)**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Creating a Pad Port

1. Select the signal layer on which the pad port lies.
2. From the **Edit** menu, select **Select Edges**.
3. Click the edges of the model on which the port lies. The edges do not need to be collinear.
4. From the **Draw** menu, select **Port** > **Create**. The new pad port is listed under **Excitations** in the **Project Manager** window.

HFSS calculates a characteristic impedance of 50 ohms for the pad port. The propagation constant is set to the propagation constant in Teflon, in order to agree with the propagation constant of coaxial probe ports.

To edit the pad port's properties, double-click the pad port in the **Project Manager** window. The **Edge Port Definition** window opens where you can perform these tasks:

- Change the name of the pad port
- De-embedding S-Matrices

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Vary the current excitation
- Renormalize the port to a specific port impedance
- Setup a Reference to the Nearest Negative Signal

When the pad port is selected, its **EM Design** tab is available in the **Properties** window. This tab displays many of the values in the **Edge Port Definition** window, including the port classification for the HFSS-PI type.

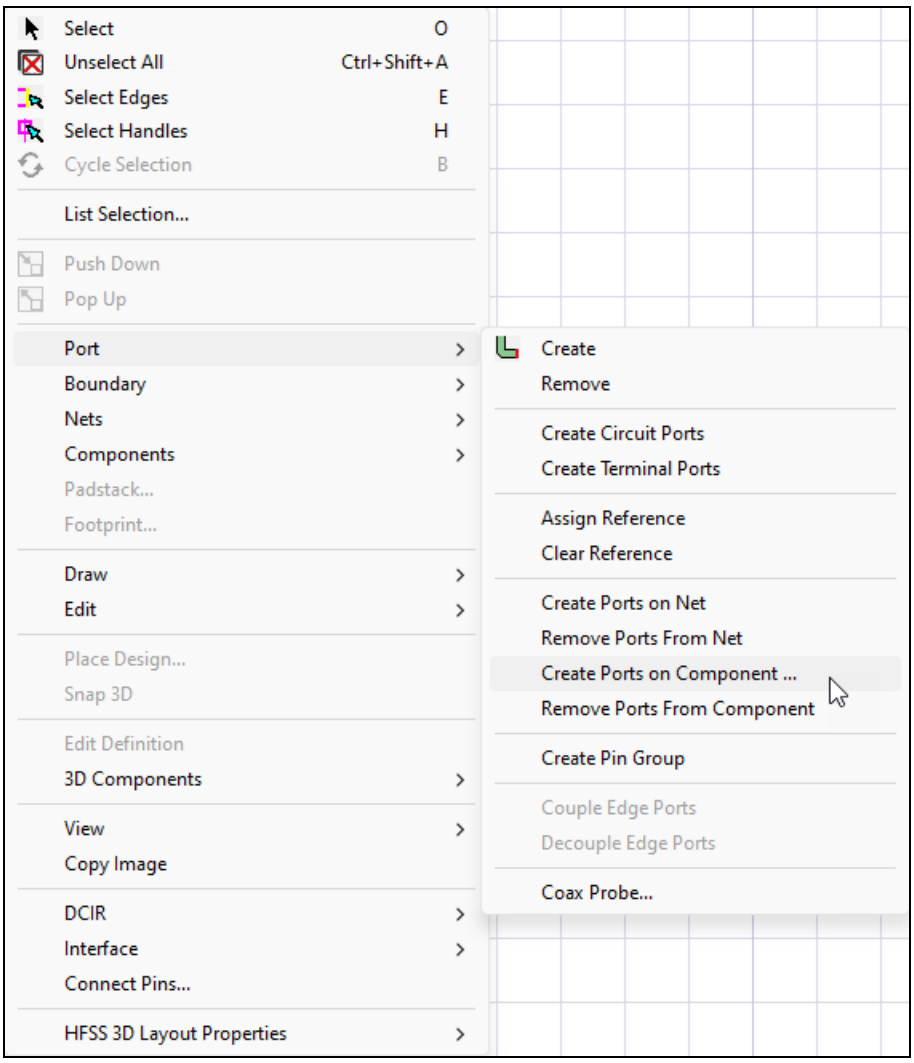
> **Note:**
>
> The desktop automatically defines all ports that connect N-ports to primitive objects as pad ports.

Configuring Ports

Using the following shortcut menu port commands, you can configure ports in the **Layout Editor**.

Right-click within the **Layout Editor** and navigate to **Port** to view the following options.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

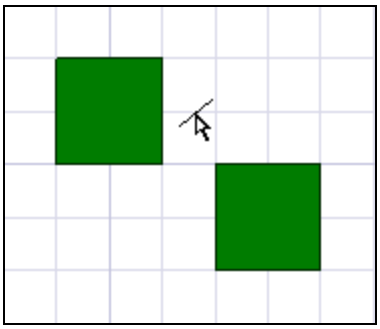
All Port options require the user to select one or more objects in the **Layout Editor**. These instructions assume no object has been selected and the shortcut menu is not open.

Create an Edge Port

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

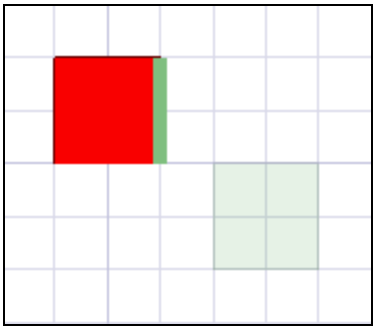
1. Do either of the following to enter edge selection mode:
   - From the **Layout Ribbon**, choose the **Select Edges** cursor.

   - Enter **E** in the **Layout Editor** and wait for the cursor to transform.

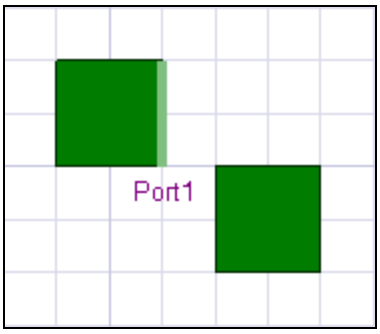


2. Select the edge of a primitive.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Right-click in the **Layout Editor** and select **Port** > Create to create an edge port.



> **Note:**
>
> Refer to Ports for Transmission Lines.

Remove an Edge Port

Right-click on an edge port and select **Port** > **Remove**.

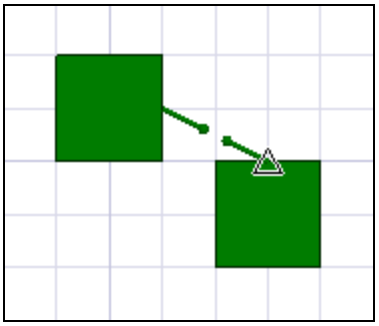
Create Circuit Ports

To transform an edge port into a circuit port, right-click on an edge port and select **Port** > **Create Circuit Ports**.

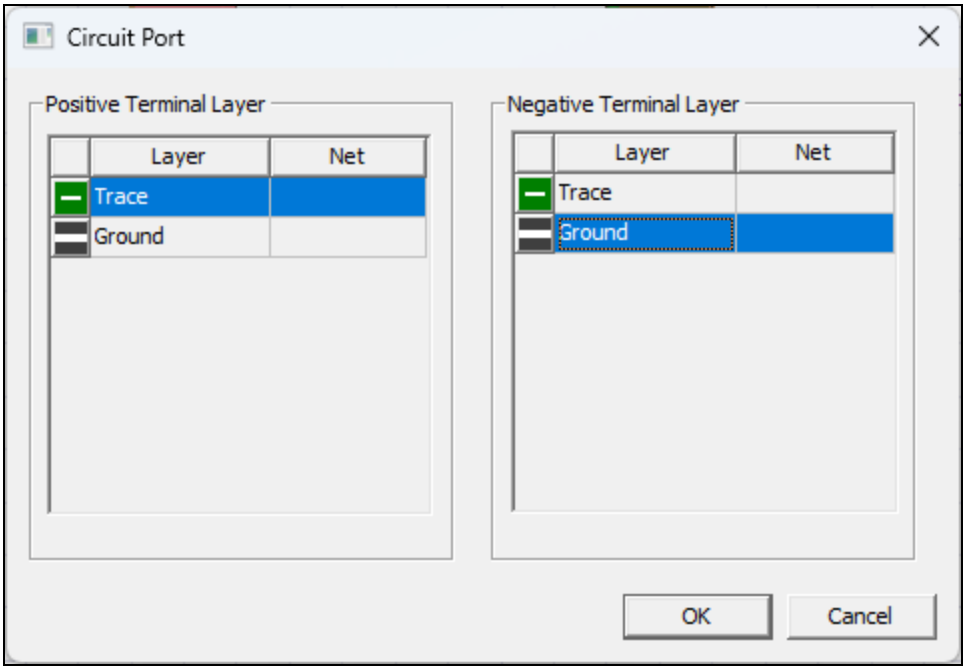
To create a circuit port:

1. Right-click in the **Layout Editor** and select **Port** > **Create Circuit Ports**.
2. Click the edges of two primitives to select the positive (i.e., first selection) and negative (i.e., second selection) terminal locations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

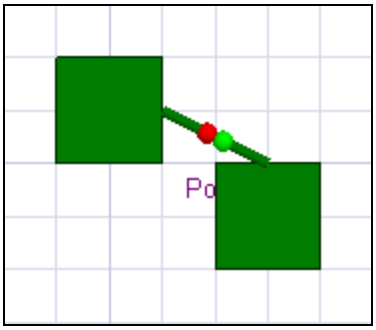


The **Circuit Port** window opens.



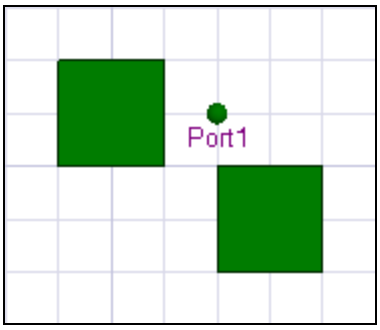
3. Select a **Positive Terminal Layer** and a **Negative Terminal Layer**.
4. Click **OK**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



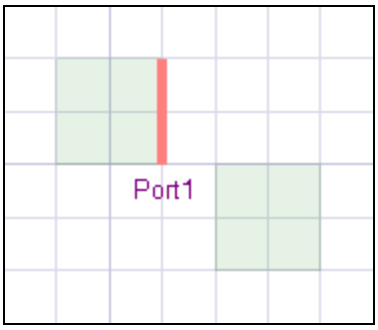
Create Terminal Ports

1. Right-click in the **Layout Editor** and select **Port** > **Create Terminal Ports**.
2. Click anywhere in the **Layout Editor** to create a terminal port. The port automatically seeks out a reference.



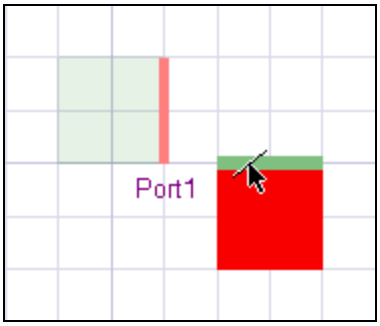
Assign Reference

1. Select a port.

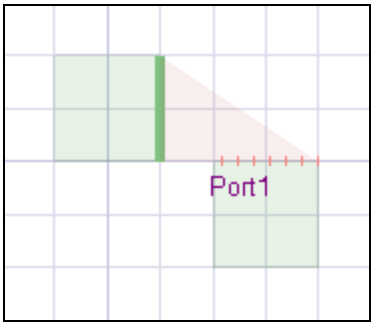


2. Enter edge selection mode and click the edge of an appropriate primitive.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Right-click in the **Layout Editor** and select **Port** > **Assign Reference** to use the primitive is used as a reference.



> **Note:**
>
> Refer to Assigning Reference Ports in the Layout Editor.

Clear Reference

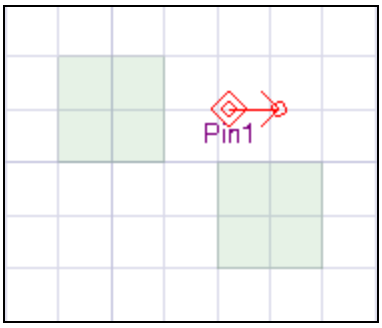
1. Select a port or visible reference.
2. Right-click in the **Layout Editor** and select **Port**> **Clear Reference**.

Refer to Assigning Reference Ports in the Layout Editor.

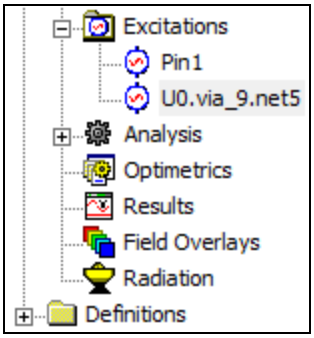
Create Ports on Net

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select a pin assigned to a net.



2. Right-click in the **Layout Editor** and select **Port**> **Create Ports on Net**. The new edge port is added to the **Excitation** folder in the **Project Manager** window.



> **Note:**
>
> Refer to Assigning Reference Ports in the Layout Editor.

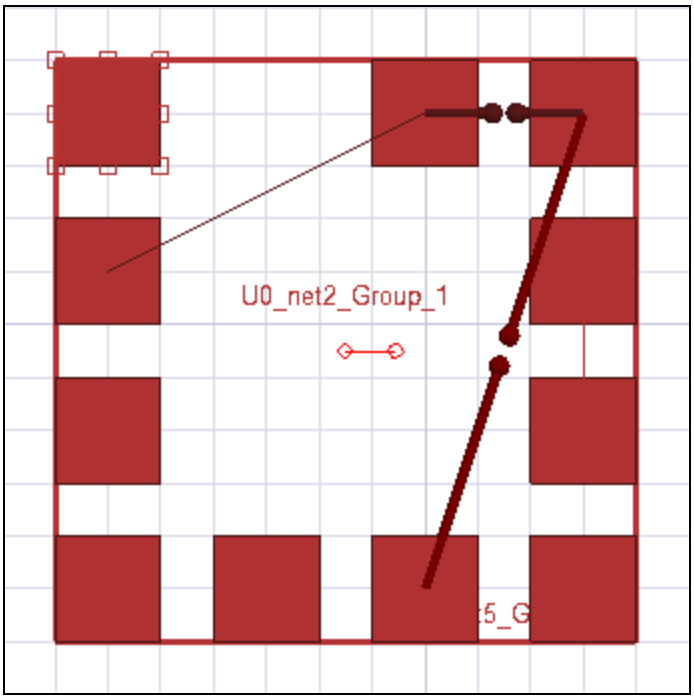
Remove Ports From Net

Right-click in the **Layout Editor** and select **Port** > **Remove Ports From Net**. The new edge port is deleted from the **Excitation** folder, along with the pin, and the pin is deleted from the **Layout Editor**.

Create Ports on Component

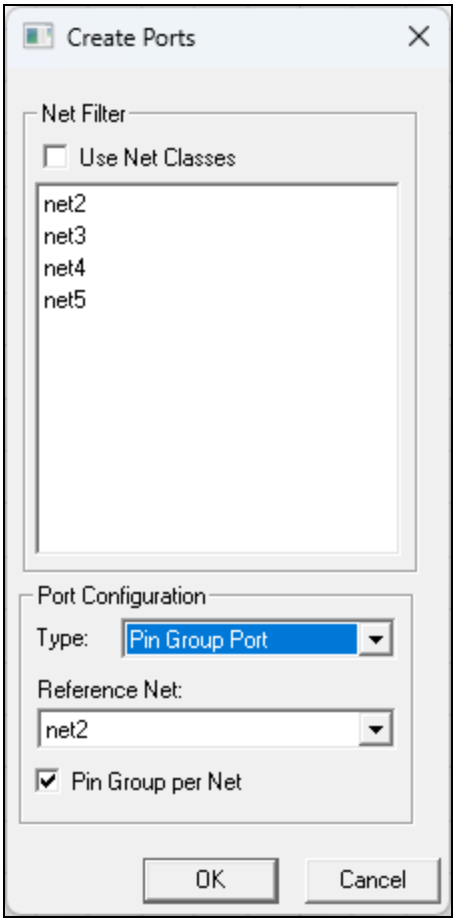
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Highlight a component.



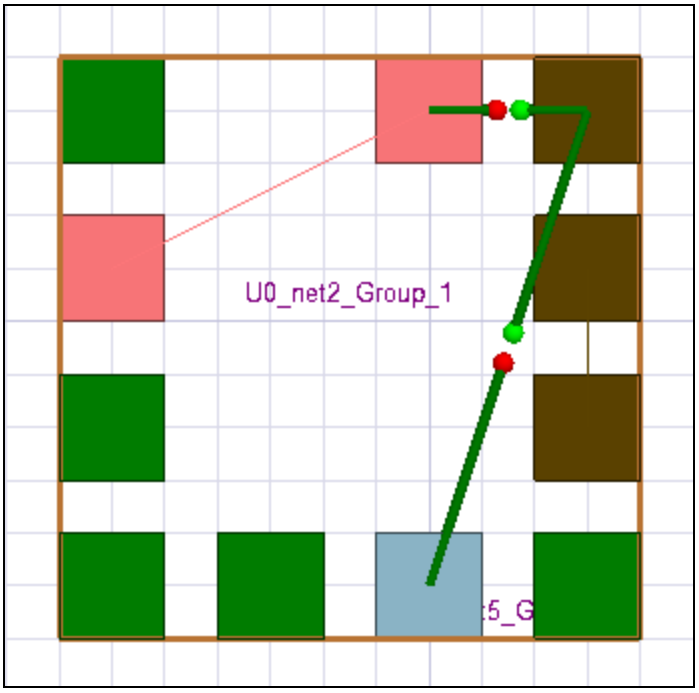
2. Right-click in the **Layout Editor** and select **Port** > **Create Ports on Component** to open the **Create Ports** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. From the **Create Ports** window, do the following:
    - From the **Net Filter** area, check the **Use Net Classes** box, if applicable.
    - Select a net from the list.
    - From the **Port Configuration** area, select a **Type** of port from the drop-down menu (i.e., **Gap Coax Port**, **Circuit Port**, or **Pin Group Port**).
    - If **Pin Group Port** or **Circuit Port** is selected from the **Type** drop-down menu, the **Reference Net** drop-down menu appears. Select a **Reference Net** from the drop-down menu.
    - If **Pin Group Port** is selected from the **Type** drop-down menu, the **Pin Group per Net** check box appears. Check the **Pin Group per Net** box, if applicable.
4. Click **OK** and the new ports appear on the component.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

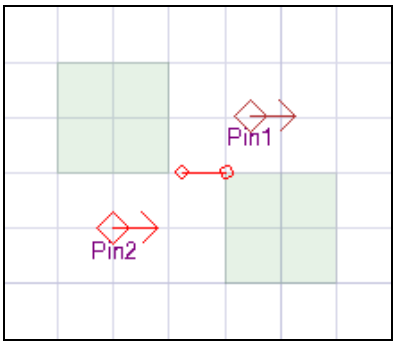


Remove Ports From Component

Right-click the appropriate component in the **Layout Editor** and select **Port** > **Remove Ports From Component**.

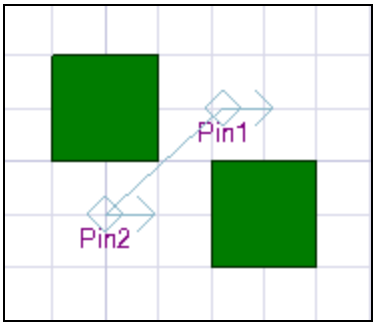
Create Pin Group

1. Select two or more pins.

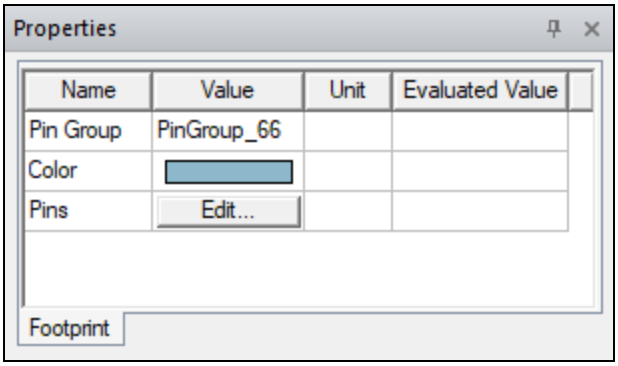


2. Right-click in the **Layout Editor** and select **Port** > **Create Pin Group** and a line is drawn between the pins on the **Layout Editor**, a visual representation of the new group.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



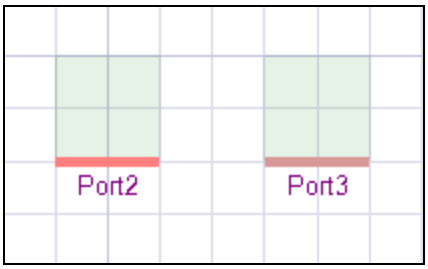
3. Select the line to view the group's details in the **Properties** window.



> **Note:**
>
> Refer to Creating a Pin Group.

Couple Edge Ports

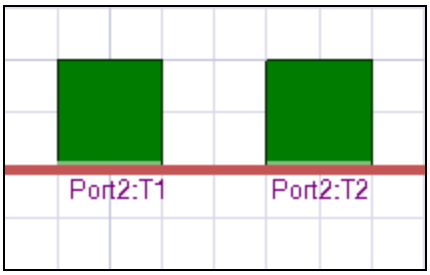
1. Select two parallel edge ports.



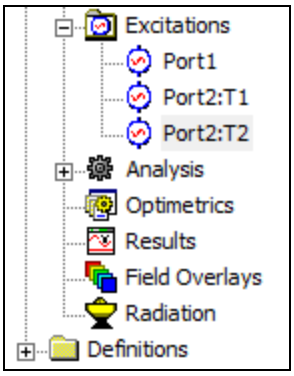
2. Right-click in the **Layout Editor** and select **Port** > **Couple Edge Ports** and a line is drawn under the pins on the **Layout Editor**, a visual representation of the new group.. The

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

coupled ports retain the name given to the first selected port, which becomes Terminal 1. The second selected port becomes Terminal 2.



The coupled ports appear in the **Project Manager** window > **Excitation** folder with their newly coupled names (e.g., Port2:T1 and Port2:T2).



> **Note:**
>
> Refer to Creating Coupled Ports From Existing Edge Ports.

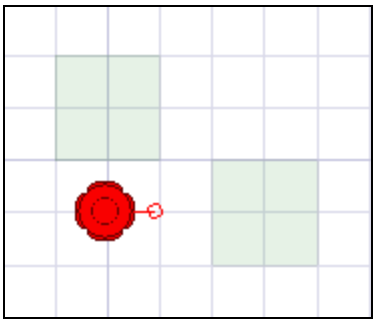
Decouple Edge Ports

Right-click the coupled edge port line in the **Layout Editor** and select **Port** > **Decouple Edge Ports**.

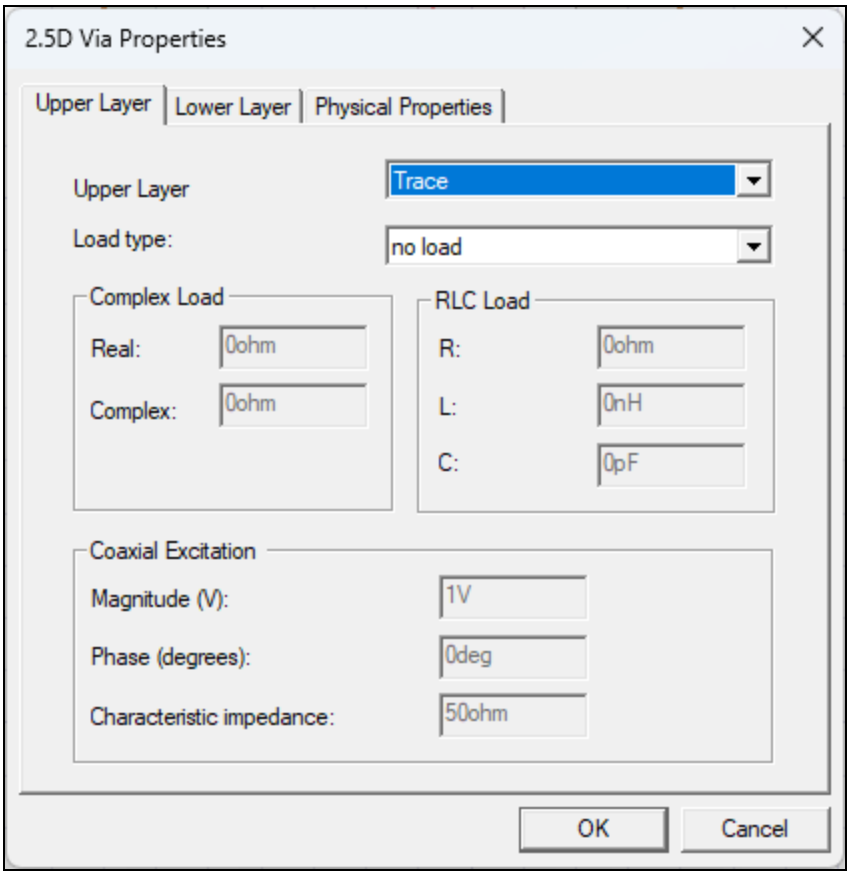
Coax Probe

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Select a via.

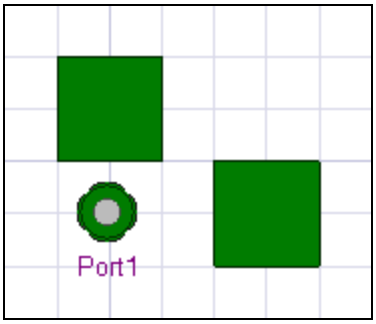


2. Right-click in the **Layout Editor** and select **Port** > **Coax Probe** to open the **2.5D Via Properties** window. Refer to Creating a Probe Port to configure the new probe port.



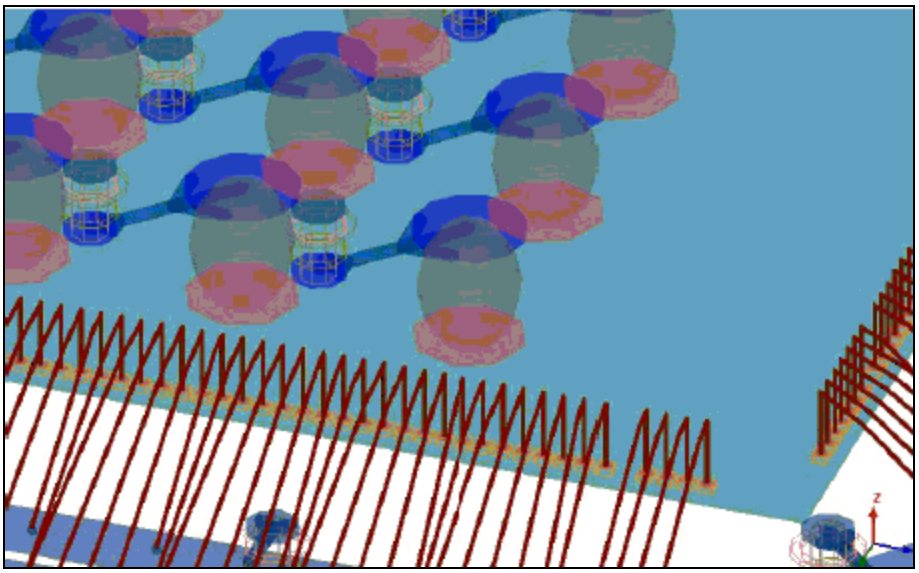
3. Click **OK** and the new probe port appears in the **Layout Editor**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Gap(coax) Ports

The Gap(coax) lumped port is commonly used to excite terminals at package interfaces. Common applications include excitation of vias, bondwires, and solderballs. Ports create circular geometry, the 2D cross-section for which should resemble a coaxial conductor.



The following pre-simulation validation checks apply:

- Port geometry does not intersect other port geometry
- Circumference is wholly contained by conductor

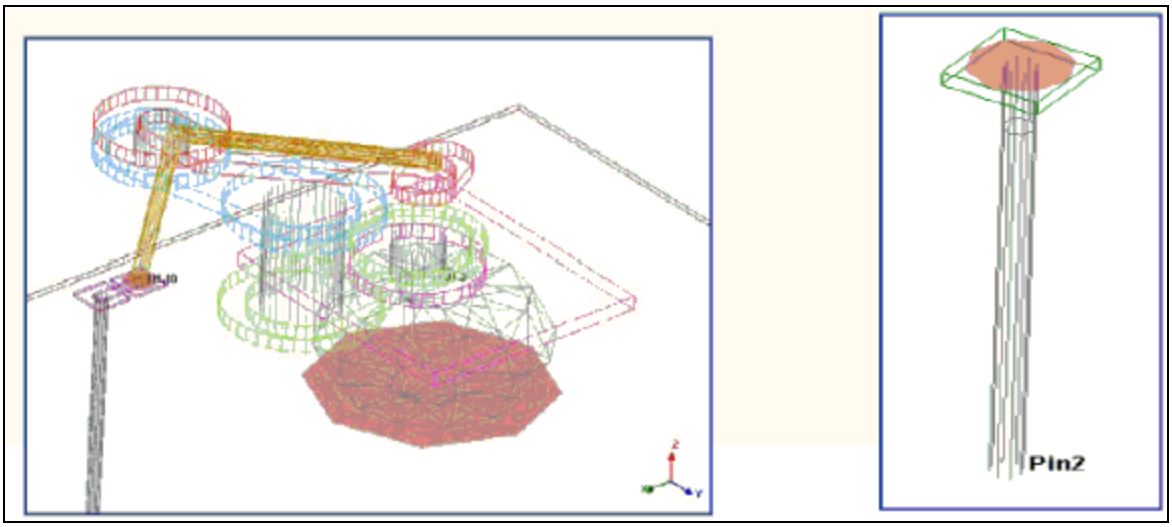
Note that, unlike other port types, terminal identification is performed post-mesh by the solver.

Terminal Assignments in Gap(coax) Ports

Because the terminal geometry of Gap(coax) ports often originates from unrelated and/or 3D structures, their identification and most validation checks are deferred to post-mesh. The port-

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

solver searches for a valid terminal that is interior to the port-face in order to generate a selected field distribution. Various checks are included, and accurate messaging is provided. If applicable, pay particular attention to the **LayerAlignment** property, since the port face must contain the terminal geometry.



Wave(coax) Ports

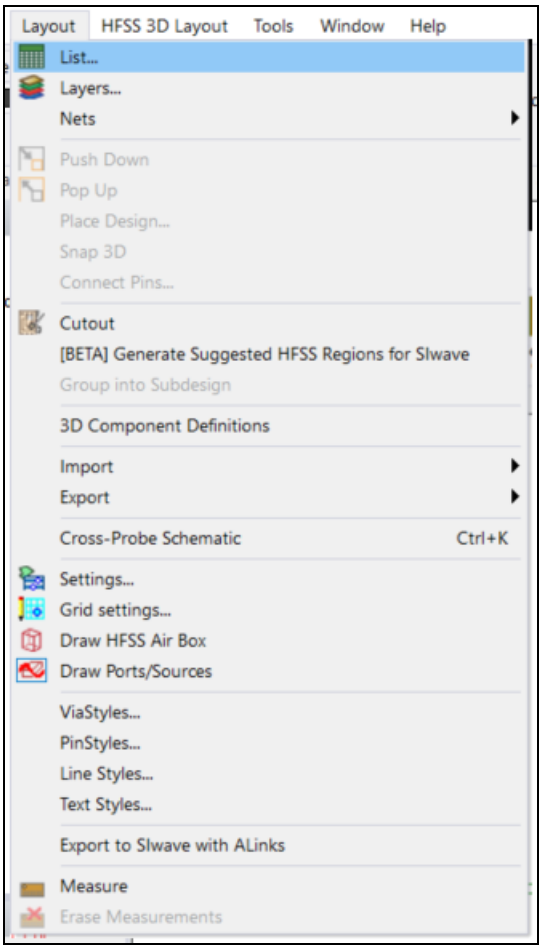
Coaxial wave ports can be used to excite solderballs at component interfaces. A wave port represents the region through which electromagnetic energy enters or exits the solution space. In the Ansys Electronics Desktop (AEDT)™ electronics systems design platform, a wave port is treated as if it were a semi-infinitely long waveguide or transmission line of the exact same cross-section attached to the model where it's excited. Wave ports assigned on waveguide structures are defined by the cross-section of the waveguides. For transmission lines (i.e. microstrip, coplanar waveguides, slotline etc.) ports should be defined carefully. Placement of a wave port is critical since it can affect the accuracy of the solutions.

If a coaxial wave port is placed on a component (e.g., a flip-chip), the reference plane is changed to a volume body with a thickness given by the "PEC Launch Width" property. This reference plane provides the required PEC backing for the wave port. Otherwise, the port is modified based on launch-width and becomes the Perfect Electric Conductor (i.e., PEC) instead.

Follow these steps to create a wave port using an existing Gap(coax) port.

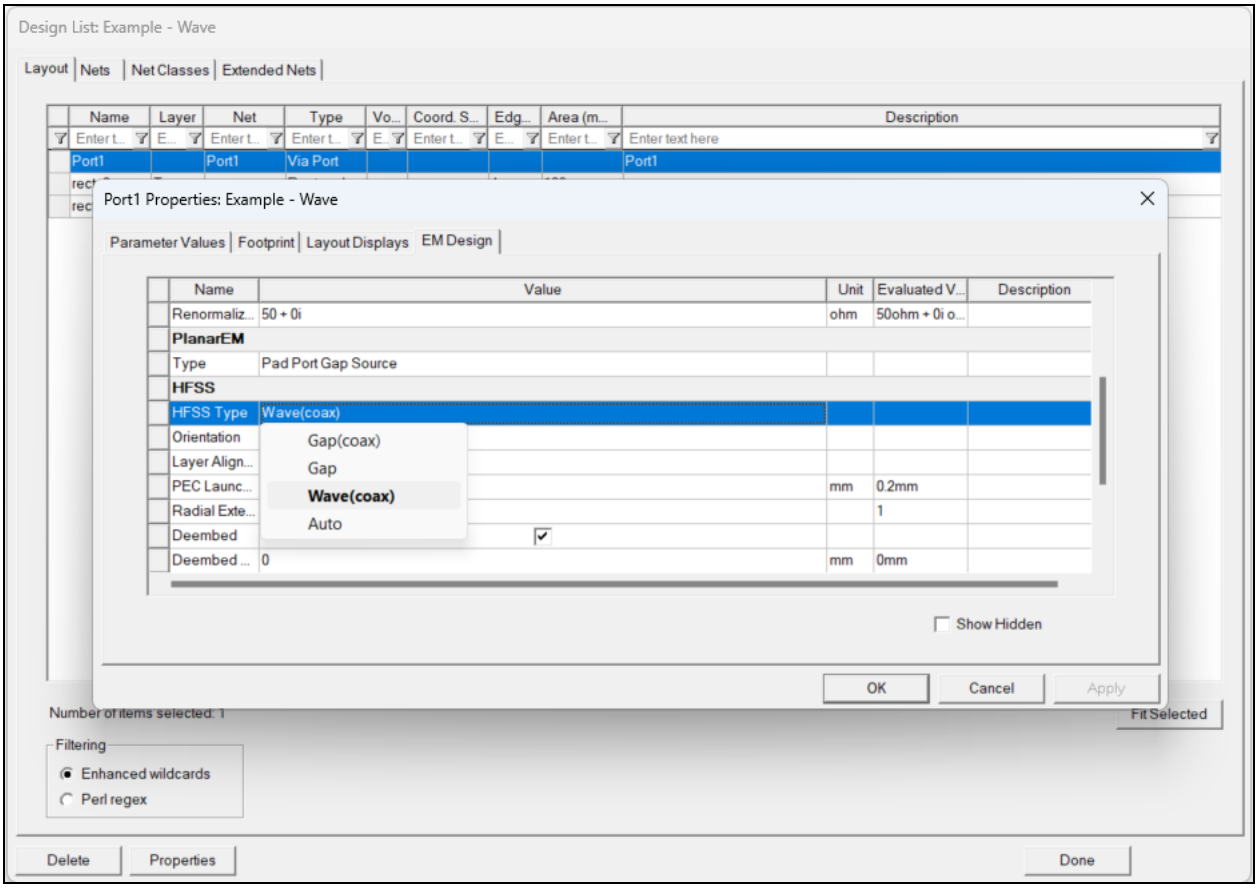
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Navigate to **Layout** > **List** to open the **Design List** window.



2. Select a port from the table and click **Properties** to open its individual **Properties** window.
3. From the **HFSS** section of the **Parameter Values** tab, select **Wave(coax)** from the **HFSS Type** drop-down menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Click **OK** to close the **Properties** window.

Horizontal Lumped Ports

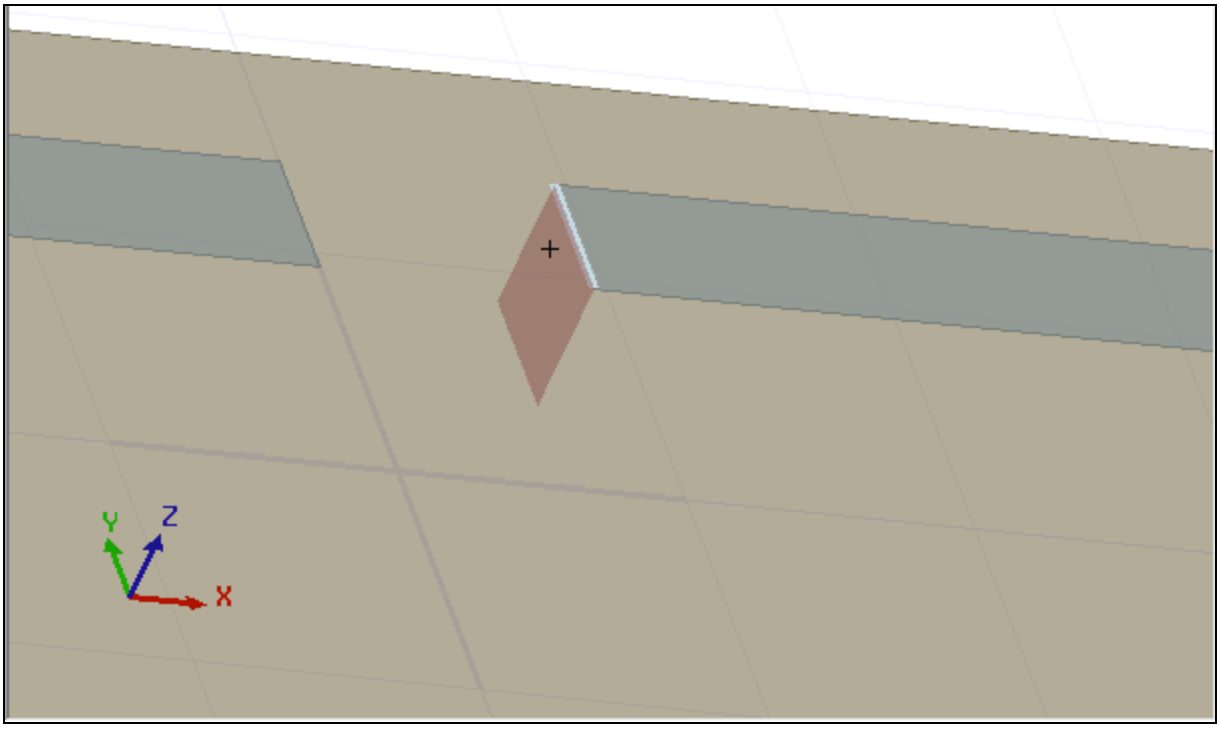
It is possible to configure an HFSS port to be a horizontal lumped port. Any existing horizontal edge port or pin may be assigned a reference segment. Reference assignment for an edge port requires a coplanar and parallel edge to realize valid port-geometry, but reference assignment to a pin can tolerate some geometry overlap.

Follow these steps to create a horizontal lumped port.

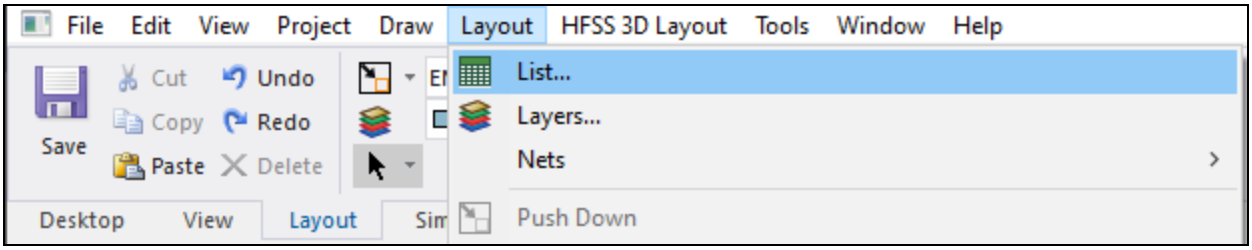
1. Do one of the following to select the vertical edge port you want to assign a reference segment:

- From the **Layout Editor**, click the port with the **Select** cursor (i.e., the default cursor, which resembles cross hairs in the **Layout Editor**).

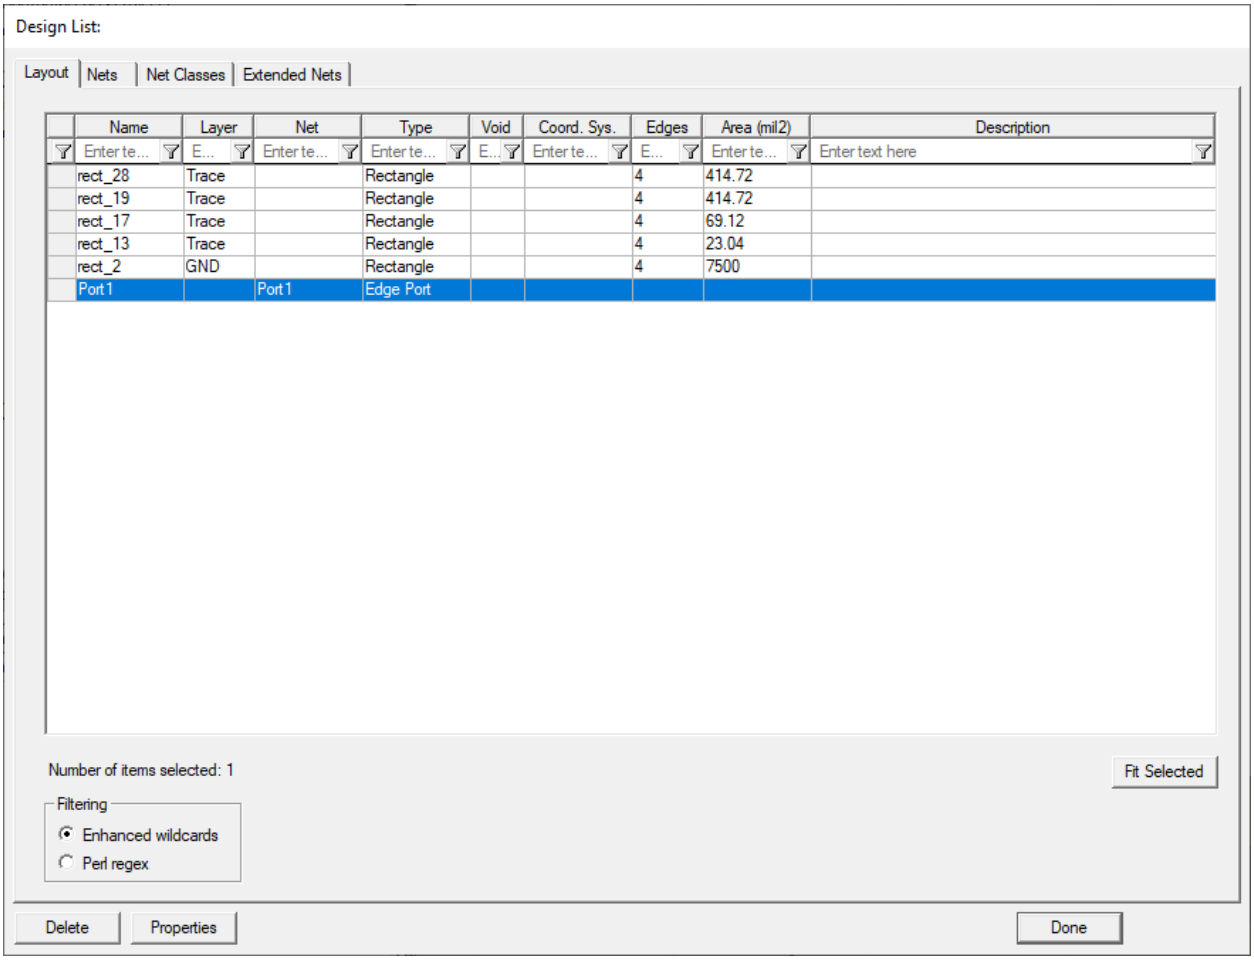
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



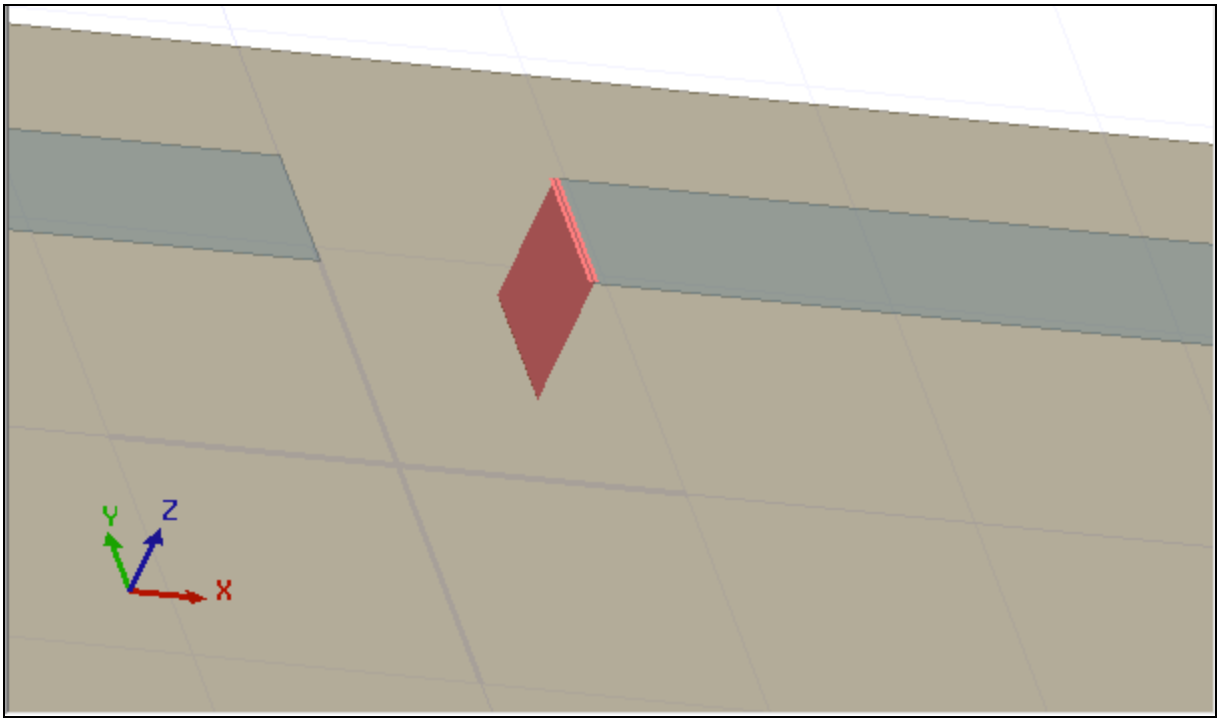
- From **Layout**, select **List** to open the **List** window. Then click anywhere within the port's row to highlight it. Click **Done** to close the **List** window.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



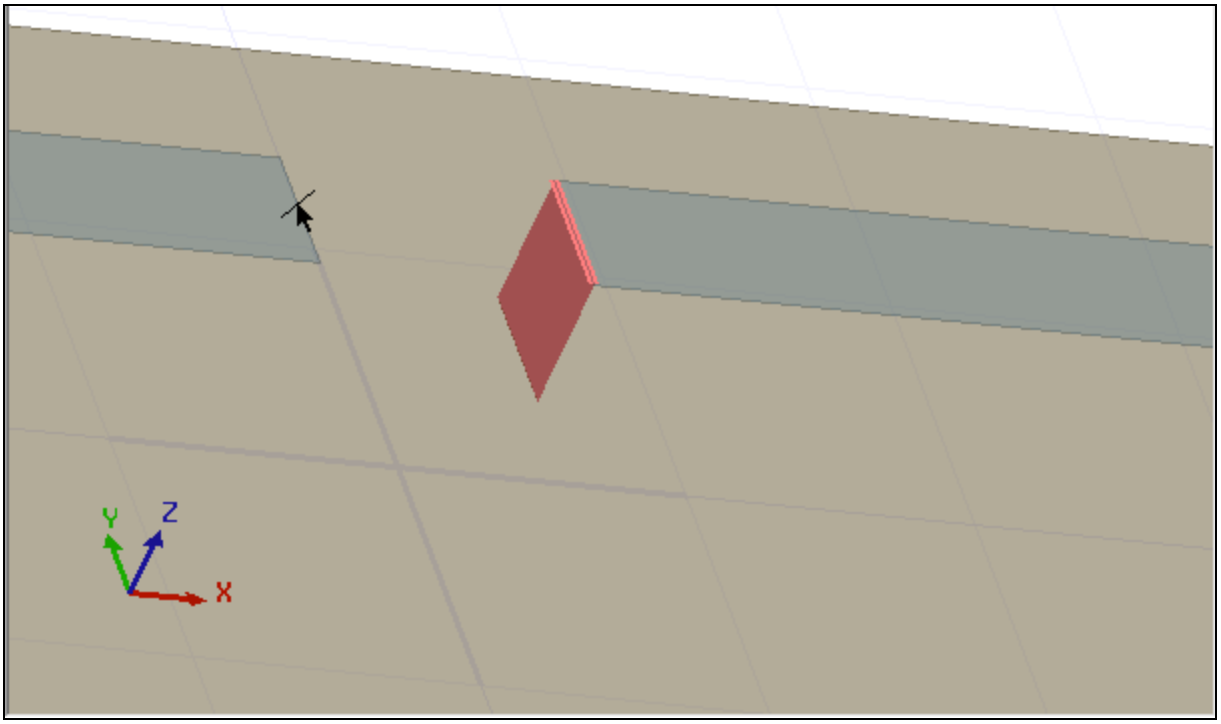
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



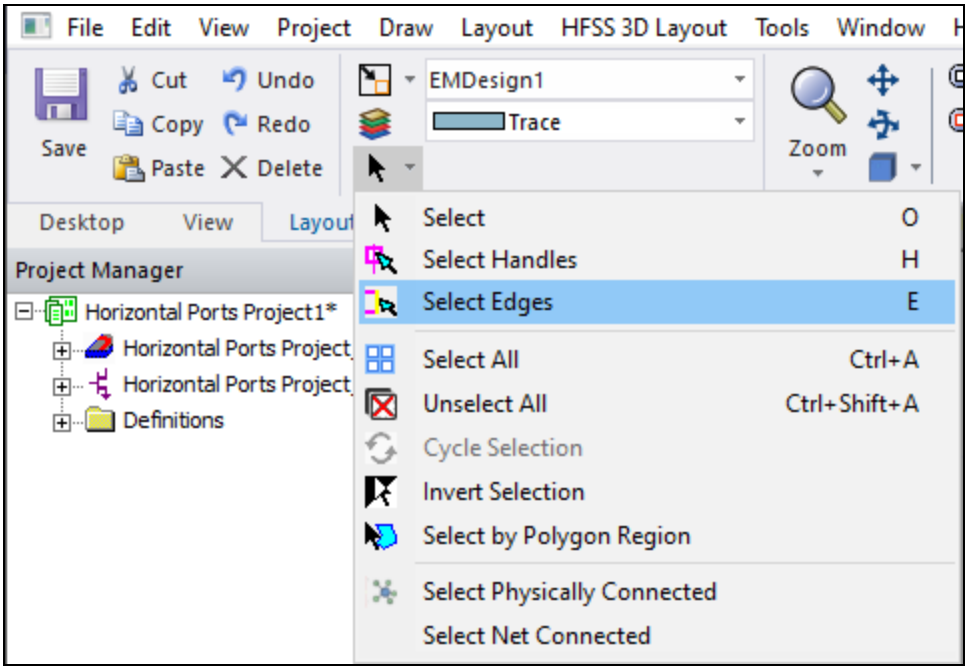
2. Do one of the following to select the reference edge:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

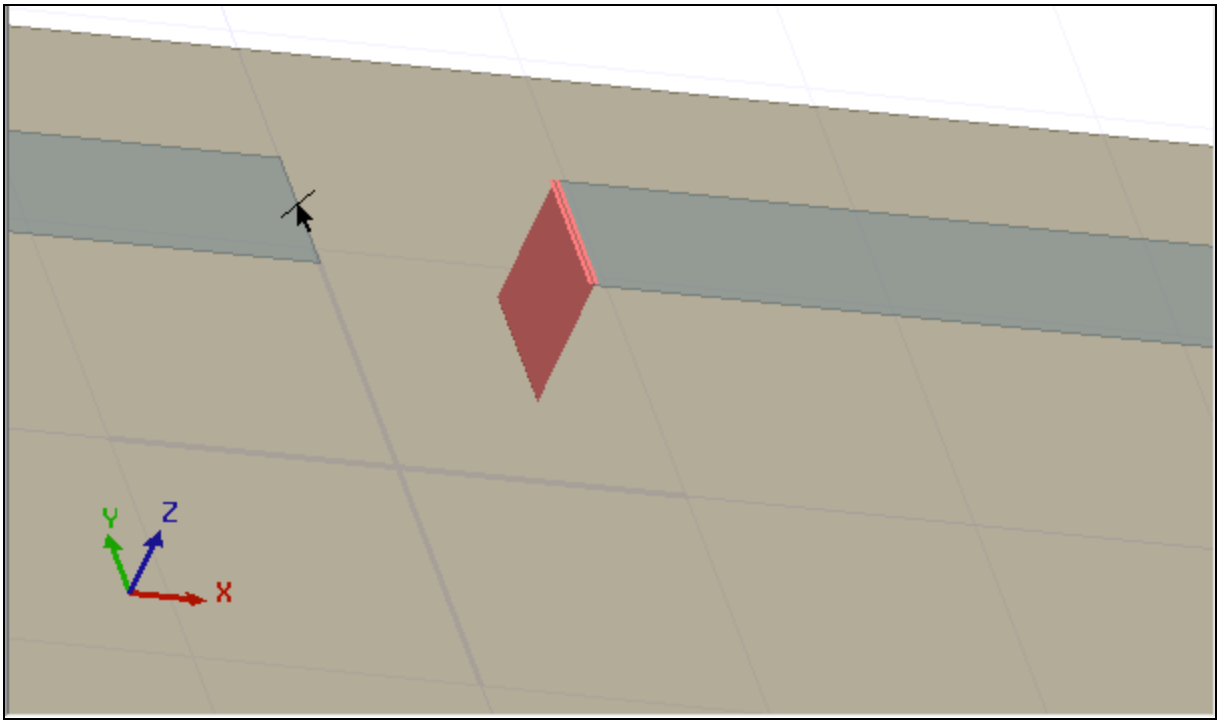
- Press **E** to change the cursor to the edge selection cursor. Then click the reference edge.



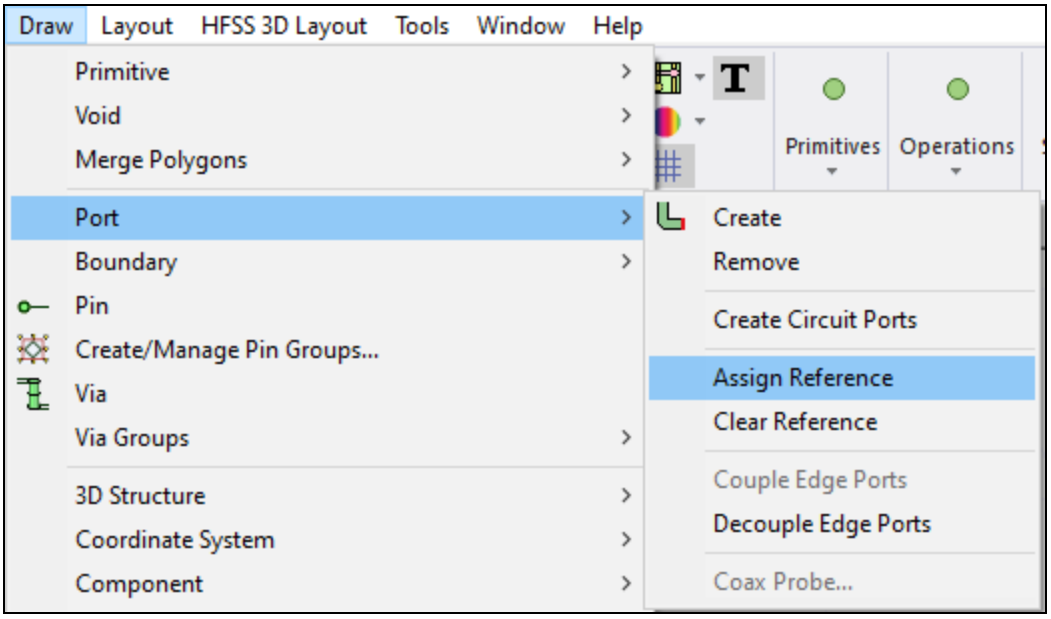
- From the **Layout** tab, choose **Select Edges** on the cursor drop-down menu. Then click the reference edge.



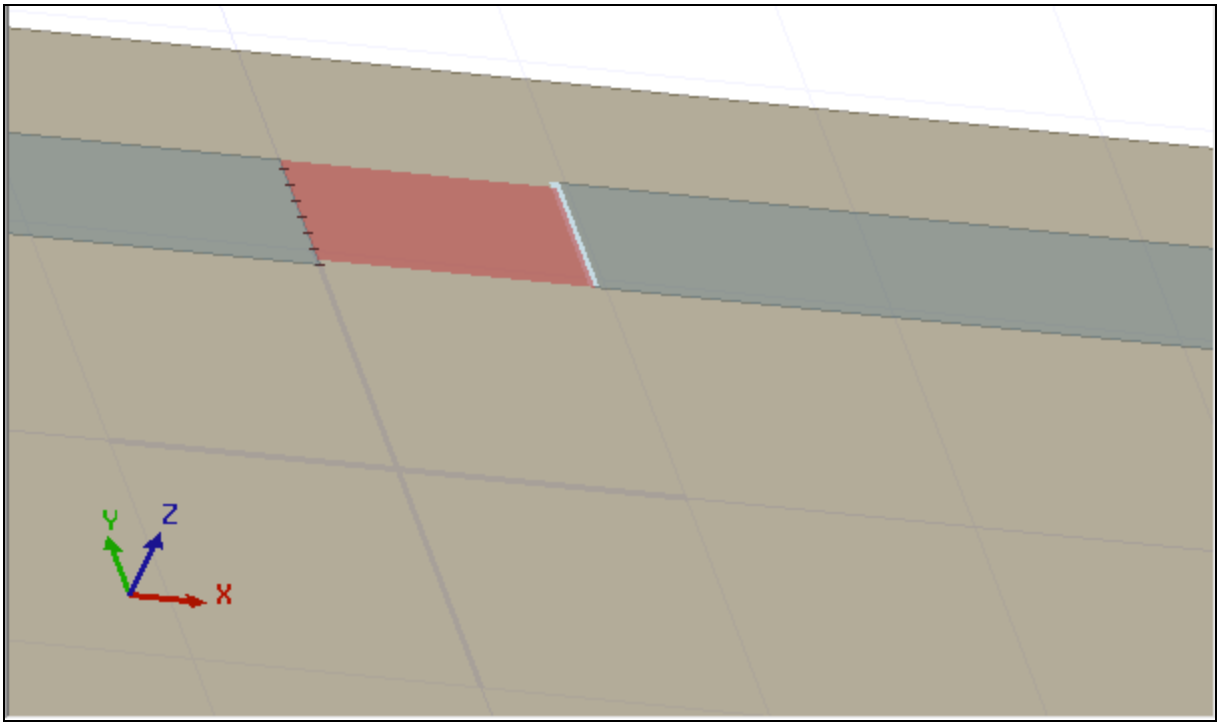
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. From **Draw**, select **Port** > **Assign Reference** to create a horizontal lumped port.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

Deembedded lumped ports in HFSS 3D Layout are not restricted to being rectangular. They can be arbitrary in shape. A typical non-rectangular lumped port are trapezoidal, with parallel sides connecting to the terminal and its reference. But more complicated shapes are allowed.

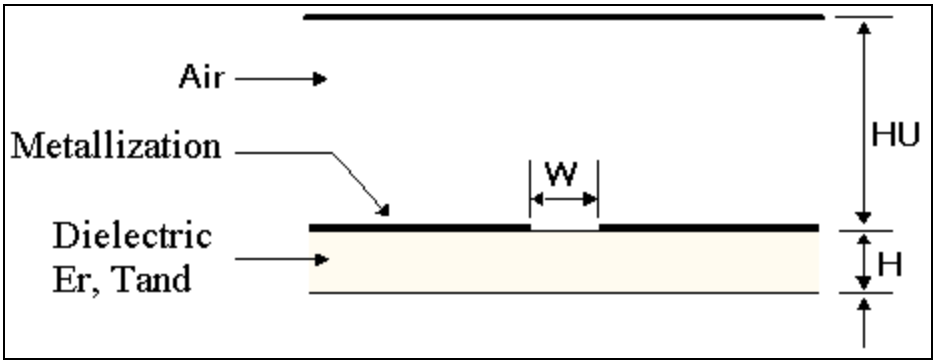
To tune the solver to reliably solve low frequencies for designs that only contain lumped ports as sources, see the **Enhanced low frequency accuracy** setting in the Options Tab of the **HFSS Setup** window.

CPW and Slotline Ports

CPW and Slotline Ports are allowed and can be configured in light of the following information.

- On a Negative Signal layer, edge selections must be co-linear and co-planar.
- The CPW mode can also be solved on a Signal layer by selecting only the single conductor and sizing the port appropriately.
- Various configurations using lumped-gap ports are possible.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Circuit Ports and Elements in HFSS 3D Layout

Significant simulation speed and efficiency can be gained by using circuit ports and elements in HFSS. Reduce simulation times by limiting the number of excitations by using circuit elements to include black-box representations directly in HFSS solutions.

Circuit Element Advantages

A circuit port consists of an impressed current source along with a user-defined parallel impedance load. Compared with traditional ports in HFSS 3D Layout, circuit ports are easier to setup but still provide S-parameters.

- The only geometry that must be specified is the location of two terminals.
- A terminal can be defined as a selected edge or as a point touching a metallic object (e.g., an edge port or a point port).
- A design that only contains circuit ports can also be solved at much lower frequencies, compared with using standard ports.

Circuit elements provide a simple and flexible approach to include the effects of lumped circuit elements and allow you to include black box representations as S-parameters directly in an HFSS solution. One benefit of this approach is to reduce the number of excitations required. Reducing the number of excitations reduces the simulation time.

Deembedded Lumped Ports in HFSS 3D Layout are not restricted to being rectangular, they can be arbitrary in shape. A typical non-rectangular lumped port are trapezoidal, with parallel sides connecting to the terminal and its reference. But more complicated shapes are allowed.

A circuit element connection is modeled as if there is actual geometry carrying a conduction current but without the explicit need to define the geometry. This is important to keep in mind since there is an actual connection between two terminals being enforced at the discretized FEM system matrix, and that connection is being solved. Which is similar to the solution if there existed explicit geometry to model that connection. Similar to circuit ports, the only geometry that

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

must be specified is the locations of the terminals defining the circuit connections where each terminal is defined as a selected edge of a metallic object.

Restrictions and Workarounds

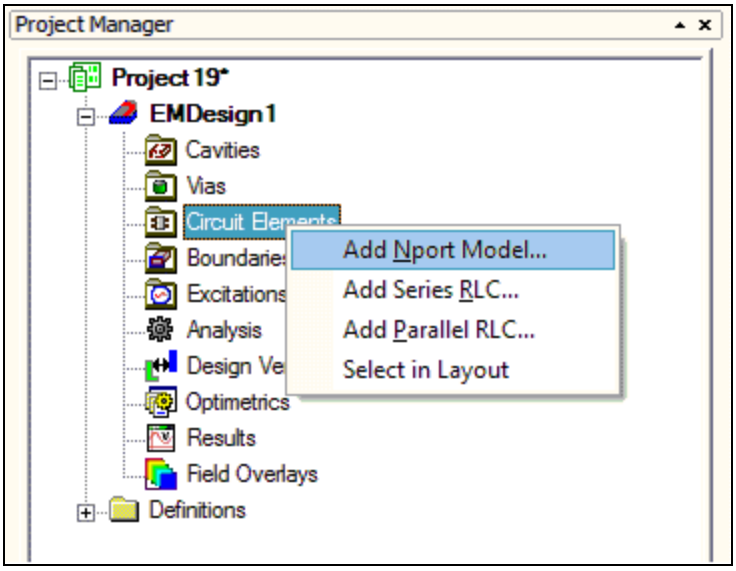
The only restriction on the placement of circuit elements and ports is there may not be any gap or wave ports located directly between the terminals of the circuit element/port. While adding a circuit element/port to a design does not explicitly add any conductive material between the terminals, it does add a current path which interferes with any gap or wave ports in between. Such intersections are usually an unintended consequence of using a highly conductive circuit element to add a current return path to a design and can usually be avoided by one of four methods:

- The intersecting wave ports or gap ports can be switched to circuit ports.
- The circuit element can be re-routed by moving the terminals.
- Two separate circuit elements can be used to connect the terminals to a common ground plane or an explicit return path in a separate signal layer.
- If the intersecting ports are horizontal gap ports in a signal layer with non-zero thickness, they can be switched to align with the upper surface of the layer.

HFSS SoD

HFSS SoD supports simulation of two-port models, as well as Parallel and Series RLC ideal components. Additionally, HFSS 3D Layout can simulate N-port models. The HFSS solver models two terminal circuit elements by assuming a constant impressed current between the two terminals. HFSS 3D Layout also assumes this current has no radiative coupling to the structure. These assumptions are valid when the separation between the two terminals is electrically short, which is typically the case for such devices as surface mount resistors and capacitors. To add one of these components, right-click 'Circuit Elements' and select 'Add Nport Model', 'Add Series RLC' or 'Add Parallel RLC'.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

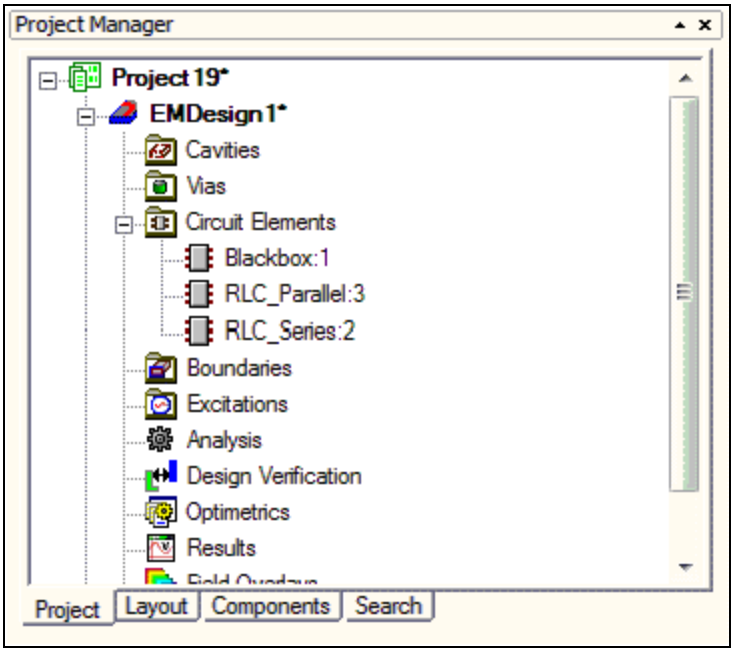


Select **Import Component Mapping File** or **Import Component File**.

- **Import Component Mapping File** opens a window to select a *.dat partmap file. HFSS reads the partmap file and create (or re-assign) and orient circuit-elements for given components.
- **Import Component File** opens a window to select a *.cmp file. HFSS reads this cmp file and create (or re-assign) circuit-elements.

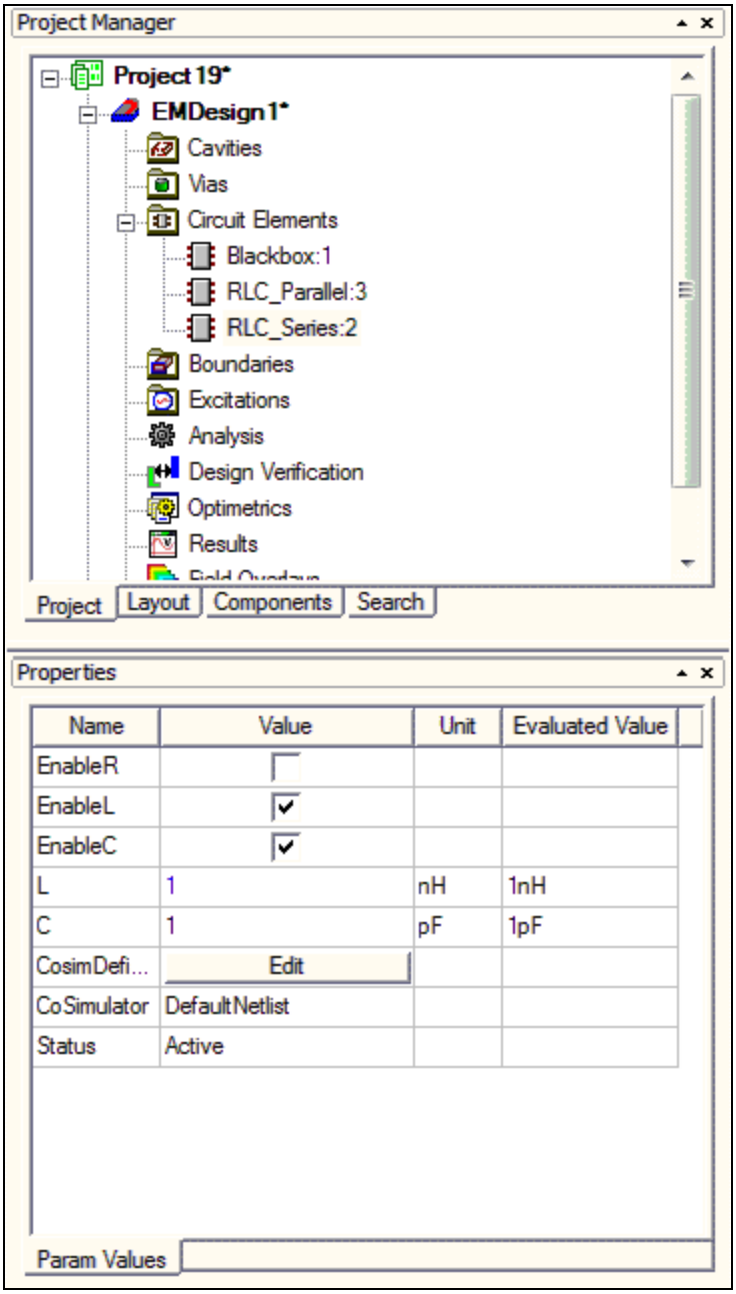
Once circuit elements have been added to an HFSS 3D Layout they appear under the Circuit Elements tree item.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Properties of the RLC components can be edited in the properties window and R, L and C can be deactivated.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



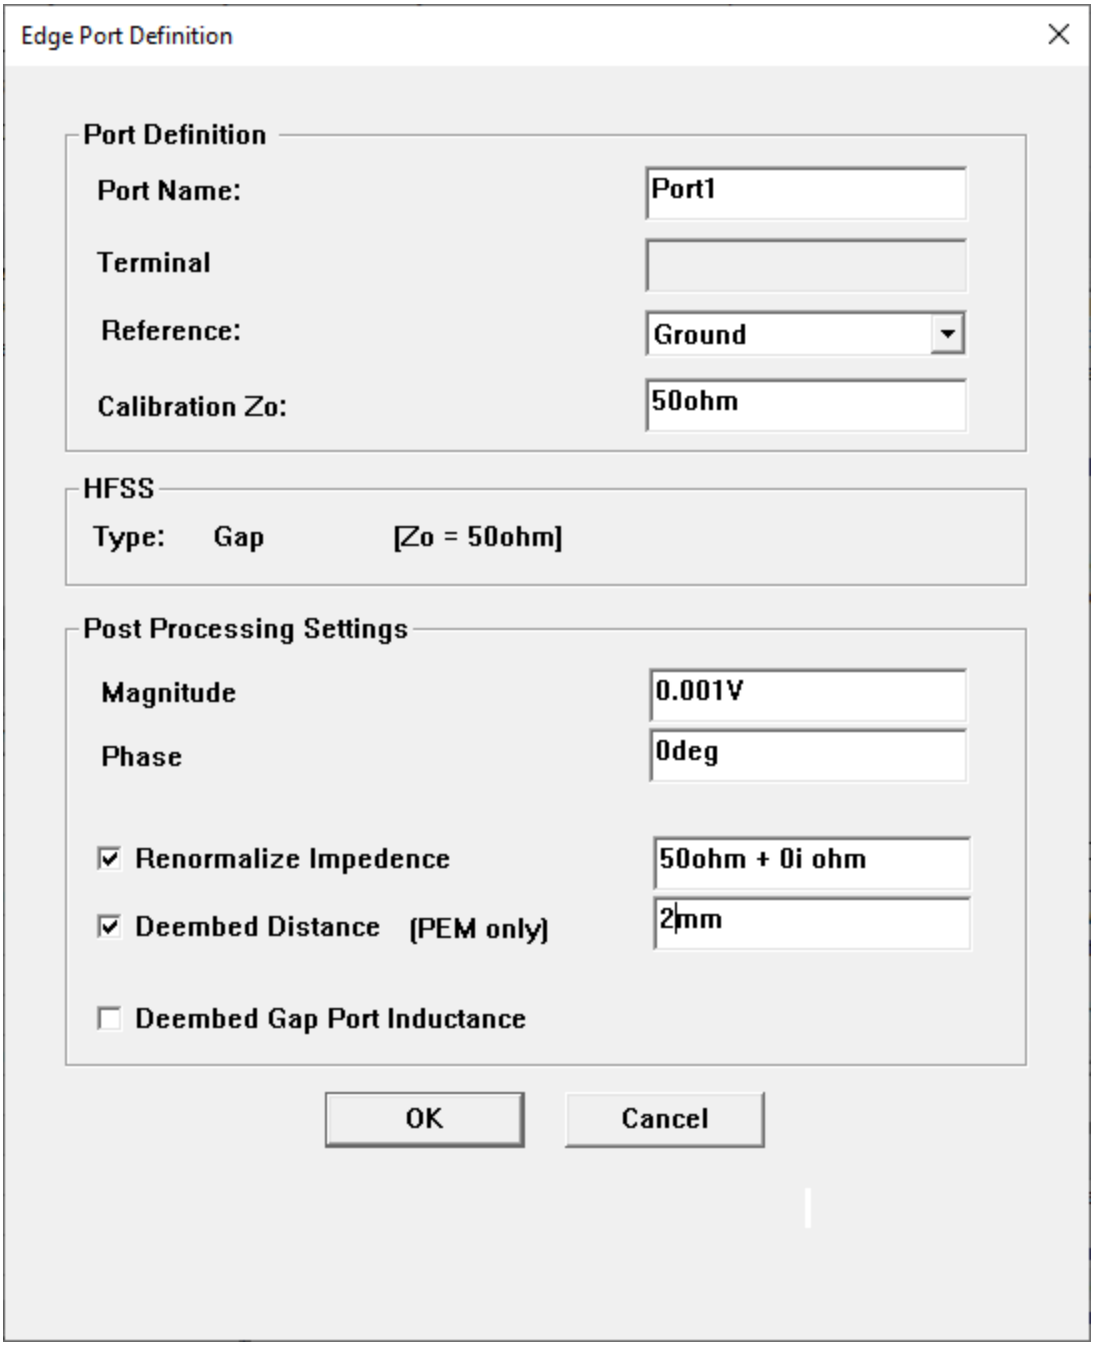
Note:

Components that do not have footprint geometry are initially rendered on the Symbol layer. When the component is first wired to an object on a physical layer, it renders on that physical layer. For more information see Components with a Symbol Footprint.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

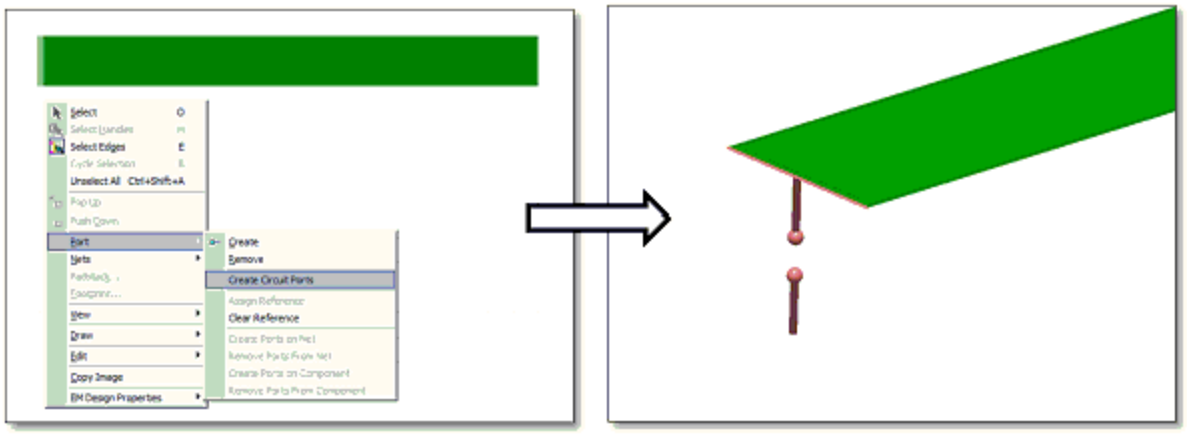
Creating a Circuit Port

Circuit ports can be created in multiple ways: automatically referenced to the closest ground plane, between two edges, or point-to-point. All circuit ports are listed under **Excitations** in the **Project Tree**. To edit a circuit port's properties, double-click the port in the **Project Tree** to open the **Edge Port Definition** window.



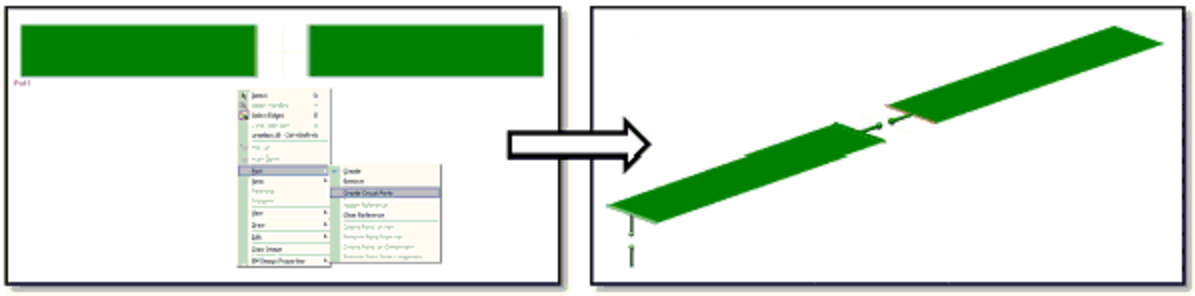
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

To create a circuit port automatically referenced to the closest ground plane, select an edge of a conductor, right-click and select **Port** > **Create Circuit Ports** on the floating menu.



A circuit port are created with the selected edge as its positive terminal and the nearest ground plane as its negative terminal.

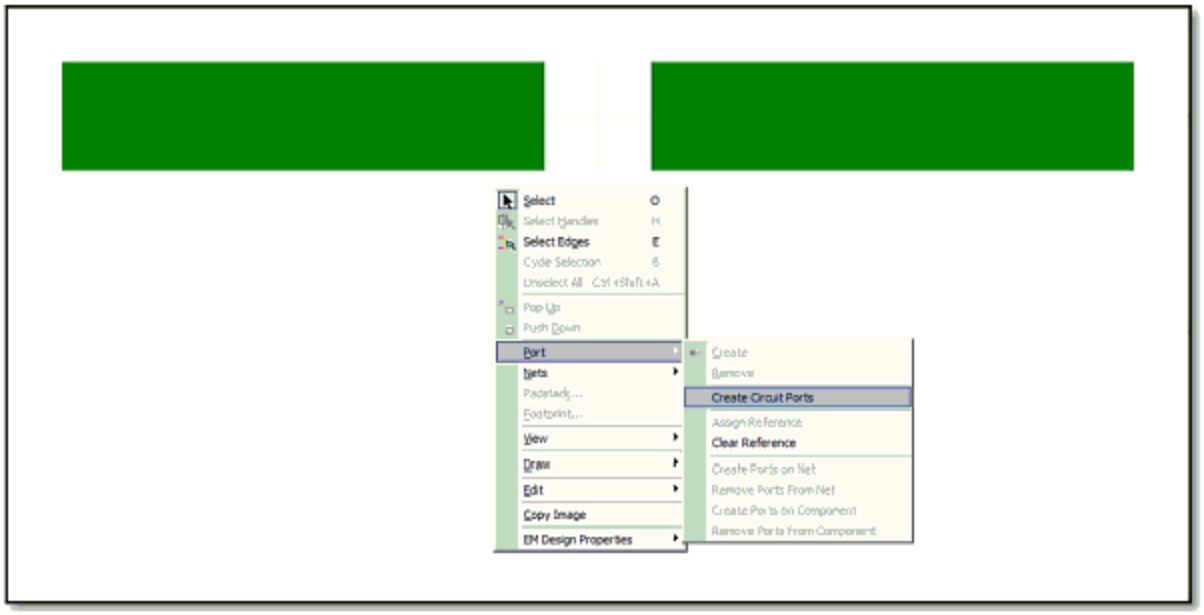
To create a circuit port between two edges, select a pair of edges from different conductors, right-click and select **Port** > **Create Circuit Ports** on the floating menu.



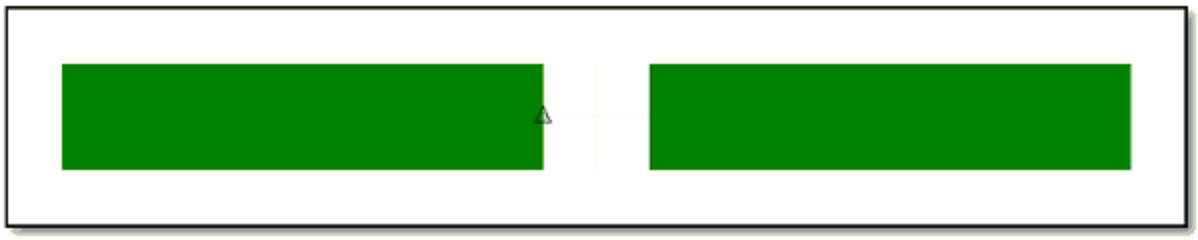
The first selected edge defines the positive terminal and the second selected edge defines the negative terminal of the port.

Circuit ports can also be introduced in a point-to-point manner. With no edges selected, right-click and select **Port** > **Create Circuit Ports** on the floating menu.

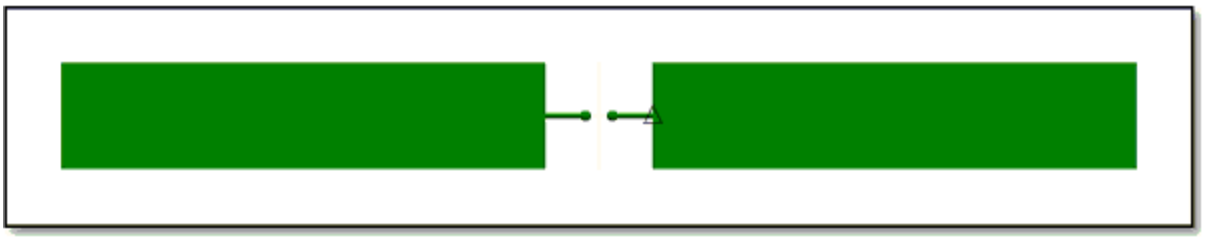
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Click on a conductor to select the positive terminal.

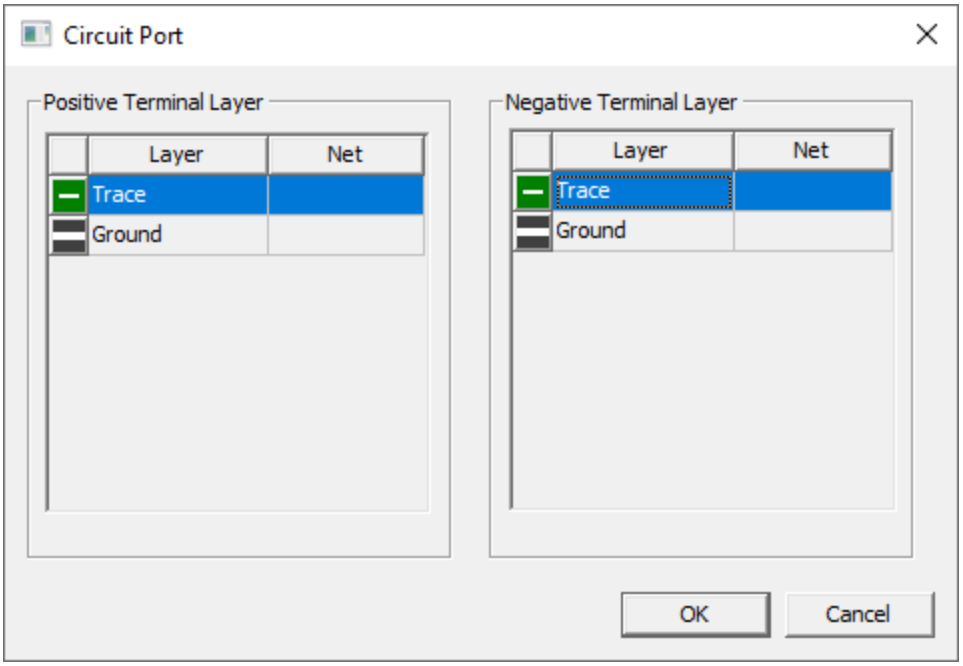


Click on a second conductor to select the negative terminal.



A window appears that allows the selection of a layer for each terminal.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The circuit port is listed under **Excitations** in the **Project Tree**. To edit the port's properties, double-click the edge port in the **Project Tree**. The **Edge Port Definition** window opens where you can perform these tasks:

- Change the name of the pad port.
- De-embedding S-Matrices.
- Vary the current excitation.
- Renormalize the port to a specific port impedance.
- Setup a Reference to the Nearest Negative Signal.

When the circuit port is selected, its **EM Design** tab is available in the **Properties** window. This tab displays many of the values in the **Edge Port Definition** window, including the port classification for the HFSS-PI type. The **Footprint** tab lists whether the circuit port is a point or edge port.

A port can be split across multiple signal layers. It can be made of up to three different line segments on three different primitive objects. Ports located over apertures in negative signal planes can generate incorrect results. HFSS automatically displays a warning message if referencing a gap source to the nearest negative signal produces such an error.

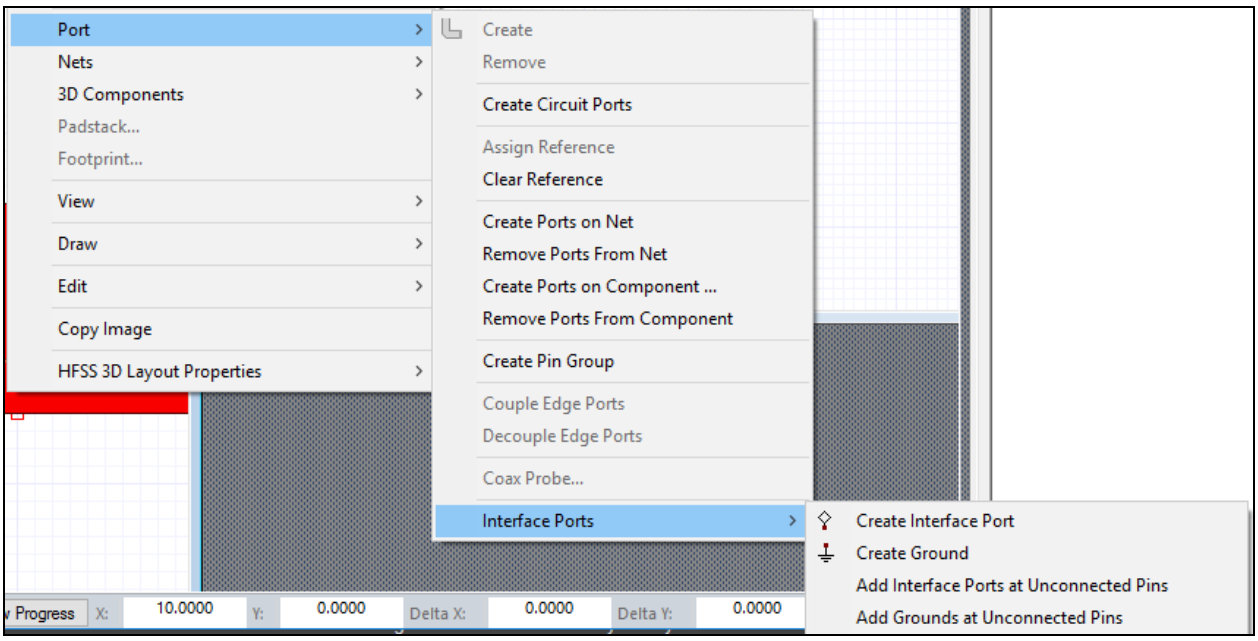
Interface Ports and Sources in 3D Layout

Interface ports and sources (interface and ground) can be added to a 3D Layout design. This applies to any Nexxim solution in 3D Layout (Transient or LNA). Creating interface ports and

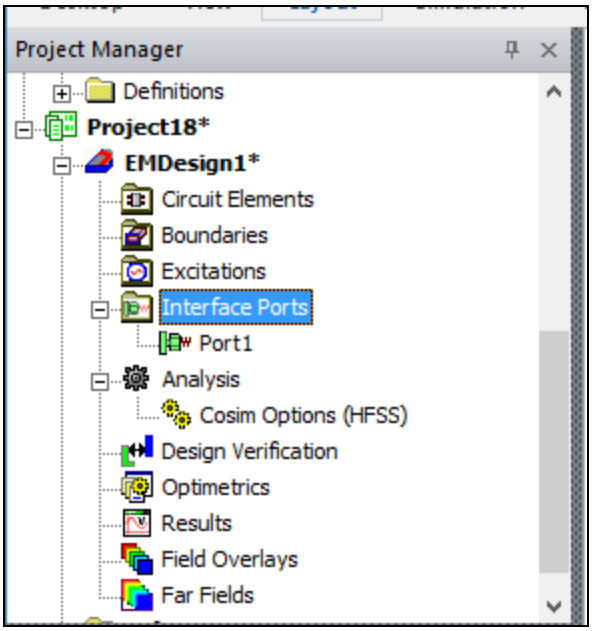
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

sources is appropriate to drive Nexxim simulation from 3D Layout.

To place an interface port, click the toolbar icon or right-click in the **Layout Editor** and select **Port** > **Interface Ports** > **Create Interface Port**.

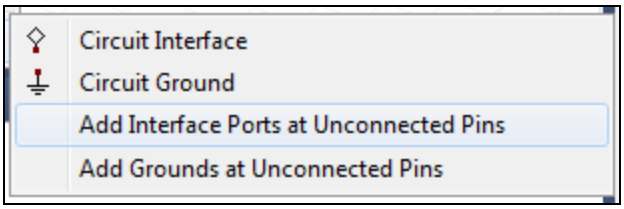


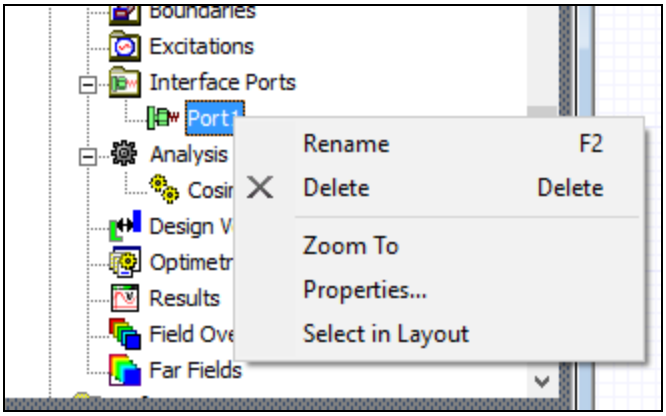
Interface and ground ports can be connected to 3D Layout ports.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Add Interface Ports at Unconnected Pins**: Automatically create interface ports on unconnected port instances for the selected component(s).
- **Add Grounds at Unconnected Pins**: Automatically create circuit grounds on unconnected port instances for the selected component(s).





Interface Ports

Once interface ports are placed in layout, an Interface Ports item appears in the **Project Tree**.

- **Properties**: Invokes the Interface Port window; users can add interface sources from this window.

Interface Sources

When interface sources have been added to ports, they appear under this **Project Tree** item.

Netlisting for Interface Ports and Grounds

To see how ports and grounds are netlists, RMC on the LNA or Transient setup to browse the netlist. Netlisting for ports, sources, and grounds is similar to that of a Circuit Design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Changing the Reference Surface

HFSS 3D Layout edge ports are usually single-terminal excitations, in which the negative polarity reference for a port automatically defaults to the closest signal layer (with geometry) or negative layer, above or below the primary terminal.

If the model has a two-terminal excitation, override this default behavior by designating the voltage reference for the port. Typical applications include referencing one signal line to another (a differential pair,) or referencing a trace to a finite negative signal, either in-plane (a CPW) or out of plane (a finite negative signal antenna.) Follow these steps to change a port's voltage reference.

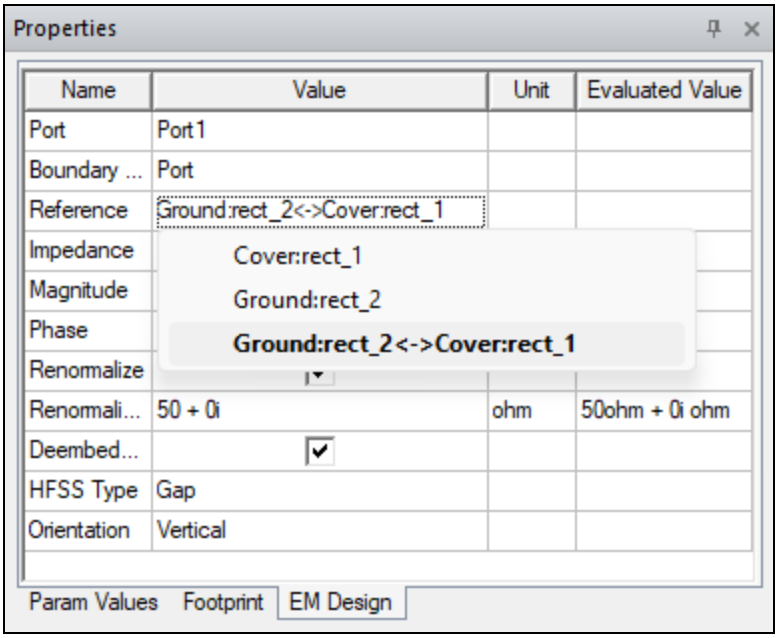
1. Select an edge on a signal layer to mark it as the reference surface.
2. Right-click the excitation in the project tree and select **Add Reference**.

The reference is changed to the edge you selected.

Selecting a Dual Reference

If a lumped port abuts two planes (i.e., two possible reference surfaces), users can select both surfaces. With the port selected, navigate to the **Properties** window. Then select the dual reference option from the **Reference** drop-down menu (i.e., the dual reference option lists both reference surfaces with a **<->** demarcation between them).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Reference to Nearest Negative Signal

When you setup excitations using the Edge Port Definition window, select to select the **Reference** option and specify the nearest negative signal. This option explicitly forces the reference of a port to be located on the nearest negative signal plane, directly below (or above) the port. A vertical trace connecting the port to its reference is added to the structure.

The **Reference** to a nearest negative signal option should be used when the port is over one-tenth of a wavelength on the negative signal plane. If the port is closer than one-tenth of a wavelength, referencing to the nearest negative signal is inappropriate.

> **Warning:**
>
> In a stripline environment, the additional vertical current that results from using the **Reference** option to the nearest negative signal may excite the parallel plate mode — which could create inaccurate results.

Configuring Multiple Ports

It is possible to configure multiple HFSS ports at once. All port attributes exist as HFSS 3D Layout properties. The **Properties** window is populated with a union of properties for the active selection set. To edit many ports at once, select multiple ports to populate the **Properties** window. Finer selection is available by:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

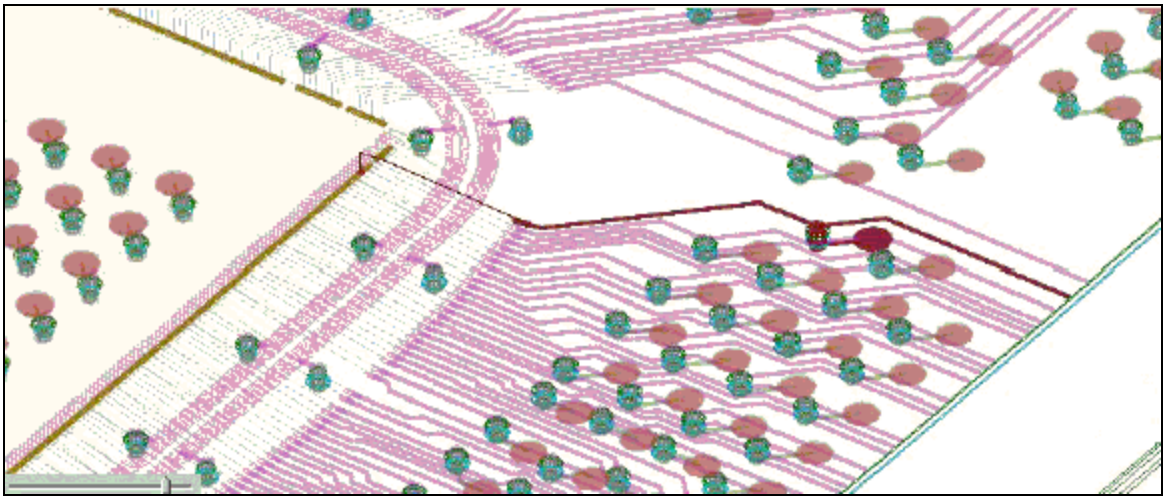
- Editing layer selectability using the **Layout** tab or **Layers** window.
- Using the **List** window

Validating Connectivity and Return Paths

Users can select and view objects that are physically connected to a component in a geometry. The objects can be viewed in the **Design List** and **Editor Layout** window, which can in turn be resized to zoom in on just the objects selected. This workflow allows the user to trace and highlight connected paths across layers in a design in order to validate connectivity and return paths. And then, within this feature, examine complex geometry through selection, net highlighting, transparency, Z-scaling, and cross-sectioning in the 3D view.

To select objects physically connected to a specific object:

1. Select the pertinent objects.
2. Right-click and select **Nets** > **Select Physically Connected**. Alternatively, click **Layout** > **Nets** > **Select Physically Connected** in the menu bar.All connected objects are selected.



To view connected objects in the Design List and the Layout window:

3. Right-click on one of the objects and select **List Selection**. The Design List opens with only its Layout tab.
4. From the window's list, select the row of every object selected in the **Editor Layout** window. Click **Shift** and **Ctrl** if appropriate.
5. Click **Fit Selected**. The Layout window zooms in on the selected objects.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

Not all geometry types work with the **Select Physically Connected** command. Connections through solderballs, planar bondwires, and very simple instances of 3D-extrusion are supported. Bondwires with 3D geometry and most 3D-extrusions cannot be tracked.

Exposing Horizontal Lumped Ports in Hierarchy

- If a top-level port exposes a port in hierarchy, and that port has an explicit horizontal reference, the **Use Hierarchy Reference** property appears. If this option is selected, the original reference geometry within hierarchy (i.e., in the sub-circuit) is used.

Note:

Enabling the reference in hierarchy results in the removal of the properties: **Reference**, **PortSolver**, **Ignore Reference**, and **Pad port layer**.

Name	Value
Port	Port3
Boundary Type	Port
Use Hierarchy Reference	☑
Impedance	50
Magnitude	1
Phase	0
PostProcess	☑
Renormalize	50 + 0i
Deembed	0

Port Settings for Post Processing

When you specify an excitation for an HFSS 3D Layout structure, you can configure settings for post-processing that are specific to HFSS 3D Layout. These settings are:

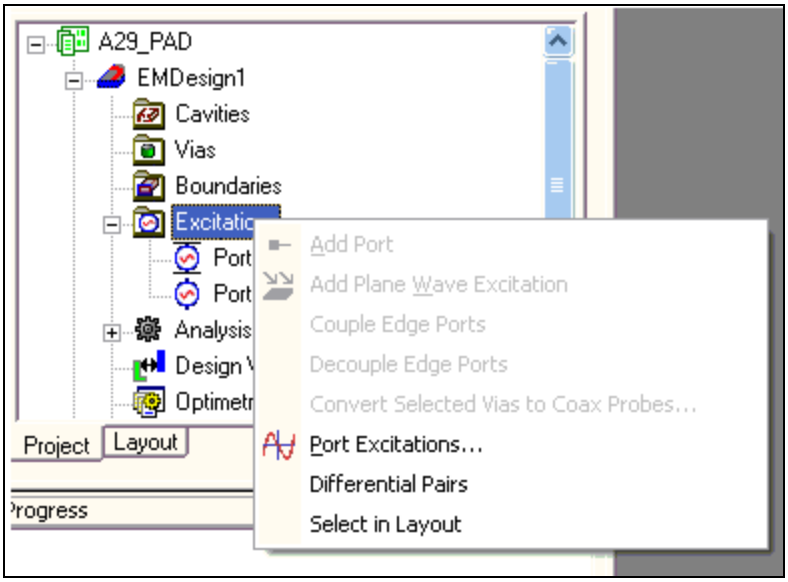
- Edit Port Excitations
- Renormalizing S-Matrices
- De-embedding S-Matrices

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

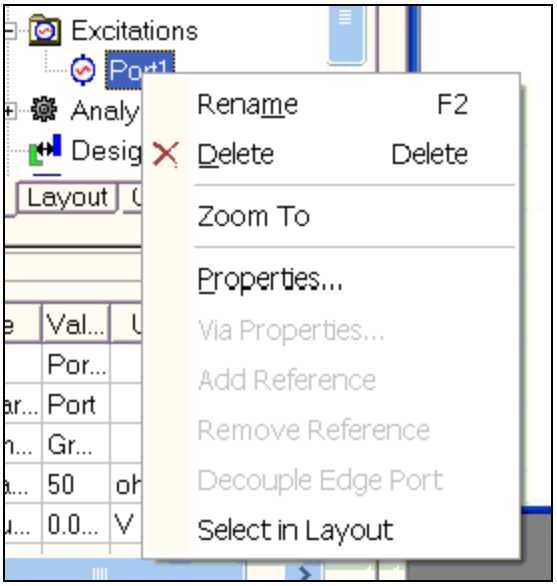
- Varying the Port Excitation
- Differential Pairs

Edit Port Excitations

Many of the excitation features described in the following sections can be accessed by right-clicking the **Excitations** folder in the **Project Manager** window.

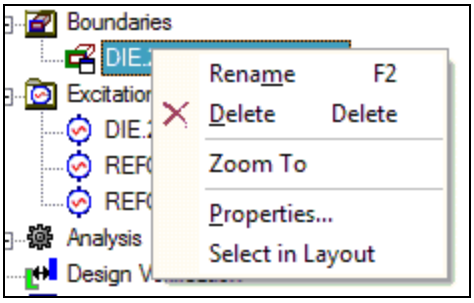


Or can be accessed by right-clicking **Excitations** items and **Boundaries** items.

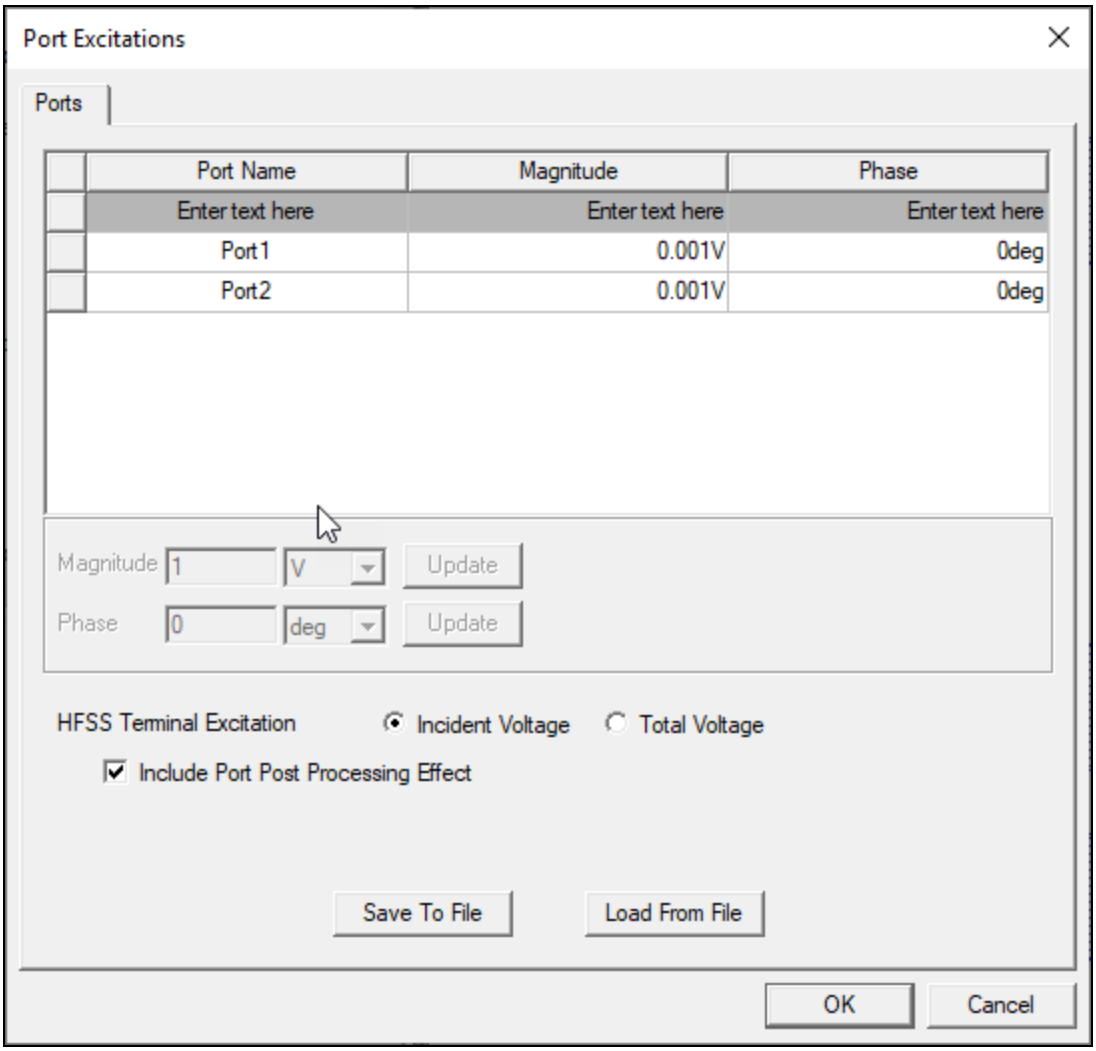


AND

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

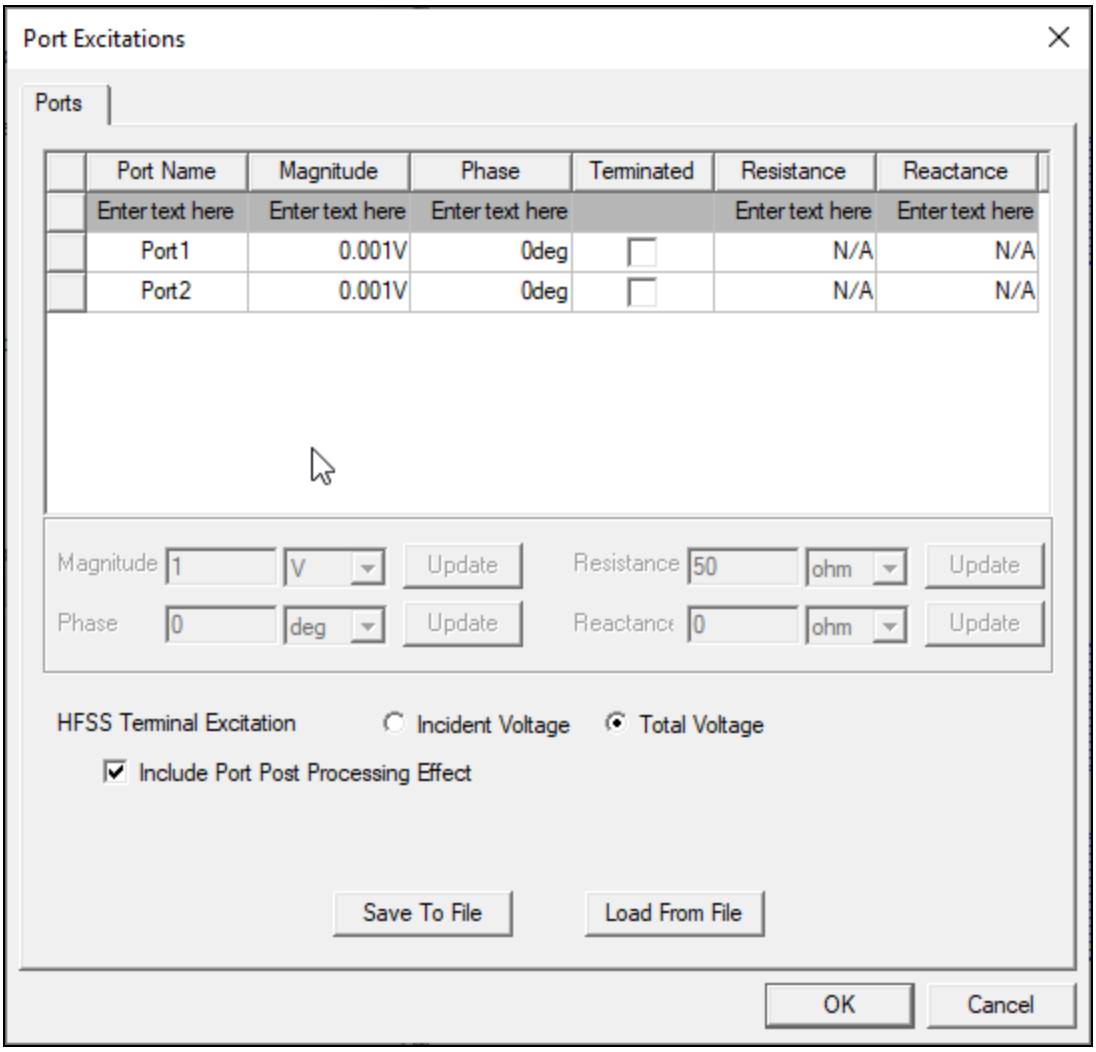


Select **Port Excitations** to open the **Port Excitations** window:



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

You can use this window to modify port excitations, including post-processing and renormalization settings. For HFSS Terminal solutions, select a terminal excitation type of **Incident Voltage** or **Total Voltage**. Selecting **Total Voltage** adds more columns to the table.



You can scale the sources individually through the source table or import a list of the port excitations and their settings from a text or CSV file through **Load From File**. This feature can help for projects with many ports. Follow these steps to directly edit the ports table.

1. Select ports and their corresponding settings fields activate beneath the table.
    a. Use the first row of the table to filter the ports to find the ones you want.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **Magnitude** field, enter the magnitude you want. Design variables can be used.

> **Note:**
>
> You may not enter a negative voltage. To obtain the equivalent of a negative magnitude, add or subtract 180 degrees on the phase value.
>
> If you use a design variable as a scaling factor note that solutions are invalidated if the variable is changed.
>
> At least one port should be excited (non-zero). If all ports are set to zero, a warning appears, but the values do go through.

3. From the **Phase** field, enter the new phase for the port. The phase of the source is changed by the value that you enter.
4. Optionally, if your solution type is driven terminal, you may specify a complex reference impedance:
    a. For the selected terminal, select **Terminated**. This turns off the values to the left of the check box, and enables the **Resistance** and **Reactance** fields.
    b. Enter the **Resistance** and the **Reactance** and select the units. Ohms is the default.
5. Optionally, click a check box to **Include Post Processing Effects**. The post-processing effect has no impact on the impedance of a terminated port, but the post processing operations (renormalization and/or deembedding) affects the plotted fields.
6. To saves a list of the port excitations in the grid and their settings in a text or CSV file, click **Save to File**.
7. Click **OK**.

> **Note:**
>
> Renormalization is ignored if it is set to zero, but de-embedding is still honored. The following warning message is produced for all ports with a zero post-processing renormalization impedance: *Zero impedance on port '<arg1>' is ignored; renormalization is skipped for this port*.

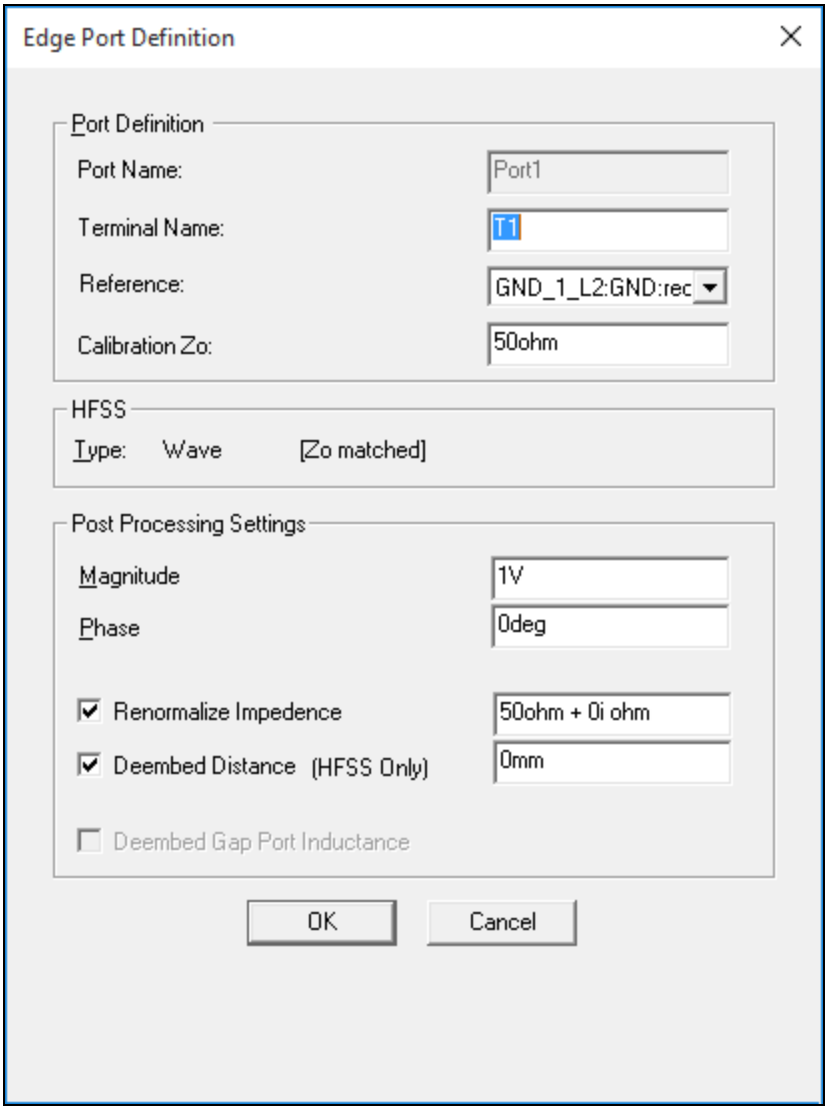
Renormalizing S-Matrices

To renormalize an S-matrix to a specific port impedance:

1. From the **Project Manager** window, expand the **Project Tree** and **[*Active Design Folder*]** > **Excitations**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Double-click an appropriate edge port to open the **Edge Port Definition** window.



3. Ensure **Post Process Port** is selected (default).
4. Select **Renormalize Impedence** and set the amount to a non-zero value. The default impedance for re-normalization of each port is 50 ohms.

- If the impedance is a complex quantity, type the real part of the impedance to the left of a plus sign (**+**) and the imaginary part of the impedance followed by **i** to the right of the plus sign (e.g., enter **50 + 10i**).

4. Enter the length of the transmission line to add in the **Deembed Distance** field.
5. Click **OK** to renormalize the port to the new impedance.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

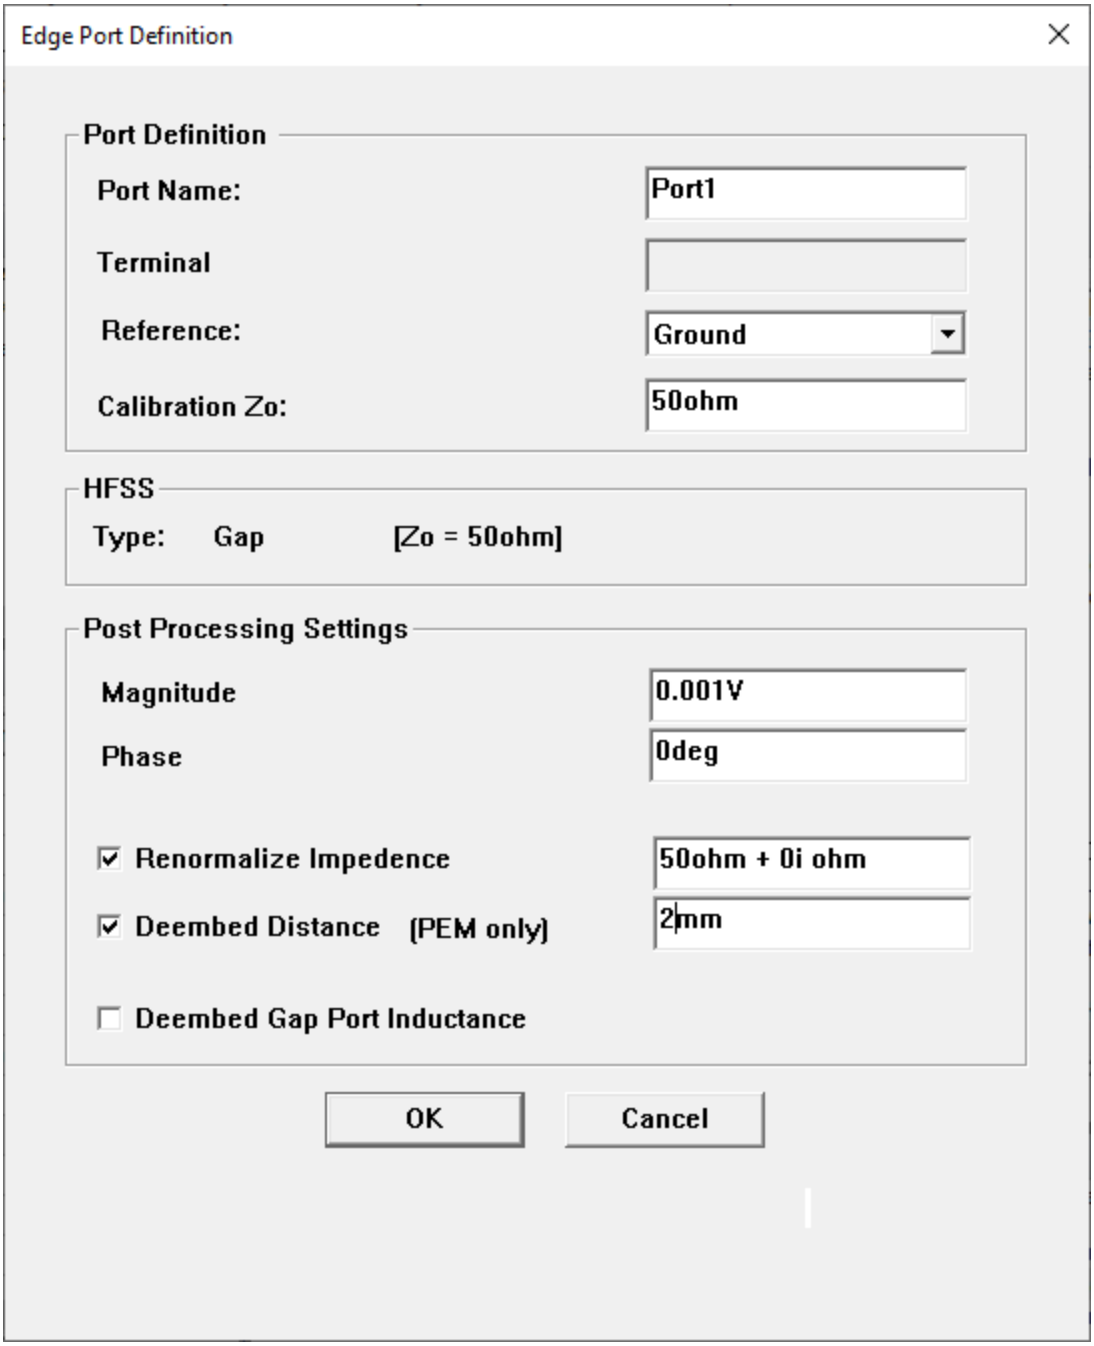
You do not need to re-run a simulation in order to renormalize a port. The 2D Reporter automatically updates its reports to reflect the renormalized S-matrix.

De-embedding S-Matrices

Follow these steps to compute a de-embedded or phase-rotated S-matrix.

1. From the **Project Manager** window, expand the **Project Tree** and the **Excitations** folder. Then double-click a port to open the **Edge Port Definition** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

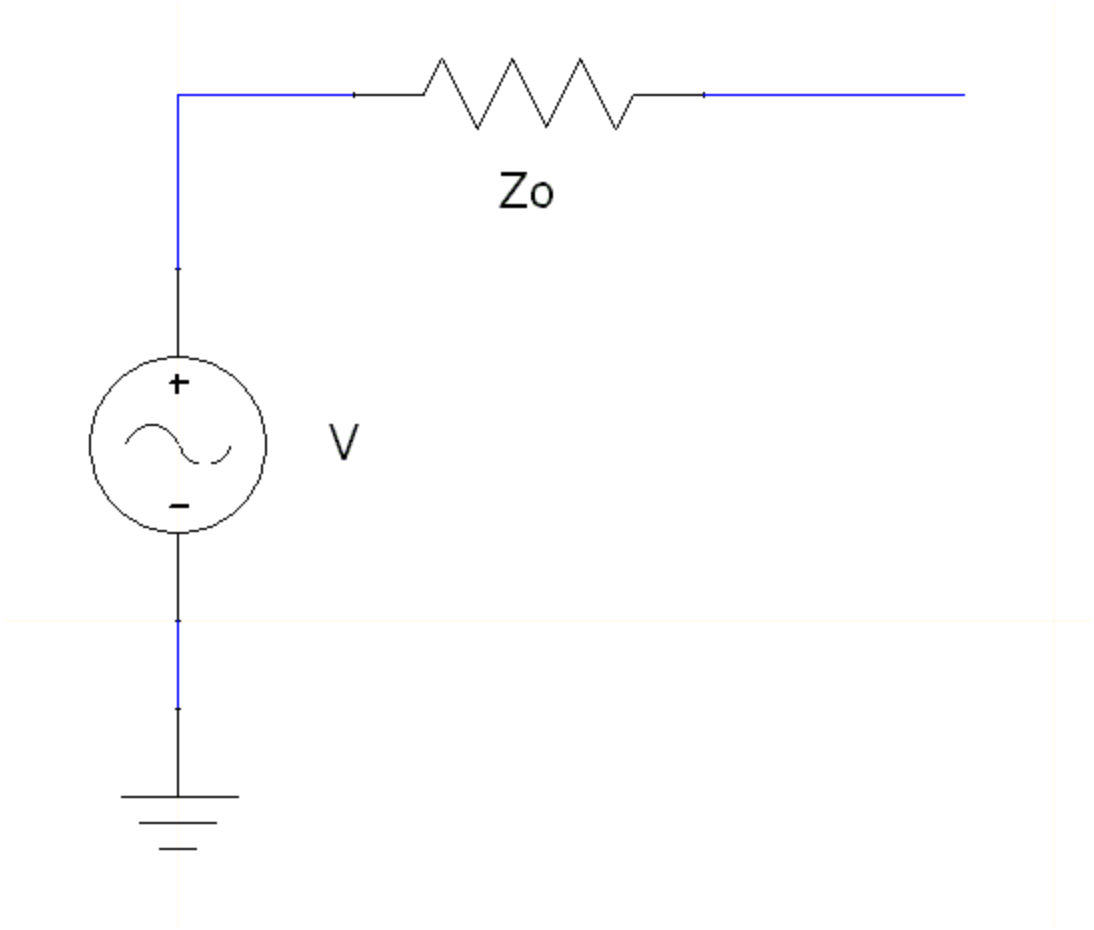


2. Click **Renormalize Impedence** and set the amount to a non-zero value.
3. Enter the length of the new transmission line in the **Deembed Distance** field.
4. Click **OK** to assign that length to the selected port. The 2D Reporter automatically updates its reports to reflect the de-embedded S-matrix.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Varying the Port Excitation

You can vary the voltage applied to a model by scaling its magnitude and modifying its phase in the **Edge Port Definition** window. A schematic of an excitation is shown in the following diagram. The voltage source model is in series with an impedance called Calibration Zo that is equal to the characteristic impedance of the port. Hence, renormalizing the port impedance change the port excitation model.

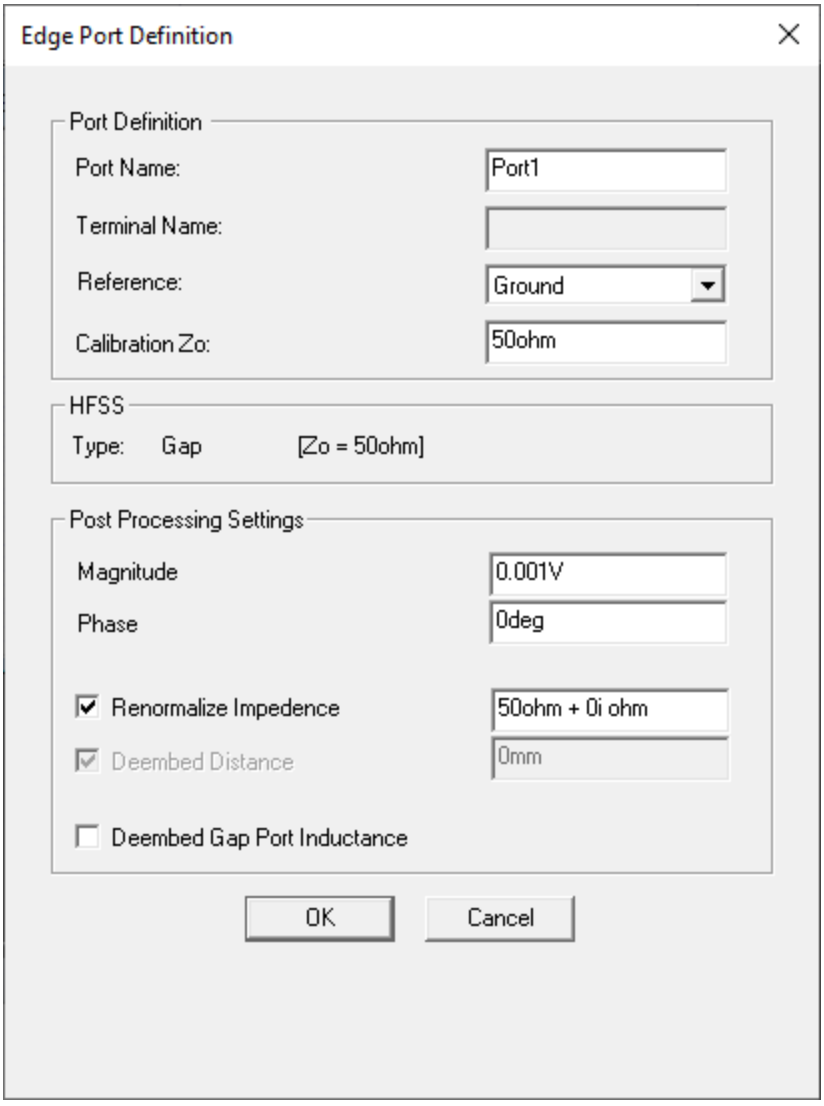


Zo is equivalent to the Full Port Impedance of the port. It is user-defined with the format "<real_part> + <complex_part>*i ohm" (e.g., example 50ohm + (-5ohm) * 1i). You can assign a variable as these values, (e.g., " resistance + (reactance) * 1i"). This variable can be dependent on the frequency, which allows use of a dataset for frequency dependent impedance, (e.g., pwl (ds1,freq) + (pwl(ds2,freq)) * 1i). The real part must be positive and the complex part non-zero if the resistance is zero. See lumped port theory for details.

To vary the applied voltage at a port:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Double-click the edge port in the project tree to open the **Edge Port Definition** window.



2. For the ignore reference option:
- If not selected, the port and the reference plane are physically connected. For most cases, this has better high frequency performance.
- If selected, the port and the reference plane are not connected. This is typically the better option for a stripline environment since a vertical current between two infinite ground planes can excite a parallel plate mode.
3. For the port solver option:
- If selected, the Z_0 and gamma are calculated and the port is calibrated.
- If not selected, Z_0 is user-defined (default is 50) and the port is not calibrated.
4. From the **Magnitude** field, enter the magnitude of the voltage applied at the port.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In general, you may use the default value of 1 volt. This specifies the solution's current is scaled so that the excitation source is 1 volt. To view the solution at a different excitation level, enter a different positive value for **Magnitude**. Only modes with non-zero magnitudes are used in post-processing.

5. From the **Phase** field, enter a phase of the voltage applied at the port.
6. Click **OK**.

Differential Pairs

A differential pair signal resides on two conducting traces in the presence of a ground plane. To form the differential pair, the transmitter launches a wave that carries equal but opposite voltages on the two traces (e.g., one trace is +1 volt and the other -1 volt). When two traces are routed in close proximity to each other, the waves traveling on those traces exhibits similar amounts of system noise. A differential pair is an effective way to remove noise from a signal because when a receiver processes a differential signal it subtracts the voltages on the two traces. This can dramatically reduce the amount of noise in the differential signal compared to if the traces are driven individually (single-ended signals). In HFSS, a differential pair can be defined for two terminals residing in the same wave port or for terminals that reside in two different wave ports or lumped ports. From the case of wave ports, matched differential pairs can be defined by not renormalizing the wave ports involved in the differential pair definitions.

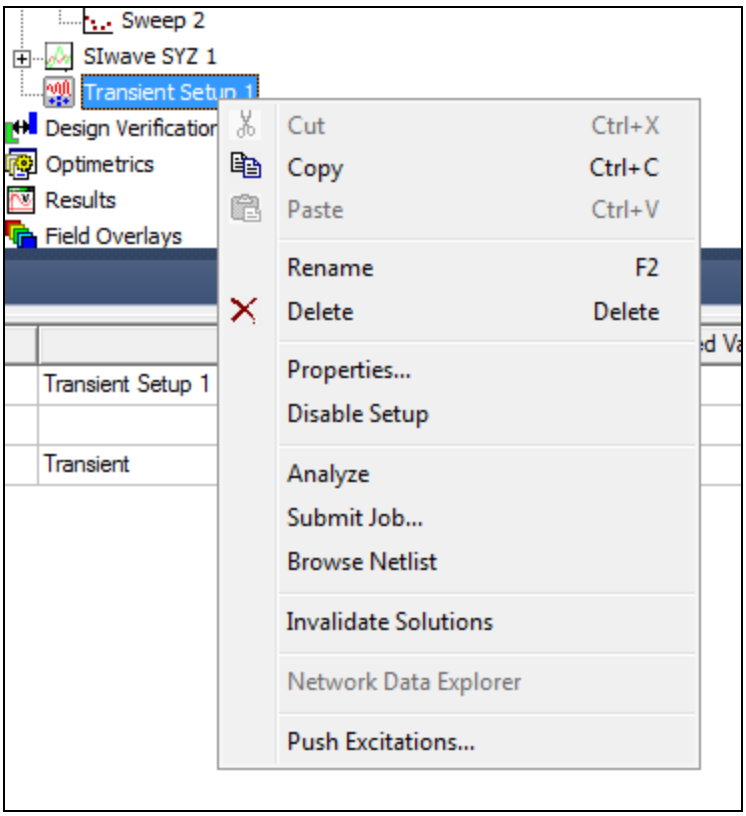
Pushing Excitations

Push Excitations combines Circuit and HFSS 3D Layout features to extract excitations from a Circuit simulation to use in the post-processing of an HFSS 3D Layout design (e.g., if you have a model that you extracted with a field solver, you can import that model as a “black box” into Circuit, solve its circuit, then use the solution to calculate the model’s excitation vector. The vector is pushed back to HFSS 3D Layout to solve for the model’s field distributions.). Excitations can be pushed to HFSS 3D Layout ports, to dynamic links, and to subdesigns. Excitations can also be pushed if they have a Thevenin Equivalent.

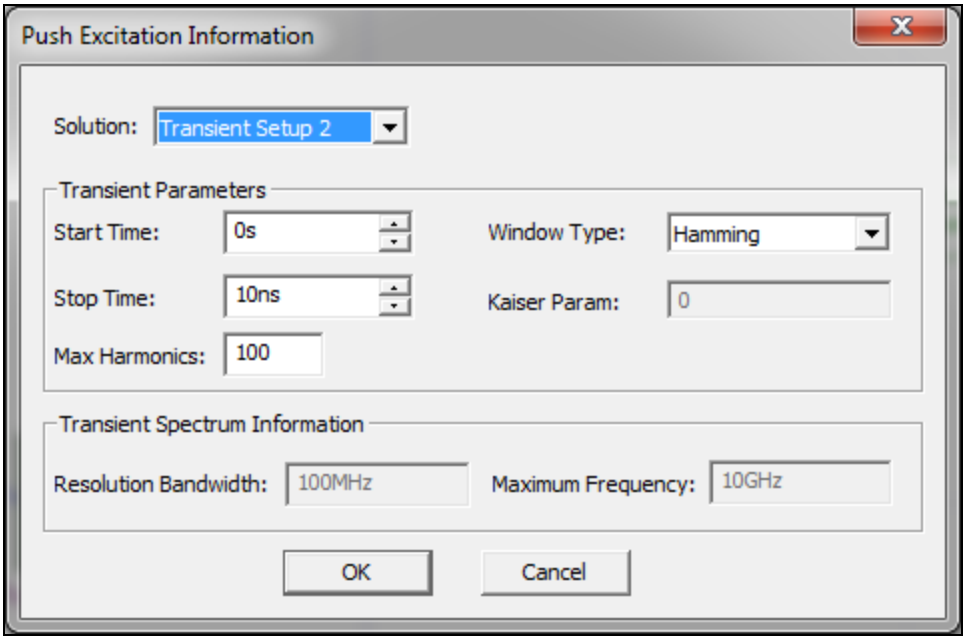
Push Excitations to HFSS 3D Layout Ports

Excitations are calculated at the 3D Layout ports and are pushed in the same design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

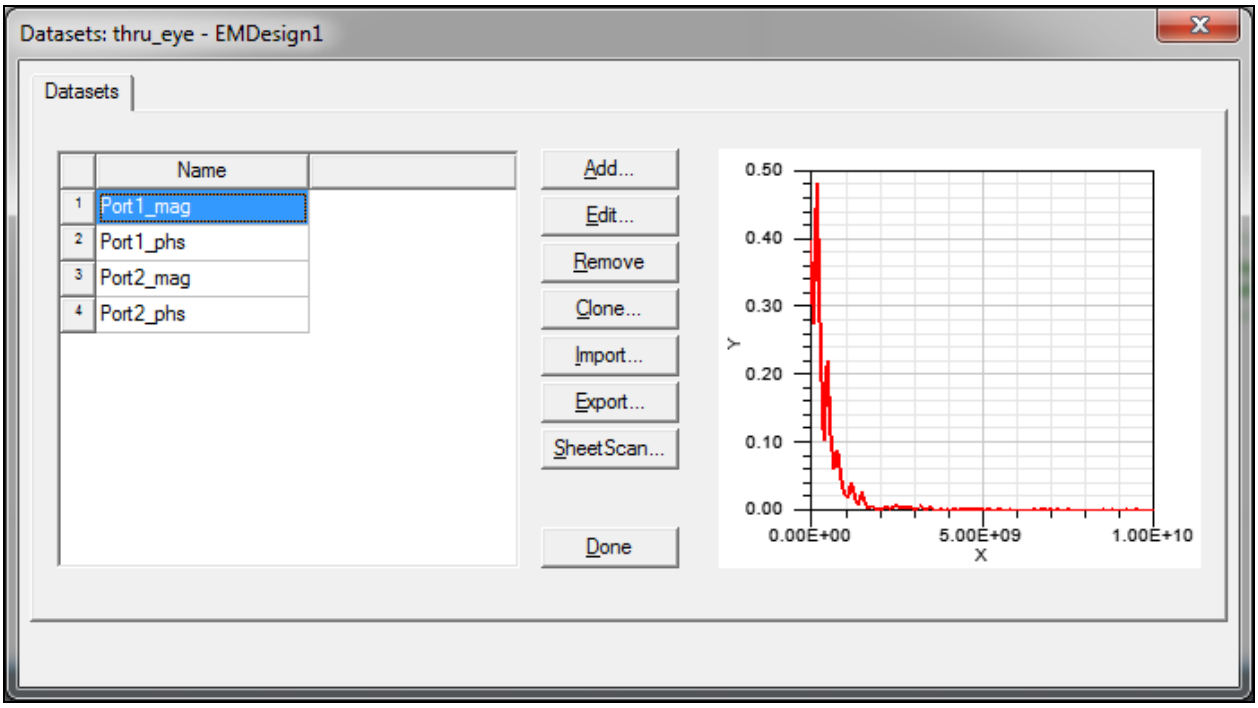


Users can right-click a Nexxim solution and select **Push Excitations** to open the **Push Excitations Information** window.



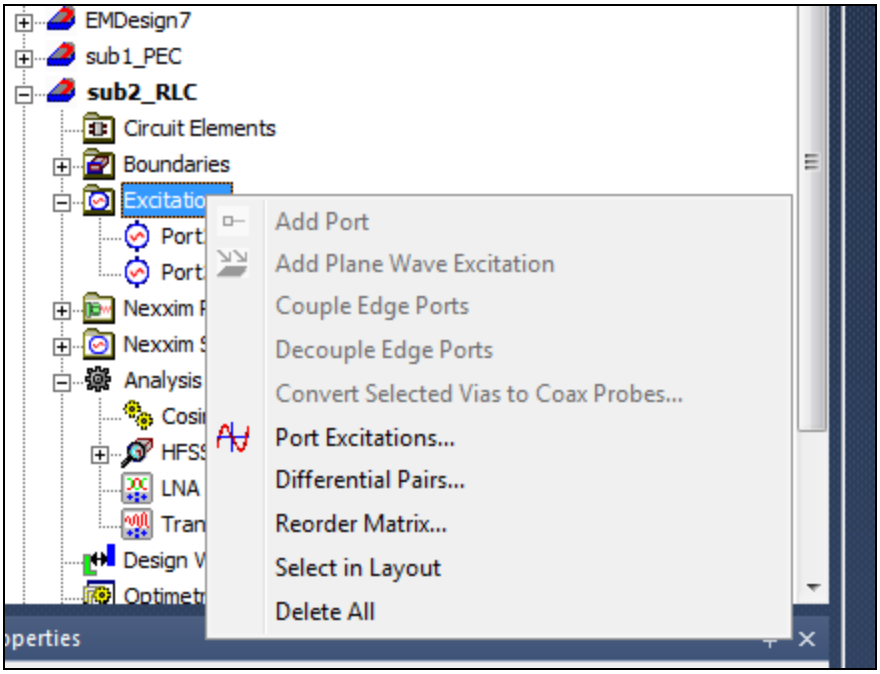
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Data sets are created using these port excitations.

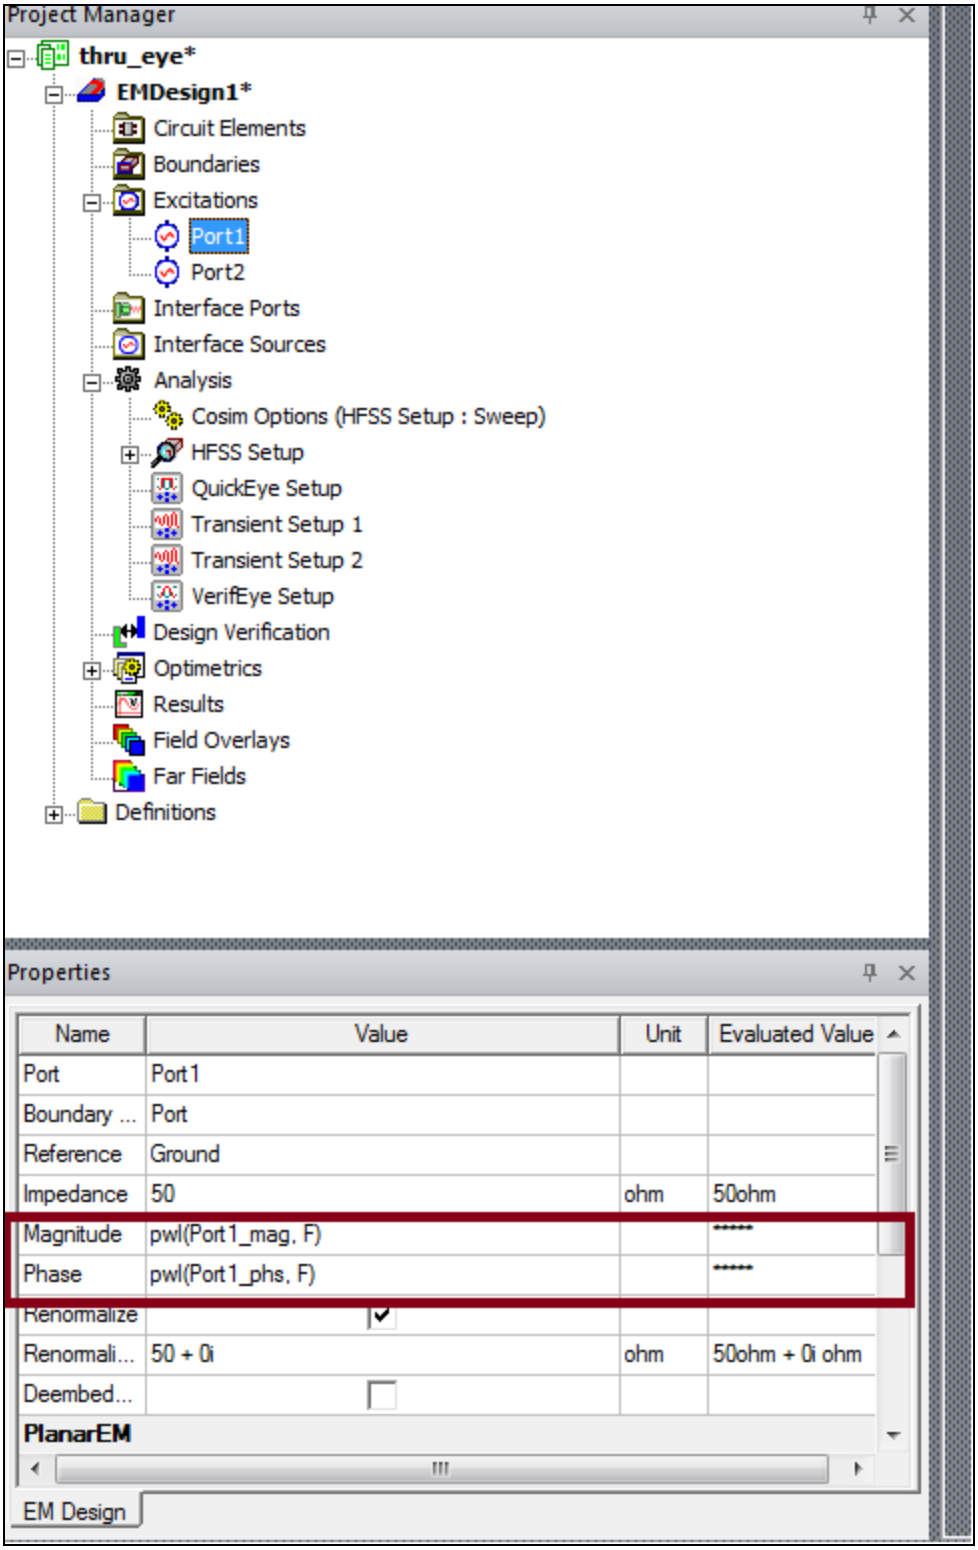


Voltages are extracted and port-excitations are calculated. The **Port Excitations** option in the shortcut menu that is accessed on the **Excitations** folder also allows users to edit excitations at 3D Layout ports.

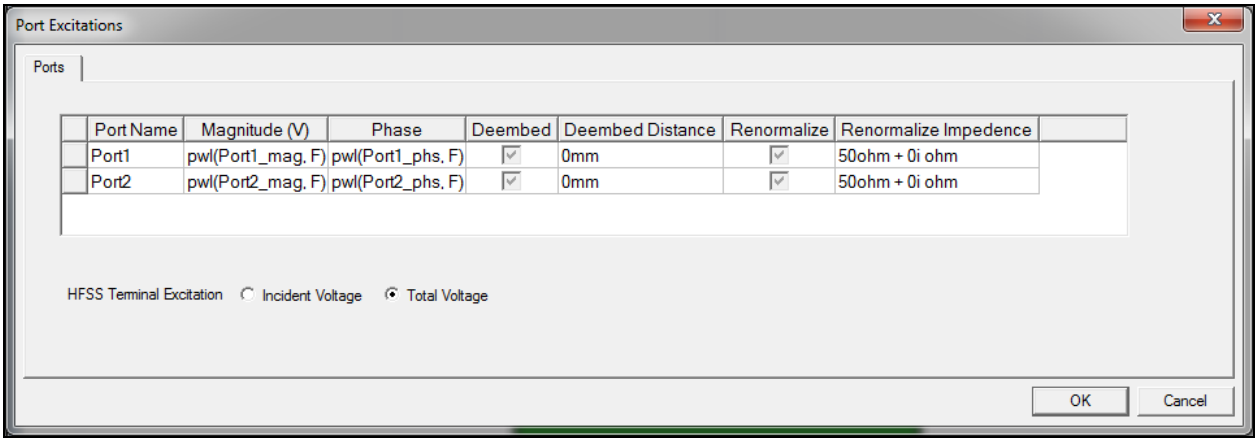
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The excitation calculated for each port is also available on the **Port Excitations** window and from Port Properties. Far Field plots and Field Overlays are updated with the new excitations.

Push Excitations to Dynamic Links

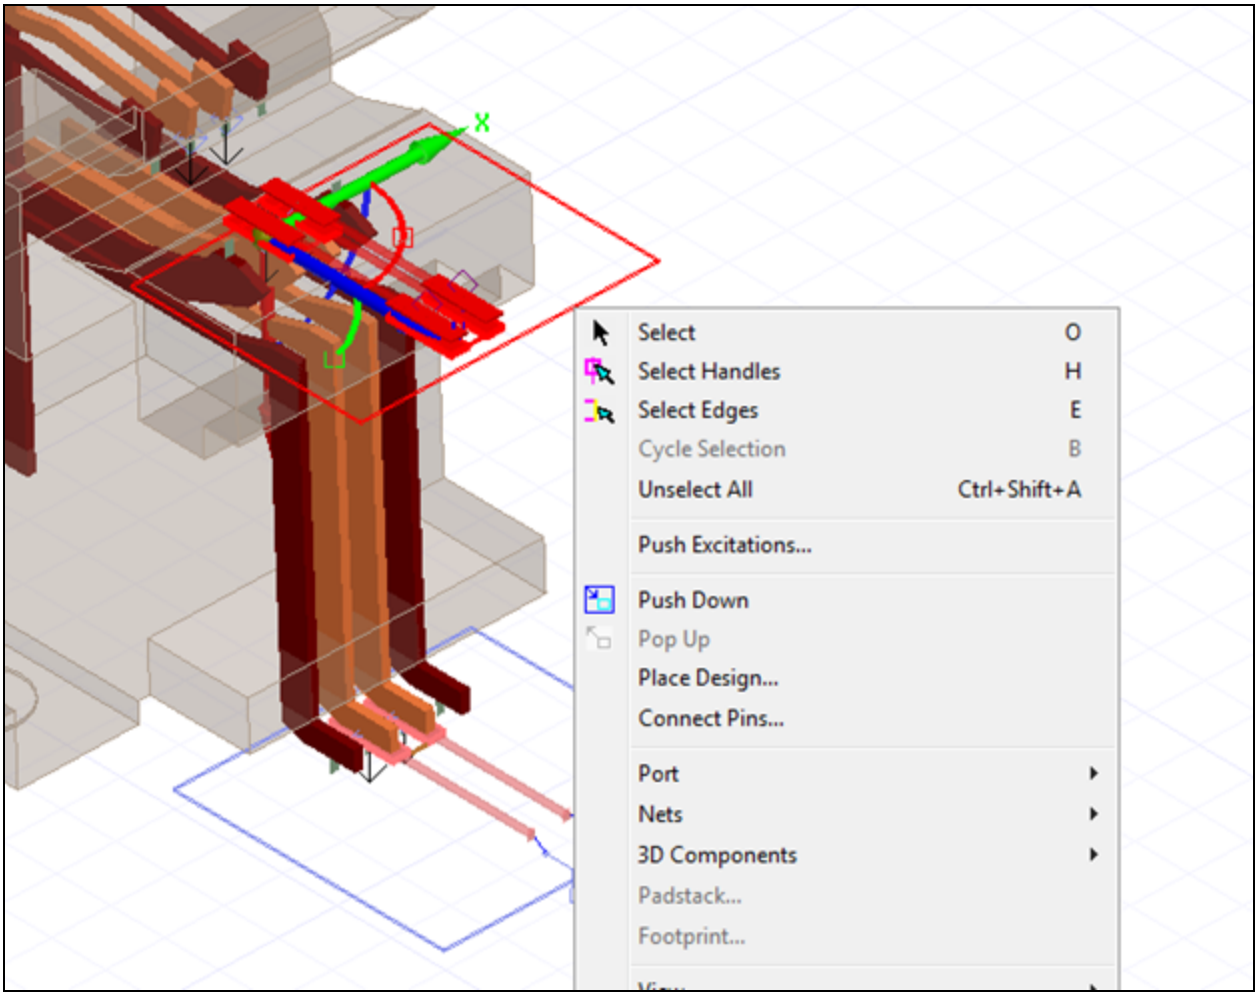
Select a dynamic link in the Layout Editor. Then right-click to see the **Push Excitations** option. The option is only available if there are Nexxim solutions to be pushed. Excitations that are pushed can be viewed in HFSS design.

Push Excitations to Sub-designs

To push excitations select a sub-design in Layout Editor and right-click to see the **Push Excitations** option. The option is only available if there are Nexxim solutions available to push.

Excitations that are pushed can be viewed by going to the sub-design and updating or plotting Far Field and New Field plots or plots with currents. The **Excitations** area in the sub-design also provides feedback if excitations have been pushed.

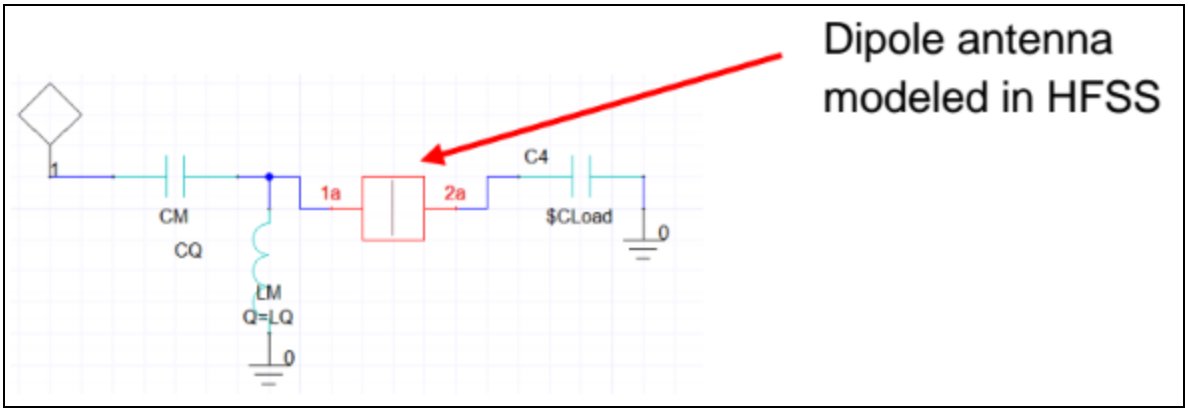
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



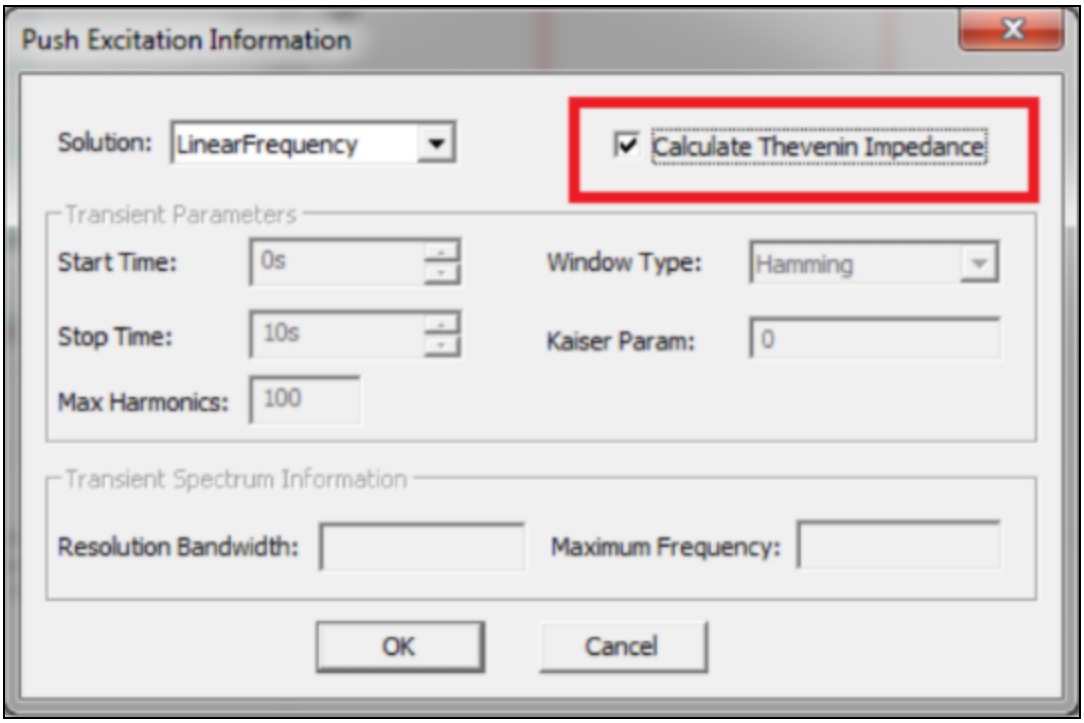
Push Excitations with Thevenin Equivalent

A Thevenin Equivalent is the efficiency and realized gain of an antenna in a circuit. The Thevenin Equivalent calculation is supported only with a LNA solution. To capture the loss of any intermediate circuitry (such as a matching circuit) the design needs to push incident power at the Circuit ports and push the Thevenin Equivalent at the HFSS ports. These values can be computed by HFSS.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



A push excitation with a Thevenin Equivalent is configured through a dynamic link, with the complex impedance defined in the Circuit Tool and with the antenna defined as an HFSS dynamic-link sub-circuit.



- From the **Push Excitation Information** window, the **Calculate Thevenin Impedance** check box is cleared by default.
- Thevenin impedance values are calculated per pin and are pushed to HFSS when the check-box is selected. The impedance is *0 ohms* for shorted pins and is *inf ohms* for open pins. These values are functions of frequency.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- For an HFSS discrete sweep, the push excitations, available power, and Thevenin impedances are at HFSS sweep frequencies. For all other cases, pushed data corresponds to frequency points on the Nexxim solution.
- The pushed renormalized port-impedances can be examined at the port properties. Pushed source-settings can be viewed in the **Edit Post Process Sources** window.
- For pushing excitations to HFSS 3D Layout, there is a control for **Target Solution**. Its drop-down menu shows adaptive and discrete solutions that have the **Save Fields** option selected by default.

Error Handling

- If errors are encountered while calculating the impedances, a message are posted and excitations are not pushed.
- If invalid excitation values are pushed to HFSS, error messages are posted and the pushed values are not applied. Examples of invalid excitation values include:

  -inf impedance values

  <=0 system power

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

10 - Solution Setup in HFSS 3D Layout

After drawing a model and defining its excitations, you must specify how HFSS 3D Layout computes the solution. You can define one or more sets of solution parameters to solve. Each solution set appears as one *setup* in the **Project Manager** window. Choose multiple types of analysis setup for an HFSS 3D Layout depending on the selected solver. Time Domain Reflectometer (TDR) plots are available for LNA and imported solutions in HFSS 3D Layout. After a solution is set up, you can modify it as needed. High Performance Computing (HPC) options that allow you to speed up processing.

> **Note:**
>
> Adding an HFSS analysis setup, editing frequency sweeps, and analyzing the setup are functions performed the same in both **General** and IC modes, although the options available in General mode differ from the options available in IC mode.

Adding a Solution Setup for HFSS 3D Layout

Each set of unsolved solution parameters is listed as a setup under **Analysis** in the **Project Tree**.

To add a new solution setup to a project using initial meshing tools:

1. Do one of the following:
   - From the **HFSS 3D Layout** menu, open **Solution Setup**.
   - From the **Project Manager** window, expand the **Project Tree** and right-click **Analysis**.
2. To open the **Solution Setup** window, select a solution type from the menu.

The easiest way to set up a solution is to accept the **Fixed Mesh** and **Frequency** defaults that appear in the HFSS 3D Layout or HFSS setup window, then click **OK**, which automatically opens the **Sweep** window. Click **OK** to accept the sweep with the suggested defaults. Alternately, change the default values or add more setups by referring to one or more of the following topics.

Adding an HFSS Solution Setup (General Mode and IC Mode)

For HFSS Terminal Solution types, select two HFSS solution setups: auto and advanced. The auto setup offers a simplified interface balanced between accuracy and speed, without many configurations. Advanced provides greater control of the solution setup in exchange for more complex configurations. For more information about HFSS solutions, see in *An Introduction to HFSS*.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

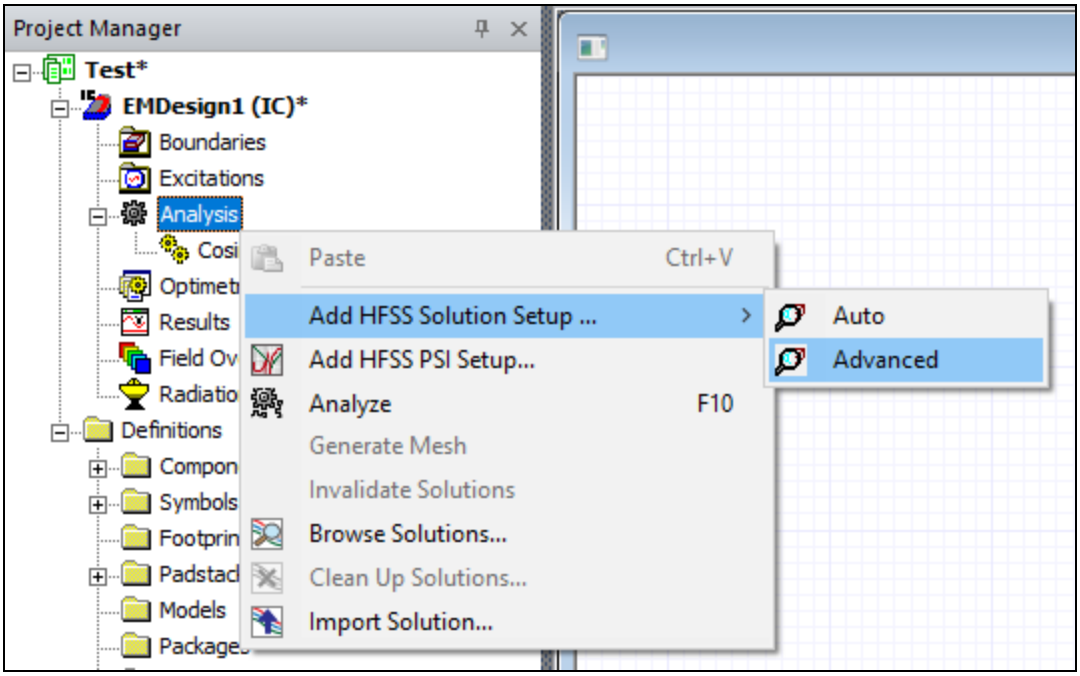
To define bounding computational regions, see HFSS 3D Model Extents.

> **Note:**
>
> For HFSS setups, there is an extra solution “Adaptive Pass” to plot S-parameter data for all adaptive solutions. The primary sweep is “pass” which can be swept from 1 to the number of adaptive passes in the setup.

Follow these steps to add an **HFSS Solution** setup to a project in **General** or IC mode.

1. Open the **Setup** window by doing one of the following:
   - From the **Simulation** ribbon tab, click **HFSS** > **Advanced**.

   - Right-click **Analysis** in the **Project Manager** window and select **Add HFSS Solution Setup** > **Advanced**.

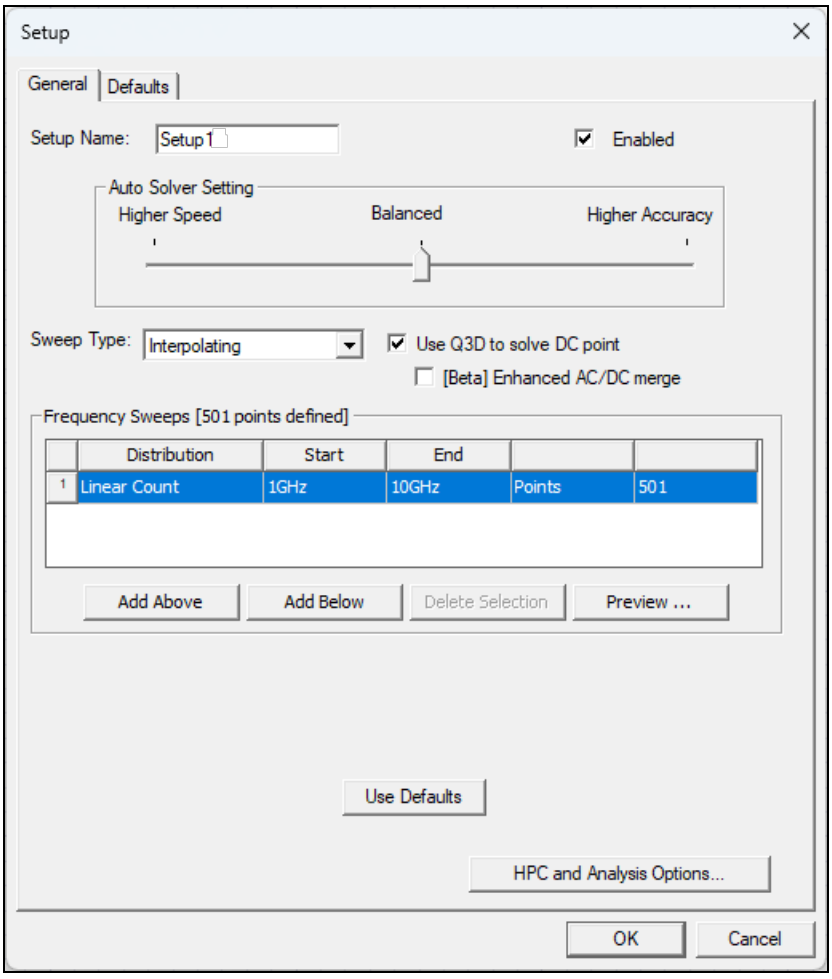


Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1. Do one of the following:
   - Click **HFSS 3D Layout** > **Solution Setup** > **Add HFSS Solution Setup**.
   - From the **Project Manager** window, right-click **Analysis** > **Add HFSS Solution Setup**.
2. Click Auto or Advanced to open the **HFSS Setup** window.

Adding an Auto HFSS Solution Setup

Auto setup includes a simplified window with an **Auto Solver Setting** slide bar from **Higher Speed** (i.e., lowered accuracy to achieve optimum speed) to **Balanced** (i.e., a balance between speed and accuracy) to **Higher Accuracy** (i.e., optimal accuracy at the lowest speed).



The auto setup includes a single sweep, to edit the **Distribution**, **Start**, and **End**. The design must include one or more ports. The **Sweep Type** can be **Discrete** or **Interpolating**:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Discrete** generates field solutions at specific frequency points in a frequency range.
- **Interpolating** estimates a solution for an entire frequency range using an adaptive rational function interpolation method. An Interpolating fast sweep will result in faster analysis, however the current distribution values cannot be saved.

Check the **Use Q3D to solve DC point** box to invoke the Q3D Extractor to explicitly solve for a DC point. The mesh from HFSS is used for the Q3D extraction, with sources and sinks defined based on HFSS port assignment. Matrix reductions are automated to integrate the Q3D results with HFSS.

> **Note:**
>
> **Use Q3D to solve DC point** provides network data only and cannot be used for fields overlays.

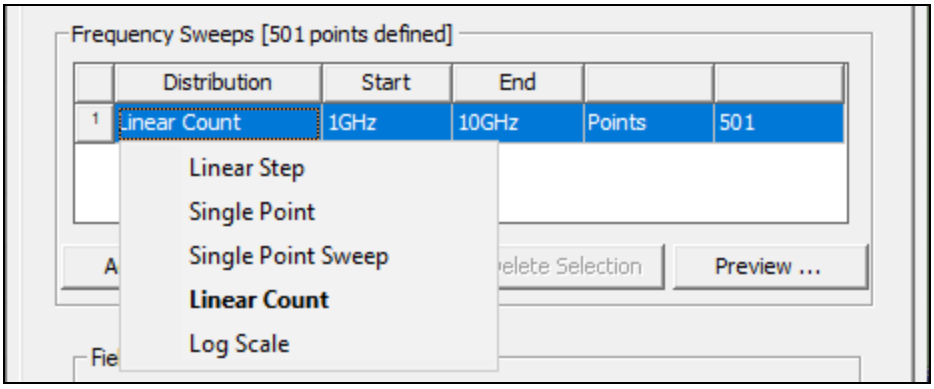
If the **Sweep Type** is **Interpolating** and the **Use Q3D to solve DC point** box is checked, the **Enhanced AC/DC merge** check box activates. Check the box to enforce causality and generate S-parameters at the DC point. By combining the DC results with the frequency-swept AC results, accuracy is improved over the entire simulation bandwidth.

Sweeps can be of the following **Distribution** types:

- Linear Step
- Linear Count
- Log Scale
- Single Point
- Single Point Sweep, which adds a set of 10 single Point sweeps, defaulting from 1 GHz to 10 GHz in increments.

To add more sweeps, including mixed sweep types, click **Add Above** and/or **Add Below**. This feature provides flexibility (e.g., define sweeps with log scale at lower frequencies and linear step at higher frequencies). Frequency sweeps cannot be added to auto setups in the **Project Manager** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



To remove a sweep, highlight it and click **Delete**.

Preview displays the sweep(s) as currently defined.

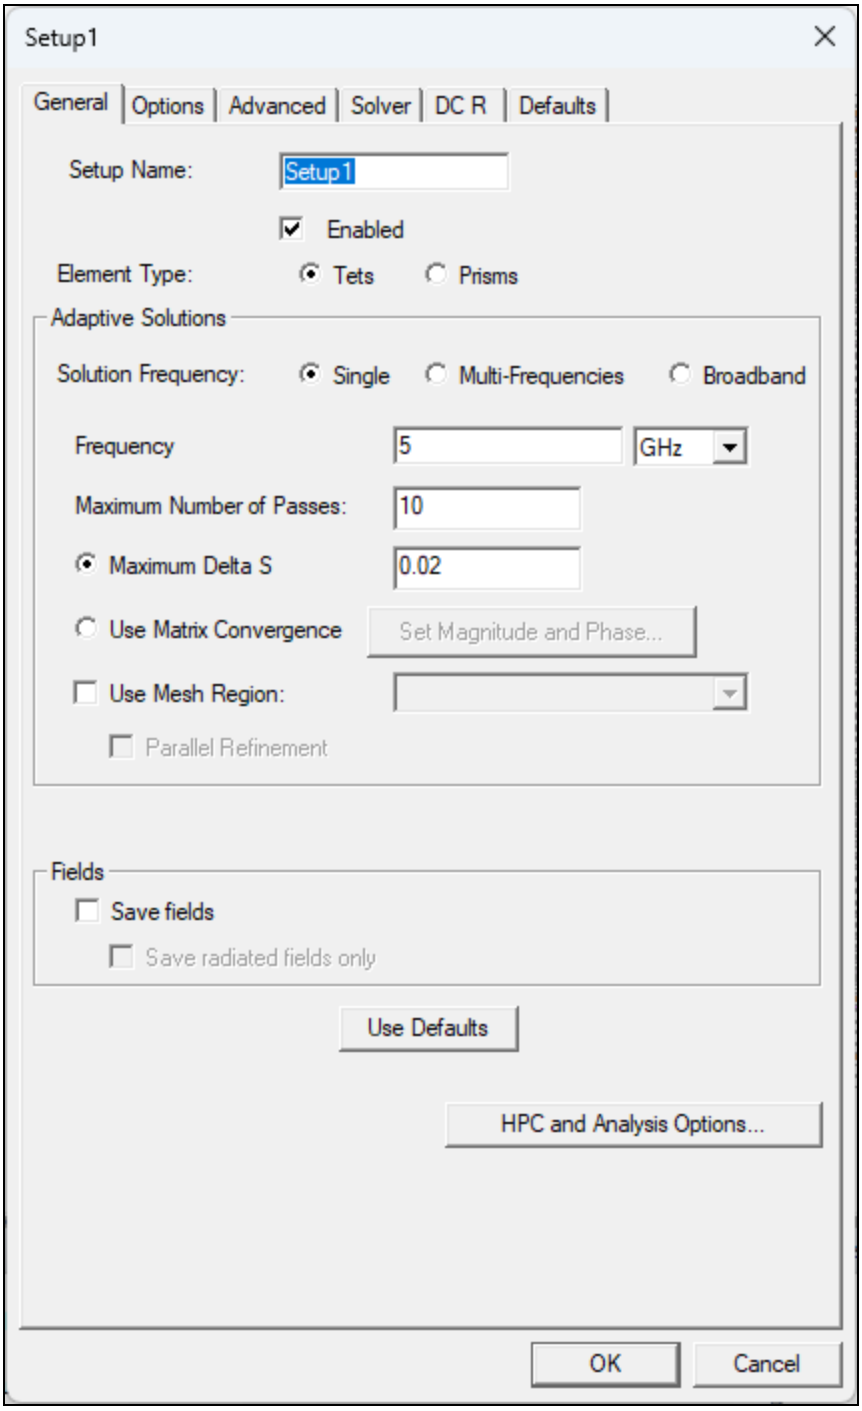
The auto **Solution Setup** window has two tabs:

General	Includes general solution settings. Specify the name, change the slider bar to do different solver settings, select sweep type, set frequency range, and configure **HPC** settings. The selection in the solution setup dictates the behavior of the frequency sweep solve. Changing the selected lists invalidates the last adaptive solution. In a **Discrete** sweep, if a Near Field or Far Field Radiation setup is created, and a list is selected, a warning appears if your selections do not match those selected for the solve.
Defaults	Saves the current settings as the defaults for future solution setups or revert the current settings to HFSS 3D Layout standard settings.

Adding an Advanced HFSS Solution Setup

Click **Advanced** to open the **Setup** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The **Element Type** selection is only visible in IC mode if the HFSS-Prism beta feature is activated.

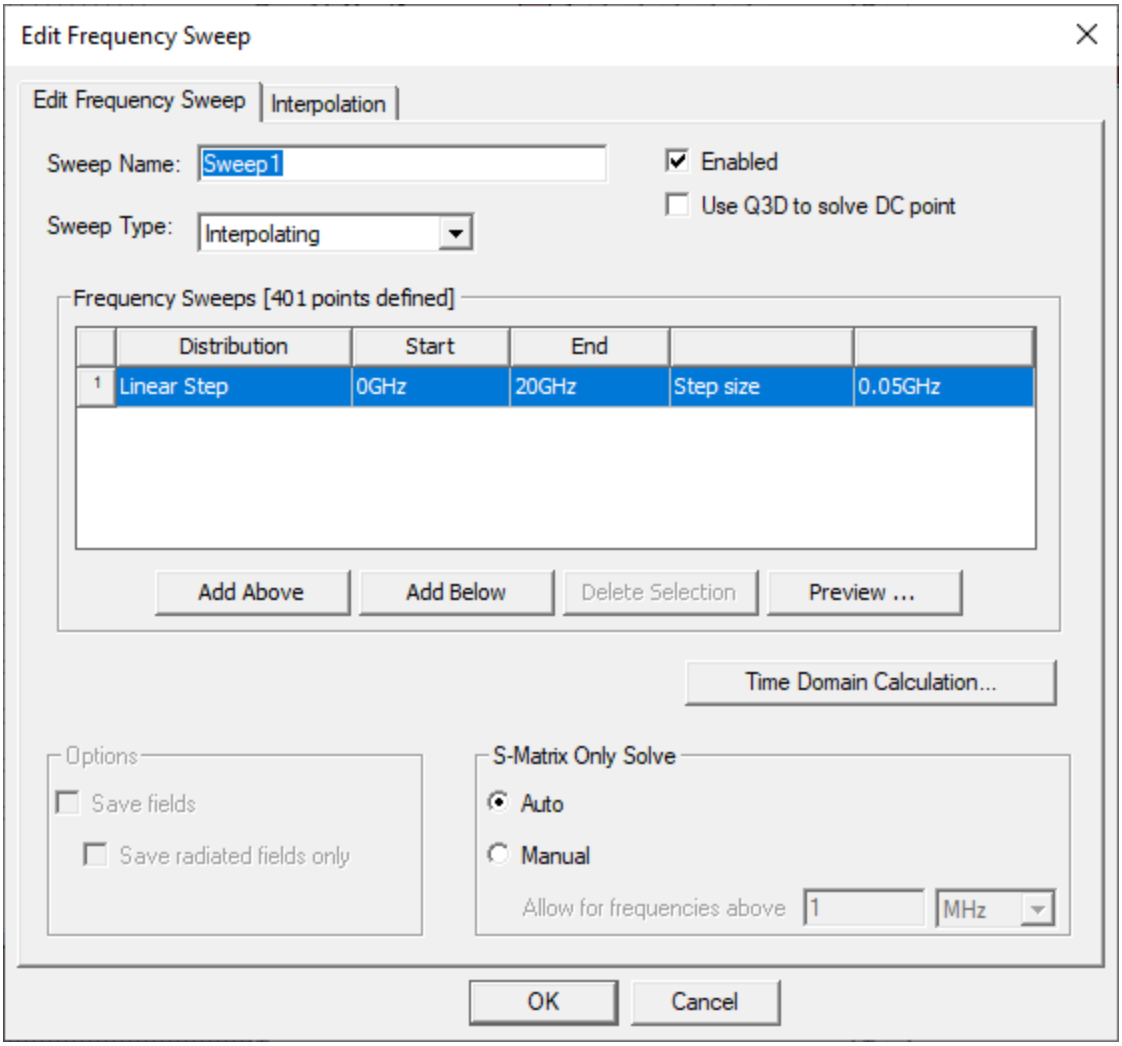
The **Setup** window is divided into the following tabs:

General	General solution settings.
Options	Settings for lambda refinement, adaptive analysis and solution options, the Order of Basis setting, and whether to enable the use of solver domains, if available for the solution type.
Advanced	Settings for defeaturing a mesh, which model type to use, and vias.
Advanced Meshing	**(General Mode Only)** Settings for curve approximations and layer alignment.
Solver	Port settings and configurations for modeling.
DC R	Settings for DC Resistance analysis.
Defaults	Saves the current settings as the defaults for future solution setups or revert the current settings to HFSS's standard settings.

1. Click the **General** tab.
2. If applicable, clear the **Enabled** check box so the setup does not run automatically when Analyze All is applicable,.
3. Select a **Solution Frequency** and configure it.
4. For an adaptive analysis, enter the Maximum Number of Passes and then specify the remaining adaptive analysis parameters for HFSS.
5. To select or create an analysis configuration, click HPC and Analysis options.
6. To post-process or plot fields, click **Save Fields**.
    - To only analyze the far field, click **Save radiated fields only**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

7. Click **OK** to close the **Setup** window and open the **Edit Frequency Sweep** window.



8. From the **Edit Frequency Sweep** window, click **OK** to accept the sweep with its default values or change the default values. Refer to Adding a Frequency Sweep for more information.

(IC Mode Only)

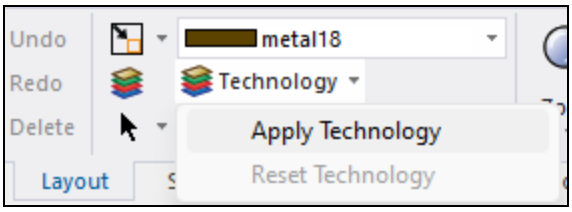
9. If any technology files were imported during the initial setup of the design, follow these steps to apply a technology before simulation:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

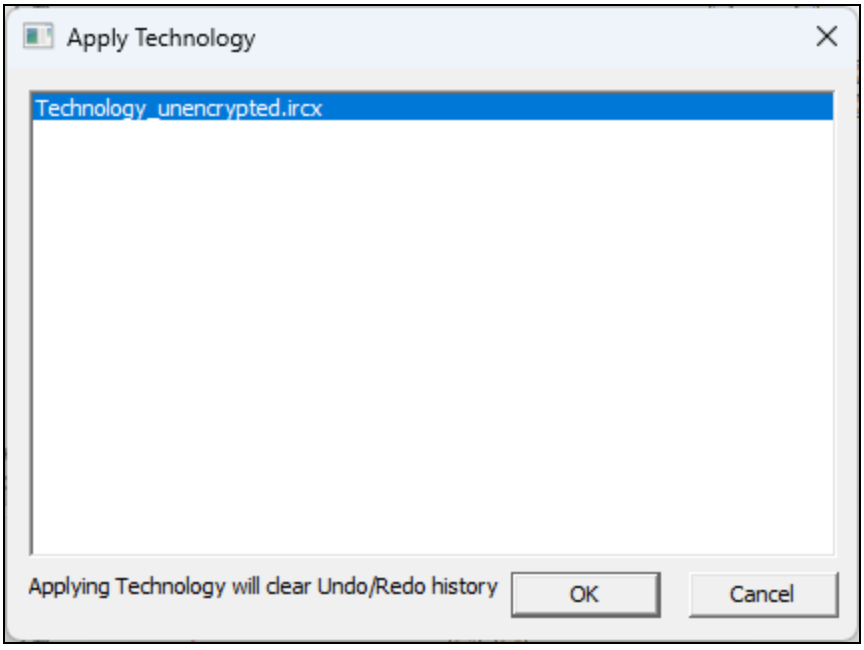
Note:

If technology files were **not** imported during the initial setup of the design, users can add one or more files at any time before simulation. If a technology file **was** applied during setup, the technology's name should already appear in the **Layout** ribbon adjacent to the **Technology** drop-down menu. Users will not need to follow these steps. Refer to Adding a Technology File to a Design.

a. If a technology is available, navigate to the **Layout** ribbon and select **Apply Technology** from the **Technology** drop-down menu.



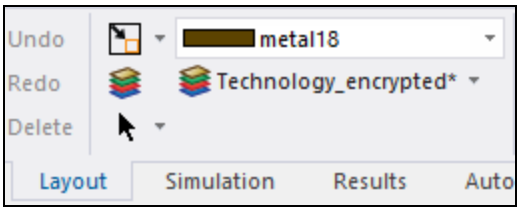
b. Once the **Apply Technology** window opens, select an appropriate technology from the list and click **OK**.



Once the technology is applied to the design, the technology's name appears

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

adjacent to the **Technology** drop-down menu.



10. Once the simulation is prepared, run the analysis to solve the setup. Refer to Running Simulations.

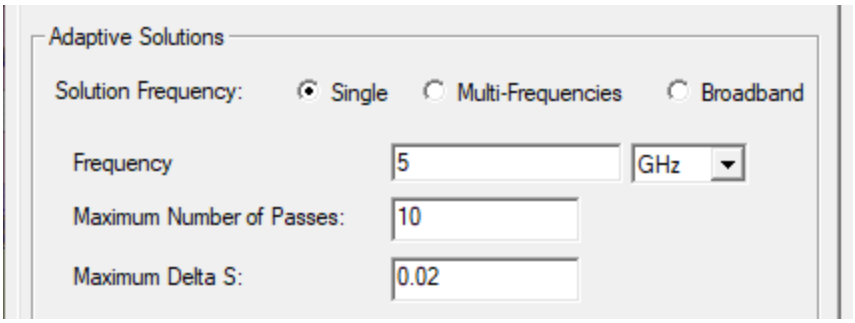
Setting the Solution Frequency

For every Driven solution setup, specify whether to solve a **Single Frequency**, **Multi-Frequency**, or **Broadband**, and provide the **frequency** information and units at which to generate the solution. Each method changes the fields shown in the dialog to those needed for the selection. If you enable HPC, multiple frequencies will be distributed.

If a single frequency sweep is solved, an adaptive analysis is performed only at the solution frequency. If you want to solve over a range of frequencies, define a frequency sweep or a Mult-Frequency or Broadband solve. You must first assign an excitation for the Mult-Frequencies and Broadband options to appear on the setup.

Single Frequency

If you select Single for solution frequency, you specify a value and units with a maximum delta S (or Matrix Convergence), plus the maximum number of passes.



- Enter a value for **Solution Frequency** and select the frequency units from the pull down list.

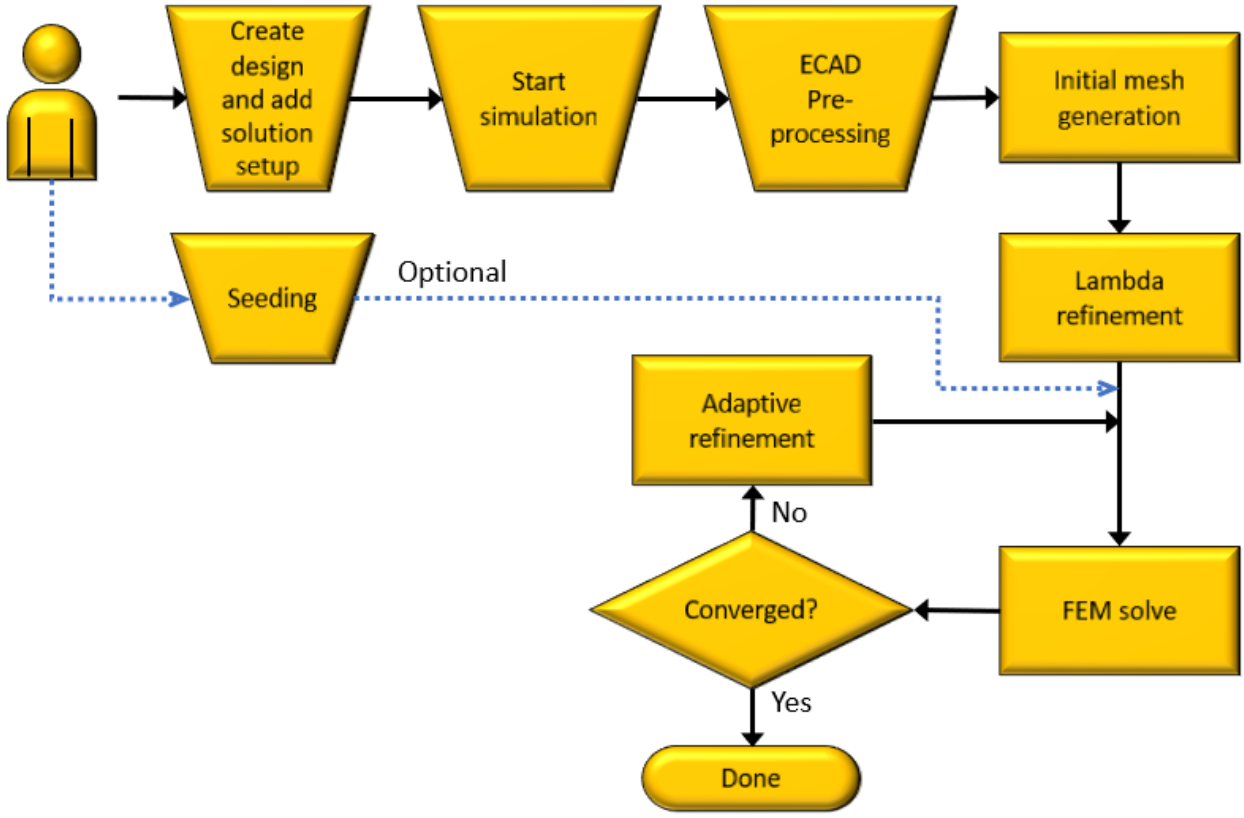
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Specify the **Maximum Number of Passes** and Maximum Delta S.

> **Note:**
>
> For Fast sweeps, HFSS uses the solution frequency as the center frequency if it is within the frequency range (greater than the start frequency and less than the stop frequency.) Otherwise the middle of the frequency range is used as the center frequency.

Multi-Frequency

If you select **Multi-Frequencies**, you can click **Add** to add additional frequencies, and edit the value, units, and Max. Delta for each frequency. You can also assign existing output variables in these fields.



You can use the **Add** button to specify one frequency at a time.

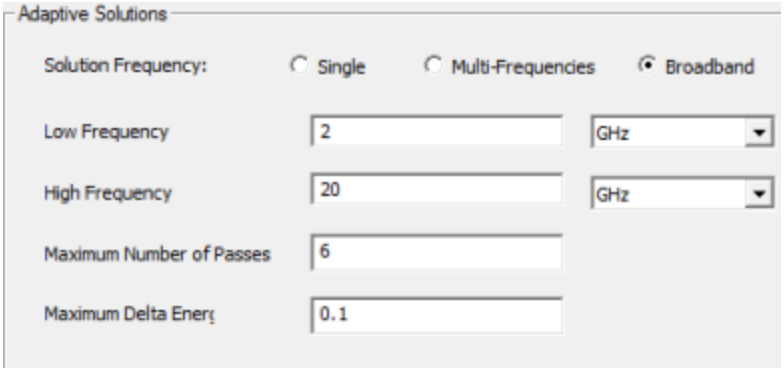
You can use **Remove** to remove any selected items in the Frequency Sweeps table.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

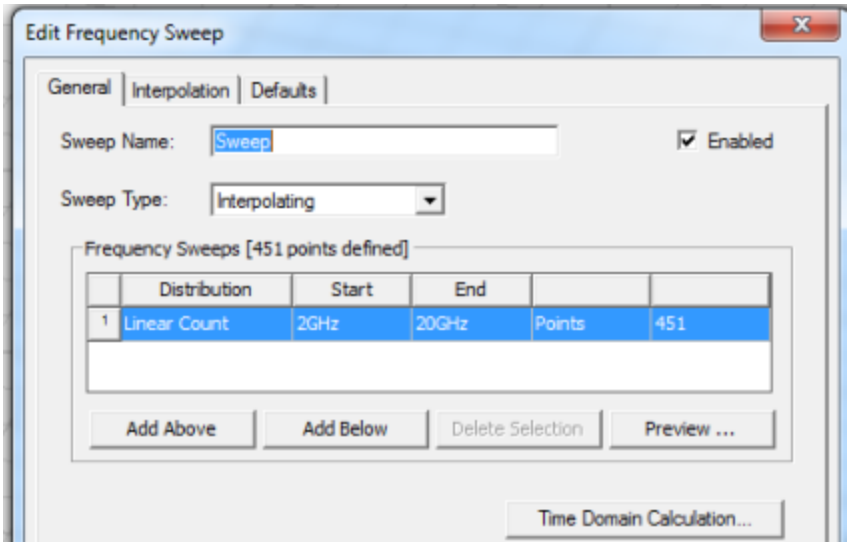
> **Note:**
>
> If you want to create a Frequency animation of field results, you must specify the frequencies here in the Multi-Frequency **Solution** setup.

Broadband

If you select Broadband, you define the frequency band by providing the low and high frequency, with a maximum delta S (that is applied to all solved frequencies), plus the maximum number of passes. The meshing frequencies include the Low and High with the remaining points determined automatically by HFSS. When the user requests DC as the low frequency, the lowest frequency solved by the adaptive meshing process is determined by an algorithm that looks at the range of frequencies you entered.



When you OK the Solution Setup for Broadband, you are automatically presented with a dialog for specifying an Interpolating sweep.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Simulation and Convergence

In multiple frequencies modes, when frequency point p convergences prior to frequency point q, keep adapting at p until q and all other points achieve convergence.

The convergence data in the solution data dialog for single frequency mode is calculated in the same way as before. In multiple frequencies mode, the convergence plotted on the convergence display item corresponds to the global maximum delta S. Convergence data such as “Max. Delta S” appear in the reporter as standard solution quantity so that you can easily plot the maximum delta S for each frequency point vs. pass.

Setting the Maximum Number of Passes

The **Maximum Number of Passes** value is the maximum number of mesh refinement cycles that you would like HFSS to perform. This value is a stopping criterion for the adaptive solution; if the maximum number of passes has been completed, the adaptive analysis stops. If the maximum number of passes has not been completed, the adaptive analysis will continue unless the convergence criteria are reached.

To set the maximum number of passes for an adaptive analysis:

- Under the **General** tab of the **Solution Setup** dialog box, enter a value for **Maximum Number of Passes**.

For driven problems and no frequency sweeps, HFSS requires at least one adaptive pass. Entering **1** will bypass adaptive analysis, generating a solution only at the solution frequency you specified.

> **Note:**
>
> The size of the finite element mesh — and the amount of memory required to generate a solution — increases with each adaptive refinement of the mesh. Setting the maximum number of passes too high can result in HFSS requesting more memory than is available or taking excessive time to compute solutions.

To shorten the solution time for solutions with a frequency sweep, you can set the **Maximum number of passes** to 0 to skip the adaptive pass phase during simulation.

Selecting 0 passes for a setup means that when you create a Report or a Field Overlay, in the Context field, the Solutions menu will not list ‘Adaptive Passes’ and ‘Last Adaptive’ for those setups. However, you can still plot the fields based on Sweep solutions if ‘Save field’ is turned on. Also, you can plot meshes using ‘Last Adaptive’ and this ‘Last Adaptive’ should be initial mesh or mesh link source mesh plus user defined mesh (if any).

If you change **Maximum number of passes** from non-zero to 0, then all plots or reports related to Last Adaptive or Adaptive pass are deleted once you click OK in the Driven Setup window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

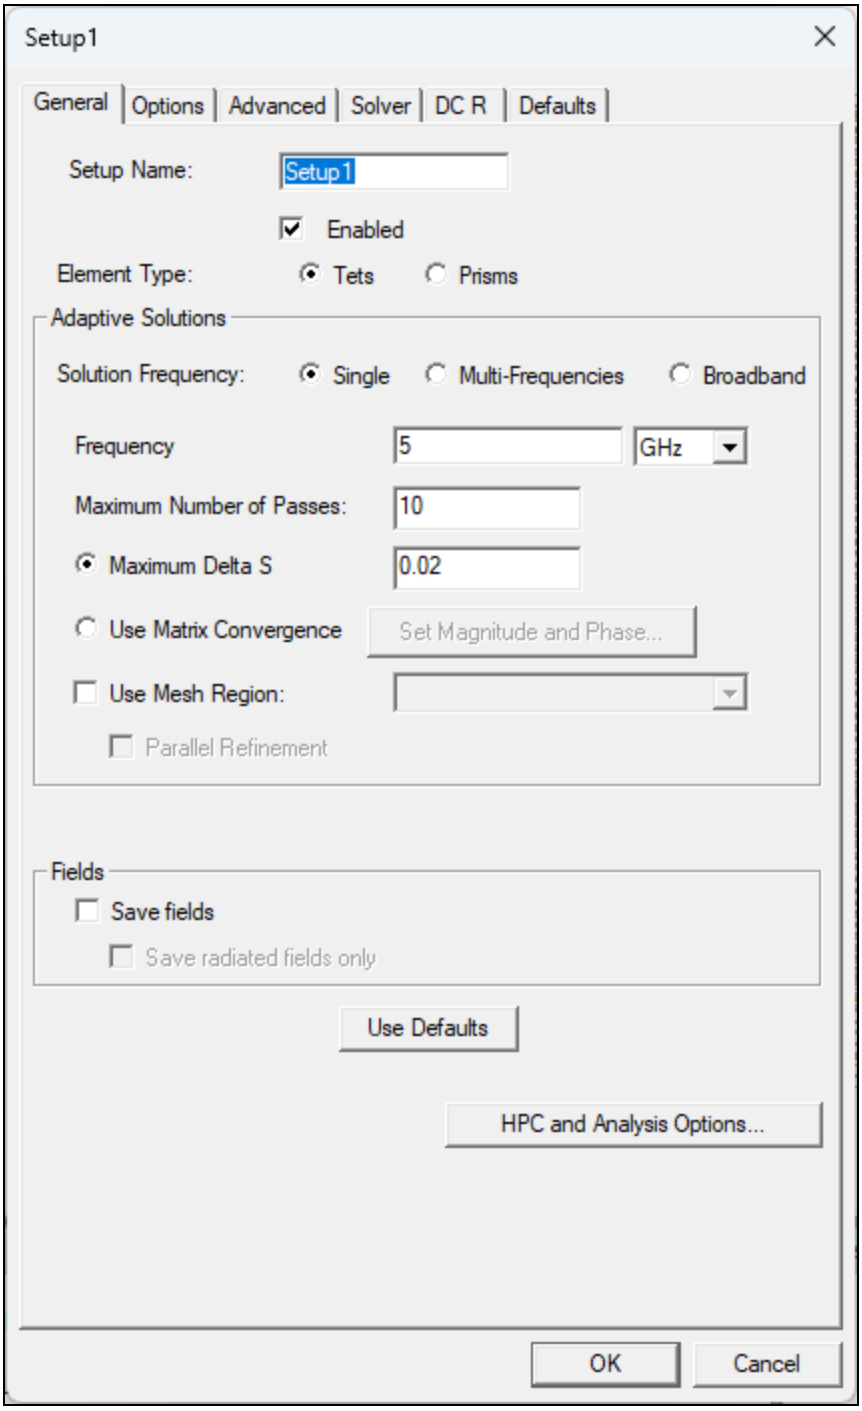
You can Undo this to recover if this was done in error. Messages in the Message window describe these actions.

If you choose 0 as the **Maximum number of passes**, the Solution Profile reports that analysis does not perform adaptive meshing.

HFSS Setup: General Tab

If applicable, select the **General** tab of the HFSS Setup window to access the following advanced HFSS solution setup settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Note:

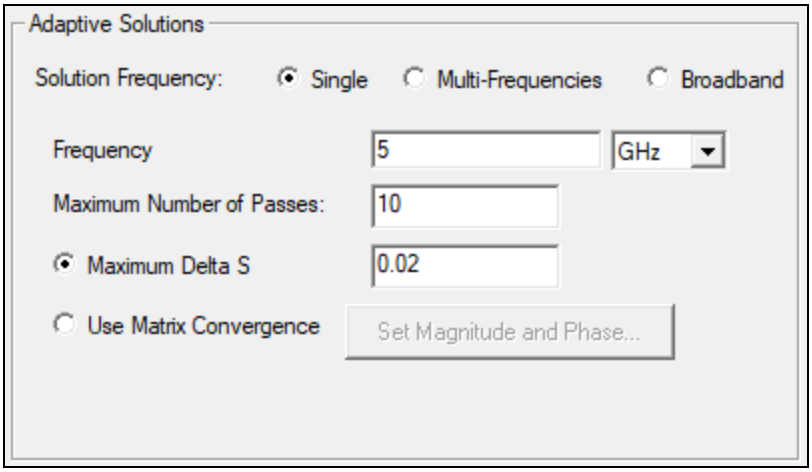
This tab is also available for the auto HFSS solution setup but with different settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The **Element Type** selection is only visible in IC mode if the HFSS-Prism beta feature is activated.

- **Setup Name**: Name of the setup. It must be unique.
- **Enabled**: If not enabled, this setup cannot be analyzed and is not included in a general analysis of all setups.
- **Element Type** – By default, the simulation uses tetrahedron-shaped meshing elements. To utilizes prism-shaped meshing elements in the simulation, select **Prisms**. An HFSS-Prism solution setup offers a subset of the advanced HFSS solution setup options. Refer to Adding an HFSS-Prism Solution Setup.
- **Solution Frequency**: Specify the frequency and units at which to generate the solution (i.e., **Single**, **Multi-Frequencies**, or **Broadband**). If a frequency sweep is solved, an adaptive analysis is performed only at the solution frequency. Options in the **Adaptive Solutions** area change depending on the **Solution Frequency**.
    - **Single**



- **Frequency**: The adaptive frequency for refinement and associated unit of measurement (i.e., from the drop-down menu, choose **Hz**, **kHz**, **MHz**, **GHz**, **THz**, **rps**, or **per_sec**).
- **Maximum Number of Passes**:The maximum number of mesh refinement cycles that HFSS will perform. This value is a stopping criterion for the adaptive solution. If the maximum number of passes has been completed, the adaptive analysis stops. If the maximum number of passes has not been completed, the adaptive analysis continues until the convergence criteria are reached.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Maximum Delta S** or **Use Matrix Convergence**: Choose **Maximum Delta S** to affixes the magnitude of the change of the S-parameters between two consecutive adaptive passes. This is a stopping criterion for the adaptive solution. If the magnitude of the change of all S-parameters are less than this value from one iteration to the next, the adaptive analysis stops. Otherwise, it continues until the requested number of passes is completed. Choose **Use Matrix Convergence** to specify different stopping criteria for specific entries in the S-matrix. The adaptive analysis will continue until the magnitude and phase of the entries change by an amount less than the specified criteria from one pass to the next, or until the number of requested passes is complete. Click **Set Magnitude and Phase** to configure stopping criteria. Refer to "The Matrix Convergence Window" on page 10-19.

- **Multi-Frequencies**

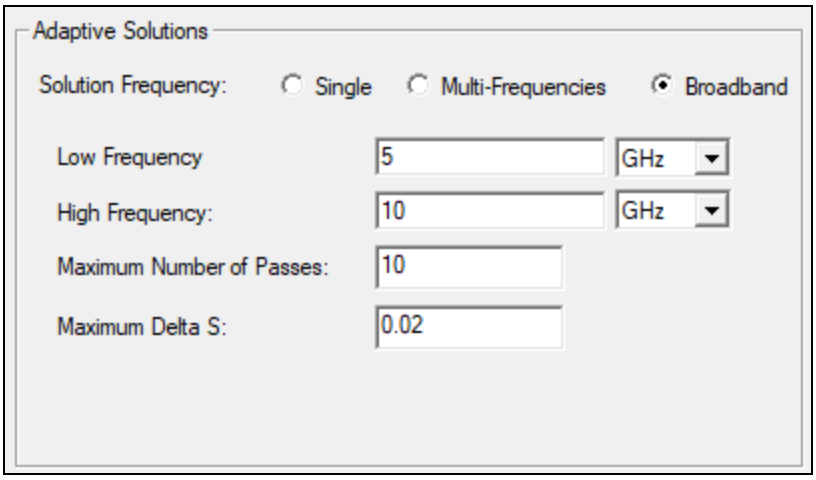
  - **Frequency**: The adaptive frequency for refinement.
  - **Units**: The associated unit of measurement (i.e., click the **Unit** field in the selected row to open a drop-down menu. Then choose **Hz**, **kHz**, **MHz**, **GHz**, **THz**, **rps**, or **per_sec**).
  - **Max Delta S**: The magnitude of the change of the S-parameters between two consecutive adaptive passes. This is a stopping criterion for the adaptive solution. If the magnitude of the change of all S-parameters are less than this value from one iteration to the next, the adaptive analysis stops. Otherwise, it continues until the requested number of passes is completed.
  - **Output Var.**: Click **Add** in the selected row to add output variables to the refinement criteria for that frequency. Selecting this option brings up the **Advanced Mesh Convergence** window or displays the error message 'You must have at least one output variable defined' if no output variables defined in the design. Users may receive the error 'You must have at least one output variable defined that returns a single real value (as opposed to complex, etc)'.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Output Variable**: The name of the output variable.
- **Include**: A check box for whether to include the value of this output variable in the mesh convergence calculations.
- **Max Delta**: The maximum amount of change selected in the output variable between adaptive passes. It is a stopping criterion for the adaptive solution. If the output variable changes from one iteration to the next by an amount that is less than Max Delta, the adaptive solution stops.

- **Add**: Adds a new frequency to the table.
- **Remove**: Removes a selected frequency on the table.

- **Broadband**



- **Low Frequency**: The smallest adaptive frequency for refinement for a **Broadband**.
- **High Frequency**: The largest adaptive frequency for refinement for a **Broadband**.
- **Maximum Number of Passes**:The maximum number of mesh refinement cycles that HFSS will perform. This value is a stopping criterion for the adaptive solution. If the maximum number of passes has been completed, the adaptive analysis stops. If the maximum number of passes has not been completed, the adaptive analysis continues until the convergence criteria are reached.
- **Maximum Delta S**: The magnitude of the change of the S-parameters between two consecutive adaptive passes. This is a stopping criterion for the adaptive solution. If the magnitude of the change of all S-parameters are less than this value from one iteration to the next, the adaptive analysis stops. Otherwise, it continues until the requested number of passes is completed.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

The **Adaptive Solutions** area includes additional parameters in IC mode:

- **Use Mesh Region**: check this box to designate specific mesh regions for enhanced simulation precision (i.e., check the box and then select a specific mesh region to refine from the drop-down menu). Refer to Creating Mesh Regions.
- **Parallel Refinement**: by default, mesh partitions are simulated sequentially for more accurate results. Check the **Parallel Refinement** box and the partitions will be simulated in parallel.

- **Fields**: Click **Save fields** to post-process or plot fields. This is only available for Discrete Sweep Types. To restrict the fields saved to radiated fields, click **Save radiated fields only**.
- **Use Defaults**: The target defaults depend on the Order of Basis function selections (e.g., for Driven solutions and a First Order basis function, the default target is 0.3333. HFSS refines the mesh until most element lengths are approximately one-third wavelength.).
- **HPC and Analysis Options**: Refer to Setting HPC and Analysis Options.

When configuration is complete, click **OK** to close the **HFSS Setup** window.

The Matrix Convergence Window

Note: For designs with ports.

Choose **Use Matrix Convergence** to specify different stopping criteria for specific entries in the S-matrix. The adaptive analysis will continue until the magnitude and phase of the entries change by an amount less than the specified criteria from one pass to the next, or until the number of requested passes is completed. Setup Matrix Convergence by completing these steps.

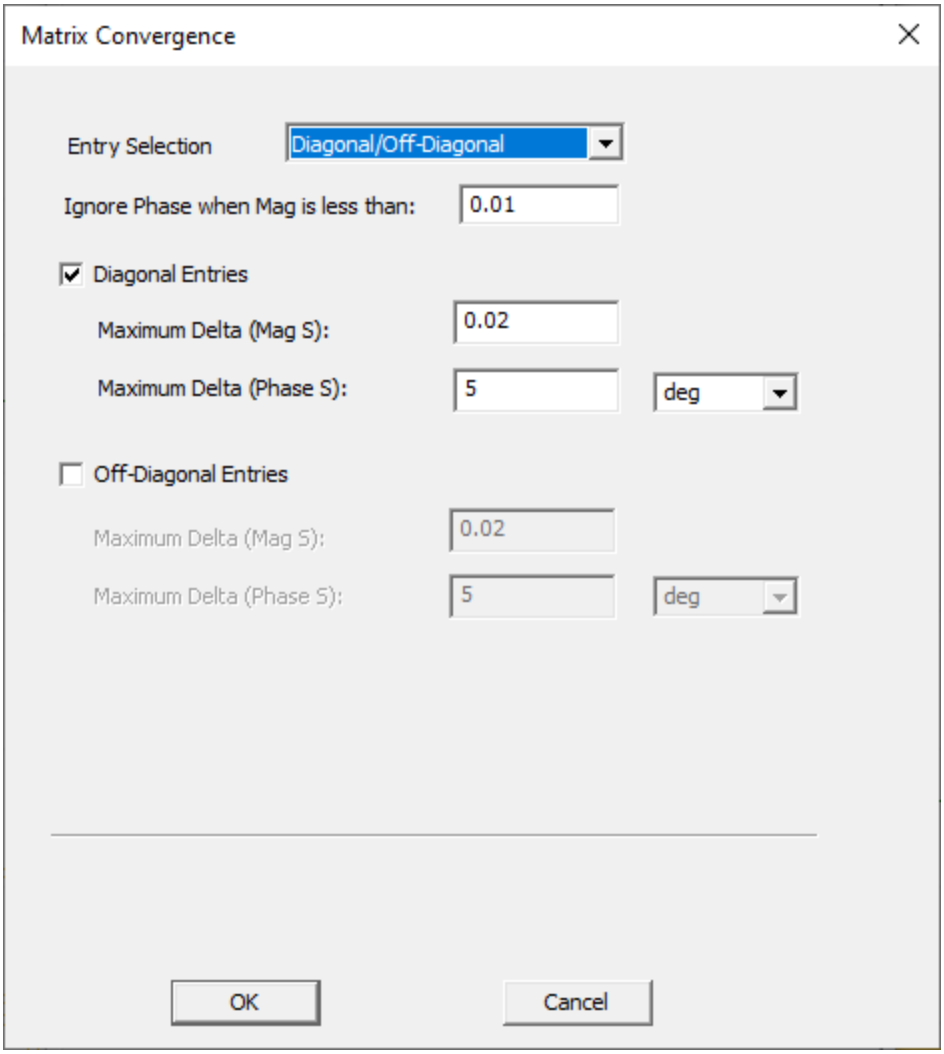
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

When the Mag S becomes small (near to zero) its phase becomes indefinite and insignificant due to mathematical issues. In HFSS 10 and 11 there was a 0.05 magnitude threshold that caused that Phase Margin to be discarded. However, some users may want to continue running additional passes to stabilize phase margins even when the S-parameter magnitude is below this threshold. For this reason, the magnitude threshold has been removed. This calls for caution: to see a good phase convergence for S_{12}, which is near to 1. If a small delta_phi with small delta_s is set, after a couple of passes, S_{12} will converge, but S_{11} never, since S_{11} ~0 and its phase changes with the mesh noise because the phase is indefinite. In other words, under these conditions the adaptive process never stops, so abort it.

1. From the **HFSS Setup** window, choose **Use Matrix Convergence**. Then click **Set Magnitude and Phase** to open the **Matrix Convergence** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. Options in the **Matrix Convergence** window change depending on the **Entry Selection**. Choose one of the following on the Entry Selection drop-down menu:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

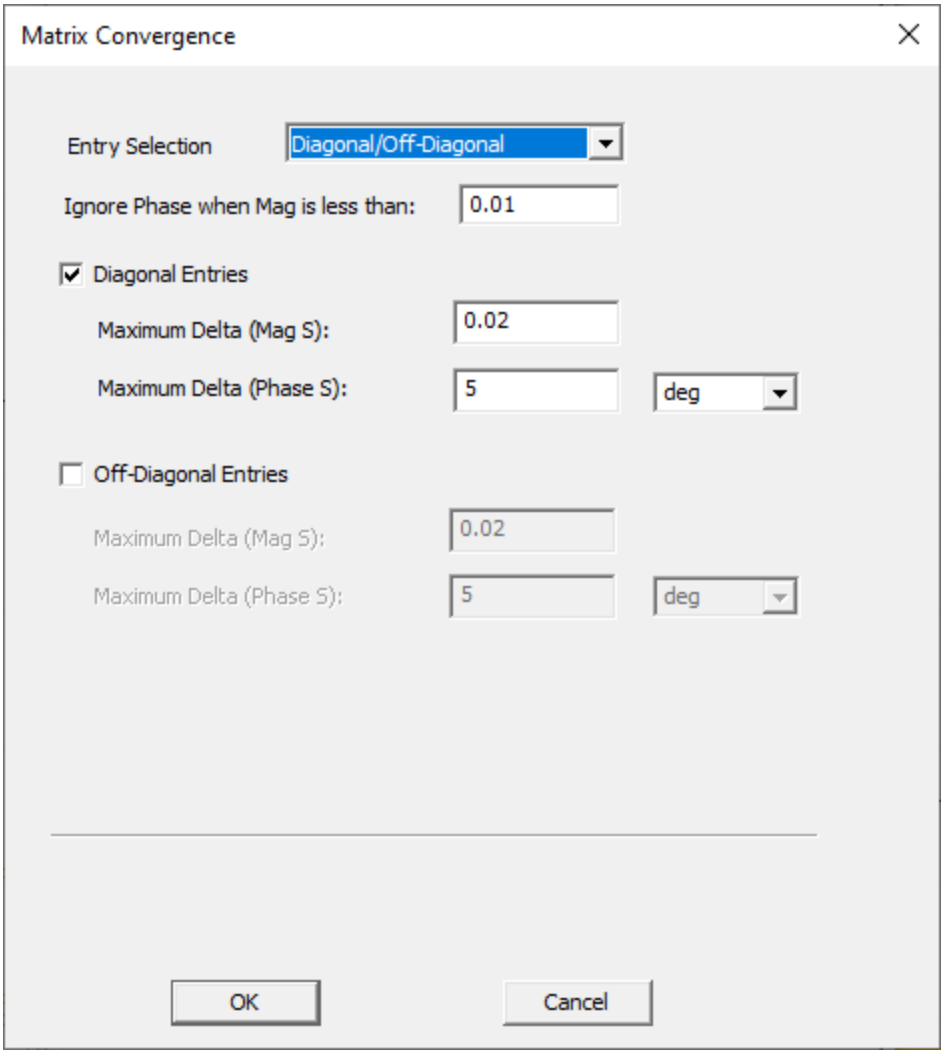
- **All**: Sets all the matrix entries at once. (The default).

  a. If applicable, enter a value in the **Ignore Phase when Mag is less than:** field.

  b. Enter the convergence criteria for the **Maximum Delta (Mag S)** and the **Maximum Delta (Phase S)** in the selected fields, and choose a unit of measurement from the drop-down menu (i.e., **deg**, **degmin**, **degsec**, **rag**).

- **Diagonal/Off-Diagonal**: Sets all the diagonal matrix entries at once, all off-diagonal matrix entries at once, or both diagonal and off diagonal entries at once.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



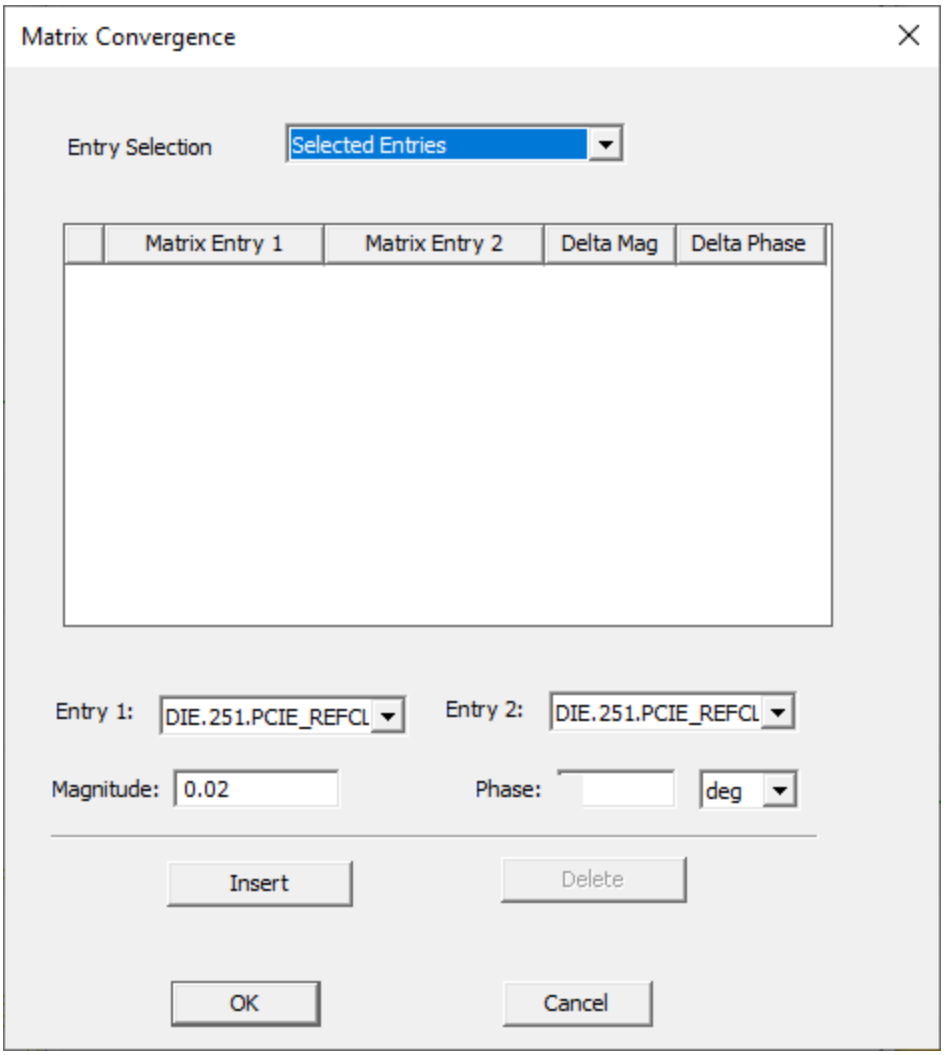
a. If applicable, enter a value in the **Ignore Phase when Mag is less than:** field.

b. Check **Diagonal Entries**, **Off-Diagonal Entries**, or both, to enable the convergence criteria field(s).

c. Enter the convergence criteria for the **Maximum Delta (Mag S)** and the **Maximum Delta (Phase S)** in the appropriate fields, and choose a unit of measurement from the drop-down menu (i.e., **deg**, **degmin**, **degsec**, **rag**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Selected Entries**: Sets individual matrix entries that users select.



Do the following to select the selected ports and mode (or terminal) pairs:

a. Select **Entry 1:** and **Entry 2:** from the drop-down menus.

b. From the **Magnitude:** field, enter the maximum change in magnitude from **Entry 1** (first pass) to **Entry 2** (second pass).

c. From the **Phase:** field, enter the maximum change in phase from **Entry 1** (first pass) to **Entry 2** (second pass), and choose a unit of measurement from the drop-down menu (i.e., **deg**, **degmin**, **degsec**, **rag**).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

d. Click **Insert** and the selected perimeters will appear in the table, dispersed into fields in the **Matrix Entry 1**, **Matrix Entry 2**, **Delta Mag**, and **Delta Phase** columns.

e. Repeat steps a-d, as appropriate.

f. Select a row in the table to enable the **Delete** button. Click **Delete** to remove the row, as appropriate.

g. Clicking in the **Delta Mag** and **Delta Phase** columns enables editing in the selected field.

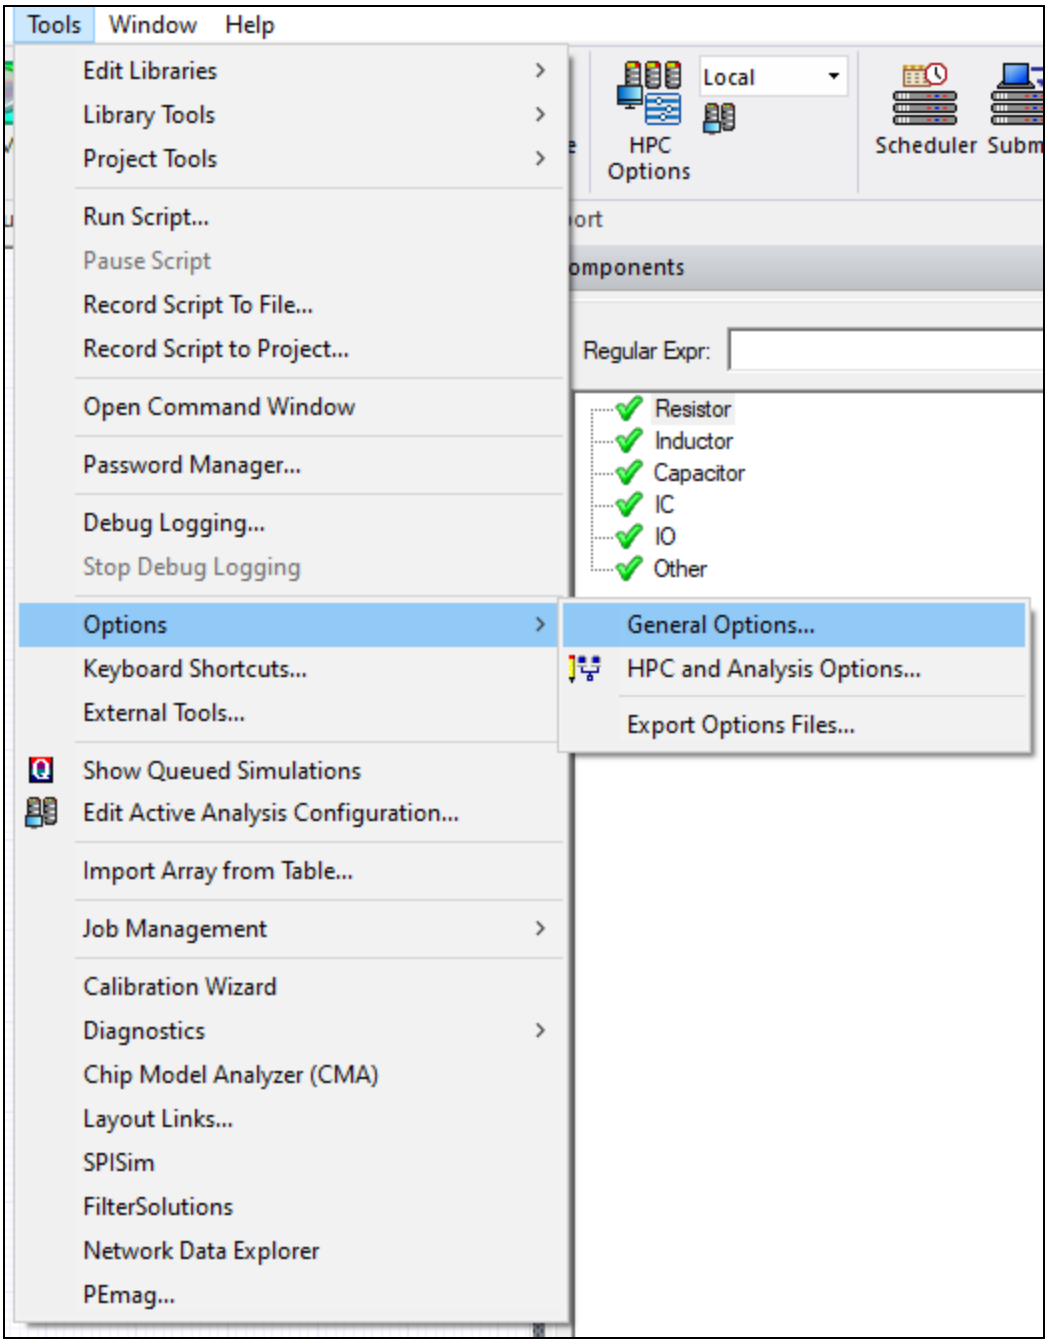
When configuration is complete, click **OK** to close the **Matrix Convergence** window.

Activating the Parallel Refinement Beta Feature

Follow these steps to enable the parallel refinement beta feature.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

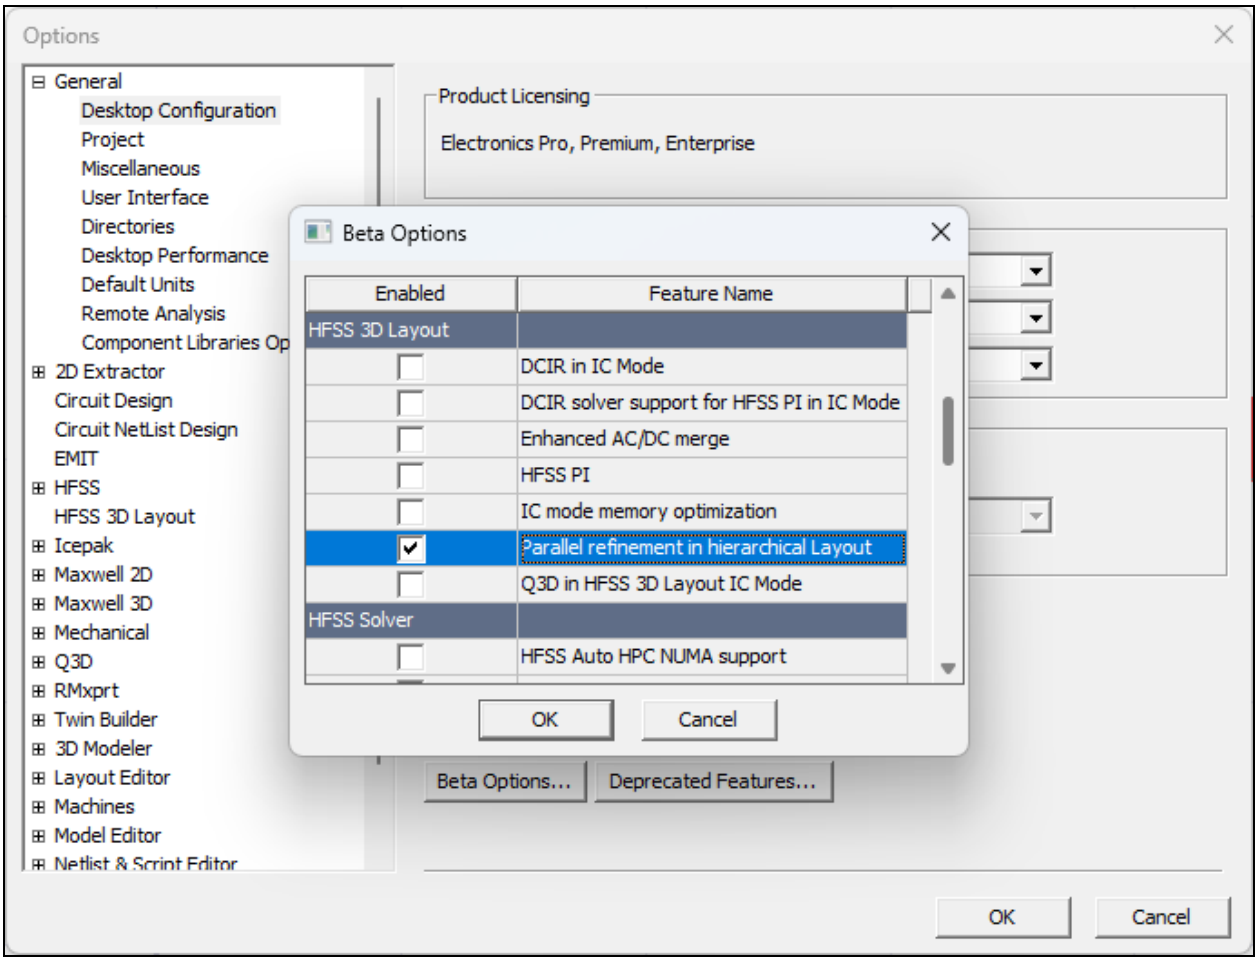
1. From the **Tools** menu, select **Options** > **General Options** to open the **Options** window



2. Expand **General** > **Desktop Configuration** and click **Beta Options** to open the **Beta Options** window

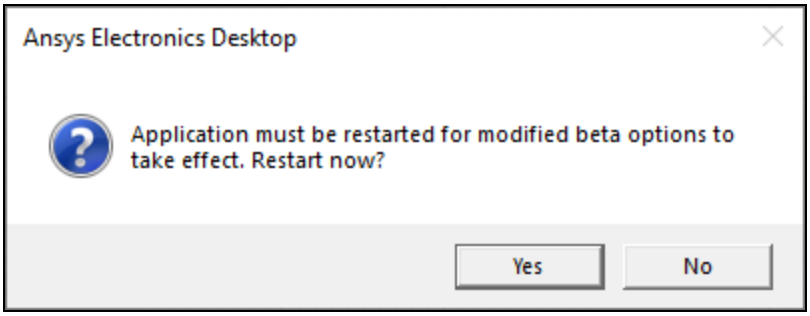
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Scroll down to **Q3D in HFSS 3D Layout IC Mode** and check the adjacent box



4. Click **OK** to close the **Beta Options** window.
5. Click **OK** to close the **Options** window and open a prompt to restart the software. Users may be asked to save their work.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



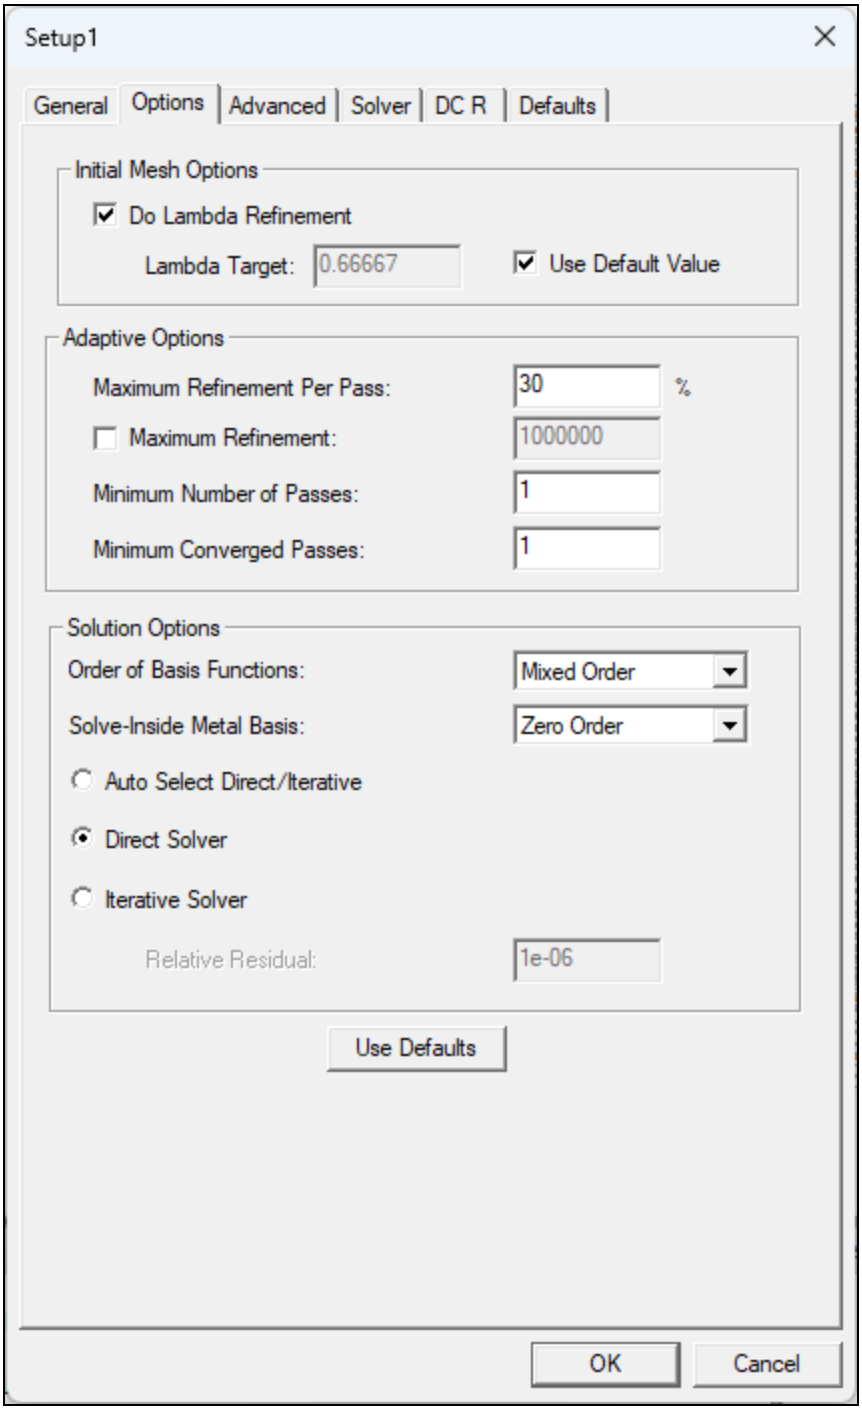
6. Click **Yes** to restart immediately.

After restarting the software, the parallel refinement option is available from the locations described in the previous section.

HFSS Setup: Options Tab

Select the **Options** tab of the **HFSS Setup** window to access the following settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Initial Mesh Options: options that define the initial mesh before adaption.

- **Do Lambda Refinement**: Lambda refinement is the process of refining the initial mesh based on the material-dependent wavelength.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Lambda Target**: The fraction of the wavelength that determines the refined tetrahedra edge length (e.g., if the value is 0.1 then a edge length of 0.1 is used as the refinement target).
- **Use Default Value**: The target defaults depend on the Order of Basis function selections (e.g., for Driven solutions and a First Order basis function, the default target is 0.3333; HFSS refines the mesh until most element lengths are approximately one-third wavelength.).

Adaptive Options:

- **Maximum Refinement Per Pass**: determines how many tetrahedra are added at each iteration of the adaptive refinement process. The tetrahedra with the highest error is refined. The value is a percentage.
- **Maximum Refinement**: The maximum number of tetrahedra that can be added during an adaptive pass. By default, this unchecked, to there is no maximum. If you enable the Maximum Refinement, the initial value is 1000000.
- **Minimum Number of Passes**: The maximum number of mesh refinement cycles that you want HFSS to perform. This value is a stopping criterion for the adaptive solution. If the maximum number of passes has been completed, the adaptive analysis stops. If the maximum number of passes has not been completed, the adaptive analysis continues unless the convergence criteria are reached.
- **Minimum Converged Passes**: An adaptive analysis does not stop unless the minimum number of converged passes has been completed. The convergence criteria must be met for at least this number of passes before the adaptive analysis stops.

Solution Options:

- **Order of Basis Functions**: The order of the basis functions HFSS uses to interpolate field values from nodal values. The **Zero Order** option is useful when a model requires a mesh that produces more than 100,000 tetrahedra, but the model size is small compared to wavelength. The higher order options (i.e., **First** and **Second Order**) solve progressively more unknowns for each tetrahedra. **Mixed Order** uses higher order where more accuracy is required, and lower order where fields are weaker.
- **Solver-Inside Metal Basis (IC Mode Only)**: determines the order of basis functions used inside metallic objects. The **Zero Order** option uses lower-order interpolation, reducing computation time and memory usage in most designs. The **First Order** option uses a higher-order basis for increased accuracy inside metal regions. Recommended if currents inside metal regions would significantly impact results.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Important:**
>
> If **Zero Order** is selected from the **Order of Basis Functions** drop-down menu, only **Zero Order** can be selected from the **Solver-Inside Metal Basis** drop-down menu.

- **Auto Select Direct/Iterative**: The auto solver automatically chooses whether to use the direct (i.e., default) or iterative solver **for each pass**. The direct solver provides a multi-frontal (MF) approach and is invoked by default if the matrix is not well-conditioned for an iterative solution. The iterative solver significantly reduces memory usage, and it can also reduce solution time for large simulations.
- **Enable Direct Solver** (i.e., default): The direct solver is a multi-frontal solver ideal for smaller simulations.
- **Enable Iterative Solver**: The iterative solver provides an alternative to the multi-frontal solver when a matrix is well-conditioned for an iterative solution. The iterative solver significantly reduces memory usage, and it can also provide a savings in the solution time for large simulations. When this option is enabled, HFSS automatically invokes the iterative solver when it decides the matrix is conditioned well enough to take advantage of the iterative approach. HFSS uses the multi-frontal solver if the matrix does not meet this requirement.
- **Relative Residual**: The residual measures the convergence of the iterative solver. The default value is 1E-4.
- **Enhanced low frequency accuracy**: When enabled, the solver is tuned to reliably solve low frequencies for designs that only contain lumped ports as sources or a combination of lumped and circuit ports. For designs with only lumped ports and/or circuit ports, interpolating sweeps are tuned to solve more low frequency points in order to accurately represent very low frequency results.

> **Important:**
>
> **Enhanced low frequency accuracy** has no affect on **Discrete** sweeps.

> **Note:**
>
> **Enhanced low frequency accuracy** does not support wave ports at this time.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> **Enhanced low frequency accuracy** requires more RAM in order to solve the entire solution vector for interpolation sweeps and for discrete sweeps not saving fields. For more information, see Horizontal Lumped Ports.

Enable Auto Select Direct/Iterative

In order to reduce the need for user intervention, speed up the solution process, and minimize solver failure, HFSS automatically chooses whether to use the direct (i.e., default) or iterative solver **for each pass**. Depending on a wide range of parameters (e.g., geometry, mesh size and quality, basis order, the number of excitations, et cetera), the performance of the direct and iterative solvers can vary significantly. The direct solver provides a multi-frontal (MF) approach and is invoked by default if the matrix is not well-conditioned for an iterative solution. The iterative solver significantly reduces memory usage, and it can also reduce solution time for large simulations. Enabling **Auto Select Direct/Iterative** could therefore potentially improve the speed of the simulation while maintaining accuracy.

Enable the Auto Select Direct/Iterative

From the **Solution Setup** window, select the **Options** tab. Then select **Auto Select Direct/Iterative** on the **Solution Options** area.

> **Note:**
>
> The Iterative Solver is not available for zero order basis solutions.

During and after analysis, the solver selected for each pass and sweep is viewable on the **Solutions** window > **Profile** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Enable Direct Solver

The direct solver provides a multi-frontal (MF) approach when a matrix is not well-conditioned for an iterative solution. The iterative solver significantly reduces memory usage, and it can also provide a savings in the solution time for large simulations.

When you select the **Enable Direct Solver** option, HFSS automatically invokes the multi-frontal solver. If you select **Iterative Solver** and HFSS decides that the matrix is not conditioned well enough to take advantage of the iterative approach HFSS still uses the multi-frontal solver.

Enable the Direct Solver

From the **Solution Setup** window, select the **Options** tab. Then select **Direct Solver** from the *Solution Options* group box.

> **Note:** The Iterative Solver is not available for zero order basis solutions.

Enable Iterative Solver

The iterative solver provides an alternative to the multi-frontal solver when a matrix is well-conditioned for an iterative solution. The iterative solver significantly reduces memory usage, and it can also provide a savings in the solution time for large simulations.

When you select **Enable Iterative Solver**, HFSS automatically invokes the iterative solver when it decides that the matrix is conditioned well enough to take advantage of the iterative approach. HFSS uses the multi-frontal solver if the matrix does not meet this requirement.

For more detail, see the technical notes for Iterative Matrix Solver.

Enable the Iterative Solver

From the **Solution Setup** window, select the **Options** tab. Then select **Iterative Solver** from the *Solution Options* group box.

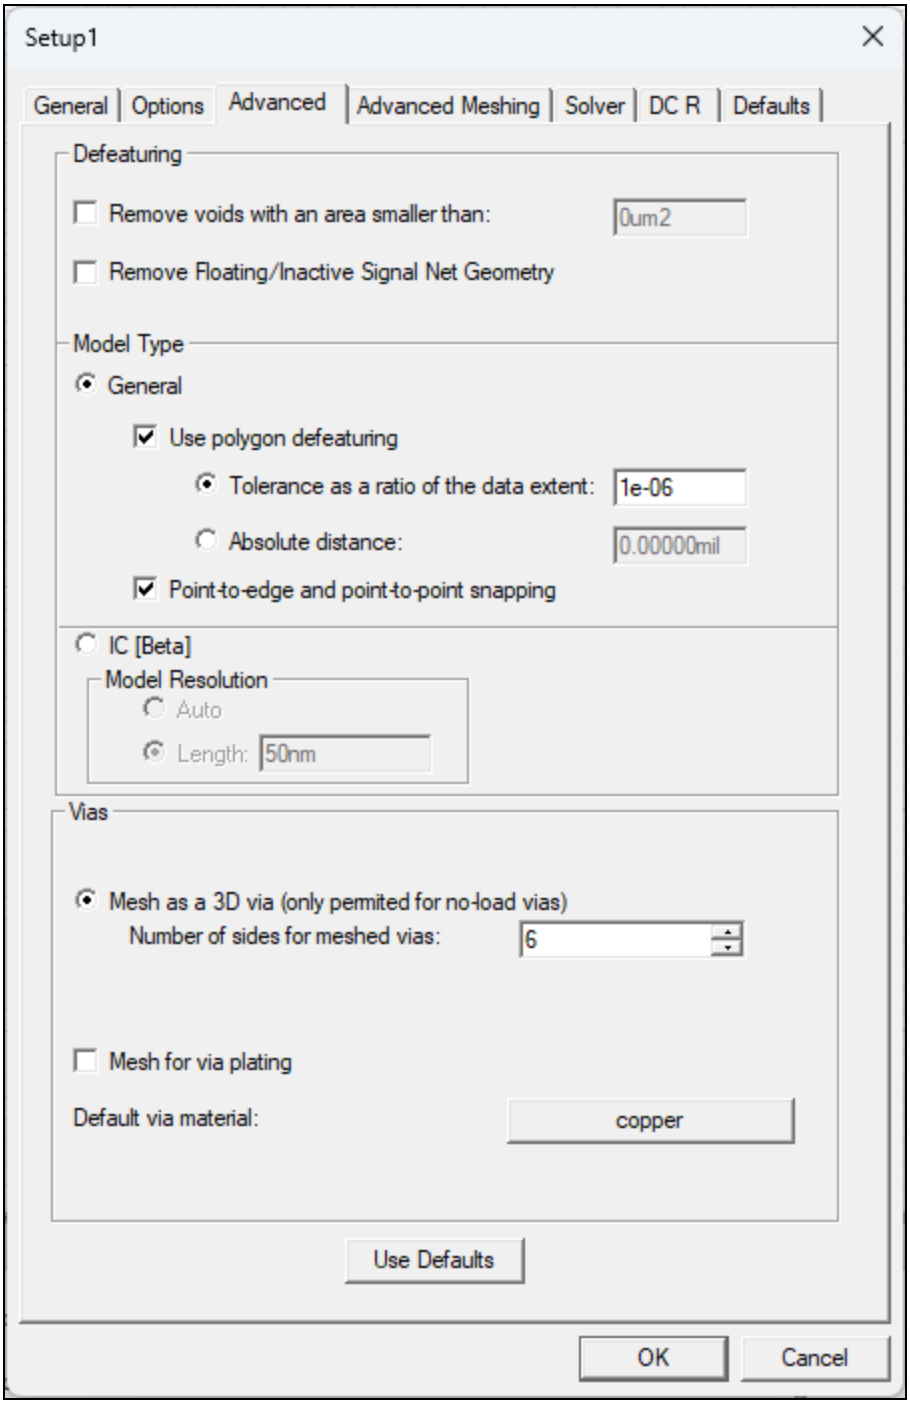
This enables the **Relative Residual** check box. The residual measures the convergence of the iterative solver. Check the box, if desired, and enter a **Relative Residual** value in the adjacent text field (default value is 1E-6).

> **Note:** The Iterative Solver is not available for zero order basis solutions.

HFSS Setup: Advanced Tab

Select the **Advanced** tab of the HFSS Setup window to access the following settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Defeaturing

- **Remove voids with an area smaller than** <value>: simplifies meshing by removing small voids.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Remove Floating/Inactive Signal Net Geometry**: removes floating and inactive signal net geometry.

Model Resolution (IC Mode Only)

- **Auto**: automatically sets the model resolution.
- **Length**: allows you to manually set the model resolution.

> **Note:**
>
> The following options are only available in General mode.

Model Type: offers two types of models.

- **General**: offers standard mesh processing.
  - **Use polygon defeaturing**: removes very close points, points that do not contribute to the geometry of an edge (e.g., collinear), and very thin intrusions. When used with “unioning”, it can be helpful in healing geometry that is not snapped together.
    - **Tolerance as a ratio of the data exent**: tolerance value specified as a ratio of the overall data extent. This value must be very small.
    - **Absolute distance**: tolerance specified as an absolute value (e.g., 0.0001mm).

    > **Note:**
    >
    > From the **Vias** area, vias may be modeled as a simple 'wirebond' or as a 3D ribbon or solid. The values specified in the analysis setup only apply to vias that do not have specific property overrides; all properties explicitly specified for a via take precedence over these values.

  - **Point -to-edge and point-to-point snapping**: snaps points to edges and points to points if they are within a minimum dimensional tolerance. This tolerance is based on geometry extents.
- **IC [Beta]**: optimizes geometry processing to simulate small, on-chip structures.
  - **Auto**: automatically sets the model resolution based on the design's geometry. Recommended for most designs.
  - **Length**: allows the user to manually set a resolution threshold. Features smaller than the entered value may be merged with nearby geometry, snapped, or removed entirely, especially if they don’t affect the overall structure or function of the design. Recommended if the design includes fine or critical details.

Vias

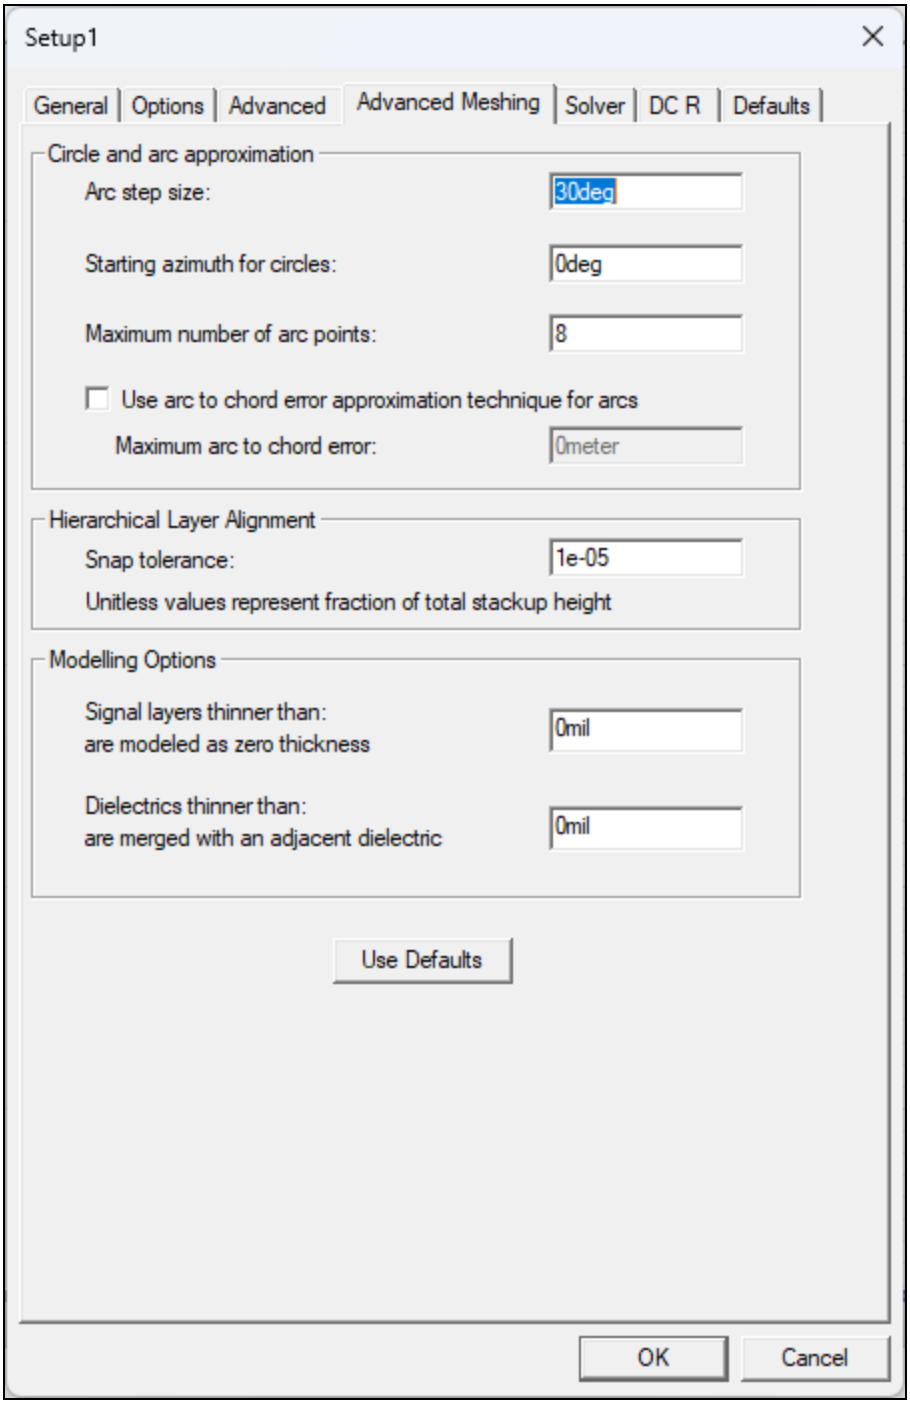
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Mesh as a 3D via** vias are modeled using rectangles to form a 3D ribbon or solid.
  - **Number of sides**: number of sides to use when creating the 3D representation. If less than 3, the via is modeled as a flat ribbon.
  - **Mesh for via plating** – check the box to create a mesh around the plating percent specified in the **Edit Padstack Definition** window, resulting in a more accurate DC thickness value. A via that is not fully plated includes a void filled with the material defined in the surrounding air box (e.g., air). Zero plating is not recognized and is treated as fully plated.
- **Via material default**: when a material has not been specified in the padstack definition and there is no override in the properties for a via, then this is the material associated with the via mesh. It is initially set to copper.

HFSS Setup: Advanced Meshing Tab

Select the **Advanced Meshing** tab of the HFSS Setup window to access the following settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **Circle and arc approximation**: circles and arcs must be replaced with straight edge approximations before meshing. There is no attempt to match areas. Points are introduced on the original arc at the locations specified by the following parameters.

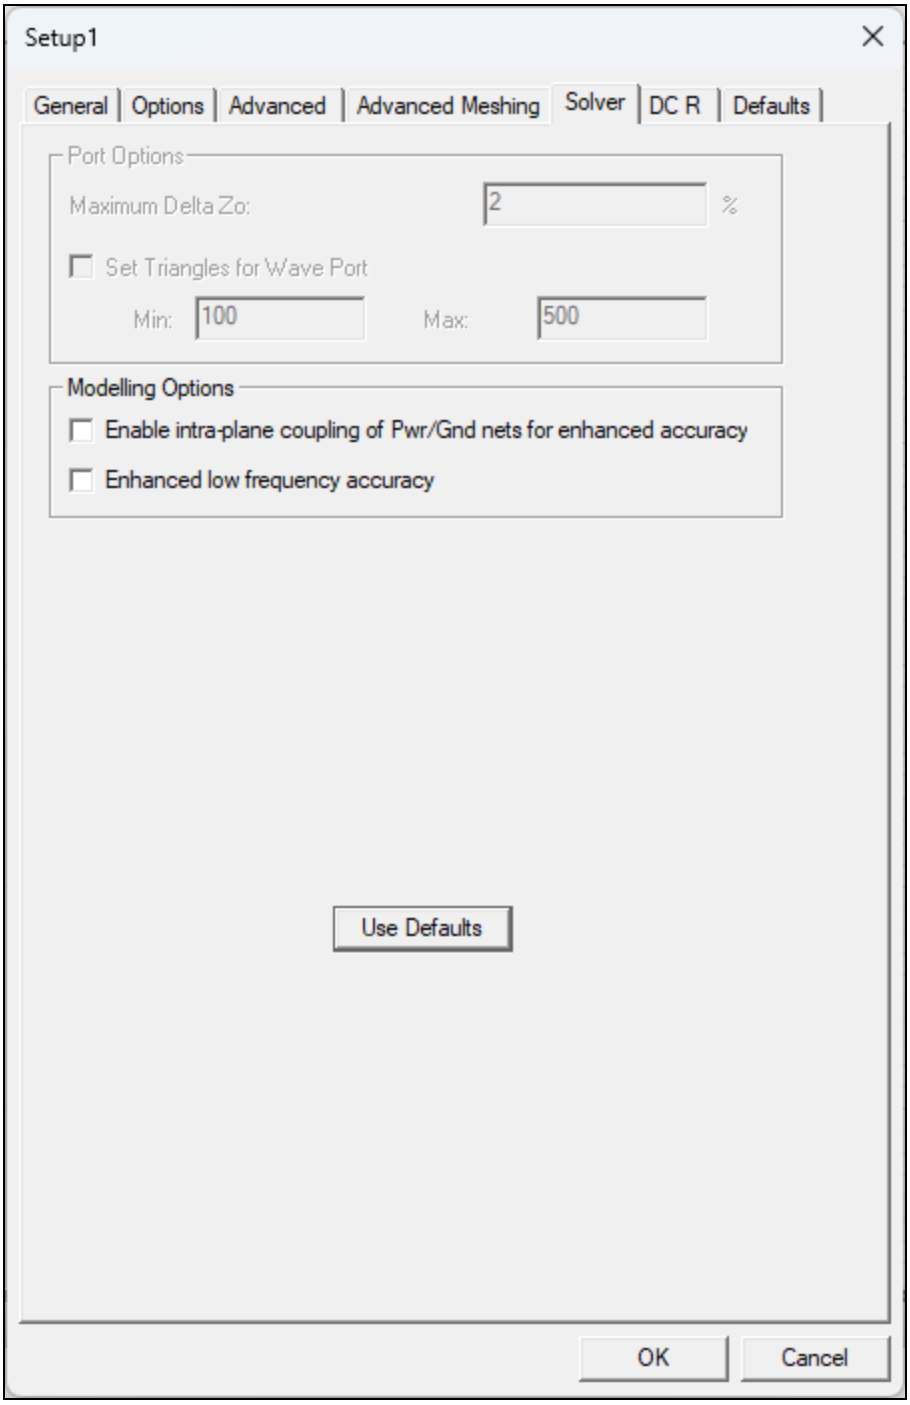
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Arc step size**: the angular interval below which mesh points are added.
  - **Starting azimuth for circles**: specifies the location of the first mesh point or circles.
  - **Maximum number of arc points**: the maximum number of mesh points on a given arc segment.
  - **Use arc to chord error approximation technique for arc**: the resulting straight edge approximation deviate from the original arc by more than the specified error.
    - **Maximum arc to chord error**: maximum distance permissible between a straight edge approximation (the chord) and the original arc.
- **Hierarchical Layer Alignment**: aligns layers across hierarchical boundaries.
  - **Snap tolerance**: When layers across hierarchical boundaries are within this unitless tolerance, they are aligned to the same elevation. This value represents a fraction of total stackup height.
  - **Signal layers thinner than <*value*> are modeled as zero thickness**: enter a value. Negative signal layers in the design which are thinner than the value are modeled as being infinitely thin in order to reduce simulation time.
  - **Dielectrics thinner than <*value*> are merged with an adjacent**: enter a value. Dielectric layers in the design which are thinner than the value are merged into an adjacent dielectric. Material properties are accumulated using a weighted average.

HFSS Setup: Solver Tab

Select the **Solver** tab of the HFSS Setup window to access the following settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Port Options (General Mode Only)

- **Maximum Delta Zo**: Change to Zo specified as a target percentage. The default is 2%.
- **Set Triangles for Wave Port**: Controls the number of triangles used for a wave port. For designs with lumped ports, this option is not active. Higher numbers of triangles do not

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

benefit a solution setup in this case.

- **Min**: Minimum number of triangles on the wave port face.
- **Max**: Maximum number of triangles on the wave port face.

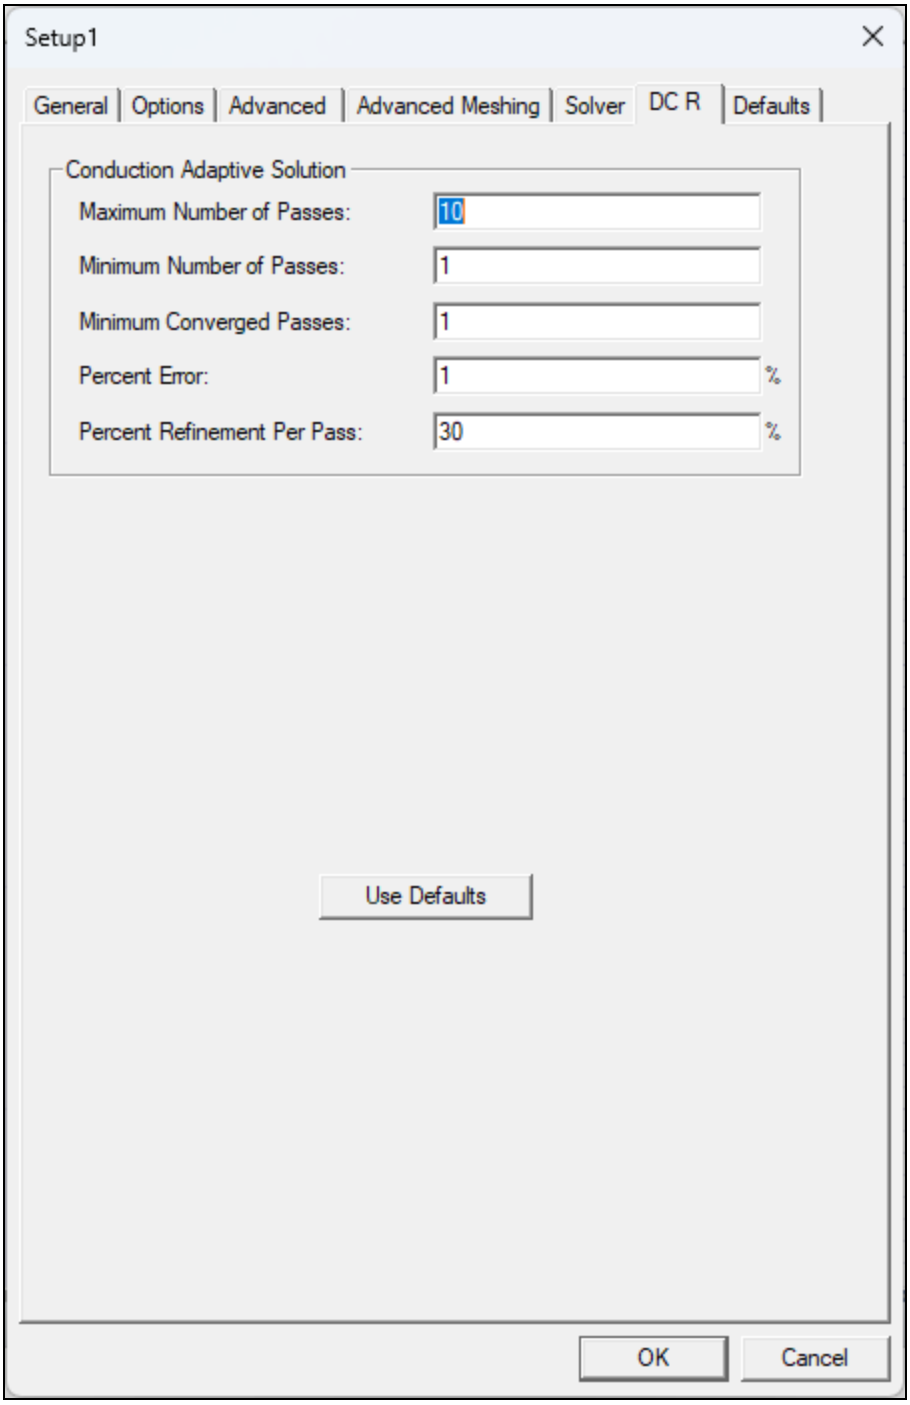
Modeling Options

- **Enable intra-plane coupling of Pwr/Gnd nets for enhanced accuracy**: Check the box to increase accuracy by including interactions between power and ground planes in simulation results.
- **Enhanced low frequency accuracy**: Check the box to increase simulation accuracy at low frequencies.

HFSS Setup: DC RTab

Select the **DC R** (i.e., DC Resistance) tab of the HFSS Setup window to access the following settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Conduction Adaptive Solution

- **Maximum Number of Passes** – the maximum number of mesh refinement cycles to perform. This value is a stopping criterion for the adaptive solution; if the maximum

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

number of passes has been completed, the adaptive analysis stops. If the maximum number of passes has not been completed, the adaptive analysis continues unless convergence criteria are reached.

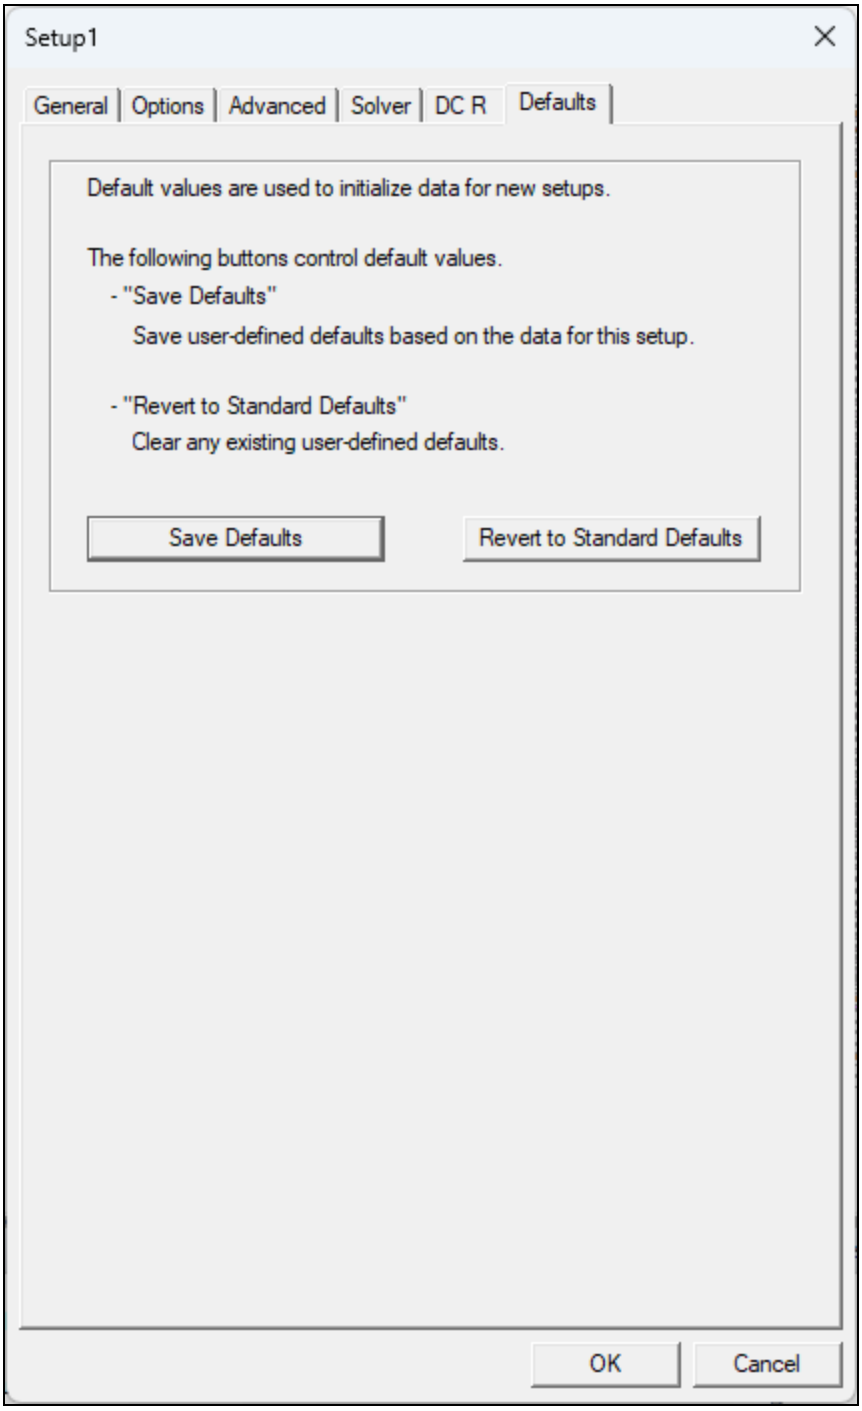
> **Important:**
>
> The size of the finite element mesh and the amount of memory required to generate a solution increases with each adaptive refinement of the mesh. Setting the maximum number of passes too high can result in the simulation requesting more memory than is available or taking excessive time to compute solutions.

- **Minimum Number of Passes** – the minimum number of mesh refinement cycles. The simulation will not stop analysis until after this number of passes has been completed.
- **Minimum Converged Passes** – the minimum number of passes that must meet convergence criteria before the adaptive analysis will stop.
- **Percent Error** – the desired solution accuracy. Smaller values produce more accurate but slower solutions; larger values produce less accurate but faster solutions.
- **Percent Refinement Per Pass** – determines how many tetrahedra (or prism) elements are added at each iteration of the adaptive refinement process. The elements with the highest error are refined. The default value is 30%.

HFSS Setup: Defaults Tab

Select the **Defaults** tab of the HFSS Setup window to access the following settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **Save Defaults**: Save user-defined defaults based on the data for this setup for all tabs.
- **Revert to Standard Defaults**: Clear any existing user-defined defaults for all tabs.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Adding an HFSS-Prism Solution Setup (IC Mode Only)

HFSS-Prism is a new simulation workflow and solver technology designed for power integrity (PI) analysis that utilizes prism-shaped meshing elements in the simulation to more efficiently handle complex on-chip and interposer designs. Users can optionally simplify stackups, vias, and other primitives into a form suitable for high-efficiency simulation. HFSS-Prism supports large-scale high-performance computing (HPC) for faster and more accurate results.

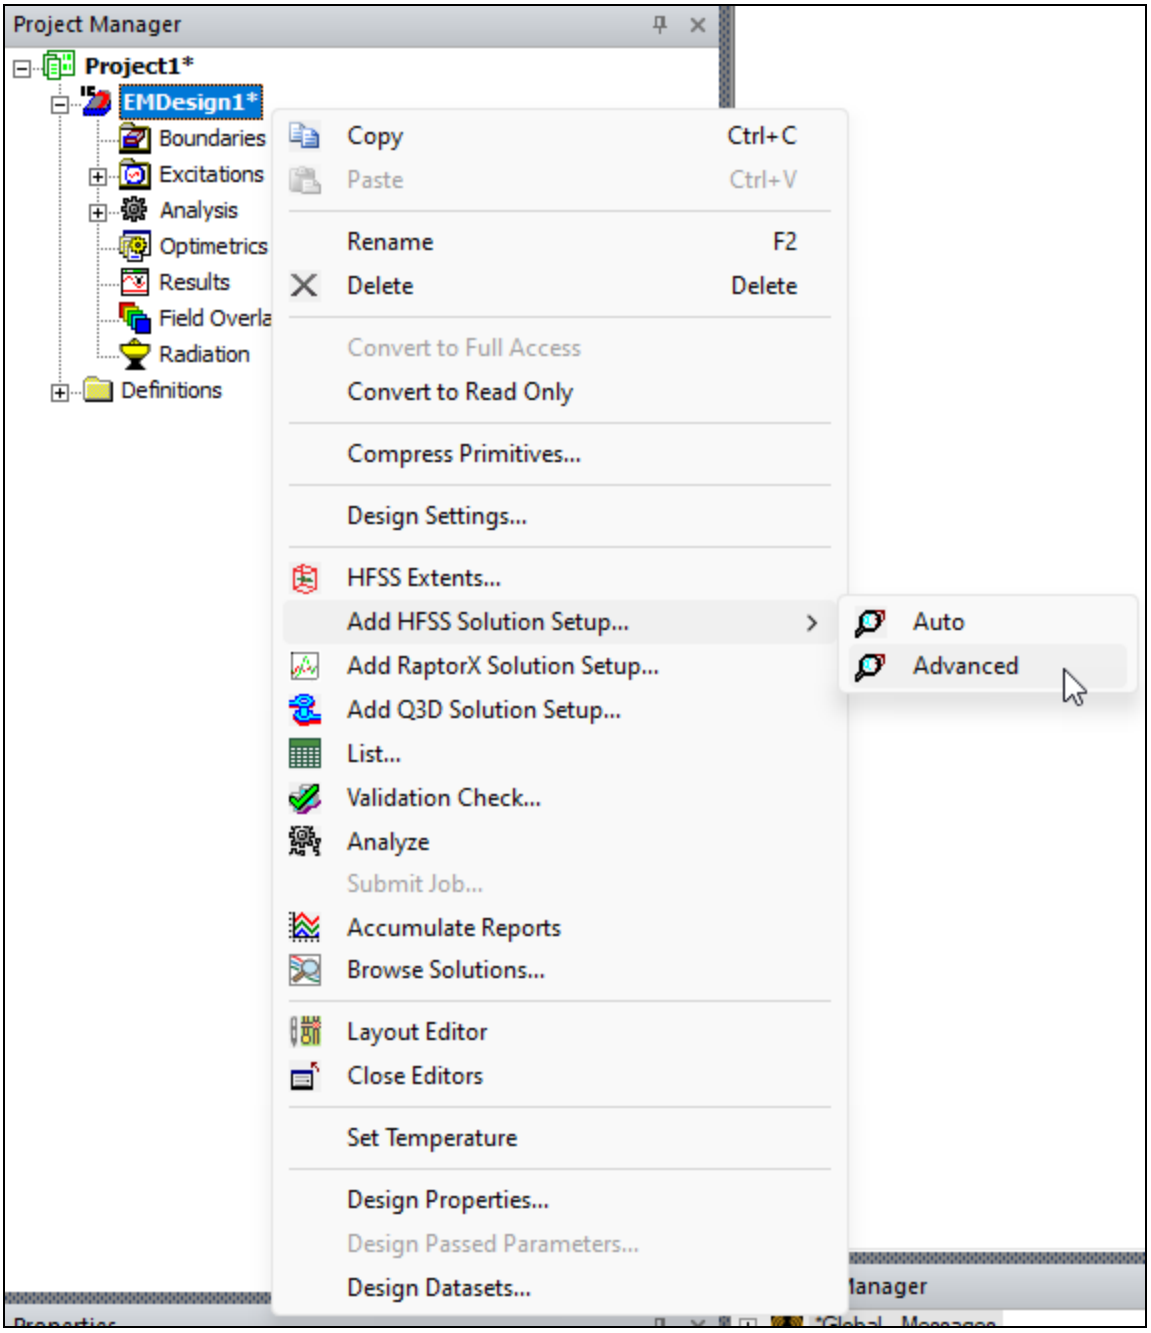
> **Note:**
>
> The prism solution setup is a beta feature. Beta features must be activated prior to use. Refer to Activating the HFSS-Prism Solution Setup Beta Feature for instructions.

Setting Up an HFSS-Prism Simulation

Follow these steps to add a prism solution setup to a project in IC mode.

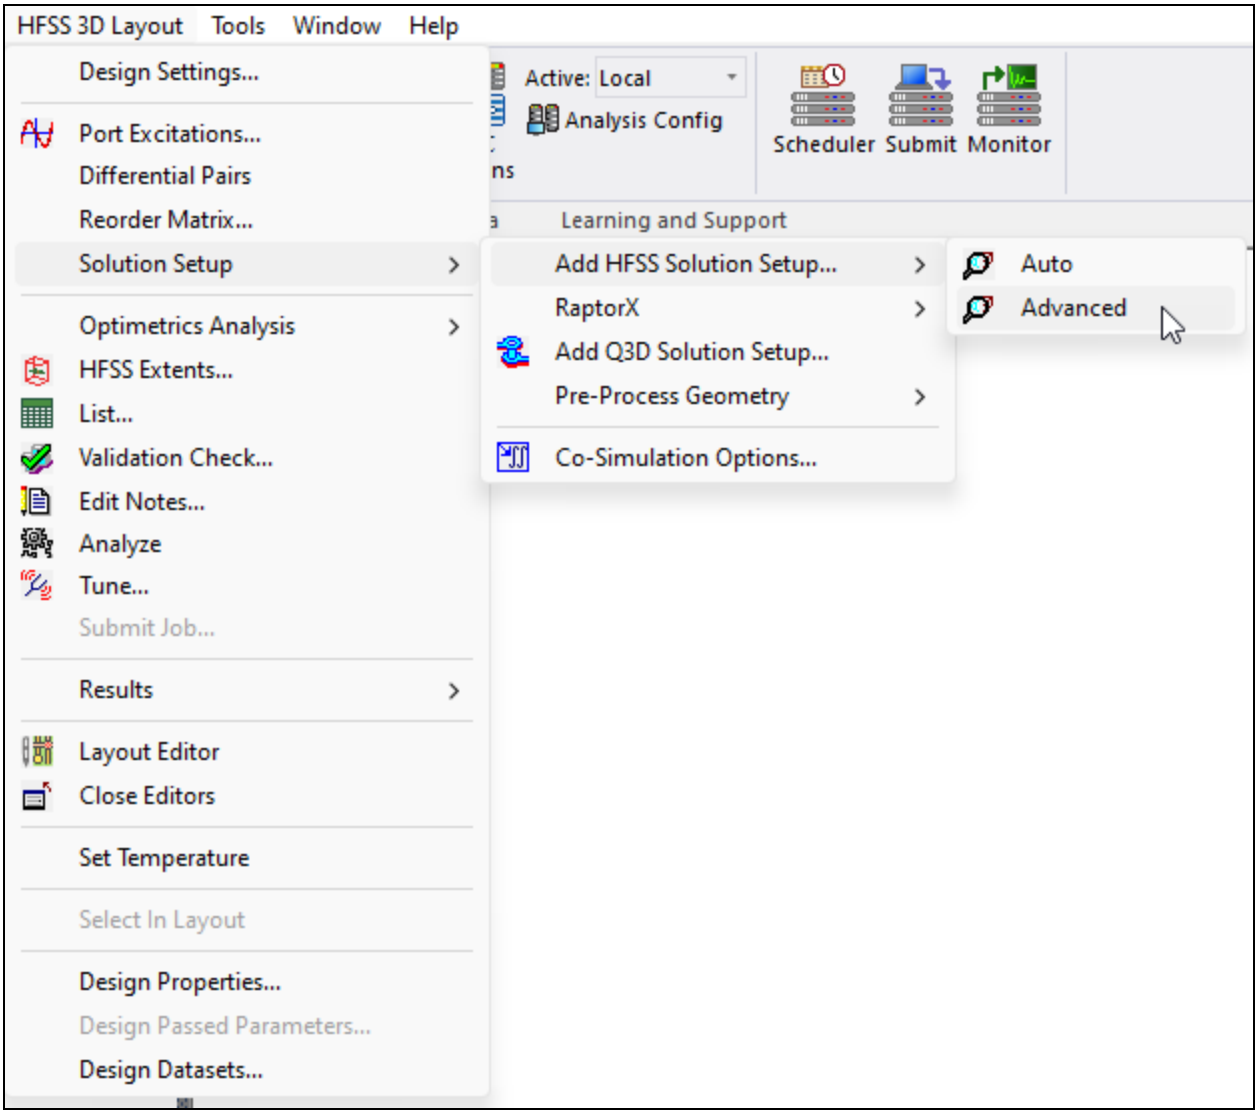
1. Open the **Setup** window by doing one of the following:
   - From the **Project Manager** window, expand the **Project Tree** > [***Active Design Folder***]. Then right-click **EMDesign1** and select **Add HFSS Solution Setup** > **Advanced**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

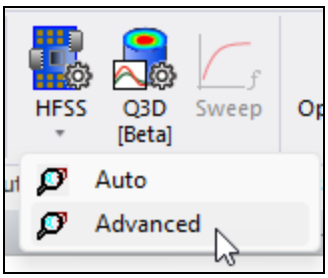


- From **HFSS 3D Layout**, select **Solution Setup** > **Add HFSS Solution Setup** > **Advanced**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

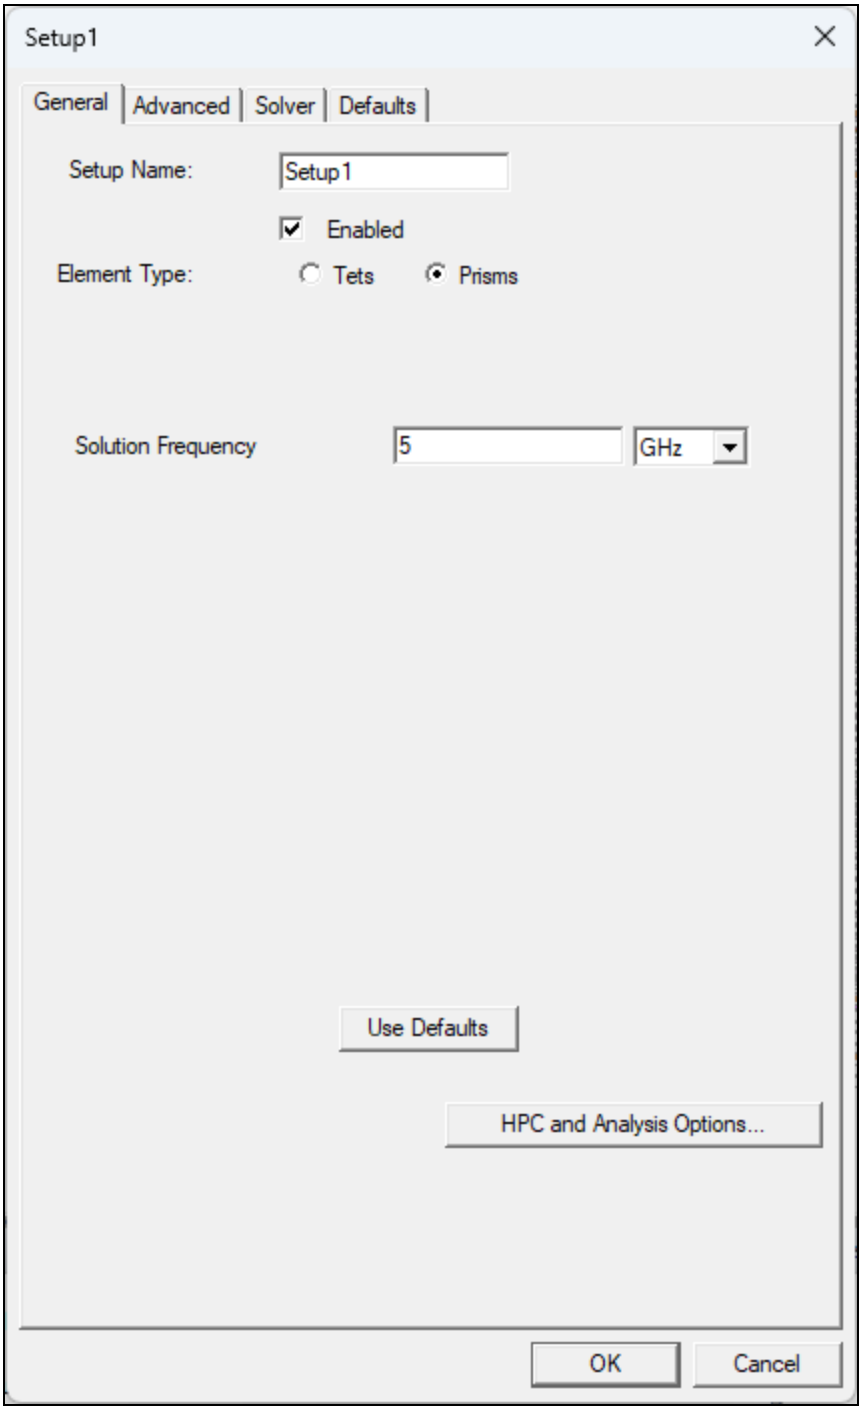


- From the **Simulation** tab, select **HFSS** > **Advanced**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **Setup** window, select **Prisms** from the **Element Type** options. An HFSS-Prism solution setup supports a subset of the advanced HFSS solution setup options available from the **General**, **Advanced**, **Solver**, and **Defaults** tabs. Default values shown.



3. From the **General** tab, set the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

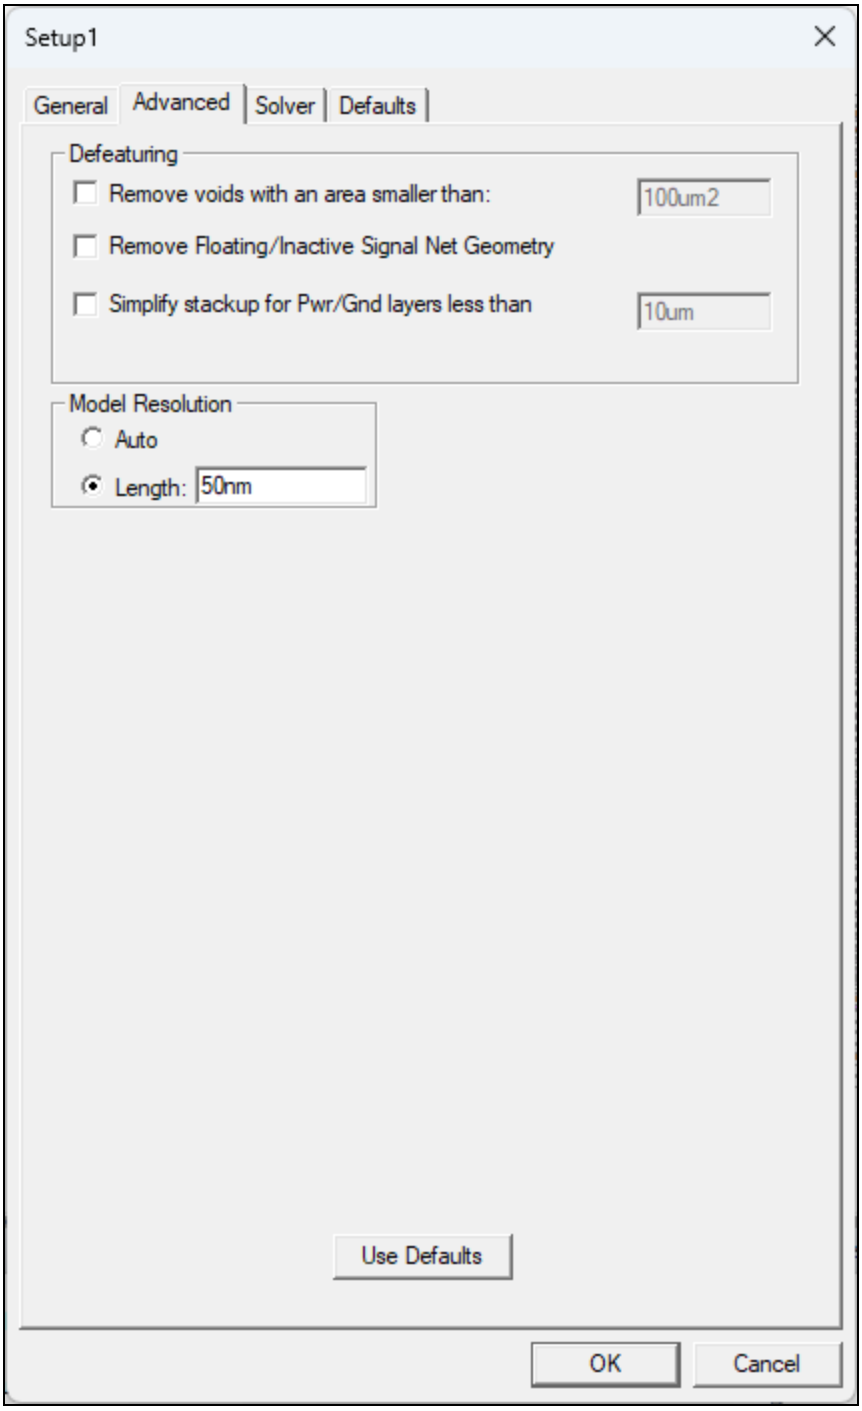
- **Setup Name** – type a name in the field or accept the default.
- **Enabled** – check the box to activate the setup.
- **Element Type** – To add an HFSS-Prism solution setup to the design, do **not** change this selection. The design utilizes prism-shaped meshing elements in the simulation.

> **Note:**
>
> Select **Tets** to use tetrahedron-shaped meshing elements in the simulation. This is the default meshing method. Refer to Adding an Advanced HFSS Solution Setup.

- **Solution Frequency** – specify the frequency and units at which to generate the solution.

4. Click the **Advanced** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



5. From the **Advanced** tab, set the following:
    - **Remove voids with an area smaller than** – check the box and enter a <value> to simplify meshing by removing small voids.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Remove Floating/Inactive Signal Net Geometry** – check the box to remove floating and inactive signal net geometry.
- **Simplify stackup for Pwr/Gnd layers less than** – check the box, enter a <value>, and metal layers with a thickness less than the specified value are set to **0** during simulation. The corresponding layer elevations are adjusted.
- **Model Resolution** – select **Auto** to automatically set the model resolution based on the design's geometry (recommended for most designs) or select **Length** to manually set a resolution threshold. Features smaller than the entered value may be merged with nearby geometry, snapped, or removed entirely, especially if they don’t affect the overall structure or function of the design (recommended if the design includes fine or critical details).

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Click the **Solver** tab.

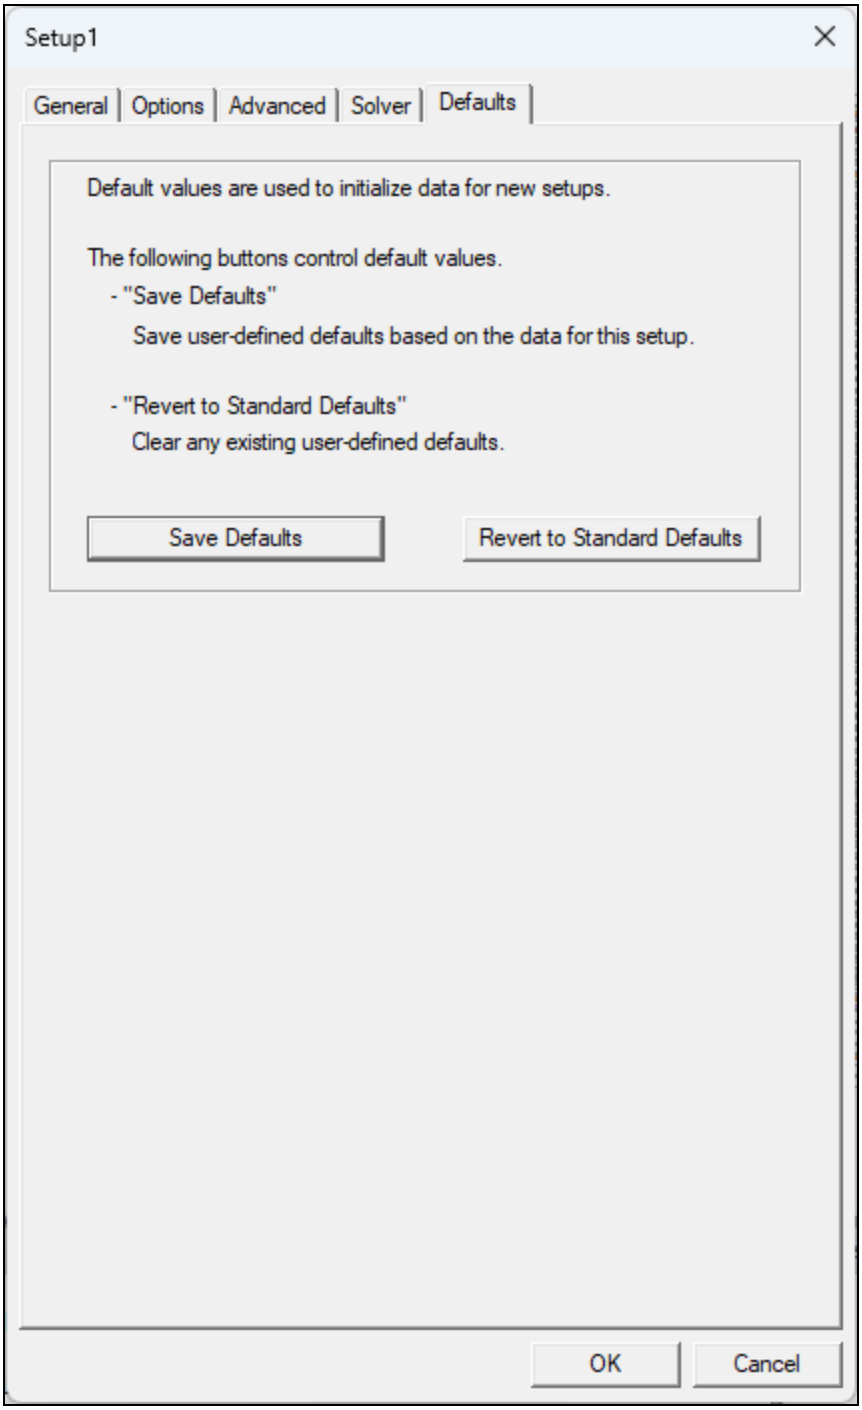
7. From the **Solver** tab, set the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Enhanced low frequency accuracy** – check the box to increase simulation accuracy at low frequencies.
- **Enable intra-plane coupling of Pwr/Gnd nets for enhanced accuracy** – check the box to increase accuracy by including interactions between power and ground planes in simulation results.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

8. Click the **Defaults** tab.

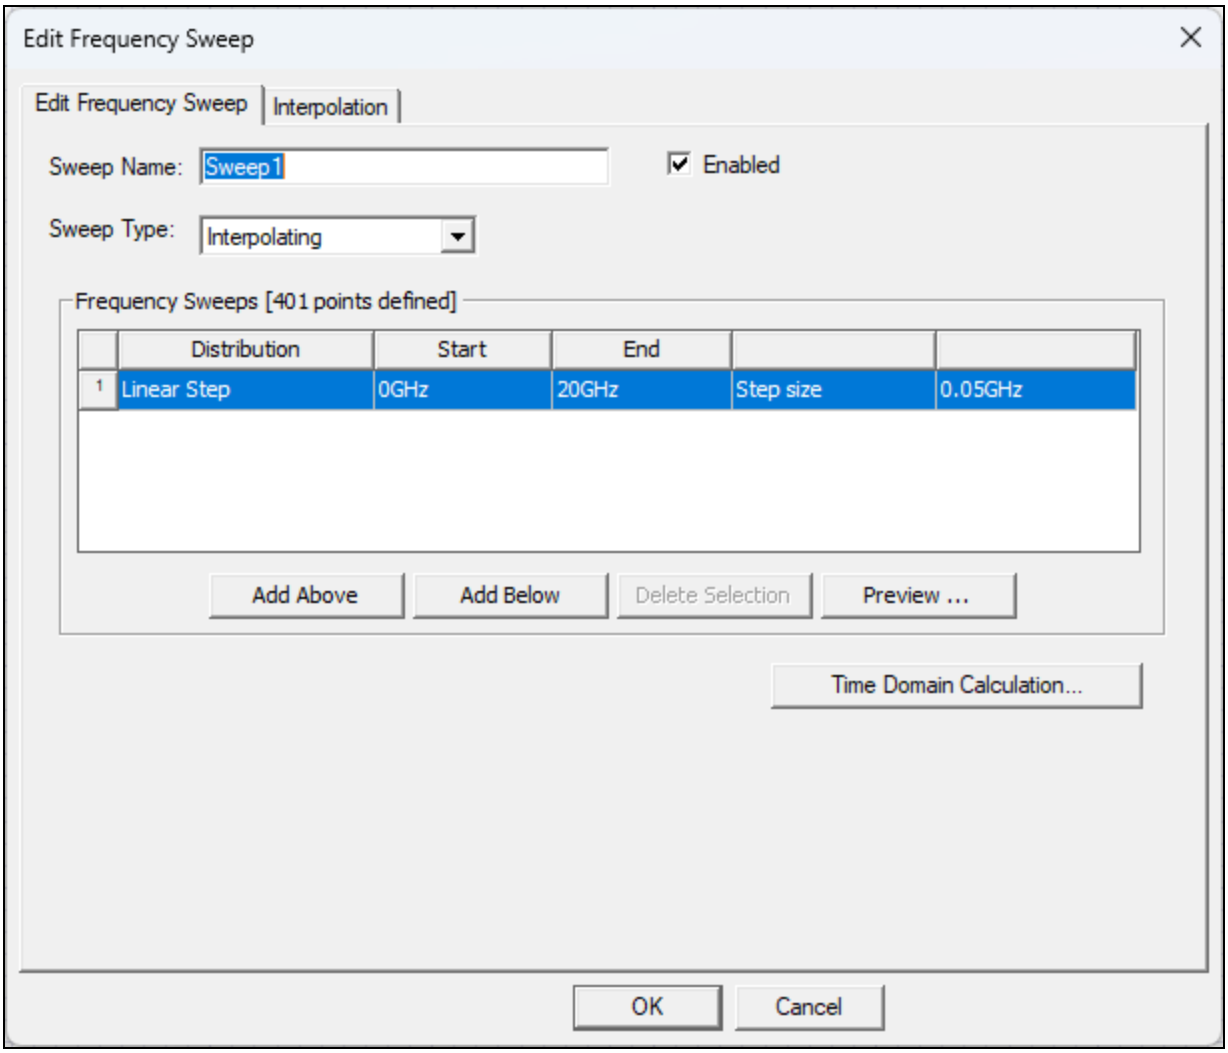


9. From the **Defaults** tab, set the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Save Defaults** – click to save user-defined defaults based on the data for this setup for all tabs.
- **Revert to Standard Defaults** – click to clear any existing user-defined defaults for all tabs.

10. Click **OK** to add the prism solution setup to the active design and simultaneously open the **Edit Frequency Sweep** window.

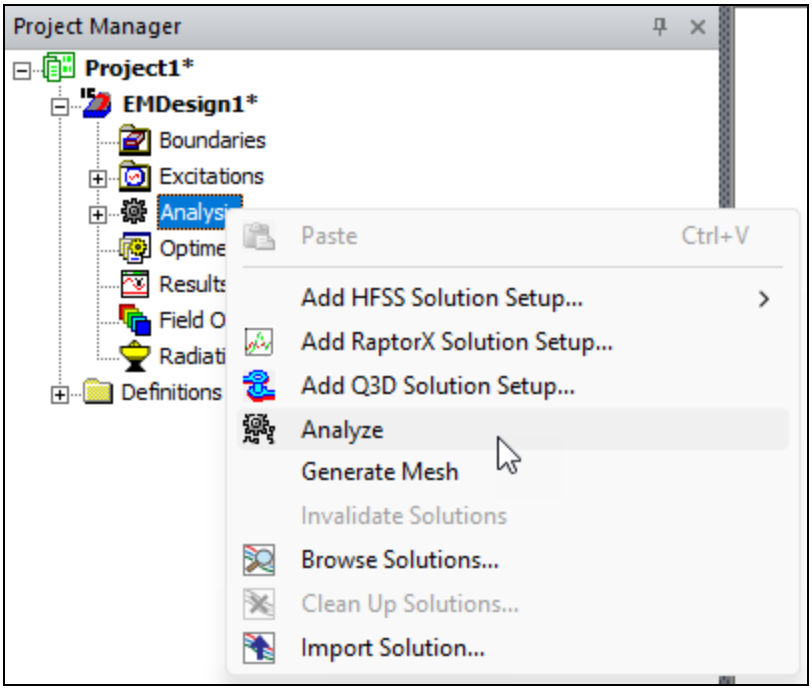


11. From the **Edit Frequency Sweep** window, click **OK** to accept the sweep with its default values or change the default values before continuing. Refer to Adding a Frequency Sweep for more information.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Analyzing the Design

To run the new HFSS-Prism solution setup, navigate to the **Project Manager** window, right-click **Analysis** and select **Analyze**. Refer to Running Simulations.

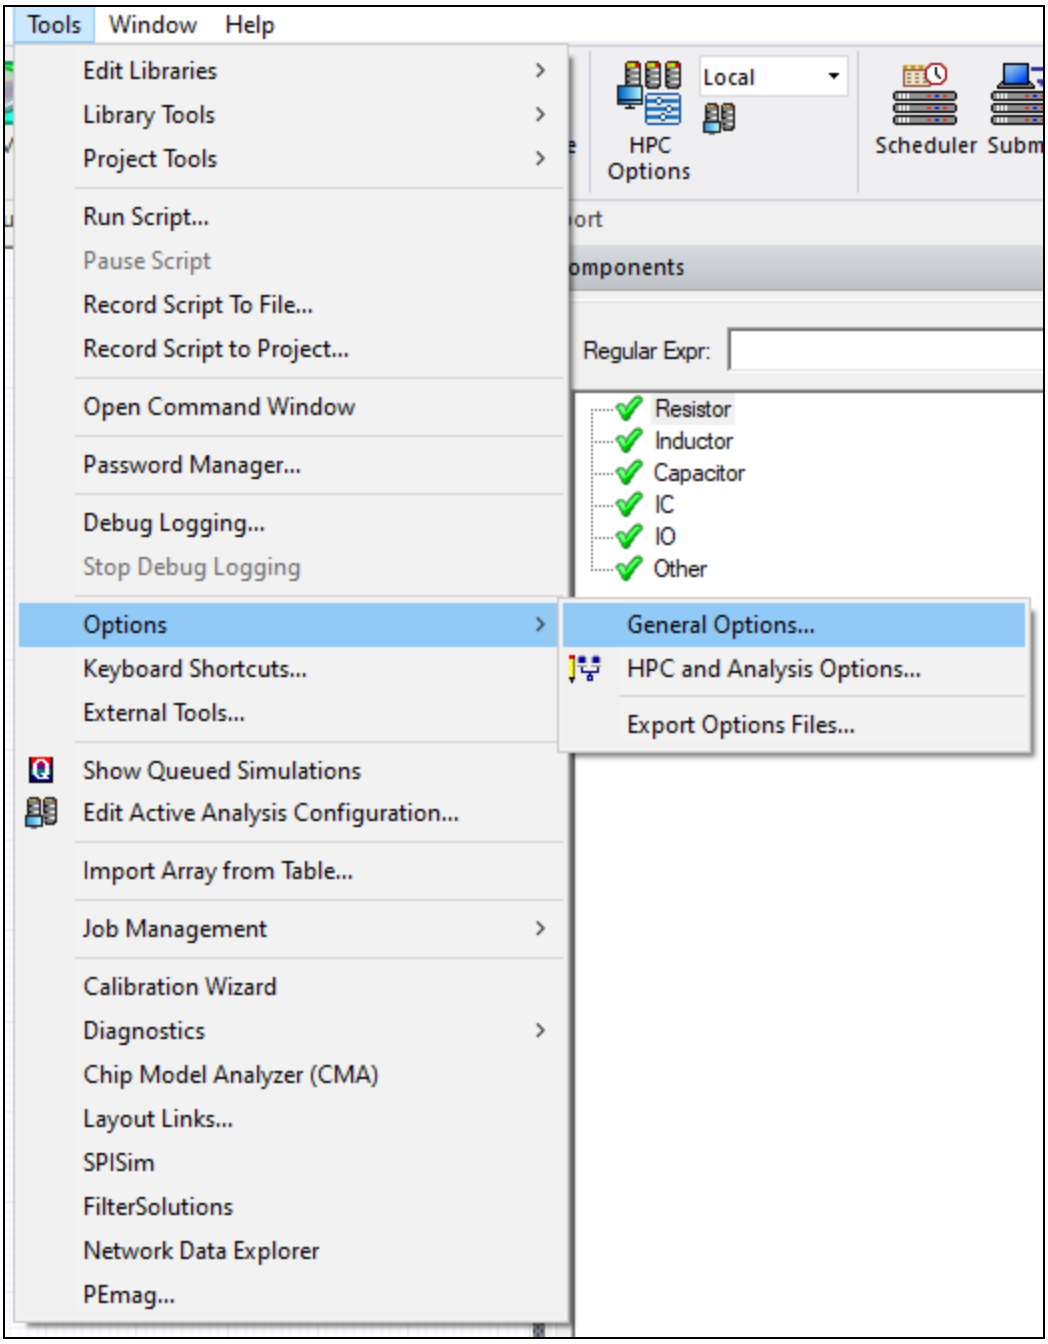


Activating the HFSS-Prism Solution Setup Beta Feature

Follow these steps to enable the prism solution setup beta feature, then activate IC mode.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

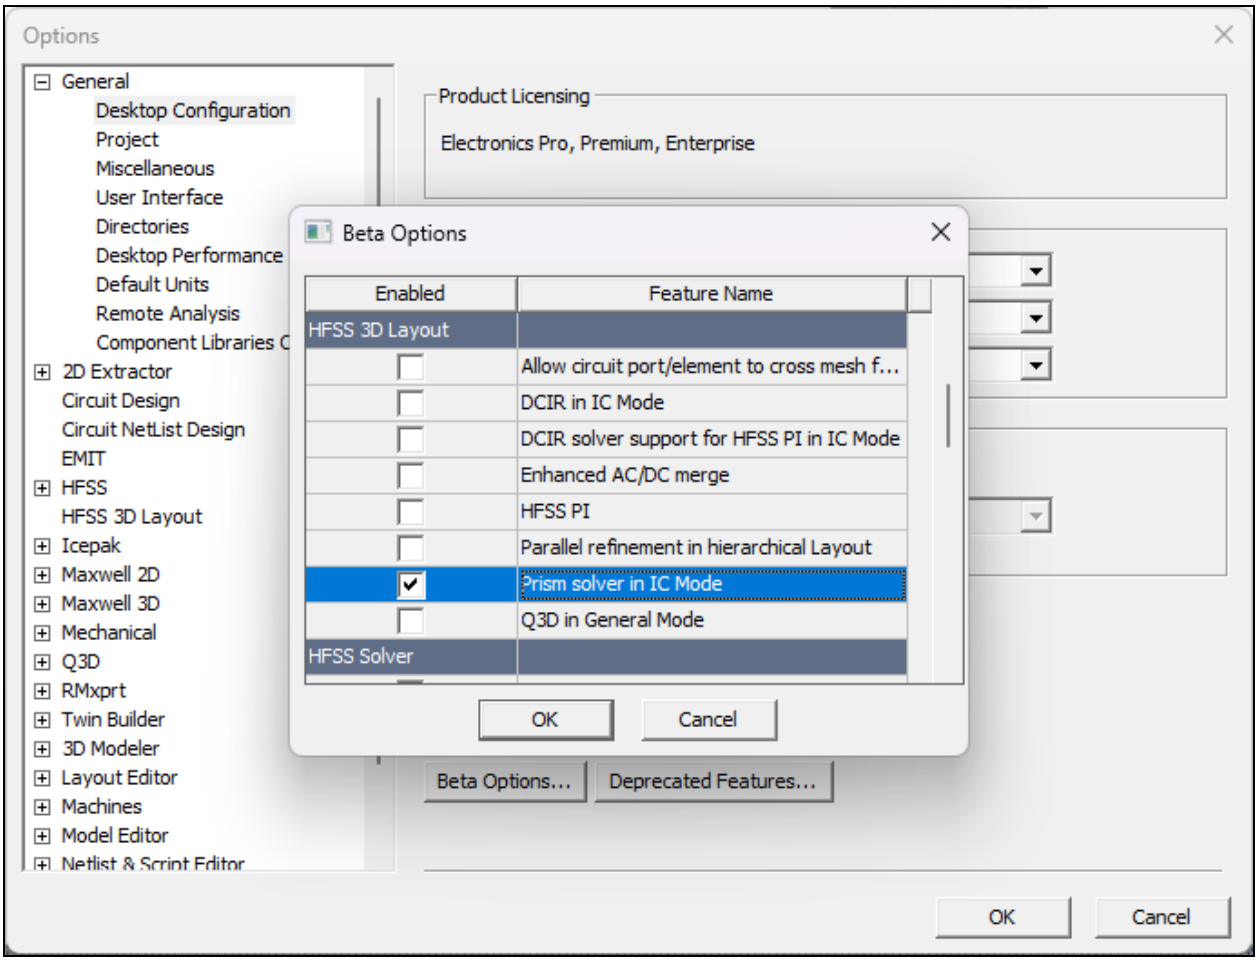
1. From the **Tools** menu, select **Options** > **General Options** to open the **Options** window



2. Expand **General** > **Desktop Configuration** and click **Beta Options** to open the **Beta Options** window

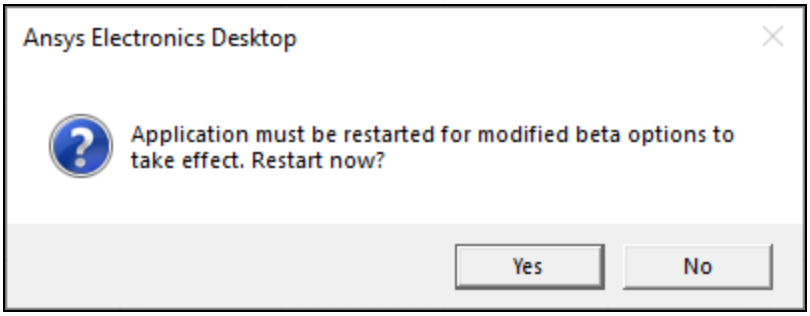
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. Scroll down to the **HFSS 3D Layout** section and check the box adjacent to **Prism solver in IC Mode**.



4. Click **OK** to close the **Beta Options** window.
5. Click **OK** to close the **Options** window and open a prompt to restart the software. Users may be asked to save their work.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



6. Click **Yes** to restart immediately.
7. After restarting the software, the prism solution setup is available from the location described in the previous section.

The procedure is complete.

HFSS 3D Model Extents

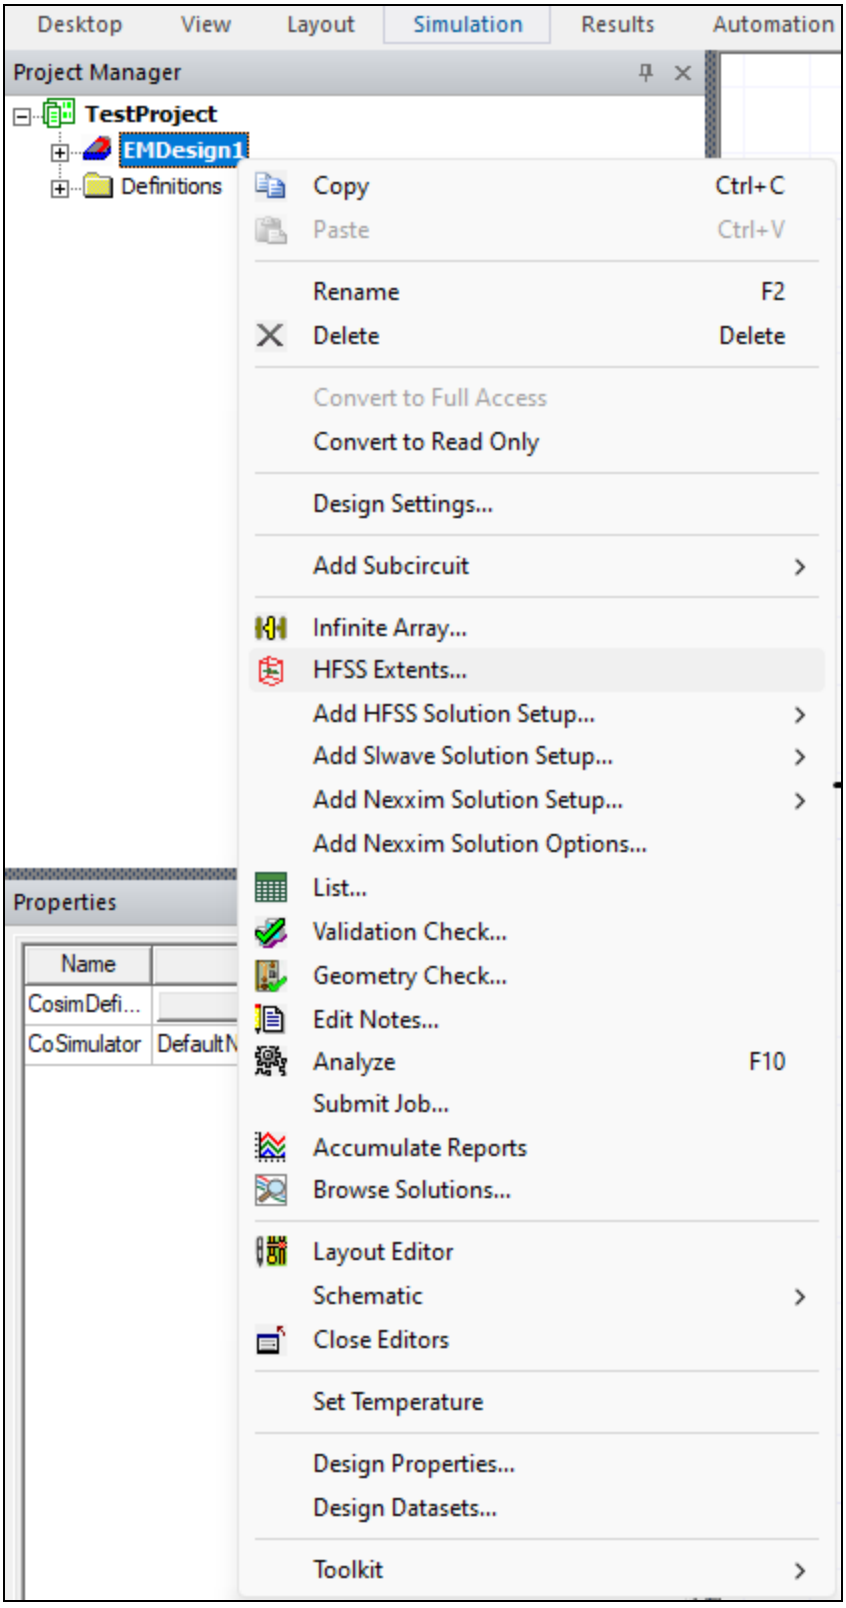
The HFSS 3D Layout type can be simulated directly using HFSS. To achieve this, the bounding computational region (extents) for HFSS must be defined. The airbox's extents can have a type that is independent of the dielectric's extents.

Define or Edit HFSS 3D Model Extents

1. To open the **Set HFSS Model Extents** window, do either of the following:
   - From the **Layout** ribbon, click **HFSS Extents**.

   - From the **Project Manager** window, expand the **Project Tree** (e.g., **TestProject**). Then right-click the active design (e.g., **EMDesign1**) and select **HFSS Extents**.

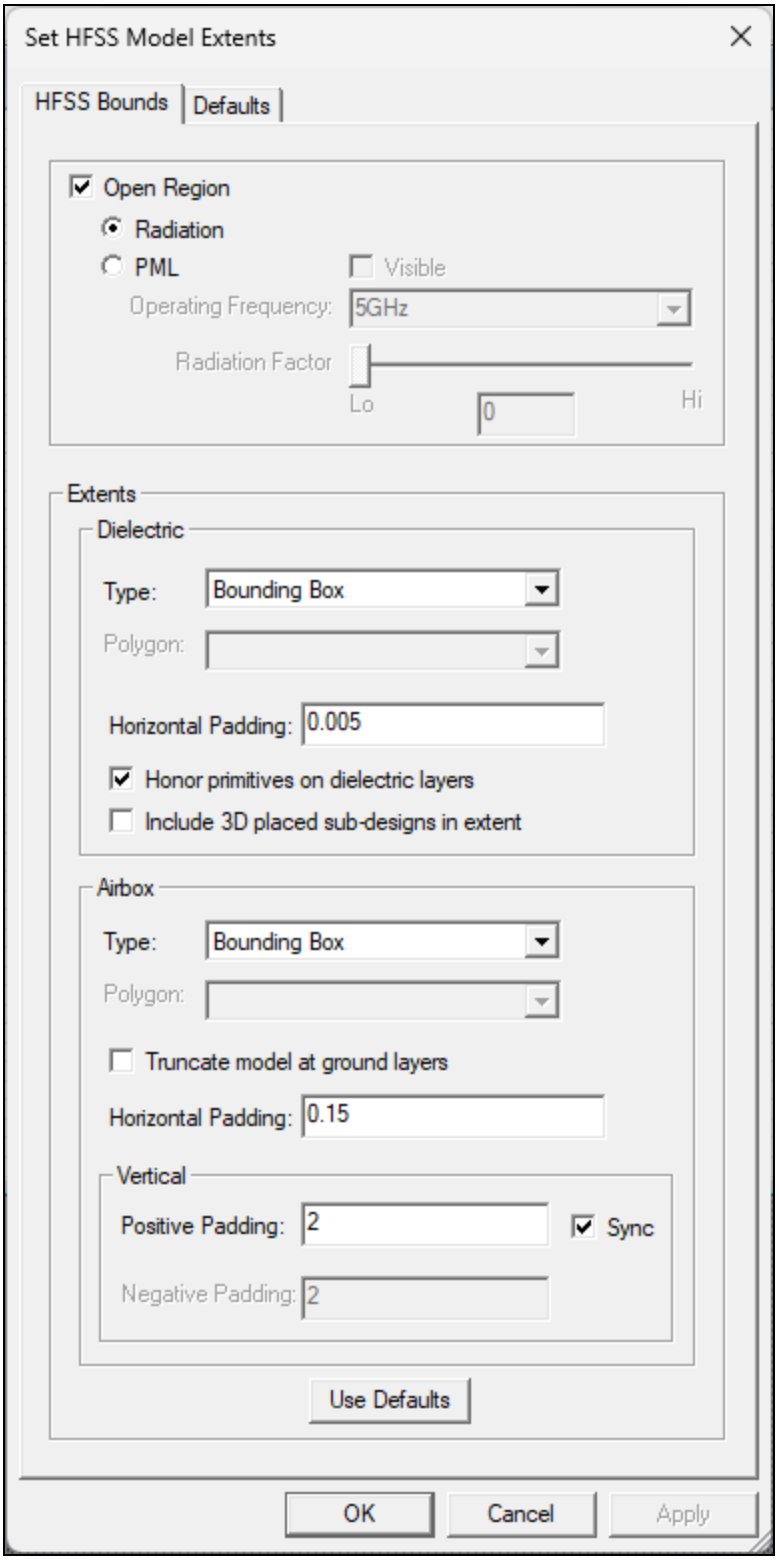
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **HFSS Bounds** tab displays by default.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Set the following options:
    - **Open Region** – allows support for Radiation boundaries or perfectly matched layers (i.e., PML) boundaries in HFSS 3D Layout.
        - **Radiation** – selects a radiation open region.
        - **PML** – selects a PML open region, with the following additional options:

> **Note:**
>
> The PML option only works with bounding box extents because their geometry generation with PML has fewer corner and edge regions. When **PML** is selected:
>
> - Do **not** select **Truncate Model at Ground Layers**. It is incompatible with PML.
> - **Horizontal Padding** must be greater than zero.

            - **Visible** – sets visibility of PML boundaries.
            - **Operating Frequency** – select a frequency of PML boundary calculation from the drop-down menu and enter a value, which is automatically converted to GHz.
            - **Radiation Factor** – controls the thickness of PML boundaries, on a scale of 0 (thinnest) to 10 (thickest).
    - **Extents** – these settings control extent types and padding. **Dielectric** and **Airbox** can have different extent types:
        - **Type** – specifies the method used to derive the base-polygon for the extents region. Options include:
            - **Bounding Box** – the base-polygon is calculated as a rectangle around all active layout geometry across all layers, aligned with the X/Y axes.
            - **Bounding Box (oriented)** – the bounding box is oriented around all active layout geometry across all layers, rather than aligning with the XY axes, to create the tightest bounding box possible.
            - **Conformal** – the base-polygon is calculated as the union of all active layout geometry across all layers.
            - **Convex Hull** – the base-polygon is calculated as the convex hull of all active layout geometry across all layers.
            - Specifiy the following parameters, depending on whether they reside in the **Dielectric** or **Airbox** areas:
                - **Dielectric** – the base-polygon is defined by the exact dimensions of the zone extents input by users on the **Outline** layer. **Horizontal Padding** is deactivated and any existing value in the **Horizontal Padding** field is ignored.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

        - **Airbox** – creates a union of the zone extent polygons on the **Outline** layer and the user-entered value in the **Horizontal Padding** field to set airbox extents.
    - **Polygon** – the base-polygon can be selected from any polygons present on user layer types. This option is only available when one or more polygons are on an assembly, outline, or user layer.
- **Polygon** – presents a list of polygons for selection when **Polygon** is the selected **Type**. The polygons must be on an assembly, outline, or user layer.
- **Dielectric** – these settings define how the polygon for dielectric and negative signal layers is generated relative to the base-polygon:
    - **Horizontal Padding** – an expansion factor (i.e., unitless fraction) or absolute offset (e.g., **0.005**, **0.15**) to be applied to the base-polygon in constructing HFSS geometry for dielectric layers.
    - **Honor primitives on dielectric layers** – If checked, and layout geometry is present on a dielectric layer, that geometry is created for the HFSS simulation. If not checked, the geometry is ignored and an expanded base-polygon is created (checked by default).
    - **Include 3D placed sub-designs in extent** – If checked, and sub-design is 3D placed, the parent design extent will include the sub-design region. If not checked, the sub-design region's geometry will not be included in the parent design extent (unchecked by default).
- **Airbox** – these settings define how the airbox is generated relative to the base-polygon:
    - **Truncate Model at Ground Layers** – if ground layers are present such that regions above or below are electromagnetically isolated from all sources, selecting this option caps the simulation volume at these elevations. Any horizontal padding on the airbox is ignored. This option is not compatible with PML.
    - **Horizontal Padding** – an expansion factor or absolute offset to be applied to the dielectric-polygon in constructing the HFSS geometry for the airbox. For PML, This must be greater than zero.
    - **Vertical** – these settings specify expansion factors for the Z-dimension:
        - **Positive Padding** – the expansion factor or absolute offset for the +Z dimension of the airbox. When applying as an expansion factor, the base dimension is the maximum of either length or width of the dielectric-polygon.
        - **Negative Padding** – the expansion factor or absolute offset for the -Z dimension of the airbox.
        - **Sync** – synchronizes **Positive Padding** and **Negative Padding** settings.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:** The calculations for **Airbox** extents changed in version 2020 R2: the vertical padding is calculated by multiplying the vertical padding factor to the stackup height. Previously, the vertical padding was calculated based on the horizontal extents. If a pre-2020 R2 design is opened in the current version, the vertical padding factor adjusts to keep the absolute vertical extent the same. If a design has no stackup height, its vertical padding factor is applied to the horizontal extent.

- **Use Defaults** – resets the entire window to default settings.

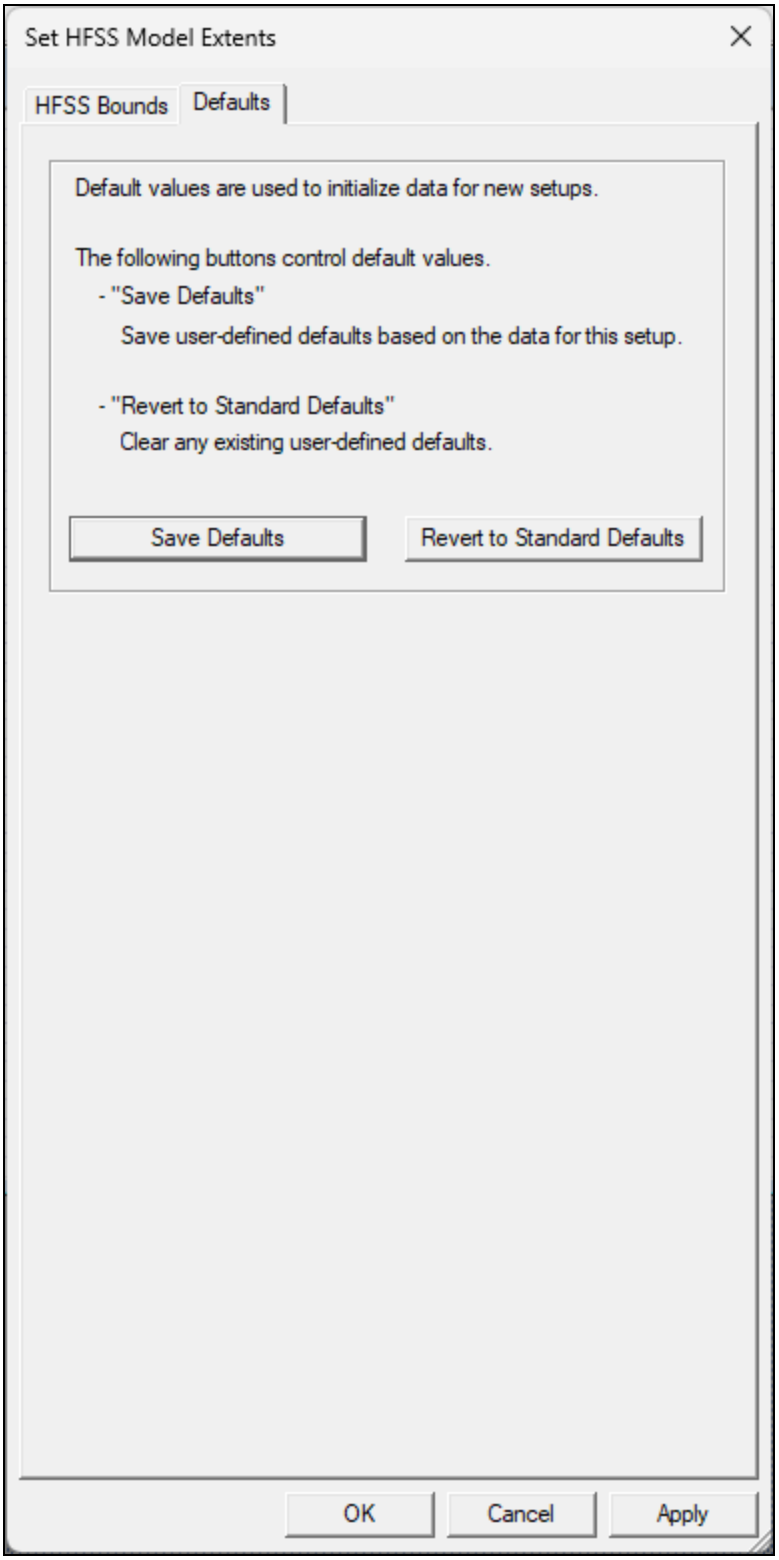
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

3. If applicable, do the following to set the defaults:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

a. Click the **Defaults** tab to display the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

b. Chose a default option:
   - **Save Defaults** – saves user-defined defaults based on the data for this setup (for all tabs).
   - **Revert to Standard Defaults** – clears any existing user-defined defaults (for all tabs).

4. To analyze the existing HFSS simulation setup to obtain information about the PML materials in the results project folder, click **OK**.

View or Hide the Extents

To view the extents, either click **Layout** > **Draw HFSS Air Box** on the menu bar, or on the **Layout** tab, click the down arrow adjacent to **HFSS Extents** > **Show**. A bounding box appears in the **Layout Editor**. To hide the bounding box, select **Layout** > **Draw HFSS Air Box**, or select **Hide** on the **HFSS Extends** drop-down menu on the **Layout** tab.

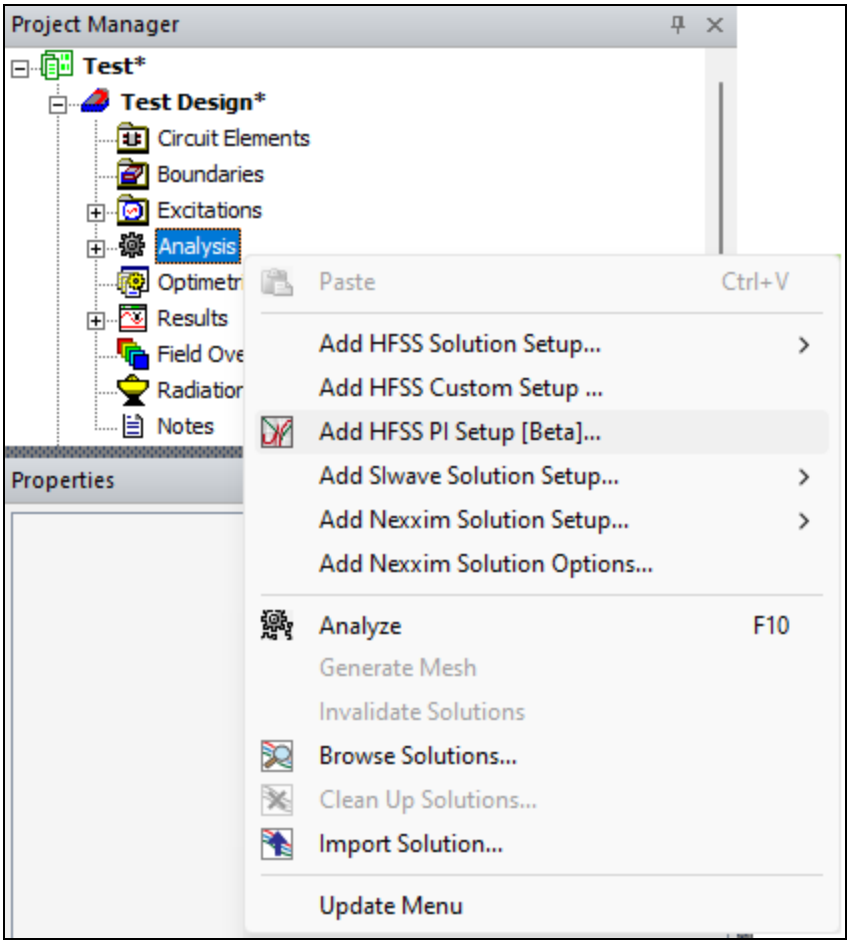
> **Note:** Dynamic updates of conformal HFSS extents can adversely affect Layout performance. You can improve performance by setting **Type** to **Bounding Box** in the **Set HFSS Model Extents** window or by hiding the extents.

Adding an HFSS PI Solution Setup (Beta)

> **Note:**
>
> The HFSS PI Setup is a beta feature in both General and IC modes, although some customization options are unique to either mode. This section describes setting up an HFSS PI solution specifically in **General mode**. Refer to Activating the HFSS PI Solution Beta Feature for instructions.

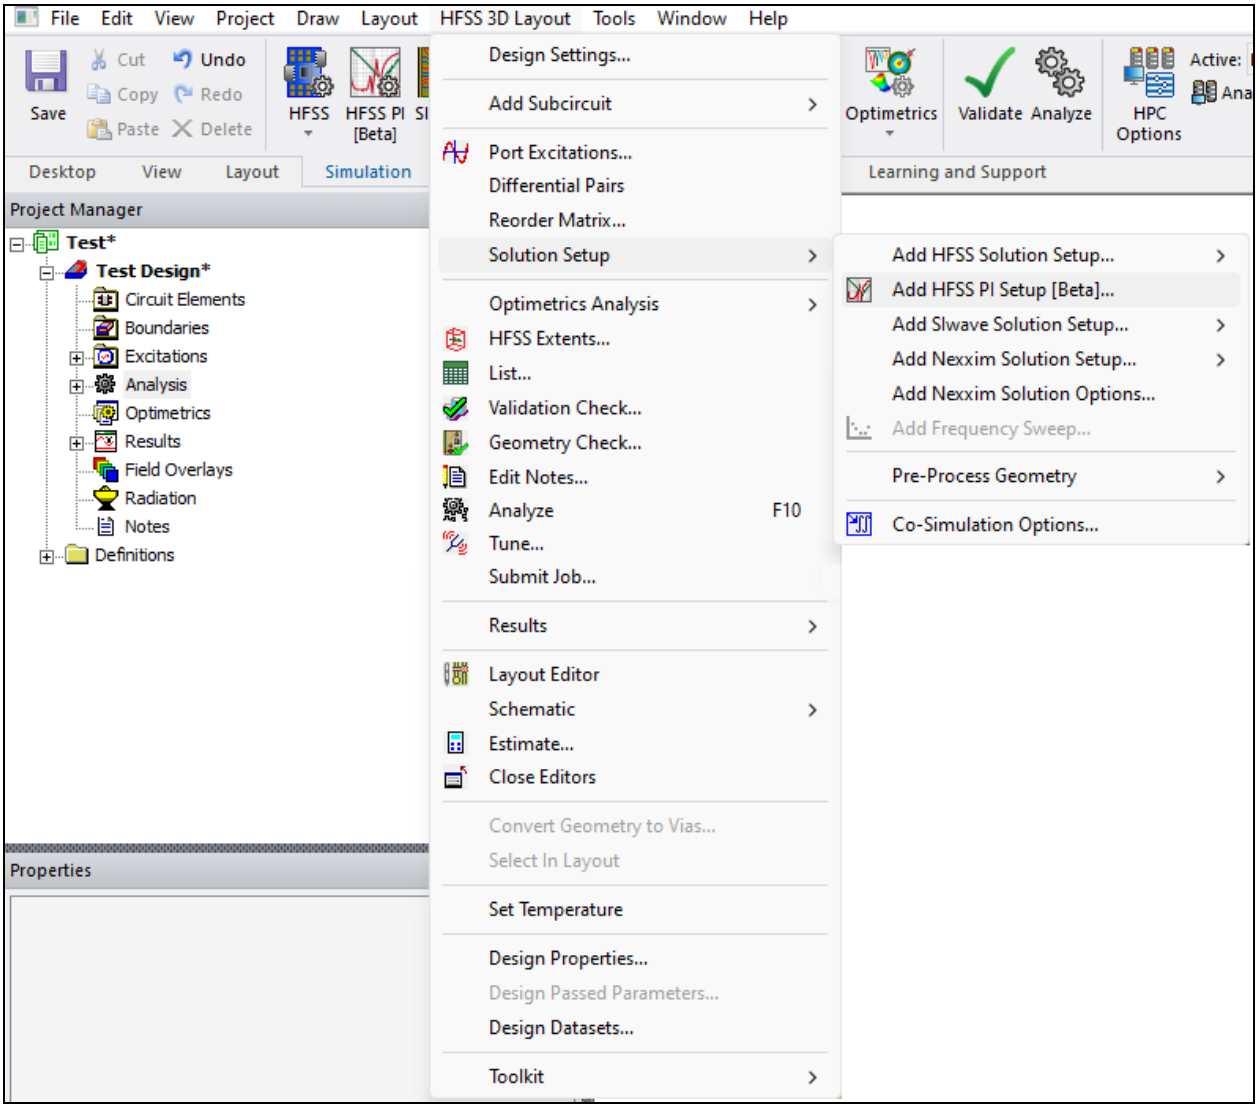
1. Open the **Setup** window by doing one of the following:
   - From the **Project Manager** window, expand the **Project Tree** > **[*Active Design Folder*]**. Then right-click **Analysis** and select **Add HFSS PI Setup**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

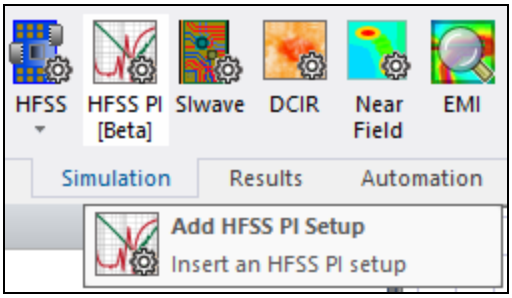


- From **HFSS 3D Layout**, select **Solution Setup** > **Add HFSS PI Setup**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

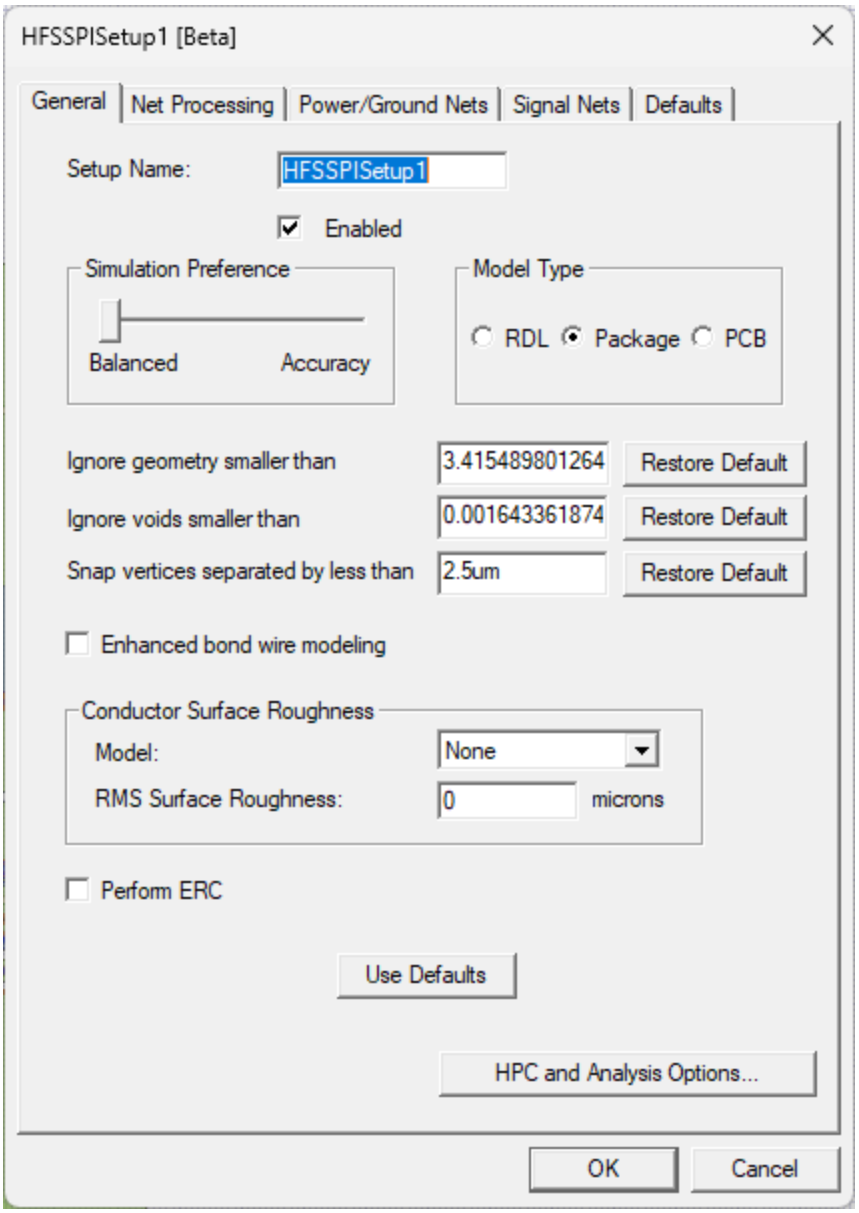


- From the **Simulation** ribbon tab, click **HFSS PI**.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. From the **Setup** window, make selections from the **General**, **Net Processing**, **Power/Ground Nets**, **Signal Nets**, and **Defaults** tabs.



3. From the **General** tab, set the following:

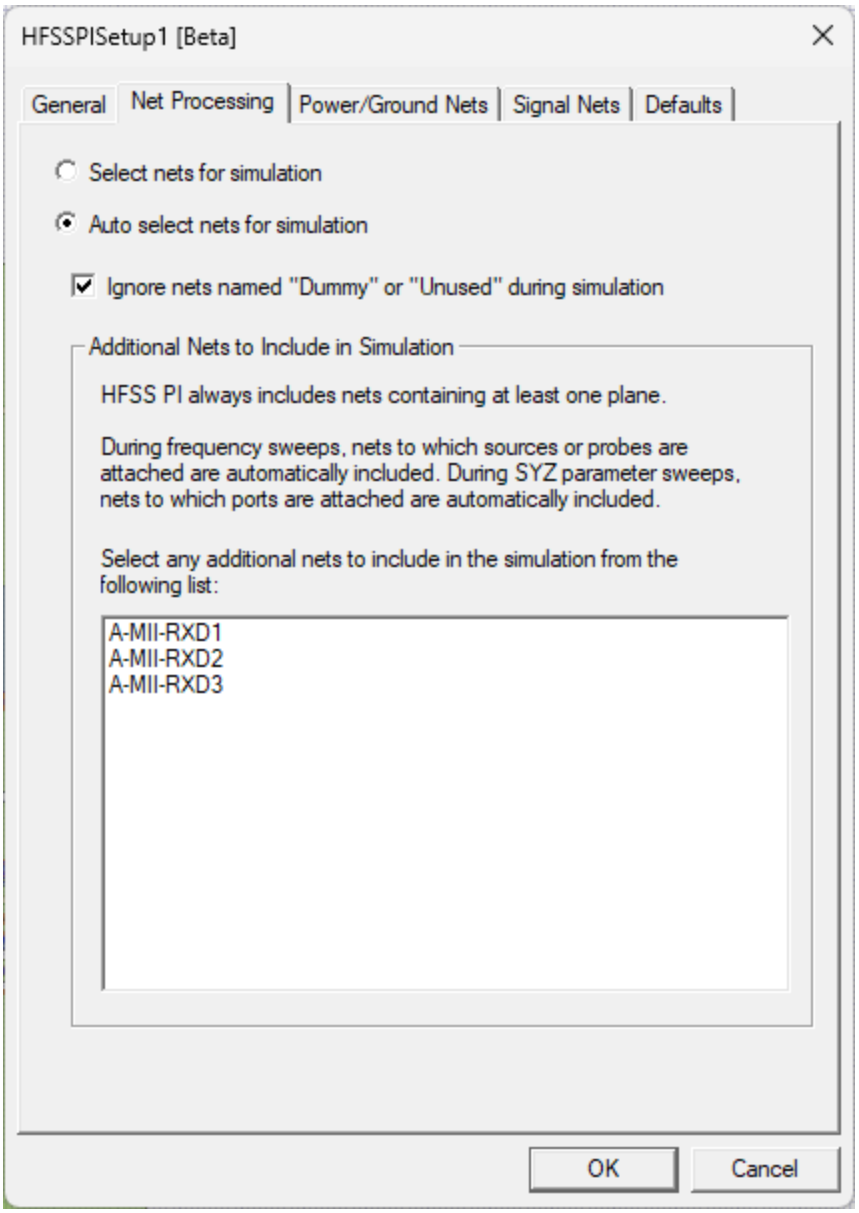
   - **Setup Name** – type a name in the field or accept the default
   - **Enabled** – check the box to activate or deactivate the setup

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Simulation Preference** – use the slider to set the simulation to **Balanced** (i.e., use less memory) or **Accuracy** (i.e., use more memory)
- **(General Mode Only) Model Type** – select **RDL**, **Package**, or **PCB**
- **(General Mode Only) Ignore geometry smaller than** – enter a value and specify the unit. If applicable, you can **Restore Default**.
- **(General Mode Only) Ignore voids smaller than** – enter a value and specify the unit. If applicable, you can **Restore Default**.
- **(General Mode Only) Snap vertices separated by less than** – enter a value and specify the unit. If applicable, you can **Restore Default**.
- **Enhanced Bond Wire Modeling** – check the box to activate. This can slow simulation.
- **Conductor Surface Roughness**area – select a roughness model type from the drop-down menu (i.e., **None**, **Exponential**, or **Hammerstad**) and enter a variable in the **RMS Surface Roughness**field to specify the surface in microns.
- **(General Mode Only) Perform ERC** – check the box to determine whether to perform error checking while generating the solver input file.
- **HPC and Analysis Options** – open a window allowing you to specify HPC options

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click the **Net Processing** tab.



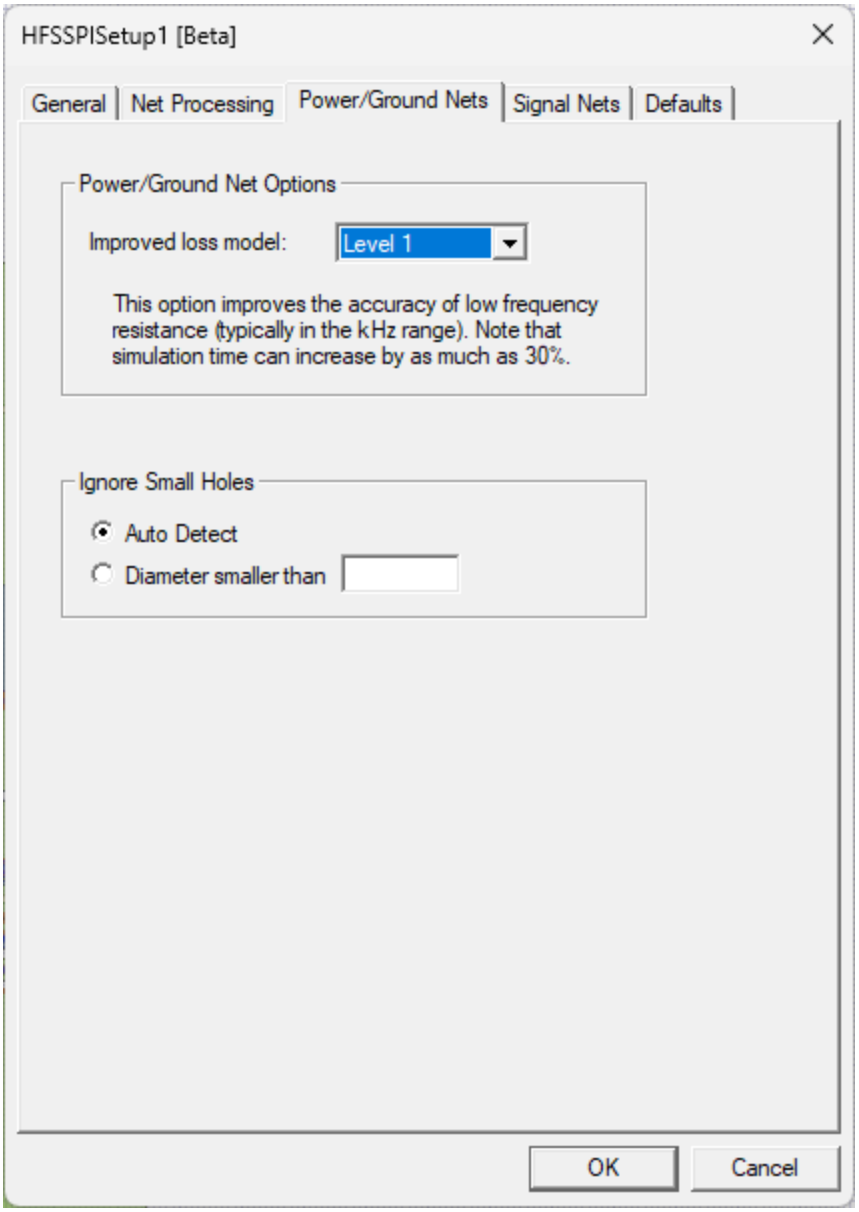
5. From the **Net Processing** tab, set the following:

   - Select **Select nets for simulation** (i.e., allows you to manually select nets to include in the simulation) or **Auto select nets for simulation** (i.e., allows HFSS 3D Layout to select nets to include in the simulation)
   - **Ignore Nets Named "Dummy" or "Unused" during simulation** – check the box to ignore dummy nets

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Additional Nets to Include in Simulation** – when **Auto select nets for simulation** is selected, select additional nets that **must** be included

6. Click the **Power/Ground Nets** tab.



7. From the **Power/Ground Nets** tab, set the following:

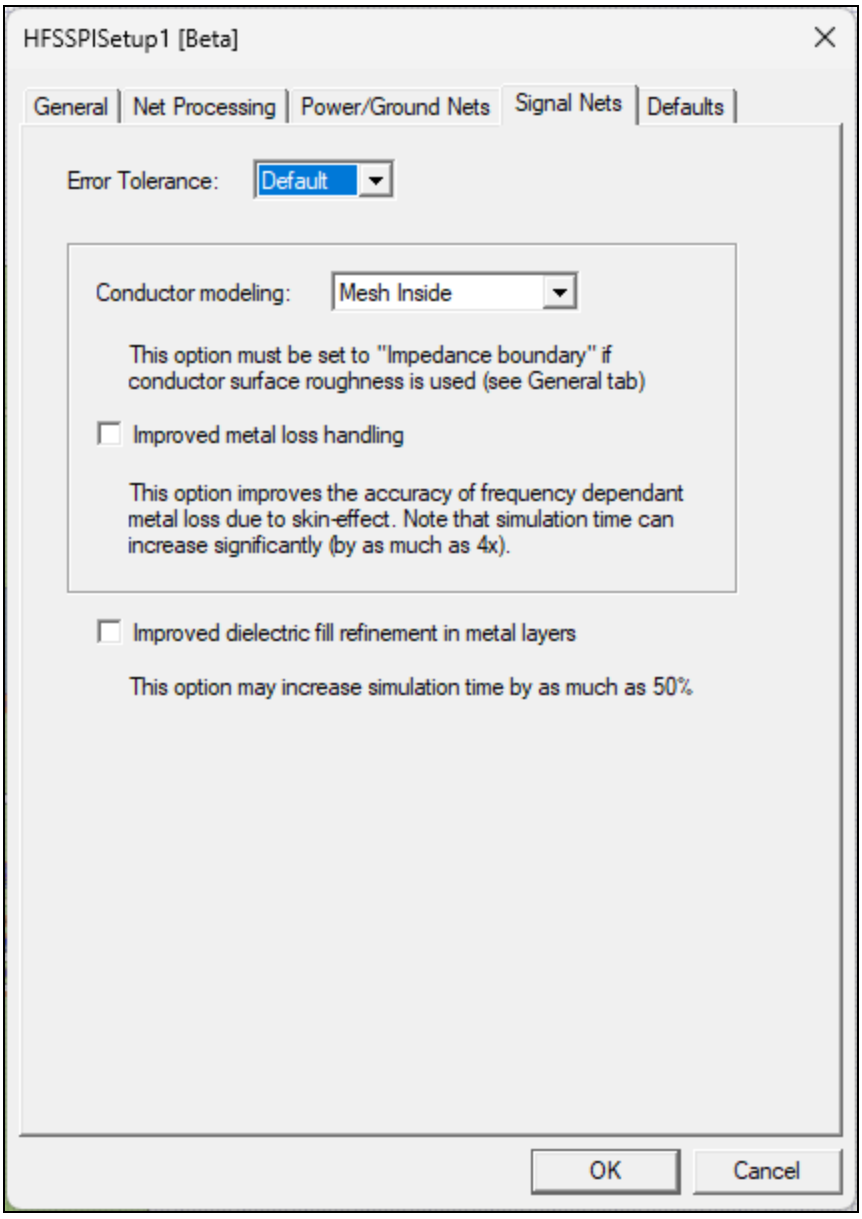
- **Power/Ground Net Options** > **Improved loss model** – select an accuracy level from the drop-down menu (i.e., **Level 1**, **Level 2**, or **Level 3**)

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Warning:**
>
> Simulation time increases at higher levels, by as much as 30%.

- **Ignore Small Holes** – select **Auto Detect** (i.e., allow HFSS 3D Layout to detect and ignore small holes) or **Diameter smaller than** and enter a parameter in the field (i.e., specify a diameter and holes smaller than the diameter will be ignored)

8. Click the **Signal Nets** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

9. From the **Signal Nets** tab, set the following:

    - **Error Tolerance** – select a tolerance level from the drop-down menu (i.e., **Default**, **0.02**, **0.04**, **0.06**, **0.08**, **0.1**, **0.2**, **0.5**, or **1.0**)
    - **Conductor Modeling** – select **Mesh Inside** or **Impedance Boundary** from the drop-down menu

      > **Important:**
      >
      > When using surface roughness, users must select **Impedance Boundary** from the **Conductor Modeling** drop-down menu.

    - **(General Mode Only) Improved Metal Loss Handling** – check the box to activate.

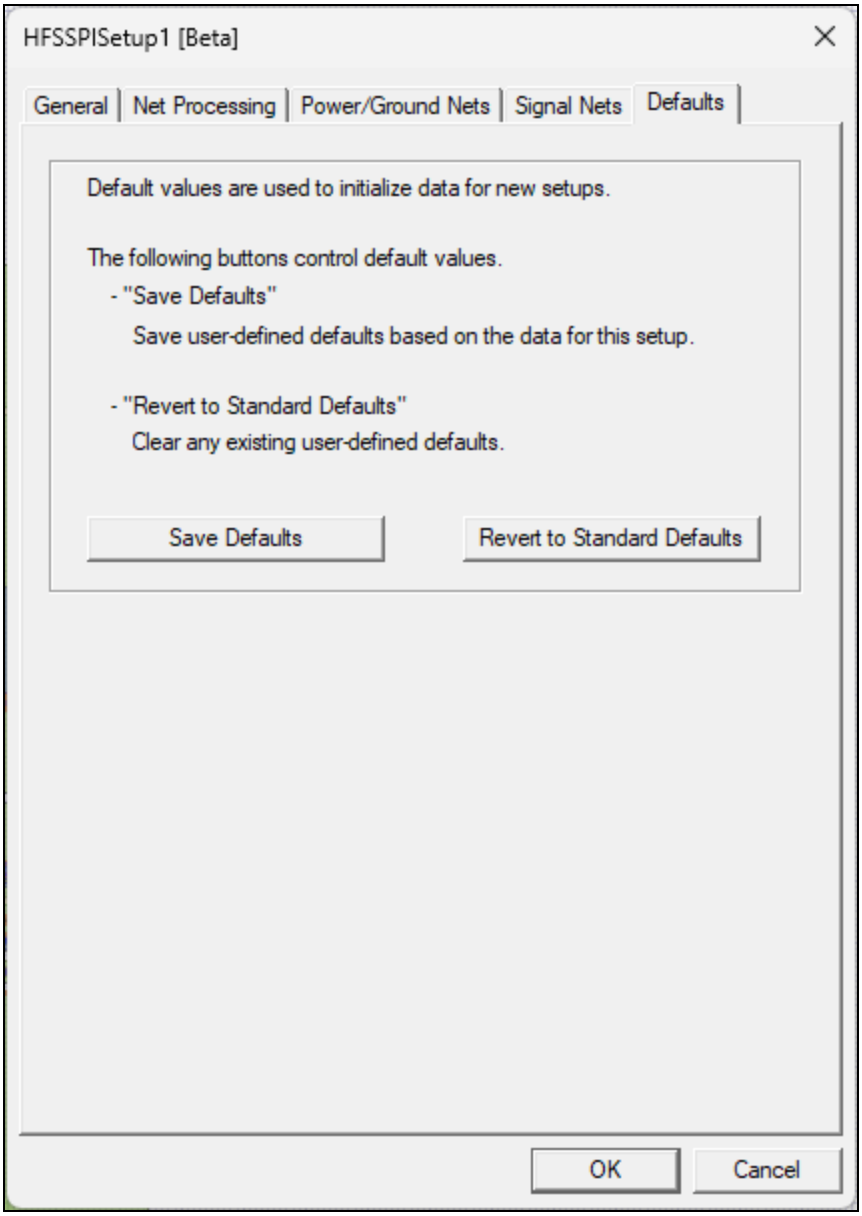
      > **Warning:**
      >
      > Enabling this option can significantly slow simulation time.

    - **Improved Dielectric Fill Refinement in Metal Layers** – check the box to activate or deactivate **Improved Dielectric Fill Refinement**

      > **Warning:**
      >
      > Activating **Improved Dielectric Fill Refinement in Metal Layers** can significantly slow simulation time.

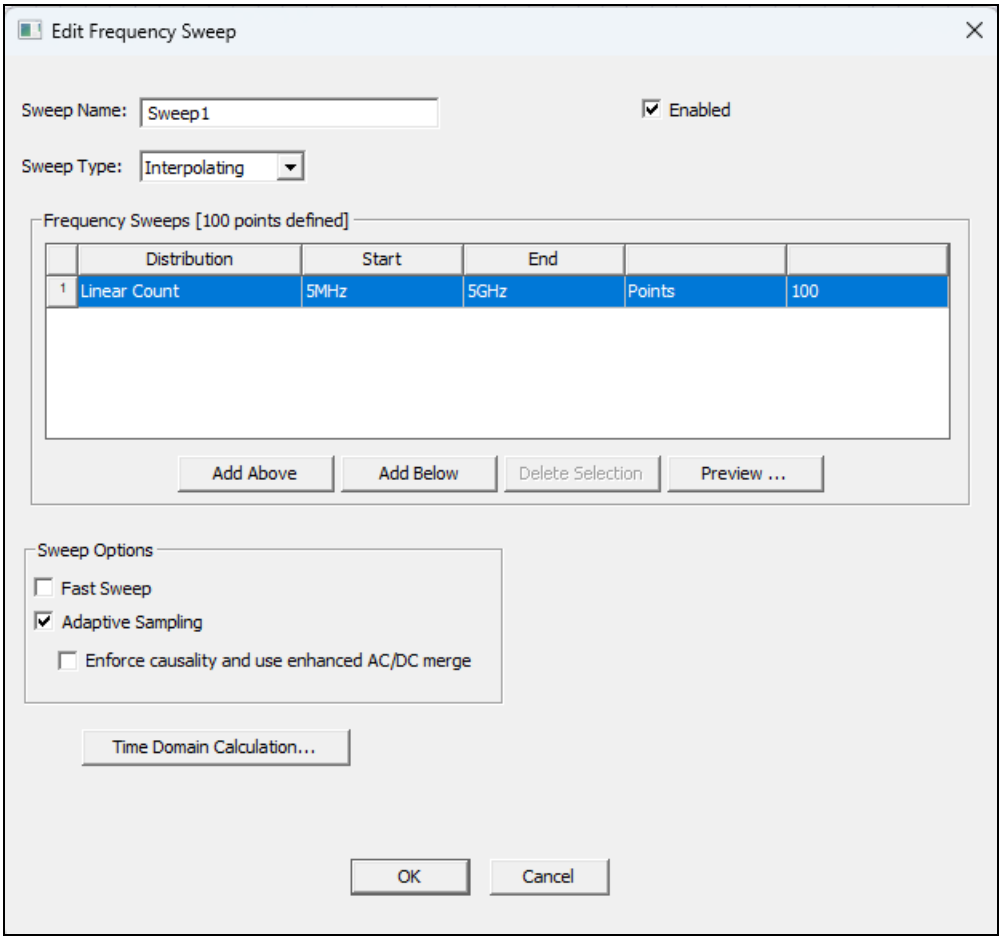
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

10. Click the **Defaults** tab.



11. From the **Defaults** tab, either **Save Defaults** or **Revert to Standard Defaults**.
12. Click **OK** to add the HFSS PI solution setup to the active design and simultaneously open the **Edit Frequency Sweep** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



13. From the **Edit Frequency Sweep** window, click **OK** to accept the sweep with its default values or specify the following:

> **Note:**
>
> The available tabs and options change with the selected sweep type.

14. **Sweep Name** field – enter a name for the sweep.
15. **Sweep Type** drop-down menu – select **Discrete** or **Interpolating**:
    - **Discrete** – Generates field solutions at specific frequency points in a frequency range. Ideal when only a few frequency points are appropriate to accurately represent the results in a frequency range.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Interpolating** – Estimates a solution for an entire frequency range. Ideal when the frequency range is wide and the frequency response is smooth. When Interpolating is selected, the **Interpolation** tab appears.

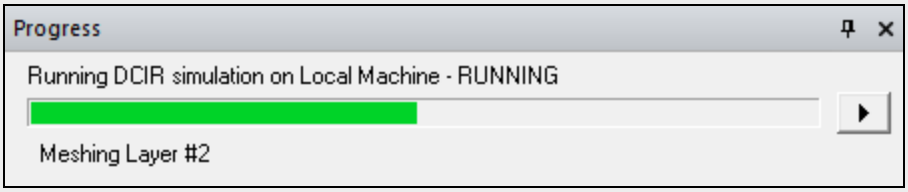
  > **Note:**
  >
  > The information specified for an Interpolating sweep dictates the amount of information that can be viewed on a post-processing plot.

16. **Enabled** – check to enable the sweep.
17. **Frequency Sweeps** area – use **Add Above**, **Add Below**, and **Delete** to add or remove sweeps. Each row in the table represents a separate sweep and each column is either a selectable parameter or a value field. You can add multiple frequency sweeps to the same setup. Specify the **Start** and **End** frequency for each sweep, and make selections from the additional options specific to the **Distribution** type.
    - **Distribution** – select from the following:
      - **Linear Step** – A linear range of frequency points for which users specify a constant step size. The simulation will solve the frequency point at each step in the specified frequency range, including the start and stop frequencies (e.g. , specifying 10 for the **Start** frequency, 20 for the **Stop** frequency, and 2.5 for the **Step Size** instructs the simulation to compute a solution for frequencies of 10, 12.5, 15, 17.5, and 20).
      - **Single Point** – Individual frequency points. Insert specific frequency points to solve in the frequency range after uniform frequency points. For **Discrete** sweep types only.
      - **Single Point Sweep** – Adds a set of 10 Single Point Sweeps, defaulting from 1 GHz to 10 GHz in increments.
      - **Linear Count** – A linear range of frequency points for which users specify the number (count) of points within the frequency range. The simulation divides the frequency range into the count specified and solve each frequency point in the count.
      - **Log Scale** – A range of points for which users specify **Start**, **End**, and the number of **Samples**.The simulation assigns the sampled points using intervals based on a logarithmic scale.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

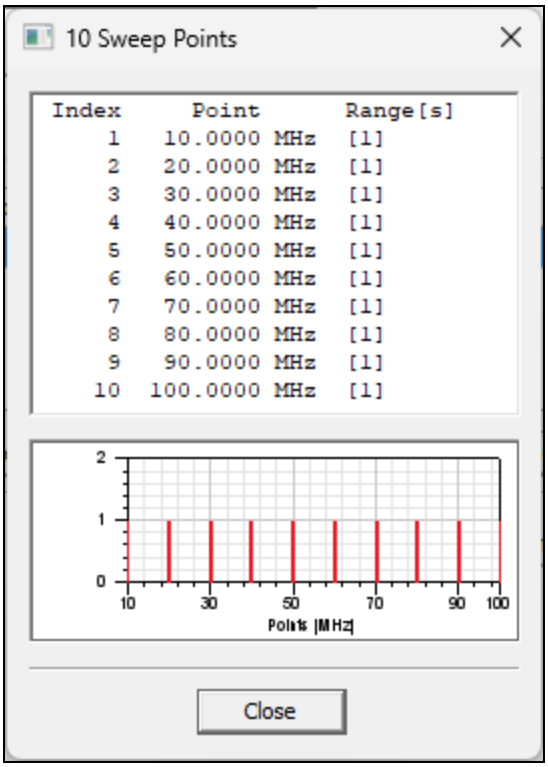
Note:

(IC Mode Only) If the user enters **0MHz** in the **Start** value field, the Ansys Electronics Desktop (AEDT)™ electronics systems design platform can use a DCIR solver within the HFSS PI simulation to calculate DC point.



To activate this beta feature, navigate to the **Beta Options** window as described in Activating the HFSS PI Solution Beta Feature steps 1-2, then check the box adjacent to **DCIR solver support for HFSS PI in IC Mode**.

18. Click **Preview** to view a preview of the sweep, as currently defined.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

19. From the **Sweep Options** area, check boxes to activate any/all of the following options:

> **Note:**
>
> **Sweep Options** are only available if the **Sweep Type** is **Interpolating**.

- **Fast Sweep** check box – check to improve runtime by requiring fewer samples to simulate. Uses more memory.
- **Adaptive Sampling** check box – check to determine the number of sample frequency points from the response over the frequency band, adding more points around rapidly changing responses (e.g., resonance peaks). Checking the **Adaptive Sampling** box activates the **Enforce causality and use enhanced AC/DC merge** box.
  - **Enforce causality and use enhanced AC/DC merge** check box – check to enforce causality and generate S-parameters at the DC point. By combining the DC results with the frequency-swept AC results, accuracy is improved over the entire simulation bandwidth.

20. Click **OK** to close the **Edit Frequency Sweep** window and add any sweeps.
21. From the **Edit Frequency Sweep** window, click **OK** to accept the sweep with its default values or change the default values. Refer to Adding a Frequency Sweep for more information.
22. **(IC Mode Only)** If applicable, apply a technology file to the design.

> **Note:**
>
> Encrypted technologies are only supported by HFSS, Q3D, and RaptorX simulations.

23. Run the analysis to solve the setup. Refer to Running Simulations.
24. To add a PI type:
    a. Select the port in the **Layout Editor**.
    b. From the **EM Design** tab of the **Properties** tab, click the **HFSS-PI Type** value and select from the following:
       - Default (the initial condition of a new port)
       - Coaxial Open
       - Coaxial Shorted
       - Gap
       - Lumped

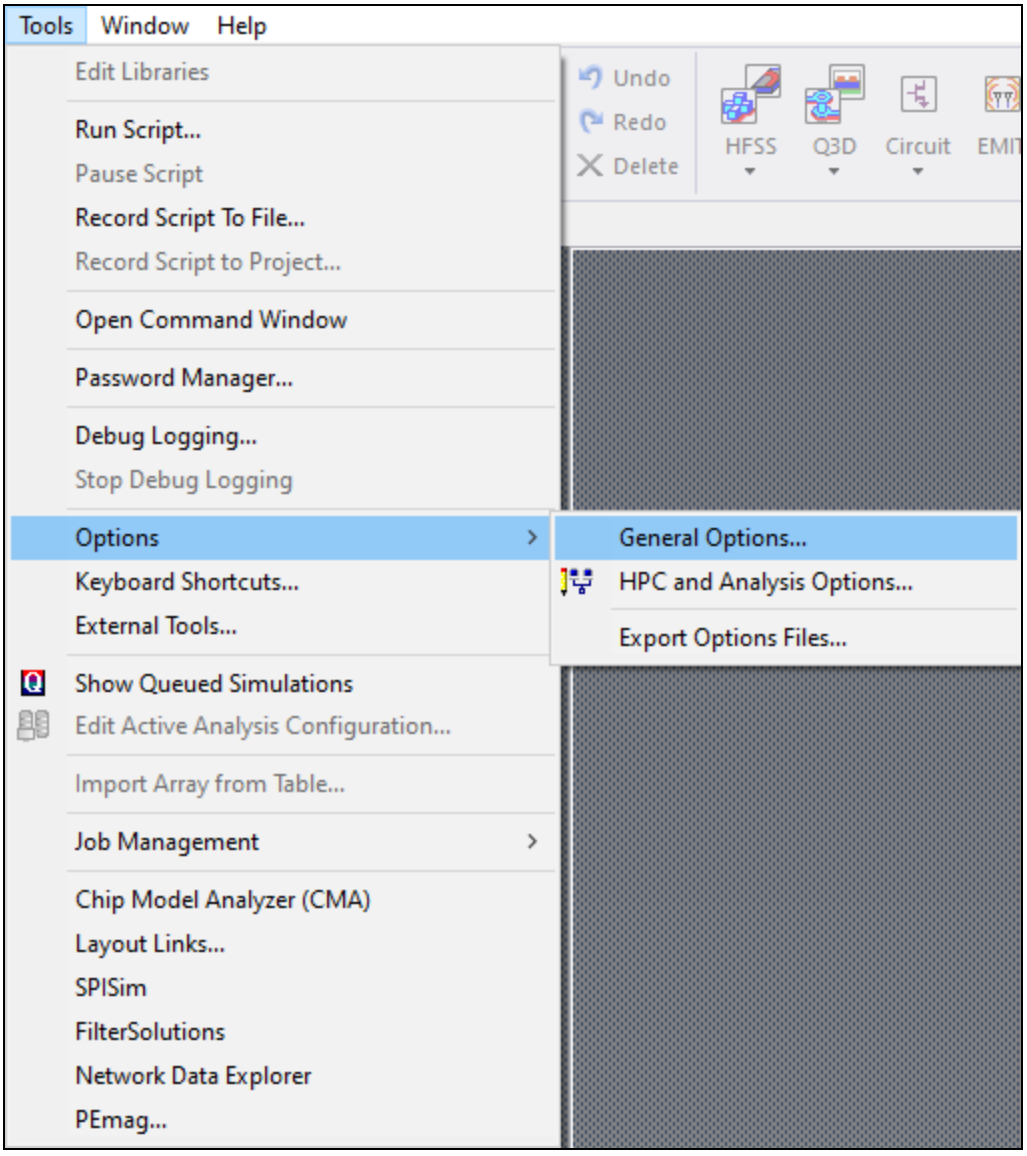
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The procedure is complete.

Activating the HFSS PI Solution Beta Feature

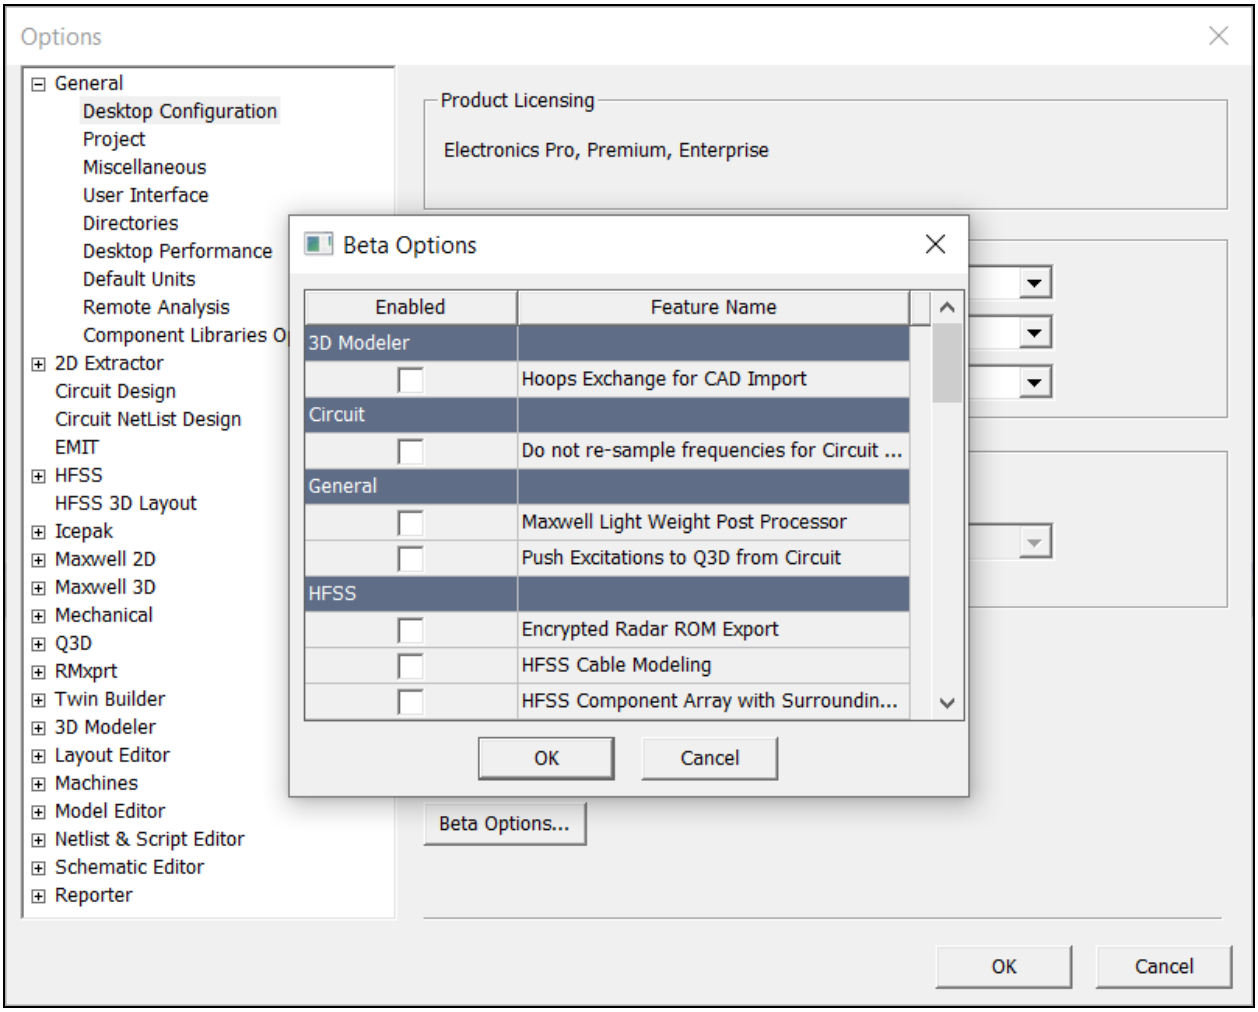
Follow these steps to enable the HFSS PI Solution Setup beta feature, then activate IC mode.

1. From the **Tools** menu, select **Options** > **General Options** to open the **Options** window.



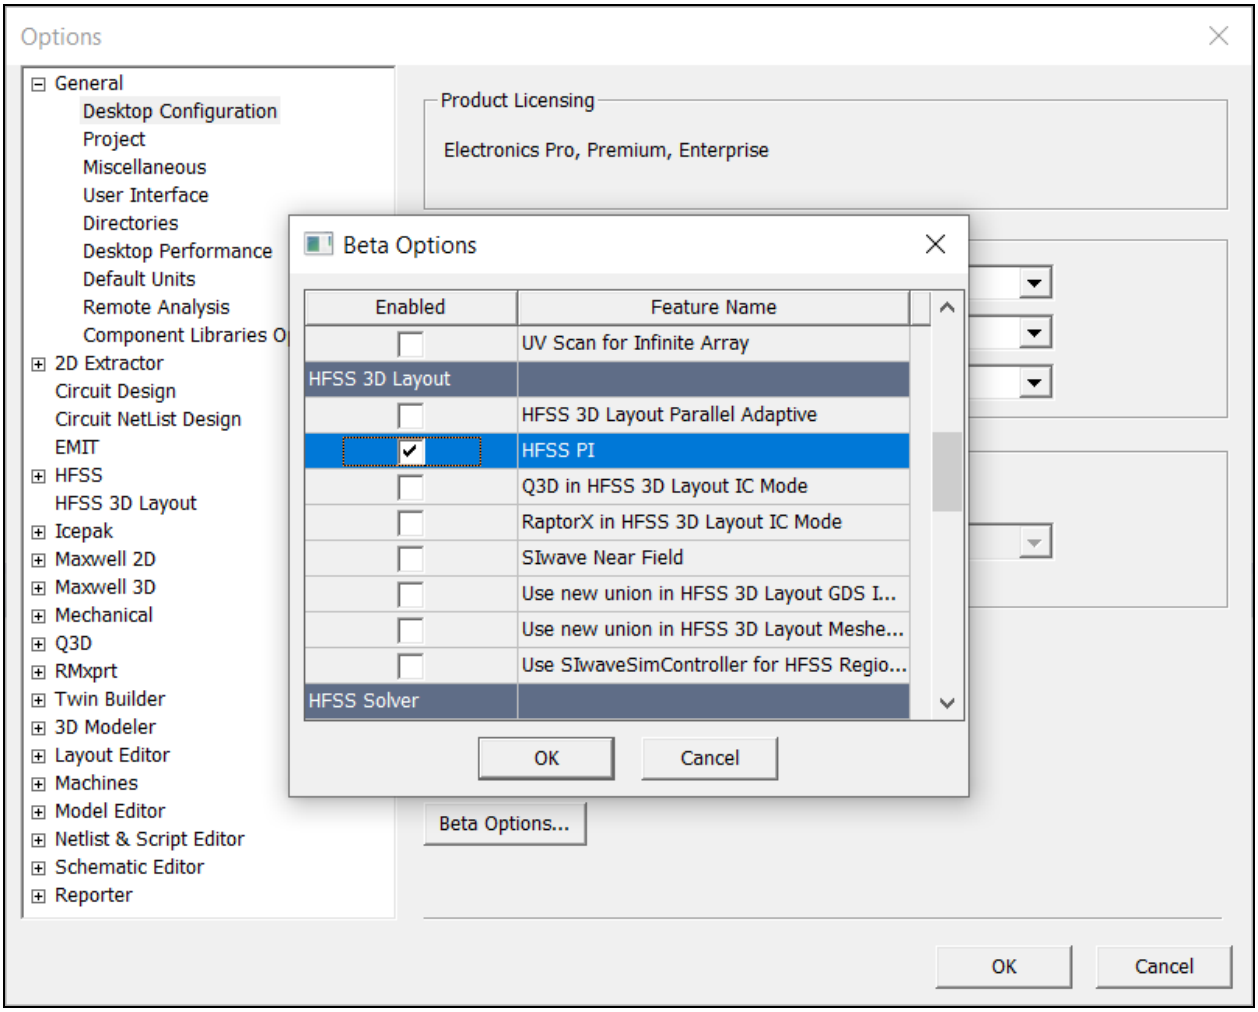
2. Expand **General** > **Desktop Configuration** and click **Beta Options** to open the **Beta Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



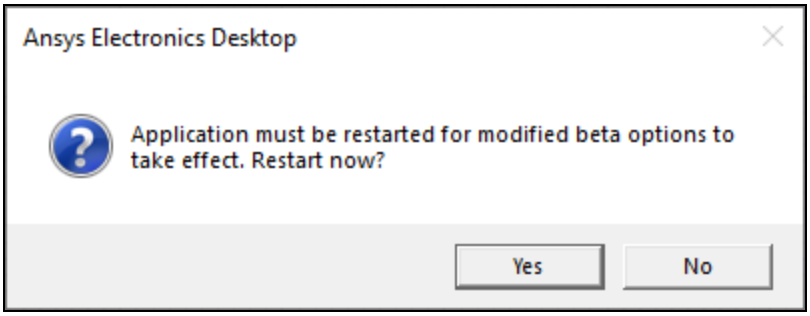
3. Scroll down and check the **HFSS PI** box.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. Click **OK** to close the **Beta Options** window.
5. Click **OK** to close the **Options** window and open a prompt to restart the software. Users may be asked to save their work.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



6. Click **Yes** to restart immediately.
7. After restarting the software, the HFSS PI solution setup is available from the locations described in the previous section.

The procedure is complete.

Adding a RaptorX Solution Setup (IC Mode Only)

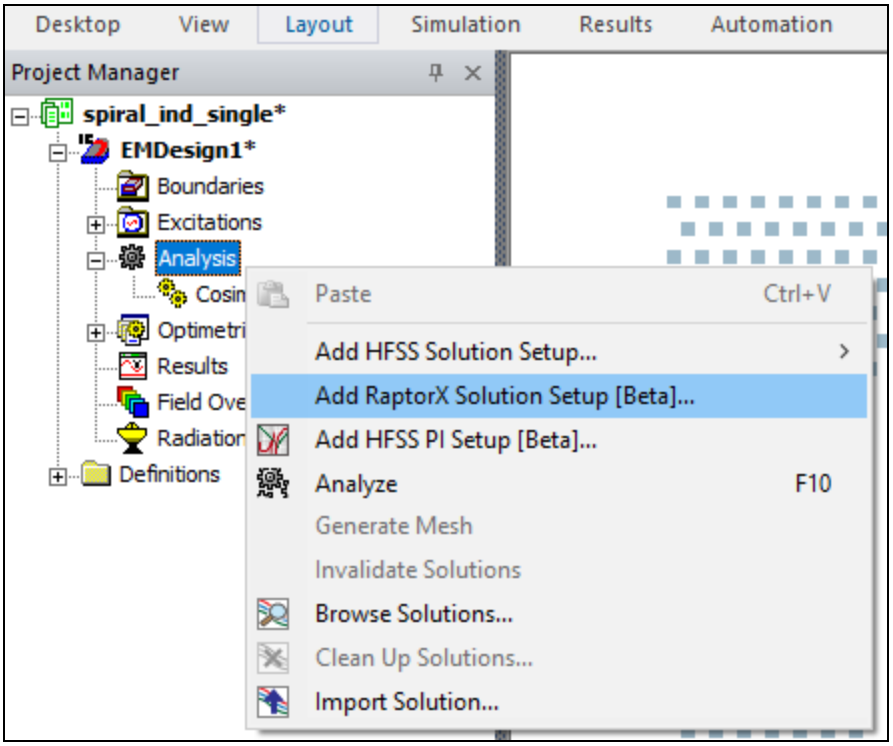
RaptorX is a pre-LVS electromagnetic (EM) modeling solver created especially for integrated circuit designs.

Setting Up a RaptorX Simulation

Follow these steps to add a RaptorX solution setup to a project in IC mode.

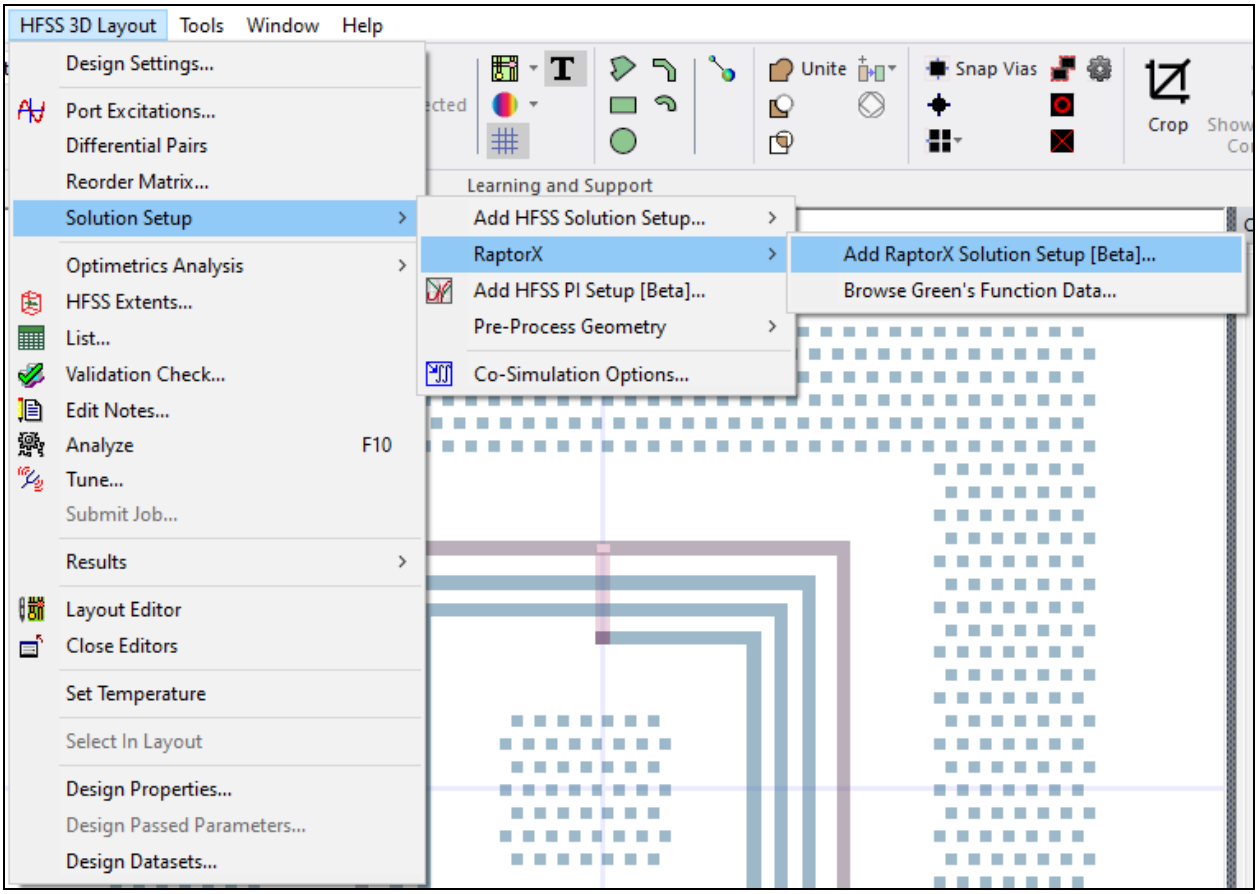
1. Open the **RaptorX Solution Setup** window by doing one of the following:
   - From the **Project Manager** window, expand the **Project Tree** > [*Active Design Folder*] (e.g., **spiral_ind_single** > **EMDesign1**). Then right-click **Analysis** and select **Add RaptorX Solution Setup**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



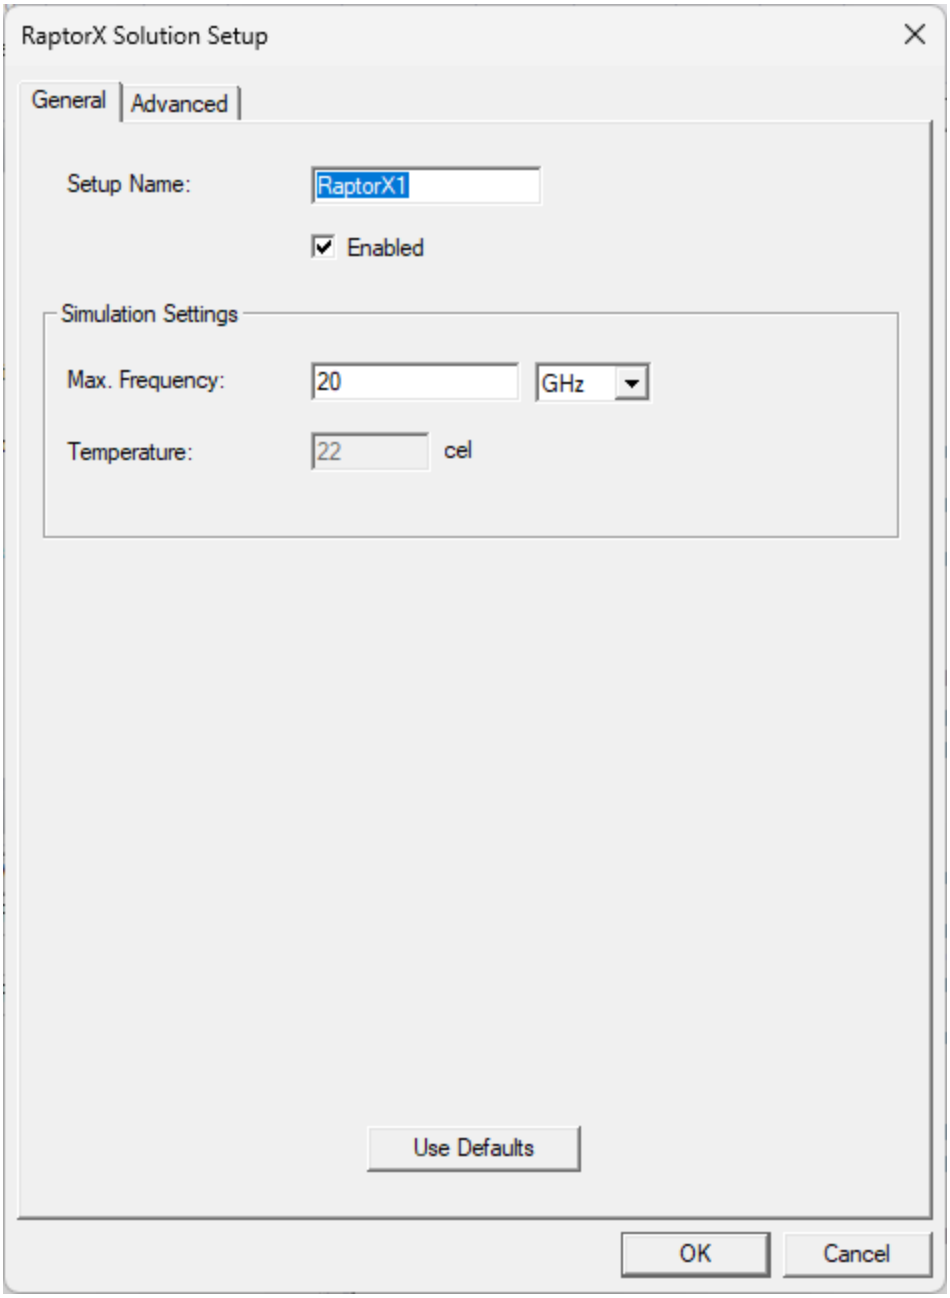
- From **HFSS 3D Layout**, select **Solution Setup** > **RaptorX** > **Add RaptorX Solution Setup**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **RaptorX Solution Setup** window, make selections from the **General** and **Advanced** tabs. Default values shown.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

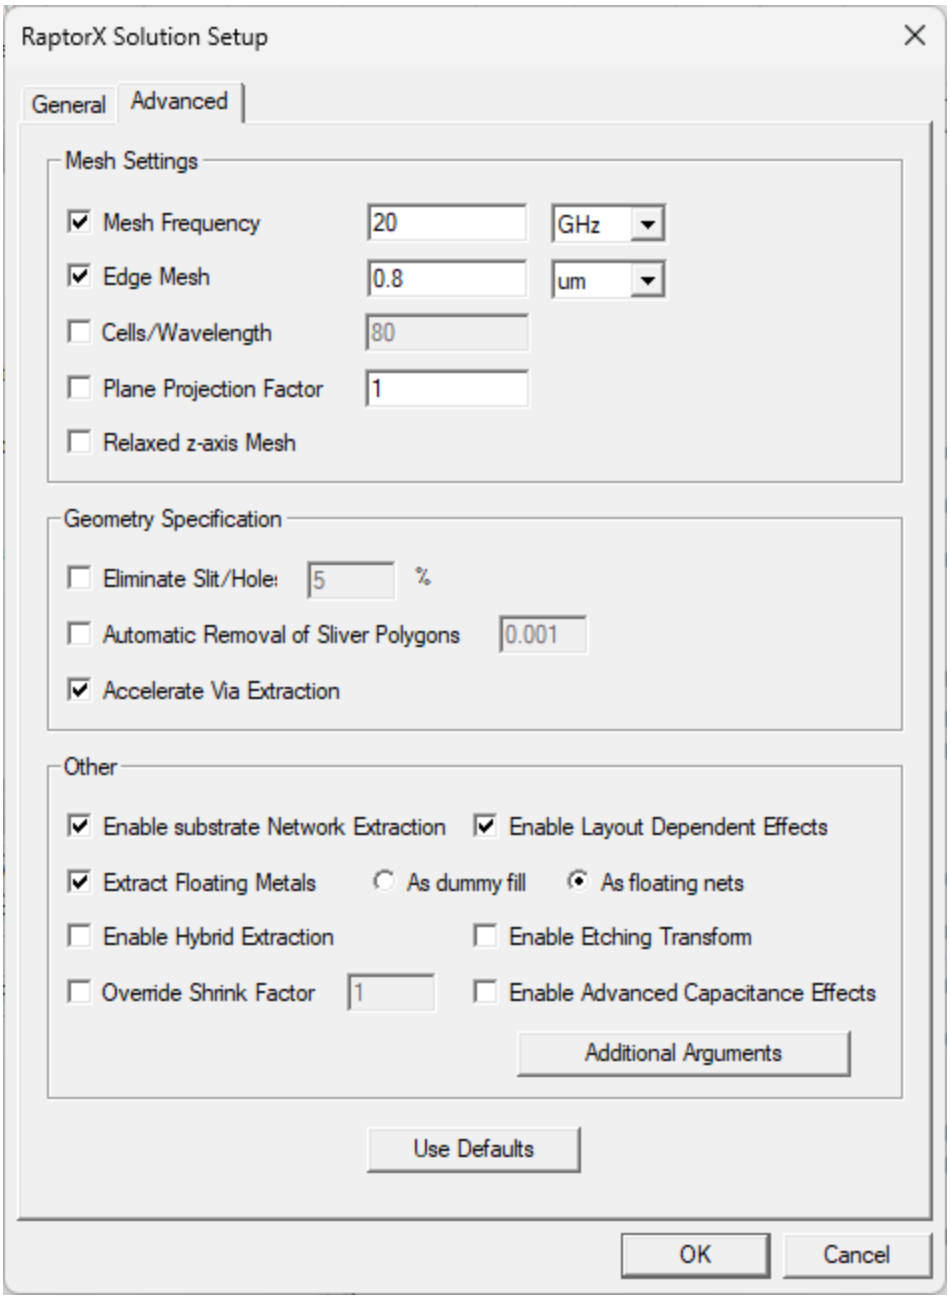


3. From the **General** tab, set the following:
    - **Setup Name** – type a name in the field or accept the default.
    - **Enabled** – check the box to activate the setup.
    - **Max. Frequency** – enter a value in the provided field to specify the maximum simulation frequency (Ansys recommends at least 10 GHz) and select a unit of measurement from the corresponding drop-down menu.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Temperature** – specifies the simulation temperature. To modify the simulation temperature, refer to Setting Uniform Temperature in HFSS 3D Layout.

4. Click the **Advanced** tab.



5. From the **Advanced** tab, check the corresponding box next to any or all of the following settings to activate them. Then enter any appropriate value or make drop-down menu selections, as applicable.

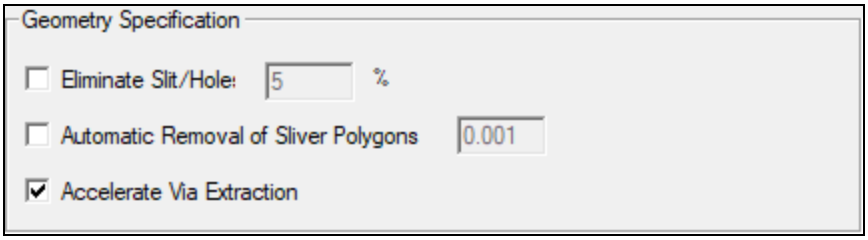
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

a. From the **Mesh Settings** area, set the following:

- **Mesh Frequency** – enter a value in the provided field to specify a custom frequency for mesh generation. Then select a unit of measurement from the corresponding drop-down menu. A higher mesh frequency improves simulation accuracy.
- **Edge Mesh** – enter a value in the provided field to specify the thickness and width of the exterior conductor filament. Then select a unit of measurement from the corresponding drop-down menu. **Edge Mesh** prevails over **Max. Frequency** and **Mesh Frequency**. If **Edge Mesh** is left unchecked, edge mesh is calculated internally equal to the layer depth defined by **Mesh Frequency** or **Max. Frequency**.
- **Cells/Wavelength** – enter a value in the provided field to specify the number of cells under each wavelength. Wavelength is calculated according to **Max. Frequency** or **Mesh Frequency** (e.g., If users enter **20** in the **Cells/Wavelength** field, the design is divided into 10 cells if its width or length is 1/2 wavelengths).
- **Plane Projection Factor** – enter a value in the provided field to set a hard limit on the complexity of the simulation. The mesh conforms to the limit to improve extraction time. Activate **Plane Projection Factor**, then refer to Changing Net Settings to set individual values for certain nets.
- **Relaxed z-axis Mesh** – check the box to simplify mesh along the z-axis. If the thickness of a conductor is greater than three times the layer depth, then instead of performing dynamic meshing, **Relaxed z-axis Mesh** creates no more than three filaments along the z-axis. The top and bottom filament thickness are equal to layer depth, as previously calculated, and the middle filament is equal to the remaining thickness. This improves extraction time and resource use with a negligible effect on accuracy.

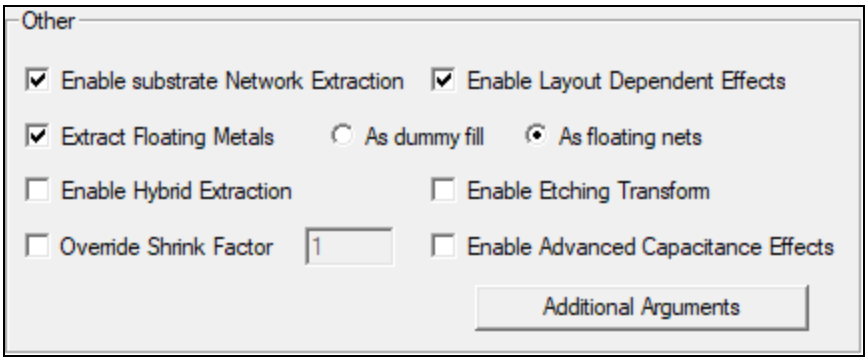
b. From the **Geometry Specification** area, set the following:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **Eliminate Slit/Holes** – enter a value (i.e., threshold) to simplify designs with strain relief or thermal relief slits and holes. Any slits/holes below the threshold are filled.
- **Automatic Removal of Sliver Polygons** – enter a value threshold to simplify layouts by aligning slightly misaligned polygons. Any overlap below the threshold is removed.
- **Accelerate Via Extraction** – check the box to merge neighboring vias. Merged vias are treated as ideal (i.e., non-resistive).

c. From the **Other** area, set the following:



- **Enable substrate Network Extraction** – models substrate coupling effects by simulating an equivalent distributed RC network. Checked by default.
- **Enable Layout Dependent Effects** – calculates the variation of resistivity as a function of a conductor's drawn width and spacing to its neighbors or as a function of its local density, due to dishing, slotting, cladding thickness, et cetera. Checked by default.
- **Extract Floating Metals** – after activating, select either of the following:
  - **As dummy fill** – calculates the effective capacitance between any pairs of metal segments in the design, while taking into account the presence of dummy metal islands that are not included in a net. This fill is represented as a new entity (i.e., *dummyFill*). **Mesh Frequency** does not apply to *dummyFill*.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

    - **As floating nets** – groups every metal segment in the design not explicitly included in a net in a new entity (i.e., *floatingNets*), which will be meshed according to **Mesh Frequency** settings.
- **Enable Hybrid Extraction** – assumes electromagnetic (EM) effects dominate the top (metal) layers of the design, so the design is separated horizontally into two parts. The upper part is assumed to contain a smaller number of ports compared to the bottom, potentially decreasing extraction time significantly.
- **Override Shrink Factor** – enter a value to override the default shrink factor.
- **Enable Etching Transform** – distorts the design based on foundry rules and applies the conductor's bias (i.e., positive/negative, deflation/inflation) at the conductor's edges due to presumed unavoidable effects in the manufacturing process. Ignored if LDE data is not present.
- **Enable Advanced Capacitance Effects** – applies capacitance-related effects to the design (e.g., conformal dielectrics, loading effects, and/or dielectric damage).
- **Additional Arguments** – click to open the **Additional Extraction Arguments** window. From the **Additional Extraction Arguments** window, do the following:
    a. Enter a parameter in the **Name** field and an appropriate **Value**. Select from one or more of the following:

Argument Name	Value
pe-edt-package-vias	Comma-separated list of via layers, which will be designated as package vias (e.g., **via1**, **via2**, et cetera). **Note:** This parameter is ignored if a technology definition is applied to the design.
pp-circloid-arc-simplification-min-no-of-points-in-arc	The minimum number of points in a circloid arc. Default value is **5**.
pp-circloid-arc-simplification-try-hexadecagons	• **True** (Default) – Use hexadecagons for circloid-arc simplification. • **False** – Do not use

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

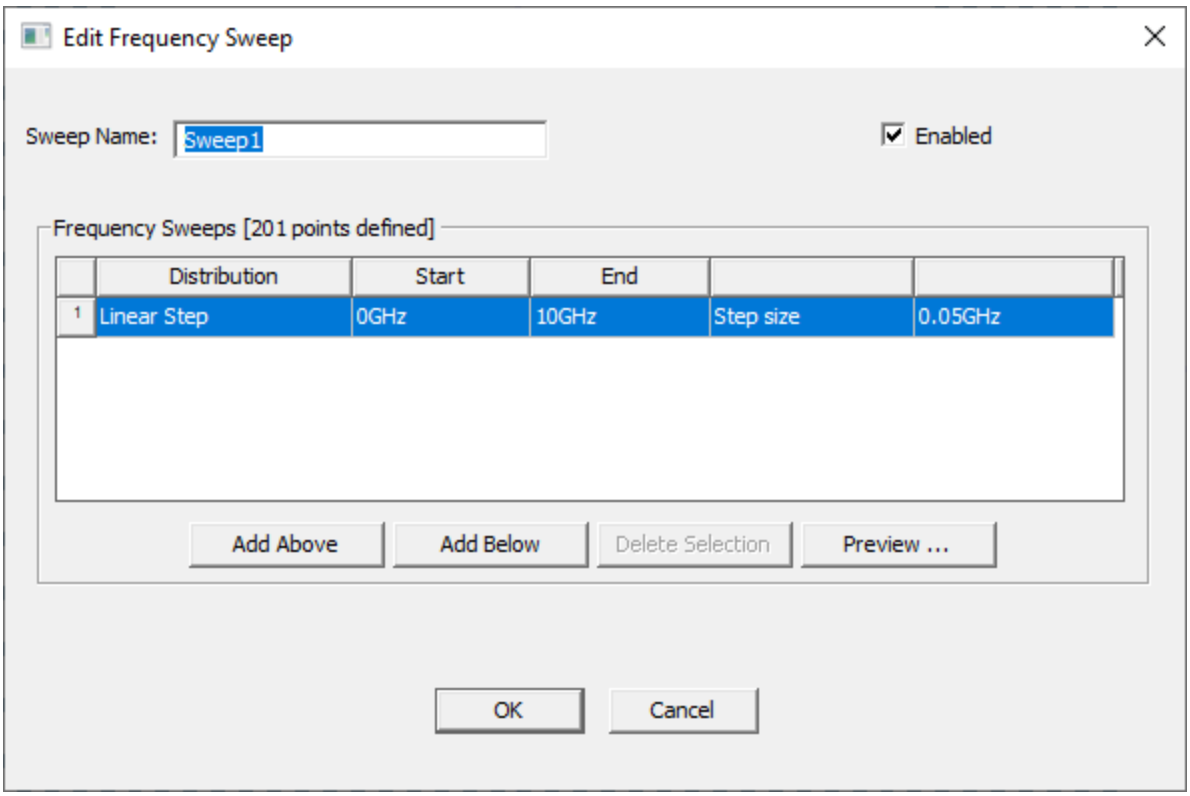
	hexadecagons for circloid-arc simplification. **Note:** If **False**, then **pp-circloid-arc-simplification-try-octagons** (if inserted) must have the value **True**.
pp-circloid-arc-simplification-try-octagons	• **True** – Use octagons for circloid-arc simplification. • **False** (Default) – Do not use octagons for circloid-arc simplification. **Note:** If **False**, then **pp-circloid-arc-simplification-try-hexadecagons** (if inserted) must have the value **True**.
pp-via-stacking	• **True** (Default) – A stacking approach is used on silicon vias, merging any overlapping vias in adjacent layers into a single stacked region. • **False** – A stacking approach is not used on silicon vias.

b. Click **Insert** to save the argument.

c. Repeat steps **a**-**b**, as appropriate. Then click **OK** to close the window and return to the **RaptorX Solution Setup** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. Click **OK** to add the RaptorX solution setup to the active design and simultaneously open the **Edit Frequency Sweep** window.



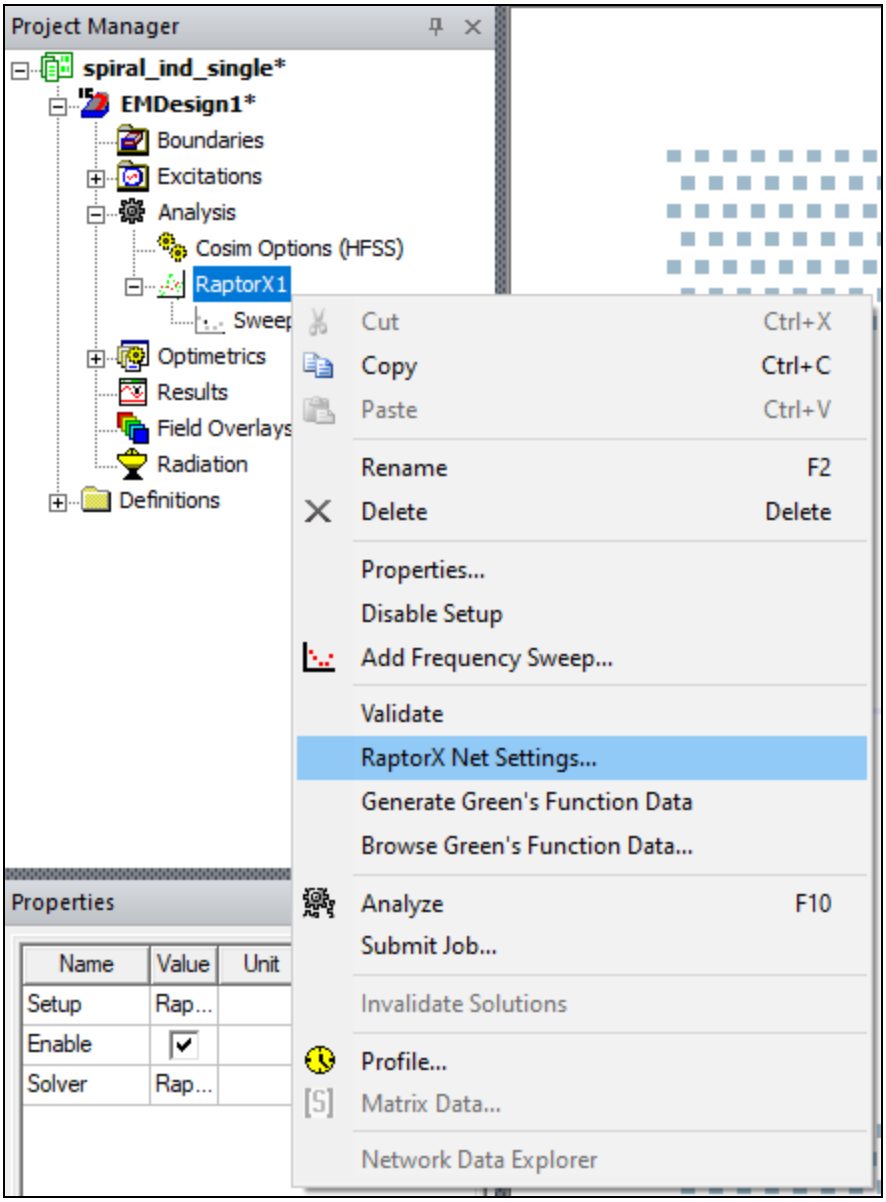
7. From the **Edit Frequency Sweep** window, click **OK** to accept the sweep with its default values or change the default values before continuing. Refer to Adding a Frequency Sweep for more information.

Changing Net Settings

RaptorX solution setups can be customized further by making changes to the **Mesh Frequency** and **Edge Mesh** parameters for specific nets. Follow these steps to view all of the nets recognized by RaptorX during simulation, including the virtual nets created as a result of user-selected options selected during setup (e.g., such as the **floatingNets** group created by activating **Extract Floating Metals**), and modify as appropriate.

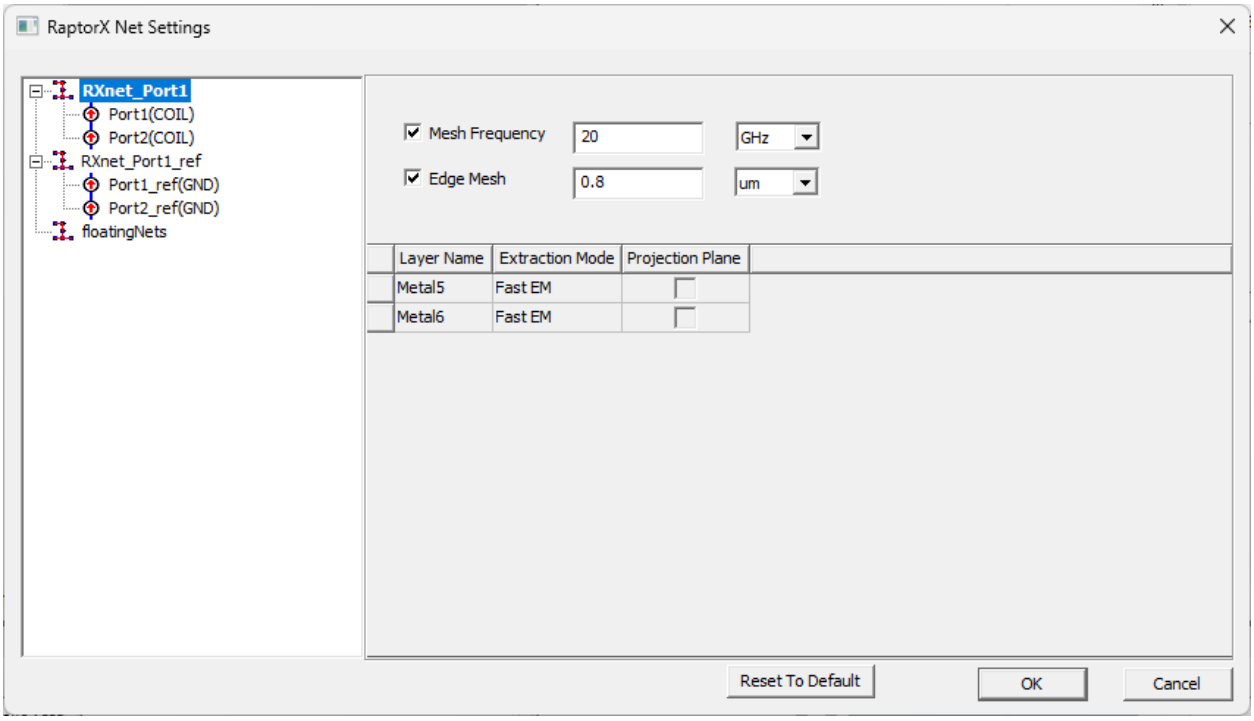
1. From the **Project Manager** window, expand **Analysis**. Then right-click the RaptorX solution setup (e.g., **RaptorX1**) and select **RaptorX Net Settings** to open the **RaptorX Net Settings** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **RaptorX Net Settings** window, select a mesh to view its individual settings or **Ctrl**+**click**/**Shift**+**click** to select multiple meshes.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



3. Check the corresponding box next to any or all of the following settings to activate them. Then enter any appropriate value or make drop-down menu selections, as applicable. The settings function as described in Setting Up a RaptorX Simulation.
    - **Mesh Frequency**
    - **Edge Mesh**
    - **Projection Plane** (active if **Plane Projection Factor** is also active in the **RaptorX Solution Setup** window)
4. Click **OK** to close the **RaptorX Net Settings** window.

Applying Technology

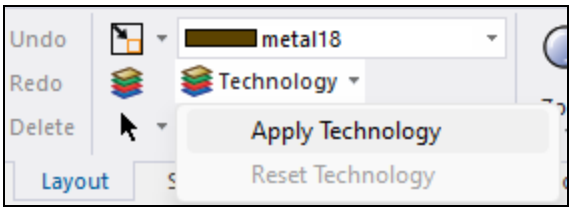
If any technology files were imported during the initial setup of the design, follow these steps to apply a technology before simulation.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

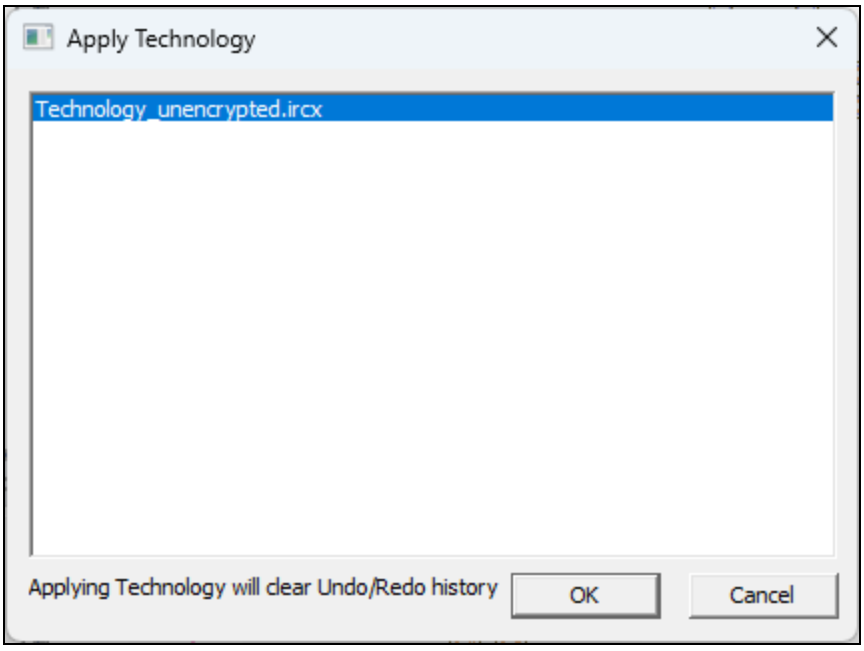
Note:

If technology files were **not** imported during the initial setup of the design, users can add one or more files at any time before simulation. If a technology file **was** applied during setup, the technology's name should already appear in the **Layout** ribbon adjacent to the **Technology** drop-down menu. Users will not need to follow these steps. Refer to Adding a Technology File to a Design.

1. If a technology is available, navigate to the **Layout** ribbon and select **Apply Technology** from the **Technology** drop-down menu.



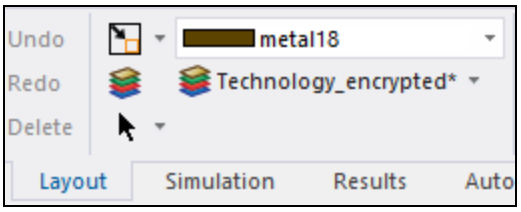
2. Once the **Apply Technology** window opens, select an appropriate technology from the list and click **OK**.



Once the technology is applied to the design, the technology's name appears adjacent to

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the **Technology** drop-down menu.

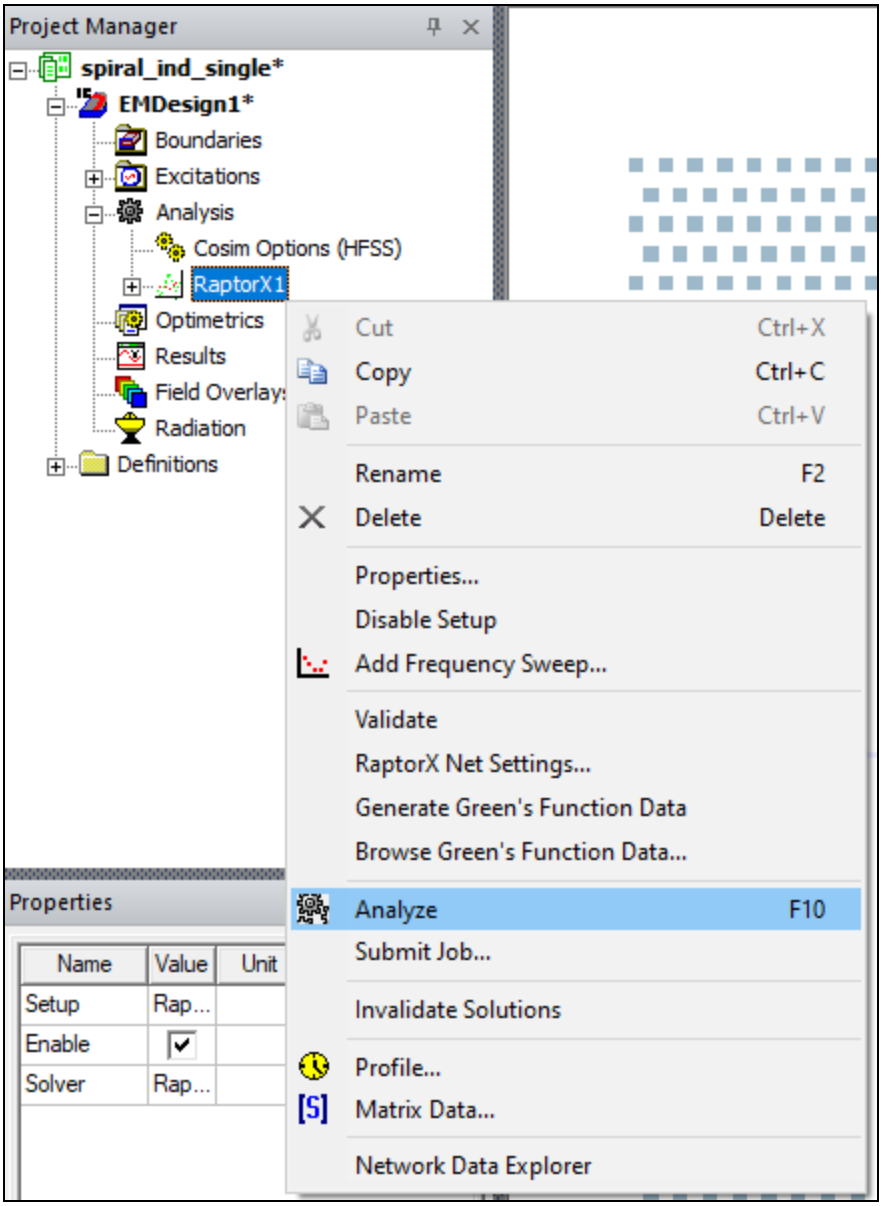


Analyzing the Design and Post-Processing

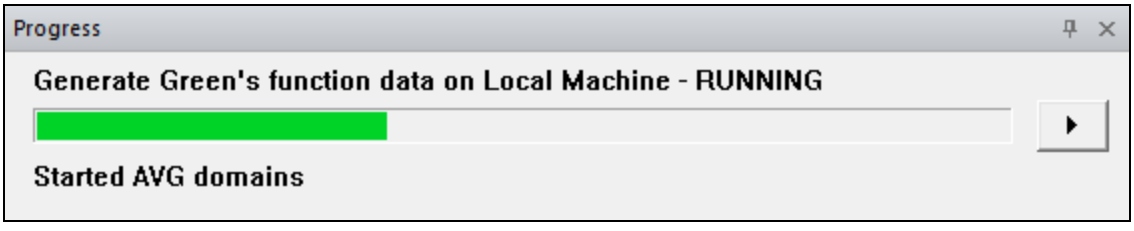
Follow these steps to analyze the new RaptorX solution setup, then create an overlay, mesh, and generate a report.

1. From the **Project Manager** window, right-click **RaptorX1** and select **Analyze** to run the simulation. Refer to Running Simulations.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

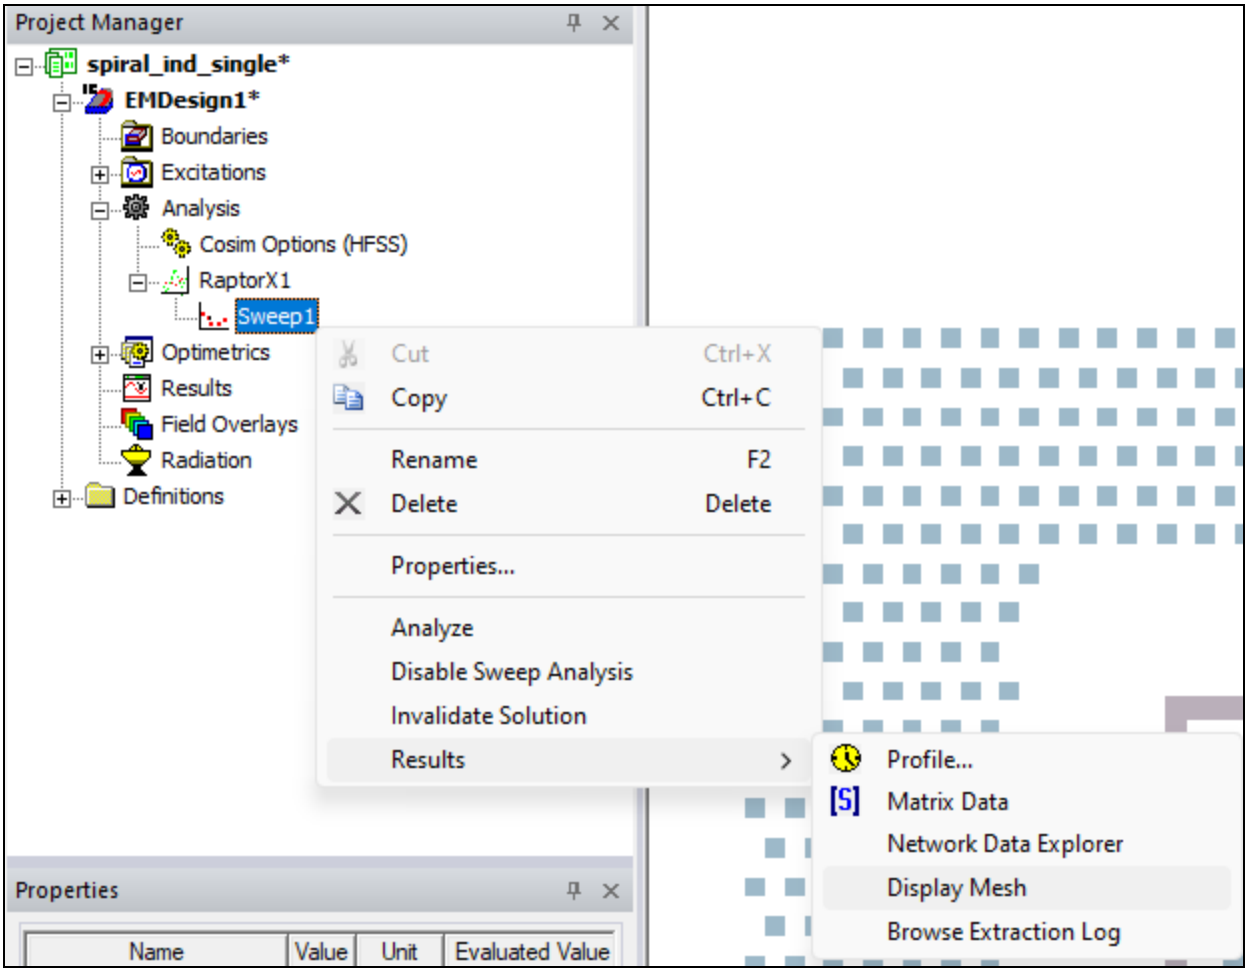


If this is the first time the design has been analyzed with a RaptorX solution setup, Green's Function Data is generated during the analysis.



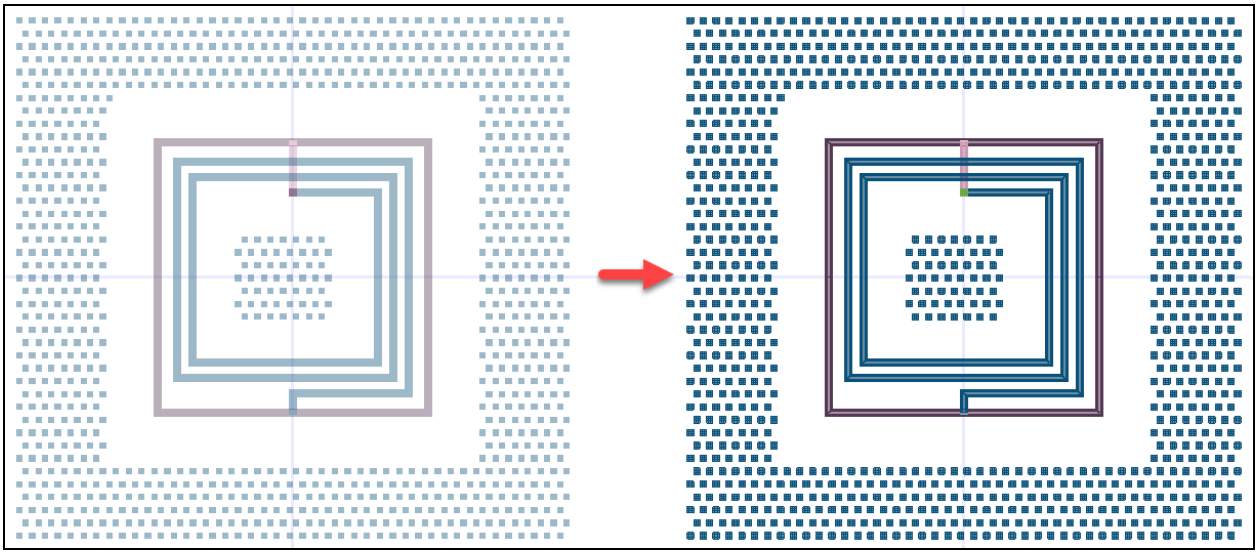
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Once the simulation is complete, a mesh visualization is generated. Navigate to the **Project Manager** window and expand **RaptorX1**. Then right-click **Sweep1** and select **Results** > **Display Mesh**.



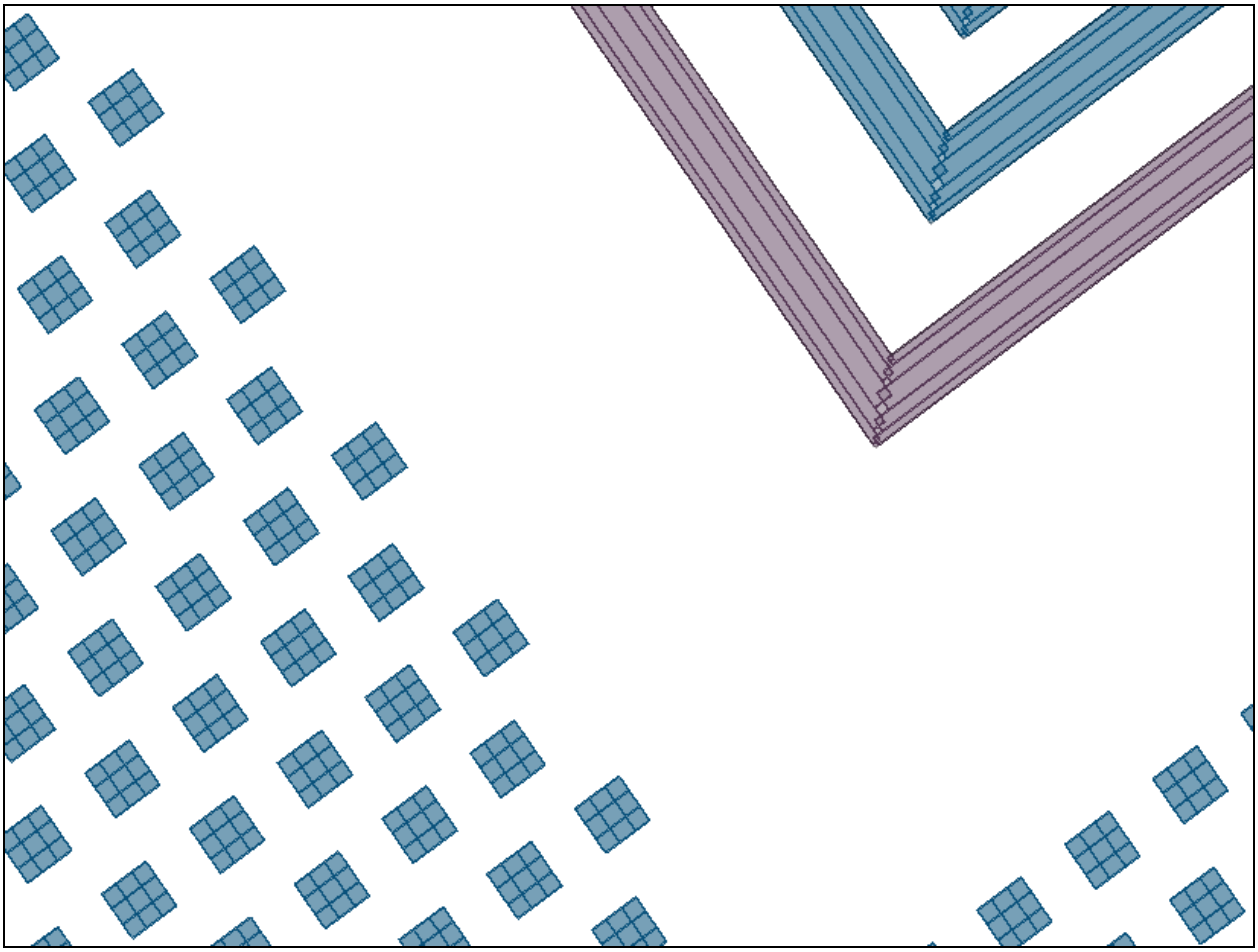
The mesh visualization overlay immediately appears on the design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



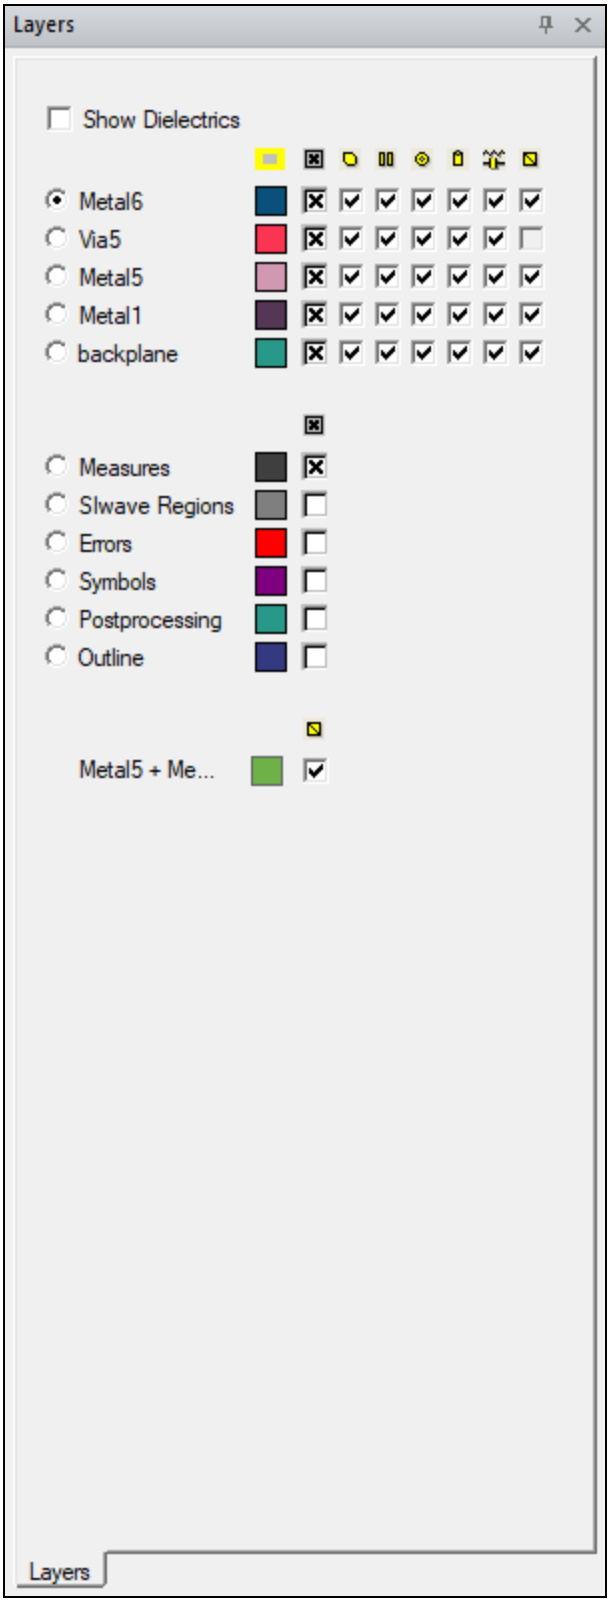
3. Reorient the design to view the mesh visualization from different angles.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



4. From the **Layers** window, control which layers of the mesh visualization are visible.

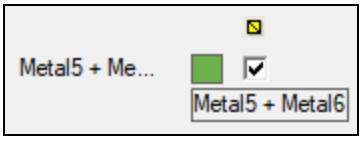
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Add or remove checks from the right-hand column (i.e., the **Mesh** column) to show or hide layers of the mesh visualization.

The lowest quadrant of the **Layers** window displays mesh groups created by RaptorX. Refer to **Viewing Green's Function Data**.



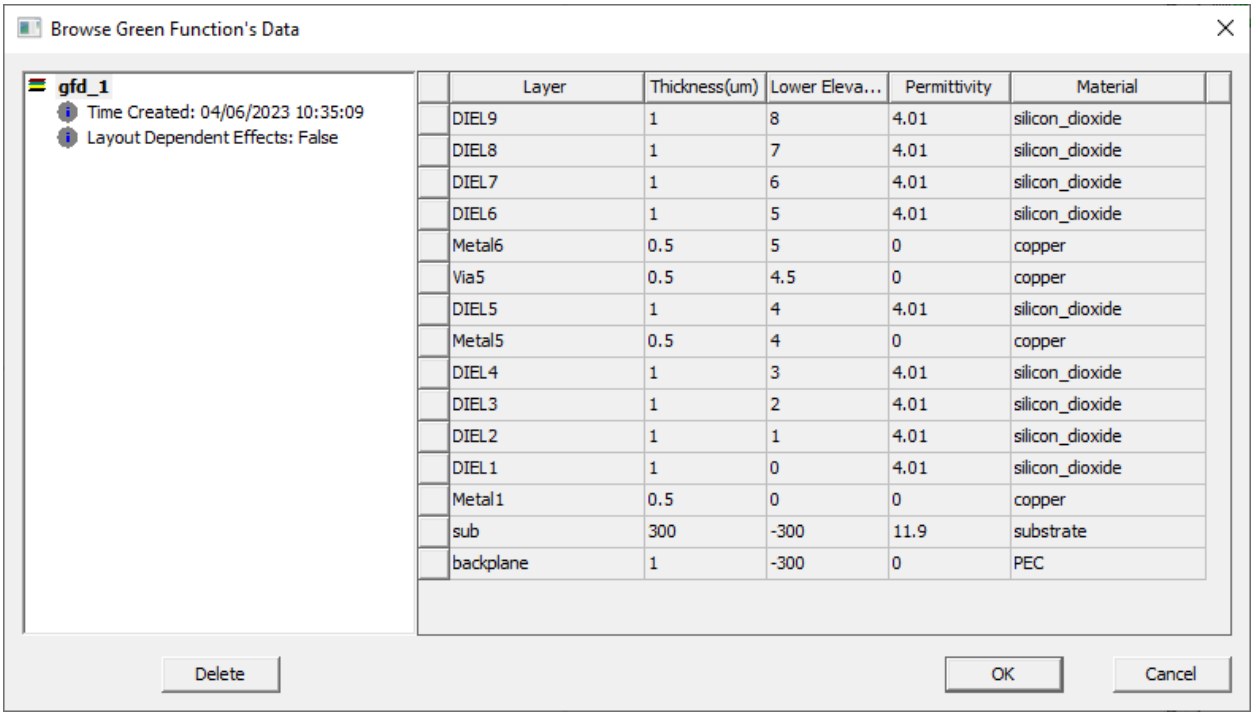
The procedure is complete.

> **Note:**
>
> Certain RaptorX simulations can be distributed over multiple nodes using MPI. RaptorX HPC-integration only works with **Intel MPI** and currently, only auto-distribution setup is supported. All setups will be treated as auto distribution setups by the solver.
>
> Familiarize yourself with the chapter titled, *"Installing MPI for Ansys Parallel Processing"* in the Windows Installation Guide. At the end of the Windows and Linux installation processes, links are provided to access the Intel MPI installation program and its documentation. Install and configure MPI before attempting to run Distributed solutions.

Viewing Green's Function Data

Either during analysis of a RaptorX solution setup or by selecting **Generate Green's Function Data**, the design's current stackup parameters are compiled and entered into a reference database. If the design is not altered, reusing the gathered data will speed up future RaptorX simulations.

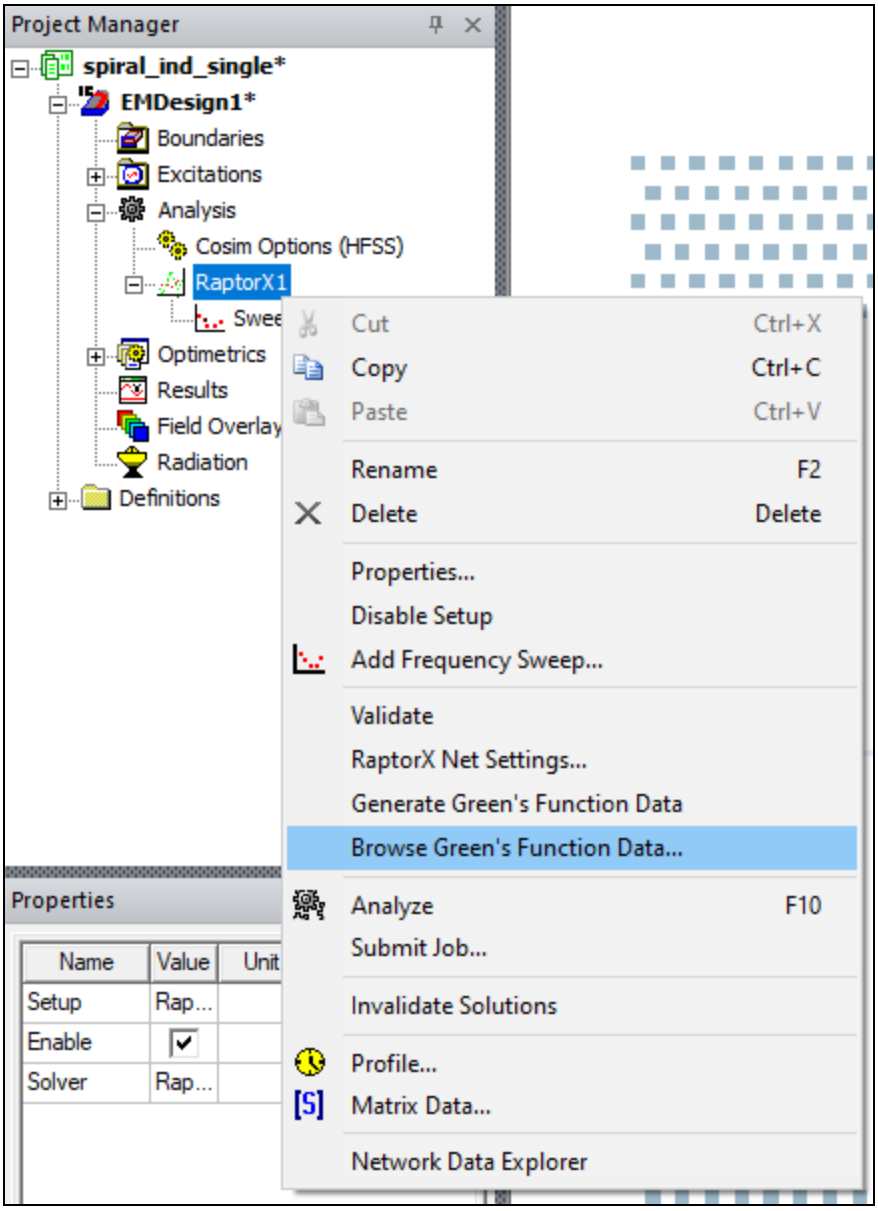
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



To open the **Browse Green's Function Data** window, do either of the following:

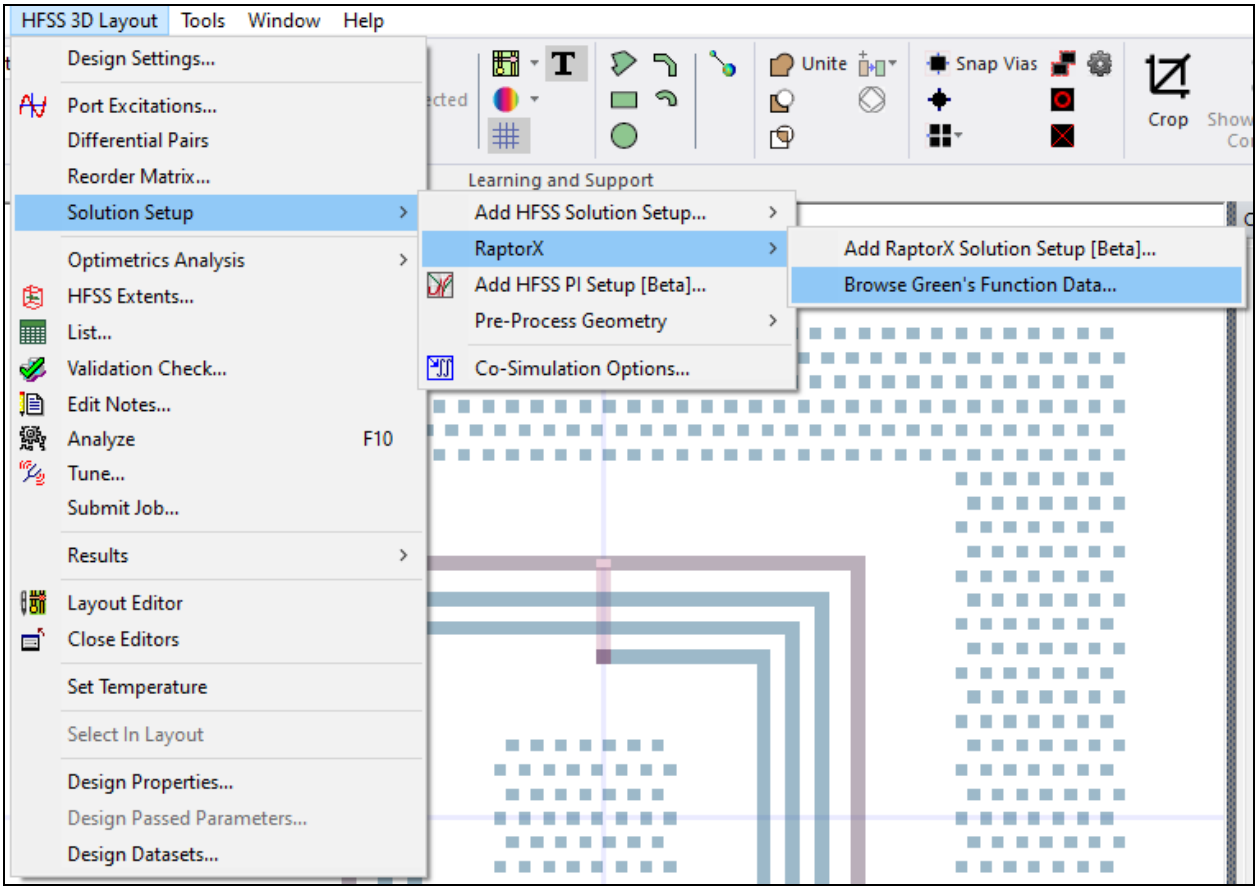
- From the **Project Manager** window, right-click the RaptorX solution setup (e.g., **RaptorX1**) and select **Browse Green's Function Data**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- From **HFSS 3D Layout**, select **Solution Setup** > **RaptorX** > **Browse Green's Function Data**.

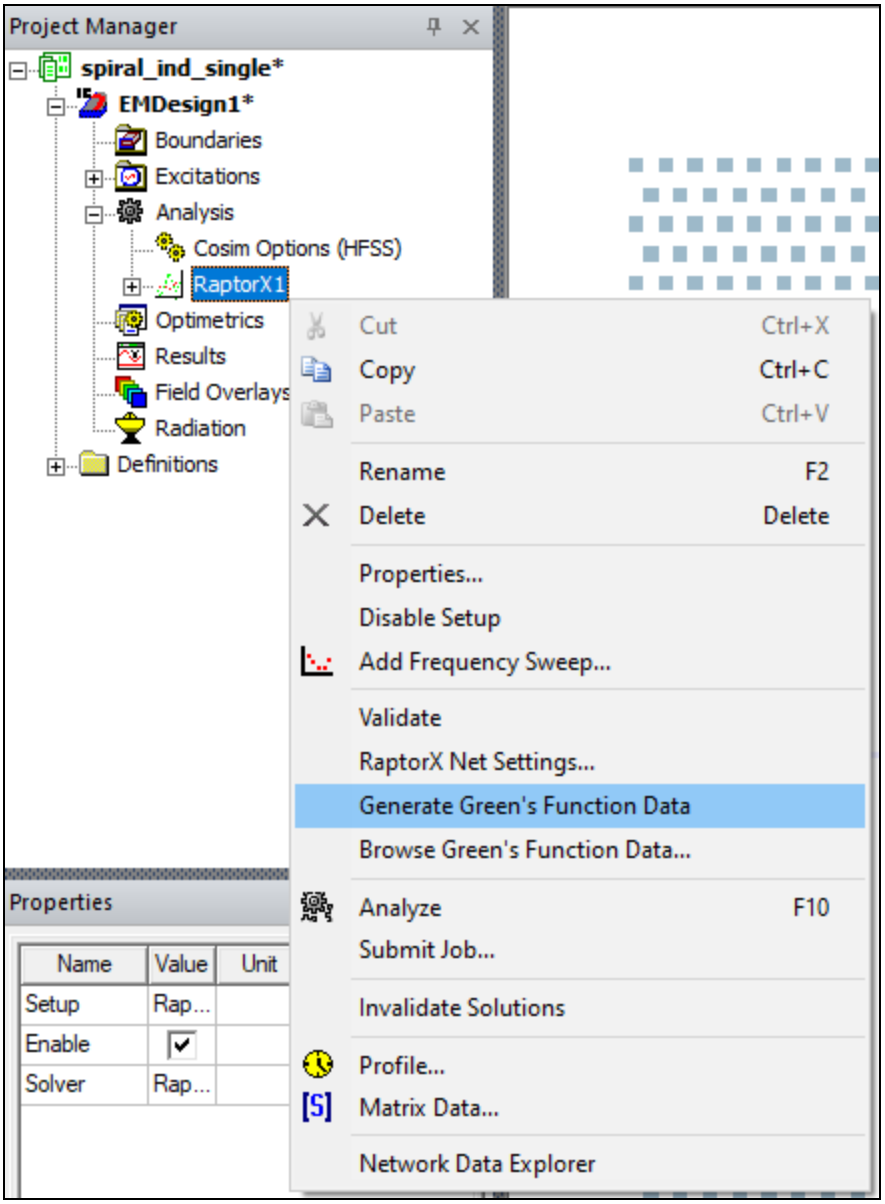
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Generating Green's Function Data

To generate Green's function data before running a simulation, navigate to the **Project Manager** window. Right-click the RaptorX solution setup (e.g., **RaptorX1**) and select **Generate Green's Function Data**.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Adding a Q3D Solution Setup

The Q3D solution setup mirrors the capabilities of a simulation run using Q3D Extractor. Follow these steps to add a Q3D solution setup to a project.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

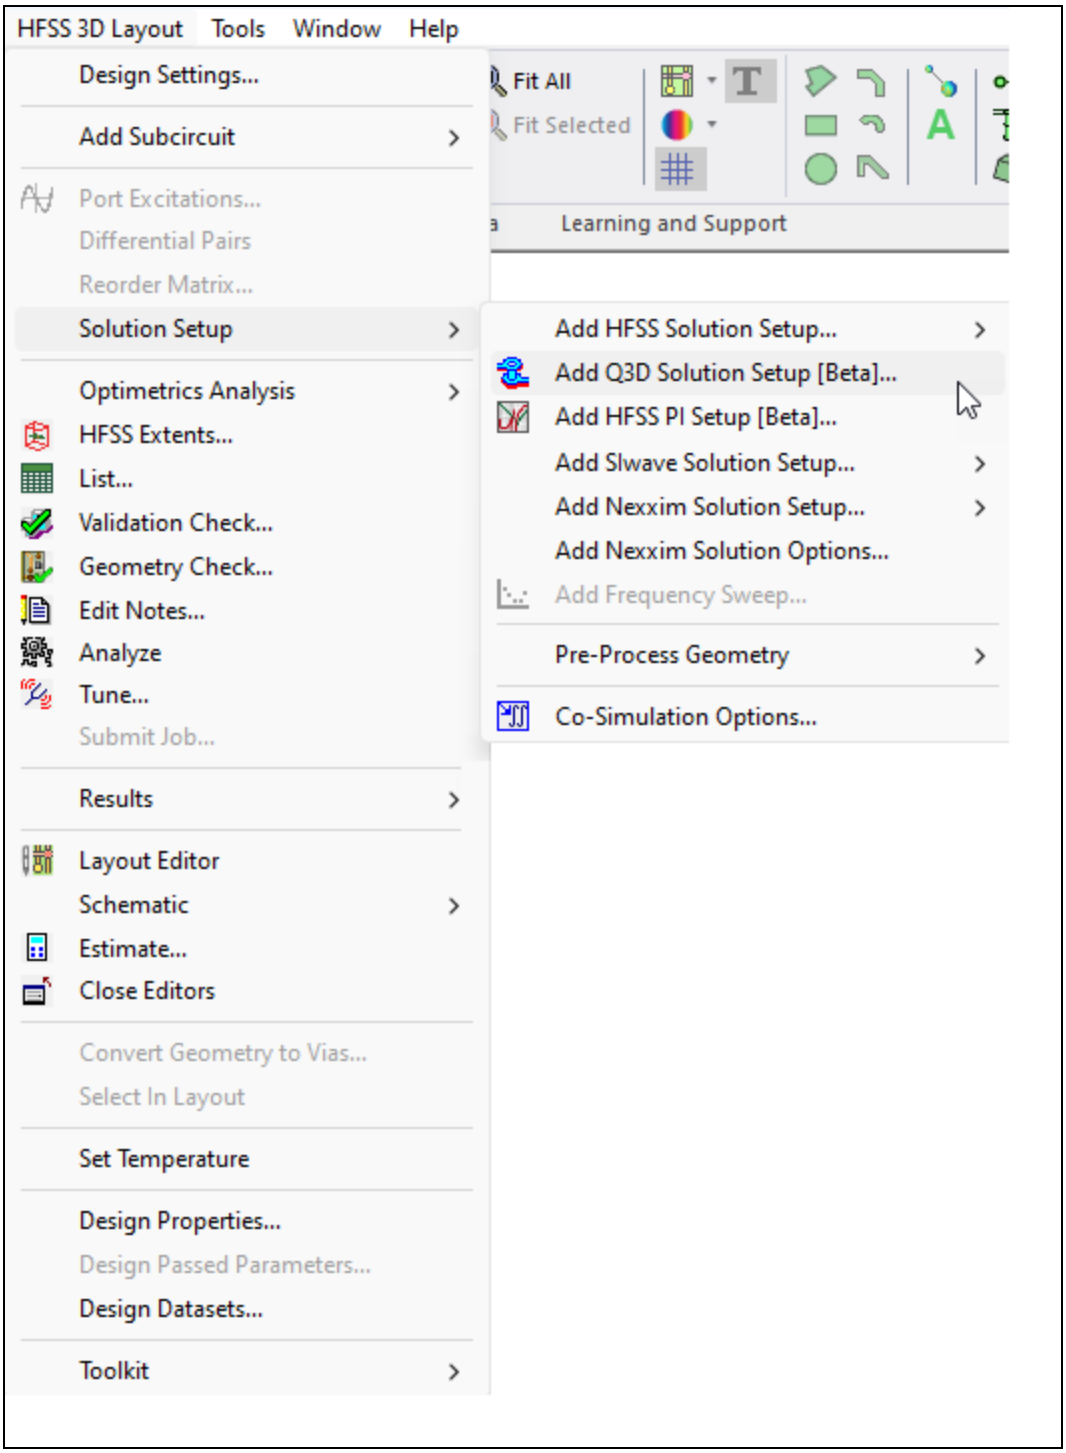
The Q3D solution setup is a beta feature. Beta features must be activated prior to use. Refer to Activating the Q3D Solution Setup Beta Feature for instructions.

1. Open the **Q3D Solution Setup** window by doing one of the following:
    - From the **Project Manager** window, expand the **Project Tree** > [*Active Design Folder*] (e.g., **Example Project** > **Example Design**). Then right-click **Analysis** and

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

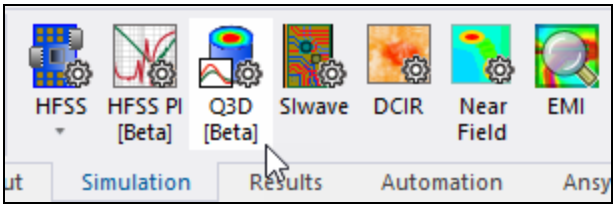
select **Add Q3D Solution Setup**.

- From **HFSS 3D Layout**, select **Solution Setup** > **Add Q3D Solution Setup**.



- From the **Simulation** tab, select **Q3D**.

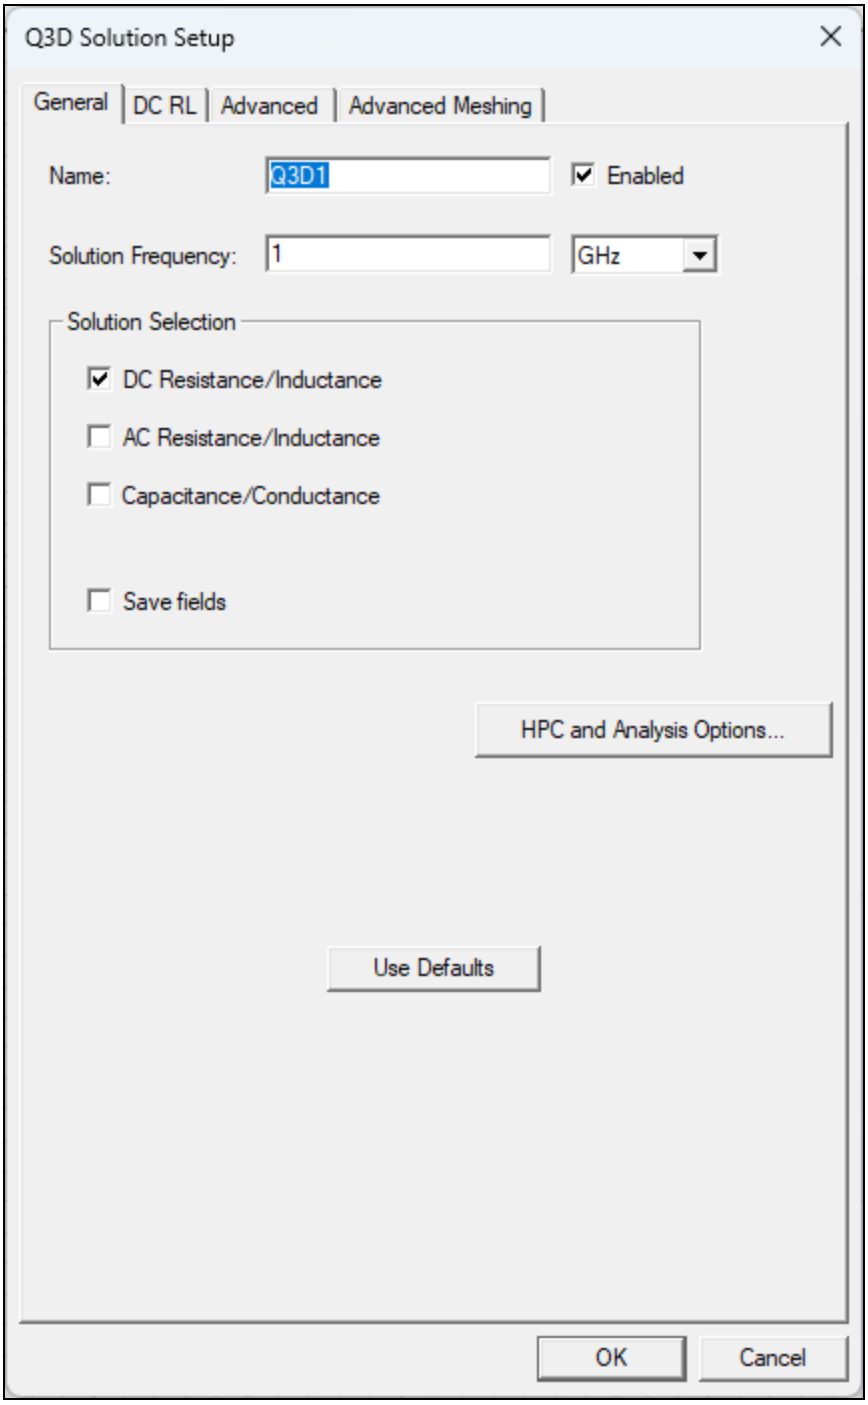
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Q3D Solution Setup** window, make selections from the visible tabs (i.e., by default, **General**, **DC RL**, **Advanced**, and **Advanced Meshing** tabs are visible). Default values shown.

> **Note:**
>
> The **Advanced Meshing** tab only appears in **General** mode.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



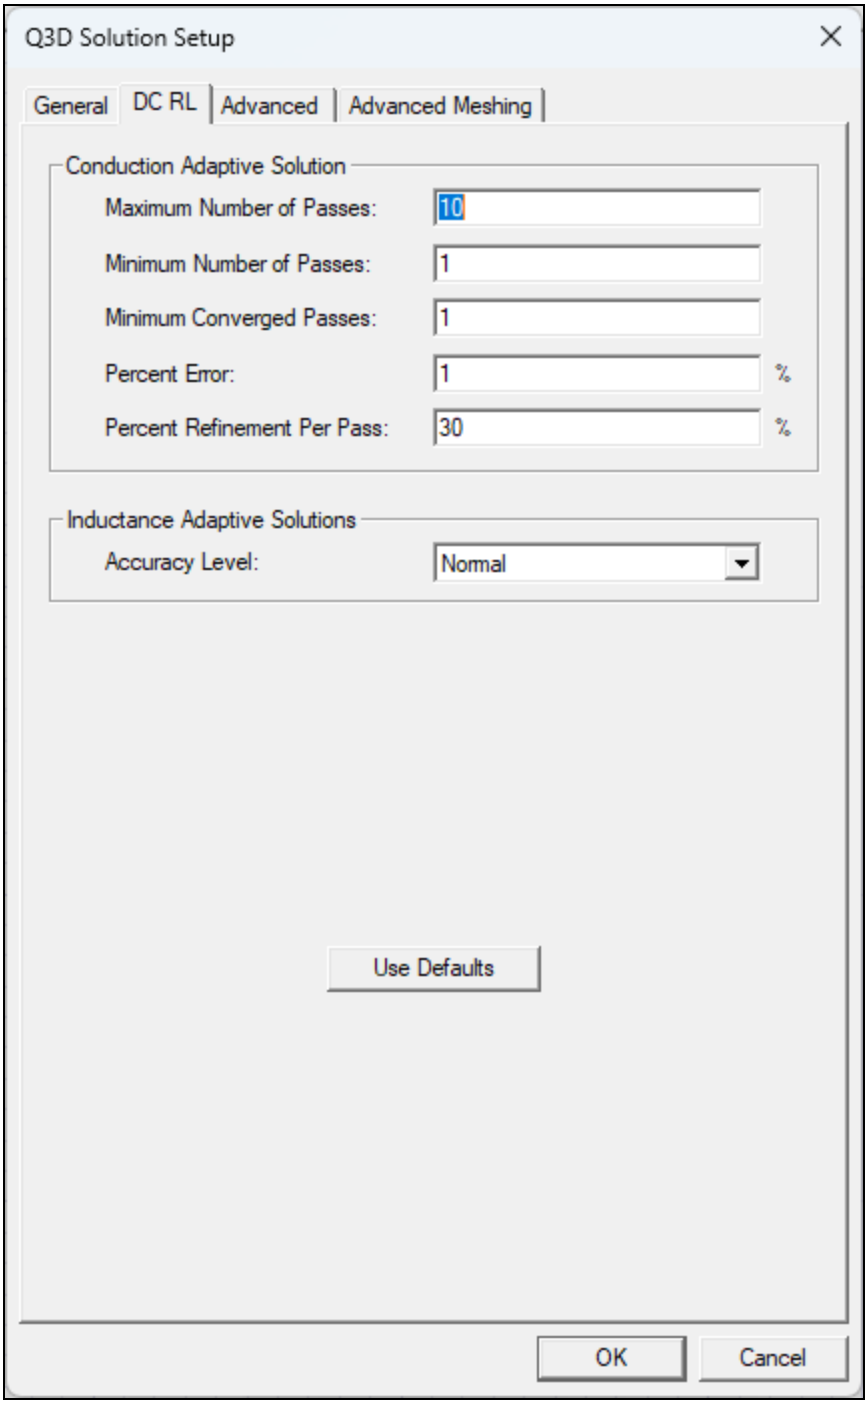
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> The **CG** and **AC RL** tabs appear depending on selections made in the **General** tab; **DC RL** is visible by default, but is likewise hidden if the check is removed from the **DC Resistance/Inductance** box).

3. From the **General** tab, set the following:
   - **Name** – type a name in the field or accept the default.
   - **Enabled** – check the box to activate the setup.
   - **Solution Frequency** – enter a value in the provided field to specify the simulation frequency and select a unit of measurement from the corresponding drop-down menu.
   - **DC Resistance/Inductance** – checked by default to solve and generate mesh for for DC resistance and inductance; activates the **DC RL** tab.
   - **AC Resistance/Inductance** – check the box to solve and generate mesh for AC resistance and inductance; activates the **AC RL** tab.
   - **Capacitance/Conductance** – check the box to solve and generate mesh for DC capacitance and conductance; activates the **CG** tab.
   - **Save fields** – check the box to save the current settings as the new default settings.
   - **HPC and Analysis Options** – click to open the **HPC and Analysis Options** window. Refer to Setting HPC and Analysis Options.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

4. Click the **DC RL** tab.



5. From the **DC RL** tab, set the following DC resistance/inductance options:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Maximum Number of Passes** – enter a value in the provided field to specify the maximum number of mesh refinement cycles to perform. This value is a stopping criterion for the adaptive solution; the simulation continues until the maximum number of passes complete or convergence criteria are reached.

  > **Important:**
  >
  > The size of the finite element mesh — and the amount of memory required to generate a solution — increases with each adaptive refinement of the mesh. Setting the maximum number of passes too high can result in the Ansys Electronics Desktop (AEDT)™ electronics systems design platform requesting more memory than available or taking excessive time to compute solutions.

- **Minimum Number of Passes** – enter a value in the provided field to specify the minimum number of mesh refinement cycles. Simulation continues until *after* this number of passes complete.

  Minimum Converged Passes – enter a value in the provided field to specify the minimum number of passes that must meet convergence criteria before the simulation stops.

- **Percent Error** – enter a value in the provided field to specify an appropriate solution accuracy. Larger values produce solutions faster, but with less accurate results.

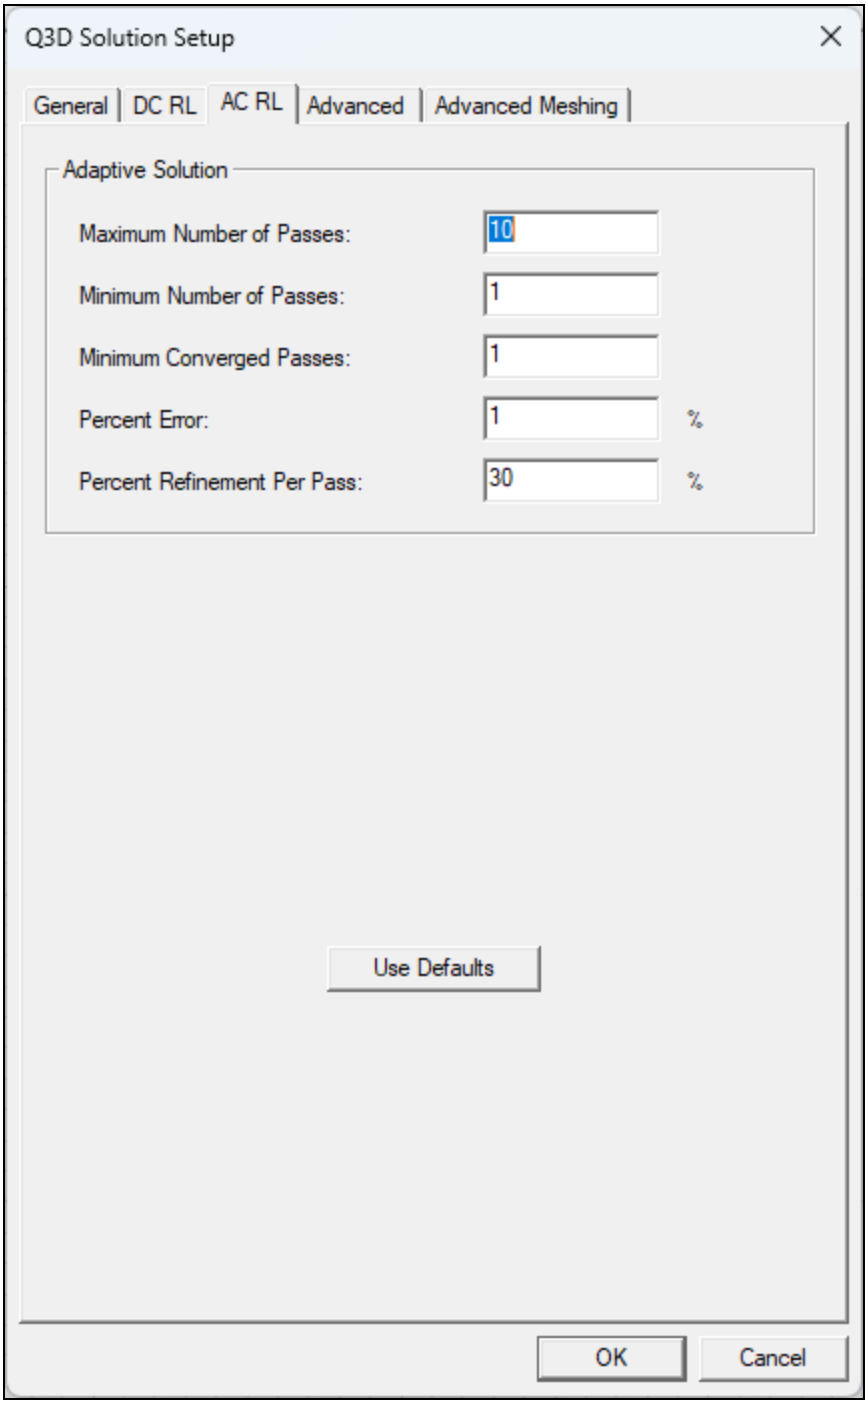
- **Percent Refinement Per Pass** – enter a value in the provided field to specify how many tetrahedra are added at each iteration of the adaptive refinement process. The tetrahedra with the highest error are refined (e.g., entering 10 causes the mesh to increase approximately 10% each pass. If the mesh consisted of 1000 elements, the tetrahedra are refined such that 100 new elements are added to the mesh). The default percentage works well for most applications.

  > **Note:**
  >
  > A growth rate lower than the maximum occurs when there are not enough high error elements to warrant adaption. This reduces memory usage without sacrificing accuracy.

- **Accuracy Level** – select an inductance adaptive solution accuracy from the drop-down menu. The solver will give accurate results at the **Normal** setting for most applications. The **High**, **Higher**, and **Highest** options offer greater accuracy at the expense of speed and memory.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

6. If visible, click the **AC RL** tab.



7. From the **AC RL** tab, set the following AC resistance/inductance options:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Maximum Number of Passes** – enter a value in the provided field to specify the maximum number of mesh refinement cycles to perform. This value is a stopping criterion for the adaptive solution; the simulation continues until the maximum number of passes complete or convergence criteria are reached.

  > **Important:**
  >
  > The size of the finite element mesh — and the amount of memory required to generate a solution — increases with each adaptive refinement of the mesh. Setting the maximum number of passes too high can result in AEDT requesting more memory than available or taking excessive time to compute solutions.

- **Minimum Number of Passes** – enter a value in the provided field to specify the minimum number of mesh refinement cycles. Simulation continues until *after* this number of passes complete.

  Minimum Converged Passes – enter a value in the provided field to specify the minimum number of passes that must meet convergence criteria before the simulation stops.

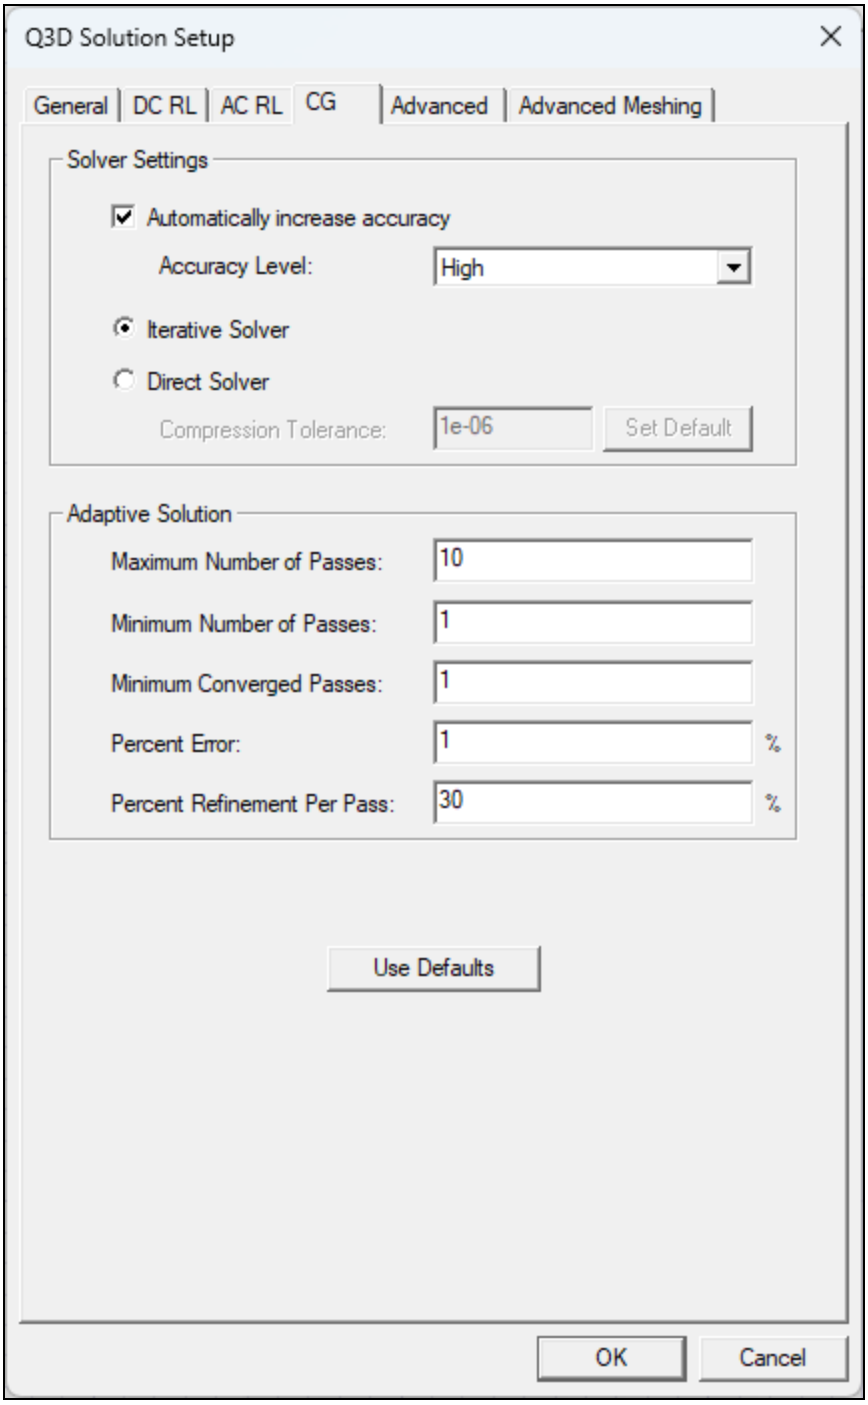
- **Percent Error** – enter a value in the provided field to specify an appropriate solution accuracy. Larger values produce solutions faster, but with less accurate results.

- **Percent Refinement Per Pass** – enter a value in the provided field to specify how many tetrahedra are added at each iteration of the adaptive refinement process. The tetrahedra with the highest error are refined (e.g., entering 10 causes the mesh to increase approximately 10% each pass. If the mesh consisted of 1000 elements, the tetrahedra are refined such that 100 new elements are added to the mesh). The default percentage works well for most applications.

  > **Note:**
  >
  > A growth rate lower than the maximum occurs when there are not enough high error elements to warrant adaption. This reduces memory usage without sacrificing accuracy.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

8. If visible, click the **CG** tab.



9. From the **CG** tab, set the following DC capacitance/conductance options:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Automatically increase accuracy** – check the box to automatically increase accuracy, then select an **Accuracy Level** from the drop-down menu. The solver will give accurate results at the **Normal** setting for most applications. The **High**, **Higher**, and **Highest** options offer greater accuracy at the expense of speed and memory.
- Select either of the following:
    - **Iterative Solver** – check the box to activate the **Iterative Solver**, which is generally the fastest option. However, the **Iterative Solver** uses FMM compression, which may lead to slow convergence of GMRES iterations for poorly conditioned matrices.
    - **Direct Solver** – check the box to activate the **Direct Solver**, which has a higher setup time and uses more memory than the **Iterative Solver**. During setup, the **Direct Solver** performs an LU factorization of the FMM-compressed MoM system of equation. From the solution phase, each right hand side is solved using forward(L) and backward(U) substitutions. The **Direct Solver** converges quickly for poorly conditioned matrices and should only be used in cases requiring longer solution times (i.e., cases with extreme geometries and cases with more than 500 nets). After selection, enter a **Compression Tolerance** value. By default, the tolerance is ***1e-6*** for **Normal** or **High** accuracy, ***1e-7*** for **Higher** accuracy, and ***ie-8*** for **Highest** accuracy. Setting a larger tolerance requires less setup time and memory, while setting a tighter tolerance requires more setup time and memory but leads to rapid convergence and faster solution time.
- **Maximum Number of Passes** – enter a value in the provided field to specify the maximum number of mesh refinement cycles to perform. This value is a stopping criterion for the adaptive solution; the simulation continues until the maximum number of passes complete or convergence criteria are reached.

> **Important:**
>
> The size of the finite element mesh — and the amount of memory required to generate a solution — increases with each adaptive refinement of the mesh. Setting the maximum number of passes too high can result in AEDT requesting more memory than available or taking excessive time to compute solutions.

- **Minimum Number of Passes** – enter a value in the provided field to specify the minimum number of mesh refinement cycles. Simulation continues until *after* this number of passes complete.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

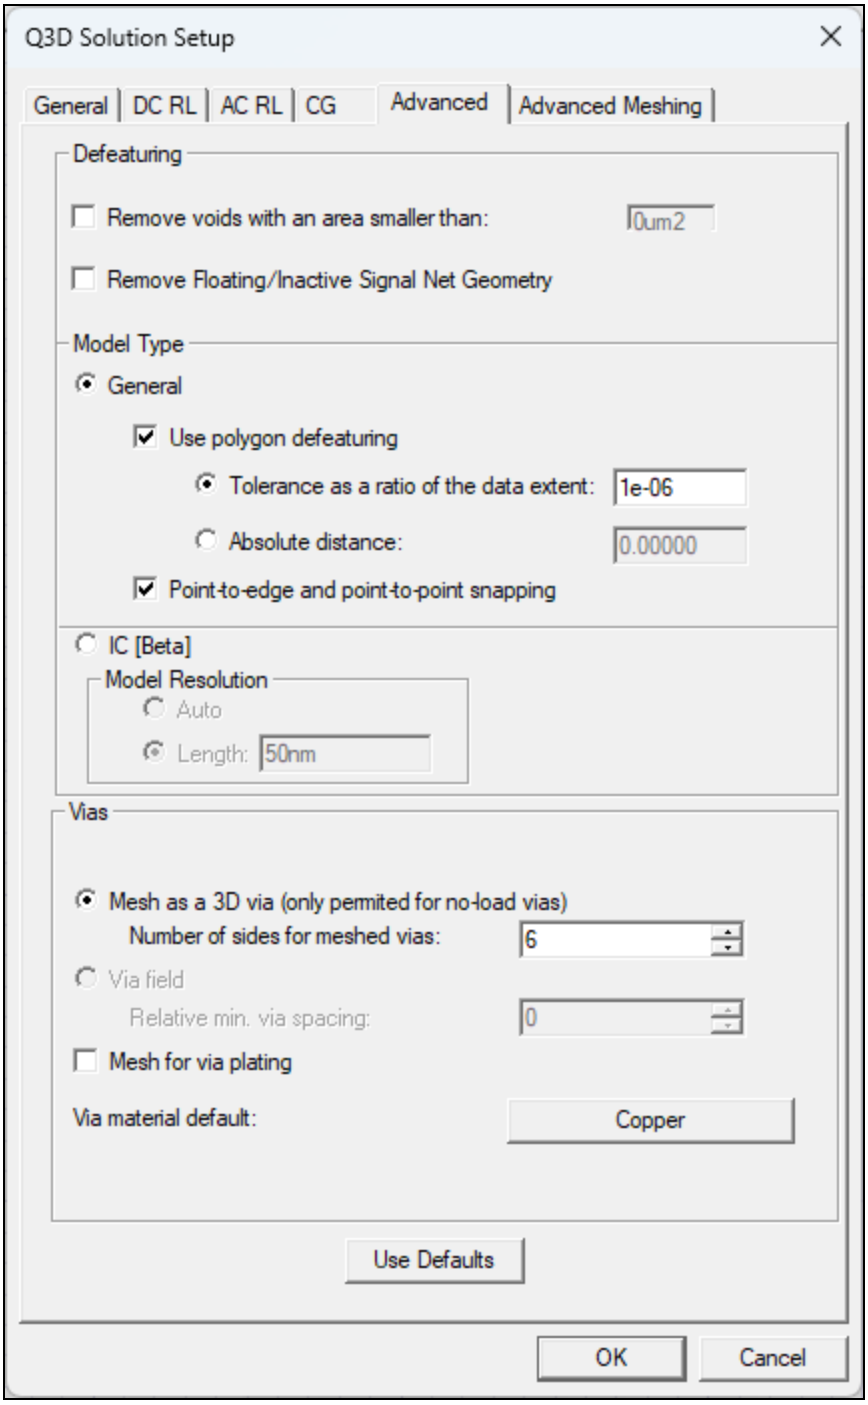
Minimum Converged Passes – enter a value in the provided field to specify the minimum number of passes that must meet convergence criteria before the simulation stops.

- **Percent Error** – enter a value in the provided field to specify an appropriate solution accuracy. Larger values produce solutions faster, but with less accurate results.
- **Percent Refinement Per Pass** – enter a value in the provided field to specify how many tetrahedra are added at each iteration of the adaptive refinement process. The tetrahedra with the highest error are refined (e.g., entering 10 causes the mesh to increase approximately 10% each pass. If the mesh consisted of 1000 elements, the tetrahedra are refined such that 100 new elements are added to the mesh). The default percentage works well for most applications.

> **Note:**
>
> A growth rate lower than the maximum occurs when there are not enough high error elements to warrant adaption. This reduces memory usage without sacrificing accuracy.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

10. Click the **Advanced** tab.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

11. From the **Advanced** tab, set the following:

    - **Remove voids with an area smaller than** – check the box to remove voids from the simulated primitives. Enter a tolerance value in the field. Voids smaller than the tolerance value will be removed.
    - **Remove Floating/Inactive Signal Net Geometry** – check the box to remove floating or inactive signal net geometry from the simulation.
    - **Model Type** – select either of the following:
        - **General** offers standard mesh processing.
            - **Use polygon defeaturing** – check the box to remove very close points, points that do not contribute to the geometry of an edge (e.g., collinear), and very thin intrusions. Used with “unioning”, to assist healing geometry that is not snapped together. Then select either of the following:
                - **Tolerance as a ratio of the data exent** – tolerance value specified as a ratio of the overall data extent. This value must be very small.
                - **Absolute distance** – tolerance specified as an absolute value (e.g., 0.0001mm).
            - **Point-to-edge and point-to-point snapping** – check the box to snap points to edges and points to points if they are within a minimum dimensional tolerance based on geometry extents.
        - **IC [Beta]** optimizes mesh processing to simulate on-chip structures. Select either of the following:
            - **Auto** – the mesher automatically calculates **Model Resolution** length based on each object's effective thickness.
            - **Length** – the mesher uses the manually-specified **Model Resolution** length and unit of measurement.

    > **Note:**
    >
    > Vias may be modeled as a simple 'wirebond' or as a 3D ribbon or solid. The values specified in the analysis setup only apply to vias that do not have specific property overrides. A ll properties explicitly specified for a via take precedence over these values.

    - From the **Vias** area, select either of the following:

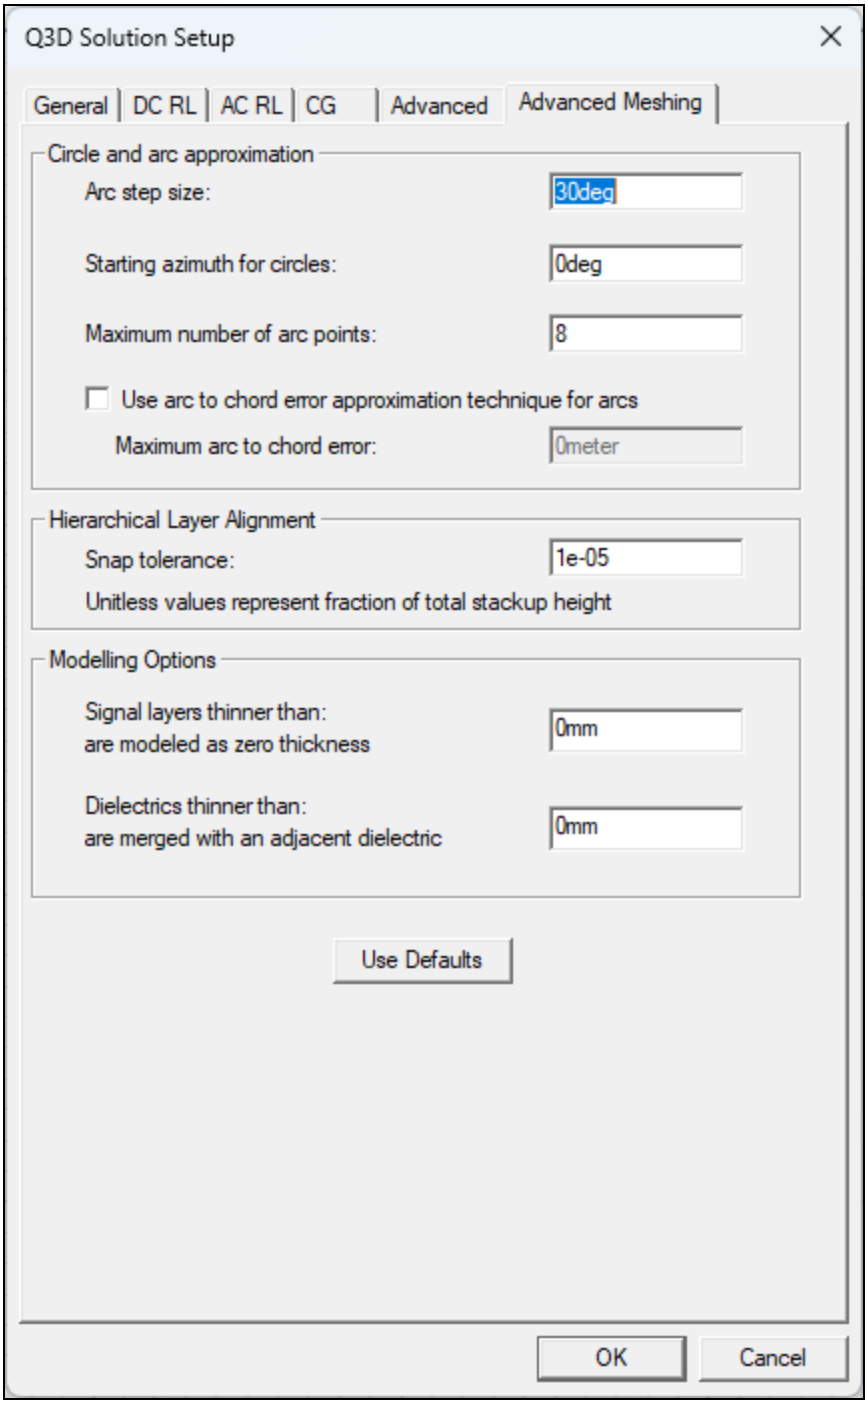
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Mesh as a 3D via** – vias are modeled using rectangles to form a 3D ribbon or solid. Enter a **Number of sides for meshed vias** to use when creating a 3D representation. If the entered value is less than 3, the via is modeled as a flat ribbon.
- **Via Field** – reduces the density of via fields and model them using wirebonds without significant loss in accuracy. A via field is defined by vias that connect two signal layers without intervening geometr) and attach to connected geometry at their upper and lower points. Vias that span multiple layers are broken up vertically at all intersection points. Each segment is treated independently. Two vias may be adjacent and close, but they are not thinned if they connect to electrically separate geometry either at their upper or lower connection points. Doing so would break the electrical connection. Then enter a **Relative minimum via spacing** to define a radius around a via. Any via that falls within the radius is eliminated. The value specified is a multiple of the average via spacing (i.e., the algorithm considers the averages for all via clusters and uses the minimum average spacing. Assuming all vias are spaced equally, a value of 1 eliminates every other via, 2 eliminates 2 vias between each via, et cetera).
- **Mesh for via plating** – check the box to create a mesh around the plating percent specified in the **Edit Padstack Definition** window, resulting in a more accurate DC thickness value. A via that is not fully plated includes a void filled with the material defined in the surrounding air box (e.g., air). Zero plating (i.e., 0%) is not recognized and is treated as fully plated.

- **Via material default** – when a material has not been specified in the padstack definition and there is no override in the properties for a via, then this is the material associated with the via mesh. It is initially set to copper.

12. To continue setup in IC mode, skip to step 14. Otherwise, click the **Advanced Meshing** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



13. From the **Advanced Meshing** tab, set the following:

    - **Arc step size** – enter a value to set the angular interval, in degrees, below which mesh points are added.

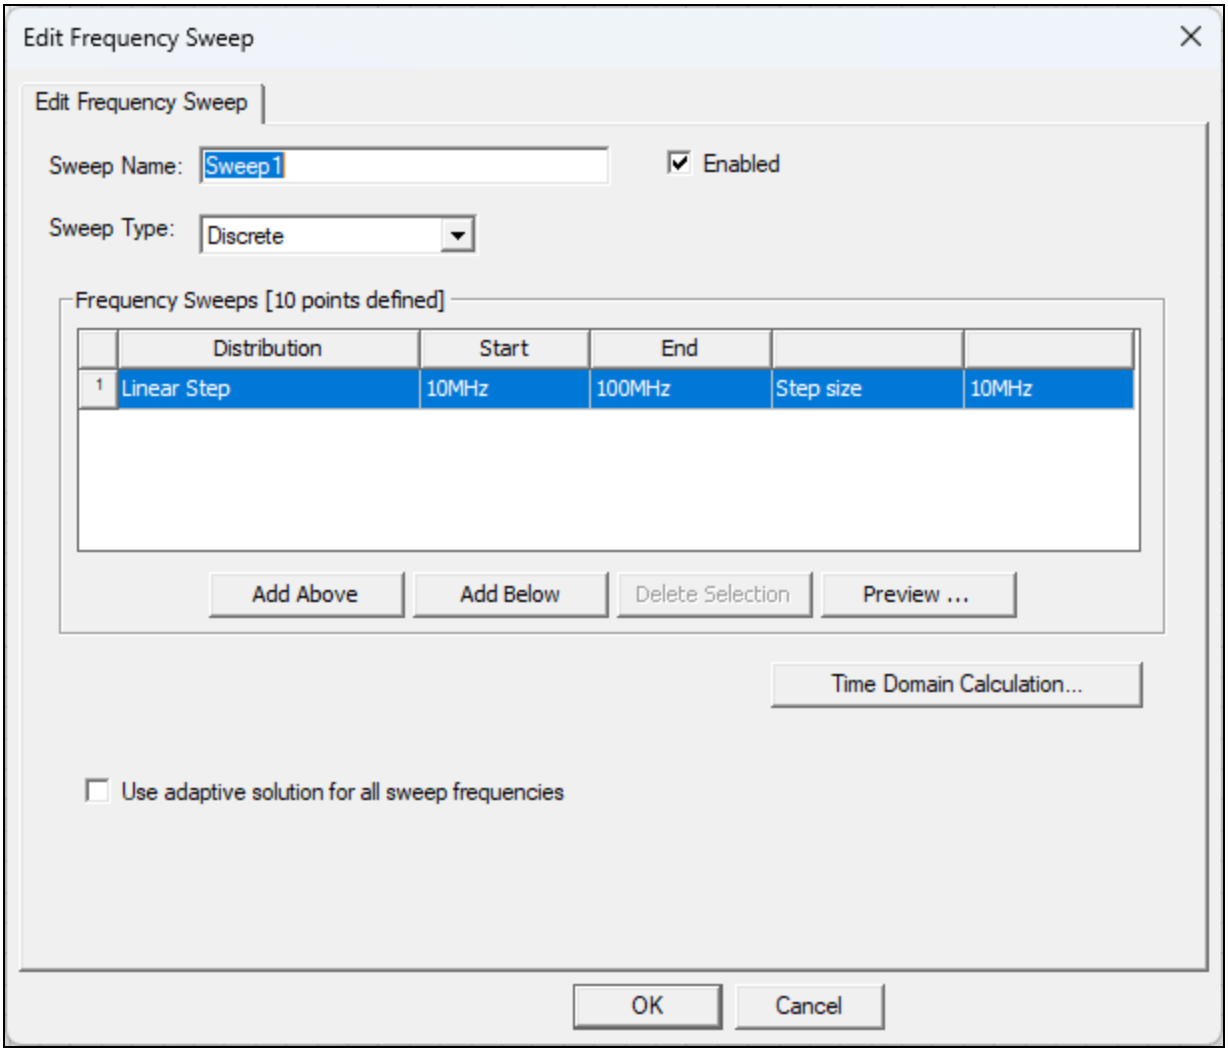
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Starting azimuth for circles** – enter a value to specify the location, in degrees, of the first mesh point or circles.
- **Maximum number of arc points** – enter a value to set the maximum number of mesh points on a given arc segment.
- **Use arc to chord error approximation technique for arcs** – check the box to calculate whether the resulting straight edge approximation deviate from the original arc by more than the specified error. Then enter a **Maximum arc to chord error** value and unit of measurement to set a maximum distance permissible between a straight edge approximation (i.e., chord) and the original arc.
- **Snap Tolerance** – enter a value/variable to set the tolerance by which layers align across hierarchical boundaries.
- **Signal layers thinner than <*value*> are modeled as zero thickness** – enter a value. Negative signal layers in the design which are thinner than the value are modeled as being infinitely thin in order to reduce simulation time.
- **Dielectrics thinner than <*value*> are merged with an adjacent** – enter a value. Dielectric layers in the design which are thinner than the value are merged into an adjacent dielectric. Material properties are accumulated using a weighted average

14. Click **OK** to add the Q3D solution setup to the active design and simultaneously open the **Edit Frequency Sweep** window.

> **Note:**
>
> For Q3D solution setups, the frequency sweep is only used to generate S parameters.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



15. From the **Edit Frequency Sweep** window, click **OK** to accept the sweep with its default values or specify the following:

> **Note:**
>
> The available tabs and options change with the selected sweep type.

- **Sweep Name** – enter a name for the sweep.
- **Sweep Type** – select **Discrete** or **Interpolating**:
  - **Discrete** – Generates field solutions at specific frequency points in a frequency range. Ideal when only a few frequency points are appropriate to accurately

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

represent the results in a frequency range.

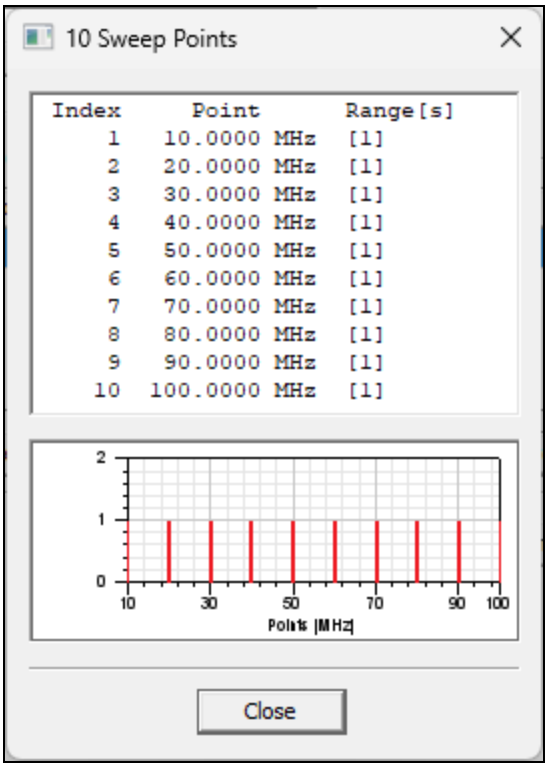
- **Interpolating** – Estimates a solution for an entire frequency range. Ideal when the frequency range is wide and the frequency response is smooth. When Interpolating is selected, the **Interpolation** tab appears.

  > **Note:**
  >
  > The information specified for an Interpolating sweep dictates the amount of information that can be viewed on a post-processing plot.

- **Enabled** – check to enable the sweep.
- **Frequency Sweeps** area – use **Add Above**, **Add Below**, and **Delete** to add or remove sweeps. Each row in the table represents a separate sweep and each column is either a selectable parameter or a value field. If applicable, add multiple frequency sweeps to the same setup. Specify the **Start** and **End** frequency for each sweep, and make selections from the additional options specific to the **Distribution** type.
  - **Distribution** – select from the following:
    - **Linear Step** – A linear range of frequency points for which users specify a constant step size. The simulation will solve the frequency point at each step in the specified frequency range, including the start and stop frequencies (e.g. , specifying 10 for the **Start** frequency, 20 for the **Stop** frequency, and 2.5 for the **Step Size** instructs the simulation to compute a solution for frequencies of 10, 12.5, 15, 17.5, and 20).
    - **Single Point** – Individual frequency points. Insert specific frequency points to solve in the frequency range after uniform frequency points. For **Discrete** sweep types only.
    - **Linear Count** – A linear range of frequency points for which users specify the number (count) of points within the frequency range. The simulation divides the frequency range into the count specified and solve each frequency point in the count.
    - **Log Scale** – A range of points for which users specify **Start**, **End**, and the number of **Samples**.The simulation assigns the sampled points using intervals based on a logarithmic scale.
    - **Use adaptive solution for all sweep frequencies** – check to optimizes the accuracy and efficiency of the solution by refining the mesh or adjusting parameters as needed across all frequencies.

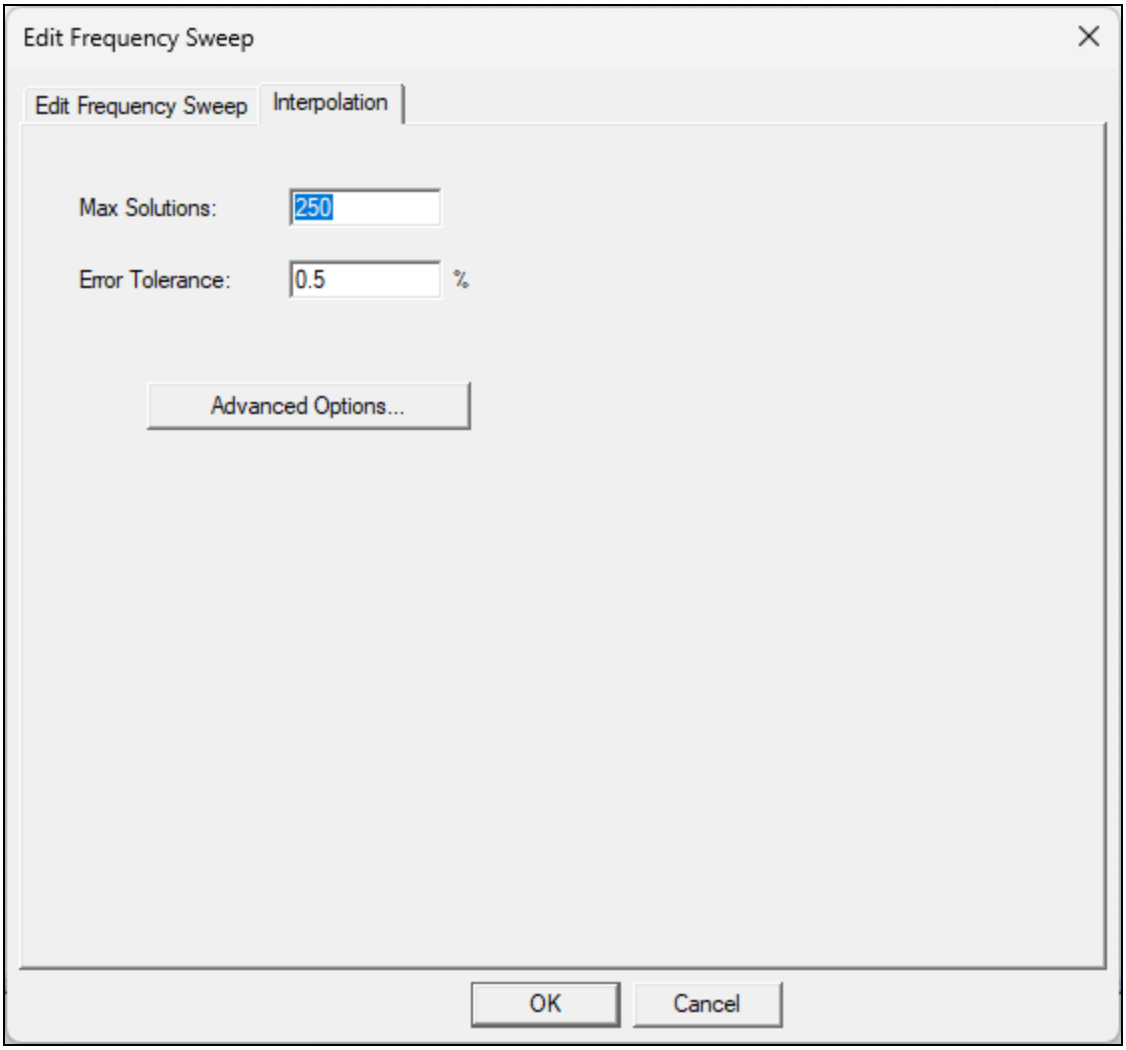
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

16. Click **Preview** to view a preview of the sweep, as currently defined.



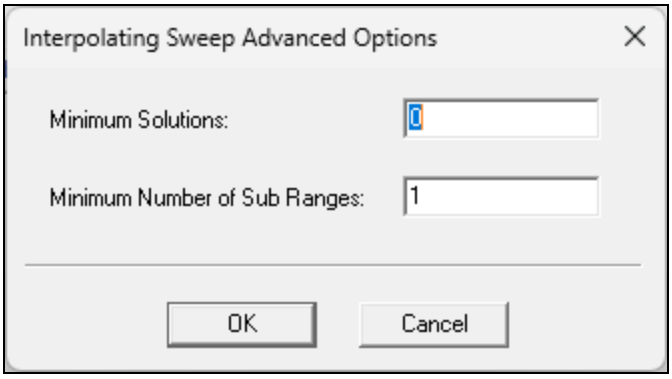
17. If **Interpolating** is selected from the **Sweep Type** drop-down menu, the **Interpolation** tab appears. Click the **Interpolation** tab.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



18. From the **Interpolation** tab, specify the following:
    - **Max Solutions** – the maximum number of solutions that will be solved for the frequency range. The default is **250**.
    - **Error Tolerance** – the maximum relative difference allowed between two successive interpolation solutions. The default is **0.5** percent.
19. Click **Advanced Options** to open the **Interpolating Sweep Advanced Options** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

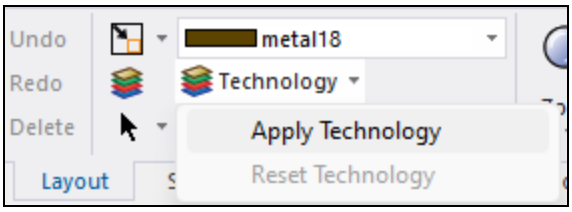


20. From the **Interpolating Sweep Advanced Options** window, specify the following:
    - **Minimum Solutions** – the minimum number of converged solutions that will be solved for the frequency range (e.g., if this value is three, then once the sweep reaches convergence it simulates at two extra frequencies, resembling the minimum number of converged adaptive passes in a regular simulation). Setting a minimum number of solutions can eliminate non-physical S-parameter spikes. The default value is **0**.
    - **Minimum Number of Sub Ranges** – the sub range number acts as an initial condition on the sweep to force initial even breakup of the null range into subranges. The end points and middle of each subrange will be solved, controlling the points at which the interpolating sweep is broken up and preventing redundant effort caused by neighboring interpolating sweeps solving the same point (e.g., 1 GHz-4 GHz and 4 GHz-9 GHz sweeps do not both solve the 4 GHz datapoint). The default value is **1**.
21. Click **OK** to close the **Interpolating Sweep Advanced Options** window.
22. Click **OK** to close the **Edit Frequency Sweep** window and add any sweeps.
23. If any technology files were imported during the initial setup of the design, follow these steps to apply a technology before simulation.

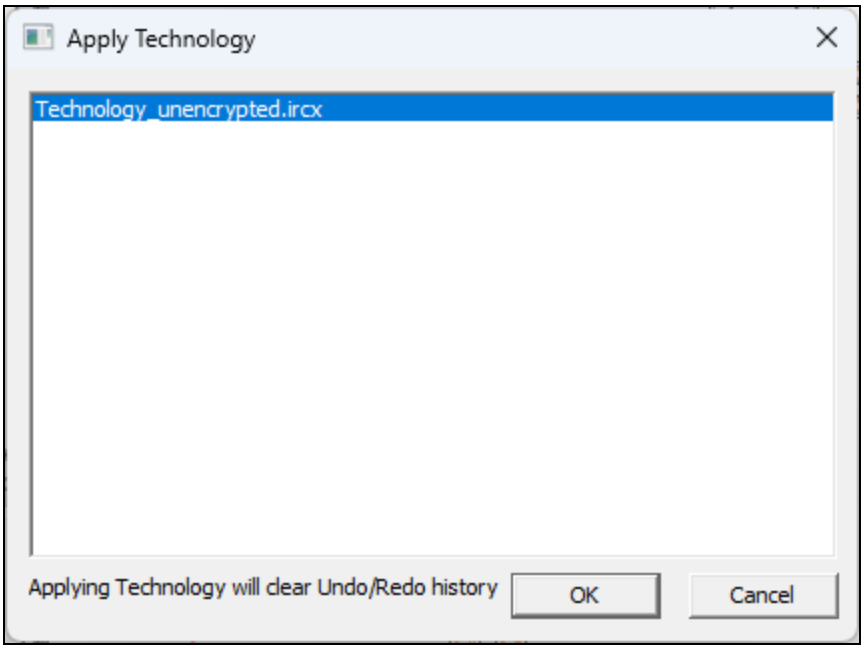
> **Note:**
>
> If technology files were **not** imported during the initial setup of the design, users can add one or more files at any time before simulation. If a technology file **was** applied during setup, the technology's name should already appear in the **Layout** ribbon adjacent to the **Technology** drop-down menu. Users will not need to follow these steps. Refer to Adding a Technology File to a Design.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

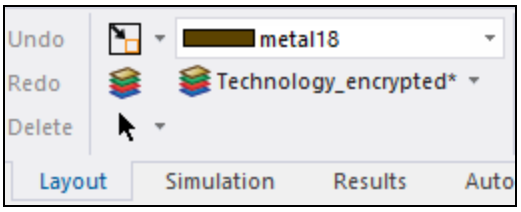
a. If a technology is available, navigate to the **Layout** ribbon and select **Apply Technology** from the **Technology** drop-down menu.



b. Once the **Apply Technology** window opens, select an appropriate technology from the list and click **OK**.

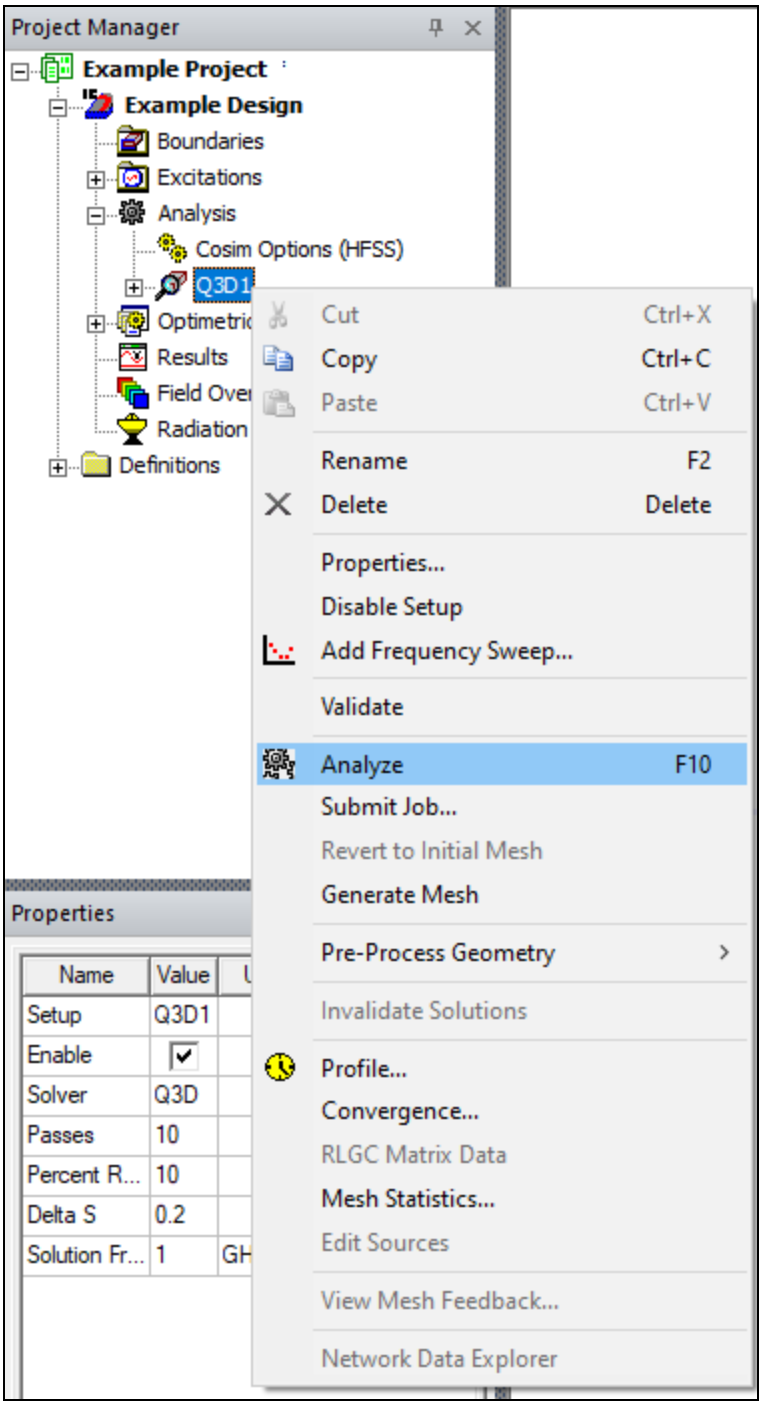


Once the technology is applied to the design, the technology's name appears adjacent to the **Technology** drop-down menu.



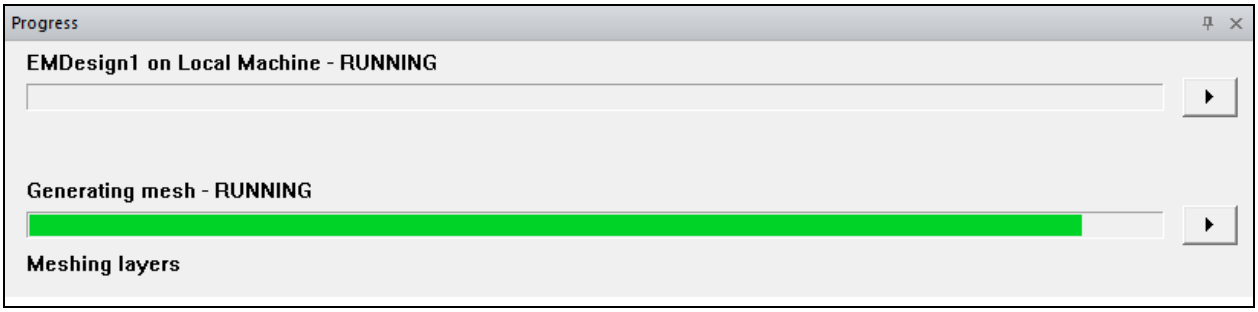
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

24. From the **Project Manager** window, right-click the Q3D solution setup (e.g., **Q3D1**) and select **Analyze** to run the simulation. Refer to Running Simulations.

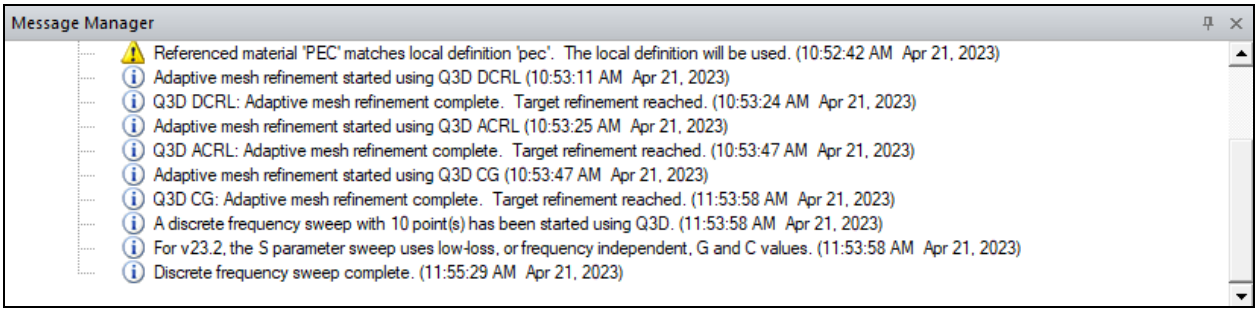


AEDT will begin simulation and generate an appropriate mesh. View, pause, or stop the simulation from the **Progress** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

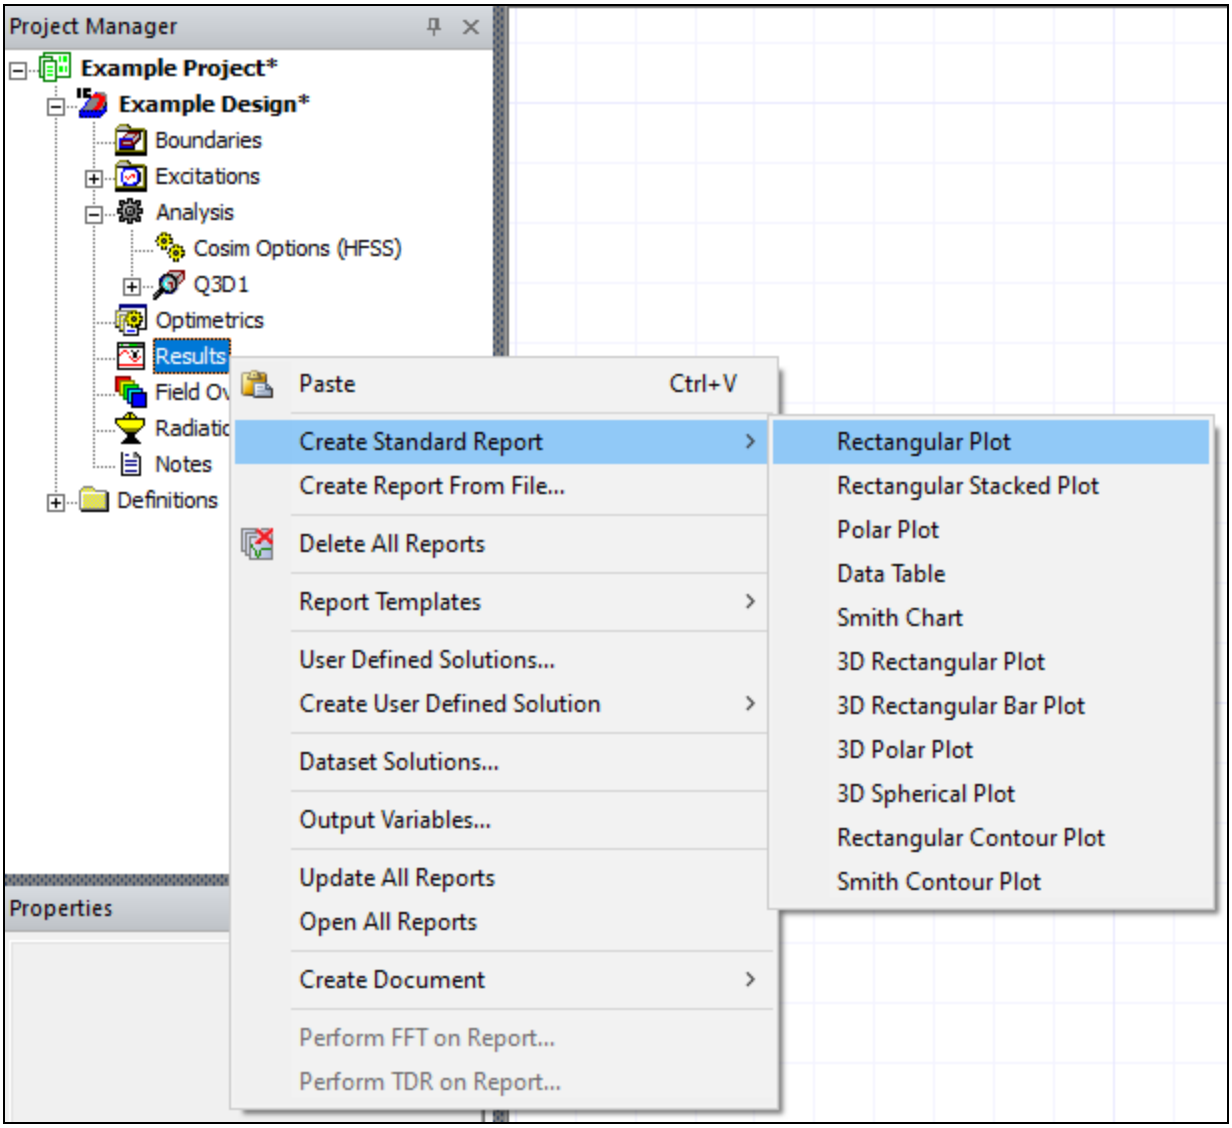


The **Message Manager** window will display pertinent information as the simulation progresses.



25. Once the simulation is complete, navigate to the **Project Manager** window and right-click **Results** to view the available **Report** options. Then select a report to open the **Report** window. Refer to Creating Reports.

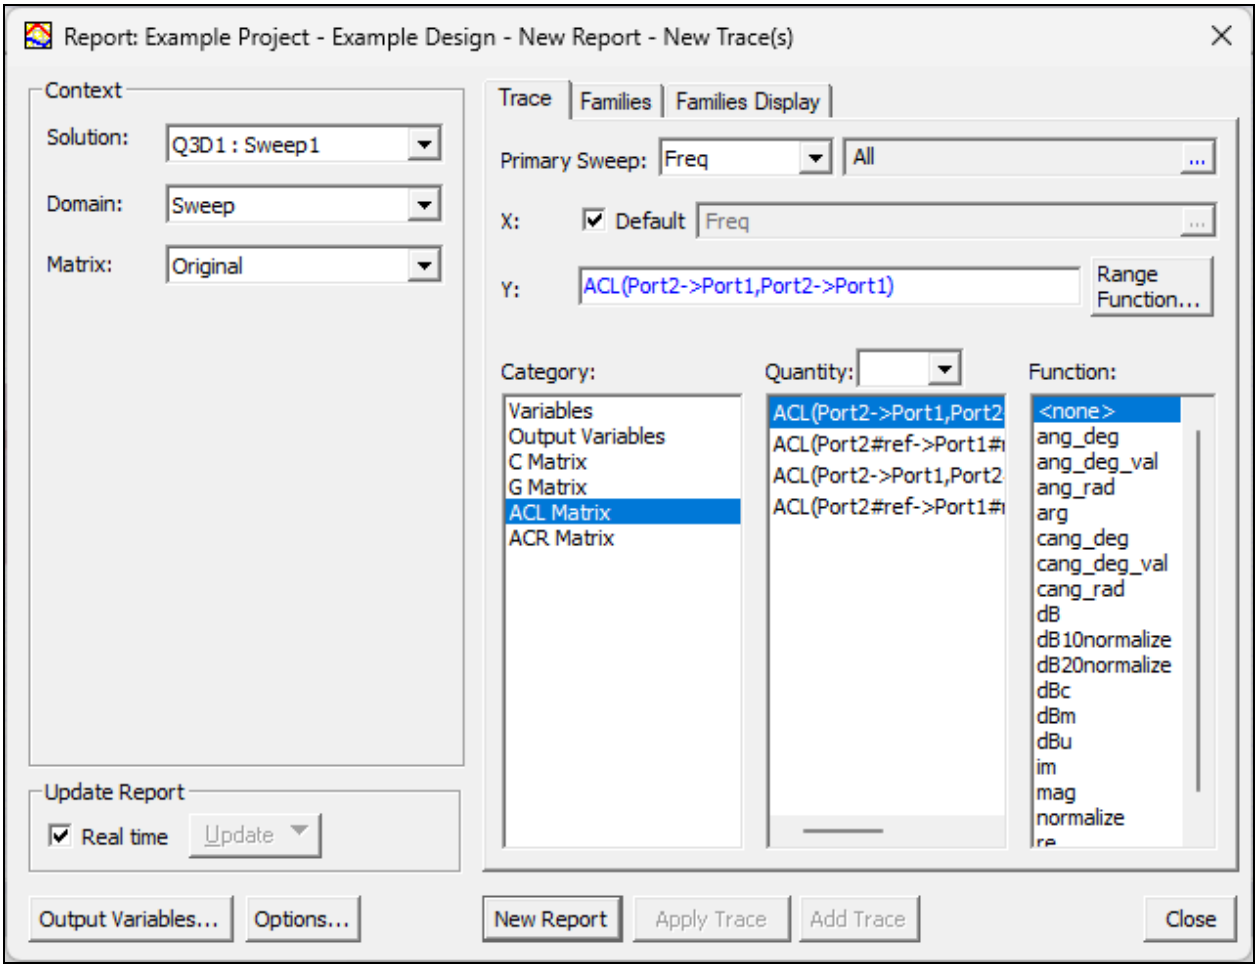
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



26. There are several report options unique to Q3D solution setups. Refer to the following:

Sweep Solution

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



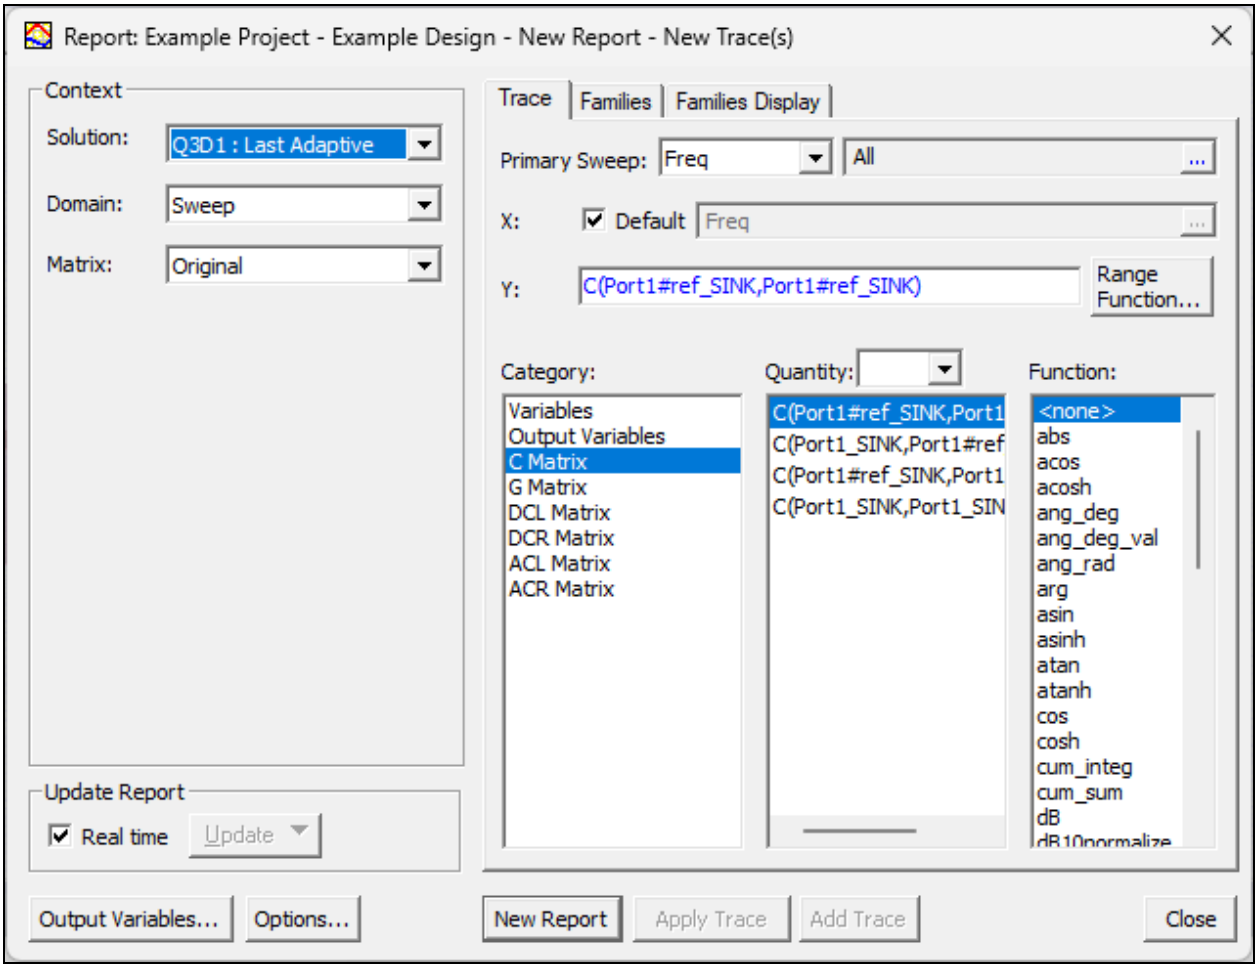
a. From the **Solution** drop-down menu, select **Sweep**.

b. From the **Matrix** drop-down menu, select one of the following:

- **Original** – populates the **Category** and **Quantity** list with **C**, **G ACL** and **ACR** matrices pertinent to the Q3D simulation.
- **Reduced** – populates the **Category** list with parameters (e.g., **S Parameter**).

Last Adaptive Solution

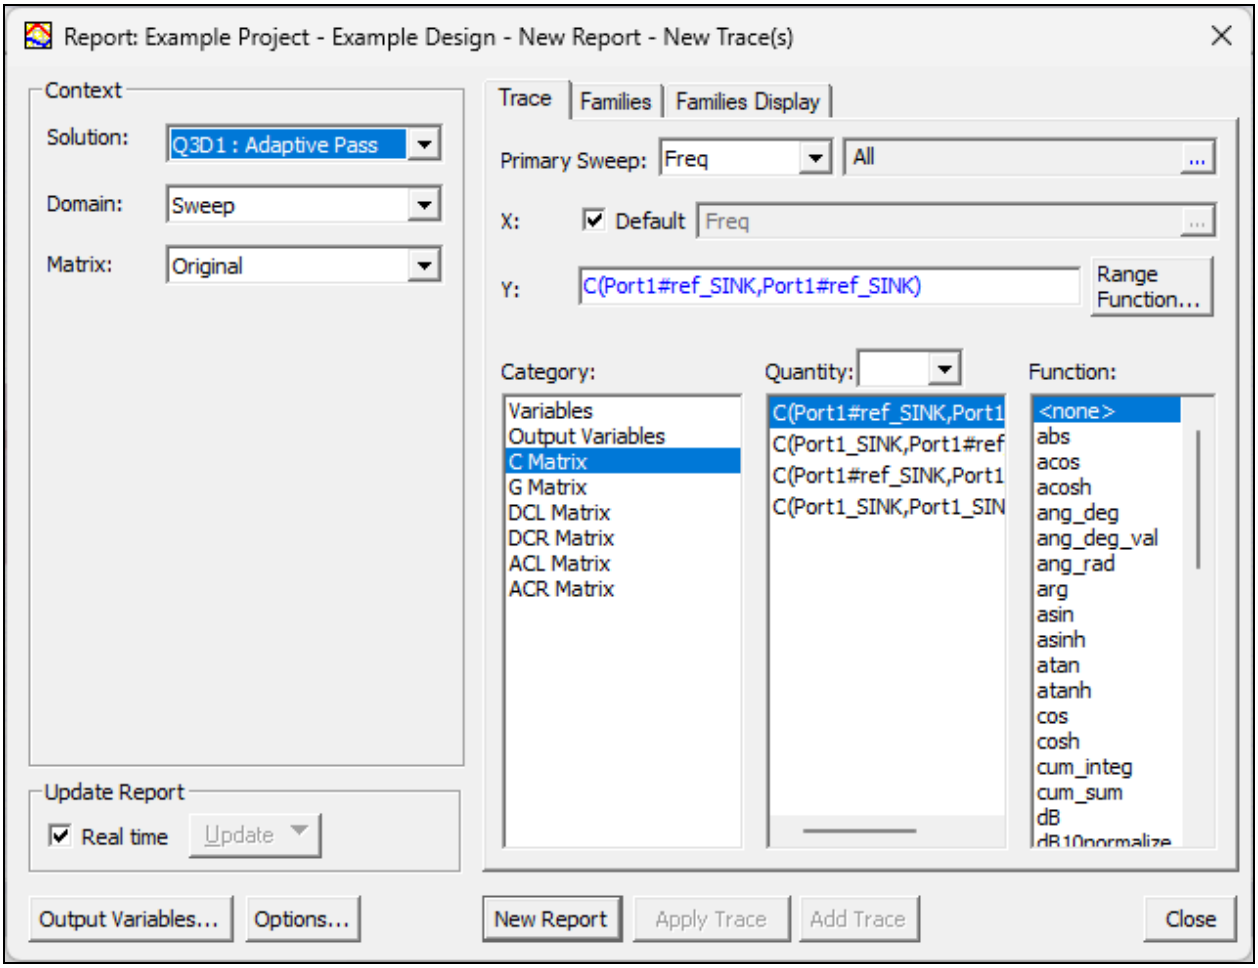
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



From the **Solution** drop-down menu, select **Last Adaptive** to populate the **Category** and **Quantity** list with matrices pertinent to the Q3D simulation (i.e., **C**, **G**, **DCL**, **DCR**, **ACL**, and **ACR**).

Adaptive Pass Solution

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

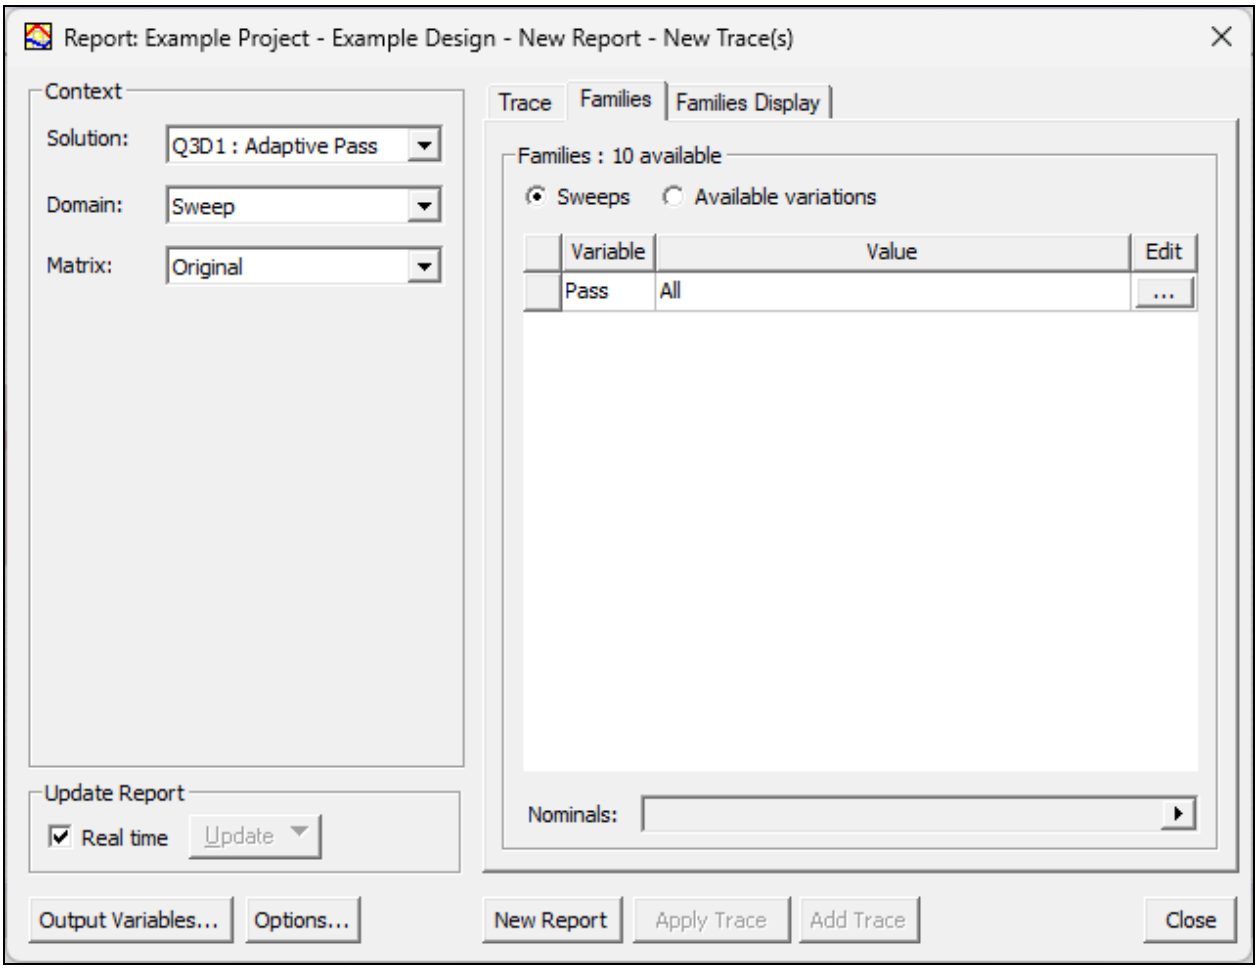


a. From the **Solution** drop-down menu, select **Adaptive Pass** to populate the **Category** and **Quantity** list with matrices pertinent to the Q3D simulation (i.e., **C**, **G**, **DCL**, **DCR**, **ACL**, and **ACR**).

b. Navigate to the **Families** tab and select either all passes or an individual pass (if

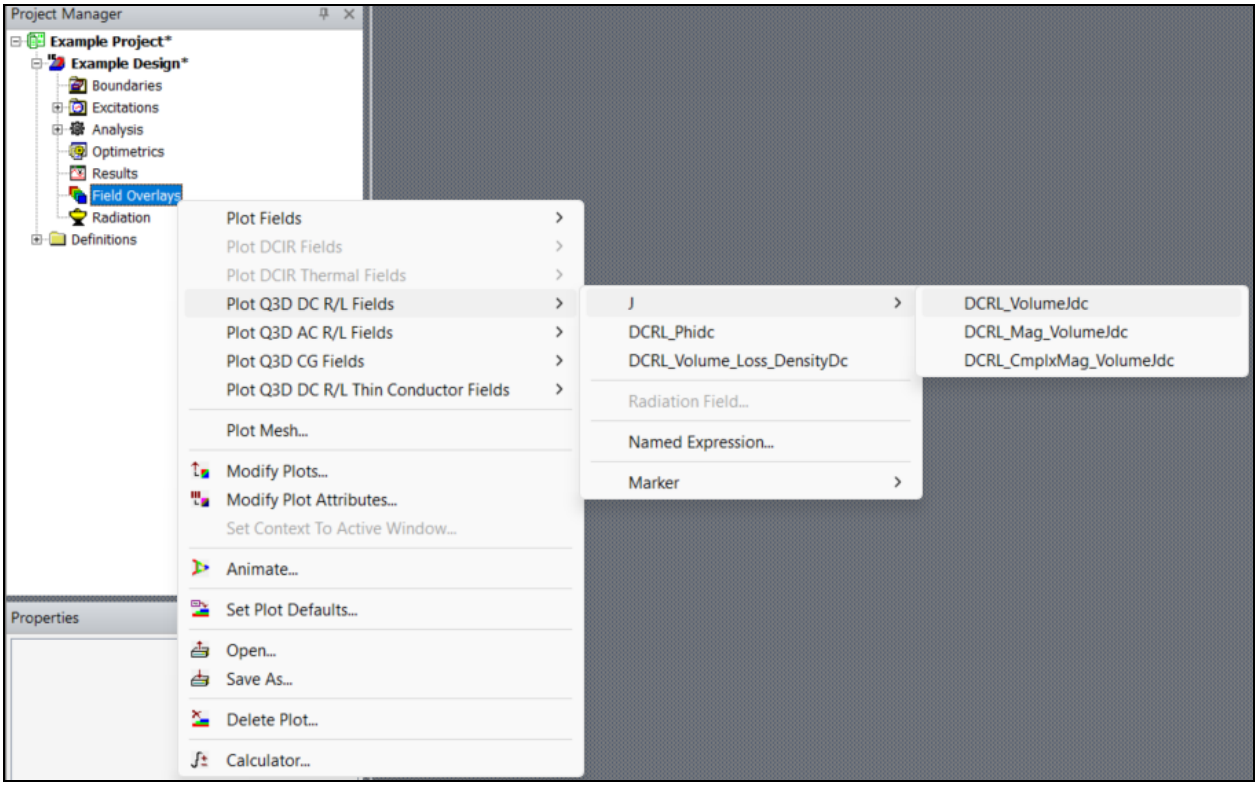
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

multiple sweeps are available) to view.



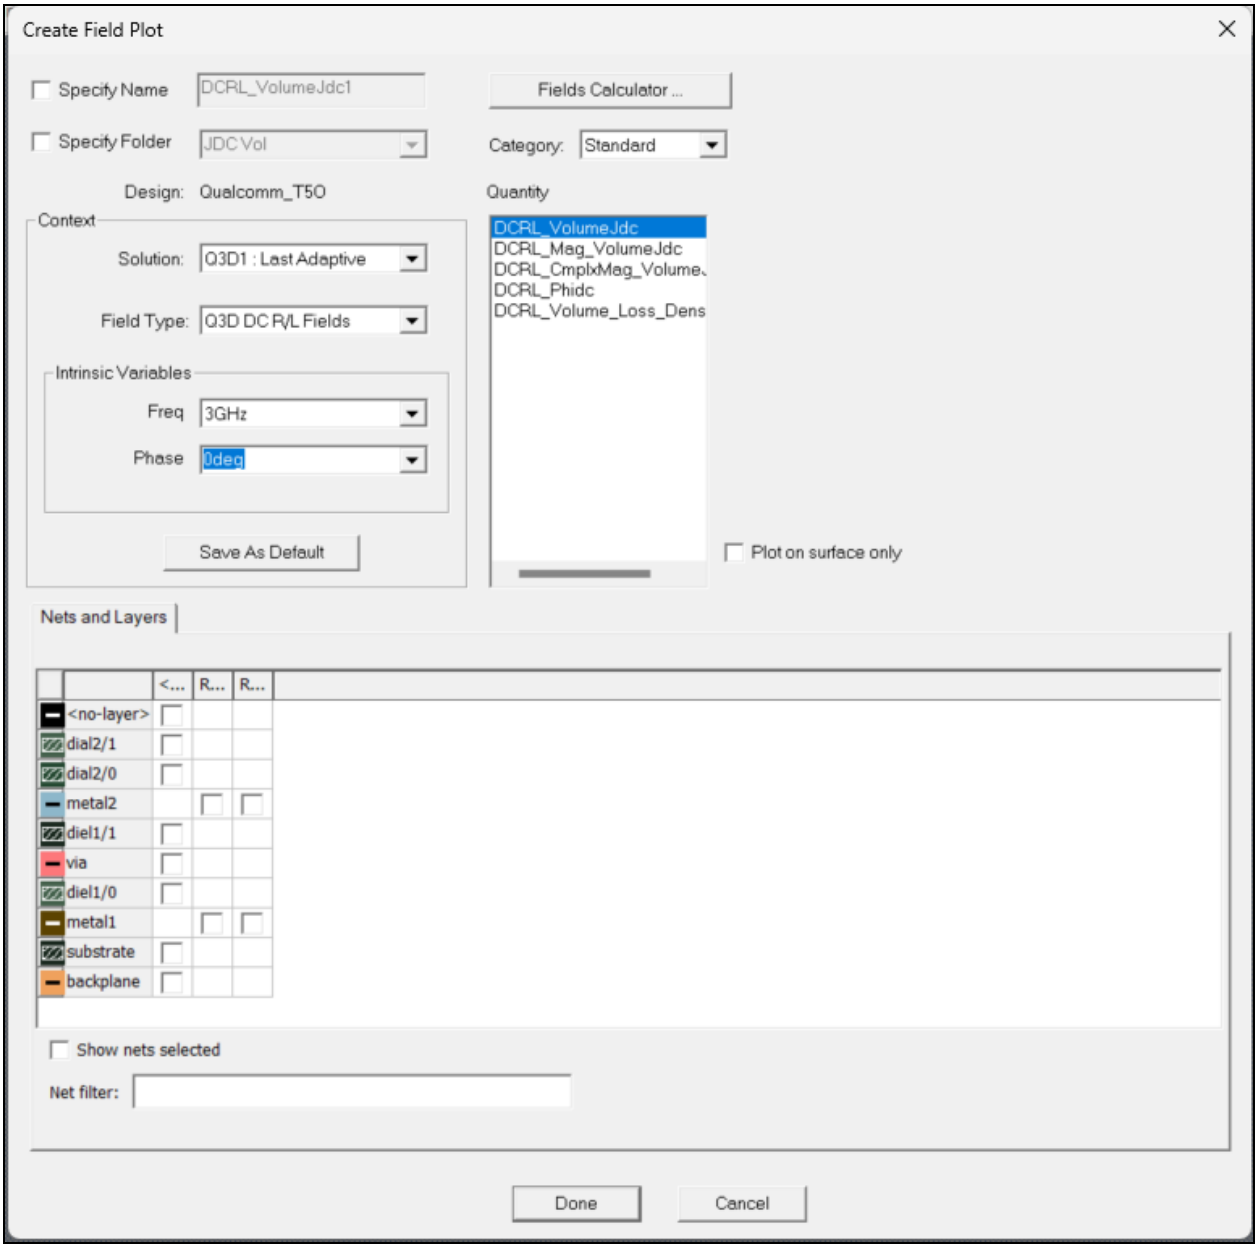
27. Navigate to the **Project Manager** window and right-click **Field Overlays** to view the available plot types. Several plot types are unique to Q3D solution setups (i.e., **NF Fields**, **DC R/L Fields**, **AC R/L Fields**, **CG Fields**, and **DC R/L Thin Conductor Fields**). Refer to Field Quantities.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



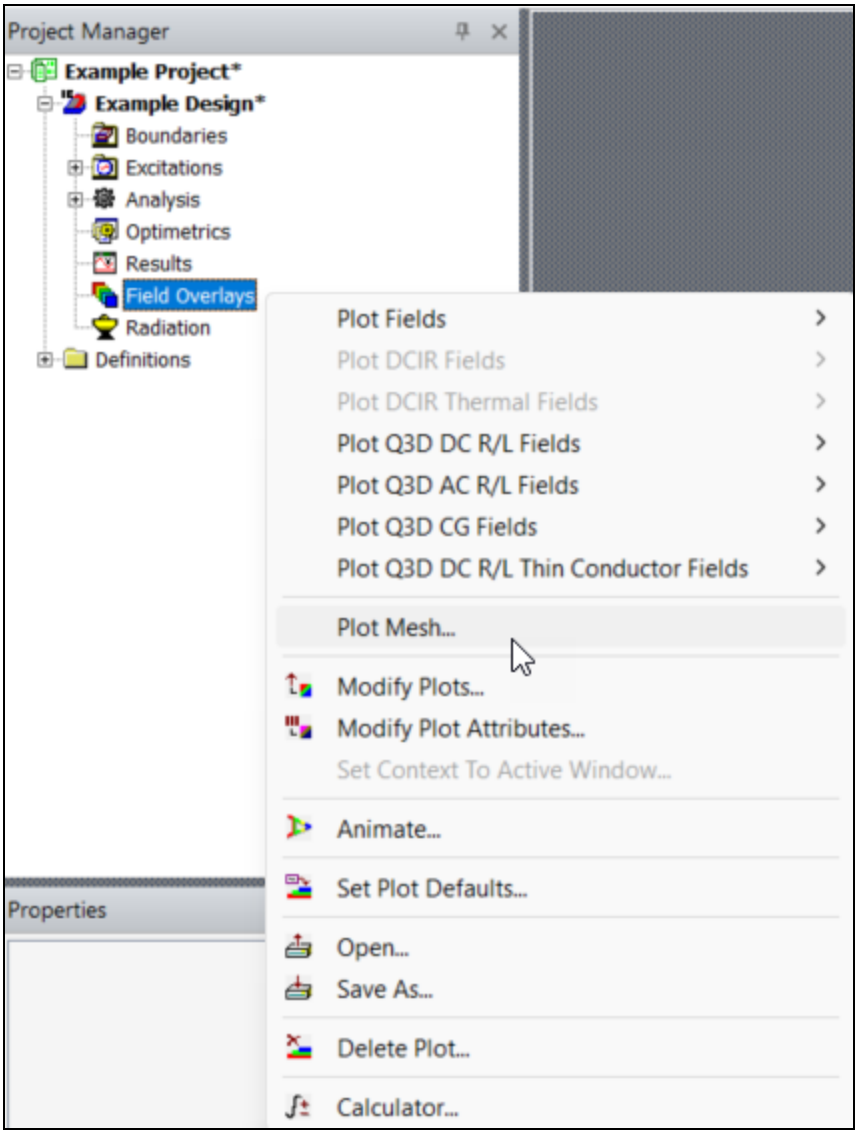
28. Select a plot type to open the **Create Field Plot** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



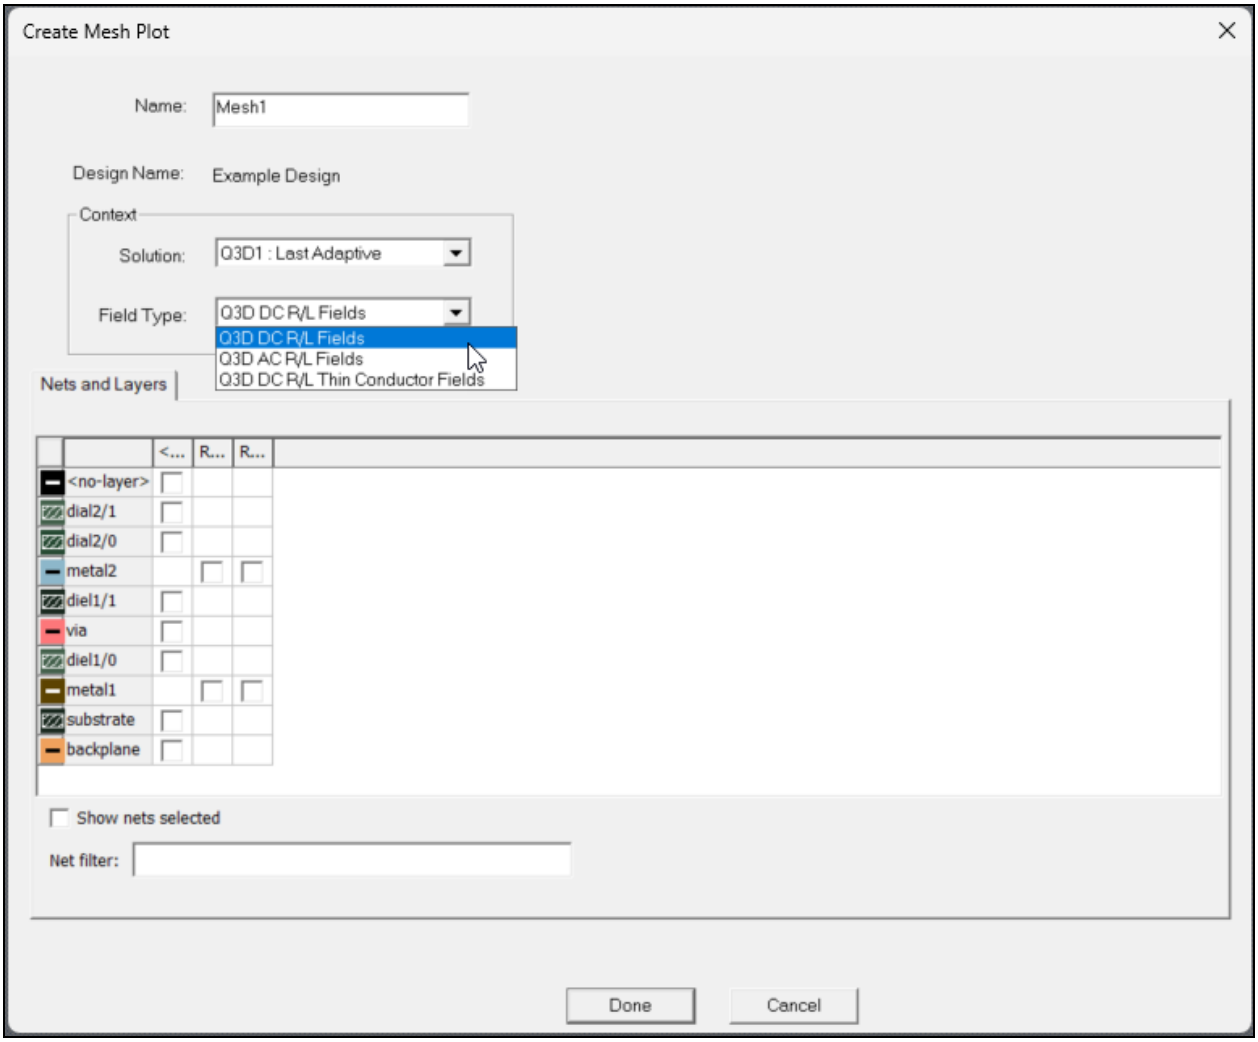
29. **Specify** a **Name**, **Folder**, and make changes to the default settings in the **Context** area and from the **Quantity** list, as appropriate. Select **Nets** and **Layers** from the table.
30. Click **Done** to create the field plot. Refer to Plotting Field Overlays.
31. Navigate to the **Project Manager** window. Then right-click **Field Overlays** and select **Plot Mesh** to open the **Create Mesh Plot** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



32. Select a Q3D solution from the **Solution** drop-down menu to populate the **Field Type** drop-down menu with options unique to Q3D solution setups (i.e., **DC R/L Fields**, **AC R/L Fields**, **CG Fields**, and **DC R/L Thin Conductor Fields**). Refer to Create Mesh Plot.

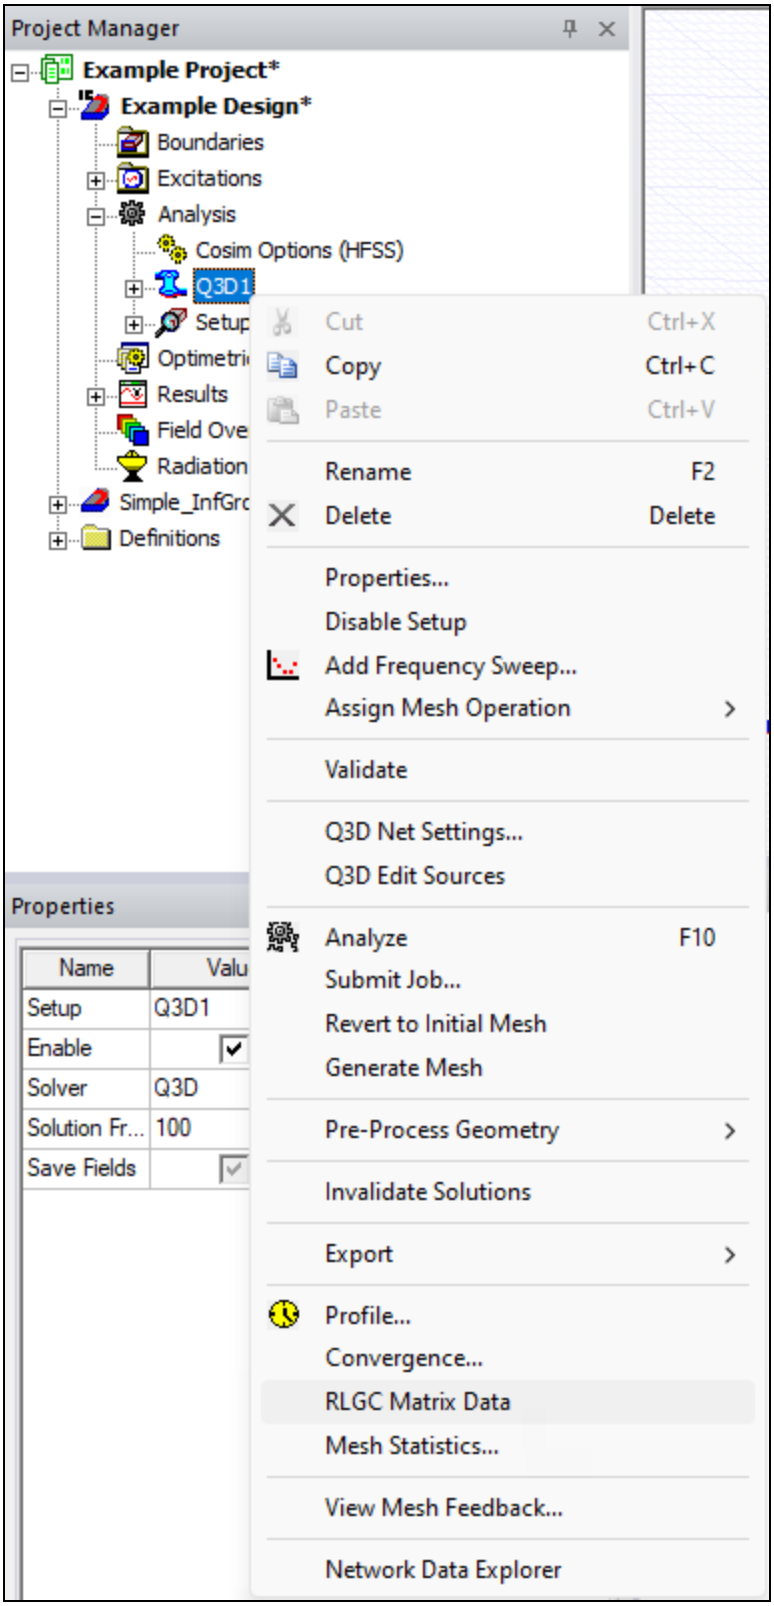
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Viewing RLGC Matrix Data

To view computed matrix data from a Q3D solution setup, navigate to the **Project Manager** window. Then right-click the Q3D solution setup (e.g., **Q3D1**) and select **RLGC Matrix Data** to open the **Solution** window. Refer to Viewing Matrix Data.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



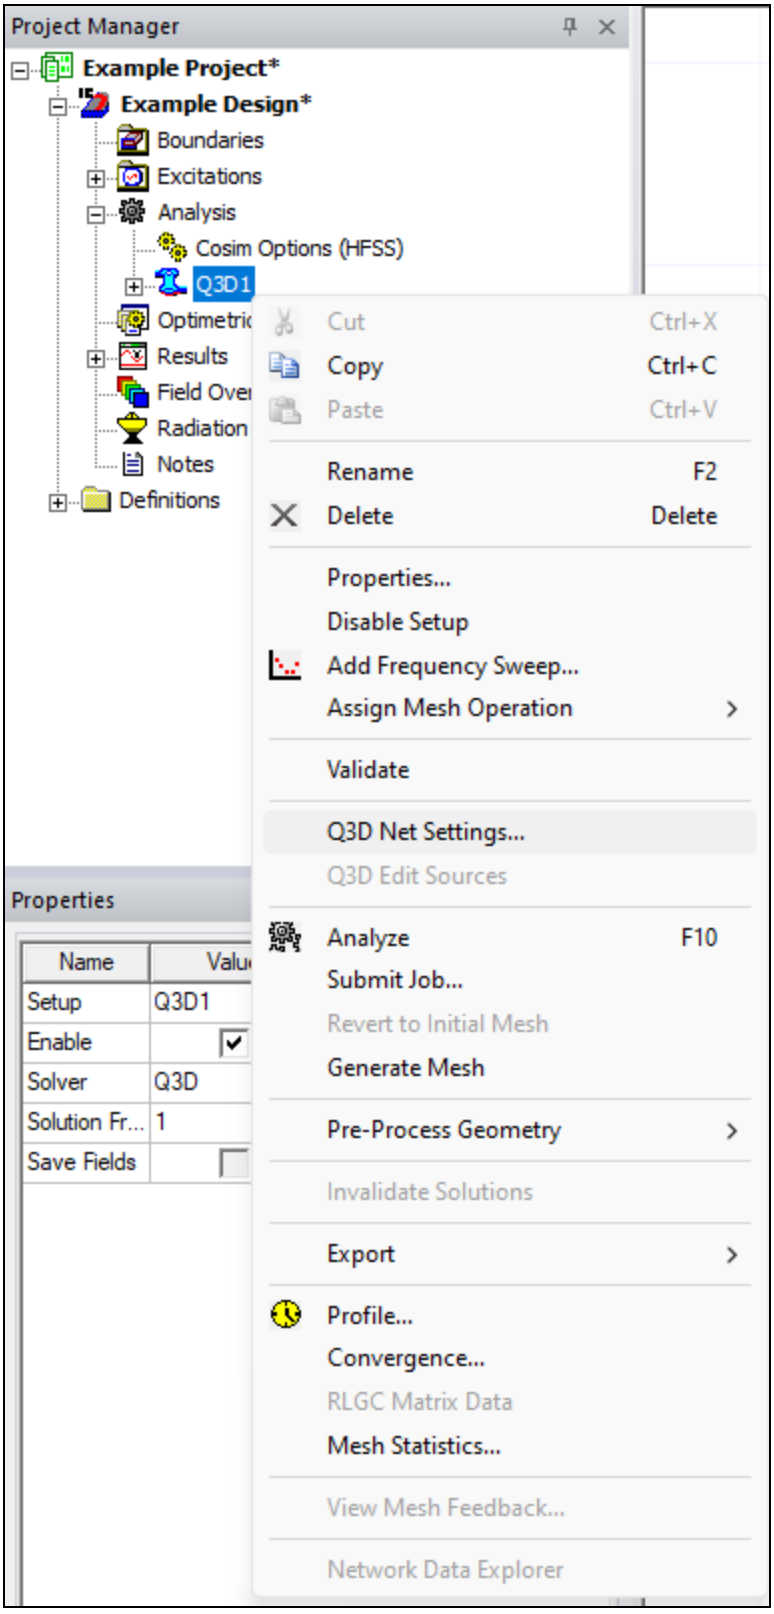
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Changing Net Settings

Follow these steps to view all of the nets recognized by Q3D during simulation, and modify as appropriate.

1. From the **Project Manager** window, expand **Analysis**. Then right-click the Q3D solution setup (e.g., **Q3D1**) and select **Q3D Net Settings** to open the **Q3D Net Settings** window.

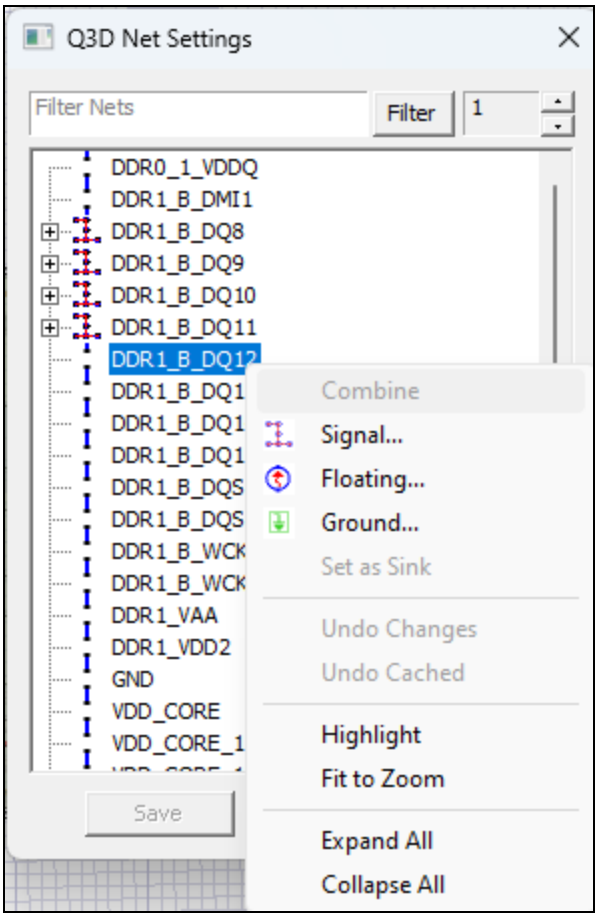
Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

> **Note:**
>
> If the mesh has not been generated by the user, AEDT will automatically generate the mesh before opening the **Q3D Net Settings** window.

2. From the **Q3D Net Settings** window, right-click the appropriate nets and/or net groups to do the following:



- **Combine** – combine (only) floating nets.
- Set floating nets to **Signal**, **Floating**, or **Ground** types.

  > **Note:**
  >
  > Regular nets can only be set to **Signal** type.

- **Set as sink** – set the selected net to **Sink** type.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Undo Changes** – restore original net attributes.
- **Undo Cached** – c1lear saved net data from the Q3D solution setup.
- **Highlight** – highlights the selected nets/sources/sinks in the **Layout Editor**.
- **Fit to Zoom** – Centers the screen on the selected nets/sources/sinks and zooms in.
- **Expand All/Collapse All** – Adjust the net node tree accordingly.

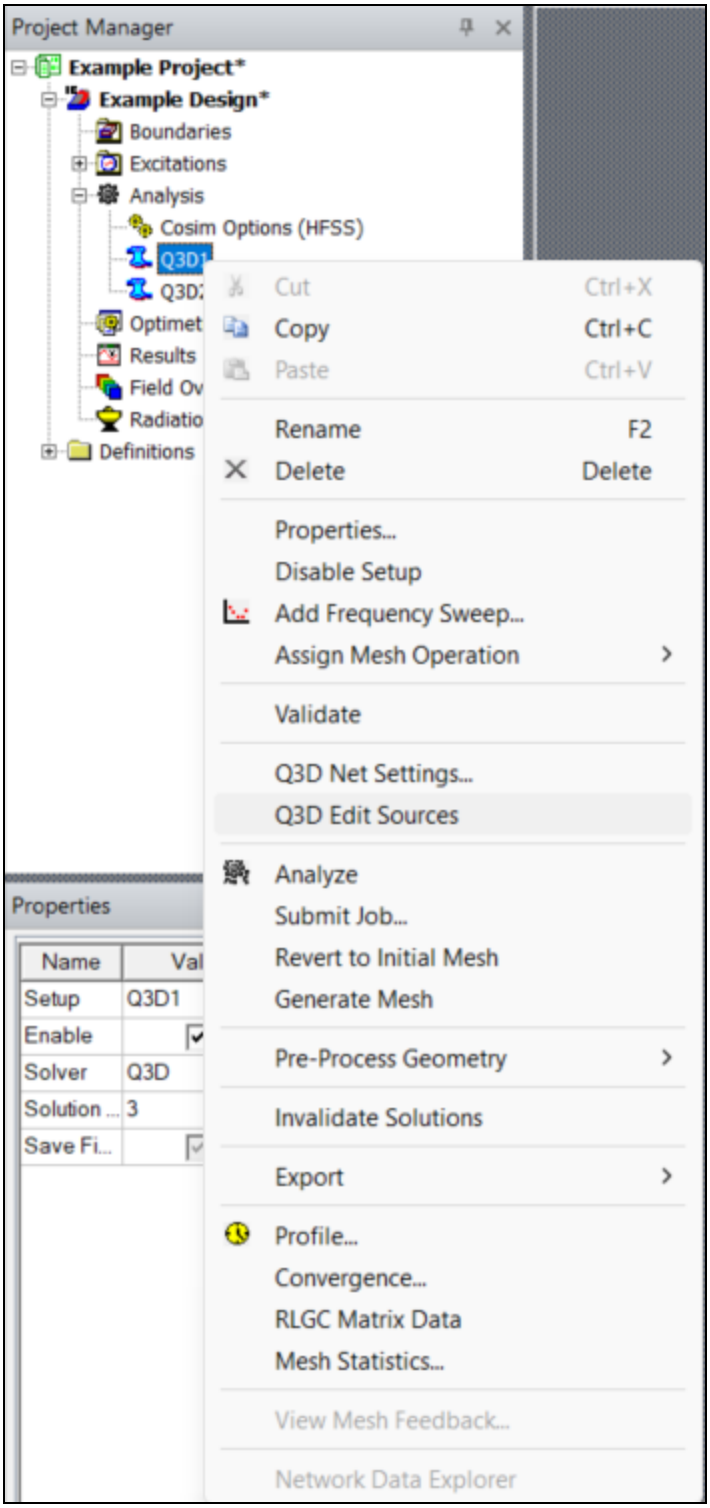
3. Click **OK** to close the **Q3D Net Settings** window.

Editing Sources

Follow these steps to edit port magnitudes and phase.

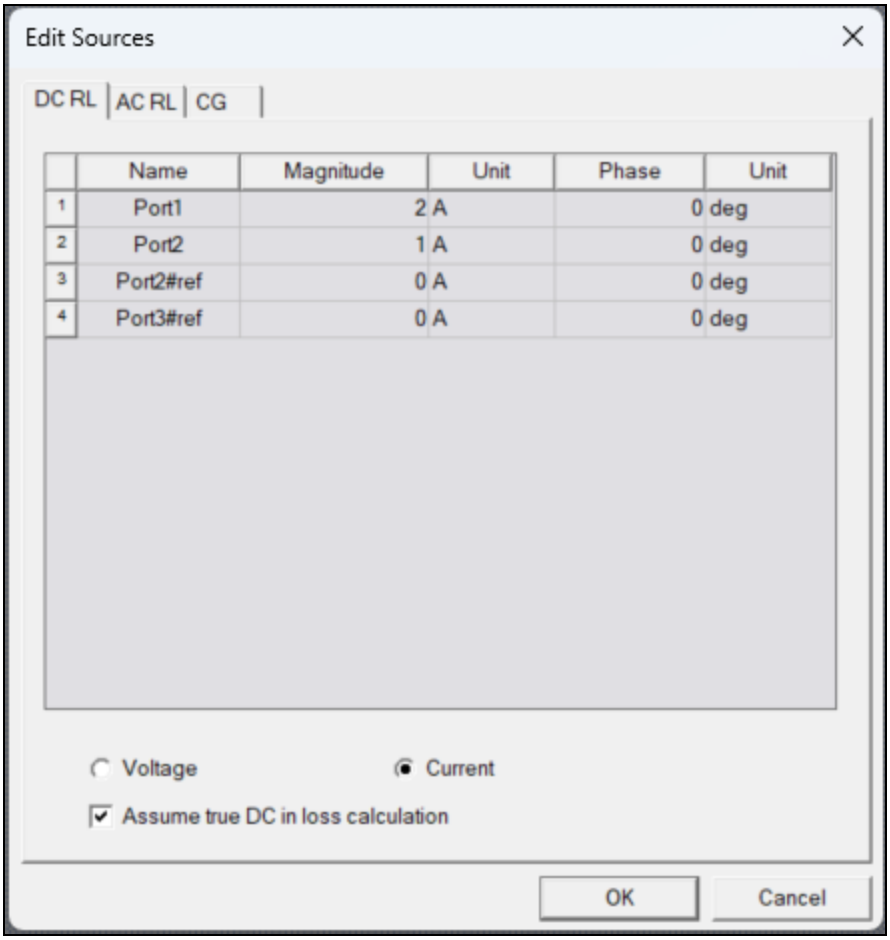
1. From the **Project Manager** window, expand **Analysis**. Then right-click the Q3D solution setup (e.g., **Q3D1**) and select **Q3D Edit Settings** to open the **Edit Sources** window.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



2. From the **Edit Sources** window, do the following from the **DC RL**, **AC RL**, and **CG** tabs:

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



- **DC RL** – select **Voltage** or **Current** and specify those values in the table above. Manually edit the **Magnitude** and/or **Phase** values, or select a new **Unit** of measurement from the drop-down menus. Then check or uncheck **Assume true DC in loss calculation**, as appropriate.

Ansys Electromagnetics Suite 2025 R2 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note:

When **Assume true DC in loss calculation** is enabled, DC volume loss calculations assume a standard DC scenario, where currents are either fully aligned (0° degrees) or fully opposed (180° degrees). The loss is calculated as *P = IRI*. Loss calculated with this option matches legacy results.

When this option is deselected, the calculation includes the possibility of low-frequency alternating components (i.e., sinusoids) with given phase shift. Both in-phase and out-of-phase aspects of the current are included, resulting in a more detailed and accurate calculation of losses, similar to how AC current losses are calculated. The loss is calculated as RMS loss:

$$P = \frac{1}{2} I_{re} R I_{re} + \frac{1}{2} I_{im} R I_{im}$$

- **AC RL** – select **Voltage** or **Current** and specify those values in the table above. Manually edit the **Magnitude** and/or **Phase** values, or select a new **Unit** of measurement from the drop-down menus. AC RL voltage and current sources are assumed as peak quantities.
- **CG** – select **Voltage** or **Current** and specify those values in the table above. Manually edit the **Magnitude** and/or **Phase** values, or select a new **Unit** of measurement from the drop-down menus.

3. Click **OK** to close the **Edit Sources** window.

Exporting RLGC Matrix Data

Follow these steps to export RLGC matrix data or lumped RLGC data (i.e., **Equivalent Circuit Export**) from an analyzed solution.

1. From the **Project Manager** window, expand **Analysis**. Then right-click the Q3D solution setup (e.g., **Q3D1**) and select **Profile** to open the **Solutions** window.
